6.1001.1 Detailed Description

template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩ Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
class std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >

A standard container composed of equivalent keys (possibly containing multiple of each key value) that associates values of another type with the keys.

Since

C++11

Template Parameters

_Key	Type of key objects.
_Tp	Type of mapped objects.
_Hash	Hashing function object type, defaults to hash<_Key>.
_Pred	Predicate function object type, defaults to equal_to<_Key>.
_Alloc	Allocator type, defaults to std::allocator<std::pair<const _Key, _Tp>>.

Meets the requirements of a `container`, and `unordered associative container`
The resulting value type of the container is std::pair<const _Key, _Tp>.
Base is _Hashtable, dispatched at compile time via template alias __ummap_hashtable.

6.1001.3 Constructor & Destructor Documentation

unordered_multimap() [1/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap () [default]
```

Default constructor.

unordered_multimap() [2/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
            size_type __n,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

Parameters

__n	Mnimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

unordered_multimap() [3/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
            _InputIterator __first,
            _InputIterator __last,
            size_type __n = 0,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type())  [inline]
```

Builds an unordered_multimap from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_multimap consisting of copies of the elements from [__first,__last). This is linear in N (where N is distance(__first,__last)).

unordered_multimap() [4/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
            const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & )  [default]
```

Copy constructor.

unordered_multimap() [5/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
            unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > && )  [default]
```

Move constructor.

unordered_multimap() [6/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
            const allocator_type & __a)  [inline], [explicit]
```

Creates an unordered_multimap with no elements.

Parameters

_↩ _a	An allocator object.

unordered_multimap() [7/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
            initializer_list< value_type > __l,
            size_type __n = 0,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type())  [inline]
```

Builds an unordered_multimap from an initializer_list.

Parameters

__l	An initializer_list.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_multimap consisting of copies of the elements in the list. This is linear in N (where N is *__l.size()*).

6.1001.4 Member Function Documentation

begin() [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin () const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multimap.

begin() [2/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin ()  [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the unordered_multimap.

begin() [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (
            size_type __n)  [inline]
```

Returns a read/write iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read/write local iterator.

begin() [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (
            size_type __n) const  [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

bucket_count()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::bucket_count () const  [inline],
[noexcept]
```

Returns the number of buckets of the unordered_multimap.

cbegin() [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin () const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multimap.

cbegin() [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin (
            size_type __n) const  [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

cend() [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cend () const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multimap.

cend() [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cend (
            size_type __n) const  [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

clear()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::clear ()  [inline], [noexcept]
```

Erases all elements in an unordered_multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

contains() [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Kt>
auto std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::contains (
            const _Kt & __x) const -> decltype(_M_h._M_find_tr(__x), void(), true)  [inline]
```

Finds whether an element with the given key exists.

Parameters

_↩ _x	Key of elements to be located.

Returns

True if there is any element with the specified key.

contains() [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
bool std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::contains (
            const key_type & __x) const  [inline]
```

Finds whether an element with the given key exists.

Parameters

_↩ _x	Key of elements to be located.

Returns

True if there is any element with the specified key.

count()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::count (
            const key_type & __x) const  [inline]
```

Finds the number of elements.

Parameters

_↩ _x	Key to count.

Returns

Number of elements with specified key.

emplace()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename...  _Args>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace (
            _Args &&...  __args)  [inline]
```

Attempts to build and insert a std::pair into the unordered_multimap.

Parameters

__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the inserted pair.

This function attempts to build and insert a (key, value) pair into the unordered_multimap.
Insertion requires amortized constant time.

emplace_hint()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (
            const_iterator __pos,
            _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the unordered_multimap.

Parameters

__pos	An iterator that serves as a hint as to where the pair should be inserted.
__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the std::pair built from *__args*.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↩associative.insert_hints for more on *hinting*.
Insertion requires amortized constant time.

empty()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
bool std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::empty () const [inline], [nodiscard],
[noexcept]
```

Returns true if the unordered_multimap is empty.

end() [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multimap.

end() [2/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the unordered_multimap.

end() [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
            size_type __n) [inline]
```

Returns a read/write iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read/write local iterator.

end() [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
            size_type __n) const  [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

equal_range() [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair< iterator, iterator > std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >↩
::equal_range (
            const key_type & __x)  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

equal_range() [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair< const_iterator, const_iterator > std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _↩
Alloc >::equal_range (
            const key_type & __x) const  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

erase() [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            const key_type & __x)  [inline]
```

Erases elements according to the provided key.

Parameters

_↩ _x	Key of elements to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered_multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last)  [inline]
```

Erases a [__first,__last) range of elements from an unordered_multimap.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from an unordered_multimap. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            const_iterator __position)  [inline]
```

Erases an element from an unordered_multimap.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            iterator __position)  [inline]
```

Erases an element from an unordered_multimap.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

find() [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
            const key_type & __x)  [inline]
```

Tries to locate an element in an unordered_multimap.

Parameters

_↩ *_x*	Key to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
            const key_type & __x) const  [inline]
```

Tries to locate an element in an unordered_multimap.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

get_allocator()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
allocator_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::get_allocator () const
[inline], [noexcept]
```

Returns the allocator object used by the unordered_multimap.

hash_function()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
hasher std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::hash_function () const  [inline]
```

Returns the hash functor object with which the unordered_multimap was constructed.

insert() [1/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            _InputIterator __first,
            _InputIterator __last)  [inline]
```

A template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            _Pair && __x)  [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

insert() [3/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            const value_type & __x)  [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

insert() [4/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            _Pair && __x)  [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

__hint	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of __x (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires amortized constant time.

insert() [5/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            const value_type & __x)  [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

__hint	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of __x (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires amortized constant time.

insert() [6/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            value_type && __x)  [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

__hint	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of __x (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires amortized constant time.

insert() [7/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            initializer_list< value_type > __l)  [inline]
```

Attempts to insert a list of elements into the unordered_multimap.

Parameters

↩ _↩ ↩ _↩ *l*	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.

insert() [8/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            value_type && __x)  [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

_↩ _*x*	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

key_eq()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
key_equal std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::key_eq () const  [inline]
```

Returns the key comparison object with which the unordered_multimap was constructed.

load_factor()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::load_factor () const  [inline],
[noexcept]
```

Returns the average number of elements per bucket.

max_bucket_count()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count () const
[inline], [noexcept]
```

Returns the maximum number of buckets of the unordered_multimap.

max_load_factor() [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor () const  [inline],
[noexcept]
```

Returns a positive number that the unordered_multimap tries to keep the load factor less than or equal to.

max_load_factor() [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor (
            float __z)  [inline]
```

Change the unordered_multimap maximum load factor.

Parameters

_↩ _z	The new maximum load factor.

max_size()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_size () const  [inline],
[noexcept]
```

Returns the maximum size of the unordered_multimap.

operator=() [1/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
            const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & )  [default]
```

Copy assignment operator.

operator=() [2/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
            initializer_list< value_type > __l)  [inline]
```

Unordered_multimap list assignment operator.

Parameters

↩ _↩ ↩ _↩ *l*	An initializer_list.

This function fills an unordered_multimap with copies of the elements in the initializer list *__l*.
Note that the assignment completely changes the unordered_multimap and that the resulting unordered_multimap's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
            unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > && )  [default]
```

Move assignment operator.

rehash()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::rehash (
            size_type __n)  [inline]
```

May rehash the unordered_multimap.

Parameters

_↩ _*n*	The new number of buckets.

Rehash will occur only if the new number of buckets respect the unordered_multimap maximum load factor.

reserve()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::reserve (
            size_type __n)  [inline]
```

Prepare the unordered_multimap for a specified number of elements.

Parameters

_↩ _*n*	Number of elements required.

Same as rehash(ceil(n / max_load_factor())).

size()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

`size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::size () const [inline], [noexcept]`
Returns the size of the unordered_multimap.

swap()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::swap (
            unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & __x) [inline], [noexcept]
```
Swaps data with another unordered_multimap.

Parameters

_↩ _x	An unordered_multimap of the same element and allocator types.

This exchanges the elements between two unordered_multimap in constant time. Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.
The documentation for this class was generated from the following file:

6.1003.1 Detailed Description

template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
class std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >

A standard container composed of equivalent keys (possibly containing multiple of each key value) in which the elements' keys are the elements themselves.

Since

C++11

Template Parameters

_Value	Type of key objects.
_Hash	Hashing function object type, defaults to hash<_Value>.
_Pred	Predicate function object type, defaults to equal_to<_Value>.
_Alloc	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a `container`, and `unordered associative container`
Base is _Hashtable, dispatched at compile time via template alias __umset_hashtable.

6.1003.3 Constructor & Destructor Documentation

unordered_multiset() [1/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset () [default]
```

Default constructor.

unordered_multiset() [2/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
            size_type __n,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

Parameters

__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

unordered_multiset() [3/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
            _InputIterator __first,
            _InputIterator __last,
            size_type __n = 0,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered_multiset from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_multiset consisting of copies of the elements from [__first,__last). This is linear in N (where N is distance(__first,__last)).

unordered_multiset() [4/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
            const unordered_multiset< _Value, _Hash, _Pred, _Alloc > & )  [default]
```

Copy constructor.

unordered_multiset() [5/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
            unordered_multiset< _Value, _Hash, _Pred, _Alloc > && )  [default]
```

Move constructor.

unordered_multiset() [6/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
            initializer_list< value_type > __l,
            size_type __n = 0,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type())  [inline]
```

Builds an unordered_multiset from an initializer_list.

Parameters

__l	An initializer_list.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_multiset consisting of copies of the elements in the list. This is linear in N (where N is *__l.size()*).

unordered_multiset() [7/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
            const allocator_type & __a)  [inline], [explicit]
```

Creates an unordered_multiset with no elements.

Parameters

_↩ _a	An allocator object.

6.1003.4 Member Function Documentation

begin() [1/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.

begin() [2/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.

begin() [3/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
            size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

begin() [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
            size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

bucket_count()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::bucket_count () const  [inline],
[noexcept]
```

Returns the number of buckets of the unordered_multiset.

cbegin() [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin () const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.

cbegin() [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin (
            size_type __n) const  [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

cend() [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend () const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.

cend() [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend (
            size_type __n) const  [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

clear()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::clear ()  [inline], [noexcept]
```

Erases all elements in an unordered_multiset.
Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

contains() [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt>
auto std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::contains (
            const _Kt & __x) const -> decltype(_M_h._M_find_tr(__x), void(), true)   [inline]
```

Finds whether an element with the given key exists.

Parameters

_↩ _x	Key of elements to be located.

Returns

True if there is any element with the specified key.

contains() [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::contains (
            const key_type & __x) const  [inline]
```

Finds whether an element with the given key exists.

Parameters

_↩ _x	Key of elements to be located.

Returns

True if there is any element with the specified key.

count()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::count (
            const key_type & __x) const  [inline]
```

Finds the number of elements.

Parameters

_↩ _x	Element to located.

Returns

Number of elements with specified key.

emplace()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename...  _Args>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace (
            _Args &&...  __args)  [inline]
```

Builds and insert an element into the unordered_multiset.

Parameters

__args	Arguments used to generate an element.

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

emplace_hint()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename...  _Args>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace_hint (
            const_iterator __pos,
            _Args &&...  __args)  [inline]
```

Inserts an element into the unordered_multiset.

Parameters

__pos	An iterator that serves as a hint as to where the element should be inserted.
__args	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires amortized constant time.

empty()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::empty () const [inline], [nodiscard],
[noexcept]
```

Returns true if the unordered_multiset is empty.

end() [1/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.

end() [2/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.

end() [3/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (
            size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

end() [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (
            size_type __n) const  [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

equal_range() [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, iterator > std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::equal↩
_range (
            const key_type & __x)  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

equal_range() [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< const_iterator, const_iterator > std::unordered_multiset< _Value, _Hash, _Pred, _Alloc
>::equal_range (
            const key_type & __x) const  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

erase() [1/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
            const key_type & __x)  [inline]
```

Erases elements according to the provided key.

Parameters

_↩ _x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered_multiset.
Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last)  [inline]
```

Erases a [__first,__last) range of elements from an unordered_multiset.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from an unordered_multiset.
Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
            const_iterator __position)  [inline]
```

Erases an element from an unordered_multiset.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multiset.
Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
            iterator __position)  [inline]
```

Erases an element from an unordered_multiset.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multiset.
Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

find() [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
            const key_type & __x)  [inline]
```

Tries to locate an element in an unordered_multiset.

Parameters

_↩ *_x*	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
            const key_type & __x) const  [inline]
```

Tries to locate an element in an unordered_multiset.

Parameters

_↩ *_x*	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

get_allocator()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
allocator_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::get_allocator () const
[inline], [noexcept]
```

Returns the allocator object used by the unordered_multiset.

hash_function()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
hasher std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::hash_function () const  [inline]
```

Returns the hash functor object with which the unordered_multiset was constructed.

insert() [1/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
            _InputIterator __first,
            _InputIterator __last)  [inline]
```

A template function that inserts a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
            const value_type & __x)  [inline]
```

Inserts an element into the unordered_multiset.

Parameters

_↩ _x	Element to be inserted.

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

insert() [3/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            const value_type & __x)  [inline]
```

Inserts an element into the unordered_multiset.

Parameters

__hint	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires amortized constant.

insert() [4/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            value_type && __x)  [inline]
```

Inserts an element into the unordered_multiset.

Parameters

__hint	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires amortized constant.

insert() [5/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
            initializer_list< value_type > __l)  [inline]
```

Inserts a list of elements into the unordered_multiset.

Parameters

↩ _↩ ↩ _↩ *l*	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.

insert() [6/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
            value_type && __x)  [inline]
```

Inserts an element into the unordered_multiset.

Parameters

_↩ _*x*	Element to be inserted.

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

key_eq()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
key_equal std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::key_eq () const  [inline]
```

Returns the key comparison object with which the unordered_multiset was constructed.

load_factor()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::load_factor () const  [inline],
[noexcept]
```

Returns the average number of elements per bucket.

max_bucket_count()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_bucket_count () const
[inline], [noexcept]
```

Returns the maximum number of buckets of the unordered_multiset.

max_load_factor() [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],
[noexcept]
```

Returns a positive number that the unordered_multiset tries to keep the load factor less than or equal to.

max_load_factor() [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor (
            float __z) [inline]
```

Change the unordered_multiset maximum load factor.

Parameters

_↩ _z	The new maximum load factor.

max_size()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_size () const [inline],
[noexcept]
```

Returns the maximum size of the unordered_multiset.

operator=() [1/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
            const unordered_multiset< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

operator=() [2/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
            initializer_list< value_type > __l) [inline]
```

Unordered_multiset list assignment operator.

Parameters

↩ _↩ ↩ _↩ l	An initializer_list.

This function fills an unordered_multiset with copies of the elements in the initializer list __l.

Note that the assignment completely changes the unordered_multiset and that the resulting unordered_multiset's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
            unordered_multiset< _Value, _Hash, _Pred, _Alloc > && )  [default]
```

Move assignment operator.

rehash()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::rehash (
            size_type __n)  [inline]
```

May rehash the unordered_multiset.

Parameters

_↩ _n	The new number of buckets.

Rehash will occur only if the new number of buckets respect the unordered_multiset maximum load factor.

reserve()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::reserve (
            size_type __n)  [inline]
```

Prepare the unordered_multiset for a specified number of elements.

Parameters

_↩ _n	Number of elements required.

Same as rehash(ceil(n / max_load_factor())).

size()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::size () const  [inline], [noexcept]
```

Returns the size of the unordered_multiset.

swap()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::swap (
            unordered_multiset< _Value, _Hash, _Pred, _Alloc > & __x)  [inline], [noexcept]
```

Swaps data with another unordered_multiset.

Parameters

_↩ _x	An unordered_multiset of the same element and allocator types.

This exchanges the elements between two sets in constant time. Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.

6.1005.1 Detailed Description

template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
class std::unordered_set< _Value, _Hash, _Pred, _Alloc >

A standard container composed of unique keys (containing at most one of each key value) in which the elements' keys are the elements themselves.

Since

C++11

Template Parameters

_Value	Type of key objects.
_Hash	Hashing function object type, defaults to hash<_Value>.
_Pred	Predicate function object type, defaults to equal_to<_Value>.
_Alloc	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a `container`, and `unordered associative container`
Base is _Hashtable, dispatched at compile time via template alias __uset_hashtable.

```

```
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set () [default]
```

Default constructor.

unordered_set() [2/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
            size_type __n,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

Parameters

__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

unordered_set() [3/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
            _InputIterator __first,
            _InputIterator __last,
            size_type __n = 0,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered_set from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_set consisting of copies of the elements from [__first,__last). This is linear in N (where N is distance(__first,__last)).

unordered_set() [4/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
            const unordered_set< _Value, _Hash, _Pred, _Alloc > & )  [default]
```

Copy constructor.

unordered_set() [5/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
            unordered_set< _Value, _Hash, _Pred, _Alloc > && )  [default]
```

Move constructor.

unordered_set() [6/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
            const allocator_type & __a)  [inline], [explicit]
```

Creates an unordered_set with no elements.

Parameters

_↩ _a	An allocator object.

unordered_set() [7/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
            initializer_list< value_type > __l,
            size_type __n = 0,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type())  [inline]
```

Builds an unordered_set from an initializer_list.

Parameters

__l	An initializer_list.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_set consisting of copies of the elements in the list. This is linear in N (where N is *__l.size()*).

6.1005.4 Member Function Documentation

begin() [1/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_set.

begin() [2/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_set.

begin() [3/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin (
            size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

begin() [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin (
            size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

bucket_count()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::bucket_count () const [inline],
[noexcept]
```

Returns the number of buckets of the unordered_set.

cbegin() [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin () const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_set.

cbegin() [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin (
            size_type __n) const  [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

cend() [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cend () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_set.

cend() [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cend (
            size_type __n) const  [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

clear()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in an unordered_set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

contains() [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt>
auto std::unordered_set< _Value, _Hash, _Pred, _Alloc >::contains (
            const _Kt & __k) const -> decltype(_M_h._M_find_tr(__k), void(), true)  [inline]
```

Finds whether an element with the given key exists.

Parameters

_↩ _x	Key of elements to be located.

Returns

True if there is any element with the specified key.

contains() [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_set< _Value, _Hash, _Pred, _Alloc >::contains (
            const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

Parameters

_↩ _x	Key of elements to be located.

Returns

True if there is any element with the specified key.

count()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::count (
            const key_type & __x) const [inline]
```

Finds the number of elements.

