Referenced by `std::basic_filebuf<_CharT, _Traits>::open()`.

**badbit**

```
const iostate std::ios_base::badbit [static], [inherited]
```

Indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file).

Referenced by `std::basic_istream<_CharT, _Traits>::sentry::sentry()`, `std::basic_ostream<_CharT, _Traits>::sentry::~~sentry()`, `std::basic_ios<_CharT, _Traits>::clear()`, `std::basic_ostream<_CharT, _Traits>::flush()`, `std::basic_iostream<char_type, traits_type>::flush()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_iostream<char_type, traits_type>::get()`, `std::basic_ostream<_CharT, _Traits>::operator<<()`, `std::basic_istream<_CharT, _Traits>::operator>>()`, `std::operator>>()`, `std::basic_ostream<_CharT, _Traits>::put()`, `std::basic_istream<_CharT, _Traits>::putback()`, `std::basic_istream<_CharT, _Traits>::read()`, `std::basic_istream<_CharT, char_traits<_CharT>>::read()`, `std::basic_istream<_CharT, _Traits>::readsome()`, `std::basic_istream<_CharT, _Traits>::seekg()`, `std::basic_istream<_CharT, _Traits>::seekg()`, `std::basic_istream<_CharT, _Traits>::seekg()`, `std::basic_istream<_CharT, _Traits>::tellg()`, `std::basic_istream<_CharT, _Traits>::unget()`, and `std::ws()`.

**basefield**

```
const fmtflags std::ios_base::basefield [static], [inherited]
```

A mask of dec|oct|hex. Useful for the 2-arg form of `setf`.

Referenced by `std::dec()`, `std::num_get<_CharT, _Inlter>::do_get()`, `std::num_put<_CharT, _Outlter>::do_put()`, `std::hex()`, and `std::oct()`.

**beg**

```
const seekdir std::ios_base::beg [static], [inherited]
```

Request a seek relative to the beginning of the stream.

Referenced by `std::basic_filebuf<_CharT, _Traits>::seekpos()`.

**binary**

```
const openmode std::ios_base::binary [static], [inherited]
```

Perform input and output in binary mode (as opposed to text mode). This is probably not what you think it is; see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/fstreams.html#std.io.filestreams.binary>.

Referenced by `std::basic_filebuf<_CharT, _Traits>::showmanyc()`.

**boolalpha**

```
const fmtflags std::ios_base::boolalpha [static], [inherited]
```

Insert/extract `bool` in alphabetic rather than numeric format.

Referenced by [std::boolalpha\(\)](#), [std::num\\_get< \\_CharT, \\_InIter >::do\\_get\(\)](#), [std::num\\_put< \\_CharT, \\_OutIter >::do\\_put\(\)](#), and [std::noboolalpha\(\)](#).

**cur**

```
const seekdir std::ios_base::cur [static], [inherited]
```

Request a seek relative to the current position within the sequence.

Referenced by [std::basic\\_filebuf< \\_CharT, \\_Traits >::imbue\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::overflow\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::pbackfail\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::seekoff\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, std::basic\\_istream< \\_CharT, \\_Traits >::tellg\(\)](#), and [std::basic\\_ostream< \\_CharT, \\_Traits >::tellp\(\)](#).

**dec**

```
const fmtflags std::ios_base::dec [static], [inherited]
```

Converts integer input or generates integer output in decimal base.

Referenced by [std::dec\(\)](#).

**end**

```
const seekdir std::ios_base::end [static], [inherited]
```

Request a seek relative to the current end of the sequence.

Referenced by [std::basic\\_filebuf< \\_CharT, \\_Traits >::open\(\)](#), and [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::seekoff\(\)](#).

**eofbit**

```
const iostate std::ios_base::eofbit [static], [inherited]
```

Indicates that an input operation reached the end of an input sequence.

Referenced by [std::num\\_get< \\_CharT, \\_InIter >::do\\_get\(\)](#), [std::num\\_get< \\_CharT, \\_InIter >::do\\_get\(\)](#), [std::num\\_get< \\_CharT, \\_InIter >::do\\_get\(\)](#), [std::time\\_get< \\_CharT, \\_InIter >::do\\_get\\_date\(\)](#), [std::time\\_get< \\_CharT, \\_InIter >::do\\_get\\_monthname\(\)](#), [std::time\\_get< \\_CharT, \\_InIter >::do\\_get\\_time\(\)](#), [std::time\\_get< \\_CharT, \\_InIter >::do\\_get\\_year\(\)](#), [std::basic\\_istream< \\_CharT, \\_Traits >::get\(\)](#), [std::basic\\_istream< \\_CharT, \\_Traits >::get\(\)](#), [std::time\\_get< \\_CharT, \\_InIter >::get\(\)](#), [std::basic\\_istream< \\_CharT, \\_Traits >::ignore\(\)](#), [std::basic\\_istream< \\_CharT, \\_Traits >::operator>>\(\)](#), [std::basic\\_istream< \\_CharT, char\\_traits< \\_CharT > >::peek\(\)](#), [std::basic\\_istream< \\_CharT, \\_Traits >::putback\(\)](#), [std::basic\\_istream< \\_CharT, \\_Traits >::read\(\)](#), [std::basic\\_istream< \\_CharT, \\_Traits >::readsome\(\)](#), [std::basic\\_istream< \\_CharT, \\_Traits >::seekg\(\)](#), [std::basic\\_istream< \\_CharT, char\\_traits< \\_CharT > >::seekg\(\)](#), [std::basic\\_istream< \\_CharT, \\_Traits >::unget\(\)](#), [std::basic\\_istream< \\_CharT, char\\_traits< \\_CharT > >::unget\(\)](#), and [std::ws\(\)](#).

**failbit**

```
const iostate std::ios_base::failbit [static], [inherited]
```

Indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.

Referenced by [std::basic\\_ostream< \\_CharT, \\_Traits >::sentry::sentry\(\)](#), [std::basic\\_fstream< char >::close\(\)](#), [std::basic\\_ifstream< char >::close\(\)](#), [std::basic\\_ofstream< char >::close\(\)](#), [std::num\\_get< \\_CharT, \\_InIter >::do\\_get\(\)](#), [std::time\\_get< \\_CharT, \\_InIter >::do\\_get\\_monthname\(\)](#), [std::time\\_get< \\_CharT, \\_InIter >::do\\_get\\_weekday\(\)](#), [std::time\\_get< \\_CharT, \\_InIter >::do\\_get\\_year\(\)](#), [std::basic\\_istream< \\_CharT, \\_Traits >::get\(\)](#), [std::time\\_get< \\_CharT, \\_InIter >::get\(\)](#), [std::basic\\_fstream< char >::open\(\)](#), [std::basic\\_fstream< char >::open\(\)](#), [std::basic\\_ifstream< char >::open\(\)](#), [std::basic\\_ofstream< char >::open\(\)](#), [std::basic\\_ofstream< char >::open\(\)](#), [std::operator<<\(\)](#), [std::basic\\_istream< char\\_type, traits\\_type >::operator>>\(\)](#), [std::basic\\_istream< \\_CharT, \\_Traits >::operator>>\(\)](#), [std::operator>>\(\)](#), [std::operator>>\(\)](#), [std::basic\\_istream< \\_CharT, \\_Traits >::read\(\)](#), [std::basic\\_istream< \\_CharT, \\_Traits >::seekg\(\)](#), [std::basic\\_istream< \\_CharT, \\_Traits >::seekp\(\)](#), and [std::basic\\_ostream< \\_CharT, \\_Traits >::seekp\(\)](#).

**fixed**

```
const fmtflags std::ios_base::fixed [static], [inherited]
```

Generate floating-point output in fixed-point notation.

Referenced by [std::fixed\(\)](#), and [std::hexfloat\(\)](#).

**floatfield**

```
const fmtflags std::ios_base::floatfield [static], [inherited]
```

A mask of scientific|fixed. Useful for the 2-arg form of setf.

Referenced by [std::defaultfloat\(\)](#), [std::fixed\(\)](#), [std::hexfloat\(\)](#), and [std::scientific\(\)](#).

**goodbit**

```
const iostate std::ios_base::goodbit [static], [inherited]
```

Indicates all is well.

Referenced by [std::basic\\_istream<\\_CharT, \\_Traits>::sentry::sentry\(\)](#), [std::num\\_get<\\_CharT, \\_InIter>::do\\_get\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::do\\_get\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::do\\_get\\_monthname\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::do\\_get\\_year\(\)](#), [std::basic\\_ostream<\\_CharT, \\_Traits>::flush\(\)](#), [std::basic\\_iostream<char\\_type, traits\\_type>::get\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::get\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::get\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::get\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::get\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::ignore\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::ignore\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::ignore\(\)](#), [std::basic\\_iostream<char\\_type, traits\\_type>::operator<<\(\)](#), [std::basic\\_iostream<char\\_type, traits\\_type>::operator>>\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::operator>>\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::operator>>\(\)](#), [std::operator>>\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::peek\(\)](#), [std::basic\\_ostream<\\_CharT, \\_Traits>::put\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::put\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::read\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::readsomewhat\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::seekg\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::sync\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::unget\(\)](#), and [std::ws\(\)](#).

**hex**

```
const fmtflags std::ios_base::hex [static], [inherited]
```

Converts integer input or generates integer output in hexadecimal base.

Referenced by [std::num\\_get<\\_CharT, \\_InIter>::do\\_get\(\)](#), [std::num\\_put<\\_CharT, \\_OutIter>::do\\_put\(\)](#), and [std::hex\(\)](#).

**in**

```
const openmode std::ios_base::in [static], [inherited]
```

Open for input. Default for ifstream and fstream.

Referenced by [std::basic\\_fstream<char>::basic\\_fstream\(\)](#), [std::basic\\_fstream<char>::basic\\_fstream\(\)](#), [std::basic\\_fstream<char>::open\(\)](#), [std::basic\\_ifstream<char>::basic\\_ifstream\(\)](#), [std::basic\\_ifstream<char>::basic\\_ifstream\(\)](#), [std::basic\\_ifstream<char>::basic\\_ifstream\(\)](#), [std::basic\\_ifstream<char>::open\(\)](#), [std::basic\\_istream<char>::basic\\_istream\(\)](#), [std::basic\\_stringbuf<char>::basic\\_stringbuf\(\)](#), [std::basic\\_stringstream<char>::basic\\_stringstream\(\)](#), [std::basic\\_filebuf<char\\_type, traits\\_type>::M\\_set\\_buffer\(\)](#), [std::basic\\_fstream<char>::open\(\)](#), [std::basic\\_fstream<char>::open\(\)](#), [std::basic\\_fstream<char>::open\(\)](#), [std::basic\\_ifstream<char>::open\(\)](#), [std::basic\\_ifstream<char>::open\(\)](#), [std::basic\\_ifstream<char>::open\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::overflow\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::pubseekoff\(\)](#), [std::basic\\_streambuf<char\\_type, traits\\_type>::pubseekoff\(\)](#), [std::basic\\_streambuf<char\\_type, traits\\_type>::pubseekpos\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::seekg\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::seekg\(\)](#), [std::basic\\_streambuf<char\\_type, traits\\_type>::seekoff\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::seekoff\(\)](#), [std::basic\\_stringbuf<char>::seekoff\(\)](#), [std::basic\\_streambuf<char\\_type, traits\\_type>::seekpos\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::seekpos\(\)](#), [std::basic\\_stringbuf<char>::seekpos\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::showmanyc\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::tellg\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::underflow\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::underflow\(\)](#), and [std::basic\\_filebuf<\\_CharT, \\_Traits>::xsgetn\(\)](#).

**internal**

```
const fmtflags std::ios_base::internal [static], [inherited]
```

**showpos**

const `fmtflags` `std::ios_base::showpos` [static], [inherited]

Generates a + sign in non-negative generated numeric output.

Referenced by `std::noshowpos()`, and `std::showpos()`.

**skipws**

const `fmtflags` `std::ios_base::skipws` [static], [inherited]

Skips leading white space before certain input operations.

Referenced by `std::noskipws()`, `std::__detail::operator>>()`, and `std::skipws()`.

**trunc**

const `openmode` `std::ios_base::trunc` [static], [inherited]

Truncate an existing stream when opening. Default for `ofstream`.

**unitbuf**

const `fmtflags` `std::ios_base::unitbuf` [static], [inherited]

Flushes output after each output operation.

Referenced by `std::basic_ostream<_CharT, _Traits>::sentry::~~sentry()`, `std::noinitbuf()`, and `std::unitbuf()`.

**uppercase**

const `fmtflags` `std::ios_base::uppercase` [static], [inherited]

Replaces certain lowercase letters with their uppercase equivalents in generated output.

Referenced by `std::num_put<_CharT, _OutIter>::do_put()`, `std::nouppercase()`, and `std::uppercase()`.

The documentation for this class was generated from the following files:

- `iosfwd`
- `sstream`

## Friends

- `bool operator== (const bernoulli_distribution &__d1, const bernoulli_distribution &__d2)`

### 6.239.1 Detailed Description

A Bernoulli random number distribution.

Generates a sequence of true and false values with likelihood  $p$  that true will come up and  $(1 - p)$  that false will appear.

Since

C++11

### 6.239.2 Member Typedef Documentation

#### result\_type

```
typedef bool std::bernoulli_distribution::result_type
```

The type of the range of the distribution.

### 6.239.3 Constructor & Destructor Documentation

#### bernoulli\_distribution() [1/2]

```
std::bernoulli_distribution::bernoulli_distribution () [inline]
```

Constructs a Bernoulli distribution with likelihood 0.5.

References [bernoulli\\_distribution\(\)](#).

Referenced by [bernoulli\\_distribution\(\)](#), and [operator==](#).

#### bernoulli\_distribution() [2/2]

```
std::bernoulli_distribution::bernoulli_distribution (
    double __p) [inline], [explicit]
```

Constructs a Bernoulli distribution with likelihood  $p$ .

#### Parameters

|                  |                                                                                         |
|------------------|-----------------------------------------------------------------------------------------|
| <code>__p</code> | [IN] The likelihood of a true result being returned. Must be in the interval $[0, 1]$ . |
|------------------|-----------------------------------------------------------------------------------------|

#### 6.239.4 Member Function Documentation

##### max()

```
result_type std::bernoulli_distribution::max () const [inline]
```

Returns the least upper bound value of the distribution.

References [std::numeric\\_limits<\\_Tp>::max\(\)](#).

##### min()

```
result_type std::bernoulli_distribution::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

References [std::numeric\\_limits<\\_Tp>::min\(\)](#).

##### operator>()()

```
template<typename _UniformRandomNumberGenerator>
result_type std::bernoulli_distribution::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

References [operator>\(\)\(\)](#).

Referenced by [operator>\(\)\(\)](#).

##### p()

```
double std::bernoulli_distribution::p () const [inline]
```

Returns the `p` parameter of the distribution.

##### param() [1/2]

```
param_type std::bernoulli_distribution::param () const [inline]
```

Returns the parameter set of the distribution.

Referenced by [std::operator>>\(\)](#).

##### param() [2/2]

```
void std::bernoulli_distribution::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

##### Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

##### reset()

```
void std::bernoulli_distribution::reset () [inline]
```

Resets the distribution state.

Does nothing for a Bernoulli distribution.

### 6.239.5 Friends And Related Symbol Documentation

#### operator==

```
bool operator== (
    const bernoulli\_distribution & __d1,
    const bernoulli\_distribution & __d2) [friend]
```

Return true if two Bernoulli distributions have the same parameters.

References [bernoulli\\_distribution\(\)](#).

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

### 6.240 std::bidirectional\_iterator\_tag Struct Reference

```
#include <stl_iterator_base_types.h>
```

Inheritance diagram for std::bidirectional\_iterator\_tag:

#### 6.240.1 Detailed Description

Bidirectional iterators support a superset of forward iterator operations.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

#### 6.242.1 Detailed Description

`template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>`

`class __gnu_pbds::detail::bin_search_tree_const_node_it_< Node, Const_Iterator, Iterator, _Alloc >`

Const node iterator.

## 6.242.2 Member Typedef Documentation

### const\_reference

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
typedef Const_Iterator \_\_gnu\_pbds::detail::bin\_search\_tree\_const\_node\_it\_< Node, Const_Iterator,
Iterator, _Alloc >::const_reference
```

Iterator's `__const` reference type.

### difference\_type

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
typedef trivial\_iterator\_difference\_type \_\_gnu\_pbds::detail::bin\_search\_tree\_const\_node\_it\_<
Node, Const_Iterator, Iterator, _Alloc >::difference_type
```

Difference type.

### iterator\_category

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
typedef trivial\_iterator\_tag \_\_gnu\_pbds::detail::bin\_search\_tree\_const\_node\_it\_< Node, Const_↵
Iterator, Iterator, _Alloc >::iterator_category
```

Category.

### metadata\_const\_reference

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
typedef rebind\_traits<_Alloc,metadata\_type>::const_reference \_\_gnu\_pbds::detail::bin\_search\_tree\_const\_node\_it\_<
Node, Const_Iterator, Iterator, _Alloc >::metadata_const_reference
```

Const metadata reference type.

### metadata\_type

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
typedef Node::metadata_type \_\_gnu\_pbds::detail::bin\_search\_tree\_const\_node\_it\_< Node, Const_↵
Iterator, Iterator, _Alloc >::metadata_type
```

Metadata type.

### reference

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
typedef Const_Iterator \_\_gnu\_pbds::detail::bin\_search\_tree\_const\_node\_it\_< Node, Const_Iterator,
Iterator, _Alloc >::reference
```

Iterator's reference type.

### value\_type

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
typedef Const_Iterator \_\_gnu\_pbds::detail::bin\_search\_tree\_const\_node\_it\_< Node, Const_Iterator,
Iterator, _Alloc >::value_type
```

Iterator's value type.

## 6.242.3 Member Function Documentation

### get\_l\_child()

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
```

```
bin_search_tree_const_node_it_< Node, Const_Iterator, Iterator, _Alloc > __gnu_pbds::detail::bin_search_tree_const_node_it_< Node, Const_Iterator, Iterator, _Alloc >::get_l_child () const [inline]
Returns the __const node iterator associated with the left node.
```

### `get_metadata()`

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
constexpr const_reference __gnu_pbds::detail::bin_search_tree_const_node_it_< Node, Const_Iterator, Iterator, _Alloc >::get_metadata () const [inline]
Metadata access.
```

### `get_r_child()`

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
constexpr const_bin_search_tree_const_node_it_< Node, Const_Iterator, Iterator, _Alloc > __gnu_pbds::detail::bin_search_tree_const_node_it_< Node, Const_Iterator, Iterator, _Alloc >::get_r_child () const [inline]
Returns the __const node iterator associated with the right node.
```

### `operator!=()`

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
bool __gnu_pbds::detail::bin_search_tree_const_node_it_< Node, Const_Iterator, Iterator, _Alloc >::operator!= (
    const bin_search_tree_const_node_it_< Node, Const_Iterator, Iterator, _Alloc > &
    other) const [inline]
Compares (negatively) to a different iterator object.
```

### `operator*()`

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
constexpr const_reference __gnu_pbds::detail::bin_search_tree_const_node_it_< Node, Const_Iterator, Iterator, _Alloc >::operator* () const [inline]
Access.
```

### `operator==()`

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
bool __gnu_pbds::detail::bin_search_tree_const_node_it_< Node, Const_Iterator, Iterator, _Alloc >::operator== (
    const bin_search_tree_const_node_it_< Node, Const_Iterator, Iterator, _Alloc > &
    other) const [inline]
Compares to a different iterator object.
```

The documentation for this class was generated from the following file:

- [bin\\_search\\_tree\\_/node\\_iterators.hpp](#)

## 6.243 `__gnu_pbds::detail::bin_search_tree_it_< Node_Pointer, Value_Type, Pointer, Const_Pointer, Reference, Const_Reference, Is_Forward_Iterator, _Alloc >` Class Template Reference

```
#include <point_iterators.hpp>
```

Inheritance diagram for `__gnu_pbds::detail::bin_search_tree_it_< Node_Pointer, Value_Type, Pointer, Const_Pointer, Reference, Const_Reference, Is_Forward_Iterator, _Alloc >`:

### 6.244.1 Detailed Description

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
class __gnu_pbds::detail::bin_search_tree_node_it_< Node, Const_Iterator, Iterator, _Alloc >
```

Node iterator.

### 6.244.2 Member Typedef Documentation

#### [const\\_reference](#)

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
typedef Iterator __gnu_pbds::detail::bin_search_tree_node_it_< Node, Const_Iterator, Iterator, _↵
_Alloc >::const_reference
Iterator's __const reference type.
```

#### [difference\\_type](#)

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
typedef trivial\_iterator\_difference\_type __gnu_pbds::detail::bin_search_tree_const_node_it_<
Node, Const_Iterator, Iterator, _Alloc >::difference_type [inherited]
Difference type.
```

#### [iterator\\_category](#)

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
typedef trivial\_iterator\_tag __gnu_pbds::detail::bin_search_tree_const_node_it_< Node, Const_↵
Iterator, Iterator, _Alloc >::iterator_category [inherited]
Category.
```

**metadata\_const\_reference**

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
typedef rebind\_traits<_Alloc,metadata\_type>::const_reference \_\_gnu\_pbds::detail::bin\_search\_tree\_const\_node\_it\_<
Node, Const_Iterator, Iterator, _Alloc >::metadata_const_reference [inherited]
Const metadata reference type.
```

**metadata\_type**

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
typedef Node::metadata_type \_\_gnu\_pbds::detail::bin\_search\_tree\_const\_node\_it\_< Node, Const_Iterator,
Iterator, Iterator, _Alloc >::metadata_type [inherited]
Metadata type.
```

**reference**

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
typedef Iterator \_\_gnu\_pbds::detail::bin\_search\_tree\_node\_it\_< Node, Const_Iterator, Iterator, _Alloc >::reference
Iterator's reference type.
```

**value\_type**

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
typedef Iterator \_\_gnu\_pbds::detail::bin\_search\_tree\_node\_it\_< Node, Const_Iterator, Iterator, _Alloc >::value_type
Iterator's value type.
```

**6.244.3 Member Function Documentation****get\_l\_child()**

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
bin\_search\_tree\_node\_it\_< Node, Const_Iterator, Iterator, _Alloc > \_\_gnu\_pbds::detail::bin\_search\_tree\_node\_it\_<
Node, Const_Iterator, Iterator, _Alloc >::get_l_child () const [inline]
Returns the node iterator associated with the left node.
```

**get\_metadata()**

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
metadata\_const\_reference \_\_gnu\_pbds::detail::bin\_search\_tree\_const\_node\_it\_< Node, Const_Iterator,
Iterator, _Alloc >::get_metadata () const [inline], [inherited]
Metadata access.
```

**get\_r\_child()**

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
bin\_search\_tree\_node\_it\_< Node, Const_Iterator, Iterator, _Alloc > \_\_gnu\_pbds::detail::bin\_search\_tree\_node\_it\_<
Node, Const_Iterator, Iterator, _Alloc >::get_r_child () const [inline]
Returns the node iterator associated with the right node.
```

**operator"!="()**

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
bool \_\_gnu\_pbds::detail::bin\_search\_tree\_const\_node\_it\_< Node, Const_Iterator, Iterator, _Alloc
>::operator!= (
```

```
const bin_search_tree_const_node_it_< Node, Const_Iterator, Iterator, _Alloc > &
other) const [inline], [inherited]
```

Compares (negatively) to a different iterator object.

### operator\*()

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
Iterator __gnu_pbds::detail::bin_search_tree_node_it_< Node, Const_Iterator, Iterator, _Alloc >↵
::operator* () const [inline]
```

Access.

### operator==( )

```
template<typename Node, class Const_Iterator, class Iterator, typename _Alloc>
bool __gnu_pbds::detail::bin_search_tree_const_node_it_< Node, Const_Iterator, Iterator, _Alloc
>::operator==(
```

```
const bin_search_tree_const_node_it_< Node, Const_Iterator, Iterator, _Alloc > &
other) const [inline], [inherited]
```

Compares to a different iterator object.

The documentation for this class was generated from the following file:

- [bin\\_search\\_tree\\_/node\\_iterators.hpp](#)

## 6.245 \_\_gnu\_pbds::detail::bin\_search\_tree\_traits< Key, Mapped, Cmp\_Fn, Node\_Update, Node, \_Alloc > Struct Template Reference

```
#include <traits.hpp>
```

### Public Types

### 6.245.1 Detailed Description

```
template<typename Key, typename Mapped, class Cmp_Fn, template< typename Node_Cltr, class Node_Itr,
class Cmp_Fn, typename _Alloc > class Node_Update, class Node, typename _Alloc>
struct __gnu_pbds::detail::bin_search_tree_traits< Key, Mapped, Cmp_Fn, Node_Update, Node, _Alloc >
```

Binary search tree traits, primary template.

## 6.245.2 Member Typedef Documentation

### node\_const\_iterator

```
template<typename Key, typename Mapped, class Cmp_Fn, template< typename Node_CItr, class Node_It, class _Cmp_Fn, typename _Alloc > class Node_Update, class Node, typename _Alloc>
typedef bin_search_tree_const_node_it< Node, point_const_iterator, point_iterator, _Alloc> __gnu_pbds::detail::bin_search_tree_traits<
Key, Mapped, Cmp_Fn, Node_Update, Node, _Alloc >::node_const_iterator
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

The documentation for this struct was generated from the following file:

- [bin\\_search\\_tree\\_/traits.hpp](#)

## 6.246 `__gnu_pbds::detail::bin_search_tree_traits< Key, null_type, Cmp_Fn, Node_Update, Node, _Alloc >` Struct Template Reference

```
#include <traits.hpp>
```

### Public Types

- typedef `bin_search_tree_const_it< typename node_alloc_traits::pointer, typename type_traits::value_type, typename type_traits::pointer, typename type_traits::const_pointer, typename type_traits::reference, typename type_traits::const_reference, false, _Alloc >` **const\_reverse\_iterator**
- typedef `Node` **node**
- typedef `bin_search_tree_const_node_it< Node, point_const_iterator, point_iterator, _Alloc >` **node\_const\_iterator**
- typedef `node_const_iterator` **node\_iterator**
- typedef `Node_Update< node_const_iterator, node_iterator, Cmp_Fn, _Alloc >` **node\_update**
- typedef `__gnu_pbds::null_node_update< node_const_iterator, node_iterator, Cmp_Fn, _Alloc > * null_node_update_pointer`
- typedef `bin_search_tree_const_it< typename node_alloc_traits::pointer, typename type_traits::value_type, typename type_traits::pointer, typename type_traits::const_pointer, typename type_traits::reference, typename type_traits::const_reference, true, _Alloc >` **point\_const\_iterator**
- typedef `point_const_iterator` **point\_iterator**
- typedef `const_reverse_iterator` **reverse\_iterator**

### 6.246.1 Detailed Description

```
template<typename Key, class Cmp_Fn, template< typename Node_CItr, class Node_Itr, class _Cmp_Fn, typename _Alloc > class Node_Update, class Node, typename _Alloc>
struct __gnu_pbds::detail::bin_search_tree_traits< Key, null_type, Cmp_Fn, Node_Update, Node, _Alloc >
```

Specialization.

### 6.246.2 Member Typedef Documentation

#### node\_const\_iterator

```
template<typename Key, class Cmp_Fn, template< typename Node_CItr, class Node_Itr, class _Cmp_Fn, typename _Alloc > class Node_Update, class Node, typename _Alloc>
typedef bin_search_tree_const_node_it< Node, point_const_iterator, point_iterator, _Alloc> __gnu_pbds::detail::bin_search_tree_traits<
Key, null_type, Cmp_Fn, Node_Update, Node, _Alloc >::node_const_iterator
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

The documentation for this struct was generated from the following file:

- [bin\\_search\\_tree\\_/traits.hpp](#)

## 6.247 `__gnu_cxx::binary_compose< _Operation1, _Operation2, _Operation3 >` Class Template Reference

```
#include <functional>
```

Inheritance diagram for `__gnu_cxx::binary_compose< _Operation1, _Operation2, _Operation3 >`:

### Public Types

### Protected Attributes

- `_Operation1` **\_M\_fn1**
- `_Operation2` **\_M\_fn2**
- `_Operation3` **\_M\_fn3**

#### 6.247.1 Detailed Description

```
template<class _Operation1, class _Operation2, class _Operation3>
class __gnu_cxx::binary_compose< _Operation1, _Operation2, _Operation3 >
```

An [SGI extension](#) .

#### 6.247.2 Member Typedef Documentation

##### **argument\_type**

```
typedef _Operation2::argument_type std::unary\_function< _Operation2::argument_type, _Operation1::
::result_type >::argument_type [inherited]
argument_type is the type of the argument
```

**result\_type**

```
typedef _Operation1::result_type std::unary_function< _Operation2::argument_type, _Operation1↵  
::result_type >::result_type [inherited]
```

`result_type` is the return type

The documentation for this class was generated from the following file:

- [ext/functional](#)

**6.248 `std::binary_function<_Arg1, _Arg2, _Result >` Struct Template Reference**

```
#include <stl_function.h>
```

Inheritance diagram for `std::binary_function<_Arg1, _Arg2, _Result>`:

### Public Types

- typedef `_Arg1` [first\\_argument\\_type](#)
- typedef `_Result` [result\\_type](#)
- typedef `_Arg2` [second\\_argument\\_type](#)

## 6.248.1 Detailed Description

```
template<typename _Arg1, typename _Arg2, typename _Result>
struct std::binary_function< _Arg1, _Arg2, _Result >
```

Helper for defining adaptable binary function objects.

**Deprecated** Deprecated in C++11, no longer in the standard since C++17.

## 6.248.2 Member Typedef Documentation

**first\_argument\_type**

```
template<typename _Arg1, typename _Arg2, typename _Result>
typedef _Arg1 std::binary_function< _Arg1, _Arg2, _Result >::first_argument_type
first_argument_type is the type of the first argument
```

**result\_type**

```
template<typename _Arg1, typename _Arg2, typename _Result>
typedef _Result std::binary_function< _Arg1, _Arg2, _Result >::result_type
result_type is the return type
```

**second\_argument\_type**

```
template<typename _Arg1, typename _Arg2, typename _Result>
typedef _Arg2 std::binary_function< _Arg1, _Arg2, _Result >::second_argument_type
second_argument_type is the type of the second argument
```

The documentation for this struct was generated from the following file:

- [stl\\_function.h](#)

6.249 `__gnu_pbds::detail::binary_heap< Value_Type, Cmp_Fn, _Alloc >` Class Template Reference

#### 6.250.1 Detailed Description

```
template<typename Value_Type, typename Entry, bool Simple, typename _Alloc>
class __gnu_pbds::detail::binary_heap_const_iterator_< Value_Type, Entry, Simple, _Alloc >
```

Const point-type iterator.

#### 6.250.2 Member Typedef Documentation

##### `const_pointer`

```
template<typename Value_Type, typename Entry, bool Simple, typename _Alloc>
typedef base_type::const_pointer __gnu_pbds::detail::binary_heap_const_iterator_< Value_Type,
Entry, Simple, _Alloc >::const_pointer
Iterator's const pointer type.
```

##### `const_reference`

```
template<typename Value_Type, typename Entry, bool Simple, typename _Alloc>
typedef base_type::const_reference __gnu_pbds::detail::binary_heap_const_iterator_< Value_Type,
Entry, Simple, _Alloc >::const_reference
Iterator's const reference type.
```

##### `difference_type`

```
template<typename Value_Type, typename Entry, bool Simple, typename _Alloc>
typedef _Alloc::difference_type __gnu_pbds::detail::binary_heap_const_iterator_< Value_Type,
Entry, Simple, _Alloc >::difference_type
Difference type.
```

**iterator\_category**

```
template<typename Value_Type, typename Entry, bool Simple, typename _Alloc>
typedef std::forward_iterator_tag __gnu_pbds::detail::binary_heap_const_iterator_< Value_Type,  
Entry, Simple, _Alloc >::iterator_category  
Category.
```

**pointer**

```
template<typename Value_Type, typename Entry, bool Simple, typename _Alloc>
typedef base_type::pointer __gnu_pbds::detail::binary_heap_const_iterator_< Value_Type, Entry,  
Simple, _Alloc >::pointer  
Iterator's pointer type.
```

**reference**

```
template<typename Value_Type, typename Entry, bool Simple, typename _Alloc>
typedef base_type::reference __gnu_pbds::detail::binary_heap_const_iterator_< Value_Type, Entry,  
Simple, _Alloc >::reference  
Iterator's reference type.
```

**value\_type**

```
template<typename Value_Type, typename Entry, bool Simple, typename _Alloc>
typedef base_type::value_type __gnu_pbds::detail::binary_heap_const_iterator_< Value_Type, Entry,  
Simple, _Alloc >::value_type  
Iterator's value type.
```

**6.250.3 Constructor & Destructor Documentation****binary\_heap\_const\_iterator\_() [1/2]**

```
template<typename Value_Type, typename Entry, bool Simple, typename _Alloc>
__gnu_pbds::detail::binary_heap_const_iterator_< Value_Type, Entry, Simple, _Alloc >::binary_↵  
heap_const_iterator_ () [inline]  
Default constructor.

std::basic\_istream< \_CharT, \_Traits > & operator>> (std::basic\_istream< \_CharT, \_Traits > &\_\_is, std::binomial\_distribution< \_IntType1 > &\_\_x)

### 6.256.1 Detailed Description

template<typename \_IntType = int>  
class std::binomial\_distribution< \_IntType >

A discrete binomial random number distribution.

The formula for the binomial probability density function is  $p(i|t, p) = \binom{t}{i} p^i (1-p)^{t-i}$  where  $t$  and  $p$  are the parameters of the distribution.

Since

C++11

### 6.256.2 Member Typedef Documentation

#### result\_type

template<typename \_IntType = int>  
typedef \_IntType std::binomial\_distribution< \_IntType >::result\_type  
The type of the range of the distribution.

### 6.256.3 Member Function Documentation

#### max()

template<typename \_IntType = int>  
result\_type std::binomial\_distribution< \_IntType >::max () const [inline]  
Returns the least upper bound value of the distribution.

#### min()

template<typename \_IntType = int>  
result\_type std::binomial\_distribution< \_IntType >::min () const [inline]  
Returns the greatest lower bound value of the distribution.

#### operator()() [1/2]

template<typename \_IntType = int>  
template<typename \_UniformRandomNumberGenerator>  
result\_type std::binomial\_distribution< \_IntType >::operator() (   
\_UniformRandomNumberGenerator & \_\_urng) [inline]

Generating functions.

Referenced by operator()().

**operator()()** [2/2]

```
template<typename _IntType>
template<typename _UniformRandomNumberGenerator>
binomial_distribution< _IntType >::result_type std::binomial_distribution< _IntType >::operator()
(
    _UniformRandomNumberGenerator & __urng,
    const param_type & __param)

```

A rejection algorithm when  $t * p \geq 8$  and a simple waiting time method - the second in the referenced book - otherwise. NB: The former is available only if `_GLIBCXX_USE_C99_MATH_FUNCS` is defined.

Reference: Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. X, Sect. 4 (+ Errata!).

References `std::abs()`, `std::numeric_limits< _Tp >::epsilon()`, `std::log()`, and `std::numeric_limits< _Tp >::max()`.

**p()**

```
template<typename _IntType = int>
double std::binomial_distribution< _IntType >::p () const [inline]
Returns the distribution p parameter.

```

**param()** [1/2]

```
template<typename _IntType = int>
param_type std::binomial_distribution< _IntType >::param () const [inline]
Returns the parameter set of the distribution.

```

**param()** [2/2]

```
template<typename _IntType = int>
void std::binomial_distribution< _IntType >::param (
    const param_type & __param) [inline]
Sets the parameter set of the distribution.

