### 6.256.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

### 6.256.2 Macro Definition Documentation

#### **`__glibcxx_check_erase`**

```
#define __glibcxx_check_erase(  
    _Position)
```

Verify that we can erase the element referenced by the iterator `_Position`. We can erase the element if the `_Position` iterator is dereferenceable and references this sequence.

#### **`__glibcxx_check_erase_after`**

```
#define __glibcxx_check_erase_after(  
    _Position)
```

Verify that we can erase the element after the iterator `_Position`. We can erase the element if the `_Position` iterator is before a dereferenceable one and references this sequence.

#### **`__glibcxx_check_erase_range`**

```
#define __glibcxx_check_erase_range(  
    _First,  
    _Last)
```

Verify that we can erase the elements in the iterator range `[_First, _Last)`. We can erase the elements if `[_First, _Last)` is a valid iterator range within this sequence.

#### **`__glibcxx_check_erase_range_after`**

```
#define __glibcxx_check_erase_range_after(  
    _First,  
    _Last)
```

Verify that we can erase the elements in the iterator range `(_First, _Last)`. We can erase the elements if `(_First, _Last)` is a valid iterator range within this sequence.

#### **`__glibcxx_check_heap_pred`**

```
#define __glibcxx_check_heap_pred(  
    _First,  
    _Last,  
    _Pred)
```

Verify that the iterator range `[_First, _Last)` is a heap w.r.t. the predicate `_Pred`.

#### **`__glibcxx_check_insert`**

```
#define __glibcxx_check_insert(  
    _Position)
```

Verify that we can insert into `*this` with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular, either dereferenceable or past-the-end, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

#### **`__glibcxx_check_insert_after`**

```
#define __glibcxx_check_insert_after(  
    _Position)
```

Verify that we can insert into *\*this* after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular, either dereferenceable or before-begin, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_↔` iterator.

### **`__glibcxx_check_insert_range`**

```
#define __glibcxx_check_insert_range(
    _Position,
    _First,
    _Last,
    _Dist)
```

Verify that we can insert the values in the iterator range `[_First, _Last)` into *\*this* with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

### **`__glibcxx_check_insert_range_after`**

```
#define __glibcxx_check_insert_range_after(
    _Position,
    _First,
    _Last,
    _Dist)
```

Verify that we can insert the values in the iterator range `[_First, _Last)` into *\*this* after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

### **`__glibcxx_check_partitioned_lower`**

```
#define __glibcxx_check_partitioned_lower(
    _First,
    _Last,
    _Value)
```

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value`.

### **`__glibcxx_check_partitioned_lower_pred`**

```
#define __glibcxx_check_partitioned_lower_pred(
    _First,
    _Last,
    _Value,
    _Pred)
```

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

### **`__glibcxx_check_partitioned_upper_pred`**

```
#define __glibcxx_check_partitioned_upper_pred(
    _First,
    _Last,
    _Value,
    _Pred)
```

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

### `__glibcxx_check_sorted_pred`

```
#define __glibcxx_check_sorted_pred(
    _First,
    _Last,
    _Pred)
```

Verify that the iterator range `[_First, _Last)` is sorted by the predicate `_Pred`.

### `_GLIBCXX_DEBUG_VERIFY_AT_F`

```
#define _GLIBCXX_DEBUG_VERIFY_AT_F(
    _Cond,
    _ErrMsg,
    _File,
    _Line,
    _Func)
```

Macros used by the implementation to verify certain properties. These macros may only be used directly by the debug wrappers. Note that these are macros (instead of the more obviously *correct* choice of making them functions) because we need line and file information at the call site, to minimize the distance between the user error and where the error is reported.

### 6.536.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Author

Bob Walters

Provides reusable `_Pointer_adapter` for assisting in the development of custom pointer types that can be used with the standard containers via the `allocator::pointer` and `allocator::const_pointer` typedefs.

### 6.547.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Contains two exception-generating types (`throw_value`, `throw_allocator`) intended to be used as value and allocator types while testing exception safety in templated containers and algorithms. The allocator has additional log and debug features. The exception generated is of type `forced_exception_error`.

### 6.572.1 Detailed Description

This is a Standard C++ Library header.

## 6.573 iostream File Reference

### Namespaces

- namespace `std`

### Macros

- #define `_GLIBCXX_IOSTREAM`

### Variables

- static `ios_base::Init` `std::__ioinit`

### Standard Stream Objects

The `<iostream>` header declares the eight standard stream objects. For other declarations, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/io.html> and the *I/O forward declarations*

They are required by default to cooperate with the global C library's `FILE` streams, and to be available during program startup and termination. For more information, see the section of the manual linked to above.

- `ostream` `std::cerr`
- `istream` `std::cin`
- `ostream` `std::clog`
- `ostream` `std::cout`
- `wostream` `std::wcerr`
- `wistream` `std::wcin`
- `wostream` `std::wclog`
- `wostream` `std::wcout`

### 6.587.1 Detailed Description

This is a Standard C++ Library header.