Parameters

_↩ _x	Element to located.

Returns

Number of elements with specified key.

This function only makes sense for unordered_multisets; for unordered_set the result will either be 0 (not present) or 1 (present).

emplace()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename...  _Args>
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace (
            _Args &&...  __args)  [inline]
```

Attempts to build and insert an element into the unordered_set.

Parameters

__args	Arguments used to generate an element.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set.
Insertion requires amortized constant time.

emplace_hint()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename...  _Args>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace_hint (
            const_iterator __pos,
            _Args &&...  __args)  [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

__pos	An iterator that serves as a hint as to where the element should be inserted.
__args	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the element with key equivalent to the one generated from *__args* (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument emplace() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires amortized constant time.

empty()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_set< _Value, _Hash, _Pred, _Alloc >::empty () const  [inline], [nodiscard],
[noexcept]
```

Returns true if the unordered_set is empty.

end() [1/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_set.

end() [2/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end ()  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_set.

end() [3/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (
            size_type __n)  [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

end() [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (
            size_type __n) const  [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

equal_range() [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, iterator > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::equal_range
(
            const key_type & __x)  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

equal_range() [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< const_iterator, const_iterator > std::unordered_set< _Value, _Hash, _Pred, _Alloc >↩
::equal_range (
            const key_type & __x) const  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

erase() [1/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
            const key_type & __x)  [inline]
```

Erases elements according to the provided key.

Parameters

_↩ _x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered_set. For an unordered_set the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last)  [inline]
```

Erases a [__first,__last) range of elements from an unordered_set.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from an unordered_set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
            const_iterator __position)  [inline]
```

Erases an element from an unordered_set.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
            iterator __position)  [inline]
```

Erases an element from an unordered_set.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

find() [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (
            const key_type & __x)  [inline]
```

Tries to locate an element in an unordered_set.

Parameters

_↩ *_x*	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (
            const key_type & __x) const  [inline]
```

Tries to locate an element in an unordered_set.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

get_allocator()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
allocator_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::get_allocator () const  [inline],
[noexcept]
```

Returns the allocator object used by the unordered_set.

hash_function()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
hasher std::unordered_set< _Value, _Hash, _Pred, _Alloc >::hash_function () const  [inline]
```

Returns the hash functor object with which the unordered_set was constructed.

insert() [1/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
            _InputIterator __first,
            _InputIterator __last)  [inline]
```

A template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
            const value_type & __x)  [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

_↩ _x	Element to be inserted.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set.
Insertion requires amortized constant time.

insert() [3/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            const value_type & __x)  [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

__hint	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the element with key of __x (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↩html#containers.associative.insert_hints
Insertion requires amortized constant.

insert() [4/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            value_type && __x)  [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

__hint	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the element with key of __x (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires amortized constant.

insert() [5/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
            initializer_list< value_type > __l)  [inline]
```

Attempts to insert a list of elements into the unordered_set.

Parameters

__l	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.

insert() [6/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
            value_type && __x)  [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

__x	Element to be inserted.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set.
Insertion requires amortized constant time.

key_eq()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
key_equal std::unordered_set< _Value, _Hash, _Pred, _Alloc >::key_eq () const  [inline]
```

Returns the key comparison object with which the unordered_set was constructed.

load_factor()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_set< _Value, _Hash, _Pred, _Alloc >::load_factor () const  [inline], [noexcept]
```

Returns the average number of elements per bucket.

max_bucket_count()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_bucket_count () const  [inline],
[noexcept]
```

Returns the maximum number of buckets of the unordered_set.

max_load_factor() [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_load_factor () const  [inline],
[noexcept]
```

Returns a positive number that the unordered_set tries to keep the load factor less than or equal to.

max_load_factor() [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_load_factor (
            float __z)  [inline]
```

Change the unordered_set maximum load factor.

Parameters

_↩ _z	The new maximum load factor.

max_size()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_size () const  [inline], [noexcept]
```

Returns the maximum size of the unordered_set.

operator=() [1/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
            const unordered_set< _Value, _Hash, _Pred, _Alloc > & )  [default]
```

Copy assignment operator.

operator=() [2/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
            initializer_list< value_type > __l)  [inline]
```

Unordered_set list assignment operator.

Parameters

↩ _↩ ↩ _↩ *l*	An initializer_list.

This function fills an unordered_set with copies of the elements in the initializer list *__l*.
Note that the assignment completely changes the unordered_set and that the resulting unordered_set's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
            unordered_set< _Value, _Hash, _Pred, _Alloc > && )  [default]
```

Move assignment operator.

rehash()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::rehash (
            size_type __n)  [inline]
```

May rehash the unordered_set.

Parameters

_↩ _*n*	The new number of buckets.

Rehash will occur only if the new number of buckets respect the unordered_set maximum load factor.

reserve()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::reserve (
            size_type __n)  [inline]
```

Prepare the unordered_set for a specified number of elements.

Parameters

_↩ _*n*	Number of elements required.

Same as rehash(ceil(n / max_load_factor())).

size()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::size () const  [inline], [noexcept]
```

Returns the size of the unordered_set.

swap()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::swap (
            unordered_set< _Value, _Hash, _Pred, _Alloc > & __x)  [inline], [noexcept]
```

Swaps data with another unordered_set.

Parameters

_↩ _x	An unordered_set of the same element and allocator types.

This exchanges the elements between two sets in constant time. Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.
The documentation for this class was generated from the following file:

- unordered_set.h

6.1006 std::pmr::unsynchronized_pool_resource Class Reference

```
#include <memory_resource>
```

Inheritance diagram for std::pmr::unsynchronized_pool_resource:

Public Member Functions

- **unsynchronized_pool_resource** (const pool_options &__opts)
- **unsynchronized_pool_resource** (const pool_options &__opts, memory_resource *__upstream)
- **unsynchronized_pool_resource** (const unsynchronized_pool_resource &)=delete
- **unsynchronized_pool_resource** (memory_resource *__upstream)

- void **release** ()
- memory_resource * **upstream_resource** () const noexcept

Protected Member Functions

- void * do_allocate (size_t __bytes, size_t __alignment) override
- void do_deallocate (void *__p, size_t __bytes, size_t __alignment) override
- bool do_is_equal (const memory_resource &__other) const noexcept override

6.1006.1 Detailed Description

A non-thread-safe memory resource that manages pools of fixed-size blocks.

Since

C++17

6.1006.2 Member Function Documentation

do_allocate()

```
void * std::pmr::unsynchronized_pool_resource::do_allocate (
            size_t __bytes,
            size_t __alignment)  [override], [protected], [virtual]
```

Implements std::pmr::memory_resource.

do_deallocate()

```
void std::pmr::unsynchronized_pool_resource::do_deallocate (
            void * __p,
            size_t __bytes,
            size_t __alignment)  [override], [protected], [virtual]
```

Implements std::pmr::memory_resource.

do_is_equal()

```
bool std::pmr::unsynchronized_pool_resource::do_is_equal (
            const memory_resource & __other) const  [inline], [override], [protected], [virtual],
[noexcept]
```

Implements std::pmr::memory_resource.

The documentation for this class was generated from the following file:

- memory_resource

6.1007 std::uses_allocator< typename, typename > Struct Template Reference

6.1007.1 Detailed Description

template<typename, typename>
struct std::uses_allocator< typename, typename >

Declare uses_allocator so it can be specialized in <queue> etc.
The documentation for this struct was generated from the following file:

- memoryfwd.h

6.1008 std::uses_allocator< tuple< _Types... >, _Alloc > Struct Template Reference

```
#include <tuple>
```

6.1008.1 Detailed Description

template<typename... _Types, typename _Alloc>
struct std::uses_allocator< tuple< _Types... >, _Alloc >

Partial specialization for tuples.
The documentation for this struct was generated from the following file:

- tuple

6.1009 std::chrono::utc_clock Class Reference

```
#include <chrono>
```

Public Types

6.1010.1 Detailed Description

template<class _Tp>
class std::valarray< _Tp >

Smart array designed to support numeric processing.
A valarray is an array that provides constraints intended to allow for effective optimization of numeric array processing by reducing the aliasing that can result from pointer representations. It represents a one-dimensional array from which different multidimensional subsets can be accessed and modified.

Template Parameters

_Tp	Type of object in the array.

6.1010.2 Constructor & Destructor Documentation

valarray()

```
template<class _Tp>
std::valarray< _Tp >::valarray (
            const _Tp * __restrict__,
            size_t )
```

Construct an array initialized to the first *n* elements of *t*.
References valarray().

6.1010.3 Member Function Documentation

operator"!()

```
template<class _Tp>
_UnaryOp< __logical_not >::_Rt std::valarray< _Tp >::operator!  () const
```

Return a new valarray by applying unary ! to each element.

operator%=() [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator%= (
            const _Tp & )
```

Set each element e of array to e % *t*.
References valarray().

operator%=() [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator%= (
            const valarray< _Tp > & )
```

Modulo elements of array by corresponding elements of *v*.
References valarray().

operator&=() [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator&= (
            const _Tp & )
```

Set each element e of array to e & *t*.
References valarray().

operator&=() [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator&= (
            const valarray< _Tp > & )
```

Logical and corresponding elements of *v* with elements of array.
References valarray().

operator*=() [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator*= (
            const _Tp & )
```

Multiply each element of array by *t*.
References valarray().

operator*=() [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator*= (
            const valarray< _Tp > & )
```

Multiply elements of array by corresponding elements of *v*.
References valarray().

operator+()

```
template<class _Tp>
_UnaryOp< __unary_plus >::_Rt std::valarray< _Tp >::operator+ () const
```

Return a new valarray by applying unary + to each element.

operator+=() [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator+= (
            const _Tp & )
```

Add *t* to each element of array.
References valarray().

operator+=() [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator+= (
            const valarray< _Tp > & )
```

Add corresponding elements of *v* to elements of array.
References valarray().

operator-()

```
template<class _Tp>
_UnaryOp< __negate >::_Rt std::valarray< _Tp >::operator- () const
```

Return a new valarray by applying unary - to each element.

operator-=() [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator-= (
            const _Tp & )
```

Subtract *t* to each element of array.
References valarray().

operator-=() [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator-= (
            const valarray< _Tp > & )
```

Subtract corresponding elements of *v* from elements of array.
References valarray().

operator/=() [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator/= (
            const _Tp & )
```

Divide each element of array by *t*.
References valarray().

operator/=() [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator/= (
            const valarray< _Tp > & )
```

Divide elements of array by corresponding elements of *v*.
References valarray().

operator<<=() [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator<<= (
            const _Tp & )
```

Left shift each element e of array by *t* bits.
References valarray().

operator<<=() [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator<<= (
            const valarray< _Tp > & )
```

Left shift elements of array by corresponding elements of *v*.

operator>>=() [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator>>= (
            const _Tp & )
```

Right shift each element e of array by *t* bits.
References valarray().

operator>>=() [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator>>= (
            const valarray< _Tp > & )
```

Right shift elements of array by corresponding elements of *v*.
References valarray().

operator^=() [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator^= (
            const _Tp & )
```

Set each element e of array to e ^ *t*.
References valarray().

operator^=() [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator^= (
            const valarray< _Tp > & )
```

Logical xor corresponding elements of *v* with elements of array.
References valarray().

operator"|=() [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator|= (
            const _Tp & )
```

Set each element e of array to e | *t*.

operator"|=() [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator|= (
            const valarray< _Tp > & )
```

Logical or corresponding elements of *v* with elements of array.
References valarray().

operator~()

```
template<class _Tp>
_UnaryOp< __bitwise_not >::_Rt std::valarray< _Tp >::operator~ () const
```

Return a new valarray by applying unary ~ to each element.
The documentation for this class was generated from the following file:

6.1012.1 Detailed Description

template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::vector< _Tp, _Alloc >

A standard container which offers fixed time access to individual elements in any order.

Since

C++98

Template Parameters

_Tp	Type of element.
_Alloc	Allocator type, defaults to allocator<_Tp>.

Meets the requirements of a `container`, a `reversible container`, and a `sequence`, including the `optional sequence requirements` with the exception of `push_front` and `pop_front`.
In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ([]) access is also provided as with C-style arrays.

6.1012.2 Constructor & Destructor Documentation

vector() [1/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector ()  [default]
```

Creates a vector with no elements.
Referenced by insert(), and operator=().

vector() [2/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
            const allocator_type & __a)  [inline], [explicit], [constexpr], [noexcept]
```

Creates a vector with no elements.

Parameters

_↩ _a	An allocator object.

vector() [3/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
            size_type __n,
            const allocator_type & __a = allocator_type())  [inline], [explicit], [constexpr]
```

Creates a vector with default constructed elements.

Parameters

_↩ _n	The number of elements to initially create.

_↩ _a	An allocator.

This constructor fills the vector with __n default constructed elements.

vector() [4/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
            size_type __n,
            const value_type & __value,
            const allocator_type & __a = allocator_type())  [inline], [constexpr]
```

Creates a vector with copies of an exemplar element.

Parameters

__n	The number of elements to initially create.
__value	An element to copy.
__a	An allocator.

This constructor fills the vector with __n copies of __value.

vector() [5/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
            const vector< _Tp, _Alloc > & __x)  [inline], [constexpr]
```

Vector copy constructor.

Parameters

_↩ _x	A vector of identical element and allocator types.

All the elements of __x are copied, but any unused capacity in __x will not be copied (i.e. capacity() == size() in the new vector).
The newly-created vector uses a copy of the allocator object used by __x (unless the allocator traits dictate a different object).

vector() [6/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
            vector< _Tp, _Alloc > && )  [default], [noexcept]
```

Vector move constructor.
The newly-created vector contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified vector.

vector() [7/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
```

```
            const vector< _Tp, _Alloc > & __x,
            const __type_identity_t< allocator_type > & __a)  [inline], [constexpr]
```

Copy constructor with alternative allocator.

vector() [8/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
            vector< _Tp, _Alloc > && __rv,
            const __type_identity_t< allocator_type > & __m)  [inline], [constexpr], [noexcept]
```

Move constructor with alternative allocator.

vector() [9/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
            initializer_list< value_type > __l,
            const allocator_type & __a = allocator_type())  [inline], [constexpr]
```

Builds a vector from an initializer list.

Parameters

_↩ _l	An initializer_list.
_↩ _a	An allocator.

Create a vector consisting of copies of the elements in the initializer_list *__l*.
This will call the element type's copy constructor N times (where N is *__l.size()*) and do no memory reallocation.

vector() [10/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
std::vector< _Tp, _Alloc >::vector (
            _InputIterator __first,
            _InputIterator __last,
            const allocator_type & __a = allocator_type())  [inline], [constexpr]
```

Builds a vector from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__a	An allocator.

Create a vector consisting of copies of the elements from [first,last).
If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor N times (where N is distance(first,last)) and do no memory reallocation. But if only input iterators are used, then this will do at most 2N calls to the copy constructor, and logN memory reallocations.

~vector()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::~vector ()  [inline], [constexpr], [noexcept]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

6.1012.3 Member Function Documentation

_M_allocate_and_copy()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _ForwardIterator>
pointer std::vector< _Tp, _Alloc >::_M_allocate_and_copy (
            size_type __n,
            _ForwardIterator __first,
            _ForwardIterator __last)  [inline], [constexpr], [protected]
```

Memory expansion handler. Uses the member allocation function to obtain *n* bytes of memory, and then copies [first,last) into it.

Referenced by operator=(), and reserve().

_M_range_check()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::_M_range_check (
            size_type __n) const  [inline], [constexpr], [protected]
```

Safety check used only from at().

Referenced by std::vector< _Tp, polymorphic_allocator< _Tp > >::at(), and std::vector< _Tp, polymorphic_allocator< _Tp > >::at().

assign() [1/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
void std::vector< _Tp, _Alloc >::assign (
            _InputIterator __first,
            _InputIterator __last)  [inline], [constexpr]
```

Assigns a range to a vector.

Parameters

__first	An input iterator.
__last	An input iterator.

This function fills a vector with copies of the elements in the range [__first,__last).

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

assign() [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::assign (
            initializer_list< value_type > __l)  [inline], [constexpr]
```

Assigns an initializer list to a vector.

Parameters

↩ _↩ ↩ _↩ *l*	An initializer_list.

This function fills a vector with copies of the elements in the initializer list *__l*.
Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

assign() [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::assign (
            size_type __n,
            const value_type & __val)  [inline], [constexpr]
```

Assigns a given value to a vector.

Parameters

__n	Number of elements to be assigned.
__val	Value to be assigned.

This function fills a vector with *__n* copies of the given value. Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

at() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::at (
            size_type __n)  [inline], [nodiscard], [constexpr]
```

Provides access to the data contained in the vector.

Parameters

_↩ *_n*	The index of the element for which data should be accessed.

Returns

Read/write reference to data.

Exceptions

std::out_of_range	If *__n* is an invalid index.

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws out_of_range if the check fails.

at() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::at (
            size_type __n) const  [inline], [nodiscard], [constexpr]
```

Provides access to the data contained in the vector.

Parameters

_↩ _n	The index of the element for which data should be accessed.

Returns

Read-only (constant) reference to data.

Exceptions

std::out_of_range	If __n is an invalid index.