```

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _IntType = int>
void std::binomial_distribution< _IntType >::reset () [inline]
Resets the distribution state.

```

**t()**

```
template<typename _IntType = int>
_IntType std::binomial_distribution< _IntType >::t () const [inline]
Returns the distribution t parameter.

```

**6.256.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>

```

```
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::binomial_distribution< _IntType1 > & __x) [friend]
```

Inserts a `binomial_distribution` random number distribution `__x` into the output stream `__os`.

#### Parameters

|                   |                                                                  |
|-------------------|------------------------------------------------------------------|
| <code>__os</code> | An output stream.                                                |
| <code>__x</code>  | A <code>binomial_distribution</code> random number distribution. |

#### Returns

The output stream with the state of `__x` inserted or in an error state.

#### `operator==`

```
template<typename _IntType = int>
bool operator== (
    const binomial_distribution< _IntType > & __d1,
    const binomial_distribution< _IntType > & __d2) [friend]
```

Return true if two binomial distributions have the same parameters and the sequences that would be generated are equal.

#### `operator>>`

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::binomial_distribution< _IntType1 > & __x) [friend]
```

Extracts a `binomial_distribution` random number distribution `__x` from the input stream `__is`.

#### Parameters

|                   |                                                                      |
|-------------------|----------------------------------------------------------------------|
| <code>__is</code> | An input stream.                                                     |
| <code>__x</code>  | A <code>binomial_distribution</code> random number generator engine. |

#### Returns

The input stream with `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

### 6.260.1 Detailed Description

```
template<typename _Tp>
class __gnu_cxx::bitmap_allocator<_Tp>
```

Bitmap Allocator, primary template.

### 6.260.2 Member Function Documentation

#### **\_M\_allocate\_single\_object()**

```
template<typename _Tp>
pointer __gnu_cxx::bitmap_allocator<_Tp>::_M_allocate_single_object () [inline]
Allocates memory for a single object of size sizeof(_Tp).
```

#### Exceptions

|                              |                                |
|------------------------------|--------------------------------|
| <code>std::bad_alloc.</code> | If memory cannot be allocated. |
|------------------------------|--------------------------------|

Complexity: Worst case complexity is  $O(N)$ , but that is hardly ever hit. If and when this particular case is encountered, the next few cases are guaranteed to have a worst case complexity of  $O(1)$ ! That's why this function performs very well on average. You can consider this function to have a complexity referred to commonly as: Amortized Constant time.

**\_M\_deallocate\_single\_object()**

```
template<typename _Tp>
void __gnu_cxx::bitmap_allocator< _Tp >::_M_deallocate_single_object (
    pointer __p) throw ( ) [inline]
```

Deallocates memory that belongs to a single object of size sizeof(\_Tp).

Complexity:  $O(\lg(N))$ , but the worst case is not hit often! This is because containers usually deallocate memory close to each other and this case is handled in  $O(1)$  time by the deallocate function.

The documentation for this class was generated from the following file:

- [bitmap\\_allocator.h](#)

## 6.262.1 Detailed Description

**template<size\_t \_Nb>**  
**class std::bitset< \_Nb >**

The `bitset` class represents a *fixed-size* sequence of bits.

(Note that `bitset` does *not* meet the formal requirements of a [container](#). Mainly, it lacks iterators.)

The template argument, `Nb`, may be any non-negative number, specifying the number of bits (e.g., "0", "12", "1024\*1024").

In the general unoptimized case, storage is allocated in word-sized blocks. Let `B` be the number of bits in a word, then  $(Nb+(B-1))/B$  words will be used for storage. `B - Nb` bits are unused. (They are the high-order bits in the highest word.) It is a class invariant that those unused bits are always zero.

If you think of `bitset` as a *simple array of bits*, be aware that your mental picture is reversed: a `bitset` behaves the same way as bits in integers do, with the bit at index 0 in the *least significant / right-hand* position, and the bit at index `Nb-1` in the *most significant / left-hand* position. Thus, unlike other containers, a `bitset`'s index *counts from right to left*, to put it very loosely.

This behavior is preserved when translating to and from strings. For example, the first line of the following program probably prints *b('a') is 0001100001* on a modern ASCII system.

```
#include <bitset>
#include <iostream>
#include <sstream>

using namespace std;

int main()
{
    long    a = 'a';
    bitset<10> b(a);

    cout << "b('a') is " << b << endl;

    ostringstream s;
    s << b;
    string str = s.str();
    cout << "index 3 in the string is " << str[3] << " but\n"
         << "index 3 in the bitset is " << b[3] << endl;
}
```

Also see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/ext\\_containers.html](https://gcc.gnu.org/onlinedocs/libstdc++/manual/ext_containers.html) for a description of extensions.

Most of the actual code isn't contained in `bitset<>` itself, but in the base class `_Base_bitset`. The base class works with whole words, not with individual bits. This allows us to specialize `_Base_bitset` for the important special case where the bitset is only a single word.

Extra confusion can result due to the fact that the storage for `_Base_bitset` is a regular array, and is indexed as such. This is carefully encapsulated.

## 6.262.2 Constructor & Destructor Documentation

### `bitset()` [1/5]

```
template<size_t _Nb>
std::bitset<_Nb>::bitset () [inline], [constexpr], [noexcept]
```

All bits set to zero.

Referenced by `operator&=()`, `operator<<()`, `operator<<=()`, `operator==()`, `operator>>()`, `operator^=()`, `operator|=()`, and `operator~()`.

### `bitset()` [2/5]

```
template<size_t _Nb>
std::bitset<_Nb>::bitset (
    unsigned long long __val) [inline], [constexpr], [noexcept]
```

Initial bits bitwise-copied from a single word (others set to zero).

### `bitset()` [3/5]

```
template<size_t _Nb>
template<class _CharT, class _Traits, class _Alloc>
std::bitset<_Nb>::bitset (
    const std::basic_string<_CharT, _Traits, _Alloc> & __s,
    size_t __position = 0) [inline], [explicit], [constexpr]
```

Use a subset of a string.

#### Parameters

|                         |                                                                            |
|-------------------------|----------------------------------------------------------------------------|
| <code>__s</code>        | A string of 0 and 1 characters.                                            |
| <code>__position</code> | Index of the first character in <code>__s</code> to use; defaults to zero. |

## Exceptions

|                              |                                                                |
|------------------------------|----------------------------------------------------------------|
| <i>std::out_of_range</i>     | If <code>__position &gt; __s.size()</code> .                   |
| <i>std::invalid_argument</i> | If a character appears in the string which is neither 0 nor 1. |

References [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::npos](#).

**bitset()** [4/5]

```
template<size_t _Nb>
template<class _CharT, class _Traits, class _Alloc>
std::bitset<_Nb>::bitset (
    const std::basic_string<_CharT, _Traits, _Alloc> & __s,
    size_t __position,
    size_t __n) [inline], [constexpr]
```

Use a subset of a string.

## Parameters

|                         |                                                          |
|-------------------------|----------------------------------------------------------|
| <code>__s</code>        | A string of 0 and 1 characters.                          |
| <code>__position</code> | Index of the first character in <code>__s</code> to use. |
| <code>__n</code>        | The number of characters to copy.                        |

## Exceptions

|                              |                                                                |
|------------------------------|----------------------------------------------------------------|
| <i>std::out_of_range</i>     | If <code>__position &gt; __s.size()</code> .                   |
| <i>std::invalid_argument</i> | If a character appears in the string which is neither 0 nor 1. |

**bitset()** [5/5]

```
template<size_t _Nb>
template<typename _CharT, typename = _Require<is_trivially_copyable<_CharT>, is_standard_↵
layout<_CharT>, is_trivially_default_constructible<_CharT>, __not<is_array<_CharT>>>>
std::bitset<_Nb>::bitset (
    const _CharT * __str,
    typename __bitset<_Nb>::__string<_CharT>::size_type __n = __bitset<_Nb>::__↵
string<_CharT>::npos,
    _CharT __zero = _CharT('0'),
    _CharT __one = _CharT('1')) [inline], [explicit], [constexpr]
```

Construct from a character array.

## Parameters

|                     |                                                                     |
|---------------------|---------------------------------------------------------------------|
| <code>__str</code>  | An array of characters <code>__zero</code> and <code>__one</code> . |
| <code>__n</code>    | The number of characters to use.                                    |
| <code>__zero</code> | The character corresponding to the value 0.                         |
| <code>__one</code>  | The character corresponding to the value 1.                         |

**Exceptions**

|                                    |                                                                                                    |
|------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>std::invalid_argument</code> | If a character appears in the string which is neither <code>__zero</code> nor <code>__one</code> . |
|------------------------------------|----------------------------------------------------------------------------------------------------|

References [std::basic\\_string<\\_CharT>::npos](#).

**6.262.3 Member Function Documentation****all()**

```
template<size_t _Nb>
bool std::bitset<_Nb>::all () const [inline], [constexpr], [noexcept]
```

Tests whether all the bits are on.

**Returns**

True if all the bits are set.

**any()**

```
template<size_t _Nb>
bool std::bitset<_Nb>::any () const [inline], [constexpr], [noexcept]
```

Tests whether any of the bits are on.

**Returns**

True if at least one bit is set.

**count()**

```
template<size_t _Nb>
size_t std::bitset<_Nb>::count () const [inline], [constexpr], [noexcept]
```

Returns the number of bits which are set.

**flip() [1/2]**

```
template<size_t _Nb>
bitset<_Nb> & std::bitset<_Nb>::flip () [inline], [constexpr], [noexcept]
```

Toggles every bit to its opposite value.

**flip() [2/2]**

```
template<size_t _Nb>
bitset<_Nb> & std::bitset<_Nb>::flip (
    size_t __position) [inline], [constexpr]
```

Toggles a given bit to its opposite value.

**Parameters**

|                         |                       |
|-------------------------|-----------------------|
| <code>__position</code> | The index of the bit. |
|-------------------------|-----------------------|

**Exceptions**

|                                |                                              |
|--------------------------------|----------------------------------------------|
| <code>std::out_of_range</code> | If <i>pos</i> is bigger the size of the set. |
|--------------------------------|----------------------------------------------|

References [\\_Unchecked\\_flip\(\)](#).

**none()**

```
template<size_t _Nb>
bool std::bitset<_Nb>::none () const [inline], [constexpr], [noexcept]
```

Tests whether any of the bits are on.

**Returns**

True if none of the bits are set.

**operator&=()**

```
template<size_t _Nb>
bitset<_Nb> & std::bitset<_Nb>::operator&= (
    const bitset<_Nb> & __rhs) [inline], [constexpr], [noexcept]
```

Operations on bitsets.

**Parameters**

|                    |                      |
|--------------------|----------------------|
| <code>__rhs</code> | A same-sized bitset. |
|--------------------|----------------------|

These should be self-explanatory.

References [bitset\(\)](#).

**operator<<()**

```
template<size_t _Nb>
bitset<_Nb> & std::bitset<_Nb>::operator<< (
    size_t __position) const [inline], [constexpr], [noexcept]
```

Self-explanatory.

References [bitset\(\)](#).

**operator<<=()**

```
template<size_t _Nb>
bitset<_Nb> & std::bitset<_Nb>::operator<<= (
    size_t __position) [inline], [constexpr], [noexcept]
```

Operations on bitsets.

**Parameters**

|                         |                                |
|-------------------------|--------------------------------|
| <code>__position</code> | The number of places to shift. |
|-------------------------|--------------------------------|

These should be self-explanatory.

References [bitset\(\)](#), and [operator<<=\(\)](#).

Referenced by [operator<<=\(\)](#).

**operator==()**

```
template<size_t _Nb>
bool std::bitset<_Nb>::operator== (
    const bitset<_Nb> & __rhs) const [inline], [constexpr], [noexcept]
```

These comparisons for equality/inequality are, well, *bitwise*.

References [bitset\(\)](#).

**operator>>()**

```
template<size_t _Nb>
bitset< _Nb > std::bitset< _Nb >::operator>> (
    size_t __position) const [inline], [constexpr], [noexcept]
```

Self-explanatory.

References [bitset\(\)](#).

**operator>>=()**

```
template<size_t _Nb>
bitset< _Nb > & std::bitset< _Nb >::operator>>= (
    size_t __position) [inline], [constexpr], [noexcept]
```

Operations on bitsets.

**Parameters**

|                         |                                |
|-------------------------|--------------------------------|
| <code>__position</code> | The number of places to shift. |
|-------------------------|--------------------------------|

These should be self-explanatory.

**operator[]() [1/2]**

```
template<size_t _Nb>
reference std::bitset< _Nb >::operator[] (
    size_t __position) [inline], [constexpr]
```

Array-indexing support.

**Parameters**

|                         |                        |
|-------------------------|------------------------|
| <code>__position</code> | Index into the bitset. |
|-------------------------|------------------------|

**Returns**

A bool for a *const bitset*. For non-const bitsets, an instance of the reference proxy class.

**Note**

These operators do no range checking and throw no exceptions, as required by DR 11 to the standard.

**\_GLIBCXX\_RESOLVE\_LIB\_DEFECTS** Note that this implementation already resolves DR 11 (items 1 and 2), but does not do the range-checking required by that DR's resolution. -pme The DR has since been changed: range-checking is a precondition (users' responsibility), and these functions must not throw. -pme

**operator[]() [2/2]**

```
template<size_t _Nb>
bool std::bitset< _Nb >::operator[] (
    size_t __position) const [inline], [constexpr]
```

Array-indexing support.

**Parameters**

|                         |                        |
|-------------------------|------------------------|
| <code>__position</code> | Index into the bitset. |
|-------------------------|------------------------|

**Returns**

A bool for a *const bitset*. For non-const bitsets, an instance of the reference proxy class.

**Note**

These operators do no range checking and throw no exceptions, as required by DR 11 to the standard.

`_GLIBCXX_RESOLVE_LIB_DEFECTS` Note that this implementation already resolves DR 11 (items 1 and 2), but does not do the range-checking required by that DR's resolution. -pme The DR has since been changed: range-checking is a precondition (users' responsibility), and these functions must not throw. -pme

References [\\_Unchecked\\_test\(\)](#).

**`operator^=()`**

```
template<size_t _Nb>
bitset<_Nb> & std::bitset<_Nb>::operator^= (
    const bitset<_Nb> & __rhs) [inline], [constexpr], [noexcept]
```

Operations on bitsets.

**Parameters**

|                    |                      |
|--------------------|----------------------|
| <code>__rhs</code> | A same-sized bitset. |
|--------------------|----------------------|

These should be self-explanatory.

References [bitset\(\)](#).

**`operator" |=()`**

```
template<size_t _Nb>
bitset<_Nb> & std::bitset<_Nb>::operator|= (
    const bitset<_Nb> & __rhs) [inline], [constexpr], [noexcept]
```

Operations on bitsets.

**Parameters**

|                    |                      |
|--------------------|----------------------|
| <code>__rhs</code> | A same-sized bitset. |
|--------------------|----------------------|

These should be self-explanatory.

References [bitset\(\)](#).

**`operator~()`**

```
template<size_t _Nb>
bitset<_Nb> std::bitset<_Nb>::operator~ () const [inline], [constexpr], [noexcept]
```

See the no-argument `flip()`.

References [bitset\(\)](#).

**`reset()` [1/2]**

```
template<size_t _Nb>
bitset<_Nb> & std::bitset<_Nb>::reset () [inline], [constexpr], [noexcept]
```

Sets every bit to false.

**reset()** [2/2]

```
template<size_t _Nb>
bitset< _Nb > & std::bitset< _Nb >::reset (
    size_t __position) [inline], [constexpr]
```

Sets a given bit to false.

**Parameters**

|                         |                       |
|-------------------------|-----------------------|
| <code>__position</code> | The index of the bit. |
|-------------------------|-----------------------|

**Exceptions**

|                                |                                              |
|--------------------------------|----------------------------------------------|
| <code>std::out_of_range</code> | If <i>pos</i> is bigger the size of the set. |
|--------------------------------|----------------------------------------------|

Same as writing `set (pos, false)`.

References [\\_Unchecked\\_reset\(\)](#).

**set()** [1/2]

```
template<size_t _Nb>
bitset< _Nb > & std::bitset< _Nb >::set () [inline], [constexpr], [noexcept]
```

Sets every bit to true.

**set()** [2/2]

```
template<size_t _Nb>
bitset< _Nb > & std::bitset< _Nb >::set (
    size_t __position,
    bool __val = true) [inline], [constexpr]
```

Sets a given bit to a particular value.

**Parameters**

|                         |                                         |
|-------------------------|-----------------------------------------|
| <code>__position</code> | The index of the bit.                   |
| <code>__val</code>      | Either true or false, defaults to true. |

**Exceptions**

|                                |                                              |
|--------------------------------|----------------------------------------------|
| <code>std::out_of_range</code> | If <i>pos</i> is bigger the size of the set. |
|--------------------------------|----------------------------------------------|

References [\\_Unchecked\\_set\(\)](#).

**size()**

```
template<size_t _Nb>
size_t std::bitset< _Nb >::size () const [inline], [constexpr], [noexcept]
```

Returns the total number of bits.

**test()**

```
template<size_t _Nb>
bool std::bitset<_Nb>::test (
    size_t __position) const [inline], [constexpr]
```

Tests the value of a bit.

**Parameters**

|                         |                     |
|-------------------------|---------------------|
| <code>__position</code> | The index of a bit. |
|-------------------------|---------------------|

**Returns**

The value at *pos*.

**Exceptions**

|                                |                                              |
|--------------------------------|----------------------------------------------|
| <code>std::out_of_range</code> | If <i>pos</i> is bigger the size of the set. |
|--------------------------------|----------------------------------------------|

References [\\_Unchecked\\_test\(\)](#).

**to\_string()**

```
template<size_t _Nb>
template<class _CharT, class _Traits, class _Alloc>
std::basic_string<_CharT, _Traits, _Alloc> std::bitset<_Nb>::to_string () const [inline],
[constexpr]
```

Returns a character interpretation of the bitset.

**Returns**

The string equivalent of the bits.

Note the ordering of the bits: decreasing character positions correspond to increasing bit positions (see the main class notes for an example).

**to\_ulong()**

```
template<size_t _Nb>
unsigned long std::bitset<_Nb>::to_ulong () const [inline], [constexpr]
```

Returns a numerical interpretation of the bitset.

**Returns**

The integral equivalent of the bits.

**Exceptions**

|                                  |                                                                   |
|----------------------------------|-------------------------------------------------------------------|
| <code>std::overflow_error</code> | If there are too many bits to be represented in an unsigned long. |
|----------------------------------|-------------------------------------------------------------------|

### 6.263.1 Detailed Description

[bool\\_set](#)

See N2136, [Bool\\_set](#): multi-valued logic by Hervé Brönnimann, Guillaume Melquiond, Sylvain Pion.

The implicit conversion to bool is slippery! I may use the new explicit conversion. This has been specialized in the language so that in contexts requiring a bool the conversion happens implicitly. Thus most objections should be eliminated.

### 6.263.2 Constructor & Destructor Documentation

#### [bool\\_set](#)() [1/2]

```
std::tr2::bool_set::bool_set () [inline], [constexpr]
```

Default constructor.

Referenced by [equals\(\)](#).

#### [bool\\_set](#)() [2/2]

```
std::tr2::bool_set::bool_set (  
    bool __t) [inline], [constexpr]
```

Constructor from bool.

### 6.263.3 Member Function Documentation

#### `equals()`

```
bool std::tr2::bool_set::equals (
    bool_set __b) const [inline]
```

Return true if states are equal.

References [bool\\_set\(\)](#).

#### `is_emptyset()`

```
bool std::tr2::bool_set::is_emptyset () const [inline]
```

Return true if this is empty.

#### `is_indeterminate()`

```
bool std::tr2::bool_set::is_indeterminate () const [inline]
```

Return true if this is indeterminate.

#### `is_singleton()`

```
bool std::tr2::bool_set::is_singleton () const [inline]
```

Return true if this is false or true (normal boolean).

Referenced by [operator bool\(\)](#).

#### `operator bool()`

```
std::tr2::bool_set::operator bool () const [inline]
```

Conversion to bool.

### 6.266.1 Detailed Description

```
template<typename _RealType = double>
class std::cauchy_distribution< _RealType >
```

A `cauchy_distribution` random number distribution.

The formula for the normal probability mass function is  $p(x|a,b) = (\pi b(1 + (\frac{x-a}{b})^2))^{-1}$

Since

C++11

### 6.266.2 Member Typedef Documentation

#### result\_type

```
template<typename _RealType = double>
typedef _RealType std::cauchy_distribution< _RealType >::result_type
```

The type of the range of the distribution.

### 6.266.3 Member Function Documentation

#### max()

```
template<typename _RealType = double>
result_type std::cauchy_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### min()

```
template<typename _RealType = double>
result_type std::cauchy_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

#### operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::cauchy_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by `operator()()`.

#### param() [1/2]

```
template<typename _RealType = double>
param_type std::cauchy_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Referenced by `std::operator>>()`.

## param() [2/2]

```
template<typename _RealType = double>
void std::cauchy_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

### Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

## reset()

```
template<typename _RealType = double>
void std::cauchy_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

## 6.266.4 Friends And Related Symbol Documentation

### operator==

```
template<typename _RealType = double>
bool operator== (
    const cauchy_distribution< _RealType > & __d1,
    const cauchy_distribution< _RealType > & __d2) [friend]
```

Return true if two Cauchy distributions have the same parameters.

The documentation for this class was generated from the following files:

### 6.267.1 Detailed Description

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
class __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >
```

A resize trigger policy based on collision checks. It keeps the simulated load factor lower than some given load factor.

### 6.267.2 Member Enumeration Documentation

#### anonymous enum

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
anonymous enum
```

#### Enumerator

|                                   |                                                                                                                                                                 |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>external_load_access</code> | Specifies whether the load factor can be accessed externally. The two options have different trade-offs in terms of flexibility, genericity, and encapsulation. |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 6.267.3 Constructor & Destructor Documentation

#### `cc_hash_max_collision_check_resize_trigger()`

```
template<bool External_Load_Access, typename Size_Type>
__gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >::cc_↵
hash_max_collision_check_resize_trigger (
    float load = 0.5)
```

Default constructor, or constructor taking load, a `__load` factor which it will attempt to maintain.

### 6.267.4 Member Function Documentation

#### `get_load()`

```
template<bool External_Load_Access, typename Size_Type>
float __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↵
::get_load () const [inline]
```

Returns the current load.

**is\_grow\_needed()**

```
template<bool External_Load_Access, typename Size_Type>
bool __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↵
::is_grow_needed (
    size_type size,
    size_type num_entries) const [inline], [protected]
```

Queries whether a grow is needed. This method is called only if this object indicated is needed.

**is\_resize\_needed()**

```
template<bool External_Load_Access, typename Size_Type>
bool __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↵
::is_resize_needed () const [inline], [protected]
```

Queries whether a resize is needed.

**notify\_cleared()**

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↵
::notify_cleared () [protected]
```

Notifies the table was cleared.

References [notify\\_resized\(\)](#).

**notify\_erase\_search\_collision()**

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↵
::notify_erase_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

**notify\_erase\_search\_end()**

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↵
::notify_erase_search_end () [inline], [protected]
```

Notifies a search ended.

**notify\_erase\_search\_start()**

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↵
::notify_erase_search_start () [inline], [protected]
```

Notifies an erase search started.

**notify\_erased()**

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↵
::notify_erased (
    size_type num_entries) [inline], [protected]
```

Notifies an element was erased.

**notify\_externally\_resized()**

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↵
::notify_externally_resized (
    size_type new_size) [protected]
```

Notifies the table was resized externally.

**notify\_find\_search\_collision()**

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↵
::notify_find_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

**notify\_find\_search\_end()**

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↵
::notify_find_search_end () [inline], [protected]
```

Notifies a search ended.

**notify\_find\_search\_start()**

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↵
::notify_find_search_start () [inline], [protected]
```

Notifies a find search started.

**notify\_insert\_search\_collision()**

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↵
::notify_insert_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

**notify\_insert\_search\_end()**

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↵
::notify_insert_search_end () [inline], [protected]
```

Notifies a search ended.

**notify\_insert\_search\_start()**

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↵
::notify_insert_search_start () [inline], [protected]
```

Notifies an insert search started.

**notify\_inserted()**

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↵
::notify_inserted (
    size_type num_entries) [inline], [protected]
```

Notifies an element was inserted.

### `notify_resized()`

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↔
::notify_resized (
    size_type new_size) [protected]
```

Notifies the table was resized as a result of this object's signifying that a resize is needed.

Referenced by [notify\\_cleared\(\)](#).

### `set_load()`

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >↔
::set_load (
    float load)
```

Sets the load; does not resize the container.

The documentation for this class was generated from the following file:

### 6.268.1 Detailed Description

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type,
typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Hash_Fn = detail::default_comb_hash_fn::type,
typename Resize_Policy = typename detail::default_resize_policy<Comb_Hash_Fn>::type, bool Store_Hash = detail::default_store_hash,
typename _Alloc = std::allocator<char>>>
class __gnu_pbds::cc_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Hash_Fn, Resize_Policy, Store_Hash, _Alloc >
```

A collision-chaining hash-based associative container.

#### Template Parameters

|                      |                                                                                                                                                                                                 |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Key</i>           | Key type.                                                                                                                                                                                       |
| <i>Mapped</i>        | Map type.                                                                                                                                                                                       |
| <i>Hash_Fn</i>       | Hashing functor.                                                                                                                                                                                |
| <i>Eq_Fn</i>         | Equal functor.                                                                                                                                                                                  |
| <i>Comb_Hash_Fn</i>  | Combining hash functor. If Hash_Fn is not null_type, then this is the ranged-hash functor; otherwise, this is the range-hashing functor. XXX(See Design::Hash-Based Containers::Hash Policies.) |
| <i>Resize_Policy</i> | Resizes hash.                                                                                                                                                                                   |
| <i>Store_Hash</i>    | Indicates whether the hash value will be stored along with each key. If Hash_Fn is null_type, then the container will not compile if this value is true                                         |
| <i>_Alloc</i>        | Allocator type.                                                                                                                                                                                 |

Base tag choices are: `cc_hash_tag`.

Base is `basic_hash_table`.

### 6.268.2 Constructor & Destructor Documentation

#### `cc_hash_table()` [1/10]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type,
typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Hash_Fn =
```

```
detail::default_comb_hash_fn::type, typename Resize_Policy = typename detail::default_resize_↵
policy<Comb_Hash_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std↵
::allocator<char>>
```

```
__gnu_pbds::cc_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Hash_Fn, Resize_Policy, Store_Hash,
_Alloc >::cc_hash_table () [inline]
```

Default constructor.

### `cc_hash_table()` [2/10]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Hash_Fn =
detail::default_comb_hash_fn::type, typename Resize_Policy = typename detail::default_resize_↵
policy<Comb_Hash_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std↵
::allocator<char>>
```

```
__gnu_pbds::cc_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Hash_Fn, Resize_Policy, Store_Hash,
_Alloc >::cc_hash_table (
    const hash_fn & h) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `Hash_Fn` object of the container object.

### `cc_hash_table()` [3/10]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Hash_Fn =
detail::default_comb_hash_fn::type, typename Resize_Policy = typename detail::default_resize_↵
policy<Comb_Hash_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std↵
::allocator<char>>
```

```
__gnu_pbds::cc_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Hash_Fn, Resize_Policy, Store_Hash,
_Alloc >::cc_hash_table (
    const hash_fn & h,
    const eq_fn & e) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, and `r_eq_fn` will be copied by the `eq_fn` object of the container object.

### `cc_hash_table()` [4/10]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Hash_Fn =
detail::default_comb_hash_fn::type, typename Resize_Policy = typename detail::default_resize_↵
policy<Comb_Hash_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std↵
::allocator<char>>
```

```
__gnu_pbds::cc_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Hash_Fn, Resize_Policy, Store_Hash,
_Alloc >::cc_hash_table (
    const hash_fn & h,
    const eq_fn & e,
    const comb_hash_fn & ch) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, `r_eq_fn` will be copied by the `eq_fn` object of the container object, and `r_comb_hash_fn` will be copied by the `comb_hash_fn` object of the container object.

### `cc_hash_table()` [5/10]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Hash_Fn =
detail::default_comb_hash_fn::type, typename Resize_Policy = typename detail::default_resize_↵
policy<Comb_Hash_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std↵
```

```

::allocator<char>>
__gnu_pbds::cc_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Hash_Fn, Resize_Policy, Store_Hash,
_Alloc >::cc_hash_table (
    const hash_fn & h,
    const eq_fn & e,
    const comb_hash_fn & ch,
    const resize_policy & rp) [inline]

```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, `r_eq_fn` will be copied by the `eq_fn` object of the container object, `r_comb_hash_fn` will be copied by the `comb_hash_fn` object of the container object, and `r_resize_policy` will be copied by the `resize_policy` object of the container object.

### **cc\_hash\_table()** [6/10]

```

template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type,
typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Hash_Fn =
detail::default_comb_hash_fn::type, typename Resize_Policy = typename detail::default_resize_
policy<Comb_Hash_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::
::allocator<char>>
template<typename It>
__gnu_pbds::cc_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Hash_Fn, Resize_Policy, Store_Hash,
_Alloc >::cc_hash_table (
    It first,
    It last) [inline]

```

Constructor taking `__iterators` to a range of `value_types`. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

### **cc\_hash\_table()** [7/10]

```

template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type,
typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Hash_Fn =
detail::default_comb_hash_fn::type, typename Resize_Policy = typename detail::default_resize_
policy<Comb_Hash_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::
::allocator<char>>
template<typename It>
__gnu_pbds::cc_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Hash_Fn, Resize_Policy, Store_Hash,
_Alloc >::cc_hash_table (
    It first,
    It last,
    const hash_fn & h) [inline]

```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

### **cc\_hash\_table()** [8/10]

```

template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type,
typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Hash_Fn =
detail::default_comb_hash_fn::type, typename Resize_Policy = typename detail::default_resize_
policy<Comb_Hash_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::
::allocator<char>>
template<typename It>
__gnu_pbds::cc_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Hash_Fn, Resize_Policy, Store_Hash,
_Alloc >::cc_hash_table (
    It first,
    It last,

```

```
const hash_fn & h,
const eq_fn & e) [inline]
```

Constructor taking \_\_iterators to a range of value\_types and some policy objects The value\_types between first\_it and last\_it will be inserted into the container object. r\_hash\_fn will be copied by the hash\_fn object of the container object, and r\_eq\_fn will be copied by the eq\_fn object of the container object.

### cc\_hash\_table() [9/10]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Hash_Fn =
detail::default_comb_hash_fn::type, typename Resize_Policy = typename detail::default_resize_
policy<Comb_Hash_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::
::allocator<char>>
template<typename It>
__gnu_pbds::cc_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Hash_Fn, Resize_Policy, Store_Hash,
_Alloc >::cc_hash_table (
    It first,
    It last,
    const hash_fn & h,
    const eq_fn & e,
    const comb_hash_fn & ch) [inline]
```

Constructor taking \_\_iterators to a range of value\_types and some policy objects The value\_types between first\_it and last\_it will be inserted into the container object. r\_hash\_fn will be copied by the hash\_fn object of the container object, r\_eq\_fn will be copied by the eq\_fn object of the container object, and r\_comb\_hash\_fn will be copied by the comb\_hash\_fn object of the container object.

### cc\_hash\_table() [10/10]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Hash_Fn =
detail::default_comb_hash_fn::type, typename Resize_Policy = typename detail::default_resize_
policy<Comb_Hash_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::
::allocator<char>>
template<typename It>
__gnu_pbds::cc_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Hash_Fn, Resize_Policy, Store_Hash,
_Alloc >::cc_hash_table (
    It first,
    It last,
    const hash_fn & h,
    const eq_fn & e,
    const comb_hash_fn & ch,
    const resize_policy & rp) [inline]
```

Constructor taking \_\_iterators to a range of value\_types and some policy objects The value\_types between first\_it and last\_it will be inserted into the container object. r\_hash\_fn will be copied by the hash\_fn object of the container object, r\_eq\_fn will be copied by the eq\_fn object of the container object, r\_comb\_hash\_fn will be copied by the comb\_hash\_fn object of the container object, and r\_resize\_policy will be copied by the resize\_policy object of the container object.

### 6.270.1 Detailed Description

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Hash_Fn, typename Resize_Policy>
class __gnu_pbds::detail::cc_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Hash_Fn,
Resize_Policy >
```

A collision-chaining hash-based container.

#### Template Parameters

|                      |                                                                                                                                                                                                                                                         |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Key</i>           | Key type.                                                                                                                                                                                                                                               |
| <i>Mapped</i>        | Map type.                                                                                                                                                                                                                                               |
| <i>Hash_Fn</i>       | Hashing functor. Default is <code>__gnu_cxx::hash</code> .                                                                                                                                                                                              |
| <i>Eq_Fn</i>         | Equal functor. Default <code>std::equal_to&lt;Key&gt;</code>                                                                                                                                                                                            |
| <i>_Alloc</i>        | Allocator type.                                                                                                                                                                                                                                         |
| <i>Store_Hash</i>    | If key type stores extra metadata. Defaults to false.                                                                                                                                                                                                   |
| <i>Comb_Hash_Fn</i>  | Combining hash functor. If <i>Hash_Fn</i> is not null_type, then this is the ranged-hash functor; otherwise, this is the range-hashing functor. XXX(See Design::Hash-Based Containers::Hash Policies.) Default <code>direct_mask_range_hashing</code> . |
| <i>Resize_Policy</i> | Resizes hash. Defaults to <code>hash_standard_resize_policy</code> , using <code>hash_exponential_size_policy</code> and <code>hash_load_check_resize_trigger</code> .                                                                                  |

Bases are: `detail::hash_eq_fn`, `Resize_Policy`, `detail::ranged_hash_fn`, `detail::types_traits`. (Optional: `detail::debug_map_base`.)

### 6.270.2 Member Enumeration Documentation

#### anonymous enum

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Hash_Fn, typename Resize_Policy>
anonymous enum
Value stores hash, true or false.
```

### 6.270.3 Member Function Documentation

#### `empty()`

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Hash_Fn, typename Resize_Policy>
bool __gnu_pbds::detail::cc_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Hash_
Fn, Resize_Policy >::empty () const [inline], [nodiscard]
True if size() == 0.
```

#### `get_comb_hash_fn()` [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Hash_Fn, typename Resize_Policy>
Comb_Hash_Fn & __gnu_pbds::detail::cc_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Hash_Fn, Resize_Policy >::get_comb_hash_fn ()
Return current comb_hash_fn.
```

**get\_comb\_hash\_fn()** [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Hash_Fn, typename Resize_Policy>
const Comb_Hash_Fn & __gnu_pbds::detail::cc_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_↵
Hash, Comb_Hash_Fn, Resize_Policy >::get_comb_hash_fn () const
Return current const comb_hash_fn.
```

**get\_eq\_fn()** [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Hash_Fn, typename Resize_Policy>
Eq_Fn & __gnu_pbds::detail::cc_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_↵
Hash_Fn, Resize_Policy >::get_eq_fn ()
Return current eq_fn.
```

**get\_eq\_fn()** [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Hash_Fn, typename Resize_Policy>
const Eq_Fn & __gnu_pbds::detail::cc_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Hash_Fn, Resize_Policy >::get_eq_fn () const
Return current const eq_fn.
```

**get\_hash\_fn()** [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Hash_Fn, typename Resize_Policy>
Hash_Fn & __gnu_pbds::detail::cc_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_↵
Hash_Fn, Resize_Policy >::get_hash_fn ()
Return current hash_fn.
```

**get\_hash\_fn()** [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Hash_Fn, typename Resize_Policy>
const Hash_Fn & __gnu_pbds::detail::cc_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Hash_Fn, Resize_Policy >::get_hash_fn () const
Return current const hash_fn.
```

**get\_resize\_policy()** [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Hash_Fn, typename Resize_Policy>
Resize_Policy & __gnu_pbds::detail::cc_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Hash_Fn, Resize_Policy >::get_resize_policy ()
Return current resize_policy.
```

**get\_resize\_policy()** [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Hash_Fn, typename Resize_Policy>
const Resize_Policy & __gnu_pbds::detail::cc_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_↵
Hash, Comb_Hash_Fn, Resize_Policy >::get_resize_policy () const
Return current const resize_policy.
```

The documentation for this class was generated from the following file:

- [cc\\_ht\\_map.hpp](#)

## 6.271 `__gnu_cxx::char_traits<_CharT>` Struct Template Reference

```
#include <char_traits.h>
```

Inheritance diagram for `__gnu_cxx::char_traits<_CharT>`:

### Public Types

- typedef `_CharT` **char\_type**

- static constexpr char\_type **to\_char\_type** (const int\_type &\_\_c)
- static constexpr int\_type **to\_int\_type** (const char\_type &\_\_c)

### 6.271.1 Detailed Description

```
template<typename _CharT>
struct __gnu_cxx::char_traits< _CharT >
```

Base class used to implement `std::char_traits`.