### 6.587.2 Function Documentation

#### abs()

```
template<typename _Tp>
_Tp std::abs (
    const complex< _Tp > & __z) [inline]
```

Return magnitude of z.

**cos()**

```
template<typename _Tp>
complex< _Tp > std::cos (
    const complex< _Tp > & __z) [inline]
```

Return complex cosine of  $z$ .

**cosh()**

```
template<typename _Tp>
complex< _Tp > std::cosh (
    const complex< _Tp > & __z) [inline]
```

Return complex hyperbolic cosine of  $z$ .

**exp()**

```
template<typename _Tp>
complex< _Tp > std::exp (
    const complex< _Tp > & __z) [inline]
```

Return complex base  $e$  exponential of  $z$ .

**fabs()**

```
template<typename _Tp>
_Tp std::fabs (
    const std::complex< _Tp > & __z) [inline]
fabs(__z) TR1 8.1.8 [tr.c99.cmplx.fabs]
```

**log()**

```
template<typename _Tp>
complex< _Tp > std::log (
    const complex< _Tp > & __z) [inline]
```

Return complex natural logarithm of  $z$ .

**log10()**

```
template<typename _Tp>
complex< _Tp > std::log10 (
    const complex< _Tp > & __z) [inline]
```

Return complex base 10 logarithm of  $z$ .

**pow()**

```
template<typename _Tp>
complex< _Tp > std::pow (
    const complex< _Tp > & __z,
    int __n) [inline]
```

Return  $x$  to the  $y$ 'th power.

**sin()**

```
template<typename _Tp>
complex< _Tp > std::sin (
    const complex< _Tp > & __z) [inline]
```

Return complex sine of  $z$ .

**sinh()**

```
template<typename _Tp>
complex< _Tp > std::sinh (
    const complex< _Tp > & __z) [inline]
```

Return complex hyperbolic sine of z.

**sqrt()**

```
template<typename _Tp>
complex< _Tp > std::sqrt (
    const complex< _Tp > & __z) [inline]
```

Return complex square root of z.

**tan()**

```
template<typename _Tp>
complex< _Tp > std::tan (
    const complex< _Tp > & __z) [inline]
```

Return complex tangent of z.

**tanh()**

```
template<typename _Tp>
complex< _Tp > std::tanh (
    const complex< _Tp > & __z) [inline]
```

Return complex hyperbolic tangent of z.

### 6.593.2 Function Documentation

#### get\_default\_resource()

```
memory_resource * std::pmr::get_default_resource () [noexcept]
```

Get the current default memory resource pointer.

#### null\_memory\_resource()

```
memory_resource * std::pmr::null_memory_resource () [nodiscard], [noexcept]
```

A `pmr::memory_resource` that always throws `bad_alloc`

**set\_default\_resource()**

```
memory_resource * std::pmr::set_default_resource (
    memory_resource * __r) [noexcept]
```

Replace the default memory resource pointer.

### 6.599.1 Detailed Description

Parallel STL function calls corresponding to `stl_numeric.h`. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

### 6.603.1 Detailed Description

Parallel STL function calls corresponding to the `std::algo.h` header.

The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

### 6.604.1 Detailed Description

Parallel STL function calls corresponding to the `stl_algobase.h` header. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

### 6.605.1 Detailed Description

Implementation of a dynamically load-balanced parallel quicksort.

It works in-place and needs only logarithmic extra memory. The algorithm is similar to the one proposed in P. Tsigas and Y. Zhang. A simple, fast parallel implementation of quicksort and its performance evaluation on SUN enterprise 10000. In 11th Euromicro Conference on Parallel, Distributed and Network-Based Processing, page 372, 2003.

This file is a GNU parallel extension to the Standard C++ Library.

## `_GLIBCXX_SCALE_DOWN_FPU`

```
#define _GLIBCXX_SCALE_DOWN_FPU
```

Use floating-point scaling instead of modulo for mapping random numbers to a range. This can be faster on certain CPUs.

## `_GLIBCXX_VERBOSE_LEVEL`

```
#define _GLIBCXX_VERBOSE_LEVEL
```

Determine verbosity level of the parallel mode. Level 1 prints a message each time a parallel-mode function is entered.

### 6.621.1 Detailed Description

Implementation of sequential and parallel multiway merge.

Explanations on the high-speed merging routines in the appendix of

P. Sanders. Fast priority queues for cached memory. ACM Journal of Experimental Algorithmics, 5, 2000.

This file is a GNU parallel extension to the Standard C++ Library.

### 6.621.2 Macro Definition Documentation

#### `_GLIBCXX_PARALLEL_LENGTH`

```
#define _GLIBCXX_PARALLEL_LENGTH(  
    __s)
```

Length of a sequence described by a pair of iterators.

### 6.636.1 Detailed Description

Runtime settings and tuning parameters, heuristics to decide whether to use parallelized algorithms. This file is a GNU parallel extension to the Standard C++ Library.