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws out_of_range if the check fails.

back() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::back () const  [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the vector.

back() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::back ()  [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write reference to the data at the last element of the vector.

begin() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector< _Tp, _Alloc >::begin () const  [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

begin() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::begin ()  [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Referenced by std::vector< _Tp, polymorphic_allocator< _Tp > >::vector(), std::vector< _Tp, polymorphic_allocator< _Tp > >::crend(), std::vector< _Tp, polymorphic_allocator< _Tp > >::empty(), std::vector< _Tp, polymorphic_allocator< _Tp > >::erase(), std::vector< _Tp, polymorphic_allocator< _Tp > >::erase(), std::vector< _Tp, polymorphic_allocator< _Tp > >::front(), std::vector< _Tp, polymorphic_allocator< _Tp > >::front(), std::vector< _Tp, polymorphic_allocator< _Tp > >::insert(), std::vector< _Tp, polymorphic_allocator< _Tp > >::insert(), std::vector< _Tp, polymorphic_allocator< _Tp > >::insert(), __gnu_parallel::multiway_merge_exact_splitting(), std::operator<=>(), operator=(), std::operator==(), std::vector< _Tp, polymorphic_allo and std::vector< _Tp, polymorphic_allocator< _Tp > >::rend().

capacity()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::vector< _Tp, _Alloc >::capacity () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns the total number of elements that the vector can hold before needing to allocate more memory.
Referenced by operator=(), and reserve().

cbegin()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector< _Tp, _Alloc >::cbegin () const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.
Referenced by std::vector< _Tp, polymorphic_allocator< _Tp > >::erase(), std::vector< _Tp, polymorphic_allocator< _Tp > >::erase() std::vector< _Tp, polymorphic_allocator< _Tp > >::insert(), std::vector< _Tp, polymorphic_allocator< _Tp > >::insert(), and std::vector< _Tp, polymorphic_allocator< _Tp > >::insert().

cend()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector< _Tp, _Alloc >::cend () const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

clear()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::clear () [inline], [constexpr], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Referenced by operator=().

crbegin()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector< _Tp, _Alloc >::crbegin () const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

crend()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector< _Tp, _Alloc >::crend () const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

data()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
_Tp * std::vector< _Tp, _Alloc >::data () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a pointer such that [data(), data() + size()) is a valid range. For a non-empty vector, data() == &front().

emplace()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename...  _Args>
iterator std::vector< _Tp, _Alloc >::emplace (
            const_iterator __position,
            _Args &&...  __args)  [inline], [constexpr]
```

Inserts an object in vector before specified iterator.

Parameters

__position	A const_iterator into the vector.
__args	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.

empty()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
bool std::vector< _Tp, _Alloc >::empty () const  [inline], [nodiscard], [constexpr], [noexcept]
```

Returns true if the vector is empty. (Thus begin() would equal end().)
Referenced by std::piecewise_constant_distribution< _RealType >::densities(), std::piecewise_linear_distribution< _RealType >::densiti and std::discrete_distribution< _IntType >::probabilities().

end() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector< _Tp, _Alloc >::end () const  [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

end() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::end ()  [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write iterator that points one past the last element in the vector. Iteration is done in ordinary element order.
Referenced by std::vector< _Tp, polymorphic_allocator< _Tp > >::vector(), std::vector< _Tp, polymorphic_allocator< _Tp > >::back(), std::vector< _Tp, polymorphic_allocator< _Tp > >::back(), std::vector< _Tp, polymorphic_allocator< _Tp > >::crbegin(), std::vector< _Tp, polymorphic_allocator< _Tp > >::empty(), __gnu_parallel::multiway_merge_exact_splitting(), std::operator<=>(), operator=(), std::operator==(), std::vector< _Tp, polymorphic_allocator< _Tp > >::rbegin(), and std::vector< _Tp, polymorphic_allocator< _Tp > >::rbegin().

erase() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::erase (
```

```
            const_iterator __first,
            const_iterator __last)  [inline], [constexpr]
```

Remove a range of elements.

Parameters

__first	Iterator pointing to the first element to be erased.
__last	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by *__last* prior to erasing (or end()).

This function will erase the elements in the range [__first,__last) and shorten the vector accordingly.
Note This operation could be expensive and if it is frequently used the user should consider using std::list. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::erase (
            const_iterator __position)  [inline], [constexpr]
```

Remove element at given position.

Parameters

__position	Iterator pointing to element to be erased.

Returns

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the vector by one.
Note This operation could be expensive and if it is frequently used the user should consider using std::list. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

front() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::front () const  [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the vector.

front() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::front ()  [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write reference to the data at the first element of the vector.

get_allocator()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
allocator_type std::_Vector_base< _Tp, _Alloc >::get_allocator () const  [inline], [constexpr],
[noexcept]
```

Get a copy of the memory allocation object.
References get_allocator().
Referenced by get_allocator().

insert() [1/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
iterator std::vector< _Tp, _Alloc >::insert (
            const_iterator __position,
            _InputIterator __first,
            _InputIterator __last)  [inline], [constexpr]
```

Inserts a range into the vector.

Parameters

__position	A const_iterator into the vector.
__first	An input iterator.
__last	An input iterator.

Returns

An iterator that points to the inserted data.

This function will insert copies of the data in the range [__first,__last) into the vector before the location specified by *pos*. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.

insert() [2/5]

```
template<typename _Tp, typename _Alloc>
vector< _Tp, _Alloc >::iterator vector::insert (
            const_iterator __position,
            const value_type & __x)  [constexpr]
```

Inserts given value into vector before specified iterator.

Parameters

__position	A const_iterator into the vector.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.
References vector(), std::begin(), std::cbegin(), std::end(), insert(), and std::move().
Referenced by insert().

insert() [3/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::insert (
            const_iterator __position,
            initializer_list< value_type > __l)  [inline], [constexpr]
```

Inserts an initializer_list into the vector.

Parameters

__position	An iterator into the vector.
__l	An initializer_list.

This function will insert copies of the data in the initializer_list *l* into the vector before the location specified by *position*. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.

insert() [4/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::insert (
            const_iterator __position,
            size_type __n,
            const value_type & __x)  [inline], [constexpr]
```

Inserts a number of copies of given data into the vector.

Parameters

__position	A const_iterator into the vector.
__n	Number of elements to be inserted.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by *position*. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.

insert() [5/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::insert (
            const_iterator __position,
            value_type && __x)  [inline], [constexpr]
```

Inserts given rvalue into vector before specified iterator.

Parameters

__position	A const_iterator into the vector.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.

max_size()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::vector< _Tp, _Alloc >::max_size () const  [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns the size() of the largest possible vector.
Referenced by reserve().

operator=() [1/3]

```
template<typename _Tp, typename _Alloc>
vector< _Tp, _Alloc > & vector::operator= (
            const vector< _Tp, _Alloc > & __x)  [constexpr]
```

Vector assignment operator.

Parameters

_↩ _x	A vector of identical element and allocator types.

All the elements of __x are copied, but any unused capacity in __x will not be copied.
Whether the allocator is copied depends on the allocator traits.
References vector(), std::__addressof(), std::_Destroy(), _M_allocate_and_copy(), begin(), capacity(), clear(), std::end(), end(), std::size(), and size().

operator=() [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
vector & std::vector< _Tp, _Alloc >::operator= (
            initializer_list< value_type > __l)  [inline], [constexpr]
```

Vector list assignment operator.

Parameters

↩ _↩ ↩ _↩ l	An initializer_list.

This function fills a vector with copies of the elements in the initializer list __l.
Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
vector & std::vector< _Tp, _Alloc >::operator= (
            vector< _Tp, _Alloc > && __x)  [inline], [constexpr], [noexcept]
```

Vector move assignment operator.

Parameters

_↩ _x	A vector of identical element and allocator types.

The contents of __x are moved into this vector (without copying, if the allocators permit it). Afterwards __x is a valid, but unspecified vector.
Whether the allocator is moved depends on the allocator traits.

operator[]() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::operator[] (
            size_type __n) const  [inline], [nodiscard], [constexpr], [noexcept]
```

Subscript access to the data contained in the vector.

Parameters

_↩ _n	The index of the element for which data should be accessed.

Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out_of_range lookups are not defined. (For checked lookups see at().)

operator[]() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::operator[] (
            size_type __n)  [inline], [nodiscard], [constexpr], [noexcept]
```

Subscript access to the data contained in the vector.

Parameters

_↩ _n	The index of the element for which data should be accessed.

Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out_of_range lookups are not defined. (For checked lookups see at().)

pop_back()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::pop_back ()  [inline], [constexpr], [noexcept]
```

Removes last element.
This is a typical stack operation. It shrinks the vector by one.
Note that no data is returned, and if the last element's data is needed, it should be retrieved before pop_back() is called.

push_back()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::push_back (
            const value_type & __x)  [inline], [constexpr]
```

Add data to the end of the vector.

Parameters

_↩ _x	Data to be added.

This is a typical stack operation. The function creates an element at the end of the vector and assigns the given data to it. Due to the nature of a vector this operation can be done in constant time if the vector has preallocated space available.

rbegin() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector< _Tp, _Alloc >::rbegin () const  [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

rbegin() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::vector< _Tp, _Alloc >::rbegin ()  [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

rend() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector< _Tp, _Alloc >::rend () const  [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

rend() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::vector< _Tp, _Alloc >::rend ()  [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

reserve()

```
template<typename _Tp, typename _Alloc>
void vector::reserve (
            size_type __n)  [constexpr]
```

Attempt to preallocate enough memory for specified number of elements.

Parameters

_↩ _n	Number of elements required.

Exceptions

std::length_error	If *n* exceeds `max_size()`.

This function attempts to reserve enough memory for the vector to hold the specified number of elements. If the number requested is more than max_size(), length_error is thrown.
The advantage of this function is that if optimal code is a necessity and the user can determine the number of elements that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of vector data.
References std::_Destroy(), _M_allocate_and_copy(), capacity(), max_size(), and std::size().

resize() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::resize (
            size_type __new_size)  [inline], [constexpr]
```

Resizes the vector to the specified number of elements.

Parameters

__new_size	Number of elements the vector should contain.

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise default constructed elements are appended.
Referenced by __gnu_parallel::__shrink_and_double(), and __gnu_parallel::multiway_merge_exact_splitting().

resize() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::resize (
            size_type __new_size,
            const value_type & __x)  [inline], [constexpr]
```

Resizes the vector to the specified number of elements.

Parameters

__new_size	Number of elements the vector should contain.
__x	Data with which new elements should be populated.

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise the vector is extended and new elements are populated with given data.

shrink_to_fit()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::shrink_to_fit ()  [inline], [constexpr]
```

A non-binding request to reduce capacity() to size().

size()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::vector< _Tp, _Alloc >::size () const [inline], [nodiscard], [constexpr], [noexcept]
```

Returns the number of elements in the vector.

Referenced by __gnu_parallel::__shrink(), __gnu_parallel::__shrink_and_double(), std::vector< _Tp, polymorphic_allocator< _Tp > >::_ __gnu_parallel::list_partition(), operator=(), std::operator==(), std::vector< _Tp, polymorphic_allocator< _Tp > >::resize(), and std::vector< _Tp, polymorphic_allocator< _Tp > >::resize().

swap()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::swap (
            vector< _Tp, _Alloc > & __x) [inline], [constexpr], [noexcept]
```

Swaps data with another vector.

Parameters

_↩ _x	A vector of the same element and allocator types.

This exchanges the elements between two vectors in constant time. (Three pointers, so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(v1,v2) will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

The documentation for this class was generated from the following files:

- stl_vector.h

6.1013.1 Detailed Description

template<typename _Alloc>
class std::vector< bool, _Alloc >

A specialization of vector for booleans which offers fixed time access to individual elements in any order.

Since

C++98

Template Parameters

_Alloc	Allocator type.

Note that vector<bool> does not actually meet the requirements for being a container. This is because the reference and pointer types are not really references and pointers to bool. See DR96 for details.

See also

vector for function documentation.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ([]) access is also provided as with C-style arrays.

6.1013.2 Member Function Documentation

_M_allocate_and_copy()

```
pointer std::vector< bool, _Alloc >::_M_allocate_and_copy (
            size_type __n,
            _ForwardIterator __first,
            _ForwardIterator __last)  [inline], [constexpr], [protected]
```

Memory expansion handler. Uses the member allocation function to obtain *n* bytes of memory, and then copies [first,last) into it.

get_allocator()

```
() const
```

Get a copy of the memory allocation object.
The documentation for this class was generated from the following files:

- stl_bvector.h
- vector.tcc

6.1014 std::ranges::view_base Struct Reference

6.1016.1 Detailed Description

template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
class std::wbuffer_convert< _Codecvt, _Elem, _Tr >

Buffer conversions.

6.1016.2 Member Typedef Documentation

__streambuf_type

```
template<typename _CharT, typename _Traits>
typedef basic_streambuf<char_type, traits_type> std::basic_streambuf< _CharT, _Traits >::__↩
streambuf_type [inherited]
```

This is a non-standard type.

char_type

```
template<typename _CharT, typename _Traits>
typedef _CharT std::basic_streambuf< _CharT, _Traits >::char_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

int_type

```
template<typename _CharT, typename _Traits>
typedef traits_type::int_type std::basic_streambuf< _CharT, _Traits >::int_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

off_type

```
template<typename _CharT, typename _Traits>
typedef traits_type::off_type std::basic_streambuf< _CharT, _Traits >::off_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

pos_type

```
template<typename _CharT, typename _Traits>
typedef traits_type::pos_type std::basic_streambuf< _CharT, _Traits >::pos_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

traits_type

```
template<typename _CharT, typename _Traits>
typedef _Traits std::basic_streambuf< _CharT, _Traits >::traits_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

6.1016.3 Constructor & Destructor Documentation

wbuffer_convert() [1/2]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert () [inline]
```

Default constructor.
References wbuffer_convert().
Referenced by wbuffer_convert().

wbuffer_convert() [2/2]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert (
            streambuf * __bytebuf,
            _Codecvt * __pcvt = new _Codecvt,
            state_type __state = state_type())  [inline], [explicit]
```

Constructor.

Parameters

__bytebuf	The underlying byte stream buffer.
__pcvt	The facet to use for conversions.
__state	Initial conversion state.

Takes ownership of `__pcvt` and will delete it in the destructor.
References std::basic_streambuf< _CharT, _Traits >::setg(), and std::basic_streambuf< _CharT, _Traits >::setp().

6.1016.4 Member Function Documentation

eback()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::eback () const  [inline], [protected], [inherited]
```

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Referenced by std::basic_filebuf< char_type, traits_type >::_M_destroy_pback(), std::basic_filebuf< _CharT, _Traits >::imbue(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_filebuf< _CharT, _Traits >::pbackfail(), std::basic_stringbuf< _Cha std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos(), std::basic_streambuf< char_type, traits_type >::sputbackc(), std::basic_streambuf< char_type, traits_type >::sungetc(), std::basic_filebuf< _CharT, _Traits >::underflow(), and std::basic_filebuf< _CharT, _Traits >::xsgetn().

egptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::egptr () const  [inline], [protected], [inherited]
```

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Referenced by std::basic_filebuf< char_type, traits_type >::_M_create_pback(), std::basic_streambuf< char_type, traits_type >::in_avail std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_streambuf< char_type, traits_type >::sbumpc(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos(), std::basic_streambuf< char_type, traits_type >::sgetc(), std::basic_filebuf< _CharT, _Traits >::showmanyc(), std::basic_stringbuf< char std::basic_filebuf< _CharT, _Traits >::underflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::underflow(), std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow(), std::basic_filebuf< _CharT, _Traits >::xsgetn(), and xsgetn().

epptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::epptr () const  [inline], [protected], [inherited]
```

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Referenced by std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos(), std::basic_streambuf< char_type, traits_type >::sputc(), std::basic_filebuf< _CharT, _Traits >::xsputn(), and xsputn().

gbump()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::gbump (
            int __n)  [inline], [protected], [inherited]
```

Moving the read position.

Parameters

_↩ _n	The delta by which to move.

This just advances the read position without returning any data.
Referenced by std::basic_filebuf< _CharT, _Traits >::pbackfail(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::pbackfail(), std::basic_streambuf< char_type, traits_type >::sbumpc(), std::basic_streambuf< char_type, traits_type >::sputbackc(), std::basic_streambuf< char_type, traits_type >::sungetc(), std::basic_streambuf< char_type, traits_type >::uflow(), and std::basic_filebuf< _CharT, _Traits >::xsgetn().

getloc()

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::getloc () const  [inline], [inherited]
```

Locale access.

Returns

The current locale in effect.

If pubimbue(loc) has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.
Referenced by std::basic_streambuf< char_type, traits_type >::pubimbue().

gptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::gptr () const  [inline], [protected], [inherited]
```

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Referenced by std::basic_filebuf< char_type, traits_type >::_M_create_pback(), std::basic_filebuf< char_type, traits_type >::_M_destroy std::basic_filebuf< _CharT, _Traits >::imbue(), std::basic_streambuf< char_type, traits_type >::in_avail(), std::basic_stringbuf< _CharT, std::basic_filebuf< _CharT, _Traits >::pbackfail(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::pbackfail(), std::basic_streambuf< cha std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_streambuf< char_type, traits_type >::sgetc(), std::basic_filebuf< _CharT, _Traits >::showmanyc(), std::basic_stringbuf< char >::showmanyc(), std::basic_streambuf< char_type, trait std::basic_streambuf< char_type, traits_type >::sungetc(), std::basic_streambuf< char_type, traits_type >::uflow(), std::basic_filebuf< _CharT, _Traits >::underflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::underflow(), std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow(), std::basic_filebuf< _CharT, _Traits >::xsgetn(), and xsgetn().

imbue()

```
template<typename _CharT, typename _Traits>
virtual void std::basic_streambuf< _CharT, _Traits >::imbue (
            const locale & __loc)  [inline], [protected], [virtual], [inherited]
```

Changes translations.

Parameters

__loc	A new locale.

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

Note

Base class version does nothing.

Reimplemented in std::basic_filebuf< _CharT, _Traits >, std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >, std::basic_filebuf< _CharT, std::char_traits< _CharT > >, std::basic_filebuf< char >, std::basic_filebuf< char_type, traits_type >, and std::basic_filebuf< wchar_t >.
Referenced by std::basic_streambuf< char_type, traits_type >::pubimbue().

in_avail()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::in_avail ()  [inline], [inherited]
```

Looking ahead into the stream.

Returns

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

overflow()

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
_Wide_streambuf::int_type std::wbuffer_convert< _Codecvt, _Elem, _Tr >::overflow (
            typename _Wide_streambuf::int_type __c)  [inline], [protected], [virtual]
```

Consumes data from the buffer; writes to the controlled sequence.

Parameters

_↩ _c	An additional character to consume.

Returns

eof() to indicate failure, something else (usually __c, or not_eof())

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character *c* is also written out, if __c is not `eof()`.
For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.
A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

Note

Base class version does nothing, returns eof().

Reimplemented from std::basic_streambuf< _CharT, _Traits >.
References std::basic_streambuf< _CharT, _Traits >::sputc().

pbackfail()

```
template<typename _CharT, typename _Traits>
virtual int_type std::basic_streambuf< _CharT, _Traits >::pbackfail (
            int_type __c = traits_type::eof())  [inline], [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

Parameters

_↩ _c	The character to be inserted back into the sequence.

Returns

eof() on failure, *some other value* on success

Postcondition

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

Note

Base class version does nothing, returns eof().