#### Note

For any given actual character type, this definition is probably wrong. (Most of the member functions are likely to be right, but the `int_type` and `state_type` typedefs, and the `eof()` member function, are likely to be wrong.) The reason this class exists is so users can specialize it. Classes in namespace `std` may not be specialized for fundamental types, but classes in namespace `__gnu_cxx` may be.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/strings.html#strings.string.character\\_types](https://gcc.gnu.org/onlinedocs/libstdc++/manual/strings.html#strings.string.character_types) for advice on how to make use of this class for *unusual* character types. Also, check out `include/ext/pod_char_traits.h`.

The documentation for this struct was generated from the following file:

- [char\\_traits.h](#)

### 6.272 `std::char_traits< _CharT >` Struct Template Reference

```
#include <char_traits.h>
```

Inheritance diagram for `std::char_traits< _CharT >`:

#### Public Types

- typedef `_CharT` **char\_type**
- using **comparison\_category**
- typedef `_Char_types< _CharT >::int_type` **int\_type**
- typedef `_Char_types< _CharT >::off_type` **off\_type**
- typedef `_Char_types< _CharT >::pos_type` **pos\_type**
- typedef `_Char_types< _CharT >::state_type` **state\_type**

### Static Public Member Functions

- static constexpr void **assign** (char\_type &\_\_c1, const char\_type &\_\_c2)
- static constexpr char\_type \* **assign** (char\_type \*\_\_s, std::size\_t \_\_n, char\_type \_\_a)
- static constexpr int **compare** (const char\_type \*\_\_s1, const char\_type \*\_\_s2, std::size\_t \_\_n)
- static constexpr char\_type \* **copy** (char\_type \*\_\_s1, const char\_type \*\_\_s2, std::size\_t \_\_n)
- static constexpr int\_type **eof** ()
- static constexpr bool **eq** (const char\_type &\_\_c1, const char\_type &\_\_c2)
- static constexpr bool **eq\_int\_type** (const int\_type &\_\_c1, const int\_type &\_\_c2)
- static constexpr const char\_type \* **find** (const char\_type \*\_\_s, std::size\_t \_\_n, const char\_type &\_\_a)
- static constexpr std::size\_t **length** (const char\_type \*\_\_s)
- static constexpr bool **lt** (const char\_type &\_\_c1, const char\_type &\_\_c2)
- static constexpr char\_type \* **move** (char\_type \*\_\_s1, const char\_type \*\_\_s2, std::size\_t \_\_n)
- static constexpr int\_type **not\_eof** (const int\_type &\_\_c)
- static constexpr char\_type **to\_char\_type** (const int\_type &\_\_c)
- static constexpr int\_type **to\_int\_type** (const char\_type &\_\_c)

#### 6.272.1 Detailed Description

```
template<typename _CharT>
struct std::char_traits<_CharT>
```

Basis for explicit traits specializations.

#### Note

For any given actual character type, this definition is probably wrong. Since this is just a thin wrapper around `__gnu_cxx::char_traits`, it is possible to achieve a more appropriate definition by specializing `__gnu_cxx::char_traits`.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/strings.html#strings.string.character\\_types](https://gcc.gnu.org/onlinedocs/libstdc++/manual/strings.html#strings.string.character_types) for advice on how to make use of this class for *unusual* character types. Also, check out `include/ext/pod_char_traits.h`.

The documentation for this struct was generated from the following file:

- [char\\_traits.h](#)

### 6.273 `std::char_traits<__gnu_cxx::character<_Value,_Int,_St>>` Struct Template Reference

```
#include <pod_char_traits.h>
```

Inheritance diagram for `std::char_traits< __gnu_cxx::character< _Value, _Int, _St > >`:

### Public Types

- typedef `__gnu_cxx::character< _Value, _Int, _St >` **char\_type**
- typedef `__gnu_cxx::character< _Value, _Int, _St >` **char\_type**
- using **comparison\_category**

### 6.276.1 Detailed Description

```
template<typename _RealType = double>
class std::chi_squared_distribution< _RealType >
```

A chi\_squared\_distribution random number distribution.

The formula for the normal probability mass function is  $p(x|n) = \frac{x^{(n/2)-1}e^{-x/2}}{\Gamma(n/2)2^{n/2}}$

Since

C++11

### 6.276.2 Member Typedef Documentation

#### result\_type

```
template<typename _RealType = double>
typedef _RealType std::chi_squared_distribution< _RealType >::result_type
```

The type of the range of the distribution.

### 6.276.3 Member Function Documentation

#### max()

```
template<typename _RealType = double>
result_type std::chi_squared_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### min()

```
template<typename _RealType = double>
result_type std::chi_squared_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

#### operator>()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::chi_squared_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

#### param() [1/2]

```
template<typename _RealType = double>
param_type std::chi_squared_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

#### param() [2/2]

```
template<typename _RealType = double>
void std::chi_squared_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _RealType = double>
void std::chi_squared_distribution< _RealType >::reset () [inline]
Resets the distribution state.
```

**6.276.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::chi_squared_distribution< _RealType1 > & __x) [friend]
Inserts a chi_squared_distribution random number distribution __x into the output stream __os.
```

**Parameters**

|                   |                                                        |
|-------------------|--------------------------------------------------------|
| <code>__os</code> | An output stream.                                      |
| <code>__x</code>  | A chi_squared_distribution random number distribution. |

**Returns**

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _RealType = double>
bool operator== (
    const chi_squared_distribution< _RealType > & __d1,
    const chi_squared_distribution< _RealType > & __d2) [friend]
```

Return true if two Chi-squared distributions have the same parameters and the sequences that would be generated are equal.

**operator>>**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::chi_squared_distribution< _RealType1 > & __x) [friend]
Extracts a chi_squared_distribution random number distribution __x from the input stream __is.
```

**Parameters**

|                   |                  |
|-------------------|------------------|
| <code>__is</code> | An input stream. |
|-------------------|------------------|

|                 |                                                            |
|-----------------|------------------------------------------------------------|
| <code>_↵</code> | A chi_squared_distribution random number generator engine. |
| <code>_X</code> |                                                            |

#### Returns

The input stream with `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

## 6.277 std::codecvt< \_InternT, \_ExternT, \_StateT > Class Template Reference

### 6.277.1 Detailed Description

```
template<typename _InternT, typename _ExternT, typename _StateT>
class std::codecvt< _InternT, _ExternT, _StateT >
```

Primary class template `codecvt`.

NB: Generic, mostly useless implementation.

### 6.277.2 Member Function Documentation

#### do\_always\_noconv()

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual bool std::codecvt<_InternT, _ExternT, _StateT >::do_always_noconv () const throw ( )
[protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base<\\_InternT, \\_ExternT, \\_StateT >](#).

#### do\_encoding()

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual int std::codecvt<_InternT, _ExternT, _StateT >::do_encoding () const throw ( ) [protected],
[virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base<\\_InternT, \\_ExternT, \\_StateT >](#).

#### do\_in()

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual result std::codecvt<_InternT, _ExternT, _StateT >::do_in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base<\\_InternT, \\_ExternT, \\_StateT >](#).

#### do\_length()

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual int std::codecvt<_InternT, _ExternT, _StateT >::do_length (
    state_type & ,
    const extern_type * __from,
    const extern_type * __end,
    size_t __max) const [protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base<\\_InternT, \\_ExternT, \\_StateT >](#).

#### do\_max\_length()

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual int std::codecvt<_InternT, _ExternT, _StateT >::do_max_length () const throw ( ) [protected],
[virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base<\\_InternT, \\_ExternT, \\_StateT >](#).

#### do\_out()

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual result std::codecvt<_InternT, _ExternT, _StateT >::do_out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
```

```
extern_type * __to_end,
extern_type *& __to_next) const [protected], [virtual]
```

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This function is a hook for derived classes to change the value returned.

See also

out for more information.

Implements [std::\\_\\_codecvt\\_abstract\\_base< \\_InternT, \\_ExternT, \\_StateT >](#).

### do\_unshift()

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual result std::__codecvt< _InternT, _ExternT, _StateT >::do_unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< \\_InternT, \\_ExternT, \\_StateT >](#).

### in()

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [inline], [inherited]
```

Convert from external to internal character set.

Converts input string of extern\_type to output string of intern\_type. This is analogous to mbsrtowcs. It does this by calling codecvt::do\_in.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from\_end) are converted and written to [to,to\_end). from\_next and to\_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from\_next and to\_next are not affected.

The state argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how state is used.

The result returned is a member of codecvt\_base::result. If all the input is converted, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt\_base::partial. Otherwise the conversion failed and codecvt\_base::error is returned.

#### Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

## Returns

codecvt\_base::result.

## out()

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base<_InternT, _ExternT, _StateT >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This is analogous to wcsrtombs. It does this by calling codecvt::do\_out.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from\_end) are converted and written to [to,to\_end). from\_next and to\_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from\_next and to\_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt\_base::result. If all the input is converted, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt\_base::partial. Otherwise the conversion failed and codecvt\_base::error is returned.

## Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

## Returns

codecvt\_base::result.

References [do\\_out\(\)](#).

## unshift()

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base<_InternT, _ExternT, _StateT >::unshift (
    state_type & __state,
    extern_type * __to,
```

```
extern_type * __to_end,
extern_type *& __to_next) const [inline], [inherited]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

#### Parameters

|                        |                                      |
|------------------------|--------------------------------------|
| <code>__state</code>   | Persistent conversion state data.    |
| <code>__to</code>      | Start of output buffer.              |
| <code>__to_end</code>  | End of output buffer.                |
| <code>__to_next</code> | Returns start of unused output area. |

#### Returns

`codecvt_base::result`.

### 6.278.1 Detailed Description

`template<typename _InternT, typename _ExternT>`  
`class std::codecvt< _InternT, _ExternT, encoding_state >`

`codecvt<InternT, _ExternT, encoding_state>` specialization.

### 6.278.2 Member Function Documentation

#### `do_always_noconv()`

```
template<typename _InternT, typename _ExternT>
bool std::codecvt< _InternT, _ExternT, encoding_state >::do_always_noconv () const throw ( )
[protected], [virtual]
```

Implements `std::__codecvt_abstract_base< _InternT, _ExternT, encoding_state >`.

#### `do_encoding()`

```
template<typename _InternT, typename _ExternT>
int std::codecvt< _InternT, _ExternT, encoding_state >::do_encoding () const throw ( ) [protected],
[virtual]
```

Implements `std::__codecvt_abstract_base< _InternT, _ExternT, encoding_state >`.

#### `do_in()`

```
template<typename _InternT, typename _ExternT>
codecvt_base::result std::codecvt< _InternT, _ExternT, encoding_state >::do_in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [protected], [virtual]
```

Implements `std::__codecvt_abstract_base< _InternT, _ExternT, encoding_state >`.

**do\_length()**

```
template<typename _InternT, typename _ExternT>
int std::codecvt<_InternT, _ExternT, encoding_state >::do_length (
    state_type & ,
    const extern_type * __from,
    const extern_type * __end,
    size_t __max) const [protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base<\\_InternT, \\_ExternT, encoding\\_state >](#).

**do\_max\_length()**

```
template<typename _InternT, typename _ExternT>
int std::codecvt<_InternT, _ExternT, encoding_state >::do_max_length () const throw ( ) [protected],
[virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base<\\_InternT, \\_ExternT, encoding\\_state >](#).

**do\_out()**

```
template<typename _InternT, typename _ExternT>
codecvt_base::result std::codecvt<_InternT, _ExternT, encoding_state >::do_out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [protected], [virtual]
```

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This function is a hook for derived classes to change the value returned.

See also

[do\\_out\(\)](#) for more information.

Implements [std::\\_\\_codecvt\\_abstract\\_base<\\_InternT, \\_ExternT, encoding\\_state >](#).

**do\_unshift()**

```
template<typename _InternT, typename _ExternT>
codecvt_base::result std::codecvt<_InternT, _ExternT, encoding_state >::do_unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base<\\_InternT, \\_ExternT, encoding\\_state >](#).

**in() [1/2]**

```
result std::__codecvt_abstract_base<_InternT, _ExternT, encoding_state >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
```

```
intern_type * __to_end,
intern_type *& __to_next) const [inline], [inherited]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

#### Returns

`codecvt_base::result`.

#### `in()` [2/2]

```
result std::__codecvt_abstract_base< _InternT, _ExternT, encoding_state >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [inline]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

## Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

## Returns

`codecvt_base::result`.

**out()** [1/2]

```
result std::__codecvt_abstract_base<_InternT, _ExternT, encoding_state >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

## Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

## Returns

`codecvt_base::result`.

**out()** [2/2]

```
result std::__codecvt_abstract_base< _InternT, _ExternT, encoding_state >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

**Parameters**

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

**Returns**

`codecvt_base::result`.

**unshift()** [1/2]

```
result std::__codecvt_abstract_base< _InternT, _ExternT, encoding_state >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Reset conversion state.

Writes characters to output that would restore `state` to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

## Parameters

|                        |                                      |
|------------------------|--------------------------------------|
| <code>__state</code>   | Persistent conversion state data.    |
| <code>__to</code>      | Start of output buffer.              |
| <code>__to_end</code>  | End of output buffer.                |
| <code>__to_next</code> | Returns start of unused output area. |

## Returns

codecvt\_base::result.

## unshift() [2/2]

```
result std::__codecvt_abstract_base< _InternT, _ExternT, encoding_state >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

## Parameters

|                        |                                      |
|------------------------|--------------------------------------|
| <code>__state</code>   | Persistent conversion state data.    |
| <code>__to</code>      | Start of output buffer.              |
| <code>__to_end</code>  | End of output buffer.                |
| <code>__to_next</code> | Returns start of unused output area. |

## Returns

codecvt\_base::result.

The documentation for this class was generated from the following file:

### 6.279.1 Detailed Description

class codecvt<char, char, mbstate\_t> specialization.

### 6.279.2 Member Function Documentation

#### do\_always\_noconv()

virtual bool [std::codecvt< char, char, mbstate\\_t >::do\\_always\\_noconv](#) () const throw ( ) [protected], [virtual]

Implements [std::\\_\\_codecvt\\_abstract\\_base< char, char, mbstate\\_t >](#).

**do\_encoding()**

```
virtual int std::codecvt< char, char, mbstate_t >::do_encoding () const throw ( )    [protected],  
[virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base](#)< char, char, mbstate\_t >.

**do\_in()**

```
virtual result std::codecvt< char, char, mbstate_t >::do_in (  
    state_type & __state,  
    const extern_type * __from,  
    const extern_type * __from_end,  
    const extern_type *& __from_next,  
    intern_type * __to,  
    intern_type * __to_end,  
    intern_type *& __to_next) const    [protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base](#)< char, char, mbstate\_t >.

**do\_length()**

```
virtual int std::codecvt< char, char, mbstate_t >::do_length (  
    state_type & ,  
    const extern_type * __from,  
    const extern_type * __end,  
    size_t __max) const    [protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base](#)< char, char, mbstate\_t >.

**do\_max\_length()**

```
virtual int std::codecvt< char, char, mbstate_t >::do_max_length () const throw ( )    [protected],  
[virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base](#)< char, char, mbstate\_t >.

**do\_out()**

```
virtual result std::codecvt< char, char, mbstate_t >::do_out (  
    state_type & __state,  
    const intern_type * __from,  
    const intern_type * __from_end,  
    const intern_type *& __from_next,  
    extern_type * __to,  
    extern_type * __to_end,  
    extern_type *& __to_next) const    [protected], [virtual]
```

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This function is a hook for derived classes to change the value returned.

**See also**

[do\\_out](#) for more information.

Implements [std::\\_\\_codecvt\\_abstract\\_base](#)< char, char, mbstate\_t >.

**do\_unshift()**

```
virtual result std::codecvt< char, char, mbstate_t >::do_unshift (  
    state_type & __state,
```

```
extern_type * __to,
extern_type * __to_end,
extern_type *& __to_next) const [protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< char, char, mbstate\\_t >](#).

### in() [1/2]

```
result std::__codecvt_abstract_base< char, char, mbstate_t >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [inline], [inherited]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

### Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

### Returns

`codecvt_base::result`.

### in() [2/2]

```
result std::__codecvt_abstract_base< char, char, mbstate_t >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [inline]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

#### Returns

`codecvt_base::result`.

#### out() [1/2]

```
result std::__codecvt_abstract_base< char, char, mbstate_t >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

|                      |                                   |
|----------------------|-----------------------------------|
| <code>__state</code> | Persistent conversion state data. |
|----------------------|-----------------------------------|

## Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

## Returns

`codecvt_base::result`.

**out()** [2/2]

```
result std::__codecvt_abstract_base< char, char, mbstate_t >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

## Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

## Returns

`codecvt_base::result`.

**unshift()** [1/2]

```
result std::__codecvt_abstract_base< char, char, mbstate_t >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

**Parameters**

|                        |                                      |
|------------------------|--------------------------------------|
| <code>__state</code>   | Persistent conversion state data.    |
| <code>__to</code>      | Start of output buffer.              |
| <code>__to_end</code>  | End of output buffer.                |
| <code>__to_next</code> | Returns start of unused output area. |

**Returns**

`codecvt_base::result`.

**unshift()** [2/2]

```
result std::__codecvt_abstract_base< char, char, mbstate_t >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

**Parameters**

|                        |                                      |
|------------------------|--------------------------------------|
| <code>__state</code>   | Persistent conversion state data.    |
| <code>__to</code>      | Start of output buffer.              |
| <code>__to_end</code>  | End of output buffer.                |
| <code>__to_next</code> | Returns start of unused output area. |

## Returns

codecvt\_base::result.

The documentation for this class was generated from the following file:

     const extern\_type \* \_\_from\_end,  
     const extern\_type \*& \_\_from\_next,  
     intern\_type \* \_\_to,  
     intern\_type \* \_\_to\_end,  
     intern\_type \*& \_\_to\_next) const [protected], [virtual]

Implements [std::\\_\\_codecvt\\_abstract\\_base< char16\\_t, char, mbstate\\_t >](#).

### do\_length()

virtual int [std::codecvt< char16\\_t, char, mbstate\\_t >::do\\_length \(](#)  
     state\_type & ,  
     const extern\_type \* \_\_from,  
     const extern\_type \* \_\_end,  
     size\_t \_\_max) const [protected], [virtual]

Implements [std::\\_\\_codecvt\\_abstract\\_base< char16\\_t, char, mbstate\\_t >](#).

### do\_max\_length()

virtual int [std::codecvt< char16\\_t, char, mbstate\\_t >::do\\_max\\_length \(\)](#) const throw ( ) [protected], [virtual]

Implements [std::\\_\\_codecvt\\_abstract\\_base< char16\\_t, char, mbstate\\_t >](#).

### do\_out()

virtual result [std::codecvt< char16\\_t, char, mbstate\\_t >::do\\_out \(](#)  
     state\_type & \_\_state,  
     const intern\_type \* \_\_from,  
     const intern\_type \* \_\_from\_end,  
     const intern\_type \*& \_\_from\_next,  
     extern\_type \* \_\_to,  
     extern\_type \* \_\_to\_end,  
     extern\_type \*& \_\_to\_next) const [protected], [virtual]

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This function is a hook for derived classes to change the value returned.

See also

out for more information.

Implements `std::__codecvt_abstract_base< char16_t, char, mbstate_t >`.

### do\_unshift()

```
virtual result std::__codecvt< char16_t, char, mbstate_t >::do_unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [protected], [virtual]
```

Implements `std::__codecvt_abstract_base< char16_t, char, mbstate_t >`.

### in() [1/2]

```
result std::__codecvt_abstract_base< char16_t, char, mbstate_t >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [inline], [inherited]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

#### Returns

`codecvt_base::result`.

**in()** [2/2]

```
result std::__codecvt_abstract_base< char16_t, char, mbstate_t >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [inline]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

**Parameters**

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

**Returns**

`codecvt_base::result`.

**out()** [1/2]

```
result std::__codecvt_abstract_base< char16_t, char, mbstate_t >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

#### Returns

`codecvt_base::result`.

#### out() [2/2]

```
result std::__codecvt_abstract_base< char16_t, char, mbstate_t >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

---

**Returns**

codecvt\_base::result.

**unshift() [1/2]**

```
result std::__codecvt_abstract_base< char16_t, char, mbstate_t >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling codecvt::do\_unshift().

For example, if 4 external characters always converted to 1 internal character, and input to in() had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of codecvt\_base::result. If the state could be reset and data written, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the output has insufficient space, returns codecvt\_base::partial. Otherwise the reset failed and codecvt\_base::error is returned.

**Parameters**

|                        |                                      |
|------------------------|--------------------------------------|
| <code>__state</code>   | Persistent conversion state data.    |
| <code>__to</code>      | Start of output buffer.              |
| <code>__to_end</code>  | End of output buffer.                |
| <code>__to_next</code> | Returns start of unused output area. |

**Returns**

codecvt\_base::result.

**unshift() [2/2]**

```
result std::__codecvt_abstract_base< char16_t, char, mbstate_t >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling codecvt::do\_unshift().

For example, if 4 external characters always converted to 1 internal character, and input to in() had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of codecvt\_base::result. If the state could be reset and data written, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the output has insufficient space, returns codecvt\_base::partial. Otherwise the reset failed and codecvt\_base::error is returned.

## Parameters

|                        |                                      |
|------------------------|--------------------------------------|
| <code>__state</code>   | Persistent conversion state data.    |
| <code>__to</code>      | Start of output buffer.              |
| <code>__to_end</code>  | End of output buffer.                |
| <code>__to_next</code> | Returns start of unused output area. |

## Returns

`codecvt_base::result`.

The documentation for this class was generated from the following file:

### 6.281.1 Detailed Description

Class `codecvt<char32_t, char, mbstate_t>` specialization.  
Converts between UTF-32 and UTF-8.

### 6.281.2 Member Function Documentation

#### `do_always_noconv()`

```
virtual bool std::codecvt< char32\_t, char, mbstate\_t >::do\_always\_noconv \(\) const throw \( \) [protected],  
[virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< char32\\_t, char, mbstate\\_t >](#).

#### `do_encoding()`

```
virtual int std::codecvt< char32\_t, char, mbstate\_t >::do\_encoding \(\) const throw \( \) [protected],  
[virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< char32\\_t, char, mbstate\\_t >](#).

#### `do_in()`

```
virtual result std::codecvt< char32\_t, char, mbstate\_t >::do\_in \(  
    state_type & __state,  
    const extern_type * __from,  
    const extern_type * __from_end,  
    const extern_type *& __from_next,  
    intern_type * __to,  
    intern_type * __to_end,  
    intern_type *& __to_next) const [protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< char32\\_t, char, mbstate\\_t >](#).

#### `do_length()`

```
virtual int std::codecvt< char32\_t, char, mbstate\_t >::do\_length \(  
    state_type & ,  
    const extern_type * __from,  
    const extern_type * __end,  
    size_t __max) const [protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< char32\\_t, char, mbstate\\_t >](#).

#### `do_max_length()`

```
virtual int std::codecvt< char32\_t, char, mbstate\_t >::do\_max\_length \(\) const throw \( \) [protected],  
[virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< char32\\_t, char, mbstate\\_t >](#).

#### `do_out()`

```
virtual result std::codecvt< char32\_t, char, mbstate\_t >::do\_out \(  
    state_type & __state,  
    const intern_type * __from,  
    const intern_type * __from_end,
```

```
const intern_type * __from_next,
extern_type * __to,
extern_type * __to_end,
extern_type * __to_next) const [protected], [virtual]
```

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This function is a hook for derived classes to change the value returned.

See also

out for more information.

Implements [std::\\_\\_codecvt\\_abstract\\_base< char32\\_t, char, mbstate\\_t >](#).

### do\_unshift()

```
virtual result std::codecvt< char32_t, char, mbstate_t >::do_unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type * __to_next) const [protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< char32\\_t, char, mbstate\\_t >](#).

### in() [1/2]

```
result std::__codecvt_abstract_base< char32_t, char, mbstate_t >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type * __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type * __to_next) const [inline], [inherited]
```

Convert from external to internal character set.

Converts input string of extern\_type to output string of intern\_type. This is analogous to mbsrtowcs. It does this by calling codecvt::do\_in.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from\_end) are converted and written to [to,to\_end). from\_next and to\_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from\_next and to\_next are not affected.

The state argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how state is used.

The result returned is a member of codecvt\_base::result. If all the input is converted, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt\_base::partial. Otherwise the conversion failed and codecvt\_base::error is returned.

### Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

## Returns

codecvt\_base::result.

## in() [2/2]

```
result std::__codecvt_abstract_base< char32_t, char, mbstate_t >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [inline]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

## Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

## Returns

codecvt\_base::result.

## out() [1/2]

```
result std::__codecvt_abstract_base< char32_t, char, mbstate_t >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
```

```
extern_type * __to_end,
extern_type *& __to_next) const [inline], [inherited]
```

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This is analogous to wcsrtombs. It does this by calling codecvt::do\_out.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from\_end) are converted and written to [to,to\_end). from\_next and to\_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from\_next and to\_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt\_base::result. If all the input is converted, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt\_base::partial. Otherwise the conversion failed and codecvt\_base::error is returned.

#### Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

#### Returns

codecvt\_base::result.

#### out() [2/2]

```
result std::__codecvt_abstract_base< char32_t, char, mbstate_t >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This is analogous to wcsrtombs. It does this by calling codecvt::do\_out.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from\_end) are converted and written to [to,to\_end). from\_next and to\_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from\_next and to\_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt\_base::result. If all the input is converted, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt\_base::partial. Otherwise the conversion failed and codecvt\_base::error is returned.

**Parameters**

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

**Returns**

`codecvt_base::result`.

**unshift() [1/2]**

```
result std::__codecvt_abstract_base< char32_t, char, mbstate_t >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

**Reset conversion state.**

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

**Parameters**

|                        |                                      |
|------------------------|--------------------------------------|
| <code>__state</code>   | Persistent conversion state data.    |
| <code>__to</code>      | Start of output buffer.              |
| <code>__to_end</code>  | End of output buffer.                |
| <code>__to_next</code> | Returns start of unused output area. |

**Returns**

`codecvt_base::result`.

**unshift() [2/2]**

```
result std::__codecvt_abstract_base< char32_t, char, mbstate_t >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

**Reset conversion state.**

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

#### Parameters

|                        |                                      |
|------------------------|--------------------------------------|
| <code>__state</code>   | Persistent conversion state data.    |
| <code>__to</code>      | Start of output buffer.              |
| <code>__to_end</code>  | End of output buffer.                |
| <code>__to_next</code> | Returns start of unused output area. |

#### Returns

`codecvt_base::result`.

**6.282.1 Detailed Description**

Class codecvt<wchar\_t, char, mbstate\_t> specialization.

Converts between narrow and wide characters in the native character set

**6.282.2 Member Function Documentation****do\_always\_noconv()**

```
virtual bool std::codecvt< wchar_t, char, mbstate_t >::do_always_noconv () const throw ( )    [protected],
[virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< wchar\\_t, char, mbstate\\_t >](#).

**do\_encoding()**

```
virtual int std::codecvt< wchar_t, char, mbstate_t >::do_encoding () const throw ( )    [protected],
[virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< wchar\\_t, char, mbstate\\_t >](#).

**do\_in()**

```
virtual result std::codecvt< wchar_t, char, mbstate_t >::do_in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const    [protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< wchar\\_t, char, mbstate\\_t >](#).

**do\_length()**

```
virtual int std::codecvt< wchar_t, char, mbstate_t >::do_length (
    state_type & ,
    const extern_type * __from,
    const extern_type * __end,
    size_t __max) const [protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< wchar\\_t, char, mbstate\\_t >](#).

**do\_max\_length()**

```
virtual int std::codecvt< wchar_t, char, mbstate_t >::do_max_length () const throw ( ) [protected],
[virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< wchar\\_t, char, mbstate\\_t >](#).

**do\_out()**

```
virtual result std::codecvt< wchar_t, char, mbstate_t >::do_out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [protected], [virtual]
```

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This function is a hook for derived classes to change the value returned.

See also

[do\\_out\(\)](#) for more information.

Implements [std::\\_\\_codecvt\\_abstract\\_base< wchar\\_t, char, mbstate\\_t >](#).

**do\_unshift()**

```
virtual result std::codecvt< wchar_t, char, mbstate_t >::do_unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< wchar\\_t, char, mbstate\\_t >](#).

**in() [1/2]**

```
result std::__codecvt_abstract_base< wchar_t, char, mbstate_t >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [inline], [inherited]
```

Convert from external to internal character set.

Converts input string of extern\_type to output string of intern\_type. This is analogous to mbsrtowcs. It does this by calling codecvt::do\_in.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from\_end) are converted and written to [to,to\_end). from\_next and to\_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from\_next and to\_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt\_base::result. If all the input is converted, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt\_base::partial. Otherwise the conversion failed and codecvt\_base::error is returned.

#### Parameters

|             |                                      |
|-------------|--------------------------------------|
| __state     | Persistent conversion state data.    |
| __from      | Start of input.                      |
| __from_end  | End of input.                        |
| __from_next | Returns start of unconverted data.   |
| __to        | Start of output buffer.              |
| __to_end    | End of output buffer.                |
| __to_next   | Returns start of unused output area. |

#### Returns

codecvt\_base::result.

#### in() [2/2]

```
result std::__codecvt_abstract_base< wchar_t, char, mbstate_t >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [inline]
```

Convert from external to internal character set.

Converts input string of extern\_type to output string of intern\_type. This is analogous to mbsrtowcs. It does this by calling codecvt::do\_in.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from\_end) are converted and written to [to,to\_end). from\_next and to\_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from\_next and to\_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt\_base::result. If all the input is converted, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt\_base::partial. Otherwise the conversion failed and codecvt\_base::error is returned.

#### Parameters

|            |                                   |
|------------|-----------------------------------|
| __state    | Persistent conversion state data. |
| __from     | Start of input.                   |
| __from_end | End of input.                     |

**Parameters**

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

**Returns**

`codecvt_base::result`.

**out()** [1/2]

```
result std::__codecvt_abstract_base< wchar_t, char, mbstate_t >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

**Parameters**

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

**Returns**

`codecvt_base::result`.

**out()** [2/2]

```
result std::__codecvt_abstract_base< wchar_t, char, mbstate_t >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This is analogous to wcsrtombs. It does this by calling codecvt::do\_out.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from\_end) are converted and written to [to,to\_end). from\_next and to\_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from\_next and to\_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt\_base::result. If all the input is converted, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt\_base::partial. Otherwise the conversion failed and codecvt\_base::error is returned.

**Parameters**

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

**Returns**

codecvt\_base::result.

**unshift()** [1/2]

```
result std::__codecvt_abstract_base< wchar_t, char, mbstate_t >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling codecvt::do\_unshift().

For example, if 4 external characters always converted to 1 internal character, and input to in() had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of codecvt\_base::result. If the state could be reset and data written, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the output has insufficient space, returns codecvt\_base::partial. Otherwise the reset failed and codecvt\_base::error is returned.

**Parameters**

|                        |                                      |
|------------------------|--------------------------------------|
| <code>__state</code>   | Persistent conversion state data.    |
| <code>__to</code>      | Start of output buffer.              |
| <code>__to_end</code>  | End of output buffer.                |
| <code>__to_next</code> | Returns start of unused output area. |

**Returns**

`codecvt_base::result`.

**unshift() [2/2]**

```
result std::__codecvt_abstract_base< wchar_t, char, mbstate_t >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

**Parameters**

|                        |                                      |
|------------------------|--------------------------------------|
| <code>__state</code>   | Persistent conversion state data.    |
| <code>__to</code>      | Start of output buffer.              |
| <code>__to_end</code>  | End of output buffer.                |
| <code>__to_next</code> | Returns start of unused output area. |

**Returns**

`codecvt_base::result`.

### 6.284.1 Detailed Description

```
template<typename _InternT, typename _ExternT, typename _StateT>
class std::codecvt_byname<_InternT, _ExternT, _StateT >
```

class codecvt\_byname [22.2.1.6].

### 6.284.2 Member Function Documentation

#### do\_always\_noconv()

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual bool std::codecvt<\_InternT, \_ExternT, \_StateT >::do\_always\_noconv () const throw ( )
[protected], [virtual], [inherited]
Implements std::\_\_codecvt\_abstract\_base<\_InternT, \_ExternT, \_StateT >.
```

#### do\_encoding()

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual int std::codecvt<\_InternT, \_ExternT, \_StateT >::do\_encoding () const throw ( ) [protected],
[virtual], [inherited]
Implements std::\_\_codecvt\_abstract\_base<\_InternT, \_ExternT, \_StateT >.
```

**do\_in()**

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual result std::codecvt< _InternT, _ExternT, _StateT >::do_in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type * __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type * __to_next) const [protected], [virtual], [inherited]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< \\_InternT, \\_ExternT, \\_StateT >](#).

**do\_length()**

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual int std::codecvt< _InternT, _ExternT, _StateT >::do_length (
    state_type & ,
    const extern_type * __from,
    const extern_type * __end,
    size_t __max) const [protected], [virtual], [inherited]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< \\_InternT, \\_ExternT, \\_StateT >](#).

**do\_max\_length()**

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual int std::codecvt< _InternT, _ExternT, _StateT >::do_max_length () const throw ( ) [protected],
[virtual], [inherited]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< \\_InternT, \\_ExternT, \\_StateT >](#).

**do\_out()**

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual result std::codecvt< _InternT, _ExternT, _StateT >::do_out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type * __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type * __to_next) const [protected], [virtual], [inherited]
```

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This function is a hook for derived classes to change the value returned.

See also

[do\\_out](#) for more information.

Implements [std::\\_\\_codecvt\\_abstract\\_base< \\_InternT, \\_ExternT, \\_StateT >](#).

**do\_unshift()**

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual result std::codecvt< _InternT, _ExternT, _StateT >::do_unshift (
    state_type & __state,
    extern_type * __to,
```

```
extern_type * __to_end,
extern_type *& __to_next) const [protected], [virtual], [inherited]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base<\\_InternT, \\_ExternT, \\_StateT >](#).

### in()

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base<_InternT, _ExternT, _StateT >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [inline], [inherited]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

### Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

### Returns

`codecvt_base::result`.

### out()

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base<_InternT, _ExternT, _StateT >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

#### Returns

`codecvt_base::result`.

References [do\\_out\(\)](#).

#### unshift()

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Reset conversion state.

Writes characters to output that would restore `state` to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

#### Parameters

|                       |                                   |
|-----------------------|-----------------------------------|
| <code>__state</code>  | Persistent conversion state data. |
| <code>__to</code>     | Start of output buffer.           |
| <code>__to_end</code> | End of output buffer.             |

|                        |                                      |
|------------------------|--------------------------------------|
| <code>__to_next</code> | Returns start of unused output area. |
|------------------------|--------------------------------------|

**Returns**

`codecvt_base::result`.

### 6.285.1 Detailed Description

```
template<typename _CharT>
class std::__cxx11::collate< _CharT >
```

Facet for localized string comparison.

This facet encapsulates the code to compare strings in a localized manner.

The collate template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the collate facet.

### 6.285.2 Member Typedef Documentation

#### char\_type

```
template<typename _CharT>
typedef _CharT std::__cxx11::collate< _CharT >::char_type
```

Public typedefs.

#### string\_type

```
template<typename _CharT>
typedef basic_string<_CharT> std::__cxx11::collate< _CharT >::string_type
```

Public typedefs.

### 6.285.3 Constructor & Destructor Documentation

#### collate() [1/2]

```
template<typename _CharT>
std::__cxx11::collate< _CharT >::collate (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

## Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

References [std::locale::facet::facet\(\)](#).