### 6.636.2 Deciding whether to run an algorithm in parallel.

There are several ways the user can switch on and off the parallel execution of an algorithm, both at compile- and run-time.

Only sequential execution can be forced at compile-time. This reduces code size and protects code parts that have non-thread-safe side effects.

Ultimately, forcing parallel execution at compile-time makes sense. Often, the sequential algorithm implementation is used as a subroutine, so no reduction in code size can be achieved. Also, the machine the program is run on might have only one processor core, so to avoid overhead, the algorithm is executed sequentially.

To force sequential execution of an algorithm ultimately at compile-time, the user must add the tag `gnu_parallel::sequential_tag()` to the end of the parameter list, e. g.

```
std::sort(__v.begin(), __v.end(), __gnu_parallel::sequential_tag());
```

This is compatible with all overloaded algorithm variants. No additional code will be instantiated, at all. The same holds for most algorithm calls with iterators not providing random access.

If the algorithm call is not forced to be executed sequentially at compile-time, the decision is made at run-time. The global variable `__gnu_parallel::_Settings::algorithm_strategy` is checked. It is a tristate variable corresponding to:

- a. `force_sequential`, meaning the sequential algorithm is executed.
- b. `force_parallel`, meaning the parallel algorithm is executed.
- c. `heuristic`

For heuristic, the parallel algorithm implementation is called only if the input size is sufficiently large. For most algorithms, the input size is the (combined) length of the input sequence(`__s`). The threshold can be set by the user, individually for each algorithm. The according variables are called `gnu_parallel::_Settings::[algorithm]_minimal_n`.

For some of the algorithms, there are even more tuning options, e. g. the ability to choose from multiple algorithm variants. See below for details.

### 6.636.3 Macro Definition Documentation

#### `_GLIBCXX_PARALLEL_CONDITION`

```
#define _GLIBCXX_PARALLEL_CONDITION(  
    __c)
```

Determine at compile(?)-time if the parallel variant of an algorithm should be called.

#### Parameters

|                  |                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------|
| <code>__c</code> | A condition that is convertible to bool that is overruled by <code>__gnu_parallel::_Settings::algorithm_strategy</code> . |
| <code>__c</code> | Usually a decision based on the input size.                                                                               |

### 6.686.1 Detailed Description

This is a TS C++ Library header.

This header defines variable templates for the C++14 type traits.

Equivalent variable templates are defined in namespace `std` since C++17.

### 6.725.1 Detailed Description

The header provides an interface to the C++ ABI.

### 6.725.2 Function Documentation

#### **\_\_cxa\_demangle()**

```
char * __cxxabiv1::__cxa_demangle (
    const char * __mangled_name,
    char * __output_buffer,
    size_t * __length,
    int * __status)
```

Demangling routine. ABI-mandated entry point in the C++ runtime library for demangling.

#### Parameters

<b>__mangled_name</b>	A NUL-terminated character string containing the name to be demangled.
<b>__output_buffer</b>	A region of memory, allocated with malloc, of * <b>__length</b> bytes, into which the demangled name is stored. If <b>__output_buffer</b> is not long enough, it is expanded using realloc. <b>__output_buffer</b> may instead be null; in that case, the demangled name is placed in a region of memory allocated with malloc.

## Parameters

<code>__length</code>	If <code>__length</code> is non-null, the length of the buffer containing the demangled name is placed in <code>*__length</code> .
<code>__status</code>	If <code>__status</code> is non-null, <code>*__status</code> is set to one of the following values: 0: The demangling operation succeeded. -1: A memory allocation failure occurred. -2: <i>mangled_name</i> is not a valid name under the C++ ABI mangling rules. -3: One of the arguments is invalid.

## Returns

A pointer to the start of the NUL-terminated demangled name, or a null pointer if the demangling fails. The caller is responsible for deallocating this memory using `free`.

The demangling is performed using the C++ ABI mangling rules, with GNU extensions. For example, this function is used in `__gnu_cxx::__verbose_terminate_handler`.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/ext\\_demangling.html](https://gcc.gnu.org/onlinedocs/libstdc++/manual/ext_demangling.html) for other examples of use.

## Note

The same demangling functionality is available via `libiberty` (`<libiberty/demangle.h>` and `libiberty.h`) in GCC 3.1 and later, but that requires explicit installation (`-enable-install-libiberty`) and uses a different API, although the ABI is unchanged.

### 6.728.1 Detailed Description

This is a Standard C++ Library header.

The header `new` defines several functions to manage dynamic memory and handling memory allocation errors; see [https://gcc.gnu.org/onlinedocs/libstdc++/manual/dynamic\\_memory.html](https://gcc.gnu.org/onlinedocs/libstdc++/manual/dynamic_memory.html) for more.

### 6.728.2 Function Documentation

#### **operator new()**

```
void * operator new (
    std::size_t ) [nodiscard]
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.