Reimplemented in __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >, std::basic_filebuf< _CharT, _Traits >, std::basic_filebuf< _CharT, std::basic_filebuf< char >, std::basic_filebuf< char_type, traits_type >, std::basic_filebuf< wchar_t >, std::basic_stringbuf< _CharT, _Tr std::basic_stringbuf< char >, and std::basic_stringbuf< wchar_t >.
Referenced by std::basic_streambuf< char_type, traits_type >::sputbackc(), and std::basic_streambuf< char_type, traits_type >::sunget

pbase()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::pbase () const  [inline], [protected], [inherited]
```

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Referenced by std::basic_filebuf< _CharT, _Traits >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_filebuf< _CharT, _Traits >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_stringbuf< _CharT, std::basic_stringbuf< char >::str(), std::basic_filebuf< _CharT, _Traits >::sync(), and std::basic_filebuf< _CharT, _Traits >::xsputn().

pbump()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::pbump (
            int __n)  [inline], [protected], [inherited]
```

Moving the write position.

Parameters

_↩ _n	The delta by which to move.

This just advances the write position without returning any data.
Referenced by std::basic_filebuf< _CharT, _Traits >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), and std::basic_streambuf< char_type, traits_type >::sputc().

pptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::pptr () const  [inline], [protected], [inherited]
```

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Referenced by std::basic_filebuf< _CharT, _Traits >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_filebuf< _CharT, _Traits >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_streambuf< char_t std::basic_filebuf< _CharT, _Traits >::sync(), std::basic_filebuf< _CharT, _Traits >::xsputn(), and xsputn().

pubimbue()

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::pubimbue (
            const locale & __loc)  [inline], [inherited]
```

Entry point for imbue().

Parameters

__loc	The new locale.

Returns

The previous locale.

Calls the derived imbue(__loc).

pubseekoff()

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
            off_type __off,
            ios_base::seekdir __way,
            ios_base::openmode __mode = ios_base::in | ios_base::out)  [inline], [inherited]
```

Alters the stream position.

Parameters

__off	Offset.
__way	Value for ios_base::seekdir.
__mode	Value for ios_base::openmode.

Calls virtual seekoff function.

pubseekpos()

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
            pos_type __sp,
            ios_base::openmode __mode = ios_base::in | ios_base::out)  [inline], [inherited]
```

Alters the stream position.

Parameters

__sp	Position
__mode	Value for ios_base::openmode.

Calls virtual seekpos function.

pubsetbuf()

```
template<typename _CharT, typename _Traits>
basic_streambuf * std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
            char_type * __s,
            streamsize __n)  [inline], [inherited]
```

Entry points for derived buffer functions.
The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

pubsync()

```
template<typename _CharT, typename _Traits>
int std::basic_streambuf< _CharT, _Traits >::pubsync () [inline], [inherited]
```

Calls virtual sync function.
Referenced by std::basic_istream< _CharT, _Traits >::sync().

sbumpc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sbumpc () [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.
Referenced by std::basic_istream< _CharT, _Traits >::ignore(), std::basic_streambuf< char_type, traits_type >::snextc(), and std::basic_istream< _CharT, char_traits< _CharT > >::unget().

seekoff()

```
template<typename _CharT, typename _Traits>
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekoff (
            off_type ,
            ios_base::seekdir ,
            ios_base::openmode = ios_base::in | ios_base::out) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.
Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in std::basic_filebuf< _CharT, _Traits >, std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >, std::basic_filebuf< char >, std::basic_filebuf< char_type, traits_type >, std::basic_filebuf< wchar_t >, std::basic_stringbuf< _CharT, _Tr
std::basic_stringbuf< char >, and std::basic_stringbuf< wchar_t >.
Referenced by std::basic_streambuf< char_type, traits_type >::pubseekoff().

seekpos()

```
template<typename _CharT, typename _Traits>
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekpos (
            pos_type ,
            ios_base::openmode = ios_base::in | ios_base::out) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.
Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in std::basic_filebuf< _CharT, _Traits >, std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >, std::basic_filebuf< char >, std::basic_filebuf< char_type, traits_type >, std::basic_filebuf< wchar_t >, std::basic_stringbuf< _CharT, _Tr
std::basic_stringbuf< char >, and std::basic_stringbuf< wchar_t >.
Referenced by std::basic_streambuf< char_type, traits_type >::pubseekpos().

setbuf()

```
template<typename _CharT, typename _Traits>
virtual basic_streambuf< char_type, _Traits > * std::basic_streambuf< _CharT, _Traits >::setbuf
(
            char_type * ,
            streamsize )  [inline], [protected], [virtual], [inherited]
```

Manipulates the buffer.
Each derived class provides its own appropriate behavior. See the next-to-last paragraph of https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering for more on this function.

Note

Base class version does nothing, returns `this`.

Reimplemented in std::basic_filebuf< _CharT, _Traits >, std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >, std::basic_filebuf< _CharT, std::char_traits< _CharT > >, std::basic_filebuf< char >, std::basic_filebuf< char_type, traits_type >, std::basic_stringbuf< _CharT, _Traits, _Alloc >, and std::basic_stringbuf< char >.
Referenced by std::basic_streambuf< char_type, traits_type >::pubsetbuf().

setg()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setg (
            char_type * __gbeg,
            char_type * __gnext,
            char_type * __gend)  [inline], [protected], [inherited]
```

Setting the three read area pointers.

Parameters

__gbeg	A pointer.
__gnext	A pointer.
__gend	A pointer.

Postcondition

__gbeg == `eback()`, *__gnext* == `gptr()`, and *__gend* == `egptr()`

Referenced by std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert(), std::basic_filebuf< char_type, traits_type >::_M_create
std::basic_filebuf< char_type, traits_type >::_M_destroy_pback(), std::basic_filebuf< char_type, traits_type >::_M_set_buffer(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos(), and std::basic_filebuf< _CharT, _Traits >::xsgetn().

setp()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setp (
            char_type * __pbeg,
            char_type * __pend)  [inline], [protected], [inherited]
```

Setting the three write area pointers.

Parameters

__pbeg	A pointer.

__pend	A pointer.

Postcondition

__pbeg == `pbase()`, *__pbeg* == `pptr()`, and *__pend* == `epptr()`

Referenced by std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert(), and std::basic_filebuf< char_type, traits_type >::_M_s

sgetc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sgetc () [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

Referenced by std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _ std::basic_istream< _CharT, char_traits< _CharT > >::readsome(), and std::basic_streambuf< char_type, traits_type >::snextc().

sgetn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::sgetn (
            char_type * __s,
            streamsize __n) [inline], [inherited]
```

Entry point for xsgetn.

Parameters

_↩ _s	A buffer area.
_↩ _n	A count.

Returns xsgetn(__s,__n). The effect is to fill __s[0] through __s[__n-1] with characters from the input sequence, if possible.

showmanyc()

```
template<typename _CharT, typename _Traits>
virtual streamsize std::basic_streambuf< _CharT, _Traits >::showmanyc () [inline], [protected],
[virtual], [inherited]
```

Investigating the data available.

Returns

An estimate of the number of characters available in the input sequence, or -1.

If it returns a positive value, then successive calls to `underflow()` *will not return* `traits::eof()` *until at least that number of characters have been supplied. If* `showmanyc()` *returns -1, then calls to* `underflow()` *or* `uflow()` *will fail.* [27.5.2.4.3]/1

Note

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to underflow or uflow] will not return* `eof()` *but that they will return immediately.*

The standard adds that *the morphemes of* `showmanyc` *are* ***es-how-many-see****, not* ***show-manic****.*

Reimplemented in std::basic_filebuf< _CharT, _Traits >, std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >, std::basic_filebuf< _CharT, std::char_traits< _CharT > >, std::basic_filebuf< char >, std::basic_filebuf< char_type, traits_type >, std::basic_filebuf< wchar_t >, std::basic_stringbuf< _CharT, _Traits, _Alloc >, std::basic_stringbuf< char >, and std::basic_stringbuf< wchar_t >.
Referenced by std::basic_streambuf< char_type, traits_type >::in_avail().

snextc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::snextc () [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.
Referenced by std::basic_istream< _CharT, char_traits< _CharT > >::get(), std::basic_iostream< char_type, traits_type >::ignore(), and std::basic_istream< _CharT, char_traits< _CharT > >::readsome().

sputbackc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sputbackc (
            char_type __c) [inline], [inherited]
```

Pushing characters back into the input stream.

Parameters

__c	The character to push back.

Returns

The previous character, if possible.

Similar to sungetc(), but *__c* is pushed onto the stream instead of *the previous character.* If successful, the next character fetched from the input stream will be *__c*.
Referenced by std::basic_istream< _CharT, _Traits >::putback().

sputc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sputc (
            char_type __c) [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

_↩ _c	A character to output.

Returns

__c, if possible.

One of two public output functions.
If a write position is available for the output sequence (i.e., the buffer is not full), stores __c in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(↩ __c)`.
Referenced by std::wbuffer_convert< _Codecvt, _Elem, _Tr >::overflow().

sputn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::sputn (
            const char_type * __s,
            streamsize __n)  [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

_↩ _s	A buffer read area.
_↩ _n	A count.

One of two public output functions.
Returns xsputn(__s,__n). The effect is to write __s[0] through __s[__n-1] to the output sequence, if possible.

state()

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
state_type std::wbuffer_convert< _Codecvt, _Elem, _Tr >::state () const  [inline], [noexcept]
```

The conversion state following the last conversion.

sungetc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sungetc ()  [inline], [inherited]
```

Moving backwards in the input stream.

Returns

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns pbackfail(). The effect is to *unget* the last character *gotten*.
Referenced by std::basic_istream< _CharT, _Traits >::unget().

sync()

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
int std::wbuffer_convert< _Codecvt, _Elem, _Tr >::sync () [inline], [protected], [virtual]
```

Synchronizes the buffer arrays with the controlled sequences.

Returns

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

Note

Base class version does nothing, returns zero.

Reimplemented from std::basic_streambuf< _CharT, _Traits >.

uflow()

```
template<typename _CharT, typename _Traits>
virtual int_type std::basic_streambuf< _CharT, _Traits >::uflow () [inline], [protected], [virtual],
[inherited]
```

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.
Reimplemented in __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >.
Referenced by std::basic_streambuf< char_type, traits_type >::sbumpc(), and xsgetn().

underflow()

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
_Wide_streambuf::int_type std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow () [inline],
[protected], [virtual]
```

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.
For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.
A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html

Note

Base class version does nothing, returns eof().

Reimplemented from std::basic_streambuf< _CharT, _Traits >.
References std::basic_streambuf< _CharT, _Traits >::egptr(), and std::basic_streambuf< _CharT, _Traits >::gptr().

xsgetn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::xsgetn (
            char_type * __s,
            streamsize __n)  [protected], [virtual], [inherited]
```

Multiple character extraction.

Parameters

_↩ _s	A buffer area.
_↩ _n	Maximum number of characters to assign.

Returns

The number of characters assigned.

Fills __s[0] through __s[__n-1] with characters from the input sequence, as if by `sbumpc()`. Stops when either __n characters have been copied, or when `traits::eof()` would be copied.
It is expected that derived classes provide a more efficient implementation by overriding this definition.
Reimplemented in std::basic_filebuf< _CharT, _Traits >, std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >, std::basic_filebuf< _CharT, std::char_traits< _CharT > >, std::basic_filebuf< char >, and std::basic_filebuf< char_type, traits_type >.
References egptr(), gptr(), std::min(), and uflow().
Referenced by std::basic_streambuf< char_type, traits_type >::sgetn().

xsputn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::xsputn (
            const char_type * __s,
            streamsize __n)  [protected], [virtual], [inherited]
```

Multiple character insertion.

Parameters

_↩ _s	A buffer area.
_↩ _n	Maximum number of characters to write.

Returns

The number of characters written.

Writes __s[0] through __s[__n-1] to the output sequence, as if by `sputc()`. Stops when either *n* characters have been copied, or when `sputc()` would return `traits::eof()`.
It is expected that derived classes provide a more efficient implementation by overriding this definition.
Reimplemented in std::basic_filebuf< _CharT, _Traits >, std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >, std::basic_filebuf< _CharT, std::char_traits< _CharT > >, std::basic_filebuf< char >, and std::basic_filebuf< char_type, traits_type >.
References epptr(), std::min(), overflow(), and pptr().
Referenced by std::basic_streambuf< char_type, traits_type >::sputn().

6.1016.5 Member Data Documentation

_M_buf_locale

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::_M_buf_locale [protected], [inherited]
```

Current locale setting.
Referenced by std::basic_filebuf< _CharT, _Traits >::basic_filebuf().

_M_in_beg

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_in_beg [protected], [inherited]
```

Start of get area.

_M_in_cur

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_in_cur [protected], [inherited]
```

Current read area.

_M_in_end

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_in_end [protected], [inherited]
```

End of get area.

_M_out_beg

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_out_beg [protected], [inherited]
```

Start of put area.

_M_out_cur

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_out_cur [protected], [inherited]
```

Current put area.

_M_out_end

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_out_end [protected], [inherited]
```

End of put area.

6.1017.1 Detailed Description

template<typename _Tp>
class std::weak_ptr< _Tp >

A non-owning observer for a pointer owned by a shared_ptr.

Since

C++11

A weak_ptr provides a safe alternative to a raw pointer when you want a non-owning reference to an object that is managed by a shared_ptr.
Unlike a raw pointer, a weak_ptr can be converted to a new shared_ptr that shares ownership with every other shared↩_ptr that already owns the pointer. In other words you can upgrade from a non-owning "weak" reference to an owning shared_ptr, without having access to any of the existing shared_ptr objects.
Also unlike a raw pointer, a weak_ptr does not become "dangling" after the object it points to has been destroyed. Instead, a weak_ptr becomes *expired* and can no longer be converted to a shared_ptr that owns the freed pointer, so you cannot accidentally access the pointed-to object after it has been destroyed.
The documentation for this class was generated from the following file:

6.1018.1 Detailed Description

template<typename _RealType = double>
class std::weibull_distribution< _RealType >

A weibull_distribution random number distribution.
The formula for the normal probability density function is:

$$p(x|\alpha,\beta) = \frac{\alpha}{\beta}(\frac{x}{\beta})^{\alpha-1}\exp{(-(\frac{x}{\beta})^{\alpha})}$$

Since

C++11

6.1018.2 Member Typedef Documentation

result_type

```
template<typename _RealType = double>
typedef _RealType std::weibull_distribution< _RealType >::result_type
```

The type of the range of the distribution.

6.1018.3 Member Function Documentation

a()

```
template<typename _RealType = double>
_RealType std::weibull_distribution< _RealType >::a () const  [inline]
```

Return the a parameter of the distribution.

b()

```
template<typename _RealType = double>
_RealType std::weibull_distribution< _RealType >::b () const  [inline]
```

Return the b parameter of the distribution.

max()

```
template<typename _RealType = double>
result_type std::weibull_distribution< _RealType >::max () const  [inline]
```

Returns the least upper bound value of the distribution.

min()

```
template<typename _RealType = double>
result_type std::weibull_distribution< _RealType >::min () const  [inline]
```

Returns the greatest lower bound value of the distribution.

operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::weibull_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng)  [inline]
```

Generating functions.
Referenced by operator()().

param() [1/2]

```
template<typename _RealType = double>
param_type std::weibull_distribution< _RealType >::param () const  [inline]
```

Returns the parameter set of the distribution.
Referenced by std::operator>>().

param() [2/2]

```
template<typename _RealType = double>
void std::weibull_distribution< _RealType >::param (
            const param_type & __param)  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

reset()

```
template<typename _RealType = double>
void std::weibull_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

6.1018.4 Friends And Related Symbol Documentation

operator==

```
template<typename _RealType = double>
bool operator== (
            const weibull_distribution< _RealType > & __d1,
            const weibull_distribution< _RealType > & __d2) [friend]
```

Return true if two Weibull distributions have the same parameters.

6.1019.1 Detailed Description

template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>, typename _Byte_alloc = allocator<char>>
class std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >

String conversions.

6.1019.2 Constructor & Destructor Documentation

wstring_convert() [1/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert () [inline]
```

Default constructor.

wstring_convert() [2/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
            _Codecvt * __pcvt) [inline], [explicit]
```

Constructor.

Parameters

__pcvt	The facet to use for conversions.

Takes ownership of `__pcvt` and will delete it in the destructor.

wstring_convert() [3/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
            _Codecvt * __pcvt,
            state_type __state) [inline]
```

Construct with an initial converstion state.

Parameters

__pcvt	The facet to use for conversions.
__state	Initial conversion state.

Takes ownership of `__pcvt` and will delete it in the destructor. The object's conversion state will persist between conversions.

wstring_convert() [4/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
            const byte_string & __byte_err,
            const wide_string & __wide_err = wide_string())  [inline], [explicit]
```

Construct with error strings.

Parameters

__byte_err	A string to return on failed conversions.
__wide_err	A wide string to return on failed conversions.

6.1019.3 Member Function Documentation

converted()

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
size_t std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::converted () const
[inline], [noexcept]
```

The number of elements successfully converted in the last conversion.

from_bytes() [1/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
            char __byte)  [inline]
```

Convert from bytes.

References from_bytes().

Referenced by from_bytes(), from_bytes(), and from_bytes().

from_bytes() [2/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
            const byte_string & __str)  [inline]
```

Convert from bytes.

References std::basic_string< _CharT, _Traits, _Alloc >::data(), from_bytes(), and std::basic_string< _CharT, _Traits, _Alloc >::size().

from_bytes() [3/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
            const char * __first,
            const char * __last)  [inline]
```

Convert from bytes.

from_bytes() [4/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
            const char * __ptr)  [inline]
```

Convert from bytes.
References from_bytes().

state()

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
state_type std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::state () const
[inline]
```

The final conversion state of the last conversion.

to_bytes() [1/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
            _Elem __wchar)  [inline]
```

Convert to bytes.
References to_bytes().
Referenced by to_bytes(), to_bytes(), and to_bytes().

to_bytes() [2/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
            const _Elem * __first,
            const _Elem * __last)  [inline]
```

Convert to bytes.

to_bytes() [3/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
            const _Elem * __ptr)  [inline]
```

Convert to bytes.
References std::basic_string< _Elem, char_traits< _Elem >, _Wide_alloc >::length(), and to_bytes().

to_bytes() [4/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
            const wide_string & __wstr)  [inline]
```

Convert to bytes.
References std::basic_string< _CharT, _Traits, _Alloc >::data(), std::basic_string< _CharT, _Traits, _Alloc >::size(), and to_bytes().