Referenced by [do\\_compare\(\)](#), [do\\_hash\(\)](#), and [do\\_transform\(\)](#).

**collate()** [2/2]

```
template<typename _CharT>
std::__cxx11::collate<_CharT>::collate (
    __c_locale __cloc,
    size_t __refs = 0) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

## Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__cloc</code> | The C locale.                   |
| <code>__refs</code> | Passed to the base facet class. |

References [std::locale::facet::facet\(\)](#).

**~collate()**

```
template<typename _CharT>
virtual std::__cxx11::collate<_CharT>::~~collate () [inline], [protected], [virtual]
```

Destructor.

**6.285.4 Member Function Documentation****compare()**

```
template<typename _CharT>
int std::__cxx11::collate<_CharT>::compare (
    const _CharT * __lo1,
    const _CharT * __hi1,
    const _CharT * __lo2,
    const _CharT * __hi2) const [inline]
```

Compare two strings.

This function compares two strings and returns the result by calling `collate::do_compare()`.

## Parameters

|                    |                    |
|--------------------|--------------------|
| <code>__lo1</code> | Start of string 1. |
| <code>__hi1</code> | End of string 1.   |
| <code>__lo2</code> | Start of string 2. |
| <code>__hi2</code> | End of string 2.   |

## Returns

1 if `string1 > string2`, -1 if `string1 < string2`, else 0.

References [do\\_compare\(\)](#).

**do\_compare()**

```
template<typename _CharT>
int std::collate< _CharT >::do_compare (
    const _CharT * __lo1,
    const _CharT * __hi1,
    const _CharT * __lo2,
    const _CharT * __hi2) const [protected], [virtual]
```

Compare two strings.

This function is a hook for derived classes to change the value returned.

See also

`compare()`.

**Parameters**

|                    |                    |
|--------------------|--------------------|
| <code>__lo1</code> | Start of string 1. |
| <code>__hi1</code> | End of string 1.   |
| <code>__lo2</code> | Start of string 2. |
| <code>__hi2</code> | End of string 2.   |

**Returns**

1 if `string1 > string2`, -1 if `string1 < string2`, else 0.

References [collate\(\)](#), [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::c\\_str\(\)](#), [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::data\(\)](#), and [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::length\(\)](#).

Referenced by [compare\(\)](#).

**do\_hash()**

```
template<typename _CharT>
long std::collate< _CharT >::do_hash (
    const _CharT * __lo,
    const _CharT * __hi) const [protected], [virtual]
```

Return hash of a string.

This function computes and returns a hash on the input string. This function is a hook for derived classes to change the value returned.

**Parameters**

|                   |                  |
|-------------------|------------------|
| <code>__lo</code> | Start of string. |
| <code>__hi</code> | End of string.   |

**Returns**

Hash value.

References [collate\(\)](#).

Referenced by [hash\(\)](#).

**do\_transform()**

```
template<typename _CharT>
collate<_CharT>::string_type std::collate<_CharT>::do_transform (
    const _CharT * __lo,
    const _CharT * __hi) const [protected], [virtual]
```

Transform string to comparable form.

This function is a hook for derived classes to change the value returned.

**Parameters**

|                           |        |
|---------------------------|--------|
| $\leftrightarrow$<br>__lo | Start. |
| $\leftrightarrow$<br>__hi | End.   |

**Returns**

transformed string.

References [collate\(\)](#), [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::append\(\)](#), [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::c\\_str\(\)](#), [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::clear\(\)](#), [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::data\(\)](#), [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::push\\_back\(\)](#), and [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::push\\_back\(\)](#).

Referenced by [transform\(\)](#).

**hash()**

```
template<typename _CharT>
long std::__cxx11::collate<_CharT>::hash (
    const _CharT * __lo,
    const _CharT * __hi) const [inline]
```

Return hash of a string.

This function computes and returns a hash on the input string. It does so by returning [collate::do\\_hash\(\)](#).

**Parameters**

|                           |                  |
|---------------------------|------------------|
| $\leftrightarrow$<br>__lo | Start of string. |
| $\leftrightarrow$<br>__hi | End of string.   |

**Returns**

Hash value.

References [do\\_hash\(\)](#).

**transform()**

```
template<typename _CharT>
string_type std::__cxx11::collate<_CharT>::transform (
    const _CharT * __lo,
    const _CharT * __hi) const [inline]
```

Transform string to comparable form.

This function is a wrapper for `strxfrm` functionality. It takes the input string and returns a modified string that can be directly compared to other transformed strings. In the C locale, this function just returns a copy of the input string. In some other locales, it may replace two chars with one, change a char for another, etc. It does so by returning `collate::do_transform()`.

#### Parameters

|                         |                  |
|-------------------------|------------------|
| <code>_↔<br/>_lo</code> | Start of string. |
| <code>_↔<br/>_hi</code> | End of string.   |

#### Returns

Transformed `string_type`.

References [do\\_transform\(\)](#).

### 6.285.5 Member Data Documentation

#### id

```
template<typename _CharT>

**6.296.1 Detailed Description**

template<typename \_Tp>  
class std::complex<\_Tp>

Template to represent complex numbers.

Specializations for float, double, and long double are part of the library. Results with any other type are not guaranteed.

**Parameters**

|           |                                    |
|-----------|------------------------------------|
| <i>Tp</i> | Type of real and imaginary values. |
|-----------|------------------------------------|

**6.296.2 Member Typedef Documentation****value\_type**

template<typename \_Tp>  
typedef \_Tp [std::complex](#)<\_Tp>::value\_type  
Value typedef.

### 6.296.3 Constructor & Destructor Documentation

#### complex() [1/2]

```
template<typename _Tp>
std::complex< _Tp >::complex (
    const _Tp & __r = _Tp(),
    const _Tp & __i = _Tp()) [inline], [constexpr]
```

Default constructor. First parameter is x, second parameter is y. Unspecified parameters default to 0. Referenced by [complex\(\)](#), [operator\\*=\(\(\)\)](#), [operator+=\(\(\)\)](#), [operator-=\(\(\)\)](#), [operator/=\(\(\)\)](#), and [operator=\(\)](#).

#### complex() [2/2]

```
template<typename _Tp>
template<typename _Up>
std::complex< _Tp >::complex (
    const complex< _Up > & __z) [inline], [constexpr]
```

Converting constructor.

References [complex\(\)](#).

### 6.296.4 Member Function Documentation

#### operator+=(())

```
template<typename _Tp>
complex< _Tp > & std::complex< _Tp >::operator+= (
    const _Tp & __t) [inline], [constexpr]
```

Add a scalar to this complex number.

#### operator-=(())

```
template<typename _Tp>
complex< _Tp > & std::complex< _Tp >::operator-= (
    const _Tp & __t) [inline], [constexpr]
```

Subtract a scalar from this complex number.

The documentation for this class was generated from the following file:

- [complex](#)

### 6.297 std::complex< double > Class Reference

## Public Member Functions

- **condition\_base** (const [condition\\_base](#) &)=default
- **condition\_base & operator=** (const [condition\\_base](#) &)=default

### 6.302.1 Detailed Description

Base struct for condition policy.

Requires a public member function with the signature void throw\_conditionally()

The documentation for this struct was generated from the following file:

- [throw\\_allocator.h](#)

## 6.303 std::condition\_variable Class Reference

```
#include <condition_variable>
```

### Public Types

- typedef \_\_gthread\_cond\_t \* **native\_handle\_type**

### Public Member Functions

- **condition\_variable** (const [condition\\_variable](#) &)=delete
- native\_handle\_type **native\_handle** ()
- void **notify\_all** () noexcept
- void **notify\_one** () noexcept
- [condition\\_variable](#) & **operator=** (const [condition\\_variable](#) &)=delete
- void **wait** ([unique\\_lock](#)< [mutex](#) > &\_\_lock)
- template<typename \_Predicate>  
void **wait** ([unique\\_lock](#)< [mutex](#) > &\_\_lock, \_Predicate \_\_p)

[cv\\_status](#) **wait\_for** ([unique\\_lock](#)< [mutex](#) > &\_\_lock, const [chrono::duration](#)< \_Rep, \_Period > &\_\_rtime)
- template<typename \_Rep, typename \_Period, typename \_Predicate>  
bool **wait\_for** ([unique\\_lock](#)< [mutex](#) > &\_\_lock, const [chrono::duration](#)< \_Rep, \_Period > &\_\_rtime, \_Predicate \_\_p)
- template<typename \_Clock, typename \_Duration>  
[cv\\_status](#) **wait\_until** ([unique\\_lock](#)< [mutex](#) > &\_\_lock, const [chrono::time\\_point](#)< \_Clock, \_Duration > &\_\_atime)
- template<typename \_Clock, typename \_Duration, typename \_Predicate>  
bool **wait\_until** ([unique\\_lock](#)< [mutex](#) > &\_\_lock, const [chrono::time\\_point](#)< \_Clock, \_Duration > &\_\_atime, \_↔ Predicate \_\_p)
- template<typename \_Duration>  
[cv\\_status](#) **wait\_until** ([unique\\_lock](#)< [mutex](#) > &\_\_lock, const [chrono::time\\_point](#)< [steady\\_clock](#), \_Duration > &\_\_atime)
- template<typename \_Duration>  
[cv\\_status](#) **wait\_until** ([unique\\_lock](#)< [mutex](#) > &\_\_lock, const [chrono::time\\_point](#)< [system\\_clock](#), \_Duration > &\_\_atime)

### 6.303.1 Detailed Description

[condition\\_variable](#)

The documentation for this class was generated from the following file:

- [condition\\_variable](#)

## 6.304 std::condition\_variable\_any Class Reference

```
#include <condition_variable>
```

### Public Member Functions

- **condition\_variable\_any** (const [condition\\_variable\\_any](#) &)=delete
- void **notify\_all** () noexcept
- void **notify\_one** () noexcept
- [condition\\_variable\\_any](#) & **operator=** (const [condition\\_variable\\_any](#) &)=delete
- template<typename \_Lock>  
void **wait** (\_Lock &\_\_lock)

- `template<typename _Lock, typename _Predicate>`  
`void wait (_Lock &__lock, _Predicate __p)`
- `template<typename _Lock, typename _Rep, typename _Period>`  
`cv_status wait_for (_Lock &__lock, const chrono::duration< _Rep, _Period > &__rtime)`
- `template<typename _Lock, typename _Rep, typename _Period, typename _Predicate>`  
`bool wait_for (_Lock &__lock, const chrono::duration< _Rep, _Period > &__rtime, _Predicate __p)`
- `template<typename _Lock, typename _Clock, typename _Duration>`  
`cv_status wait_until (_Lock &__lock, const chrono::time_point< _Clock, _Duration > &__atime)`
- `template<typename _Lock, typename _Clock, typename _Duration, typename _Predicate>`  
`bool wait_until (_Lock &__lock, const chrono::time_point< _Clock, _Duration > &__atime, _Predicate __p)`

#### 6.304.1 Detailed Description

`condition_variable_any`

The documentation for this class was generated from the following file:

- [condition\\_variable](#)

### 6.305 `std::conditional< _Cond, _Iftrue, _Iffalse >` Struct Template Reference

```
#include <type_traits>
```

#### Public Types

- using `type`

#### 6.305.1 Detailed Description

```
template<bool _Cond, typename _Iftrue, typename _Iffalse>
struct std::conditional< _Cond, _Iftrue, _Iffalse >
```

Define a member typedef `type` to one of two argument types.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

### 6.306 `__gnu_pbds::detail::pat_trie_base::_Inode< _ATraits, Metadata >::const_iterator` Struct Reference

```
#include <pat_trie_base.hpp>
```

Inheritance diagram for `__gnu_pbds::detail::pat_trie_base::_Inode<_ATraits, Metadata>::const_iterator`:

### Public Types

- typedef `_Alloc::difference_type` **difference\_type**
- typedef `std::forward_iterator_tag` **iterator\_category**
- typedef `node_pointer_pointer` **pointer**
- typedef `node_pointer_reference` **reference**
- typedef `node_pointer` **value\_type**

### Public Member Functions

- **const\_iterator** (`node_pointer_pointer p_p_cur=0, node_pointer_pointer p_p_end=0`)
- bool **operator!=** (const [const\\_iterator](#) &other) const
- `node_const_pointer` **operator\*** () const
- [const\\_iterator](#) & **operator++** ()
- [const\\_iterator](#) **operator++** (int)
- const `node_pointer_pointer` **operator->** () const
- bool **operator==** (const [const\\_iterator](#) &other) const

### Public Attributes

- `node_pointer_pointer` **m\_p\_p\_cur**
- `node_pointer_pointer` **m\_p\_p\_end**

#### 6.306.1 Detailed Description

```
template<typename _ATraits, typename Metadata>
struct __gnu_pbds::detail::pat_trie_base::_Inode<_ATraits, Metadata>::const_iterator
```

Constant child iterator.

The documentation for this struct was generated from the following file:

- [pat\\_trie\\_base.hpp](#)

### 6.307 `std::chrono::tzdb_list::const_iterator` Class Reference

```
#include <chrono>
```

#### Public Types

- using **difference\_type**
- using **iterator\_category**
- using **pointer**
- using **reference**
- using **value\_type**

#### Public Member Functions

- **const\_iterator** (const [const\\_iterator](#) &)=default
- **const\_iterator** ([const\\_iterator](#) &&)=default
- reference **operator\*** () const noexcept
- [const\\_iterator](#) & **operator++** ()
- [const\\_iterator](#) **operator++** (int)
- pointer **operator->** () const noexcept
- [const\\_iterator](#) & **operator=** (const [const\\_iterator](#) &)=default
- [const\\_iterator](#) & **operator=** ([const\\_iterator](#) &&)=default
- bool **operator==** (const [const\\_iterator](#) &) const noexcept=default

#### Friends

- class **tzdb\_list**

#### 6.307.1 Detailed Description

An iterator into the `tzdb_list`

As a extension, in libstdc++ each `tzdb` is reference-counted and the `const_iterator` type shares ownership of the object it refers to. This ensures that a `tzdb` erased from the list will not be destroyed while there is an iterator that refers to it.

The documentation for this class was generated from the following file:

- [chrono](#)

### 6.308 `std::const_mem_fun1_ref_t<_Ret, _Tp, _Arg>` Class Template Reference

```
#include <stl_function.h>
```

Inheritance diagram for std::const\_mem\_fun1\_ref\_t< \_Ret, \_Tp, \_Arg >:

### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)
- typedef `_Ret` [result\\_type](#)
- typedef `_Arg` [second\\_argument\\_type](#)

### Public Member Functions

- `const_mem_fun1_ref_t` (`_Ret` (`_Tp`::\* `__pf`) (`_Arg`) `const`)
- `_Ret operator()` (`const _Tp &__r, _Arg __x`) `const`

#### 6.308.1 Detailed Description

template<typename `_Ret`, typename `_Tp`, typename `_Arg`>  
class `std::const_mem_fun1_ref_t`< `_Ret`, `_Tp`, `_Arg` >

One of the [adaptors for member pointers](#).

#### 6.308.2 Member Typedef Documentation

##### `first_argument_type`

typedef `_Tp` [std::binary\\_function](#)< `_Tp`, `_Arg`, `_Ret` >::`first_argument_type` [inherited]  
`first_argument_type` is the type of the first argument

##### `result_type`

typedef `_Ret` [std::binary\\_function](#)< `_Tp`, `_Arg`, `_Ret` >::`result_type` [inherited]  
`result_type` is the return type

##### `second_argument_type`

typedef `_Arg` [std::binary\\_function](#)< `_Tp`, `_Arg`, `_Ret` >::`second_argument_type` [inherited]  
`second_argument_type` is the type of the second argument

The documentation for this class was generated from the following file:

- [stl\\_function.h](#)

### 6.309 std::const\_mem\_fun1\_t< \_Ret, \_Tp, \_Arg > Class Template Reference

```
#include <stl_function.h>
```

Inheritance diagram for std::const\_mem\_fun1\_t< \_Ret, \_Tp, \_Arg >:

#### Public Types

- typedef const \_Tp \* [first\\_argument\\_type](#)
- typedef \_Ret [result\\_type](#)
- typedef \_Arg [second\\_argument\\_type](#)

#### Public Member Functions

- **const\_mem\_fun1\_t** (\_Ret(\_Tp::\*\_\_pf)(\_Arg) const)
- **\_Ret operator()** (const \_Tp \*\_\_p, \_Arg \_\_x) const

#### 6.309.1 Detailed Description

```
template<typename _Ret, typename _Tp, typename _Arg>
class std::const_mem_fun1_t< _Ret, _Tp, _Arg >
```

One of the [adaptors for member pointers](#).

#### 6.309.2 Member Typedef Documentation

##### first\_argument\_type

```
typedef const _Tp * std::binary\_function< const _Tp *, _Arg, _Ret >::first_argument_type [inherited]
first_argument_type is the type of the first argument
```

##### result\_type

```
typedef _Ret std::binary\_function< const _Tp *, _Arg, _Ret >::result_type [inherited]
result_type is the return type
```

**second\_argument\_type**

typedef \_Arg [std::binary\\_function](#)< const \_Tp \*, \_Arg, \_Ret >::second\_argument\_type [inherited]  
 second\_argument\_type is the type of the second argument

The documentation for this class was generated from the following file:

- [stl\\_function.h](#)

**6.310 std::const\_mem\_fun\_ref\_t< \_Ret, \_Tp > Class Template Reference**

```
#include <stl_function.h>
```

Inheritance diagram for std::const\_mem\_fun\_ref\_t< \_Ret, \_Tp >:

**Public Types**

- typedef \_Tp [argument\\_type](#)
- typedef \_Ret [result\\_type](#)

**Public Member Functions**

- **const\_mem\_fun\_ref\_t** (\_Ret(\_Tp::\*\_\_pf)()) const
- \_Ret **operator()** (const \_Tp &\_\_r) const

**6.310.1 Detailed Description**

```
template<typename _Ret, typename _Tp>
class std::const_mem_fun_ref_t< _Ret, _Tp >
```

One of the [adaptors for member pointers](#).

**6.310.2 Member Typedef Documentation****argument\_type**

typedef \_Tp [std::unary\\_function](#)< \_Tp, \_Ret >::argument\_type [inherited]  
 argument\_type is the type of the argument

**result\_type**

```
typedef _Ret std::unary_function< _Tp, _Ret >::result_type [inherited]
result_type is the return type
```

The documentation for this class was generated from the following file:

- [stl\\_function.h](#)

**6.311 std::const\_mem\_fun\_t< \_Ret, \_Tp > Class Template Reference**

```
#include <stl_function.h>
```

Inheritance diagram for `std::const_mem_fun_t< _Ret, _Tp >`:

**Public Types**

- typedef `const _Tp *` [argument\\_type](#)
- typedef `_Ret` [result\\_type](#)

**Public Member Functions**

- `const_mem_fun_t(_Ret(_Tp::*__pf)() const)`
- `_Ret operator() (const _Tp *__p) const`

**6.311.1 Detailed Description**

```
template<typename _Ret, typename _Tp>
class std::const_mem_fun_t< _Ret, _Tp >
```

One of the [adaptors for member pointers](#).

**6.311.2 Member Typedef Documentation****argument\_type**

```
typedef const _Tp * std::unary_function< const _Tp *, _Ret >::argument_type [inherited]
argument_type is the type of the argument
```

**result\_type**

```
typedef _Ret std::unary\_function< const _Tp *, _Ret >::result_type [inherited]  
result_type is the return type
```

The documentation for this class was generated from the following file:

- [stl\\_function.h](#)

**6.312 `__gnu_cxx::constant_binary_fun<_Result, _Arg1, _Arg2>` Struct Template Reference**

```
#include <functional>
```

**Public Types**

- typedef `_Arg1` **first\_argument\_type**
- typedef `_Result` **result\_type**
- typedef `_Arg2` **second\_argument\_type**

**Public Member Functions**

- **constant\_binary\_fun** (const `_Result` &\_\_v)
- const `result_type` & **operator()** (const `_Arg1` &, const `_Arg2` &) const

**Public Attributes**

- `_Result` **M\_val**

**6.312.1 Detailed Description**

```
template<class _Result, class _Arg1 = _Result, class _Arg2 = _Arg1>  
struct __gnu_cxx::constant_binary_fun<_Result, _Arg1, _Arg2>
```

An [SGI extension](#) .

The documentation for this struct was generated from the following file:

- [ext/functional](#)

**6.313 `__gnu_parallel::constant_size_blocks_tag` Struct Reference**

```
#include <tags.h>
```

Inheritance diagram for `__gnu_parallel::constant_size_blocks_tag`:

### 6.313.1 Detailed Description

Selects the constant block size variant for `std::find()`.

See also

`_GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS`

The documentation for this struct was generated from the following file:

- [tags.h](#)

## 6.314 `__gnu_cxx::constant_unary_fun<_Result, _Argument>` Struct Template Reference

```
#include <functional>
```

### Public Types

- typedef `_Argument` **argument\_type**
- typedef `_Result` **result\_type**

### Public Member Functions

- **constant\_unary\_fun** (`const _Result &__v`)
- `const result_type &` **operator()** (`const _Argument &`) `const`

### Public Attributes

- `result_type` **\_M\_val**

### 6.314.1 Detailed Description

```
template<class _Result, class _Argument = _Result>
struct __gnu_cxx::constant_unary_fun<_Result, _Argument>
```

An [SGI extension](#) .

The documentation for this struct was generated from the following file:

- [ext/functional](#)

**6.315 `__gnu_cxx::constant_void_fun<_Result>` Struct Template Reference**

```
#include <functional>
```

**Public Types**

- typedef `_Result` **result\_type**

**Public Member Functions**

- **constant\_void\_fun** (const `_Result` &\_\_v)
- const `result_type` & **operator()** () const

**Public Attributes**

- `result_type` **\_M\_val**

**6.315.1 Detailed Description**

```
template<class _Result>
struct __gnu_cxx::constant_void_fun<_Result>
```

An [SGI extension](#) .

The documentation for this struct was generated from the following file:

- [ext/functional](#)

**6.316 `__gnu_pbds::detail::container_base_dispatch<Key, Mapped, _Alloc, Tag, Policy_TI>` Struct Template Reference****6.316.1 Detailed Description**

```
template<typename Key, typename Mapped, typename _Alloc, typename Tag, typename Policy_TI = null_type>
struct __gnu_pbds::detail::container_base_dispatch<Key, Mapped, _Alloc, Tag, Policy_TI>
```

Dispatch mechanism, primary template for associative types.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

**6.317 `__gnu_pbds::detail::container_base_dispatch<_VTp, Cmp_Fn, _Alloc, binary_heap_tag, null_type>` Struct Template Reference**

```
#include <priority_queue_base_dispatch.hpp>
```

**Public Types**

- typedef [binary\\_heap](#)<\_VTp, Cmp\_Fn, \_Alloc> **type**

**6.317.1 Detailed Description**

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
struct __gnu_pbds::detail::container_base_dispatch<_VTp, Cmp_Fn, _Alloc, binary_heap_tag, null_type>
```

Specialization for `binary_heap`.

### 6.317.2 Member Typedef Documentation

#### type

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
typedef binary\_heap<_VTp, Cmp_Fn, _Alloc> \_\_gnu\_pbds::detail::container\_base\_dispatch< _VTp,
Cmp_Fn, _Alloc, binary\_heap\_tag, null\_type >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [priority\\_queue\\_base\\_dispatch.hpp](#)

### 6.318 [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch](#)< \_VTp, Cmp\_Fn, \_Alloc, [binomial\\_heap\\_tag](#), [null\\_type](#) > Struct Template Reference

```
#include <priority\_queue\_base\_dispatch.hpp>
```

#### Public Types

- typedef [binomial\\_heap](#)< \_VTp, Cmp\_Fn, \_Alloc > [type](#)

#### 6.318.1 Detailed Description

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
struct \_\_gnu\_pbds::detail::container\_base\_dispatch< _VTp, Cmp_Fn, _Alloc, binomial\_heap\_tag, null\_type >
```

Specialization for [binomial\\_heap](#).

### 6.318.2 Member Typedef Documentation

#### type

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
typedef binomial\_heap<_VTp, Cmp_Fn, _Alloc> \_\_gnu\_pbds::detail::container\_base\_dispatch< _VTp,
Cmp_Fn, _Alloc, binomial\_heap\_tag, null\_type >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [priority\\_queue\\_base\\_dispatch.hpp](#)

### 6.319 [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch](#)< \_VTp, Cmp\_Fn, \_Alloc, [pairing\\_heap\\_tag](#), [null\\_type](#) > Struct Template Reference

```
#include <priority\_queue\_base\_dispatch.hpp>
```

#### Public Types

- typedef [pairing\\_heap](#)< \_VTp, Cmp\_Fn, \_Alloc > [type](#)

#### 6.319.1 Detailed Description

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
struct \_\_gnu\_pbds::detail::container\_base\_dispatch< _VTp, Cmp_Fn, _Alloc, pairing\_heap\_tag, null\_type >
```

Specialization for [pairing\\_heap](#).

### 6.319.2 Member Typedef Documentation

#### type

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
typedef pairing\_heap<_VTp, Cmp_Fn, _Alloc> \_\_gnu\_pbds::detail::container\_base\_dispatch< _VTp,
Cmp_Fn, _Alloc, pairing\_heap\_tag, null\_type >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [priority\\_queue\\_base\\_dispatch.hpp](#)

### 6.320 \_\_gnu\_pbds::detail::container\_base\_dispatch< \_VTp, Cmp\_Fn, \_Alloc, rc\_binomial\_heap\_tag, null\_type > Struct Template Reference

```
#include <priority_queue_base_dispatch.hpp>
```

#### Public Types

- typedef [rc\\_binomial\\_heap](#)< \_VTp, Cmp\_Fn, \_Alloc > [type](#)

#### 6.320.1 Detailed Description

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
struct \_\_gnu\_pbds::detail::container\_base\_dispatch< _VTp, Cmp_Fn, _Alloc, rc_binomial_heap_tag, null_type
>
```

Specialization for rc\_binary\_heap.

### 6.320.2 Member Typedef Documentation

#### type

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
typedef rc\_binomial\_heap<_VTp, Cmp_Fn, _Alloc> \_\_gnu\_pbds::detail::container\_base\_dispatch< _VTp,
Cmp_Fn, _Alloc, rc\_binomial\_heap\_tag, null\_type >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [priority\\_queue\\_base\\_dispatch.hpp](#)

### 6.321 \_\_gnu\_pbds::detail::container\_base\_dispatch< \_VTp, Cmp\_Fn, \_Alloc, thin\_heap\_tag, null\_type > Struct Template Reference

```
#include <priority_queue_base_dispatch.hpp>
```

#### Public Types

- typedef [thin\\_heap](#)< \_VTp, Cmp\_Fn, \_Alloc > [type](#)

#### 6.321.1 Detailed Description

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
struct \_\_gnu\_pbds::detail::container\_base\_dispatch< _VTp, Cmp_Fn, _Alloc, thin_heap_tag, null_type >
```

Specialization for thin\_heap.

### 6.321.2 Member Typedef Documentation

#### type

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
typedef thin\_heap<_VTp, Cmp_Fn, _Alloc> \_\_gnu\_pbds::detail::container\_base\_dispatch< _VTp, Cmp_Fn, _Alloc, thin\_heap\_tag, null\_type >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [priority\\_queue\\_base\\_dispatch.hpp](#)

### 6.322 [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch](#)< Key, Mapped, \_Alloc, cc\_hash\_tag, Policy\_TI > Struct Template Reference

```
#include <container_base_dispatch.hpp>
```

#### Public Types

- typedef [cc\\_ht\\_map](#)< Key, Mapped, at0t, at1t, \_Alloc, at3t::value, at4t, at2t > [type](#)

#### 6.322.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_TI>
struct \_\_gnu\_pbds::detail::container\_base\_dispatch< Key, Mapped, _Alloc, cc_hash_tag, Policy_TI >
```

Specialization colision-chaining hash map.

### 6.322.2 Member Typedef Documentation

#### type

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_TI>
typedef cc\_ht\_map<Key, Mapped, at0t, at1t, _Alloc, at3t::value, at4t, at2t> \_\_gnu\_pbds::detail::container\_base\_dispatch< Key, Mapped, _Alloc, cc\_hash\_tag, Policy_TI >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

### 6.323 [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch](#)< Key, Mapped, \_Alloc, gp\_hash\_tag, Policy\_TI > Struct Template Reference

```
#include <container_base_dispatch.hpp>
```

#### Public Types

- typedef [gp\\_ht\\_map](#)< Key, Mapped, at0t, at1t, \_Alloc, at3t::value, at4t, at5t, at2t > [type](#)

#### 6.323.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_TI>
struct \_\_gnu\_pbds::detail::container\_base\_dispatch< Key, Mapped, _Alloc, gp_hash_tag, Policy_TI >
```

Specialization general-probe hash map.

### 6.323.2 Member Typedef Documentation

#### type

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_TI>
```

```
typedef gp\_ht\_map<Key, Mapped, at0t, at1t, _Alloc, at3t::value, at4t, at5t, at2t> \_\_gnu\_pbds::detail::container\_base\_dispatch< Key,
```

```
Key, Mapped, _Alloc, gp\_hash\_tag, Policy_TI >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

### 6.324 `__gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, list_update_tag, Policy_TI >` Struct Template Reference

```
#include <container_base_dispatch.hpp>
```

#### Public Types

- typedef [lu\\_map](#)< Key, Mapped, at0t, \_Alloc, at1t > [type](#)

#### 6.324.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_TI>
```

```
struct \_\_gnu\_pbds::detail::container\_base\_dispatch< Key, Mapped, _Alloc, list_update_tag, Policy_TI >
```

Specialization for list-update map.

### 6.324.2 Member Typedef Documentation

#### type

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_TI>
```

```
typedef lu\_map<Key, Mapped, at0t, _Alloc, at1t> \_\_gnu\_pbds::detail::container\_base\_dispatch< Key,
```

```
Mapped, _Alloc, list\_update\_tag, Policy_TI >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

### 6.325 `__gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, ov_tree_tag, Policy_TI >` Struct Template Reference

```
#include <container_base_dispatch.hpp>
```

#### Public Types

- typedef [ov\\_tree\\_map](#)< Key, Mapped, at0t, at1t, \_Alloc > [type](#)

#### 6.325.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_TI>
```

```
struct \_\_gnu\_pbds::detail::container\_base\_dispatch< Key, Mapped, _Alloc, ov_tree_tag, Policy_TI >
```

Specialization ordered-vector tree map.

### 6.325.2 Member Typedef Documentation

#### type

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_Tl>
typedef ov\_tree\_map<Key, Mapped, at0t, at1t, _Alloc> \_\_gnu\_pbds::detail::container\_base\_dispatch<
Key, Mapped, _Alloc, ov\_tree\_tag, Policy_Tl >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

### 6.326 [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch](#)< Key, Mapped, \_Alloc, [pat\\_trie\\_tag](#), Policy\_Tl > Struct Template Reference

```
#include <container\_base\_dispatch.hpp>
```

#### Public Types

- typedef [pat\\_trie\\_map](#)< Key, Mapped, at1t, \_Alloc > **type**

#### 6.326.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_TI>
struct \_\_gnu\_pbds::detail::container\_base\_dispatch< Key, Mapped, _Alloc, pat\_trie\_tag, Policy_TI >
```

Specialization for PATRICIA trie map.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

### 6.327 [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch](#)< Key, Mapped, \_Alloc, [rb\\_tree\\_tag](#), Policy\_TI > Struct Template Reference

```
#include <container\_base\_dispatch.hpp>
```

#### Public Types

- typedef [rb\\_tree\\_map](#)< Key, Mapped, at0t, at1t, \_Alloc > **type**

#### 6.327.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_TI>
struct \_\_gnu\_pbds::detail::container\_base\_dispatch< Key, Mapped, _Alloc, rb\_tree\_tag, Policy_TI >
```

Specialization for R-B tree map.

### 6.327.2 Member Typedef Documentation

#### type

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_Tl>
typedef rb\_tree\_map<Key, Mapped, at0t, at1t, _Alloc> \_\_gnu\_pbds::detail::container\_base\_dispatch<
Key, Mapped, _Alloc, rb\_tree\_tag, Policy_Tl >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

## 6.328 `__gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, splay_tree_tag, Policy_Tl >` Struct Template Reference

```
#include <container_base_dispatch.hpp>
```

### Public Types

- typedef `splay_tree_map< Key, Mapped, at0t, at1t, _Alloc >` `type`

#### 6.328.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_Tl>  
struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, splay_tree_tag, Policy_Tl >
```

Specialization splay tree map.

#### 6.328.2 Member Typedef Documentation

##### type

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_Tl>  
typedef splay_tree_map<Key, Mapped, at0t, at1t, _Alloc> __gnu_pbds::detail::container_base_dispatch<  
Key, Mapped, _Alloc, splay_tree_tag, Policy_Tl >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- `container_base_dispatch.hpp`

## 6.329 `__gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, cc_hash_tag, Policy_Tl >` Struct Template Reference

```
#include <container_base_dispatch.hpp>
```

### Public Types

- typedef `cc_ht_set< Key, null_type, at0t, at1t, _Alloc, at3t::value, at4t, at2t >` `type`

#### 6.329.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Policy_Tl>  
struct __gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, cc_hash_tag, Policy_Tl >
```

Specialization collision-chaining hash set.

#### 6.329.2 Member Typedef Documentation

##### type

```
template<typename Key, typename _Alloc, typename Policy_Tl>  
typedef cc_ht_set<Key, null_type, at0t, at1t, _Alloc, at3t::value, at4t, at2t> __gnu_pbds::detail::container_base_  
Key, null_type, _Alloc, cc_hash_tag, Policy_Tl >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- `container_base_dispatch.hpp`

### 6.330 `__gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, gp_hash_tag, Policy_Tl >` Struct Template Reference

```
#include <container_base_dispatch.hpp>
```

#### Public Types

- typedef `gp_ht_set< Key, null\_type, at0t, at1t, _Alloc, at3t::value, at4t, at5t, at2t >` [type](#)

#### 6.330.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, gp_hash_tag, Policy_Tl >
```

Specialization general-probe hash set.

#### 6.330.2 Member Typedef Documentation

##### type

```
template<typename Key, typename _Alloc, typename Policy_Tl>
typedef gp_ht_set<Key, null\_type, at0t, at1t, _Alloc, at3t::value, at4t, at5t, at2t> \_\_gnu\_pbds::detail::container\_base\_dispatch<
Key, null\_type, _Alloc, gp\_hash\_tag, Policy_Tl >::type
Dispatched type.
```

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

### 6.331 `__gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, list_update_tag, Policy_Tl >` Struct Template Reference

```
#include <container_base_dispatch.hpp>
```

#### Public Types

- typedef `lu_set< Key, null\_type, at0t, _Alloc, at1t >` [type](#)

#### 6.331.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, list_update_tag, Policy_Tl >
```

Specialization for list-update set.