7.39.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <chrono>.

7.39.2 Function Documentation

ceil()

```
template<typename _ToDur, typename _Rep, typename _Period>
__enable_if_is_duration< _ToDur > std::chrono::ceil (
            const duration< _Rep, _Period > & __d)  [nodiscard], [constexpr]
```

Convert a `duration` to type `ToDur` and round up.
If the duration cannot be represented exactly in the result type, returns the closest value that is greater than the argument.

Template Parameters

_ToDur	The result type must be a `duration`.

Parameters

_d	A duration.

Returns

The value of `__d` converted to type `_ToDur`.

Since

C++17

7.159.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <deque>.

7.159.2 Macro Definition Documentation

_GLIBCXX_DEQUE_BUF_SIZE

```
#define _GLIBCXX_DEQUE_BUF_SIZE
```

This function controls the size of memory nodes.

Parameters

__size	The size of an element.

Returns

The number (not byte size) of elements per node.

This function started off as a compiler kludge from SGI, but seems to be a useful wrapper around a repeated constant expression. The **512** is tunable (and no other code needs to change), but no investigation has been done since inheriting the SGI code. Touch _GLIBCXX_DEQUE_BUF_SIZE only if you know what you are doing, however: changing it breaks the binary compatibility!!

7.162.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <iterator>.
This file implements reverse_iterator, back_insert_iterator, front_insert_iterator, insert_iterator, __normal_iterator, and their supporting functions and overloaded operators.

7.198.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <valarray>.

7.199 valarray_array.h File Reference

7.205.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

7.206 cassert File Reference

7.206.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*`.h implementation files.
This is the C++ version of the Standard C Library header `assert.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.207 ccomplex File Reference

Macros

- #define **_GLIBCXX_CCOMPLEX**

7.207.1 Detailed Description

This is a Standard C++ Library header.

Since

C++11 (removed in C++20)

7.208 tr1/ccomplex File Reference

Macros

- #define **_GLIBCXX_TR1_CCOMPLEX**

7.208.1 Detailed Description

This is a TR1 C++ Library header.

7.209 cctype File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CCTYPE**

7.209.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*`.h implementation files.
This is the C++ version of the Standard C Library header `ctype.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.210 tr1/cctype File Reference

Macros

- #define **_GLIBCXX_TR1_CCTYPE**

7.210.1 Detailed Description

This is a TR1 C++ Library header.

7.211 cerrno File Reference

Macros

- #define **_GLIBCXX_CERRNO**
- #define **errno**

7.211.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.
This is the C++ version of the Standard C Library header `errno.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.212 cfenv File Reference

Macros

- #define **_GLIBCXX_CFENV**

7.212.1 Detailed Description

This is a Standard C++ Library header.

7.213 tr1/cfenv File Reference

Macros

- #define **_GLIBCXX_TR1_CFENV**

7.213.1 Detailed Description

This is a TR1 C++ Library header.

7.214 cfloat File Reference

Macros

- #define **_GLIBCXX_CFLOAT**
- #define **DECIMAL_DIG**
- #define **FLT_EVAL_METHOD**

7.214.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.
This is the C++ version of the Standard C Library header `float.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.215 tr1/cfloat File Reference

Macros

- #define **_GLIBCXX_TR1_CFLOAT**

7.215.1 Detailed Description

This is a TR1 C++ Library header.

7.216 charconv File Reference

Classes

- struct std::from_chars_result
- struct std::to_chars_result

Namespaces

- namespace std
- namespace std::__detail

Macros

- #define **__glibcxx_want_constexpr_charconv**

7.225.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*`.h implementation files.
This is the C++ version of the Standard C Library header `math.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.230.1 Detailed Description

This is a TR1 C++ Library header.

7.231 complex.h File Reference

7.231.1 Detailed Description

This is a Standard C++ Library header.

7.232 Concepts

Here is a list of all documented concepts with brief descriptions:

std::assignable_from
[concept.assignable], concept assignable_from 734

std::common_reference_with
[concept.commonref], concept common_reference_with 735

std::common_with
[concept.common], concept common_with 735

std::constructible_from
[concept.constructible], concept constructible_from 735

std::convertible_to
[concept.convertible], concept convertible_to 735

std::copy_constructible
[concept.copyconstructible], concept copy_constructible 736

std::default_initializable
[concept.defaultinitializable], concept default_initializable 736

std::derived_from
[concept.derived], concept derived_from 736

std::destructible
[concept.destructible], concept destructible 736

std::equivalence_relation
[concept.equiv], concept equivalence_relation 737

std::indirectly_comparable
[alg.req.ind.cmp], concept `indirectly_comparable` 737

std::indirectly_copyable
[alg.req.ind.copy], concept `indirectly_copyable` 737

std::indirectly_movable
[alg.req.ind.move], concept `indirectly_movable` 737

std::indirectly_readable
Requirements for types that are readable by applying operator* 738

std::indirectly_swappable
[alg.req.ind.swap], concept `indirectly_swappable` 738

std::indirectly_writable
Requirements for writing a value into an iterator's referenced object 738

std::invocable
[concept.invocable], concept invocable 738

std::mergeable
[alg.req.mergeable], concept `mergeable` 739

std::move_constructible
[concept.moveconstructible], concept move_constructible 739

std::permutable
[alg.req.permutable], concept `permutable` 739

std::predicate
[concept.predicate], concept predicate 739

std::ranges::bidirectional_range
A range for which ranges::begin returns a bidirectional iterator 740

std::ranges::borrowed_range
[range.range] The borrowed_range concept 740

std::ranges::common_range
A range for which ranges::begin and ranges::end return the same type 740

std::ranges::contiguous_range
A range for which ranges::begin returns a contiguous iterator 740

std::ranges::forward_range
A range for which ranges::begin returns a forward iterator 741

std::ranges::input_range
A range for which ranges::begin returns an input iterator 741

std::ranges::output_range
A range for which ranges::begin returns an output iterator 741

std::ranges::random_access_range
A range for which ranges::begin returns a random access iterator 741

std::ranges::range
[range.range] The range concept 741

std::ranges::sized_range
[range.sized] The sized_range concept 742

std::ranges::view
[range.view] The ranges::view concept 742

std::ranges::viewable_range
A range which can be safely converted to a view 742

std::regular_invocable
[concept.regularinvocable], concept regular_invocable 742

std::relation
[concept.relation], concept relation 743

std::same_as
[concept.same], concept same_as 743

std::sortable
[alg.req.sortable], concept `sortable` 743

std::strict_weak_order
[concept.strictweakorder], concept strict_weak_order 743

std::uniform_random_bit_generator
Requirements for a uniform random bit generator 744

std::weakly_incrementable
Requirements on types that can be incremented with ++ 744

7.233 condition_variable File Reference

Classes

- class std::condition_variable
- class std::condition_variable_any

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CONDITION_VARIABLE**

Enumerations

- enum class std::cv_status { **no_timeout** , **timeout** }

Functions

- void **std::notify_all_at_thread_exit** (condition_variable &, unique_lock< mutex >)

7.233.1 Detailed Description

This is a Standard C++ Library header.

7.234 csetjmp File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CSETJMP**
- #define **setjmp**(env)

7.234.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.
This is the C++ version of the Standard C Library header `setjmp.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.235 csignal File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CSIGNAL**

7.235.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.
This is the C++ version of the Standard C Library header `signal.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.236 cstdalign File Reference

Macros

- #define **_GLIBCXX_CSTDALIGN**

7.236.1 Detailed Description

This is a Standard C++ Library header.

Since

C++11 (removed in C++20)

7.237 cstdarg File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CSTDARG**
- #define **va_end**(ap)

7.237.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.
This is the C++ version of the Standard C Library header `stdarg.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.238 tr1/cstdarg File Reference

Macros

- #define **_GLIBCXX_TR1_CSTDARG**

7.238.1 Detailed Description

This is a TR1 C++ Library header.

7.239 cstdbool File Reference

Macros

- #define **_GLIBCXX_CSTDBOOL**

7.239.1 Detailed Description

This is a Standard C++ Library header.

Since

C++11 (removed in C++20)

7.240 tr1/cstdbool File Reference

Macros

- #define **_GLIBCXX_TR1_CSTDBOOL**

7.240.1 Detailed Description

This is a TR1 C++ Library header.

7.241 cstddef File Reference

Namespaces

- namespace std

Macros

- #define **__glibcxx_want_byte**
- #define **_GLIBCXX_CSTDDEF**

7.241.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.
This is the C++ version of the Standard C Library header `stddef.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.242 cstdint File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CSTDINT**

7.242.1 Detailed Description

This is a Standard C++ Library header.

7.243 tr1/cstdint File Reference

Namespaces

- namespace std
- namespace std::tr1

Macros

- #define **_GLIBCXX_TR1_CSTDINT**

7.243.1 Detailed Description

This is a TR1 C++ Library header.

7.244 cstdio File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CSTDIO**

7.244.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.
This is the C++ version of the Standard C Library header `stdio.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.245 tr1/cstdio File Reference

Macros

- #define **_GLIBCXX_TR1_CSTDIO**

7.245.1 Detailed Description

This is a TR1 C++ Library header.

7.246 cstdlib File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CSTDLIB**
- #define **_GLIBCXX_INCLUDE_NEXT_C_HEADERS**

Functions

- ldiv_t **std::div** (long __i, long __j) noexcept

7.246.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.
This is the C++ version of the Standard C Library header `stdlib.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.247 tr1/cstdlib File Reference

Macros

- #define **_GLIBCXX_TR1_CSTDLIB**

7.247.1 Detailed Description

This is a TR1 C++ Library header.

7.248 cstring File Reference

Namespaces

- namespace std

Macros

- #define **__glibcxx_want_freestanding_cstring**
- #define **_GLIBCXX_CSTRING**

Functions

- void * **std::memchr** (void *__s, int __c, size_t __n)
- char * **std::strchr** (char *__s, int __n)
- char * **std::strpbrk** (char *__s1, const char *__s2)
- char * **std::strrchr** (char *__s, int __n)
- char * **std::strstr** (char *__s1, const char *__s2)

7.248.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.
This is the C++ version of the Standard C Library header `string.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.249 ctgmath File Reference

Macros

- #define **_GLIBCXX_CTGMATH**

7.249.1 Detailed Description

This is a Standard C++ Library header.

Since

C++11 (removed in C++20)

7.250 tr1/ctgmath File Reference

Macros

- #define **_GLIBCXX_TR1_CTGMATH**

7.250.1 Detailed Description

This is a TR1 C++ Library header.

7.251 ctime File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CTIME**

7.251.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the ∗.h implementation files.
This is the C++ version of the Standard C Library header `time.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.252 tr1/ctime File Reference

Macros

- #define **_GLIBCXX_TR1_CTIME**

7.252.1 Detailed Description

This is a TR1 C++ Library header.

7.253 cuchar File Reference

Macros

- #define **_GLIBCXX_CUCHAR**

7.253.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the ∗.h implementation files.
This is the C++ version of the Standard C Library header `uchar.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.254 cwchar File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_CWCHAR**

Functions

- wchar_t ∗ **std::wcschr** (wchar_t ∗__p, wchar_t __c)
- wchar_t ∗ **std::wcspbrk** (wchar_t ∗__s1, const wchar_t ∗__s2)
- wchar_t ∗ **std::wcsrchr** (wchar_t ∗__p, wchar_t __c)

7.263.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

7.263.2 Macro Definition Documentation

__glibcxx_check_erase

```
#define __glibcxx_check_erase(
            _Position)
```

Verify that we can erase the element referenced by the iterator _Position. We can erase the element if the _Position iterator is dereferenceable and references this sequence.

__glibcxx_check_erase_after

```
#define __glibcxx_check_erase_after(
            _Position)
```

Verify that we can erase the element after the iterator _Position. We can erase the element if the _Position iterator is before a dereferenceable one and references this sequence.

__glibcxx_check_erase_range

```
#define __glibcxx_check_erase_range(
            _First,
            _Last)
```

Verify that we can erase the elements in the iterator range [_First, _Last). We can erase the elements if [_First, _Last) is a valid iterator range within this sequence.

__glibcxx_check_erase_range_after

```
#define __glibcxx_check_erase_range_after(
            _First,
            _Last)
```

Verify that we can erase the elements in the iterator range (_First, _Last). We can erase the elements if (_First, _Last) is a valid iterator range within this sequence.

__glibcxx_check_heap_pred

```
#define __glibcxx_check_heap_pred(
            _First,
            _Last,
            _Pred)
```

Verify that the iterator range [_First, _Last) is a heap w.r.t. the predicate _Pred.

__glibcxx_check_insert

```
#define __glibcxx_check_insert(
            _Position)
```

Verify that we can insert into ∗this with the iterator _Position. Insertion into a container at a specific position requires that the iterator be nonsingular, either dereferenceable or past-the-end, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a_Safe_sequence and the iterator is a _Safe_iterator.

__glibcxx_check_insert_after

```
#define __glibcxx_check_insert_after(
            _Position)
```

Verify that we can insert into ∗this after the iterator _Position. Insertion into a container after a specific position requires that the iterator be nonsingular, either dereferenceable or before-begin, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a_Safe_sequence and the iterator is a _Safe_↩ iterator.

__glibcxx_check_insert_range

```
#define __glibcxx_check_insert_range(
              _Position,
              _First,
              _Last,
              _Dist)
```

Verify that we can insert the values in the iterator range [_First, _Last) into ∗this with the iterator _Position. Insertion into a container at a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range [_First, _Last) is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a _Safe_sequence and the _Position iterator is a _Safe_iterator.

__glibcxx_check_insert_range_after

```
#define __glibcxx_check_insert_range_after(
              _Position,
              _First,
              _Last,
              _Dist)
```

Verify that we can insert the values in the iterator range [_First, _Last) into ∗this after the iterator _Position. Insertion into a container after a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range [_First, _Last) is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a _Safe_sequence and the _Position iterator is a _Safe_iterator.

__glibcxx_check_partitioned_lower

```
#define __glibcxx_check_partitioned_lower(
              _First,
              _Last,
              _Value)
```

Verify that the iterator range [_First, _Last) is partitioned w.r.t. the value _Value.

__glibcxx_check_partitioned_lower_pred

```
#define __glibcxx_check_partitioned_lower_pred(
              _First,
              _Last,
              _Value,
              _Pred)
```

Verify that the iterator range [_First, _Last) is partitioned w.r.t. the value _Value and predicate _Pred.

__glibcxx_check_partitioned_upper_pred

```
#define __glibcxx_check_partitioned_upper_pred(
              _First,
              _Last,
              _Value,
              _Pred)
```

Verify that the iterator range [_First, _Last) is partitioned w.r.t. the value _Value and predicate _Pred.

__glibcxx_check_sorted_pred

```
#define __glibcxx_check_sorted_pred(
              _First,
              _Last,
              _Pred)
```

Verify that the iterator range [_First, _Last) is sorted by the predicate _Pred.

_GLIBCXX_DEBUG_VERIFY_AT_F

```
#define _GLIBCXX_DEBUG_VERIFY_AT_F(
              _Cond,
              _ErrMsg,
              _File,
              _Line,
              _Func)
```

Macros used by the implementation to verify certain properties. These macros may only be used directly by the debug wrappers. Note that these are macros (instead of the more obviously *correct* choice of making them functions) because we need line and file information at the call site, to minimize the distance between the user error and where the error is reported.

7.279.1 Detailed Description

This is a Standard C++ Library header.

7.280 debug/deque File Reference

Classes

- class std::__debug::deque< _Tp, _Allocator >

Namespaces

- namespace std
- namespace std::__debug

Macros

- #define **_GLIBCXX_DEBUG_DEQUE**

Functions

- template<typename _InputIterator, typename _ValT = typename iterator_traits<_InputIterator>::value_type, typename _Allocator = allocator<_ValT>, typename = _RequireInputIter<_InputIterator>, typename = _RequireAllocator<_Allocator>>
  std::__debug::deque (_InputIterator, _InputIterator, _Allocator=_Allocator()) -> deque< _ValT, _Allocator >
- template<typename _Tp, typename _Allocator = allocator<_Tp>, typename = _RequireAllocator<_Allocator>>

7.317 unordered_iterator/const_iterator.hpp File Reference

7.317.1 Detailed Description

Contains an iterator class used for const ranging over the elements of the table.
This file is intended to be included inside a class definition, with PB_DS_CLASS_C_DEC defined to the name of the enclosing class.

7.318 bin_search_tree_/constructors_destructor_fn_imps.hpp File Reference

7.318.1 Detailed Description

Contains an implementation class for bin_search_tree_.

7.319 binary_heap_/constructors_destructor_fn_imps.hpp File Reference

7.319.1 Detailed Description

Contains an implementation class for binary_heap_.

7.320 binomial_heap_/constructors_destructor_fn_imps.hpp File Reference

7.320.1 Detailed Description

Contains an implementation for binomial_heap_.

7.321 binomial_heap_base_/constructors_destructor_fn_imps.hpp File Reference

7.321.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

7.322 left_child_next_sibling_heap_/constructors_destructor_fn_imps.hpp File Reference

7.322.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

7.323 ov_tree_map_/constructors_destructor_fn_imps.hpp File Reference

7.323.1 Detailed Description

Contains an implementation class for ov_tree_.

7.324 pairing_heap_/constructors_destructor_fn_imps.hpp File Reference

7.324.1 Detailed Description

Contains an implementation class for a pairing heap.

7.325 pat_trie_/constructors_destructor_fn_imps.hpp File Reference

7.325.1 Detailed Description

Contains an implementation class for pat_trie.

7.326 rb_tree_map_/constructors_destructor_fn_imps.hpp File Reference

7.326.1 Detailed Description

Contains an implementation for rb_tree_.

7.327 rc_binomial_heap_/constructors_destructor_fn_imps.hpp File Reference

7.327.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

7.328 splay_tree_/constructors_destructor_fn_imps.hpp File Reference

7.328.1 Detailed Description

Contains an implementation class for splay_tree_.

7.329 thin_heap_/constructors_destructor_fn_imps.hpp File Reference

7.329.1 Detailed Description

Contains an implementation for thin_heap_.

7.330 bin_search_tree_/debug_fn_imps.hpp File Reference

7.330.1 Detailed Description

Contains an implementation class for bin_search_tree_.

7.331 binary_heap_/debug_fn_imps.hpp File Reference

7.331.1 Detailed Description

Contains an implementation class for a binary_heap.