#### 6.331.2 Member Typedef Documentation

##### type

```
template<typename Key, typename _Alloc, typename Policy_Tl>
typedef lu_set<Key, null\_type, at0t, _Alloc, at1t> \_\_gnu\_pbds::detail::container\_base\_dispatch<
Key, null\_type, _Alloc, list\_update\_tag, Policy_Tl >::type
Dispatched type.
```

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

### 6.332 `__gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, ov_tree_tag, Policy_Tl >` Struct Template Reference

```
#include <container_base_dispatch.hpp>
```

#### Public Types

- typedef `ov_tree_set< Key, null\_type, at0t, at1t, _Alloc >` [type](#)

#### 6.332.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, ov_tree_tag, Policy_Tl >
```

Specialization ordered-vector tree set.

#### 6.332.2 Member Typedef Documentation

##### type

```
template<typename Key, typename _Alloc, typename Policy_Tl>
typedef ov_tree_set<Key, null\_type, at0t, at1t, _Alloc> \_\_gnu\_pbds::detail::container\_base\_dispatch<
Key, null\_type, _Alloc, ov\_tree\_tag, Policy_Tl >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

### 6.333 `__gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, pat_trie_tag, Policy_Tl >` Struct Template Reference

```
#include <container_base_dispatch.hpp>
```

#### Public Types

- typedef `pat_trie_set< Key, null\_type, at1t, _Alloc >` [type](#)

#### 6.333.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, pat_trie_tag, Policy_Tl >
```

Specialization for PATRICIA trie set.

#### 6.333.2 Member Typedef Documentation

##### type

```
template<typename Key, typename _Alloc, typename Policy_Tl>
typedef pat_trie_set<Key, null\_type, at1t, _Alloc> \_\_gnu\_pbds::detail::container\_base\_dispatch<
Key, null\_type, _Alloc, pat\_trie\_tag, Policy_Tl >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

### 6.334 `__gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, rb_tree_tag, Policy_Tl >` Struct Template Reference

```
#include <container_base_dispatch.hpp>
```

#### Public Types

- typedef `rb_tree_set< Key, null\_type, at0t, at1t, _Alloc >` `type`

#### 6.334.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, rb_tree_tag, Policy_Tl >
```

Specialization for R-B tree set.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

### 6.335 `__gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, splay_tree_tag, Policy_Tl >` Struct Template Reference

```
#include <container_base_dispatch.hpp>
```

#### Public Types

- typedef `splay_tree_set< Key, null\_type, at0t, at1t, _Alloc >` `type`

#### 6.335.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, splay_tree_tag, Policy_Tl >
```

Specialization splay tree set.

#### 6.335.2 Member Typedef Documentation

##### type

```
template<typename Key, typename _Alloc, typename Policy_Tl>
typedef splay_tree_set<Key, null\_type, at0t, at1t, _Alloc> \_\_gnu\_pbds::detail::container\_base\_dispatch<
Key, null\_type, _Alloc, splay\_tree\_tag, Policy_Tl >::type
Dispatched type.
```

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

### 6.336 `__gnu_pbds::container_error` Struct Reference

```
#include <exception.hpp>
```

Inheritance diagram for \_\_gnu\_pbds::container\_error:

### Public Member Functions

- virtual const char \* [what](#) () const noexcept

#### 6.336.1 Detailed Description

Base class for exceptions.

#### 6.336.2 Member Function Documentation

##### what()

```
virtual const char * std::logic_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this struct was generated from the following file:

- [exception.hpp](#)

### 6.337 \_\_gnu\_pbds::container\_tag Struct Reference

```
#include <tag_and_trait.hpp>
```

## Public Types

- enum { [order\\_preserving](#) , [erase\\_can\\_throw](#) , [split\\_join\\_can\\_throw](#) , [reverse\\_iteration](#) }
- typedef [container\\_traits\\_base](#)< container\_category > **base\_type**
- typedef Cntnr::container\_category **container\_category**
- typedef Cntnr **container\_type**
- typedef base\_type::invalidation\_guarantee **invalidation\_guarantee**

### 6.338.1 Detailed Description

```
template<typename Cntnr>
struct __gnu_pbds::container_traits< Cntnr >
```

Container traits.

### 6.338.2 Member Enumeration Documentation

#### anonymous enum

```
template<typename Cntnr>
anonymous enum
```

#### Enumerator

|                                   |                                                             |
|-----------------------------------|-------------------------------------------------------------|
| <code>order_preserving</code>     | True only if Cntnr objects guarantee storing keys by order. |
| <code>erase_can_throw</code>      | True only if erasing a key can throw.                       |
| <code>split_join_can_throw</code> | True only if split or join operations can throw.            |
| <code>reverse_iteration</code>    | True only reverse iterators are supported.                  |

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.339 `__gnu_pbds::container_traits_base<_Tag>` Struct Template Reference

### 6.339.1 Detailed Description

```
template<typename _Tag>
struct __gnu_pbds::container_traits_base<_Tag>
```

Primary template, container traits base.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.340 `__gnu_pbds::container_traits_base< binary_heap_tag>` Struct Reference

```
#include <tag_and_trait.hpp>
```

## Public Types

- enum { [order\\_preserving](#) , [erase\\_can\\_throw](#) , [split\\_join\\_can\\_throw](#) , [reverse\\_iteration](#) }
- typedef [binary\\_heap\\_tag](#) **container\_category**
- typedef [basic\\_invalidation\\_guarantee](#) **invalidation\_guarantee**

### 6.340.1 Detailed Description

Specialization, binary heap.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.341 `__gnu_pbds::container_traits_base< binomial_heap_tag >` Struct Reference

```
#include <tag_and_trait.hpp>
```

### Public Types

- enum { `order_preserving` , `erase_can_throw` , `split_join_can_throw` , `reverse_iteration` }
- typedef `binomial_heap_tag` `container_category`
- typedef `point_invalidation_guarantee` `invalidation_guarantee`

### 6.341.1 Detailed Description

Specialization, binomial heap.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.342 `__gnu_pbds::container_traits_base< cc_hash_tag >` Struct Reference

```
#include <tag_and_trait.hpp>
```

### Public Types

- enum { `order_preserving` , `erase_can_throw` , `split_join_can_throw` , `reverse_iteration` }
- typedef `cc_hash_tag` `container_category`
- typedef `point_invalidation_guarantee` `invalidation_guarantee`

### 6.342.1 Detailed Description

Specialization, cc hash.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.343 `__gnu_pbds::container_traits_base< gp_hash_tag >` Struct Reference

```
#include <tag_and_trait.hpp>
```

### Public Types

- enum { `order_preserving` , `erase_can_throw` , `split_join_can_throw` , `reverse_iteration` }
- typedef `gp_hash_tag` `container_category`
- typedef `basic_invalidation_guarantee` `invalidation_guarantee`

### 6.343.1 Detailed Description

Specialization, gp hash.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.344 `__gnu_pbds::container_traits_base< list_update_tag >` Struct Reference

```
#include <tag_and_trait.hpp>
```

### Public Types

- enum { `order_preserving` , `erase_can_throw` , `split_join_can_throw` , `reverse_iteration` }
- typedef `list_update_tag` `container_category`
- typedef `point_invalidation_guarantee` `invalidation_guarantee`

#### 6.344.1 Detailed Description

Specialization, list update.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.345 `__gnu_pbds::container_traits_base< ov_tree_tag >` Struct Reference

```
#include <tag_and_trait.hpp>
```

### Public Types

- enum { `order_preserving` , `erase_can_throw` , `split_join_can_throw` , `reverse_iteration` }
- typedef `ov_tree_tag` `container_category`
- typedef `basic_invalidation_guarantee` `invalidation_guarantee`

#### 6.345.1 Detailed Description

Specialization, ov tree.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.346 `__gnu_pbds::container_traits_base< pairing_heap_tag >` Struct Reference

```
#include <tag_and_trait.hpp>
```

### Public Types

- enum { `order_preserving` , `erase_can_throw` , `split_join_can_throw` , `reverse_iteration` }
- typedef `pairing_heap_tag` `container_category`
- typedef `point_invalidation_guarantee` `invalidation_guarantee`

#### 6.346.1 Detailed Description

Specialization, pairing heap.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.347 `__gnu_pbds::container_traits_base< pat_trie_tag >` Struct Reference

```
#include <tag_and_trait.hpp>
```

### Public Types

- enum { [order\\_preserving](#) , [erase\\_can\\_throw](#) , [split\\_join\\_can\\_throw](#) , [reverse\\_iteration](#) }
- typedef [pat\\_trie\\_tag](#) [container\\_category](#)
- typedef [range\\_invalidation\\_guarantee](#) [invalidation\\_guarantee](#)

#### 6.347.1 Detailed Description

Specialization, pat trie.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

### 6.348 `__gnu_pbds::container_traits_base< rb_tree_tag >` Struct Reference

```
#include <tag_and_trait.hpp>
```

### Public Types

- enum { [order\\_preserving](#) , [erase\\_can\\_throw](#) , [split\\_join\\_can\\_throw](#) , [reverse\\_iteration](#) }
- typedef [rb\\_tree\\_tag](#) [container\\_category](#)
- typedef [range\\_invalidation\\_guarantee](#) [invalidation\\_guarantee](#)

#### 6.348.1 Detailed Description

Specialization, rb tree.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

### 6.349 `__gnu_pbds::container_traits_base< rc_binomial_heap_tag >` Struct Reference

```
#include <tag_and_trait.hpp>
```

### Public Types

- enum { [order\\_preserving](#) , [erase\\_can\\_throw](#) , [split\\_join\\_can\\_throw](#) , [reverse\\_iteration](#) }
- typedef [rc\\_binomial\\_heap\\_tag](#) [container\\_category](#)
- typedef [point\\_invalidation\\_guarantee](#) [invalidation\\_guarantee](#)

#### 6.349.1 Detailed Description

Specialization, rc binomial heap.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

### 6.350 `__gnu_pbds::container_traits_base< splay_tree_tag >` Struct Reference

```
#include <tag_and_trait.hpp>
```

### Public Types

- enum { [order\\_preserving](#) , [erase\\_can\\_throw](#) , [split\\_join\\_can\\_throw](#) , [reverse\\_iteration](#) }
- typedef [splay\\_tree\\_tag](#) [container\\_category](#)
- typedef [range\\_invalidation\\_guarantee](#) [invalidation\\_guarantee](#)

### 6.350.1 Detailed Description

Specialization, splay tree.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.351 `__gnu_pbds::container_traits_base< thin_heap_tag >` Struct Reference

```
#include <tag_and_trait.hpp>
```

### Public Types

- enum { `order_preserving` , `erase_can_throw` , `split_join_can_throw` , `reverse_iteration` }
- typedef [thin\\_heap\\_tag](#) `container_category`
- typedef [point\\_invalidation\\_guarantee](#) `invalidation_guarantee`

### 6.351.1 Detailed Description

Specialization, thin heap.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.352 `std::contiguous_iterator_tag` Struct Reference

```
#include <stl_iterator_base_types.h>
```

Inheritance diagram for `std::contiguous_iterator_tag`:

#### 6.352.1 Detailed Description

Contiguous iterators point to objects stored contiguously in memory.  
The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

#### 6.353 `std::copyable_function<_Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>` Class Template Reference

```

### 6.353.1 Detailed Description

`template<typename _Res, typename... _ArgTypes, bool _Noex>`  
`class std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>`

Polymorphic copyable function wrapper.

Since

C++26

The `std::copyable_function` class template is a call wrapper similar to `std::function`, but it does not provide information about its target, and preserves constness.

It also supports const-qualification, ref-qualification, and no-throw guarantees. The qualifications and exception-specification of the `copyable_function::operator()` member function are respected when invoking the target function.

## 6.353.2 Constructor & Destructor Documentation

### copyable\_function() [1/7]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::copyable_function
() [inline], [noexcept]
```

Creates an empty object.

References [copyable\\_function\(\)](#).

Referenced by [copyable\\_function\(\)](#), [copyable\\_function\(\)](#), [copyable\\_function\(\)](#), [copyable\\_function\(\)](#), [copyable\\_function\(\)](#), [copyable\\_function\(\)](#), [copyable\\_function\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator==](#), [swap\(\)](#), and [swap](#).

### copyable\_function() [2/7]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::copyable_function (
    nullptr_t ) [inline], [noexcept]
```

Creates an empty object.

References [copyable\\_function\(\)](#).

### copyable\_function() [3/7]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::copyable_function (
    copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> && __x)
[inline], [noexcept]
```

Moves the target object, leaving the source empty.

References [copyable\\_function\(\)](#).

### copyable\_function() [4/7]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::copyable_function (
    copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> const & __x)
[inline]
```

Copies the target object.

References [copyable\\_function\(\)](#).

### copyable\_function() [5/7]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Fn, typename _Vt = decay_t<_Fn>>
requires (!is_same_v<_Vt, copyable_function>) && (!__is_in_place_type_v<_Vt>) && __is_callable<
    _from<_Vt>
std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::copyable_function (
    _Fn && __f) [inline], [noexcept]
```

Stores a target object initialized from the argument.

References [copyable\\_function\(\)](#), and [std::forward\(\)](#).

### copyable\_function() [6/7]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Tp, typename... _Args>
requires is_constructible_v<_Tp, _Args...> && __is_callable_from<_Tp>
std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::copyable_function (
```

```
in_place_type_t< _Tp > ,
_Args &&... __args) [inline], [explicit], [noexcept]
```

Stores a target object initialized from the arguments.

References [copyable\\_function\(\)](#), and [std::forward\(\)](#).

### `copyable_function()` [7/7]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Tp, typename _Up, typename... _Args>
requires is_constructible_v<_Tp, initializer_list<_Up>&, _Args...> && __is_callable_from<_Tp>
std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::copyable_function (
    in_place_type_t< _Tp > ,
    initializer_list< _Up > __il,
    _Args &&... __args) [inline], [explicit], [noexcept]
```

Stores a target object initialized from the arguments.

References [copyable\\_function\(\)](#), and [std::forward\(\)](#).

## 6.353.3 Member Function Documentation

### `operator bool()`

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator bool ()
const [inline], [explicit], [noexcept]
```

True if a target object is present, false otherwise.

### `operator()()`

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
_Res std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator() (
    _ArgTypes... __args) [inline], [noexcept]
```

Invoke the target object.

The target object will be invoked using the supplied arguments, and as an lvalue or rvalue, and as const or non-const, as dictated by the template arguments of the `copyable_function` specialization.

#### Precondition

Must not be empty.

References [std::forward\(\)](#), and [operator\(\)\(\)](#).

Referenced by [operator\(\)\(\)](#).

### `operator=()` [1/4]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Fn>
requires is_constructible_v<copyable_function, _Fn>
copyable_function & std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator= (
    _Fn && __f) [inline], [noexcept]
```

Stores a new target object, initialized from the argument.

References [copyable\\_function\(\)](#), [std::forward\(\)](#), and [operator=\(\)](#).

### `operator=()` [2/4]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
copyable_function & std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator= (
    _Res && __r) [inline], [noexcept]
```

```
Noex)>::operator= (
    const copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __x)
[inline]
```

Stores a copy of the source target object.

References [copyable\\_function\(\)](#), and [operator=\(\)](#).

#### **operator=()** [3/4]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
copyable_function & std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator= (
    copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> && __x)
[inline], [noexcept]
```

Stores a new target object, leaving x empty.

References [copyable\\_function\(\)](#), [std::addressof\(\)](#), and [operator=\(\)](#).

Referenced by [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), and [operator=\(\)](#).

#### **operator=()** [4/4]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
copyable_function & std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator= (
    nullptr_t ) [inline], [noexcept]
```

Destroys the target object (if any).

References [copyable\\_function\(\)](#), and [operator=\(\)](#).

#### **swap()**

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
void std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::swap (
    copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __x) [inline],
[noexcept]
```

Exchange the target objects (if any).

References [copyable\\_function\(\)](#), and [swap\(\)](#).

Referenced by [swap\(\)](#), and [swap](#).

### **6.353.4 Friends And Related Symbol Documentation**

#### **operator==**

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
bool operator== (
    const copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __x,
    nullptr_t ) [friend]
```

Check for emptiness by comparing with nullptr.

References [copyable\\_function\(\)](#), and [operator==](#).

Referenced by [operator==](#).

#### **swap**

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
void swap (
    copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __x,
    copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __y) [friend]
```

Exchange the target objects (if any).

References [copyable\\_function\(\)](#), and [swap\(\)](#).

### 6.355.1 Detailed Description

**template<typename \_CharT>**  
**class std::ctype< \_CharT >**

Primary class template ctype facet.

This template class defines classification and conversion functions for character sets. It wraps ctype functionality. Ctype gets used by streams for many I/O operations.

This template provides the protected virtual functions the developer will have to replace in a derived class or specialization to make a working facet. The public functions that access them are defined in `__ctype_abstract_base`, to allow for implementation flexibility. See `ctype<wchar_t>` for an example. The functions are documented in `__ctype_abstract_base`.

Note: implementations are provided for all the protected virtual functions, but will likely not be useful.

### 6.355.2 Member Function Documentation

**do\_is()** [1/2]

```
template<typename _CharT>
virtual const char_type * std::ctype< _CharT >::do_is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [protected], [virtual]
```

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the input.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

#### Parameters

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

#### Returns

`__hi`.

Implements `std::__ctype_abstract_base< _CharT >`.

**do\_is()** [2/2]

```
template<typename _CharT>
virtual bool std::ctype< _CharT >::do_is (
```

```
mask __m,
char_type __c) const [protected], [virtual]
```

Test char\_type classification.

This function finds a mask *M* for *c* and compares it to mask *m*.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

#### Parameters

|                          |                                    |
|--------------------------|------------------------------------|
| $\leftrightarrow$<br>__c | The char_type to find the mask of. |
| $\leftrightarrow$<br>__m | The mask to compare against.       |

#### Returns

(M & \_\_m) != 0.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

#### do\_narrow() [1/2]

```
template<typename _CharT>
virtual char std::ctype<_CharT>::do_narrow (
    char_type __c,
    char __default) const [protected], [virtual]
```

Narrow char\_type to char.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, default is returned instead.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|           |                                     |
|-----------|-------------------------------------|
| __c       | The char_type to convert.           |
| __default | Char to return if conversion fails. |

#### Returns

The converted char.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by [std::ctype<char>::narrow\(\)](#), and [std::ctype<char>::narrow\(\)](#).

#### do\_narrow() [2/2]

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [protected], [virtual]
```

Narrow char\_type array to char.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to `char` using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__default` is used instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

#### Returns

`__hi`.

Implements `std::__ctype_abstract_base<_CharT>`.

#### `do_scan_is()`

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Find `char_type` matching mask.

This function searches for and returns the first `char_type` `c` in `[__lo,__hi)` for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

#### Parameters

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

#### Returns

Pointer to a matching `char_type` if found, else `__hi`.

Implements `std::__ctype_abstract_base<_CharT>`.

#### `do_scan_not()`

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Find char\_type not matching mask.

This function searches for and returns a pointer to the first char\_type c of [lo,hi) for which is(m,c) is false.

do\_scan\_is() is a hook for a derived facet to change the behavior of match searching. do\_is() must always return the same result for the same input.

#### Parameters

|                          |                              |
|--------------------------|------------------------------|
| $\leftrightarrow$<br>_m  | The mask to compare against. |
| $\leftrightarrow$<br>_lo | Pointer to start of range.   |
| $\leftrightarrow$<br>_hi | Pointer to end of range.     |

#### Returns

Pointer to a non-matching char\_type if found, else \_\_hi.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

#### do\_tolower() [1/2]

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_tolower (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Convert array to lowercase.

This virtual function converts each char\_type in the range [\_\_lo,\_\_hi) to lowercase if possible. Other elements remain untouched.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

#### Parameters

|                          |                            |
|--------------------------|----------------------------|
| $\leftrightarrow$<br>_lo | Pointer to start of range. |
| $\leftrightarrow$<br>_hi | Pointer to end of range.   |

#### Returns

\_\_hi.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

#### do\_tolower() [2/2]

```
template<typename _CharT>
virtual char_type std::ctype<_CharT>::do_tolower (
    char_type __c) const [protected], [virtual]
```

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

**Parameters**

|                                                                                                                                                                                                                        |                           |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| <a href="#"></a><br><a href="#"></a> <code>_c</code> | The char_type to convert. |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|

**Returns**

The lowercase char\_type if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by [std::ctype<char>::tolower\(\)](#), and [std::ctype<char>::tolower\(\)](#).

**do\_toupper()** [1/2]

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_toupper (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Convert array to uppercase.

This virtual function converts each char\_type in the range [`__lo`,`__hi`) to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

**Parameters**

|                                                                                                                          |                            |
|--------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><code>__lo</code>  | Pointer to start of range. |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.   |

**Returns**

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**do\_toupper()** [2/2]

```
template<typename _CharT>
virtual char_type std::ctype<_CharT>::do_toupper (
    char_type __c) const [protected], [virtual]
```

Convert to uppercase.

This virtual function converts the char\_type argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

**Parameters**

|                                                                                                                         |                           |
|-------------------------------------------------------------------------------------------------------------------------|---------------------------|
| <a href="#"></a><br><code>__c</code> | The char_type to convert. |
|-------------------------------------------------------------------------------------------------------------------------|---------------------------|

**Returns**

The uppercase char\_type if convertible, else \_\_c.

Implements [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#).

Referenced by [std::ctype< char >::toupper\(\)](#), and [std::ctype< char >::toupper\(\)](#).

**do\_widen()** [1/2]

```
template<typename _CharT>
virtual char_type std::ctype< _CharT >::do_widen (
    char __c) const [protected], [virtual]
```

Widen char.

This virtual function converts the char to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                                          |                      |
|------------------------------------------|----------------------|
| <a href="#">_↔</a><br><a href="#">_C</a> | The char to convert. |
|------------------------------------------|----------------------|

**Returns**

The converted char\_type

Implements [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#).

Referenced by [std::ctype< char >::widen\(\)](#), and [std::ctype< char >::widen\(\)](#).

**do\_widen()** [2/2]

```
template<typename _CharT>
virtual const char * std::ctype< _CharT >::do_widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [protected], [virtual]
```

Widen char array.

This function converts each char in the input to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                                           |                                   |
|-------------------------------------------|-----------------------------------|
| <a href="#">_↔</a><br><a href="#">_lo</a> | Pointer to start range.           |
| <a href="#">_↔</a><br><a href="#">_hi</a> | Pointer to end of range.          |
| <a href="#">_↔</a><br><a href="#">_to</a> | Pointer to the destination array. |

**Returns**

[\\_\\_hi](#).

Implements [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#).

**is()** [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [inline], [inherited]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char\_type>::do\_is().

**Parameters**

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

**Returns**

`__hi`.

**is()** [2/2]

```
template<typename _CharT>
bool std::__ctype_abstract_base< _CharT >::is (
    mask __m,
    char_type __c) const [inline], [inherited]
```

Test char\_type classification.

This function finds a mask M for \_\_c and compares it to mask \_\_m. It does so by returning the value of ctype<char\_↵type>::do\_is().

**Parameters**

|                  |                                       |
|------------------|---------------------------------------|
| <code>_↵c</code> | The char_type to compare the mask of. |
| <code>_↵m</code> | The mask to compare against.          |

**Returns**

$(M \& \_m) \neq 0$ .

Referenced by [std::time\\_get< \\_CharT, \\_InIter >::get\(\)](#).

**narrow()** [1/2]

```
template<typename _CharT>
char std::__ctype_abstract_base< _CharT >::narrow (
    char_type __c,
    char __default) const [inline], [inherited]
```

Narrow char\_type to char.

This function converts the char\_type to char using the simplest reasonable transformation. If the conversion fails, default is returned instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_c).

Note: this is not what you want for codepage conversions. See [codecv](#) for that.

## Parameters

|                        |                                        |
|------------------------|----------------------------------------|
| <code>__c</code>       | The <code>char_type</code> to convert. |
| <code>__default</code> | Char to return if conversion fails.    |

## Returns

The converted char.

Referenced by `std::time_get<_CharT, _InIter>::do_get_year()`, `std::time_get<_CharT, _InIter>::get()`, and `std::time_put<_CharT, _OutIter>::put()`.

**narrow()** [2/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline], [inherited]
```

Narrow array to char array.

This function converts each `char_type` in the input to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `char_type` in the input that cannot be converted, *default* is used instead. It does so by returning `ctype<char_type>::do_narrow(__lo, __hi, __default, __to)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

## Returns

`__hi`.

**scan\_is()**

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Find `char_type` matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is true. It does so by returning `ctype<char_type>::do_scan_is()`.

## Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__m</code> | The mask to compare against. |
|------------------|------------------------------|

**Parameters**

|                                                                                                                        |                            |
|------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><code>__lo</code> | Pointer to start of range. |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.   |

**Returns**

Pointer to matching `char_type` if found, else `__hi`.

**scan\_not()**

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Find `char_type` not matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is false. It does so by returning `ctype<char_type>::do_scan_not()`.

**Parameters**

|                                                                                                                          |                                 |
|--------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <a href="#"></a><br><code>__m</code>   | The mask to compare against.    |
| <a href="#"></a><br><code>__lo</code> | Pointer to first char in range. |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.        |

**Returns**

Pointer to non-matching char if found, else `__hi`.

**tolower()** [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::tolower (
    char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo, __hi)`.

**Parameters**

|                                                                                                                          |                            |
|--------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><code>__lo</code> | Pointer to start of range. |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.   |

**Returns**`__hi`.**tolower()** [2/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base<_CharT>::tolower (
    char_type __c) const [inline], [inherited]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_tolower(c)`.

**Parameters**

|                  |                           |
|------------------|---------------------------|
| <code>__c</code> | The char_type to convert. |
|------------------|---------------------------|

**Returns**The lowercase char\_type if convertible, else `__c`.Referenced by `std::time_get<_CharT, _InIter>::get()`.**toupper()** [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

**Parameters**

|                   |                            |
|-------------------|----------------------------|
| <code>__lo</code> | Pointer to start of range. |
| <code>__hi</code> | Pointer to end of range.   |

**Returns**`__hi`.**toupper()** [2/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base<_CharT>::toupper (
    char_type __c) const [inline], [inherited]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

**Parameters**

|                                                                                                                                                                                                                        |                           |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| <a href="#"></a><br><a href="#"></a> <code>_c</code> | The char_type to convert. |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|

**Returns**

The uppercase char\_type if convertible, else `__c`.

Referenced by [std::time\\_get<\\_CharT, \\_InIter >::get\(\)](#).

**widen() [1/2]**

```
template<typename _CharT>
char_type std::__ctype_abstract_base<_CharT >::widen (
    char __c) const [inline], [inherited]
```

Widen char to char\_type.

This function converts the char argument to char\_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                                                                                                                                                                                                                        |                      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| <a href="#"></a><br><a href="#"></a> <code>_c</code> | The char to convert. |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|

**Returns**

The converted char\_type.

Referenced by [std::money\\_get<\\_CharT, \\_InIter >::do\\_get\(\)](#), [std::time\\_get<\\_CharT, \\_InIter >::do\\_get\(\)](#), [std::money\\_put<\\_CharT, \\_OutIter >::do\\_put\(\)](#) and [std::time\\_put<\\_CharT, \\_OutIter >::do\\_put\(\)](#).

**widen() [2/2]**

```
template<typename _CharT>
const char * std::__ctype_abstract_base<_CharT >::widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline], [inherited]
```

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                                                                                                                                                                                                                             |                                   |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------|
| <a href="#"></a><br><a href="#"></a> <code>_lo</code> | Pointer to start of range.        |
| <a href="#"></a><br><a href="#"></a> <code>_hi</code> | Pointer to end of range.          |
| <a href="#"></a><br><a href="#"></a> <code>_to</code> | Pointer to the destination array. |

Returns

`__hi`.

### 6.355.3 Member Data Documentation

**id**

```
template<typename _CharT>
locale::id std::ctype<_CharT >::id [static]
The facet id for ctype<char_type>
```

The documentation for this class was generated from the following file:

- [locale\\_facets.h](#)

## 6.356 std::ctype< char > Class Reference

```
#include <locale_facets.h>
```

Inheritance diagram for std::ctype< char >:

### 6.356.1 Detailed Description

The `ctype<char>` specialization.

This class defines classification and conversion functions for the `char` type. It gets used by `char` streams for many I/O operations. The `char` specialization provides a number of optimizations as well.

### 6.356.2 Member Typedef Documentation

#### `char_type`

`typedef char std::ctype< char >::char_type`  
 Typedef for the template parameter `char`.

### 6.356.3 Constructor & Destructor Documentation

#### `ctype()` [1/2]

```
std::ctype< char >::ctype (
    const mask * __table = 0,
    bool __del = false,
    size_t __refs = 0) [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

#### Parameters

|                      |                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------|
| <code>__table</code> | If non-zero, table is used as the per-char mask. Else <code>classic_table()</code> is used. |
| <code>__del</code>   | If true, passes ownership of table to this facet.                                           |
| <code>__refs</code>  | Passed to the base facet class.                                                             |

Referenced by `~ctype()`.

#### `ctype()` [2/2]

```
std::ctype< char >::ctype (
    __c_locale __cloc,
    const mask * __table = 0,
    bool __del = false,
    size_t __refs = 0) [explicit]
```

Constructor performs static initialization.

This constructor is used to construct the initial C locale facet.

## Parameters

|                      |                                                   |
|----------------------|---------------------------------------------------|
| <code>__cloc</code>  | Handle to C locale data.                          |
| <code>__table</code> | If non-zero, table is used as the per-char mask.  |
| <code>__del</code>   | If true, passes ownership of table to this facet. |
| <code>__refs</code>  | Passed to the base facet class.                   |

`~ctype()`

```
virtual std::ctype< char >::~~ctype () [protected], [virtual]
```

Destructor.

This function deletes table() if `del` was true in the constructor.

References [ctype\(\)](#).

## 6.356.4 Member Function Documentation

`classic_table()`

```
const mask * std::ctype< char >::classic_table () throw ( ) [static]
```

Returns a pointer to the C locale mask table.

`do_is()` [1/3]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [protected], [pure virtual], [inherited]
```

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the input.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

## Parameters

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

## Returns

`__hi`.

Implemented in [std::ctype< \\_CharT >](#), and [std::mask< \\_CharT >](#).

`do_is()` [2/3]

```
template<typename _CharT>
virtual bool std::__ctype_abstract_base< _CharT >::do_is (
    mask __m,
    char_type __c) const [protected], [pure virtual], [inherited]
```

Test `char_type` classification.

This function finds a mask *M* for *c* and compares it to mask *m*.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

#### Parameters

|                          |                                    |
|--------------------------|------------------------------------|
| $\leftrightarrow$<br>__c | The char_type to find the mask of. |
| $\leftrightarrow$<br>__m | The mask to compare against.       |

#### Returns

$(M \ \& \ \_m) \neq 0$ .

Implemented in `std::ctype< _CharT >`, `std::ctype< wchar_t >`, and `std::mask< _CharT >`.

Referenced by `std::mask< _CharT >::is()`, and `std::mask< _CharT >::is()`.

#### **do\_is()** [3/3]

```
virtual bool std::ctype< char >::do_is (
    mask __m,
    char_type __c) const [protected], [virtual]
```

Test char\_type classification.

This function finds a mask *M* for *c* and compares it to mask *m*.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

#### Parameters

|                          |                                    |
|--------------------------|------------------------------------|
| $\leftrightarrow$<br>__c | The char_type to find the mask of. |
| $\leftrightarrow$<br>__m | The mask to compare against.       |

#### Returns

$(M \ \& \ \_m) \neq 0$ .

#### **do\_narrow()** [1/4]

```
template<typename _CharT>
virtual char std::__ctype_abstract_base< _CharT >::do_narrow (
    char_type __c,
    char __default) const [protected], [pure virtual], [inherited]
```

Narrow char\_type to char.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, *default* is returned instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

|                        |                                        |
|------------------------|----------------------------------------|
| <code>__c</code>       | The <code>char_type</code> to convert. |
| <code>__default</code> | Char to return if conversion fails.    |

## Returns

The converted char.

Implemented in [std::ctype< \\_CharT >](#), [std::ctype< wchar\\_t >](#), and [std::mask< \\_CharT >](#).

Referenced by [std::mask< \\_CharT >::narrow\(\)](#), and [std::mask< \\_CharT >::narrow\(\)](#).

**do\_narrow()** [2/4]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [protected], [pure virtual], [inherited]
```

Narrow `char_type` array to char.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to char using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__default` is used instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

## Returns

`__hi`.

Implemented in [std::ctype< \\_CharT >](#), and [std::mask< \\_CharT >](#).

**do\_narrow()** [3/4]

```
virtual char std::ctype< char >::do_narrow (
    char_type __c,
    char __default) const [inline], [protected], [virtual]
```

Narrow char.

This virtual function converts the char to char using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead. For an underived `ctype<char>` facet, `c` will be returned unchanged.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

|                        |                                     |
|------------------------|-------------------------------------|
| <code>__c</code>       | The char to convert.                |
| <code>__default</code> | Char to return if conversion fails. |

## Returns

The converted char.

**do\_narrow()** [4/4]

```
virtual const char_type * std::ctype< char >::do_narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline], [protected], [virtual]
```

Narrow char array to char array.

This virtual function converts each char in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *default* is used instead. For an undervied `ctype<char>` facet, the argument will be copied unchanged.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

## Returns

`__hi`.

**do\_scan\_is()** [1/2]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [pure virtual], [inherited]
```

Find `char_type` matching mask.

This function searches for and returns the first `char_type` `c` in `[__lo,__hi)` for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

## Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__m</code> | The mask to compare against. |
|------------------|------------------------------|

## Parameters

|                                   |                            |
|-----------------------------------|----------------------------|
| <a href="#"><code>__lo</code></a> | Pointer to start of range. |
| <a href="#"><code>__hi</code></a> | Pointer to end of range.   |

## Returns

Pointer to a matching `char_type` if found, else `__hi`.

Implemented in [std::ctype< \\_CharT >](#), [std::ctype< wchar\\_t >](#), and [std::mask< \\_CharT >](#).

Referenced by [std::mask< \\_CharT >::scan\\_is\(\)](#).

**do\_scan\_is()** [2/2]

```
virtual const char_type * std::ctype< char >::do_scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Find `char_type` matching mask.

This function searches for and returns the first `char_type` `c` in `[__lo,__hi)` for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

## Parameters

|                                   |                              |
|-----------------------------------|------------------------------|
| <a href="#"><code>__m</code></a>  | The mask to compare against. |
| <a href="#"><code>__lo</code></a> | Pointer to start of range.   |
| <a href="#"><code>__hi</code></a> | Pointer to end of range.     |

## Returns

Pointer to a matching `char_type` if found, else `__hi`.

**do\_scan\_not()** [1/2]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [pure virtual], [inherited]
```

Find `char_type` not matching mask.

This function searches for and returns a pointer to the first `char_type` `c` of `[lo,hi)` for which `is(m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

## Parameters

|                                  |                              |
|----------------------------------|------------------------------|
| <a href="#"><code>__m</code></a> | The mask to compare against. |
|----------------------------------|------------------------------|

**Parameters**

|                                                                                                                        |                            |
|------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><code>__lo</code> | Pointer to start of range. |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.   |

**Returns**

Pointer to a non-matching `char_type` if found, else `__hi`.

Implemented in [std::ctype< \\_CharT >](#), [std::ctype< wchar\\_t >](#), and [std::mask< \\_CharT >](#).

Referenced by [std::mask< \\_CharT >::scan\\_not\(\)](#).