7.332 binomial_heap_/debug_fn_imps.hpp File Reference

7.332.1 Detailed Description

Contains an implementation for binomial_heap_.

7.333 binomial_heap_base_/debug_fn_imps.hpp File Reference

7.333.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

7.334 cc_hash_table_map_/debug_fn_imps.hpp File Reference

7.334.1 Detailed Description

Contains implementations of cc_ht_map_'s debug-mode functions.

7.335 gp_hash_table_map_/debug_fn_imps.hpp File Reference

7.335.1 Detailed Description

Contains implementations of gp_ht_map_'s debug-mode functions.

7.336 left_child_next_sibling_heap_/debug_fn_imps.hpp File Reference

7.336.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

7.337 list_update_map_/debug_fn_imps.hpp File Reference

7.337.1 Detailed Description

Contains implementations of cc_ht_map_'s debug-mode functions.

7.338 ov_tree_map_/debug_fn_imps.hpp File Reference

7.338.1 Detailed Description

Contains an implementation class for ov_tree_.

7.339 pairing_heap_/debug_fn_imps.hpp File Reference

7.339.1 Detailed Description

Contains an implementation class for a pairing heap.

7.340 pat_trie_/debug_fn_imps.hpp File Reference

7.340.1 Detailed Description

Contains an implementation class for pat_trie_.

7.341 rb_tree_map_/debug_fn_imps.hpp File Reference

7.341.1 Detailed Description

Contains an implementation for rb_tree_.

7.342 rc_binomial_heap_/debug_fn_imps.hpp File Reference

7.342.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

7.343 splay_tree_/debug_fn_imps.hpp File Reference

7.343.1 Detailed Description

Contains an implementation class for splay_tree_.

7.344 thin_heap_/debug_fn_imps.hpp File Reference

7.344.1 Detailed Description

Contains an implementation for thin_heap_.

7.345 entry_cmp.hpp File Reference

Classes

- struct __gnu_pbds::detail::entry_cmp< _VTp, Cmp_Fn, _Alloc, false >
- struct __gnu_pbds::detail::entry_cmp< _VTp, Cmp_Fn, _Alloc, true >
- struct __gnu_pbds::detail::entry_cmp< _VTp, Cmp_Fn, _Alloc, false >::type

Namespaces

- namespace __gnu_pbds

7.345.1 Detailed Description

Contains an implementation class for a binary_heap.

7.346 entry_pred.hpp File Reference

Classes

- struct __gnu_pbds::detail::entry_pred< _VTp, Pred, _Alloc, false >
- struct __gnu_pbds::detail::entry_pred< _VTp, Pred, _Alloc, true >

Namespaces

- namespace __gnu_pbds

7.346.1 Detailed Description

Contains an implementation class for a binary_heap.

7.347 bin_search_tree_/erase_fn_imps.hpp File Reference

7.347.1 Detailed Description

Contains an implementation class for bin_search_tree_.

7.348 binary_heap_/erase_fn_imps.hpp File Reference

7.348.1 Detailed Description

Contains an implementation class for a binary_heap.

7.349 binomial_heap_base_/erase_fn_imps.hpp File Reference

7.349.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

7.350 cc_hash_table_map_/erase_fn_imps.hpp File Reference

7.350.1 Detailed Description

Contains implementations of cc_ht_map_'s erase related functions.

7.351 gp_hash_table_map_/erase_fn_imps.hpp File Reference

7.351.1 Detailed Description

Contains implementations of gp_ht_map_'s erase related functions.

7.352 left_child_next_sibling_heap_/erase_fn_imps.hpp File Reference

7.352.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

7.353 list_update_map_/erase_fn_imps.hpp File Reference

7.353.1 Detailed Description

Contains implementations of lu_map_.

7.354 ov_tree_map_/erase_fn_imps.hpp File Reference

7.354.1 Detailed Description

Contains an implementation class for ov_tree_.

7.355 pairing_heap_/erase_fn_imps.hpp File Reference

7.355.1 Detailed Description

Contains an implementation class for a pairing heap.

7.356 pat_trie_/erase_fn_imps.hpp File Reference

7.356.1 Detailed Description

Contains an implementation class for pat_trie.

7.357 rb_tree_map_/erase_fn_imps.hpp File Reference

7.357.1 Detailed Description

Contains an implementation for rb_tree_.

7.358 rc_binomial_heap_/erase_fn_imps.hpp File Reference

7.358.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

7.359 splay_tree_/erase_fn_imps.hpp File Reference

7.359.1 Detailed Description

Contains an implementation class for splay_tree_.

7.360 thin_heap_/erase_fn_imps.hpp File Reference

7.360.1 Detailed Description

Contains an implementation for thin_heap_.

7.361 bin_search_tree_/find_fn_imps.hpp File Reference

7.361.1 Detailed Description

Contains an implementation class for bin_search_tree_.

7.362 binary_heap_/find_fn_imps.hpp File Reference

7.362.1 Detailed Description

Contains an implementation class for a binary_heap.

7.363 binomial_heap_base_/find_fn_imps.hpp File Reference

7.363.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

7.364 cc_hash_table_map_/find_fn_imps.hpp File Reference

7.364.1 Detailed Description

Contains implementations of cc_ht_map_'s find related functions.

7.365 gp_hash_table_map_/find_fn_imps.hpp File Reference

7.365.1 Detailed Description

Contains implementations of gp_ht_map_'s find related functions.

7.366 list_update_map_/find_fn_imps.hpp File Reference

7.366.1 Detailed Description

Contains implementations of lu_map_.

7.367 pairing_heap_/find_fn_imps.hpp File Reference

7.367.1 Detailed Description

Contains an implementation class for a pairing heap.

7.368 pat_trie_/find_fn_imps.hpp File Reference

7.368.1 Detailed Description

Contains an implementation class for pat_trie.

7.369 rb_tree_map_/find_fn_imps.hpp File Reference

7.369.1 Detailed Description

Contains an implementation for rb_tree_.

7.370 splay_tree_/find_fn_imps.hpp File Reference

7.370.1 Detailed Description

Contains an implementation class for splay_tree_.

7.371 thin_heap_/find_fn_imps.hpp File Reference

7.371.1 Detailed Description

Contains an implementation for thin_heap_.

7.372 bin_search_tree_/info_fn_imps.hpp File Reference

7.372.1 Detailed Description

Contains an implementation class for bin_search_tree_.

7.373 binary_heap_/info_fn_imps.hpp File Reference

7.373.1 Detailed Description

Contains an implementation class for a binary_heap.

7.374 cc_hash_table_map_/info_fn_imps.hpp File Reference

7.374.1 Detailed Description

Contains implementations of cc_ht_map_'s entire container info related functions.

7.375 gp_hash_table_map_/info_fn_imps.hpp File Reference

7.375.1 Detailed Description

Contains implementations of gp_ht_map_'s entire container info related functions.

7.376 left_child_next_sibling_heap_/info_fn_imps.hpp File Reference

7.376.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

7.377 list_update_map_/info_fn_imps.hpp File Reference

7.377.1 Detailed Description

Contains implementations of lu_map_.

7.378 ov_tree_map_/info_fn_imps.hpp File Reference

7.378.1 Detailed Description

Contains an implementation class for ov_tree_.

7.379 pat_trie_/info_fn_imps.hpp File Reference

7.379.1 Detailed Description

Contains an implementation class for pat_trie.

7.380 rb_tree_map_/info_fn_imps.hpp File Reference

7.380.1 Detailed Description

Contains an implementation for rb_tree_.

7.381 splay_tree_/info_fn_imps.hpp File Reference

7.381.1 Detailed Description

Contains an implementation.

7.382 bin_search_tree_/insert_fn_imps.hpp File Reference

7.382.1 Detailed Description

Contains an implementation class for bin_search_tree_.

7.383 binary_heap_/insert_fn_imps.hpp File Reference

7.383.1 Detailed Description

Contains an implementation class for a binary_heap.

7.384 binomial_heap_base_/insert_fn_imps.hpp File Reference

7.384.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

7.385 cc_hash_table_map_/insert_fn_imps.hpp File Reference

7.385.1 Detailed Description

Contains implementations of cc_ht_map_'s insert related functions.

7.386 gp_hash_table_map_/insert_fn_imps.hpp File Reference

7.386.1 Detailed Description

Contains implementations of gp_ht_map_'s insert related functions.

7.387 left_child_next_sibling_heap_/insert_fn_imps.hpp File Reference

7.387.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

7.388 list_update_map_/insert_fn_imps.hpp File Reference

7.388.1 Detailed Description

Contains implementations of lu_map_.

7.389 ov_tree_map_/insert_fn_imps.hpp File Reference

7.389.1 Detailed Description

Contains an implementation class for ov_tree_.

7.390 pairing_heap_/insert_fn_imps.hpp File Reference

7.390.1 Detailed Description

Contains an implementation class for a pairing heap.

7.391 rb_tree_map_/insert_fn_imps.hpp File Reference

7.391.1 Detailed Description

Contains an implementation for rb_tree_.

7.392 rc_binomial_heap_/insert_fn_imps.hpp File Reference

7.392.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

7.393 splay_tree_/insert_fn_imps.hpp File Reference

7.393.1 Detailed Description

Contains an implementation class for splay_tree_.

7.394 thin_heap_/insert_fn_imps.hpp File Reference

7.394.1 Detailed Description

Contains an implementation for thin_heap_.

7.395 bin_search_tree_/iterators_fn_imps.hpp File Reference

7.395.1 Detailed Description

Contains an implementation class for bin_search_tree_.

7.396 binary_heap_/iterators_fn_imps.hpp File Reference

7.396.1 Detailed Description

Contains an implementation class for a binary_heap.

7.397 cc_hash_table_map_/iterators_fn_imps.hpp File Reference

7.397.1 Detailed Description

Contains implementations of cc_ht_map_'s iterators related functions, e.g., begin().

7.398 left_child_next_sibling_heap_/iterators_fn_imps.hpp File Reference

7.398.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

7.399 list_update_map_/iterators_fn_imps.hpp File Reference

7.399.1 Detailed Description

Contains implementations of lu_map_.

7.400 ov_tree_map_/iterators_fn_imps.hpp File Reference

7.400.1 Detailed Description

Contains an implementation class for ov_tree_.

7.401 pat_trie_/iterators_fn_imps.hpp File Reference

7.401.1 Detailed Description

Contains an implementation class for pat_trie.

7.402 binary_heap_/point_const_iterator.hpp File Reference

Classes

- class __gnu_pbds::detail::binary_heap_point_const_iterator_< Value_Type, Entry, Simple, _Alloc >

Namespaces

- namespace __gnu_pbds

7.402.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

7.403 left_child_next_sibling_heap_/point_const_iterator.hpp File Reference

Classes

- class __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc >

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**

7.403.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

7.404 unordered_iterator/point_const_iterator.hpp File Reference

7.404.1 Detailed Description

Contains an iterator class returned by the tables' const find and insert methods.

- This file is intended to be included inside a class definition, with PB_DS_CLASS_C_DEC defined to the name of the enclosing class.

7.405 bin_search_tree_/policy_access_fn_imps.hpp File Reference

7.405.1 Detailed Description

Contains an implementation class for bin_search_tree_.

7.406 binary_heap_/policy_access_fn_imps.hpp File Reference

7.406.1 Detailed Description

Contains an implementation class for a binary_heap.

7.407 cc_hash_table_map_/policy_access_fn_imps.hpp File Reference

7.407.1 Detailed Description

Contains implementations of cc_ht_map_'s policy access functions.

7.408 gp_hash_table_map_/policy_access_fn_imps.hpp File Reference

7.408.1 Detailed Description

Contains implementations of gp_ht_map_'s policy agpess functions.

7.409 left_child_next_sibling_heap_/policy_access_fn_imps.hpp File Reference

7.409.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

7.410 ov_tree_map_/policy_access_fn_imps.hpp File Reference

7.410.1 Detailed Description

Contains an implementation class for ov_tree.

7.411 pat_trie_/policy_access_fn_imps.hpp File Reference

7.411.1 Detailed Description

Contains an implementation class for pat_trie.

7.412 resize_policy.hpp File Reference

Classes

- class __gnu_pbds::detail::resize_policy< _Tp >

Namespaces

- namespace __gnu_pbds

Variables

- template<typename _Tp>
  const _Tp **__gnu_pbds::detail::resize_policy< _Tp >::min_size**

7.412.1 Detailed Description

Contains an implementation class for a binary_heap.

7.434.1 Detailed Description

Contains an implementation class for cc_ht_map_.

7.435 cmp_fn_imps.hpp File Reference

7.435.1 Detailed Description

Contains implementations of cc_ht_map_'s entire container comparison related functions.

7.436 cond_key_dtor_entry_dealtor.hpp File Reference

Classes

- class __gnu_pbds::detail::cond_dealtor< Entry, _Alloc >

Namespaces

- namespace __gnu_pbds

7.436.1 Detailed Description

Contains a conditional key destructor, used for exception handling.

7.437 cc_hash_table_map_/constructor_destructor_fn_imps.hpp File Reference

7.437.1 Detailed Description

Contains implementations of cc_ht_map_'s constructors, destructor, and related functions.

7.438 gp_hash_table_map_/constructor_destructor_fn_imps.hpp File Reference

7.438.1 Detailed Description

Contains implementations of gp_ht_map_'s constructors, destructor, and related functions.

7.439 list_update_map_/constructor_destructor_fn_imps.hpp File Reference

7.440 cc_hash_table_map_/constructor_destructor_no_store_hash_fn_imps.hpp File Reference

7.440.1 Detailed Description

Contains implementations of cc_ht_map_'s constructors, destructor, and related functions.

7.441 gp_hash_table_map_/constructor_destructor_no_store_hash_fn_imps.hpp File Reference

7.441.1 Detailed Description

Contains implementations of gp_ht_map_'s constructors, destructor, and related functions.

7.442 cc_hash_table_map_/constructor_destructor_store_hash_fn_imps.hpp File Reference

7.442.1 Detailed Description

Contains implementations of cc_ht_map_'s constructors, destructor, and related functions.

7.443 gp_hash_table_map_/constructor_destructor_store_hash_fn_imps.hpp File Reference

7.443.1 Detailed Description

Contains implementations of gp_ht_map_'s constructors, destructor, and related functions.

7.444 cc_hash_table_map_/debug_no_store_hash_fn_imps.hpp File Reference

7.444.1 Detailed Description

Contains implementations of cc_ht_map_'s debug-mode functions.

7.445 gp_hash_table_map_/debug_no_store_hash_fn_imps.hpp File Reference

7.445.1 Detailed Description

Contains implementations of gp_ht_map_'s debug-mode functions.

7.446 cc_hash_table_map_/debug_store_hash_fn_imps.hpp File Reference

7.446.1 Detailed Description

Contains implementations of cc_ht_map_'s debug-mode functions.

7.447 gp_hash_table_map_/debug_store_hash_fn_imps.hpp File Reference

7.447.1 Detailed Description

Contains implementations of gp_ht_map_'s debug-mode functions.

7.448 entry_list_fn_imps.hpp File Reference

7.448.1 Detailed Description

Contains implementations of cc_ht_map_'s entry-list related functions.

7.449 cc_hash_table_map_/erase_no_store_hash_fn_imps.hpp File Reference

7.449.1 Detailed Description

Contains implementations of cc_ht_map_'s erase related functions, when the hash value is not stored.

7.450 gp_hash_table_map_/erase_no_store_hash_fn_imps.hpp File Reference

7.450.1 Detailed Description

Contains implementations of gp_ht_map_'s erase related functions, when the hash value is not stored.

7.451 cc_hash_table_map_/erase_store_hash_fn_imps.hpp File Reference

7.451.1 Detailed Description

Contains implementations of cc_ht_map_'s erase related functions, when the hash value is stored.

7.452 gp_hash_table_map_/erase_store_hash_fn_imps.hpp File Reference

7.452.1 Detailed Description

Contains implementations of gp_ht_map_'s erase related functions, when the hash value is stored.

7.453 cc_hash_table_map_/find_store_hash_fn_imps.hpp File Reference

7.453.1 Detailed Description

Contains implementations of cc_ht_map_'s find related functions, when the hash value is stored.

7.454 gp_hash_table_map_/find_store_hash_fn_imps.hpp File Reference

7.454.1 Detailed Description

Contains implementations of gp_ht_map_'s insert related functions, when the hash value is stored.

7.455 cc_hash_table_map_/insert_no_store_hash_fn_imps.hpp File Reference

7.455.1 Detailed Description

Contains implementations of cc_ht_map_'s insert related functions, when the hash value is not stored.

7.456 gp_hash_table_map_/insert_no_store_hash_fn_imps.hpp File Reference

7.456.1 Detailed Description

Contains implementations of gp_ht_map_'s insert related functions, when the hash value is not stored.

7.457 cc_hash_table_map_/insert_store_hash_fn_imps.hpp File Reference

7.457.1 Detailed Description

Contains implementations of cc_ht_map_'s insert related functions, when the hash value is stored.

7.458 gp_hash_table_map_/insert_store_hash_fn_imps.hpp File Reference

7.458.1 Detailed Description

Contains implementations of gp_ht_map_'s find related functions, when the hash value is stored.

7.459 cc_hash_table_map_/resize_fn_imps.hpp File Reference

7.459.1 Detailed Description

Contains implementations of cc_ht_map_'s resize related functions.

7.460 gp_hash_table_map_/resize_fn_imps.hpp File Reference

7.460.1 Detailed Description

Contains implementations of gp_ht_map_'s resize related functions.

7.461 cc_hash_table_map_/resize_no_store_hash_fn_imps.hpp File Reference

7.461.1 Detailed Description

Contains implementations of cc_ht_map_'s resize related functions, when the hash value is not stored.

7.462 gp_hash_table_map_/resize_no_store_hash_fn_imps.hpp File Reference

7.462.1 Detailed Description

Contains implementations of gp_ht_map_'s resize related functions, when the hash value is not stored.

7.463 cc_hash_table_map_/resize_store_hash_fn_imps.hpp File Reference

7.463.1 Detailed Description

Contains implementations of cc_ht_map_'s resize related functions, when the hash value is stored.

7.464 gp_hash_table_map_/resize_store_hash_fn_imps.hpp File Reference

7.464.1 Detailed Description

Contains implementations of gp_ht_map_'s resize related functions, when the hash value is stored.

7.465 size_fn_imps.hpp File Reference

7.465.1 Detailed Description

Contains implementations of cc_ht_map_'s entire container size related functions.

7.466 cond_dealtor.hpp File Reference

Classes

- class __gnu_pbds::detail::cond_dealtor< Entry, _Alloc >

Namespaces

- namespace __gnu_pbds

Variables

- template<typename Entry, class _Alloc>
  cond_dealtor< Entry, _Alloc >::entry_allocator **__gnu_pbds::detail::cond_dealtor< Entry, _Alloc >::s_alloc**

7.466.1 Detailed Description

Contains a conditional deallocator.

7.467 container_base_dispatch.hpp File Reference

Classes

- struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, cc_hash_tag, Policy_TI >
- struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, gp_hash_tag, Policy_TI >
- struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, list_update_tag, Policy_TI >
- struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, ov_tree_tag, Policy_TI >

- struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, pat_trie_tag, Policy_TI >
- struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, rb_tree_tag, Policy_TI >

- #define **PB_DS_V2S**(X)

7.467.1 Detailed Description

Contains associative container dispatching.

7.468 debug_map_base.hpp File Reference

7.468.1 Detailed Description

Contains a debug-mode base for all maps.

7.469 eq_by_less.hpp File Reference

Classes

- struct __gnu_pbds::detail::eq_by_less< Key, Cmp_Fn >

Namespaces

- namespace __gnu_pbds

7.469.1 Detailed Description

Contains an equivalence function.

7.470 hash_eq_fn.hpp File Reference

Classes

- struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, false >
- struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, true >

Namespaces

- namespace __gnu_pbds

7.470.1 Detailed Description

Contains 2 equivalence functions, one employing a hash value, and one ignoring it.

7.471 find_no_store_hash_fn_imps.hpp File Reference

7.471.1 Detailed Description

Contains implementations of gp_ht_map_'s find related functions, when the hash value is not stored.

7.472 gp_ht_map_.hpp File Reference

Classes

- class __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_Fn, Probe_Fn, Resize_

Namespaces

- namespace __gnu_pbds

Macros

7.472.1 Detailed Description

Contains an implementation class for general probing hash.

7.473 iterator_fn_imps.hpp File Reference

7.473.1 Detailed Description

Contains implementations of gp_ht_map_'s iterators related functions, e.g., begin().

7.474 direct_mask_range_hashing_imp.hpp File Reference

7.474.1 Detailed Description

Contains a range-hashing policy implementation

7.475 direct_mod_range_hashing_imp.hpp File Reference

7.475.1 Detailed Description

Contains a range-hashing policy implementation

7.476 linear_probe_fn_imp.hpp File Reference

7.476.1 Detailed Description

Contains a probe policy implementation

7.477 mask_based_range_hashing.hpp File Reference

Classes

- class __gnu_pbds::detail::mask_based_range_hashing< Size_Type >

Namespaces

- namespace __gnu_pbds

Variables

- template<typename Size_Type>
  const mask_based_range_hashing< Size_Type >::size_type **__gnu_pbds::detail::mask_based_range_↩ hashing< Size_Type >::s_highest_bit_1**
- template<typename Size_Type>
  const mask_based_range_hashing< Size_Type >::size_type **__gnu_pbds::detail::mask_based_range_↩ hashing< Size_Type >::s_num_bits_in_size_type**

7.477.1 Detailed Description

Contains a range hashing policy base.

7.478 mod_based_range_hashing.hpp File Reference

Classes

- class __gnu_pbds::detail::mod_based_range_hashing< Size_Type >

Namespaces

- namespace __gnu_pbds

7.478.1 Detailed Description

Contains a range hashing policy base.

7.479 probe_fn_base.hpp File Reference

Classes

- class __gnu_pbds::detail::probe_fn_base< _Alloc >

Namespaces

- namespace __gnu_pbds

7.479.1 Detailed Description

Contains a probe policy base.

7.480 quadratic_probe_fn_imp.hpp File Reference

7.480.1 Detailed Description

Contains a probe policy implementation

7.481 ranged_hash_fn.hpp File Reference

Classes

- class __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, false >
- class __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, true >
- class __gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, false >
- class __gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, true >

- #define **PB_DS_CLASS_T_DEC**

7.481.1 Detailed Description

Contains a unified ranged hash functor, allowing the hash tables to deal with a single class for ranged hashing.

7.482 ranged_probe_fn.hpp File Reference

Classes

- class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, false >
- class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, true >
- class __gnu_pbds::detail::ranged_probe_fn< Key, null_type, _Alloc, Comb_Probe_Fn, null_type, false >

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**
- #define **PB_DS_CLASS_T_DEC**

7.482.1 Detailed Description

Contains a unified ranged probe functor, allowing the probe tables to deal with a single class for ranged probeing.

7.483 sample_probe_fn.hpp File Reference

Classes

- class __gnu_pbds::sample_probe_fn

Namespaces

- namespace __gnu_pbds

7.483.1 Detailed Description

Contains a sample probe policy.

7.484 sample_range_hashing.hpp File Reference

Classes

- class __gnu_pbds::sample_range_hashing

Namespaces

- namespace __gnu_pbds

7.484.1 Detailed Description

Contains a range hashing policy.

7.485 sample_ranged_hash_fn.hpp File Reference

Classes

- class __gnu_pbds::sample_ranged_hash_fn

Namespaces

- namespace __gnu_pbds

7.485.1 Detailed Description

Contains a ranged hash policy.

7.486 sample_ranged_probe_fn.hpp File Reference

Classes

- class __gnu_pbds::sample_ranged_probe_fn

Namespaces

- namespace __gnu_pbds

7.486.1 Detailed Description

Contains a ranged probe policy.

7.487 left_child_next_sibling_heap_.hpp File Reference

Classes

- class __gnu_pbds::detail::left_child_next_sibling_heap< Value_Type, Cmp_Fn, Node_Metadata, _Alloc >

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**

Variables

- template<typename Value_Type, typename Cmp_Fn, typename Node_Metadata, typename _Alloc>
  left_child_next_sibling_heap< Value_Type, Cmp_Fn, Node_Metadata, _Alloc >::no_throw_copies_t **__gnu_pbds::detail::left_child_next_sibling_heap< Value_Type, Cmp_Fn, Node_Metadata, _Alloc >::s_no_throw_copies_ind**
- template<typename Value_Type, typename Cmp_Fn, typename Node_Metadata, typename _Alloc>

7.487.1 Detailed Description

Contains an implementation class for a basic heap.

7.488 left_child_next_sibling_heap_/node.hpp File Reference

Classes

- struct __gnu_pbds::detail::left_child_next_sibling_heap_node_< _Value, _Metadata, _Alloc >

Namespaces

- namespace __gnu_pbds

7.488.1 Detailed Description

Contains an implementation struct for this type of heap's node.

7.489 rb_tree_map_/node.hpp File Reference

Classes

- struct __gnu_pbds::detail::rb_tree_node_< Value_Type, Metadata, _Alloc >

Namespaces

- namespace __gnu_pbds

7.489.1 Detailed Description

Contains an implementation for rb_tree_.

7.490 splay_tree_/node.hpp File Reference

Classes

- struct __gnu_pbds::detail::splay_tree_node_< Value_Type, Metadata, _Alloc >

Namespaces

- namespace __gnu_pbds

7.490.1 Detailed Description

Contains an implementation struct for splay_tree_'s node.

7.491 entry_metadata_base.hpp File Reference

Namespaces

- namespace __gnu_pbds

7.491.1 Detailed Description

Contains an implementation for a list update map.

7.492 lu_map_.hpp File Reference

Classes

- class __gnu_pbds::detail::lu_map< Key, Mapped, Eq_Fn, _Alloc, Update_Policy >

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**
- #define **PB_DS_GEN_POS**
- #define **PB_DS_LU_NAME**
- #define **PB_DS_LU_TRAITS_BASE**

Variables

- template<typename Key, typename Mapped, typename Eq_Fn, typename _Alloc, typename Update_Policy>

- template<typename Key, typename Mapped, typename Eq_Fn, typename _Alloc, typename Update_Policy>
  Update_Policy **__gnu_pbds::detail::lu_map< Key, Mapped, Eq_Fn, _Alloc, Update_Policy >::s_update_policy**

7.492.1 Detailed Description

Contains a list update map.

7.493 lu_counter_metadata.hpp File Reference

Classes

- class __gnu_pbds::detail::lu_counter_metadata< Size_Type >
- class __gnu_pbds::detail::lu_counter_policy_base< Size_Type >

Namespaces

- namespace __gnu_pbds

7.493.1 Detailed Description

Contains implementation of a lu counter policy's metadata.

7.494 sample_update_policy.hpp File Reference

Classes

- struct __gnu_pbds::sample_update_policy

Namespaces

- namespace __gnu_pbds

7.494.1 Detailed Description

Contains a sample policy for list update containers.

7.495 ov_tree_map_.hpp File Reference

Classes

- class __gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::cond_dtor< Size_Type >
- class __gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >

7.495.1 Detailed Description

Contains an implementation class for ov_tree.

7.496 pairing_heap_.hpp File Reference

Classes

- class __gnu_pbds::detail::pairing_heap< Value_Type, Cmp_Fn, _Alloc >

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_ASSERT_NODE_CONSISTENT**(_Node, _Bool)
- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**
- #define **PB_DS_P_HEAP_BASE**

7.496.1 Detailed Description

Contains an implementation class for a pairing heap.

7.497 insert_join_fn_imps.hpp File Reference

7.497.1 Detailed Description

Contains an implementation class for pat_trie.

7.498 pat_trie_.hpp File Reference

Classes

- class __gnu_pbds::detail::pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >

Namespaces

- namespace __gnu_pbds

Macros

7.499.1 Detailed Description

Contains the base class for a patricia tree.

7.500 split_fn_imps.hpp File Reference

7.500.1 Detailed Description

Contains an implementation class for pat_trie.

7.501 synth_access_traits.hpp File Reference

Classes

- struct __gnu_pbds::detail::synth_access_traits< Type_Traits, Set, _ATraits >

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_SYNTH_E_ACCESS_TRAITS_C_DEC**
- #define **PB_DS_SYNTH_E_ACCESS_TRAITS_T_DEC**

Variables

- template<typename Type_Traits, bool Set, typename _ATraits>
  integral_constant< int, Set > **__gnu_pbds::detail::synth_access_traits< Type_Traits, Set, _ATraits >::s_set_ind**

7.501.1 Detailed Description

Contains an implementation class for a patricia tree.

7.502 update_fn_imps.hpp File Reference

7.502.1 Detailed Description

Contains an implementation class for pat_trie_.

7.503 priority_queue_base_dispatch.hpp File Reference

Classes

- struct __gnu_pbds::detail::container_base_dispatch< _VTp, Cmp_Fn, _Alloc, binary_heap_tag, null_type >
- struct __gnu_pbds::detail::container_base_dispatch< _VTp, Cmp_Fn, _Alloc, binomial_heap_tag, null_type >

7.504.1 Detailed Description

Contains an implementation for Red Black trees.

7.505 rc.hpp File Reference

Classes

- class __gnu_pbds::detail::rc< _Node, _Alloc >

Namespaces

- namespace __gnu_pbds

7.505.1 Detailed Description

Contains a redundant (binary counter).

7.506 rc_binomial_heap_.hpp File Reference

Classes

- class __gnu_pbds::detail::rc_binomial_heap< Value_Type, Cmp_Fn, _Alloc >

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**
- #define **PB_DS_RC_C_DEC**

7.506.1 Detailed Description

Contains an implementation for redundant-counter binomial heap.

7.507 cc_hash_max_collision_check_resize_trigger_imp.hpp File Reference

7.507.1 Detailed Description

Contains a resize trigger implementation.

7.508 hash_exponential_size_policy_imp.hpp File Reference

7.508.1 Detailed Description

Contains a resize size policy implementation.

7.509 hash_load_check_resize_trigger_imp.hpp File Reference

7.509.1 Detailed Description

Contains a resize trigger implementation.

7.510 hash_load_check_resize_trigger_size_base.hpp File Reference

Classes

- class __gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, true >

Namespaces

- namespace __gnu_pbds

7.510.1 Detailed Description

Contains an base holding size for some resize policies.

7.511 hash_prime_size_policy_imp.hpp File Reference

7.511.1 Detailed Description

Contains a resize size policy implementation.

7.512 hash_standard_resize_policy_imp.hpp File Reference

7.512.1 Detailed Description

Contains a resize policy implementation.

7.513 sample_resize_policy.hpp File Reference

Classes

- class __gnu_pbds::sample_resize_policy

Namespaces

- namespace __gnu_pbds

7.513.1 Detailed Description

Contains a sample resize policy for hash tables.

7.514 sample_resize_trigger.hpp File Reference

Classes

- class __gnu_pbds::sample_resize_trigger

Namespaces

- namespace __gnu_pbds

7.514.1 Detailed Description

Contains a sample resize trigger policy class.

7.515 sample_size_policy.hpp File Reference

Classes

- class __gnu_pbds::sample_size_policy

Namespaces

- namespace __gnu_pbds

7.515.1 Detailed Description

Contains a sample size resize-policy.

7.516 splay_fn_imps.hpp File Reference

7.516.1 Detailed Description

Contains an implementation class for splay_tree_.

7.517 splay_tree_.hpp File Reference

Classes

- class __gnu_pbds::detail::splay_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_ASSERT_BASE_NODE_CONSISTENT**(_Node)
- #define **PB_DS_CLASS_C_DEC**

- #define **PB_DS_S_TREE_BASE**
- #define **PB_DS_S_TREE_BASE_NAME**
- #define **PB_DS_S_TREE_NAME**

7.517.1 Detailed Description

Contains an implementation class for splay trees.

7.518 standard_policies.hpp File Reference

Classes

- struct __gnu_pbds::detail::default_comb_hash_fn
- struct __gnu_pbds::detail::default_eq_fn< Key >
- struct __gnu_pbds::detail::default_hash_fn< Key >
- struct __gnu_pbds::detail::default_probe_fn< Comb_Probe_Fn >
- struct __gnu_pbds::detail::default_resize_policy< Comb_Hash_Fn >
- struct __gnu_pbds::detail::default_trie_access_traits< std::basic_string< Char, Char_Traits, std::allocator< char > > >
- struct __gnu_pbds::detail::default_update_policy

Namespaces

- namespace __gnu_pbds

Macros

- #define **__dtrie_alloc**
- #define **__dtrie_string**

Enumerations

- enum { **default_store_hash** }

7.518.1 Detailed Description

Contains standard policies for containers.

7.518.2 Enumeration Type Documentation

anonymous enum

`anonymous enum`
Enumeration for default behavior of stored hash data.

7.519 thin_heap_.hpp File Reference

Classes

- class __gnu_pbds::detail::thin_heap< Value_Type, Cmp_Fn, _Alloc >

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_ASSERT_AUX_NULL**(X)
- #define **PB_DS_ASSERT_NODE_CONSISTENT**(_Node, _Bool)
- #define **PB_DS_BASE_T_P**
- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**

Enumerations

- enum { **num_distinct_rank_bounds** }

Variables

- static const std::size_t **__gnu_pbds::detail::g_a_rank_bounds** [num_distinct_rank_bounds]

7.519.1 Detailed Description

Contains an implementation class for a thin heap.

7.520 tree_policy/node_metadata_selector.hpp File Reference

Classes

- struct __gnu_pbds::detail::tree_metadata_helper< Node_Update, false >
- struct __gnu_pbds::detail::tree_metadata_helper< Node_Update, true >
- struct __gnu_pbds::detail::tree_node_metadata_dispatch< Key, Data, Cmp_Fn, Node_Update, _Alloc >

Namespaces

- namespace __gnu_pbds

7.520.1 Detailed Description

Contains an implementation class for trees.

7.521 trie_policy/node_metadata_selector.hpp File Reference

Classes

- struct __gnu_pbds::detail::trie_metadata_helper< Node_Update, false >
- struct __gnu_pbds::detail::trie_metadata_helper< Node_Update, true >
- struct __gnu_pbds::detail::trie_node_metadata_dispatch< Key, Data, Cmp_Fn, Node_Update, _Alloc >

Namespaces

- namespace __gnu_pbds

7.521.1 Detailed Description

Contains an implementation class for tries.

7.522 tree_policy/order_statistics_imp.hpp File Reference

7.522.1 Detailed Description

Contains forward declarations for order_statistics_key

7.523 trie_policy/order_statistics_imp.hpp File Reference

7.523.1 Detailed Description

Contains forward declarations for order_statistics_key

7.524 sample_tree_node_update.hpp File Reference

Classes

- class __gnu_pbds::sample_tree_node_update< Const_Node_Iter, Node_Iter, Cmp_Fn, _Alloc >

Namespaces

- namespace __gnu_pbds

7.524.1 Detailed Description

Contains a samle node update functor.

7.525 tree_trace_base.hpp File Reference

7.525.1 Detailed Description

Contains tree-related policies.

7.526 prefix_search_node_update_imp.hpp File Reference

7.526.1 Detailed Description

Contains an implementation of prefix_search_node_update.

7.527 sample_trie_access_traits.hpp File Reference

Classes

- struct __gnu_pbds::sample_trie_access_traits

Namespaces

- namespace __gnu_pbds

7.527.1 Detailed Description

Contains a sample probe policy.

7.528 sample_trie_node_update.hpp File Reference

Classes

- class __gnu_pbds::sample_trie_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >

Namespaces

- namespace __gnu_pbds

7.528.1 Detailed Description

Contains a samle node update functor.

7.529 trie_policy_base.hpp File Reference

Classes

- class __gnu_pbds::detail::trie_policy_base< Node_CItr, Node_Itr, _ATraits, _Alloc >

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**

7.529.1 Detailed Description

Contains an implementation of trie_policy_base.

7.530 trie_string_access_traits_imp.hpp File Reference

7.530.1 Detailed Description

Contains a policy for extracting character positions from a string for a vector-based PATRICIA tree

7.531 type_utils.hpp File Reference

Namespaces

- namespace __gnu_pbds

Macros

- #define **PB_DS_STATIC_ASSERT**(UNIQUE, E)

Typedefs

- typedef std::tr1::integral_constant< int, 0 > **__gnu_pbds::detail::false_type**
- typedef std::tr1::integral_constant< int, 1 > **__gnu_pbds::detail::true_type**

7.531.1 Detailed Description

Contains utilities for handling types. All of these classes are based on Modern C++ by Andrei Alxandrescu.