**do\_scan\_not()** [2/2]

```
virtual const char_type * std::ctype< char >::do_scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Find `char_type` not matching mask.

This function searches for and returns a pointer to the first `char_type` `c` of `[lo,hi)` for which `is(m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

**Parameters**

|                                                                                                                          |                              |
|--------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <a href="#"></a><br><code>__m</code>  | The mask to compare against. |
| <a href="#"></a><br><code>__lo</code> | Pointer to start of range.   |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to a non-matching `char_type` if found, else `__hi`.

**do\_tolower()** [1/4]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_tolower (
    char_type * __lo,
    const char_type * __hi) const [protected], [pure virtual], [inherited]
```

Convert array to lowercase.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

**Parameters**

|                                                                                                                          |                            |
|--------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><code>__lo</code> | Pointer to start of range. |
|--------------------------------------------------------------------------------------------------------------------------|----------------------------|

|                                                                                                                                  |                          |
|----------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| <a href="#"></a><br><a href="#"><u>__hi</u></a> | Pointer to end of range. |
|----------------------------------------------------------------------------------------------------------------------------------|--------------------------|

**Returns**[\\_\\_hi](#).Implemented in [std::ctype< \\_CharT >](#), and [std::mask< \\_CharT >](#).**do\_tolower()** [2/4]

```
template<typename _CharT>
virtual char_type std::__ctype_abstract_base< _CharT >::do_tolower (
    char_type __c) const [protected], [pure virtual], [inherited]
```

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

**Parameters**

|                                                                                                                                 |                           |
|---------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| <a href="#"></a><br><a href="#"><u>__c</u></a> | The char_type to convert. |
|---------------------------------------------------------------------------------------------------------------------------------|---------------------------|

**Returns**The lowercase char\_type if convertible, else [\\_\\_c](#).Implemented in [std::ctype< \\_CharT >](#), [std::ctype< wchar\\_t >](#), and [std::mask< \\_CharT >](#).Referenced by [std::mask< \\_CharT >::tolower\(\)](#), and [std::mask< \\_CharT >::tolower\(\)](#).**do\_tolower()** [3/4]

```
virtual const char_type * std::ctype< char >::do_tolower (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Convert array to lowercase.

This virtual function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

**Parameters**

|                                                                                                                                    |                                 |
|------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <a href="#"></a><br><a href="#"><u>__lo</u></a> | Pointer to first char in range. |
| <a href="#"></a><br><a href="#"><u>__hi</u></a> | Pointer to end of range.        |

**Returns**[\\_\\_hi](#).References [do\\_tolower\(\)](#).

**do\_tolower()** [4/4]

```
virtual char_type std::ctype< char >::do_tolower (
    char_type __c) const [protected], [virtual]
```

Convert to lowercase.

This virtual function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

**Parameters**

|                                                                                                    |                      |
|----------------------------------------------------------------------------------------------------|----------------------|
|  <code>__c</code> | The char to convert. |
|----------------------------------------------------------------------------------------------------|----------------------|

**Returns**

The lowercase char if convertible, else `__c`.

References [do\\_tolower\(\)](#).

Referenced by [do\\_tolower\(\)](#), and [do\\_tolower\(\)](#).

**do\_toupper()** [1/4]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_toupper (
    char_type * __lo,
    const char_type * __hi) const [protected], [pure virtual], [inherited]
```

Convert array to uppercase.

This virtual function converts each char\_type in the range [`__lo`,`__hi`) to uppercase if possible. Other elements remain untouched.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

**Parameters**

|                                                                                                       |                            |
|-------------------------------------------------------------------------------------------------------|----------------------------|
|  <code>__lo</code> | Pointer to start of range. |
|  <code>__hi</code> | Pointer to end of range.   |

**Returns**

`__hi`.

Implemented in [std::ctype< \\_CharT >](#), and [std::mask< \\_CharT >](#).

**do\_toupper()** [2/4]

```
template<typename _CharT>
virtual char_type std::__ctype_abstract_base< _CharT >::do_toupper (
    char_type __c) const [protected], [pure virtual], [inherited]
```

Convert to uppercase.

This virtual function converts the char\_type argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

## Parameters

|                                                                                                   |                           |
|---------------------------------------------------------------------------------------------------|---------------------------|
| <a href="#"></a> | The char_type to convert. |
| <code>__c</code>                                                                                  |                           |

## Returns

The uppercase char\_type if convertible, else `__c`.

Implemented in [std::ctype< \\_CharT >](#), [std::ctype< wchar\\_t >](#), and [std::mask< \\_CharT >](#).

Referenced by [std::mask< \\_CharT >::toupper\(\)](#), and [std::mask< \\_CharT >::toupper\(\)](#).

**do\_toupper()** [3/4]

```
virtual const char_type * std::ctype< char >::do_toupper (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Convert array to uppercase.

This virtual function converts each char in the range [lo,hi) to uppercase if possible. Other chars remain untouched.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

## Parameters

|                                                                                                    |                            |
|----------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a>  | Pointer to start of range. |
| <code>__lo</code>                                                                                  |                            |
| <a href="#"></a> | Pointer to end of range.   |
| <code>__hi</code>                                                                                  |                            |

## Returns

`__hi`.

References [do\\_toupper\(\)](#).

**do\_toupper()** [4/4]

```
virtual char_type std::ctype< char >::do_toupper (
    char_type __c) const [protected], [virtual]
```

Convert to uppercase.

This virtual function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

## Parameters

|                                                                                                     |                      |
|-----------------------------------------------------------------------------------------------------|----------------------|
| <a href="#"></a> | The char to convert. |
| <code>__c</code>                                                                                    |                      |

## Returns

The uppercase char if convertible, else `__c`.

References [do\\_toupper\(\)](#).

Referenced by [do\\_toupper\(\)](#), and [do\\_toupper\(\)](#).

**do\_widen()** [1/3]

```
template<typename _CharT>
virtual const char * std::\_\_ctype\_abstract\_base< _CharT >::do_widen (
    const char * __lo,
    const char * __hi,
    char\_type * __to) const    [protected], [pure virtual], [inherited]
```

Widen char array.

This function converts each char in the input to [char\\_type](#) using the simplest reasonable transformation.

[do\\_widen\(\)](#) is a hook for a derived facet to change the behavior of widening. [do\\_widen\(\)](#) must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See [codecvt](#) for that.

**Parameters**

|                            |                                   |
|----------------------------|-----------------------------------|
| <a href="#">_↔<br/>_lo</a> | Pointer to start range.           |
| <a href="#">_↔<br/>_hi</a> | Pointer to end of range.          |
| <a href="#">_↔<br/>_to</a> | Pointer to the destination array. |

**Returns**

[\\_↔  
\\_hi](#).

Implemented in [std::ctype< \\_CharT >](#), and [std::mask< \\_CharT >](#).

**do\_widen()** [2/3]

```
virtual char\_type std::ctype< char >::do_widen (
    char __c) const    [inline], [protected], [virtual]
```

Widen char.

This virtual function converts the char to [char\\_type](#) using the simplest reasonable transformation. For an underived [ctype<char>](#) facet, the argument will be returned unchanged.

[do\\_widen\(\)](#) is a hook for a derived facet to change the behavior of widening. [do\\_widen\(\)](#) must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See [codecvt](#) for that.

**Parameters**

|                           |                      |
|---------------------------|----------------------|
| <a href="#">_↔<br/>_c</a> | The char to convert. |
|---------------------------|----------------------|

**Returns**

The converted character.

Implements [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#).

References [do\\_widen\(\)](#).

Referenced by [do\\_widen\(\)](#).

**do\_widen()** [3/3]

```
virtual const char * std::ctype< char >::do_widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline], [protected], [virtual]
```

Widen char array.

This function converts each char in the range [lo,hi) to char using the simplest reasonable transformation. For an undervived ctype<char> facet, the argument will be copied unchanged.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                                                                                                     |                                   |
|-----------------------------------------------------------------------------------------------------|-----------------------------------|
|  <code>__lo</code> | Pointer to start of range.        |
|  <code>__hi</code> | Pointer to end of range.          |
|  <code>__to</code> | Pointer to the destination array. |

**Returns**

`__hi`.

**is()** [1/6]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [inline], [inherited]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char\_type>::do\_is().

**Parameters**

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

**Returns**

`__hi`.

**is()** [2/6]

```
template<typename _CharT>
bool std::__ctype_abstract_base< _CharT >::is (
    mask __m,
    char_type __c) const [inline], [inherited]
```

Test `char_type` classification.

This function finds a mask `M` for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_↵type>::do_is()`.

#### Parameters

|                   |                                                    |
|-------------------|----------------------------------------------------|
| <code>__↵c</code> | The <code>char_type</code> to compare the mask of. |
| <code>__↵m</code> | The mask to compare against.                       |

#### Returns

`(M & __m) != 0.`

Referenced by [std::time\\_get<\\_CharT, \\_InIter >::get\(\)](#).

#### is() [3/6]

```
const char * std::ctype< char >::is (
    const char * __lo,
    const char * __hi,
    mask * __vec) const [inline]
```

Return a mask array.

This function finds the mask for each char in the range `[lo, hi)` and successively writes it to `vec`. `vec` must have as many elements as the char array.

#### Parameters

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

#### Returns

`__hi.`

#### is() [4/6]

```
const char_type * std::__ctype_abstract_base< char >::is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [inline]
```

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the char array. It does so by returning the value of `ctype<char_type>::do_is()`.

#### Parameters

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

**Returns**`__hi`.**is()** [5/6]

```
bool std::ctype< char >::is (
    mask __m,
    char __c) const [inline]
```

Test char classification.

This function compares the mask table[c] to `__m`.**Parameters**

|                  |                                  |
|------------------|----------------------------------|
| <code>__c</code> | The char to compare the mask of. |
| <code>__m</code> | The mask to compare against.     |

**Returns**True if `__m & table[__c]` is true, false otherwise.**is()** [6/6]

```
bool std::__ctype_abstract_base< char >::is (
    mask __m,
    char_type __c) const [inline]
```

Test `char_type` classification.This function finds a mask M for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_type>::do_is()`.**Parameters**

|                  |                                                    |
|------------------|----------------------------------------------------|
| <code>__c</code> | The <code>char_type</code> to compare the mask of. |
| <code>__m</code> | The mask to compare against.                       |

**Returns**`(M & __m) != 0`.**narrow()** [1/6]

```
template<typename _CharT>
char std::__ctype_abstract_base< _CharT >::narrow (
    char_type __c,
    char __default) const [inline], [inherited]
```

Narrow `char_type` to `char`.This function converts the `char_type` to `char` using the simplest reasonable transformation. If the conversion fails, `default` is returned instead. It does so by returning `ctype<char_type>::do_narrow(__c)`.Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                        |                                        |
|------------------------|----------------------------------------|
| <code>__c</code>       | The <code>char_type</code> to convert. |
| <code>__default</code> | Char to return if conversion fails.    |

**Returns**

The converted char.

Referenced by `std::time_get<_CharT, _InIter>::do_get_year()`, `std::time_get<_CharT, _InIter>::get()`, and `std::time_put<_CharT, _OutIter>::put()`.

**narrow()** [2/6]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline], [inherited]
```

Narrow array to char array.

This function converts each `char_type` in the input to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `char_type` in the input that cannot be converted, *default* is used instead. It does so by returning `ctype<char_type>::do_narrow(__lo, __hi, __default, __to)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

**Returns**

`__hi`.

**narrow()** [3/6]

```
char std::__ctype_abstract_base< char >::narrow (
    char_type __c,
    char __default) const [inline]
```

Narrow `char_type` to `char`.

This function converts the `char_type` to `char` using the simplest reasonable transformation. If the conversion fails, *default* is returned instead. It does so by returning `ctype<char_type>::do_narrow(__c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                        |                                        |
|------------------------|----------------------------------------|
| <code>__c</code>       | The <code>char_type</code> to convert. |
| <code>__default</code> | Char to return if conversion fails.    |

**Returns**

The converted char.

**narrow()** [4/6]

```
char std::ctype< char >::narrow (
    char_type __c,
    char __default) const [inline]
```

Narrow char.

This function converts the char to char using the simplest reasonable transformation. If the conversion fails, *default* is returned instead. For an underived ctype<char> facet, *c* will be returned unchanged.

This function works as if it returns ctype<char>::do\_narrow(*c*). do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                        |                                     |
|------------------------|-------------------------------------|
| <code>__c</code>       | The char to convert.                |
| <code>__default</code> | Char to return if conversion fails. |

**Returns**

The converted character.

References [std::ctype< \\_CharT >::do\\_narrow\(\)](#).

**narrow()** [5/6]

```
const char_type * std::__ctype_abstract_base< char >::narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline]
```

Narrow array to char array.

This function converts each char\_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char\_type in the input that cannot be converted, *default* is used instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_lo, \_\_hi, \_\_default, \_\_to).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

**Returns**

`__hi`.

**narrow()** [6/6]

```
const char_type * std::ctype< char >::narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline]
```

Narrow char array.

This function converts each char in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *default* is used instead. For an underived `ctype<char>` facet, the argument will be copied unchanged.

This function works as if it returns `ctype<char>::do_narrow(lo, hi, default, to)`. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecv` for that.

**Parameters**

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

**Returns**

`__hi`.

References `std::ctype< _CharT >::do_narrow()`.

**scan\_is()** [1/3]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Find `char_type` matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is true. It does so by returning `ctype<char_type>::do_scan_is()`.

**Parameters**

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to matching `char_type` if found, else `__hi`.

**scan\_is()** [2/3]

```
const char * std::ctype< char >::scan_is (
    mask __m,
    const char * __lo,
    const char * __hi) const [inline]
```

Find char matching a mask.

This function searches for and returns the first char in [lo,hi) for which is(m,char) is true.

**Parameters**

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to a matching char if found, else `__hi`.

**scan\_is()** [3/3]

```
const char_type * std::__ctype_abstract_base< char >::scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline]
```

Find char\_type matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char\_type>::do\_scan\_is().

**Parameters**

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to matching char\_type if found, else `__hi`.

**scan\_not()** [1/3]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Find char\_type not matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is false. It does so by returning `ctype<char_type>::do_scan_not()`.

## Parameters

|                                                                                                           |                                 |
|-----------------------------------------------------------------------------------------------------------|---------------------------------|
| <a href="#"></a><br>__m  | The mask to compare against.    |
| <a href="#"></a><br>__lo | Pointer to first char in range. |
| <a href="#"></a><br>__hi | Pointer to end of range.        |

## Returns

Pointer to non-matching char if found, else \_\_hi.

**scan\_not()** [2/3]

```
const char * std::ctype< char >::scan_not (
    mask __m,
    const char * __lo,
    const char * __hi) const [inline]
```

Find char not matching a mask.

This function searches for and returns a pointer to the first char in [\_\_lo,\_\_hi) for which is(m,char) is false.

## Parameters

|                                                                                                             |                              |
|-------------------------------------------------------------------------------------------------------------|------------------------------|
| <a href="#"></a><br>__m    | The mask to compare against. |
| <a href="#"></a><br>__lo | Pointer to start of range.   |
| <a href="#"></a><br>__hi | Pointer to end of range.     |

## Returns

Pointer to a non-matching char if found, else \_\_hi.

**scan\_not()** [3/3]

```
const char_type * std::__ctype_abstract_base< char >::scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline]
```

Find char\_type not matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char\_type>::do\_scan\_not().

## Parameters

|                                                                                                             |                                 |
|-------------------------------------------------------------------------------------------------------------|---------------------------------|
| <a href="#"></a><br>__m  | The mask to compare against.    |
| <a href="#"></a><br>__lo | Pointer to first char in range. |
| <a href="#"></a><br>__hi | Pointer to end of range.        |

**Returns**

Pointer to non-matching char if found, else `__hi`.

**table()**

```
const mask * std::ctype< char >::table () const throw ( )    [inline]
```

Returns a pointer to the mask table provided to the constructor, or the default from `classic_table()` if none was provided.

**tolower() [1/6]**

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::tolower (
    char_type * __lo,
    const char_type * __hi) const    [inline], [inherited]
```

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo, __hi)`.

**Parameters**

|                                                                                                     |                            |
|-----------------------------------------------------------------------------------------------------|----------------------------|
|  <code>__lo</code> | Pointer to start of range. |
|  <code>__hi</code> | Pointer to end of range.   |

**Returns**

`__hi`.

**tolower() [2/6]**

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::tolower (
    char_type __c) const    [inline], [inherited]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_tolower(c)`.

**Parameters**

|                                                                                                      |                                        |
|------------------------------------------------------------------------------------------------------|----------------------------------------|
|  <code>__c</code> | The <code>char_type</code> to convert. |
|------------------------------------------------------------------------------------------------------|----------------------------------------|

**Returns**

The lowercase `char_type` if convertible, else `__c`.

Referenced by `std::time_get< _CharT, _InIter >::get()`.

**tolower()** [3/6]

```
const char_type * std::__ctype_abstract_base< char >::tolower (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to lowercase.

This function converts each char\_type in the range [\_\_lo,\_\_hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_tolower(\_\_lo, \_\_hi).

**Parameters**

|                                                                                           |                            |
|-------------------------------------------------------------------------------------------|----------------------------|
| <br>__lo | Pointer to start of range. |
| <br>__hi | Pointer to end of range.   |

**Returns**

\_\_hi.

**tolower()** [4/6]

```
const char_type * std::ctype< char >::tolower (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to lowercase.

This function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

tolower() acts as if it returns ctype<char>::do\_tolower(\_\_lo, \_\_hi). do\_tolower() must always return the same result for the same input.

**Parameters**

|                                                                                             |                                 |
|---------------------------------------------------------------------------------------------|---------------------------------|
| <br>__lo | Pointer to first char in range. |
| <br>__hi | Pointer to end of range.        |

**Returns**

\_\_hi.

References [std::ctype< \\_CharT >::do\\_tolower\(\)](#).

**tolower()** [5/6]

```
char_type std::__ctype_abstract_base< char >::tolower (
    char_type __c) const [inline]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char\_type>::do\_tolower(c).

**Parameters**

|                                                                                   |                           |
|-----------------------------------------------------------------------------------|---------------------------|
|  | The char_type to convert. |
| <code>__c</code>                                                                  |                           |

**Returns**

The lowercase char\_type if convertible, else `__c`.

**tolower()** [6/6]

```
char_type std::ctype< char >::tolower (
    char_type __c) const [inline]
```

Convert to lowercase.

This function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument. tolower() acts as if it returns `ctype<char>::do_tolower(__c)`. `do_tolower()` must always return the same result for the same input.

**Parameters**

|                                                                                   |                      |
|-----------------------------------------------------------------------------------|----------------------|
|  | The char to convert. |
| <code>__c</code>                                                                  |                      |

**Returns**

The lowercase char if convertible, else `__c`.

References `std::ctype< _CharT >::do_tolower()`.

**toupper()** [1/6]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

**Parameters**

|                                                                                     |                            |
|-------------------------------------------------------------------------------------|----------------------------|
|  | Pointer to start of range. |
| <code>__lo</code>                                                                   |                            |
|  | Pointer to end of range.   |
| <code>__hi</code>                                                                   |                            |

**Returns**

`__hi`.

**toupper()** [2/6]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::toupper (
    char_type __c) const [inline], [inherited]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char\_type>::do\_toupper().

**Parameters**

|                          |                           |
|--------------------------|---------------------------|
| $\leftrightarrow$<br>__c | The char_type to convert. |
|--------------------------|---------------------------|

**Returns**

The uppercase char\_type if convertible, else \_\_c.

Referenced by [std::time\\_get< \\_CharT, \\_Inlter >::get\(\)](#).

**toupper()** [3/6]

```
const char_type * std::__ctype_abstract_base< char >::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_toupper(lo, hi).

**Parameters**

|                           |                            |
|---------------------------|----------------------------|
| $\leftrightarrow$<br>__lo | Pointer to start of range. |
| $\leftrightarrow$<br>__hi | Pointer to end of range.   |

**Returns**

\_\_hi.

**toupper()** [4/6]

```
const char_type * std::ctype< char >::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to uppercase.

This function converts each char in the range [\_\_lo,\_\_hi) to uppercase if possible. Other chars remain untouched.

toupper() acts as if it returns ctype<char>::do\_toupper(\_\_lo, \_\_hi). do\_toupper() must always return the same result for the same input.

**Parameters**

|                           |                                 |
|---------------------------|---------------------------------|
| $\leftrightarrow$<br>__lo | Pointer to first char in range. |
|---------------------------|---------------------------------|

|                                                                                                                                  |                          |
|----------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| <a href="#"></a><br><a href="#"><u>__hi</u></a> | Pointer to end of range. |
|----------------------------------------------------------------------------------------------------------------------------------|--------------------------|

**Returns**[\\_\\_hi](#).References [std::ctype<\\_CharT>::do\\_toupper\(\)](#).**toupper()** [5/6]

```
char_type std::__ctype_abstract_base< char >::toupper (
    char_type __c) const [inline]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

**Parameters**

|                                                                                                                                 |                           |
|---------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| <a href="#"></a><br><a href="#"><u>__c</u></a> | The char_type to convert. |
|---------------------------------------------------------------------------------------------------------------------------------|---------------------------|

**Returns**The uppercase char\_type if convertible, else [\\_\\_c](#).**toupper()** [6/6]

```
char_type std::ctype< char >::toupper (
    char_type __c) const [inline]
```

Convert to uppercase.

This function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument. `toupper()` acts as if it returns `ctype<char>::do_toupper(c)`. `do_toupper()` must always return the same result for the same input.

**Parameters**

|                                                                                                                                   |                      |
|-----------------------------------------------------------------------------------------------------------------------------------|----------------------|
| <a href="#"></a><br><a href="#"><u>__c</u></a> | The char to convert. |
|-----------------------------------------------------------------------------------------------------------------------------------|----------------------|

**Returns**The uppercase char if convertible, else [\\_\\_c](#).References [std::ctype<\\_CharT>::do\\_toupper\(\)](#).**widen()** [1/5]

```
template<typename _CharT>
const char * std::__ctype_abstract_base< _CharT >::widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline], [inherited]
```

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|                                                                                                    |                                   |
|----------------------------------------------------------------------------------------------------|-----------------------------------|
|  <code>_lo</code> | Pointer to start of range.        |
|  <code>_hi</code> | Pointer to end of range.          |
|  <code>_to</code> | Pointer to the destination array. |

#### Returns

`__hi`.

#### widen() [2/5]

```
char_type std::__ctype_abstract_base< char >::widen (
    char __c) const [inline]
```

Widen char to char\_type.

This function converts the char argument to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|                                                                                                     |                      |
|-----------------------------------------------------------------------------------------------------|----------------------|
|  <code>_c</code> | The char to convert. |
|-----------------------------------------------------------------------------------------------------|----------------------|

#### Returns

The converted char\_type.

#### widen() [3/5]

```
char_type std::ctype< char >::widen (
    char __c) const [inline]
```

Widen char.

This function converts the char to char\_type using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be returned unchanged.

This function works as if it returns ctype<char>::do\_widen(c). do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|                                                                                                     |                      |
|-----------------------------------------------------------------------------------------------------|----------------------|
|  <code>_c</code> | The char to convert. |
|-----------------------------------------------------------------------------------------------------|----------------------|

**Returns**

The converted character.

References [std::ctype<\\_CharT>::do\\_widen\(\)](#).

**widen()** [4/5]

```
const char * std::__ctype_abstract_base< char >::widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline]
```

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                                                                                                                     |                                   |
|---------------------------------------------------------------------------------------------------------------------|-----------------------------------|
| <a href="#"> <code>__lo</code></a> | Pointer to start of range.        |
| <a href="#"> <code>__hi</code></a> | Pointer to end of range.          |
| <a href="#"> <code>__to</code></a> | Pointer to the destination array. |

**Returns**

`__hi`.

**widen()** [5/5]

```
const char * std::ctype< char >::widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline]
```

Widen char array.

This function converts each char in the input to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns ctype<char>::do\_widen(c). do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                                                                                                                       |                                   |
|-----------------------------------------------------------------------------------------------------------------------|-----------------------------------|
| <a href="#"> <code>__lo</code></a> | Pointer to first char in range.   |
| <a href="#"> <code>__hi</code></a> | Pointer to end of range.          |
| <a href="#"> <code>__to</code></a> | Pointer to the destination array. |

**Returns**

`__hi`.

References [std::ctype<\\_CharT>::do\\_widen\(\)](#).

### 6.356.5 Member Data Documentation

#### id

`locale::id std::ctype< char >::id [static]`

The facet id for ctype<char>

#### table\_size

`const size_t std::ctype< char >::table_size [static]`

The size of the mask table. It is SCHAR\_MAX + 1.

The documentation for this class was generated from the following files:

- [locale\\_facets.h](#)
- [ctype\\_inline.h](#)

## 6.357 std::ctype< wchar\_t > Class Reference

`#include <locale_facets.h>`

Inheritance diagram for std::ctype< wchar\_t >:

### Public Types

- `typedef const int * __to_type`
- `typedef wctype_t __wmask_type`
- `typedef wchar_t char_type`
- `typedef __ctype_abstract_base< wchar_t >::mask mask`

### Public Member Functions

- `ctype` (`__c_locale __cloc`, `size_t __refs=0`)
- `ctype` (`size_t __refs=0`)
- `const char_type * is` (`const char_type * __lo`, `const char_type * __hi`, `mask * __vec`) `const`
- `bool is` (`mask __m`, `char_type __c`) `const`

- char [narrow](#) (char\_type \_\_c, char \_\_dfault) const
- const char\_type \* [narrow](#) (const char\_type \* \_\_lo, const char\_type \* \_\_hi, char \_\_dfault, char \* \_\_to) const
- const char\_type \* [scan\\_is](#) (mask \_\_m, const char\_type \* \_\_lo, const char\_type \* \_\_hi) const
- const char\_type \* [scan\\_not](#) (mask \_\_m, const char\_type \* \_\_lo, const char\_type \* \_\_hi) const

**6.357.1 Detailed Description**

The ctype<wchar\_t> specialization.

This class defines classification and conversion functions for the wchar\_t type. It gets used by wchar\_t streams for many I/O operations. The wchar\_t specialization provides a number of optimizations as well. ctype<wchar\_t> inherits its public methods from \_\_ctype\_abstract\_base<wchar\_t>.

**6.357.2 Member Typedef Documentation****char\_type**

```
typedef wchar_t std::ctype< wchar_t >::char_type
```

Typedef for the template parameter wchar\_t.

**6.357.3 Constructor & Destructor Documentation****ctype() [1/2]**

```
std::ctype< wchar_t >::ctype (
    size_t __refs = 0) [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

**Parameters**

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

**ctype() [2/2]**

```
std::ctype< wchar_t >::ctype (
    __c_locale __cloc,
    size_t __refs = 0) [explicit]
```

Constructor performs static initialization.

This constructor is used to construct the initial C locale facet.

**Parameters**

|                     |                                 |
|---------------------|---------------------------------|
| <code>__cloc</code> | Handle to C locale data.        |
| <code>__refs</code> | Passed to the base facet class. |

**~ctype()**

```
virtual std::ctype< wchar_t >::~~ctype () [protected], [virtual]
```

Destructor.

## 6.357.4 Member Function Documentation

### do\_is() [1/2]

```
virtual const char_type * std::ctype< wchar_t >::do_is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [protected], [virtual]
```

Return a mask array.

This function finds the mask for each `wchar_t` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the input.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

#### Parameters

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

#### Returns

`__hi`.

### do\_is() [2/2]

```
virtual bool std::ctype< wchar_t >::do_is (
    mask __m,
    char_type __c) const [protected], [virtual]
```

Test `wchar_t` classification.

This function finds a mask `M` for `c` and compares it to mask `m`.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

#### Parameters

|                  |                                               |
|------------------|-----------------------------------------------|
| <code>__c</code> | The <code>wchar_t</code> to find the mask of. |
| <code>__m</code> | The mask to compare against.                  |

#### Returns

$(M \& \_m) \neq 0$ .

Implements `std::__ctype_abstract_base< wchar_t >`.

### do\_narrow() [1/2]

```
virtual char std::ctype< wchar_t >::do_narrow (
    char_type __c,
    char __dfault) const [protected], [virtual]
```

Narrow `wchar_t` to `char`.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, *dfault* is returned instead. For an underived ctype<wchar\_t> facet, *c* will be cast to char and returned. `do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

|                       |                                     |
|-----------------------|-------------------------------------|
| <code>__c</code>      | The wchar_t to convert.             |
| <code>__dfault</code> | Char to return if conversion fails. |

#### Returns

The converted char.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

#### do\_narrow() [2/2]

```
virtual const char_type * std::ctype< wchar_t >::do_narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __dfault,
    char * __to) const [protected], [virtual]
```

Narrow wchar\_t array to char array.

This virtual function converts each wchar\_t in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any wchar\_t in the input that cannot be converted, *dfault* is used instead. For an underived ctype<wchar\_t> facet, the argument will be copied, casting each element to char.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

|                       |                                   |
|-----------------------|-----------------------------------|
| <code>__lo</code>     | Pointer to start of range.        |
| <code>__hi</code>     | Pointer to end of range.          |
| <code>__dfault</code> | Char to use if conversion fails.  |
| <code>__to</code>     | Pointer to the destination array. |

#### Returns

`__hi`.

#### do\_scan\_is()

```
virtual const char_type * std::ctype< wchar_t >::do_scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Find wchar\_t matching mask.

This function searches for and returns the first wchar\_t *c* in [`__lo`,`__hi`) for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

**Parameters**

|                                                                                                                        |                              |
|------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <a href="#"></a><br><code>__m</code>  | The mask to compare against. |
| <a href="#"></a><br><code>__lo</code> | Pointer to start of range.   |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to a matching `wchar_t` if found, else `__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**do\_scan\_not()**

```
virtual const char_type * std::ctype< wchar_t >::do_scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Find `wchar_t` not matching mask.

This function searches for and returns a pointer to the first `wchar_t` `c` of `[__lo,__hi)` for which `is(__m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

**Parameters**

|                                                                                                                          |                              |
|--------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <a href="#"></a><br><code>__m</code>  | The mask to compare against. |
| <a href="#"></a><br><code>__lo</code> | Pointer to start of range.   |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to a non-matching `wchar_t` if found, else `__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**do\_tolower()** [1/2]

```
virtual const char_type * std::ctype< wchar_t >::do_tolower (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Convert array to lowercase.

This virtual function converts each `wchar_t` in the range `[lo,hi)` to lowercase if possible. Other elements remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

## Parameters

|                                                                                                                     |                            |
|---------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"> <code>__lo</code></a> | Pointer to start of range. |
| <a href="#"> <code>__hi</code></a> | Pointer to end of range.   |

## Returns

`__hi`.

**do\_tolower()** [2/2]

```
virtual char\_type std::ctype< wchar\_t >::do\_tolower (  
    char\_type __c) const [protected], [virtual]
```

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

## Parameters

|                                                                                                                    |                                      |
|--------------------------------------------------------------------------------------------------------------------|--------------------------------------|
| <a href="#"> <code>__c</code></a> | The <code>wchar_t</code> to convert. |
|--------------------------------------------------------------------------------------------------------------------|--------------------------------------|

## Returns

The lowercase `wchar_t` if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**do\_toupper()** [1/2]

```
virtual const char\_type * std::ctype< wchar\_t >::do\_toupper (  
    char\_type * __lo,  
    const char\_type * __hi) const [protected], [virtual]
```

Convert array to uppercase.

This virtual function converts each `wchar_t` in the range `[lo,hi)` to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

|                                                                                                                       |                            |
|-----------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"> <code>__lo</code></a> | Pointer to start of range. |
| <a href="#"> <code>__hi</code></a> | Pointer to end of range.   |

## Returns

`__hi`.

**do\_toupper()** [2/2]

```
virtual char_type std::ctype< wchar_t >::do_toupper (
    char_type __c) const [protected], [virtual]
```

Convert to uppercase.

This virtual function converts the `wchar_t` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

**Parameters**

|                  |                                      |
|------------------|--------------------------------------|
| <code>__c</code> | The <code>wchar_t</code> to convert. |
| <code>__C</code> |                                      |

**Returns**

The uppercase `wchar_t` if convertible, else `__c`.

Implements `std::__ctype_abstract_base< wchar_t >`.

**do\_widen()** [1/2]

```
virtual char_type std::ctype< wchar_t >::do_widen (
    char __c) const [protected], [virtual]
```

Widen char to `wchar_t`.

This virtual function converts the `char` to `wchar_t` using the simplest reasonable transformation. For an underived `ctype<wchar_t>` facet, the argument will be cast to `wchar_t`.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                  |                                   |
|------------------|-----------------------------------|
| <code>__c</code> | The <code>char</code> to convert. |
| <code>__C</code> |                                   |

**Returns**

The converted `wchar_t`.

Implements `std::__ctype_abstract_base< wchar_t >`.

**do\_widen()** [2/2]

```
virtual const char * std::ctype< wchar_t >::do_widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [protected], [virtual]
```

Widen char array to `wchar_t` array.

This function converts each char in the input to `wchar_t` using the simplest reasonable transformation. For an underived `ctype<wchar_t>` facet, the argument will be copied, casting each element to `wchar_t`.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

|                   |                                   |
|-------------------|-----------------------------------|
| <code>__lo</code> | Pointer to start range.           |
| <code>__hi</code> | Pointer to end of range.          |
| <code>__to</code> | Pointer to the destination array. |

## Returns

`__hi`.

**is()** [1/2]

```
const char_type * std::__ctype_abstract_base< wchar_t >::is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [inline]
```

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the char array. It does so by returning the value of `ctype<char_type>::do_is()`.

## Parameters

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

## Returns

`__hi`.

**is()** [2/2]

```
bool std::__ctype_abstract_base< wchar_t >::is (
    mask __m,
    char_type __c) const [inline]
```

Test `char_type` classification.

This function finds a mask `M` for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_type>::do_is()`.

## Parameters

|                  |                                                    |
|------------------|----------------------------------------------------|
| <code>__c</code> | The <code>char_type</code> to compare the mask of. |
| <code>__m</code> | The mask to compare against.                       |

## Returns

$(M \& \text{__m}) \neq 0$ .

**narrow()** [1/2]

```
char std::__ctype_abstract_base< wchar_t >::narrow (  
    char_type __c,  
    char __default) const [inline]
```

Narrow char\_type to char.

This function converts the char\_type to char using the simplest reasonable transformation. If the conversion fails, default is returned instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_c).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|           |                                     |
|-----------|-------------------------------------|
| __c       | The char_type to convert.           |
| __default | Char to return if conversion fails. |

**Returns**

The converted char.

**narrow()** [2/2]

```
const char_type * std::__ctype_abstract_base< wchar_t >::narrow (  
    const char_type * __lo,  
    const char_type * __hi,  
    char __default,  
    char * __to) const [inline]
```

Narrow array to char array.

This function converts each char\_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char\_type in the input that cannot be converted, default is used instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_lo, \_\_hi, \_\_default, \_\_to).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|           |                                   |
|-----------|-----------------------------------|
| __lo      | Pointer to start of range.        |
| __hi      | Pointer to end of range.          |
| __default | Char to use if conversion fails.  |
| __to      | Pointer to the destination array. |

**Returns**

\_\_hi.

**scan\_is()**

```
const char_type * std::__ctype_abstract_base< wchar_t >::scan_is (  
    mask __m,  
    const char_type * __lo,  
    const char_type * __hi) const [inline]
```

Find char\_type matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char\_type>::do\_scan\_is().

## Parameters

|                                                                                                     |                              |
|-----------------------------------------------------------------------------------------------------|------------------------------|
|  <code>__m</code>  | The mask to compare against. |
|  <code>__lo</code> | Pointer to start of range.   |
|  <code>__hi</code> | Pointer to end of range.     |

## Returns

Pointer to matching char\_type if found, else `__hi`.

**scan\_not()**

```
const char_type * std::__ctype_abstract_base< wchar_t >::scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline]
```

Find char\_type not matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char\_type>::do\_scan\_not().

## Parameters

|                                                                                                       |                                 |
|-------------------------------------------------------------------------------------------------------|---------------------------------|
|  <code>__m</code>  | The mask to compare against.    |
|  <code>__lo</code> | Pointer to first char in range. |
|  <code>__hi</code> | Pointer to end of range.        |

## Returns

Pointer to non-matching char if found, else `__hi`.

**tolower()** [1/2]

```
const char_type * std::__ctype_abstract_base< wchar_t >::tolower (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to lowercase.

This function converts each char\_type in the range [\_\_lo,\_\_hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_tolower(\_\_lo,\_\_hi).

## Parameters

|                                                                                                       |                            |
|-------------------------------------------------------------------------------------------------------|----------------------------|
|  <code>__lo</code> | Pointer to start of range. |
|  <code>__hi</code> | Pointer to end of range.   |

**Returns**`__hi`.**tolower()** [2/2]

```
char_type std::__ctype_abstract_base< wchar_t >::tolower (
    char_type __c) const [inline]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_tolower(c)`.

**Parameters**

|                  |                           |
|------------------|---------------------------|
| <code>__c</code> | The char_type to convert. |
|------------------|---------------------------|

**Returns**

The lowercase char\_type if convertible, else `__c`.

**toupper()** [1/2]

```
const char_type * std::__ctype_abstract_base< wchar_t >::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

**Parameters**

|                   |                            |
|-------------------|----------------------------|
| <code>__lo</code> | Pointer to start of range. |
| <code>__hi</code> | Pointer to end of range.   |

**Returns**`__hi`.**toupper()** [2/2]

```
char_type std::__ctype_abstract_base< wchar_t >::toupper (
    char_type __c) const [inline]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

**Parameters**

|                  |                           |
|------------------|---------------------------|
| <code>__c</code> | The char_type to convert. |
|------------------|---------------------------|

**Returns**

The uppercase char\_type if convertible, else \_\_c.

**widen()** [1/2]

```
char_type std::__ctype_abstract_base< wchar_t >::widen (
    char __c) const [inline]
```

Widen char to char\_type.

This function converts the char argument to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                                                                                       |                      |
|---------------------------------------------------------------------------------------|----------------------|
|  __c | The char to convert. |
|---------------------------------------------------------------------------------------|----------------------|

**Returns**

The converted char\_type.

**widen()** [2/2]

```
const char * std::__ctype_abstract_base< wchar_t >::widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline]
```

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                                                                                          |                                   |
|------------------------------------------------------------------------------------------|-----------------------------------|
|  __lo | Pointer to start of range.        |
|  __hi | Pointer to end of range.          |
|  __to | Pointer to the destination array. |

**Returns**

\_\_hi.

**6.357.5 Member Data Documentation****id**

```
locale::id std::ctype< wchar_t >::id [static]
```

The facet id for ctype<wchar\_t>

#### 6.359.1 Detailed Description

```
template<typename _CharT>
class std::ctype_byname< _CharT >
```

class [ctype\\_byname](#) [22.2.1.2].

### 6.359.2 Member Function Documentation

#### do\_is() [1/2]

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [protected], [virtual], [inherited]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

#### Parameters

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

#### Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

#### do\_is() [2/2]

```
template<typename _CharT>
virtual bool std::ctype<_CharT>::do_is (
    mask __m,
    char_type __c) const [protected], [virtual], [inherited]
```

Test char\_type classification.

This function finds a mask M for c and compares it to mask m.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

#### Parameters

|                  |                                    |
|------------------|------------------------------------|
| <code>__c</code> | The char_type to find the mask of. |
| <code>__m</code> | The mask to compare against.       |

#### Returns

$(M \& \_m) \neq 0$ .

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

#### do\_narrow() [1/2]

```
template<typename _CharT>
virtual char std::ctype<_CharT>::do_narrow (
```

```
char_type __c,
char __default) const [protected], [virtual], [inherited]
```

Narrow `char_type` to `char`.

This virtual function converts the argument to `char` using the simplest reasonable transformation. If the conversion fails, `__default` is returned instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

|                        |                                        |
|------------------------|----------------------------------------|
| <code>__c</code>       | The <code>char_type</code> to convert. |
| <code>__default</code> | Char to return if conversion fails.    |

#### Returns

The converted `char`.

Implements `std::__ctype_abstract_base<_CharT>`.

Referenced by `std::ctype<char>::narrow()`, and `std::ctype<char>::narrow()`.

#### `do_narrow()` [2/2]

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [protected], [virtual], [inherited]
```

Narrow `char_type` array to `char`.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to `char` using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__default` is used instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

#### Returns

`__hi`.

Implements `std::__ctype_abstract_base<_CharT>`.

#### `do_scan_is()`

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_scan_is (
```

```

mask __m,
const char_type * __lo,
const char_type * __hi) const [protected], [virtual], [inherited]

```

Find char\_type matching mask.

This function searches for and returns the first char\_type c in [\_\_lo,\_\_hi) for which is(\_\_m,c) is true.

do\_scan\_is() is a hook for a derived facet to change the behavior of match searching. do\_is() must always return the same result for the same input.

#### Parameters

|                                                                                           |                              |
|-------------------------------------------------------------------------------------------|------------------------------|
| <br>__m  | The mask to compare against. |
| <br>__lo | Pointer to start of range.   |
| <br>__hi | Pointer to end of range.     |

#### Returns

Pointer to a matching char\_type if found, else \_\_hi.

Implements [std::ctype\\_abstract\\_base<\\_CharT>](#).

#### do\_scan\_not()

```

template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual], [inherited]

```

Find char\_type not matching mask.

This function searches for and returns a pointer to the first char\_type c of [lo,hi) for which is(m,c) is false.

do\_scan\_is() is a hook for a derived facet to change the behavior of match searching. do\_is() must always return the same result for the same input.

#### Parameters

|                                                                                             |                              |
|---------------------------------------------------------------------------------------------|------------------------------|
| <br>__m  | The mask to compare against. |
| <br>__lo | Pointer to start of range.   |
| <br>__hi | Pointer to end of range.     |

#### Returns

Pointer to a non-matching char\_type if found, else \_\_hi.

Implements [std::ctype\\_abstract\\_base<\\_CharT>](#).

#### do\_tolower() [1/2]

```

template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_tolower (

```

```
char_type * __lo,
const char_type * __hi) const [protected], [virtual], [inherited]
```

Convert array to lowercase.

This virtual function converts each `char_type` in the range `[_lo, __hi)` to lowercase if possible. Other elements remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

#### Parameters

|                        |                            |
|------------------------|----------------------------|
| <code>↔<br/>_lo</code> | Pointer to start of range. |
| <code>↔<br/>_hi</code> | Pointer to end of range.   |

#### Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

#### do\_tolower() [2/2]

```
template<typename _CharT>
virtual char_type std::ctype<_CharT>::do_tolower (
    char_type __c) const [protected], [virtual], [inherited]
```

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

#### Parameters

|                       |                                        |
|-----------------------|----------------------------------------|
| <code>↔<br/>_c</code> | The <code>char_type</code> to convert. |
|-----------------------|----------------------------------------|

#### Returns

The lowercase `char_type` if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by [std::ctype<char>::tolower\(\)](#), and [std::ctype<char>::tolower\(\)](#).

#### do\_toupper() [1/2]

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_toupper (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual], [inherited]
```

Convert array to uppercase.

This virtual function converts each `char_type` in the range `[_lo, __hi)` to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

|                                                                                                                       |                            |
|-----------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><code>_lo</code> | Pointer to start of range. |
| <a href="#"></a><br><code>_hi</code> | Pointer to end of range.   |

## Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**do\_toupper()** [2/2]

```
template<typename _CharT>
virtual char_type std::ctype<_CharT>::do_toupper (
    char_type __c) const [protected], [virtual], [inherited]
```

Convert to uppercase.

This virtual function converts the `char_type` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

|                                                                                                                        |                                        |
|------------------------------------------------------------------------------------------------------------------------|----------------------------------------|
| <a href="#"></a><br><code>__c</code> | The <code>char_type</code> to convert. |
|------------------------------------------------------------------------------------------------------------------------|----------------------------------------|

## Returns

The uppercase `char_type` if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by [std::ctype<char>::toupper\(\)](#), and [std::ctype<char>::toupper\(\)](#).

**do\_widen()** [1/2]

```
template<typename _CharT>
virtual char_type std::ctype<_CharT>::do_widen (
    char __c) const [protected], [virtual], [inherited]
```

Widen char.

This virtual function converts the `char` to `char_type` using the simplest reasonable transformation.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

|                                                                                                                         |                      |
|-------------------------------------------------------------------------------------------------------------------------|----------------------|
| <a href="#"></a><br><code>__c</code> | The char to convert. |
|-------------------------------------------------------------------------------------------------------------------------|----------------------|

## Returns

The converted `char_type`

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by [std::ctype<char>::widen\(\)](#), and [std::ctype<char>::widen\(\)](#).

**do\_widen()** [2/2]

```
template<typename _CharT>
virtual const char * std::ctype< _CharT >::do_widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [protected], [virtual], [inherited]
```

Widen char array.

This function converts each char in the input to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                                   |                                   |
|-----------------------------------|-----------------------------------|
| <a href="#"><code>__lo</code></a> | Pointer to start range.           |
| <a href="#"><code>__hi</code></a> | Pointer to end of range.          |
| <a href="#"><code>__to</code></a> | Pointer to the destination array. |

**Returns**

[`\_\_hi`](#).

Implements [`std::\_\_ctype\_abstract\_base< \_CharT >`](#).

**is()** [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [inline], [inherited]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of `ctype<char_type>::do_is()`.

**Parameters**

|                                    |                                      |
|------------------------------------|--------------------------------------|
| <a href="#"><code>__lo</code></a>  | Pointer to start of range.           |
| <a href="#"><code>__hi</code></a>  | Pointer to end of range.             |
| <a href="#"><code>__vec</code></a> | Pointer to an array of mask storage. |

**Returns**

[`\_\_hi`](#).

**is()** [2/2]

```
template<typename _CharT>
bool std::__ctype_abstract_base< _CharT >::is (
```

```
mask __m,
char_type __c) const [inline], [inherited]
```

Test char\_type classification.

This function finds a mask M for \_\_c and compares it to mask \_\_m. It does so by returning the value of ctype<char\_type>::do\_is().

#### Parameters

|                          |                                       |
|--------------------------|---------------------------------------|
| <a href="#">↩</a><br>__c | The char_type to compare the mask of. |
| <a href="#">↩</a><br>__m | The mask to compare against.          |

#### Returns

(M & \_\_m) != 0.

Referenced by [std::time\\_get<\\_CharT, \\_InIter>::get\(\)](#).

#### narrow() [1/2]

```
template<typename _CharT>
char std::__ctype_abstract_base<_CharT>::narrow (
    char_type __c,
    char __dfault) const [inline], [inherited]
```

Narrow char\_type to char.

This function converts the char\_type to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_c).

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|          |                                     |
|----------|-------------------------------------|
| __c      | The char_type to convert.           |
| __dfault | Char to return if conversion fails. |

#### Returns

The converted char.

Referenced by [std::time\\_get<\\_CharT, \\_InIter>::do\\_get\\_year\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::get\(\)](#), and [std::time\\_put<\\_CharT, \\_OutIter>::put\(\)](#).

#### narrow() [2/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __dfault,
    char * __to) const [inline], [inherited]
```

Narrow array to char array.

This function converts each char\_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char\_type in the input that cannot be converted, dfault is used instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_lo, \_\_hi, \_\_dfault, \_\_to).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

**Returns**

`__hi`.

**scan\_is()**

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Find char\_type matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char\_type>::do\_scan\_is().

**Parameters**

|                         |                              |
|-------------------------|------------------------------|
| <code>↔<br/>__m</code>  | The mask to compare against. |
| <code>↔<br/>__lo</code> | Pointer to start of range.   |
| <code>↔<br/>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to matching char\_type if found, else `__hi`.

**scan\_not()**

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Find char\_type not matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char\_type>::do\_scan\_not().

**Parameters**

|                         |                                 |
|-------------------------|---------------------------------|
| <code>↔<br/>__m</code>  | The mask to compare against.    |
| <code>↔<br/>__lo</code> | Pointer to first char in range. |

|                                                                                                                                  |                          |
|----------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| <a href="#"></a><br><a href="#"><u>__hi</u></a> | Pointer to end of range. |
|----------------------------------------------------------------------------------------------------------------------------------|--------------------------|

**Returns**

Pointer to non-matching char if found, else `__hi`.

**tolower()** [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::tolower (
    char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo, __hi)`.

**Parameters**

|                                                                                                                                  |                            |
|----------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><a href="#"><u>__lo</u></a> | Pointer to start of range. |
| <a href="#"></a><br><a href="#"><u>__hi</u></a> | Pointer to end of range.   |

**Returns**

`__hi`.

**tolower()** [2/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base<_CharT>::tolower (
    char_type __c) const [inline], [inherited]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_tolower(c)`.

**Parameters**

|                                                                                                                                   |                                        |
|-----------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|
| <a href="#"></a><br><a href="#"><u>__c</u></a> | The <code>char_type</code> to convert. |
|-----------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|

**Returns**

The lowercase `char_type` if convertible, else `__c`.

Referenced by [std::time\\_get<\\_CharT, \\_InIter>::get\(\)](#).

**toupper()** [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_toupper(lo, hi).

**Parameters**

|                                                                                                                     |                            |
|---------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"> <code>__lo</code></a> | Pointer to start of range. |
| <a href="#"> <code>__hi</code></a> | Pointer to end of range.   |

**Returns**

`__hi`.

**toupper()** [2/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::toupper (
    char_type __c) const [inline], [inherited]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char\_type>::do\_toupper().

**Parameters**

|                                                                                                                      |                           |
|----------------------------------------------------------------------------------------------------------------------|---------------------------|
| <a href="#"> <code>__c</code></a> | The char_type to convert. |
|----------------------------------------------------------------------------------------------------------------------|---------------------------|

**Returns**

The uppercase char\_type if convertible, else `__c`.

Referenced by [std::time\\_get< \\_CharT, \\_Inlter >::get\(\)](#).

**widen()** [1/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::widen (
    char __c) const [inline], [inherited]
```

Widen char to char\_type.

This function converts the char argument to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

|                                 |                      |
|---------------------------------|----------------------|
| <a href="#"><code>_↔</code></a> | The char to convert. |
| <a href="#"><code>_c</code></a> |                      |

## Returns

The converted char\_type.

Referenced by [std::money\\_get< \\_CharT, \\_InIter >::do\\_get\(\)](#), [std::time\\_get< \\_CharT, \\_InIter >::do\\_get\(\)](#), [std::money\\_put< \\_CharT, \\_OutIter >::do\\_put\(\)](#) and [std::time\\_put< \\_CharT, \\_OutIter >::do\\_put\(\)](#).

**widen()** [2/2]

```
template<typename _CharT>
const char * std::\_\_ctype\_abstract\_base< \_CharT >::widen (
    const char * __lo,
    const char * __hi,
    char\_type * __to) const [inline], [inherited]
```

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecv` for that.

## Parameters

|                                                                     |                                   |
|---------------------------------------------------------------------|-----------------------------------|
| <a href="#"><code>_↔</code></a><br><a href="#"><code>_lo</code></a> | Pointer to start of range.        |
| <a href="#"><code>_↔</code></a><br><a href="#"><code>_hi</code></a> | Pointer to end of range.          |
| <a href="#"><code>_↔</code></a><br><a href="#"><code>_to</code></a> | Pointer to the destination array. |

## Returns

[`\_\_hi`](#).

**6.359.3 Member Data Documentation****id**

```
template<typename _CharT>
locale::id std::ctype< \_CharT >::id [static], [inherited]
```

The facet id for `ctype<char_type>`

The documentation for this class was generated from the following file:

- [locale\\_facets.h](#)

**6.360 std::ctype\_byname< char > Class Reference**

## 6.360.1 Detailed Description

22.2.1.4 Class `ctype_byname` specializations.

## 6.360.2 Member Function Documentation

### `classic_table()`

```
const mask * std::ctype< char >::classic_table () throw ( )    [static], [inherited]
```

Returns a pointer to the C locale mask table.

### `do_is()` [1/3]

```
virtual bool std::ctype< char >::do_is (
    mask __m,
    char_type __c) const    [protected], [virtual], [inherited]
```

Test `char_type` classification.

This function finds a mask `M` for `c` and compares it to mask `m`.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

### Parameters

|                  |                                                 |
|------------------|-------------------------------------------------|
| <code>__c</code> | The <code>char_type</code> to find the mask of. |
|------------------|-------------------------------------------------|

|                                                                                                    |                              |
|----------------------------------------------------------------------------------------------------|------------------------------|
|  <code>__m</code> | The mask to compare against. |
|----------------------------------------------------------------------------------------------------|------------------------------|

**Returns**

$(M \ \& \ \_\_m) \neq 0.$

**do\_is()** [2/3]

```
virtual const char_type * std::ctype< char >::do_is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [protected], [virtual]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

**Parameters**

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

**Returns**

`__hi`.

**do\_is()** [3/3]

```
virtual bool std::ctype< char >::do_is (
    mask __m,
    char_type __c) const [protected], [virtual]
```

Test char\_type classification.

This function finds a mask M for c and compares it to mask m.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

**Parameters**

|                                                                                                      |                                    |
|------------------------------------------------------------------------------------------------------|------------------------------------|
|  <code>__c</code> | The char_type to find the mask of. |
|  <code>__m</code> | The mask to compare against.       |

**Returns**

$(M \ \& \ \_\_m) \neq 0.$

**do\_narrow()** [1/4]

```
virtual char std::ctype< char >::do_narrow (
    char_type __c,
    char __dfault) const [inline], [protected], [virtual], [inherited]
```

Narrow char.

This virtual function converts the char to char using the simplest reasonable transformation. If the conversion fails, *dfault* is returned instead. For an underived ctype<char> facet, *c* will be returned unchanged.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                       |                                     |
|-----------------------|-------------------------------------|
| <code>__c</code>      | The char to convert.                |
| <code>__dfault</code> | Char to return if conversion fails. |

**Returns**

The converted char.

**do\_narrow()** [2/4]

```
virtual const char_type * std::ctype< char >::do_narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __dfault,
    char * __to) const [inline], [protected], [virtual], [inherited]
```

Narrow char array to char array.

This virtual function converts each char in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an underived ctype<char> facet, the argument will be copied unchanged.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                       |                                   |
|-----------------------|-----------------------------------|
| <code>__lo</code>     | Pointer to start of range.        |
| <code>__hi</code>     | Pointer to end of range.          |
| <code>__dfault</code> | Char to use if conversion fails.  |
| <code>__to</code>     | Pointer to the destination array. |

**Returns**

`__hi`.

**do\_narrow()** [3/4]

```
virtual char std::ctype< char >::do_narrow (
    char_type ,
    char __dfault) const [protected], [virtual]
```

Narrow char\_type to char.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

|                       |                                     |
|-----------------------|-------------------------------------|
| <code>__c</code>      | The char_type to convert.           |
| <code>__dfault</code> | Char to return if conversion fails. |

#### Returns

The converted char.

#### do\_narrow() [4/4]

```
virtual const char_type * std::ctype< char >::do_narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __dfault,
    char * __to) const [protected], [virtual]
```

Narrow char\_type array to char.

This virtual function converts each char\_type in the range [`__lo`,`__hi`) to char using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__dfault` is used instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

|                       |                                   |
|-----------------------|-----------------------------------|
| <code>__lo</code>     | Pointer to start of range.        |
| <code>__hi</code>     | Pointer to end of range.          |
| <code>__dfault</code> | Char to use if conversion fails.  |
| <code>__to</code>     | Pointer to the destination array. |

#### Returns

`__hi`.

#### do\_scan\_is() [1/2]

```
virtual const char_type * std::ctype< char >::do_scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual], [inherited]
```

Find char\_type matching mask.

This function searches for and returns the first char\_type `c` in [`__lo`,`__hi`) for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

**Parameters**

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to a matching `char_type` if found, else `__hi`.

**do\_scan\_is() [2/2]**

```
virtual const char_type * std::ctype< char >::do_scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Find `char_type` matching mask.

This function searches for and returns the first `char_type` `c` in `[__lo,__hi)` for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

**Parameters**

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to a matching `char_type` if found, else `__hi`.

**do\_scan\_not() [1/2]**

```
virtual const char_type * std::ctype< char >::do_scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual], [inherited]
```

Find `char_type` not matching mask.

This function searches for and returns a pointer to the first `char_type` `c` of `[lo,hi)` for which `is(m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <code>__m</code> | The mask to compare against. |
|------------------|------------------------------|

## Parameters

|                                                                                                           |                            |
|-----------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br>__lo | Pointer to start of range. |
| <a href="#"></a><br>__hi | Pointer to end of range.   |

## Returns

Pointer to a non-matching char\_type if found, else \_\_hi.

**do\_scan\_not()** [2/2]

```
virtual const char_type * std::ctype< char >::do_scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Find char\_type not matching mask.

This function searches for and returns a pointer to the first char\_type c of [lo,hi) for which is(m,c) is false.

do\_scan\_is() is a hook for a derived facet to change the behavior of match searching. do\_is() must always return the same result for the same input.

## Parameters

|                                                                                                             |                              |
|-------------------------------------------------------------------------------------------------------------|------------------------------|
| <a href="#"></a><br>__m   | The mask to compare against. |
| <a href="#"></a><br>__lo | Pointer to start of range.   |
| <a href="#"></a><br>__hi | Pointer to end of range.     |

## Returns

Pointer to a non-matching char\_type if found, else \_\_hi.

**do\_tolower()** [1/4]

```
virtual const char_type * std::ctype< char >::do_tolower (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual], [inherited]
```

Convert array to lowercase.

This virtual function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

## Parameters

|                                                                                                             |                                 |
|-------------------------------------------------------------------------------------------------------------|---------------------------------|
| <a href="#"></a><br>__lo | Pointer to first char in range. |
| <a href="#"></a><br>__hi | Pointer to end of range.        |

**Returns**

`__hi`.

References [do\\_tolower\(\)](#).

**do\_tolower()** [2/4]

```
virtual char_type std::ctype< char >::do_tolower (  
    char_type __c) const [protected], [virtual], [inherited]
```

Convert to lowercase.

This virtual function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

**Parameters**

|                  |                      |
|------------------|----------------------|
| <code>__c</code> | The char to convert. |
|------------------|----------------------|

**Returns**

The lowercase char if convertible, else `__c`.

References [do\\_tolower\(\)](#).

Referenced by [do\\_tolower\(\)](#), and [do\\_tolower\(\)](#).

**do\_tolower()** [3/4]

```
virtual const char_type * std::ctype< char >::do_tolower (  
    char_type * __lo,  
    const char_type * __hi) const [protected], [virtual]
```

Convert array to lowercase.

This virtual function converts each char\_type in the range [`__lo`,`__hi`) to lowercase if possible. Other elements remain untouched.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

**Parameters**

|                   |                            |
|-------------------|----------------------------|
| <code>__lo</code> | Pointer to start of range. |
| <code>__hi</code> | Pointer to end of range.   |

**Returns**

`__hi`.

**do\_tolower()** [4/4]

```
virtual char_type std::ctype< char >::do_tolower (  
    char_type __c) const [protected], [virtual]
```

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

#### Parameters

|                                  |                           |
|----------------------------------|---------------------------|
| <a href="#"><code>__c</code></a> | The char_type to convert. |
|----------------------------------|---------------------------|

#### Returns

The lowercase char\_type if convertible, else `__c`.

### do\_toupper() [1/4]

```
virtual const char_type * std::ctype< char >::do_toupper (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual], [inherited]
```

Convert array to uppercase.

This virtual function converts each char in the range [lo,hi) to uppercase if possible. Other chars remain untouched.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

#### Parameters

|                                   |                            |
|-----------------------------------|----------------------------|
| <a href="#"><code>__lo</code></a> | Pointer to start of range. |
| <a href="#"><code>__hi</code></a> | Pointer to end of range.   |

#### Returns

`__hi`.

References [do\\_toupper\(\)](#).

### do\_toupper() [2/4]

```
virtual char_type std::ctype< char >::do_toupper (
    char_type __c) const [protected], [virtual], [inherited]
```

Convert to uppercase.

This virtual function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

#### Parameters

|                                  |                      |
|----------------------------------|----------------------|
| <a href="#"><code>__c</code></a> | The char to convert. |
|----------------------------------|----------------------|

#### Returns

The uppercase char if convertible, else `__c`.

References [do\\_toupper\(\)](#).

Referenced by [do\\_toupper\(\)](#), and [do\\_toupper\(\)](#).

**do\_toupper()** [3/4]

```
virtual const char_type * std::ctype< char >::do_toupper (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Convert array to uppercase.

This virtual function converts each char\_type in the range [\_\_lo,\_\_hi) to uppercase if possible. Other elements remain untouched.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

**Parameters**

|                                                                                           |                            |
|-------------------------------------------------------------------------------------------|----------------------------|
| <br>__lo | Pointer to start of range. |
| <br>__hi | Pointer to end of range.   |

**Returns**

\_\_hi.

**do\_toupper()** [4/4]

```
virtual char_type std::ctype< char >::do_toupper (
    char_type __c) const [protected], [virtual]
```

Convert to uppercase.

This virtual function converts the char\_type argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

**Parameters**

|                                                                                            |                           |
|--------------------------------------------------------------------------------------------|---------------------------|
| <br>__c | The char_type to convert. |
|--------------------------------------------------------------------------------------------|---------------------------|

**Returns**

The uppercase char\_type if convertible, else \_\_c.

**do\_widen()** [1/3]

```
virtual const char * std::ctype< char >::do_widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline], [protected], [virtual], [inherited]
```

Widen char array.

This function converts each char in the range [lo,hi) to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be copied unchanged.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

|                          |                                   |
|--------------------------|-----------------------------------|
| $\leftrightarrow$<br>_lo | Pointer to start of range.        |
| $\leftrightarrow$<br>_hi | Pointer to end of range.          |
| $\leftrightarrow$<br>_to | Pointer to the destination array. |

## Returns

\_\_hi.

**do\_widen()** [2/3]

```
virtual char_type std::ctype< char >::do_widen (
    char __c) const [protected], [virtual]
```

Widen char.

This virtual function converts the char to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

|                         |                      |
|-------------------------|----------------------|
| $\leftrightarrow$<br>_c | The char to convert. |
|-------------------------|----------------------|

## Returns

The converted char\_type

**do\_widen()** [3/3]

```
virtual const char * std::ctype< char >::do_widen (
    const char * __lo,
    const char * __hi,
    char_type * __dest) const [protected], [virtual]
```

Widen char array.

This function converts each char in the input to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

|                          |                                   |
|--------------------------|-----------------------------------|
| $\leftrightarrow$<br>_lo | Pointer to start range.           |
| $\leftrightarrow$<br>_hi | Pointer to end of range.          |
| $\leftrightarrow$<br>_to | Pointer to the destination array. |

**Returns**

`__hi`.

**is()** [1/4]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [inline], [inherited]
```

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the char array. It does so by returning the value of `ctype<char_type>::do_is()`.

**Parameters**

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

**Returns**

`__hi`.

**is()** [2/4]

```
template<typename _CharT>
bool std::__ctype_abstract_base< _CharT >::is (
    mask __m,
    char_type __c) const [inline], [inherited]
```

Test `char_type` classification.

This function finds a mask `M` for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_↵type>::do_is()`.

**Parameters**

|                  |                                                    |
|------------------|----------------------------------------------------|
| <code>_↵c</code> | The <code>char_type</code> to compare the mask of. |
| <code>_↵m</code> | The mask to compare against.                       |

**Returns**

`(M & __m) != 0`.

Referenced by `std::time_get< _CharT, _InIter >::get()`.

**is()** [3/4]

```
const char_type * std::__ctype_abstract_base< char >::is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [inline]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char\_type>::do\_is().

#### Parameters

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

#### Returns

`__hi`.

#### is() [4/4]

```
bool std::__ctype_abstract_base< char >::is (
    mask __m,
    char_type __c) const [inline]
```

Test char\_type classification.

This function finds a mask M for \_\_c and compares it to mask \_\_m. It does so by returning the value of ctype<char\_type>::do\_is().

#### Parameters

|                  |                                       |
|------------------|---------------------------------------|
| <code>__c</code> | The char_type to compare the mask of. |
| <code>__m</code> | The mask to compare against.          |

#### Returns

$(M \& \text{__m}) \neq 0$ .

#### narrow() [1/4]

```
template<typename _CharT>
char std::__ctype_abstract_base< _CharT >::narrow (
    char_type __c,
    char __default) const [inline], [inherited]
```

Narrow char\_type to char.

This function converts the char\_type to char using the simplest reasonable transformation. If the conversion fails, default is returned instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_c).

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

|                        |                                     |
|------------------------|-------------------------------------|
| <code>__c</code>       | The char_type to convert.           |
| <code>__default</code> | Char to return if conversion fails. |

#### Returns

The converted char.

Referenced by `std::time_get< _CharT, _InIter >::do_get_year()`, `std::time_get< _CharT, _InIter >::get()`, and `std::time_put< _CharT, _OutIter >::put()`.

**narrow()** [2/4]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline], [inherited]
```

Narrow array to char array.

This function converts each `char_type` in the input to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `char_type` in the input that cannot be converted, *default* is used instead. It does so by returning `ctype<char_type>::do_narrow(__lo, __hi, __default, __to)`.

Note: this is not what you want for codepage conversions. See `codecv`t for that.

**Parameters**

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

**Returns**

`__hi`.

**narrow()** [3/4]

```
char std::__ctype_abstract_base< char >::narrow (
    char_type __c,
    char __default) const [inline]
```

Narrow `char_type` to `char`.

This function converts the `char_type` to `char` using the simplest reasonable transformation. If the conversion fails, *default* is returned instead. It does so by returning `ctype<char_type>::do_narrow(__c)`.

Note: this is not what you want for codepage conversions. See `codecv`t for that.

**Parameters**

|                        |                                        |
|------------------------|----------------------------------------|
| <code>__c</code>       | The <code>char_type</code> to convert. |
| <code>__default</code> | Char to return if conversion fails.    |

**Returns**

The converted `char`.

**narrow()** [4/4]

```
const char_type * std::__ctype_abstract_base< char >::narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline]
```

Narrow array to char array.

This function converts each `char_type` in the input to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `char_type` in the input that cannot be converted, *default* is used instead. It does so by returning `ctype<char_type>::do_narrow(__lo, __hi, __default, __to)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

#### Returns

`__hi`.

#### scan\_is() [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Find `char_type` matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is true. It does so by returning `ctype<char_type>::do_scan_is()`.

#### Parameters

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

#### Returns

Pointer to matching `char_type` if found, else `__hi`.

#### scan\_is() [2/2]

```
const char_type * std::__ctype_abstract_base< char >::scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline]
```

Find `char_type` matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is true. It does so by returning `ctype<char_type>::do_scan_is()`.

**Parameters**

|                                                                                                                        |                              |
|------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <a href="#"></a><br><code>__m</code>  | The mask to compare against. |
| <a href="#"></a><br><code>__lo</code> | Pointer to start of range.   |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to matching `char_type` if found, else `__hi`.

**scan\_not() [1/2]**

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Find `char_type` not matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is false. It does so by returning `ctype<char_type>::do_scan_not()`.

**Parameters**

|                                                                                                                          |                                 |
|--------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <a href="#"></a><br><code>__m</code>  | The mask to compare against.    |
| <a href="#"></a><br><code>__lo</code> | Pointer to first char in range. |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.        |

**Returns**

Pointer to non-matching char if found, else `__hi`.

**scan\_not() [2/2]**

```
const char_type * std::__ctype_abstract_base< char >::scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline]
```

Find `char_type` not matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is false. It does so by returning `ctype<char_type>::do_scan_not()`.

**Parameters**

|                                                                                                                          |                                 |
|--------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <a href="#"></a><br><code>__m</code>  | The mask to compare against.    |
| <a href="#"></a><br><code>__lo</code> | Pointer to first char in range. |

|                                        |                          |
|----------------------------------------|--------------------------|
| <code>__lo</code><br><code>__hi</code> | Pointer to end of range. |
|----------------------------------------|--------------------------|

**Returns**

Pointer to non-matching char if found, else `__hi`.

**table()**

```
const mask * std::ctype< char >::table () const throw ( ) [inline], [inherited]
```

Returns a pointer to the mask table provided to the constructor, or the default from `classic_table()` if none was provided.

**tolower() [1/4]**

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::tolower (
    char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo, __hi)`.

**Parameters**

|                   |                            |
|-------------------|----------------------------|
| <code>__lo</code> | Pointer to start of range. |
| <code>__hi</code> | Pointer to end of range.   |

**Returns**

`__hi`.

**tolower() [2/4]**

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::tolower (
    char_type __c) const [inline], [inherited]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_tolower(c)`.

**Parameters**

|                  |                                        |
|------------------|----------------------------------------|
| <code>__c</code> | The <code>char_type</code> to convert. |
|------------------|----------------------------------------|

**Returns**

The lowercase `char_type` if convertible, else `__c`.

Referenced by `std::time_get< _CharT, _InIter >::get()`.

**tolower()** [3/4]

```
const char_type * std::__ctype_abstract_base< char >::tolower (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to lowercase.

This function converts each char\_type in the range [\_\_lo,\_\_hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_tolower(\_\_lo, \_\_hi).

**Parameters**

|                                                                                           |                            |
|-------------------------------------------------------------------------------------------|----------------------------|
| <br>__lo | Pointer to start of range. |
| <br>__hi | Pointer to end of range.   |

**Returns**

\_\_hi.