7.532 types_traits.hpp File Reference

Classes

- struct __gnu_pbds::detail::maybe_null_type< Key, Mapped, _Alloc, Store_Hash >
- struct __gnu_pbds::detail::maybe_null_type< Key, null_type, _Alloc, Store_Hash >
- struct __gnu_pbds::detail::no_throw_copies< Key, Mapped >
- struct __gnu_pbds::detail::no_throw_copies< Key, null_type >

Variables

- template<typename Key, typename _Alloc, bool Store_Hash>
  null_type **__gnu_pbds::detail::maybe_null_type< Key, null_type, _Alloc, Store_Hash >::s_null_type**

7.532.1 Detailed Description

Contains a traits class of types used by containers.

7.533 iterator.hpp File Reference

7.533.1 Detailed Description

Contains an iterator_ class used for ranging over the elements of the table.
This file is intended to be included inside a class definition, with PB_DS_CLASS_C_DEC defined to the name of the enclosing class.

7.534 point_iterator.hpp File Reference

7.534.1 Detailed Description

Contains an iterator class returned by the tables' find and insert methods.
This file is intended to be included inside a class definition, with PB_DS_CLASS_C_DEC defined to the name of the enclosing class.

7.535 exception.hpp File Reference

Classes

- struct __gnu_pbds::container_error
- struct __gnu_pbds::insert_error
- struct __gnu_pbds::join_error
- struct __gnu_pbds::resize_error

Namespaces

- namespace __gnu_pbds

Functions

- void **__gnu_pbds::__throw_container_error** ()
- void **__gnu_pbds::__throw_insert_error** ()
- void **__gnu_pbds::__throw_join_error** ()
- void **__gnu_pbds::__throw_resize_error** ()

7.535.1 Detailed Description

Contains exception classes.

7.536 hash_policy.hpp File Reference

Classes

- class __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >
- class __gnu_pbds::direct_mask_range_hashing< Size_Type >

7.554.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.
Contains two exception-generating types (throw_value, throw_allocator) intended to be used as value and allocator types while testing exception safety in templatized containers and algorithms. The allocator has additional log and debug features. The exception generated is of type forced_exception_error.

7.579.1 Detailed Description

This is a Standard C++ Library header.

7.580 iostream File Reference

Namespaces

- namespace std

Macros

- #define **_GLIBCXX_IOSTREAM**

Variables

- static ios_base::Init **std::__ioinit**

Standard Stream Objects

The `<iostream>` *header declares the eight standard stream objects. For other declarations, see* `https://gcc.gnu.org/onlinedocs/libstdc++/manual/io.html` *and the I/O forward declarations*

They are required by default to cooperate with the global C library's `FILE` *streams, and to be available during program startup and termination. For more information, see the section of the manual linked to above.*

- ostream std::cerr
- istream std::cin
- ostream std::clog
- ostream std::cout
- wostream std::wcerr
- wistream std::wcin
- wostream std::wclog
- wostream std::wcout

7.580.1 Detailed Description

This is a Standard C++ Library header.

7.581 istream File Reference

7.594.1 Detailed Description

This is a Standard C++ Library header.

7.594.2 Function Documentation

abs()

```
template<typename _Tp>
_Tp std::abs (
            const complex< _Tp > & __z)  [inline]
```

Return magnitude of *z*.

cos()

```
template<typename _Tp>
complex< _Tp > std::cos (
            const complex< _Tp > & __z)  [inline]
```

Return complex cosine of *z*.

cosh()

```
template<typename _Tp>
complex< _Tp > std::cosh (
            const complex< _Tp > & __z)  [inline]
```

Return complex hyperbolic cosine of *z*.

exp()

```
template<typename _Tp>
complex< _Tp > std::exp (
            const complex< _Tp > & __z)  [inline]
```

Return complex base e exponential of *z*.

fabs()

```
template<typename _Tp>
_Tp std::fabs (
            const std::complex< _Tp > & __z)  [inline]
```

fabs(__z) TR1 8.1.8 [tr.c99.cmplx.fabs]

log()

```
template<typename _Tp>
complex< _Tp > std::log (
            const complex< _Tp > & __z)  [inline]
```

Return complex natural logarithm of *z*.

log10()

```
template<typename _Tp>
complex< _Tp > std::log10 (
            const complex< _Tp > & __z)  [inline]
```

Return complex base 10 logarithm of *z*.

pow()

```
template<typename _Tp>
complex< _Tp > std::pow (
            const complex< _Tp > & __z,
            int __n)  [inline]
```

Return *x* to the *y'th* power.

sin()

```
template<typename _Tp>
complex< _Tp > std::sin (
            const complex< _Tp > & __z)  [inline]
```

Return complex sine of *z*.

sinh()

```
template<typename _Tp>
complex< _Tp > std::sinh (
            const complex< _Tp > & __z)  [inline]
```

Return complex hyperbolic sine of *z*.

sqrt()

```
template<typename _Tp>
complex< _Tp > std::sqrt (
            const complex< _Tp > & __z)  [inline]
```

Return complex square root of *z*.

tan()

```
template<typename _Tp>
complex< _Tp > std::tan (
            const complex< _Tp > & __z)  [inline]
```

Return complex tangent of *z*.

tanh()

```
template<typename _Tp>
complex< _Tp > std::tanh (
            const complex< _Tp > & __z)  [inline]
```

Return complex hyperbolic tangent of *z*.

7.599.1 Detailed Description

This is a TS C++ Library header.

7.599.2 Function Documentation

get_default_resource()

`memory_resource * std::experimental::fundamentals_v2::pmr::get_default_resource () [inline], [noexcept]`

Get the current default resource.

set_default_resource()

```
memory_resource * std::experimental::fundamentals_v2::pmr::set_default_resource (
            memory_resource * __r)  [inline], [noexcept]
```

Change the default resource and return the previous one.

7.600 memory_resource File Reference

Classes

- class std::pmr::monotonic_buffer_resource

- memory_resource * std::pmr::new_delete_resource () noexcept
- memory_resource * std::pmr::null_memory_resource () noexcept
- memory_resource * std::pmr::set_default_resource (memory_resource *__r) noexcept

7.600.1 Detailed Description

This is a Standard C++ Library header.
This header declares the pmr (std::pmr) memory resources.

7.600.2 Function Documentation

get_default_resource()

```
memory_resource * std::pmr::get_default_resource ()  [noexcept]
```

Get the current default memory resource pointer.

null_memory_resource()

```
memory_resource * std::pmr::null_memory_resource ()  [nodiscard], [noexcept]
```

A pmr::memory_resource that always throws `bad_alloc`

set_default_resource()

```
memory_resource * std::pmr::set_default_resource (
            memory_resource * __r)  [noexcept]
```

Replace the default memory resource pointer.

7.606.1 Detailed Description

Parallel STL function calls corresponding to stl_numeric.h. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

7.610.1 Detailed Description

Parallel STL function calls corresponding to the stl_algo.h header.
The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

7.611 algobase.h File Reference

7.612.1 Detailed Description

Implementation of a dynamically load-balanced parallel quicksort.
It works in-place and needs only logarithmic extra memory. The algorithm is similar to the one proposed in

P. Tsigas and Y. Zhang. A simple, fast parallel implementation of quicksort and its performance evaluation on SUN enterprise 10000. In 11th Euromicro Conference on Parallel, Distributed and Network-Based Processing, page 372, 2003.
This file is a GNU parallel extension to the Standard C++ Library.

7.616.1 Detailed Description

Defines on options concerning debugging and performance, at compile-time. This file is a GNU parallel extension to the Standard C++ Library.

7.616.2 Macro Definition Documentation

_GLIBCXX_CALL

```
#define _GLIBCXX_CALL(
                __n)
```

Macro to produce log message when entering a function.

Parameters

_↩ _n	Input size.

See also

_GLIBCXX_VERBOSE_LEVEL

Referenced by __gnu_parallel::__find_template(), __gnu_parallel::__find_template(), __gnu_parallel::__find_template(), __gnu_parallel::__for_each_template_random_access_workstealing(), __gnu_parallel::__merge_advance(), __gnu_parallel::__parallel_n
__gnu_parallel::__parallel_partial_sum(), __gnu_parallel::__parallel_partition(), __gnu_parallel::__parallel_random_shuffle_drs(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort_qs()
__gnu_parallel::__parallel_sort_qsb(), __gnu_parallel::__parallel_unique_copy(), __gnu_parallel::__search_template(), __gnu_parallel::__sequential_multiway_merge(), __gnu_parallel::multiseq_partition(), __gnu_parallel::multiseq_selection(), __gnu_parallel::multiway_merge(), __gnu_parallel::multiway_merge_3_variant(), __gnu_parallel::multiway_merge_4_variant(), __gnu_parallel::multiway_merge_loser_tree(), __gnu_parallel::multiway_merge_loser_tree_sentinel(), __gnu_parallel::multiway_merge_lo
__gnu_parallel::multiway_merge_sentinels(), __gnu_parallel::parallel_multiway_merge(), and __gnu_parallel::parallel_sort_mwms().

_GLIBCXX_PARALLEL_ASSERTIONS

```
#define _GLIBCXX_PARALLEL_ASSERTIONS
```

Switch on many _GLIBCXX_PARALLEL_ASSERTions in parallel code. Should be switched on only locally.
Referenced by __gnu_parallel::__qsb_local_sort_with_helping().

_GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1

```
#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1
```

Switch on many _GLIBCXX_PARALLEL_ASSERTions in parallel code. Consider the size of the L1 cache for gnu_↩parallel::__parallel_random_shuffle().

_GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB

```
#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB
```

Switch on many _GLIBCXX_PARALLEL_ASSERTions in parallel code. Consider the size of the TLB for gnu_parallel↩::__parallel_random_shuffle().

_GLIBCXX_SCALE_DOWN_FPU

```
#define _GLIBCXX_SCALE_DOWN_FPU
```

Use floating-point scaling instead of modulo for mapping random numbers to a range. This can be faster on certain CPUs.

_GLIBCXX_VERBOSE_LEVEL

```
#define _GLIBCXX_VERBOSE_LEVEL
```

Determine verbosity level of the parallel mode. Level 1 prints a message each time a parallel-mode function is entered.

7.617.1 Detailed Description

This file is a GNU parallel extension to the Standard C++ Library.

7.618 features.h File Reference

Macros

- #define _GLIBCXX_BAL_QUICKSORT
- #define _GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS
- #define _GLIBCXX_FIND_EQUAL_SPLIT
- #define _GLIBCXX_FIND_GROWING_BLOCKS
- #define _GLIBCXX_MERGESORT
- #define _GLIBCXX_QUICKSORT
- #define _GLIBCXX_TREE_DYNAMIC_BALANCING
- #define _GLIBCXX_TREE_FULL_COPY
- #define _GLIBCXX_TREE_INITIAL_SPLITTING

7.618.1 Detailed Description

Defines on whether to include algorithm variants.
Less variants reduce executable size and compile time. This file is a GNU parallel extension to the Standard C++ Library.

7.618.2 Macro Definition Documentation

_GLIBCXX_BAL_QUICKSORT

```
#define _GLIBCXX_BAL_QUICKSORT
```

Include parallel dynamically load-balanced quicksort.

See also

__gnu_parallel::_Settings::sort_algorithm

_GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS

```
#define _GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS
```

Include the equal-sized blocks variant for std::find.

See also

__gnu_parallel::_Settings::find_algorithm

_GLIBCXX_FIND_EQUAL_SPLIT

```
#define _GLIBCXX_FIND_EQUAL_SPLIT
```

Include the equal splitting variant for std::find.

See also

__gnu_parallel::_Settings::find_algorithm

_GLIBCXX_FIND_GROWING_BLOCKS

```
#define _GLIBCXX_FIND_GROWING_BLOCKS
```

Include the growing blocks variant for std::find.

See also

__gnu_parallel::_Settings::find_algorithm

_GLIBCXX_MERGESORT

```
#define _GLIBCXX_MERGESORT
```

Include parallel multi-way mergesort.

See also

__gnu_parallel::_Settings::sort_algorithm

_GLIBCXX_QUICKSORT

```
#define _GLIBCXX_QUICKSORT
```

Include parallel unbalanced quicksort.

See also

__gnu_parallel::_Settings::sort_algorithm

_GLIBCXX_TREE_DYNAMIC_BALANCING

```
#define _GLIBCXX_TREE_DYNAMIC_BALANCING
```

Include the dynamic balancing variant for _Rb_tree::insert_unique(_IIter beg, _IIter __end).

See also

__gnu_parallel::_Rb_tree

_GLIBCXX_TREE_FULL_COPY

```
#define _GLIBCXX_TREE_FULL_COPY
```

In order to sort the input sequence of _Rb_tree::insert_unique(_IIter beg, _IIter __end) a full copy of the input elements is done.

See also

__gnu_parallel::_Rb_tree

_GLIBCXX_TREE_INITIAL_SPLITTING

```
#define _GLIBCXX_TREE_INITIAL_SPLITTING
```

Include the initial splitting variant for _Rb_tree::insert_unique(_IIter beg, _IIter __end).

See also

__gnu_parallel::_Rb_tree

7.628.1 Detailed Description

Implementation of sequential and parallel multiway merge.
Explanations on the high-speed merging routines in the appendix of
P. Sanders. Fast priority queues for cached memory. ACM Journal of Experimental Algorithmics, 5, 2000.
This file is a GNU parallel extension to the Standard C++ Library.

7.628.2 Macro Definition Documentation

_GLIBCXX_PARALLEL_LENGTH

```
#define _GLIBCXX_PARALLEL_LENGTH(
            __s)
```

Length of a sequence described by a pair of iterators.
Referenced by __gnu_parallel::__sequential_multiway_merge(), __gnu_parallel::multiway_merge_exact_splitting(), __gnu_parallel::multiway_merge_loser_tree(), __gnu_parallel::multiway_merge_sampling_splitting(), and __gnu_parallel::parallel_multiwa

7.642.1 Detailed Description

Parallel implementations of set operations for random-access iterators. This file is a GNU parallel extension to the Standard C++ Library.

7.643 settings.h File Reference

Classes

- struct __gnu_parallel::_Settings

Namespaces

- namespace __gnu_parallel

Macros

- #define _GLIBCXX_PARALLEL_CONDITION(__c)

7.643.1 Detailed Description

Runtime settings and tuning parameters, heuristics to decide whether to use parallelized algorithms.
This file is a GNU parallel extension to the Standard C++ Library.

7.643.2 Deciding whether to run an algorithm in parallel.

There are several ways the user can switch on and off the parallel execution of an algorithm, both at compile- and run-time.
Only sequential execution can be forced at compile-time. This reduces code size and protects code parts that have non-thread-safe side effects.
Ultimately, forcing parallel execution at compile-time makes sense. Often, the sequential algorithm implementation is used as a subroutine, so no reduction in code size can be achieved. Also, the machine the program is run on might have only one processor core, so to avoid overhead, the algorithm is executed sequentially.
To force sequential execution of an algorithm ultimately at compile-time, the user must add the tag gnu_parallel↩ ::sequential_tag() to the end of the parameter list, e. g.

```
std::sort(__v.begin(), __v.end(), __gnu_parallel::sequential_tag());
```

This is compatible with all overloaded algorithm variants. No additional code will be instantiated, at all. The same holds for most algorithm calls with iterators not providing random access.
If the algorithm call is not forced to be executed sequentially at compile-time, the decision is made at run-time. The global variable __gnu_parallel::_Settings::algorithm_strategy is checked. It is a tristate variable corresponding to:

- a. force_sequential, meaning the sequential algorithm is executed.
- b. force_parallel, meaning the parallel algorithm is executed.
- c. heuristic

For heuristic, the parallel algorithm implementation is called only if the input size is sufficiently large. For most algorithms, the input size is the (combined) length of the input sequence(__s). The threshold can be set by the user, individually for each algorithm. The according variables are called gnu_parallel::_Settings::[algorithm]_minimal_n .
For some of the algorithms, there are even more tuning options, e. g. the ability to choose from multiple algorithm variants. See below for details.

7.643.3 Macro Definition Documentation

_GLIBCXX_PARALLEL_CONDITION

```
#define _GLIBCXX_PARALLEL_CONDITION(
            __c)
```

Determine at compile(?)-time if the parallel variant of an algorithm should be called.

Parameters

_↩ _c	A condition that is convertible to bool that is overruled by __gnu_parallel::_Settings::algorithm_strategy. Usually a decision based on the input size.

7.693.1 Detailed Description

This is a TS C++ Library header.
This header defines variable templates for the C++14 type traits.
Equivalent variable templates are defined in namespace `std` since C++17.

7.732.1 Detailed Description

The header provides an interface to the C++ ABI.

7.732.2 Function Documentation

__cxa_demangle()

```
char * __cxxabiv1::__cxa_demangle (
            const char * __mangled_name,
            char * __output_buffer,
            size_t * __length,
            int * __status)
```

Demangling routine. ABI-mandated entry point in the C++ runtime library for demangling.

Parameters

__mangled_name	A NUL-terminated character string containing the name to be demangled.
__output_buffer	A region of memory, allocated with malloc, of ∗*__length* bytes, into which the demangled name is stored. If *__output_buffer* is not long enough, it is expanded using realloc. *__output_buffer* may instead be null; in that case, the demangled name is placed in a region of memory allocated with malloc.

Parameters

__length	If *__length* is non-null, the length of the buffer containing the demangled name is placed in ∗*__length*.
__status	If *__status* is non-null, ∗*__status* is set to one of the following values: 0: The demangling operation succeeded. -1: A memory allocation failure occurred. -2: *mangled_name* is not a valid name under the C++ ABI mangling rules. -3: One of the arguments is invalid.

Returns

A pointer to the start of the NUL-terminated demangled name, or a null pointer if the demangling fails. The caller is responsible for deallocating this memory using `free`.

The demangling is performed using the C++ ABI mangling rules, with GNU extensions. For example, this function is used in __gnu_cxx::__verbose_terminate_handler.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/ext_demangling.html for other examples of use.

Note

The same demangling functionality is available via libiberty (`<libiberty/demangle.h>` and `libiberty.a`) in GCC 3.1 and later, but that requires explicit installation (`-enable-install-libiberty`) and uses a different API, although the ABI is unchanged.

7.735.1 Detailed Description

This is a Standard C++ Library header.
The header `new` defines several functions to manage dynamic memory and handling memory allocation errors; see `https://gcc.gnu.org/onlinedocs/libstdc++/manual/dynamic_memory.html` for more.

7.735.2 Function Documentation

operator new()

```
void * operator new (
            std::size_t )  [nodiscard]
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.