**tolower()** [4/4]

```
char_type std::__ctype_abstract_base< char >::tolower (
    char_type __c) const [inline]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char\_type>::do\_tolower(c).

**Parameters**

|                                                                                            |                           |
|--------------------------------------------------------------------------------------------|---------------------------|
| <br>__c | The char_type to convert. |
|--------------------------------------------------------------------------------------------|---------------------------|

**Returns**

The lowercase char\_type if convertible, else \_\_c.

**toupper()** [1/4]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_toupper(lo, hi).

**Parameters**

|                                                                                             |                            |
|---------------------------------------------------------------------------------------------|----------------------------|
| <br>__lo | Pointer to start of range. |
| <br>__hi | Pointer to end of range.   |

## Returns

`__hi`.**toupper()** [2/4]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::toupper (
    char_type __c) const [inline], [inherited]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

## Parameters

|                  |                           |
|------------------|---------------------------|
| <code>__c</code> | The char_type to convert. |
|------------------|---------------------------|

## Returns

The uppercase char\_type if convertible, else `__c`.Referenced by `std::time_get< _CharT, _InIter >::get()`.**toupper()** [3/4]

```
const char_type * std::__ctype_abstract_base< char >::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

## Parameters

|                   |                            |
|-------------------|----------------------------|
| <code>__lo</code> | Pointer to start of range. |
| <code>__hi</code> | Pointer to end of range.   |

## Returns

`__hi`.**toupper()** [4/4]

```
char_type std::__ctype_abstract_base< char >::toupper (
    char_type __c) const [inline]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

**Parameters**

|                  |                           |
|------------------|---------------------------|
| <code>__c</code> | The char_type to convert. |
|------------------|---------------------------|

**Returns**

The uppercase char\_type if convertible, else `__c`.

**widen()** [1/3]

```
template<typename _CharT>
const char * std::__ctype_abstract_base< _CharT >::widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline], [inherited]
```

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecv`t for that.

**Parameters**

|                   |                                   |
|-------------------|-----------------------------------|
| <code>__lo</code> | Pointer to start of range.        |
| <code>__hi</code> | Pointer to end of range.          |
| <code>__to</code> | Pointer to the destination array. |

**Returns**

`__hi`.

**widen()** [2/3]

```
char_type std::__ctype_abstract_base< char >::widen (
    char __c) const [inline]
```

Widen char to char\_type.

This function converts the char argument to char\_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecv`t for that.

**Parameters**

|                  |                      |
|------------------|----------------------|
| <code>__c</code> | The char to convert. |
|------------------|----------------------|

**Returns**

The converted char\_type.

**widen()** [3/3]

```
const char * std::__ctype_abstract_base< char >::widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline]
```

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                                                                                           |                                   |
|-------------------------------------------------------------------------------------------|-----------------------------------|
| <br>__lo | Pointer to start of range.        |
| <br>__hi | Pointer to end of range.          |
| <br>__to | Pointer to the destination array. |

**Returns**

\_\_hi.

**6.360.3 Member Data Documentation****id**

```
locale::id std::ctype< char >::id [static]
```

The facet id for ctype<char\_type>

**table\_size**

```
const size_t std::ctype< char >::table_size [static], [inherited]
```

The size of the mask table. It is SCHAR\_MAX + 1.

The documentation for this class was generated from the following file:

- [locale\\_facets.h](#)

**6.361 std::ranges::dangling Struct Reference**

```
#include <ranges_base.h>
```

**Public Member Functions**

- `template<typename... _Args>`  
constexpr **dangling** (\_Args &&...) noexcept

**6.361.1 Detailed Description**

Type returned by algorithms instead of a dangling iterator or subrange.

The documentation for this struct was generated from the following file:

- [ranges\\_base.h](#)

### 6.366.1 Detailed Description

3.2.3 Class decimal64.

### 6.366.2 Constructor & Destructor Documentation

#### decimal64()

```
std::decimal::decimal64::decimal64 (
    __decfloat64 __z) [inline]
```

Conforming extension: Conversion from scalar decimal type.

The documentation for this class was generated from the following file:

- [decimal](#)

## 6.367 simd\_abi::deduce<\_Tp, \_Np,... > Struct Template Reference

```
#include <simd.h>
```

### 6.367.1 Detailed Description

```
template<typename _Tp, size_t _Np, typename...>
struct simd_abi::deduce<_Tp, _Np,... >
```

### Template Parameters

|                    |                                                                                                                                                                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>_Tp</code>   | The requested <code>value_type</code> for the elements.                                                                                                                                                                                                                                        |
| <code>_Np</code>   | The requested number of elements.                                                                                                                                                                                                                                                              |
| <code>_Abis</code> | This parameter is ignored, since this implementation cannot make any use of it. Either <code>__a</code> a good native ABI is matched and used as <code>type</code> alias, or the <code>fixed_size&lt;_Np&gt;</code> ABI is used, which internally is built from the best matching native ABIs. |

The documentation for this struct was generated from the following file:

- `simd.h`

## 6.368 `__gnu_pbds::detail::default_comb_hash_fn` Struct Reference

```
#include <standard_policies.hpp>
```

### Public Types

- typedef `direct_mask_range_hashing` type

#### 6.368.1 Detailed Description

Primary template, `default_comb_hash_fn`.

#### 6.368.2 Member Typedef Documentation

##### type

```
typedef direct_mask_range_hashing __gnu_pbds::detail::default_comb_hash_fn::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- `standard_policies.hpp`

## 6.369 `std::default_delete<_Tp>` Struct Template Reference

```
#include <memory>
```

### Public Member Functions

- constexpr `default_delete` () noexcept=default
- template<typename `_Up`, typename = `_Require<is_convertible<_Up*,_Tp*>>>`  
constexpr `default_delete` (const `default_delete<_Up>` &) noexcept
- constexpr void `operator()` (`_Tp` \*`__ptr`) const

#### 6.369.1 Detailed Description

```
template<typename _Tp>  
struct std::default_delete<_Tp>
```

Primary template of `default_delete`, used by `unique_ptr` for single objects

Since

C++11

### 6.369.2 Constructor & Destructor Documentation

#### default\_delete() [1/2]

```
template<typename _Tp>
std::default_delete< _Tp >::default_delete () [constexpr], [default], [noexcept]
```

Default constructor.  
Referenced by [default\\_delete\(\)](#).

#### default\_delete() [2/2]

```
template<typename _Tp>
template<typename _Up, typename = _Require<is_convertible<_Up*, _Tp*>>>
std::default_delete< _Tp >::default_delete (
    const default_delete< _Up > & ) [inline], [constexpr], [noexcept]
```

Converting constructor.  
Allows conversion from a deleter for objects of another type, \_Up, only if \_Up\* is convertible to \_Tp\*.  
References [default\\_delete\(\)](#).

### 6.369.3 Member Function Documentation

#### operator>()()

```
template<typename _Tp>
void std::default_delete< _Tp >::operator() (
    _Tp * __ptr) const [inline], [constexpr]
```

Calls delete \_\_ptr

The documentation for this struct was generated from the following file:

- [unique\\_ptr.h](#)

## 6.370 std::default\_delete< \_Tp[]> Struct Template Reference

```
#include <memory>
```

### Public Member Functions

- constexpr [default\\_delete](#) () noexcept=default
- template<typename \_Up, typename = \_Require<is\_convertible<\_Up(\*)[], \_Tp(\*)[]>>> constexpr [default\\_delete](#) (const [default\\_delete](#)< \_Up[]> &) noexcept
- template<typename \_Up> constexpr [enable\\_if](#)< is\_convertible< \_Up(\*)[], \_Tp(\*)[]>::value >::type [operator](#)() (\_Up \* \_\_ptr) const

### 6.370.1 Detailed Description

```
template<typename _Tp>
struct std::default_delete< _Tp[]>
```

Specialization of default\_delete for arrays, used by [unique\\_ptr<T\[\]>](#)

Since

C++11

### 6.370.2 Constructor & Destructor Documentation

#### default\_delete() [1/2]

```
template<typename _Tp>
std::default_delete< _Tp[]>::default_delete () [constexpr], [default], [noexcept]
```

Default constructor.  
Referenced by [default\\_delete\(\)](#).

#### default\_delete() [2/2]

```
template<typename _Tp>
template<typename _Up, typename = _Require<is_convertible<_Up(*)[], _Tp(*)[]>>>
std::default_delete< _Tp[]>::default_delete (
    const default_delete< _Up[]> & ) [inline], [constexpr], [noexcept]
```

Converting constructor.

Allows conversion from a deleter for arrays of another type, such as a const-qualified version of `_Tp`.

Conversions from types derived from `_Tp` are not allowed because it is undefined to `delete[]` an array of derived types through a pointer to the base type.

References [default\\_delete\(\)](#).

### 6.370.3 Member Function Documentation

#### operator>()()

```
template<typename _Tp>
template<typename _Up>
enable_if< is_convertible< _Up(*)[], _Tp(*)[]>::value >::type std::default_delete< _Tp[]>↵
::operator() (
    _Up * __ptr) const [inline], [constexpr]
```

Calls `delete[] __ptr`

The documentation for this struct was generated from the following file:

- [unique\\_ptr.h](#)

### 6.371 \_\_gnu\_pbds::detail::default\_eq\_fn< Key > Struct Template Reference

```
#include <standard_policies.hpp>
```

#### Public Types

- typedef [std::equal\\_to< Key > type](#)

#### 6.371.1 Detailed Description

```
template<typename Key>
struct __gnu_pbds::detail::default_eq_fn< Key >
```

Primary template, `default_eq_fn`.

#### 6.371.2 Member Typedef Documentation

##### type

```
template<typename Key>
typedef std::equal_to<Key> __gnu_pbds::detail::default_eq_fn< Key >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

## 6.372 `__gnu_pbds::detail::default_hash_fn< Key >` Struct Template Reference

```
#include <standard_policies.hpp>
```

### Public Types

- `typedef std::tr1::hash< Key > type`

### 6.372.1 Detailed Description

```
template<typename Key>
struct __gnu_pbds::detail::default_hash_fn< Key >
```

Primary template, `default_hash_fn`.

### 6.372.2 Member Typedef Documentation

#### `type`

```
template<typename Key>
typedef std::tr1::hash<Key> __gnu_pbds::detail::default_hash_fn< Key >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

## 6.373 `__gnu_parallel::default_parallel_tag` Struct Reference

```
#include <tags.h>
```

Inheritance diagram for `__gnu_parallel::default_parallel_tag`:

### Public Member Functions

- `default_parallel_tag` (`_ThreadIndex` `__num_threads`)
- `_ThreadIndex` `__get_num_threads` ()
- `void` `set_num_threads` (`_ThreadIndex` `__num_threads`)

### 6.373.1 Detailed Description

Recommends parallel execution using the default parallel algorithm.

### 6.373.2 Member Function Documentation

#### `__get_num_threads()`

`__ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline], [inherited]`

Find out desired number of threads.

#### Returns

Desired number of threads.

Referenced by `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, and `__gnu_parallel::__parallel_sort()`.

#### `set_num_threads()`

`void __gnu_parallel::parallel_tag::set_num_threads (   
__ThreadIndex __num_threads) [inline], [inherited]`

Set the desired number of threads.

#### Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

The documentation for this struct was generated from the following file:

- [tags.h](#)

## 6.374 `__gnu_pbds::detail::default_probe_fn< Comb_Probe_Fn >` Struct Template Reference

```
#include <standard_policies.hpp>
```

### Public Types

- `typedef cond_type::__type type`

### 6.374.1 Detailed Description

```
template<typename Comb_Probe_Fn>  
struct __gnu_pbds::detail::default_probe_fn< Comb_Probe_Fn >
```

Primary template, `default_probe_fn`.

### 6.374.2 Member Typedef Documentation

#### `type`

```
template<typename Comb_Probe_Fn>  
typedef cond_type::__type __gnu_pbds::detail::default_probe_fn< Comb_Probe_Fn >::type  
Dispatched type.
```

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

## 6.375 `__gnu_pbds::detail::default_resize_policy< Comb_Hash_Fn >` Struct Template Reference

```
#include <standard_policies.hpp>
```

### Public Types

- typedef `hash_standard_resize_policy< size_policy_type, trigger, false, size_type >` `type`

#### 6.375.1 Detailed Description

```
template<typename Comb_Hash_Fn>
struct __gnu_pbds::detail::default_resize_policy< Comb_Hash_Fn >
```

Primary template, default\_resize\_policy.

#### 6.375.2 Member Typedef Documentation

##### type

```
template<typename Comb_Hash_Fn>
typedef hash_standard_resize_policy<size_policy_type, trigger, false, size_type> __gnu_pbds::detail::default_res
Comb_Hash_Fn >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

## 6.376 `std::default_sentinel_t` Struct Reference

```
#include <iterator_concepts.h>
```

#### 6.376.1 Detailed Description

A sentinel type that can be used to check for the end of a range.

For some iterator types the past-the-end sentinel value is independent of the underlying sequence, and a default sentinel can be used with them. For example, a `std::counted_iterator` keeps a count of how many elements remain, and so checking for the past-the-end value only requires checking if that count has reached zero. A past-the-end `std::istream_iterator` is equal to the default-constructed value, which can be easily checked.

Comparing iterators of these types to `std::default_sentinel` is a convenient way to check if the end has been reached.

Since

C++20

The documentation for this struct was generated from the following file:

- [iterator\\_concepts.h](#)

## 6.377 `__gnu_pbds::detail::default_trie_access_traits< Key >` Struct Template Reference

#### 6.377.1 Detailed Description

```
template<typename Key>
struct __gnu_pbds::detail::default_trie_access_traits< Key >
```

Primary template, default\_trie\_access\_traits.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

### 6.378 `__gnu_pbds::detail::default_trie_access_traits< std::basic_string< Char, Char_Traits, std::allocator< char > > >` Struct Template Reference

```
#include <standard_policies.hpp>
```

#### Public Types

- typedef [trie\\_string\\_access\\_traits< string\\_type > type](#)

#### 6.378.1 Detailed Description

```
template<typename Char, typename Char_Traits>
struct __gnu_pbds::detail::default_trie_access_traits< std::basic_string< Char, Char_Traits, std::allocator<
char > > >
```

Partial specialization, `default_trie_access_traits`.

#### 6.378.2 Member Typedef Documentation

##### type

```
template<typename Char, typename Char_Traits>
typedef trie\_string\_access\_traits<string\_type> \_\_gnu\_pbds::detail::default\_trie\_access\_traits<
std::basic\_string< Char, Char\_Traits, std::allocator< char > > >::type
Dispatched type.
```

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

### 6.379 `__gnu_pbds::detail::default_update_policy` Struct Reference

```
#include <standard_policies.hpp>
```

#### Public Types

- typedef [lu\\_move\\_to\\_front\\_policy](#) type

#### 6.379.1 Detailed Description

Default update policy.

#### 6.379.2 Member Typedef Documentation

##### type

```
typedef lu\_move\_to\_front\_policy \_\_gnu\_pbds::detail::default\_update\_policy::type
Dispatched type.
```

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

### 6.380 `std::defer_lock_t` Struct Reference

```
#include <std_mutex.h>
```

### 6.380.1 Detailed Description

Do not acquire ownership of the mutex.

The documentation for this struct was generated from the following file:

- [std\\_mutex.h](#)

## 6.381 std::\_\_debug::deque< \_Tp, \_Allocator > Class Template Reference

```

#### 6.382.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>  
class std::deque< _Tp, _Alloc >
```

A standard container using fixed-size memory allocation and constant-time manipulation of elements at either end.

## Template Parameters

|                     |                                                                 |
|---------------------|-----------------------------------------------------------------|
| <code>_Tp</code>    | Type of element.                                                |
| <code>_Alloc</code> | Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> . |

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#).

In previous HP/SGI versions of deque, there was an extra template parameter so users could control the node size. This extension turned out to violate the C++ standard (it can be detected using template template parameters), and it was removed.

Here's how a `deque<Tp>` manages memory. Each deque has 4 members:

- `Tp** _M_map`
- `size_t _M_map_size`
- `iterator _M_start, _M_finish`

`map_size` is at least 8. `map` is an array of `map_size` pointers-to-*nodes*. (The name `map` has nothing to do with the `std::map` class, and **nodes** should not be confused with `std::list`'s usage of *node*.)

A *node* has no specific type name as such, but it is referred to as *node* in this file. It is a simple array-of-`Tp`. If `Tp` is very large, there will be one `Tp` element per node (i.e., an *array* of one). For non-huge `Tp`'s, node size is inversely related to `Tp` size: the larger the `Tp`, the fewer `Tp`'s will fit in a node. The goal here is to keep the total size of a node relatively small and constant over different `Tp`'s, to improve allocator efficiency.

Not every pointer in the `map` array will point to a node. If the initial number of elements in the deque is small, the /middle/ `map` pointers will be valid, and the ones at the edges will be unused. This same situation will arise as the `map` grows: available `map` pointers, if any, will be on the ends. As new nodes are created, only a subset of the `map`'s pointers need to be copied *outward*.

Class invariants:

- For any nonsingular iterator `i`:
  - `i.node` points to a member of the `map` array. (Yes, you read that correctly: `i.node` does not actually point to a node.) The member of the `map` array is what actually points to the node.
  - `i.first == *(i.node)` (This points to the node (first `Tp` element).)
  - `i.last == i.first + node_size`
  - `i.cur` is a pointer in the range `[i.first, i.last)`. NOTE: the implication of this is that `i.cur` is always a dereferenceable pointer, even if `i` is a past-the-end iterator.
- `Start` and `Finish` are always nonsingular iterators. NOTE: this means that an empty deque must have one node, a deque with `<N` elements (where `N` is the node buffer size) must have one node, a deque with `N` through `(2N-1)` elements must have two nodes, etc.
- For every node other than `start.node` and `finish.node`, every element in the node is an initialized object. If `start.cur == finish.cur`, then `[start.cur, finish.cur)` are initialized objects, and the elements outside that range are uninitialized storage. Otherwise, `[start.cur, start.last)` and `[finish.first, finish.cur)` are initialized objects, and `[start.cur, start.first)` and `[finish.cur, finish.last)` are uninitialized storage.
- `[map, map + map_size)` is a valid, non-empty range.
- `[start.node, finish.node]` is a valid range contained within `[map, map + map_size)`.
- A pointer in the range `[map, map + map_size)` points to an allocated node if and only if the pointer is in the range `[start.node, finish.node]`.

Here's the magic: nothing in deque is **aware** of the discontinuous storage!

The memory setup and layout occurs in the parent, `_Base`, and the iterator class is entirely responsible for *leaping* from one node to the next. All the implementation routines for deque itself work only through the `start` and `finish` iterators. This keeps the routines simple and sane, and we can use other standard algorithms as well.

## 6.382.2 Constructor & Destructor Documentation

### deque() [1/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque () [default]
```

Creates a deque with no elements.

Referenced by [insert\(\)](#), and [operator=\(\)](#).

### deque() [2/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
    const allocator_type & __a) [inline], [explicit]
```

Creates a deque with no elements.

#### Parameters

|                                                                                                                       |                      |
|-----------------------------------------------------------------------------------------------------------------------|----------------------|
| <a href="#"></a><br><code>__a</code> | An allocator object. |
|-----------------------------------------------------------------------------------------------------------------------|----------------------|

### deque() [3/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
    size_type __n,
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a deque with default constructed elements.

#### Parameters

|                                                                                                                         |                                             |
|-------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|
| <a href="#"></a><br><code>__n</code> | The number of elements to initially create. |
| <a href="#"></a><br><code>__a</code> | An allocator.                               |

This constructor fills the deque with *n* default constructed elements.

### deque() [4/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
    size_type __n,
    const value_type & __value,
    const allocator_type & __a = allocator_type()) [inline]
```

Creates a deque with copies of an exemplar element.

#### Parameters

|                      |                                             |
|----------------------|---------------------------------------------|
| <code>__n</code>     | The number of elements to initially create. |
| <code>__value</code> | An element to copy.                         |
| <code>__a</code>     | An allocator.                               |

This constructor fills the deque with `__n` copies of `__value`.

**deque()** [5/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque<_Tp, _Alloc>::deque (
    const deque<_Tp, _Alloc> & __x) [inline]
```

Deque copy constructor.

**Parameters**

|                  |                                                   |
|------------------|---------------------------------------------------|
| <code>__x</code> | A deque of identical element and allocator types. |
|------------------|---------------------------------------------------|

The newly-created deque uses a copy of the allocator object used by `__x` (unless the allocator traits dictate a different object).

**deque()** [6/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque<_Tp, _Alloc>::deque (
    deque<_Tp, _Alloc> && ) [default]
```

Deque move constructor.

The newly-created deque contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified deque.

**deque()** [7/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque<_Tp, _Alloc>::deque (
    const deque<_Tp, _Alloc> & __x,
    const __type_identity_t< allocator_type > & __a) [inline]
```

Copy constructor with alternative allocator.

**deque()** [8/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque<_Tp, _Alloc>::deque (
    deque<_Tp, _Alloc> && __x,
    const __type_identity_t< allocator_type > & __a) [inline]
```

Move constructor with alternative allocator.

**deque()** [9/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque<_Tp, _Alloc>::deque (
    initializer_list< value_type > __l,
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a deque from an initializer list.

**Parameters**

|                  |                                    |
|------------------|------------------------------------|
| <code>__l</code> | An <code>initializer_list</code> . |
| <code>__a</code> | An allocator object.               |

Create a deque consisting of copies of the elements in the initializer\_list \_\_l.  
This will call the element type's copy constructor N times (where N is \_\_l.size()) and do no memory reallocation.

#### deque() [10/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>>
std::deque< _Tp, _Alloc >::deque (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a deque from a range.

##### Parameters

|                      |                      |
|----------------------|----------------------|
| <code>__first</code> | An input iterator.   |
| <code>__last</code>  | An input iterator.   |
| <code>__a</code>     | An allocator object. |

Create a deque consisting of copies of the elements from [\_\_first, \_\_last).  
If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor N times (where N is distance(\_\_first, \_\_last)) and do no memory reallocation. But if only input iterators are used, then this will do at most 2N calls to the copy constructor, and logN memory reallocations.

#### ~deque()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::~~deque () [inline]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

### 6.382.3 Member Function Documentation

#### \_M\_fill\_initialize()

```
template<typename _Tp, typename _Alloc>
void deque::_M_fill_initialize (
    const value_type & __value) [protected]
```

Fills the deque with copies of value.

##### Parameters

|                      |                |
|----------------------|----------------|
| <code>__value</code> | Initial value. |
|----------------------|----------------|

##### Returns

Nothing.

##### Precondition

\_M\_start and \_M\_finish have already been initialized, but none of the deque's elements have yet been constructed.

This function is called only when the user provides an explicit size (with or without an explicit exemplar value).

References [std::\\_Destroy\(\)](#).

Referenced by [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::deque\(\)](#).

**\_M\_new\_elements\_at\_back()**

```
template<typename _Tp, typename _Alloc>
void deque::_M_new_elements_at_back (
    size_type __new_elements) [protected]
```

Memory-handling helpers for the previous internal insert functions.

References [\\_M\\_reserve\\_map\\_at\\_back\(\)](#), [max\\_size\(\)](#), and [std::size\(\)](#).

Referenced by [std::deque<\\_Tp, polymorphic\\_allocator<\\_Tp>>::\\_M\\_reserve\\_elements\\_at\\_back\(\)](#).

**\_M\_new\_elements\_at\_front()**

```
template<typename _Tp, typename _Alloc>
void deque::_M_new_elements_at_front (
    size_type __new_elements) [protected]
```

Memory-handling helpers for the previous internal insert functions.

References [\\_M\\_reserve\\_map\\_at\\_front\(\)](#), [max\\_size\(\)](#), and [std::size\(\)](#).

Referenced by [std::deque<\\_Tp, polymorphic\\_allocator<\\_Tp>>::\\_M\\_reserve\\_elements\\_at\\_front\(\)](#).

**\_M\_pop\_back\_aux()**

```
template<typename _Tp, typename _Alloc>
void deque::_M_pop_back_aux () [protected]
```

Helper functions for push\_\* and pop\_\*.

Referenced by [std::deque<\\_Tp, polymorphic\\_allocator<\\_Tp>>::pop\\_back\(\)](#).

**\_M\_pop\_front\_aux()**

```
template<typename _Tp, typename _Alloc>
void deque::_M_pop_front_aux () [protected]
```

Helper functions for push\_\* and pop\_\*.

Referenced by [std::deque<\\_Tp, polymorphic\\_allocator<\\_Tp>>::pop\\_front\(\)](#).

**\_M\_push\_back\_aux()**

```
template<typename _Tp, typename _Alloc>
template<typename... _Args>
void deque::_M_push_back_aux (
    _Args &&... __args) [protected]
```

Helper functions for push\_\* and pop\_\*.

References [\\_M\\_reserve\\_map\\_at\\_back\(\)](#), [std::forward\(\)](#), [max\\_size\(\)](#), and [std::size\(\)](#).

Referenced by [std::deque<\\_Tp, polymorphic\\_allocator<\\_Tp>>::push\\_back\(\)](#).

**\_M\_push\_front\_aux()**

```
template<typename _Tp, typename _Alloc>
template<typename... _Args>
void deque::_M_push_front_aux (
    _Args &&... __args) [protected]
```

Helper functions for push\_\* and pop\_\*.

References [\\_M\\_reserve\\_map\\_at\\_front\(\)](#), [std::forward\(\)](#), [max\\_size\(\)](#), and [std::size\(\)](#).

Referenced by [std::deque<\\_Tp, polymorphic\\_allocator<\\_Tp>>::push\\_front\(\)](#).

**\_M\_range\_check()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
```

```
void std::deque< _Tp, _Alloc >::_M_range_check (
    size_type __n) const [inline], [protected]
```

Safety check used only from `at()`.

Referenced by `std::deque< _Tp, polymorphic_allocator< _Tp > >::at()`, and `std::deque< _Tp, polymorphic_allocator< _Tp > >::at()`.

### **`_M_range_initialize()` [1/2]**

```
template<typename _Tp, typename _Alloc>
template<typename _ForwardIterator>
void deque::_M_range_initialize (
    _ForwardIterator __first,
    _ForwardIterator __last,
    std::forward_iterator_tag ) [protected]
```

Fills the deque with whatever is in `[first,last)`.

#### **Parameters**

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

#### **Returns**

Nothing.

If the iterators are actually forward iterators (or better), then the memory layout can be done all at once. Else we move forward using `push_back` on each value from the iterator.

References `std::_Destroy()`, `std::advance()`, and `std::distance()`.

### **`_M_range_initialize()` [2/2]**

```
template<typename _Tp, typename _Alloc>
template<typename _InputIterator>
void deque::_M_range_initialize (
    _InputIterator __first,
    _InputIterator __last,
    std::input_iterator_tag ) [protected]
```

Fills the deque with whatever is in `[first,last)`.

#### **Parameters**

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

#### **Returns**

Nothing.

If the iterators are actually forward iterators (or better), then the memory layout can be done all at once. Else we move forward using `push_back` on each value from the iterator.

References `clear()`, and `push_back()`.

Referenced by `std::deque< _Tp, polymorphic_allocator< _Tp > >::deque()`, and `std::deque< _Tp, polymorphic_allocator< _Tp > >::de`

**\_M\_reallocate\_map()**

```
template<typename _Tp, typename _Alloc>
void deque::_M_reallocate_map (
    size_type __nodes_to_add,
    bool __add_at_front) [protected]
```

Memory-handling helpers for the major map.

Makes sure the `_M_map` has space for new nodes. Does not actually add the nodes. Can invalidate `_M_map` pointers.

(And consequently, deque iterators.)

References [std::max\(\)](#), and [max\\_size\(\)](#).

Referenced by [std::deque<\\_Tp, polymorphic\\_allocator<\\_Tp>>::\\_M\\_reserve\\_map\\_at\\_back\(\)](#), and [std::deque<\\_Tp, polymorphic\\_allocator<\\_Tp>>::\\_M\\_reserve\\_map\\_at\\_front\(\)](#).

**\_M\_reserve\_elements\_at\_back()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque<_Tp, _Alloc>::_M_reserve_elements_at_back (
    size_type __n) [inline], [protected]
```

Memory-handling helpers for the previous internal insert functions.

**\_M\_reserve\_elements\_at\_front()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque<_Tp, _Alloc>::_M_reserve_elements_at_front (
    size_type __n) [inline], [protected]
```

Memory-handling helpers for the previous internal insert functions.

**\_M\_reserve\_map\_at\_back()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque<_Tp, _Alloc>::_M_reserve_map_at_back (
    size_type __nodes_to_add = 1) [inline], [protected]
```

Memory-handling helpers for the major map.

Makes sure the `_M_map` has space for new nodes. Does not actually add the nodes. Can invalidate `_M_map` pointers.

(And consequently, deque iterators.)

Referenced by [\\_M\\_new\\_elements\\_at\\_back\(\)](#), and [\\_M\\_push\\_back\\_aux\(\)](#).

**\_M\_reserve\_map\_at\_front()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque<_Tp, _Alloc>::_M_reserve_map_at_front (
    size_type __nodes_to_add = 1) [inline], [protected]
```

Memory-handling helpers for the major map.

Makes sure the `_M_map` has space for new nodes. Does not actually add the nodes. Can invalidate `_M_map` pointers.

(And consequently, deque iterators.)

Referenced by [\\_M\\_new\\_elements\\_at\\_front\(\)](#), and [\\_M\\_push\\_front\\_aux\(\)](#).

**assign() [1/3]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
void std::deque<_Tp, _Alloc>::assign (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Assigns a range to a deque.

**Parameters**

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

This function fills a deque with copies of the elements in the range `[__first,__last)`.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

**assign()** [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque<_Tp, _Alloc >::assign (
    initializer_list< value_type > __l) [inline]
```

Assigns an initializer list to a deque.

**Parameters**

|                  |                      |
|------------------|----------------------|
| <code>↵</code>   | An initializer_list. |
| <code>__↵</code> |                      |
| <code>↵</code>   |                      |
| <code>__↵</code> |                      |
| <code>/</code>   |                      |

This function fills a deque with copies of the elements in the initializer\_list `__l`.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

**assign()** [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque<_Tp, _Alloc >::assign (
    size_type __n,
    const value_type & __val) [inline]
```

Assigns a given value to a deque.

**Parameters**

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Number of elements to be assigned. |
| <code>__val</code> | Value to be assigned.              |

This function fills a deque with *n* copies of the given value. Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

**at()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::deque<_Tp, _Alloc >::at (
    size_type __n) [inline]
```

Provides access to the data contained in the deque.

## Parameters

|                                       |                                                             |
|---------------------------------------|-------------------------------------------------------------|
| $\leftrightarrow$<br><code>__n</code> | The index of the element for which data should be accessed. |
|---------------------------------------|-------------------------------------------------------------|

## Returns

Read/write reference to data.

## Exceptions

|                                |                                          |
|--------------------------------|------------------------------------------|
| <code>std::out_of_range</code> | If <code>__n</code> is an invalid index. |
|--------------------------------|------------------------------------------|

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws `out_of_range` if the check fails.

**at()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque< _Tp, _Alloc >::at (
    size_type __n) const [inline]
```

Provides access to the data contained in the deque.

## Parameters

|                                       |                                                             |
|---------------------------------------|-------------------------------------------------------------|
| $\leftrightarrow$<br><code>__n</code> | The index of the element for which data should be accessed. |
|---------------------------------------|-------------------------------------------------------------|

## Returns

Read-only (constant) reference to data.

## Exceptions

|                                |                                          |
|--------------------------------|------------------------------------------|
| <code>std::out_of_range</code> | If <code>__n</code> is an invalid index. |
|--------------------------------|------------------------------------------|

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws `out_of_range` if the check fails.

**back()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque< _Tp, _Alloc >::back () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the deque.

**back()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::deque< _Tp, _Alloc >::back () [inline], [nodiscard], [noexcept]
```

Returns a read/write reference to the data at the last element of the deque.

**begin()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque< _Tp, _Alloc >::begin () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

**begin()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::begin () [inline], [nodiscard], [noexcept]
```

Returns a read/write iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Referenced by [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::deque\(\)](#), [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::deque](#), [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::~~deque\(\)](#), [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::clear\(\)](#), [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::front\(\)](#), [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::front\(\)](#), [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::insert\(\)](#), [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::insert\(\)](#), [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::insert\(\)](#), [std::operator<=>\(\)](#), and [operator=\(\)](#).

**cbegin()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque< _Tp, _Alloc >::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Referenced by [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::insert\(\)](#), [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::insert\(\)](#) and [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::insert\(\)](#).

**cend()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque< _Tp, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

**clear()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::clear () [inline], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Referenced by [\\_M\\_range\\_initialize\(\)](#).

**crbegin()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque< _Tp, _Alloc >::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

**crend()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque< _Tp, _Alloc >::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

**emplace()**

```
template<typename _Tp, typename _Alloc>
template<typename... _Args>
deque< _Tp, _Alloc >::iterator deque::emplace (
    const_iterator __position,
    _Args &&... __args)
```

Inserts an object in deque before specified iterator.

**Parameters**

|                         |                                  |
|-------------------------|----------------------------------|
| <code>__position</code> | A const_iterator into the deque. |
| <code>__args</code>     | Arguments.                       |

**Returns**

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) before the specified location.

References [std::forward\(\)](#).

Referenced by [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::insert\(\)](#).

**empty()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
bool std::deque< _Tp, _Alloc >::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the deque is empty. (Thus begin() would equal end().)

**end()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque< _Tp, _Alloc >::end () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

**end()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::end () [inline], [nodiscard], [noexcept]
```

Returns a read/write iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Referenced by [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::deque\(\)](#), [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::deque](#), [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::~deque\(\)](#), [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::back\(\)](#), [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::back\(\)](#), [std::operator<=>\(\)](#), and [operator=\(\)](#).

**erase()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Remove a range of elements.

**Parameters**

|                      |                                                      |
|----------------------|------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the first element to be erased. |
|----------------------|------------------------------------------------------|

|                     |                                                              |
|---------------------|--------------------------------------------------------------|
| <code>__last</code> | Iterator pointing to one past the last element to be erased. |
|---------------------|--------------------------------------------------------------|

#### Returns

An iterator pointing to the element pointed to by *last* prior to erasing (or `end()`).

This function will erase the elements in the range `[__first,__last)` and shorten the deque accordingly.

The user is cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

#### **erase()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::erase (
    const_iterator __position) [inline]
```

Remove element at given position.

#### Parameters

|                         |                                            |
|-------------------------|--------------------------------------------|
| <code>__position</code> | Iterator pointing to element to be erased. |
|-------------------------|--------------------------------------------|

#### Returns

An iterator pointing to the next element (or `end()`).

This function will erase the element at the given position and thus shorten the deque by one.

The user is cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

#### **front()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque< _Tp, _Alloc >::front () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the deque.

#### **front()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::deque< _Tp, _Alloc >::front () [inline], [nodiscard], [noexcept]
```

Returns a read/write reference to the data at the first element of the deque.

#### **get\_allocator()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
allocator_type std::deque< _Tp, _Alloc >::get_allocator () const [inline], [nodiscard], [noexcept]
```

Get a copy of the memory allocation object.

Referenced by `operator=()`.

#### **insert()** [1/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::insert (
    const_iterator __p,
    initializer_list< value_type > __l) [inline]
```

Inserts an initializer list into the deque.

## Parameters

|                                  |                             |
|----------------------------------|-----------------------------|
| <a href="#"><code>__p</code></a> | An iterator into the deque. |
| <a href="#"><code>__l</code></a> | An initializer_list.        |

## Returns

An iterator that points to the inserted data.

This function will insert copies of the data in the initializer\_list `__l` into the deque before the location specified by `__p`. This is known as *list insert*.

**insert()** [2/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
iterator std::deque<_Tp, _Alloc >::insert (
    const_iterator __position,
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Inserts a range into the deque.

## Parameters

|                                         |                                  |
|-----------------------------------------|----------------------------------|
| <a href="#"><code>__position</code></a> | A const_iterator into the deque. |
| <a href="#"><code>__first</code></a>    | An input iterator.               |
| <a href="#"><code>__last</code></a>     | An input iterator.               |

## Returns

An iterator that points to the inserted data.

This function will insert copies of the data in the range [`__first`,`__last`) into the deque before the location specified by `__position`. This is known as *range insert*.

**insert()** [3/5]

```
template<typename _Tp, typename _Alloc>
deque<_Tp, _Alloc >::iterator deque::insert (
    const_iterator __position,
    const value_type & __x)
```

Inserts given value into deque before specified iterator.

## Parameters

|                                         |                                  |
|-----------------------------------------|----------------------------------|
| <a href="#"><code>__position</code></a> | A const_iterator into the deque. |
| <a href="#"><code>__x</code></a>        | Data to be inserted.             |

## Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location.

References [deque\(\)](#), [insert\(\)](#), [push\\_back\(\)](#), and [push\\_front\(\)](#).

Referenced by [insert\(\)](#).

**insert()** [4/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::insert (
    const_iterator __position,
    size_type __n,
    const value_type & __x) [inline]
```

Inserts a number of copies of given data into the deque.

**Parameters**

|                         |                                    |
|-------------------------|------------------------------------|
| <code>__position</code> | A const_iterator into the deque.   |
| <code>__n</code>        | Number of elements to be inserted. |
| <code>__x</code>        | Data to be inserted.               |

**Returns**

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by `__position`.

**insert()** [5/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::insert (
    const_iterator __position,
    value_type && __x) [inline]
```

Inserts given rvalue into deque before specified iterator.

**Parameters**

|                         |                                  |
|-------------------------|----------------------------------|
| <code>__position</code> | A const_iterator into the deque. |
| <code>__x</code>        | Data to be inserted.             |

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location.

**max\_size()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::deque< _Tp, _Alloc >::max_size () const [inline], [nodiscard], [noexcept]
```

Returns the size() of the largest possible deque.

Referenced by [\\_M\\_new\\_elements\\_at\\_back\(\)](#), [\\_M\\_new\\_elements\\_at\\_front\(\)](#), [\\_M\\_push\\_back\\_aux\(\)](#), [\\_M\\_push\\_front\\_aux\(\)](#), and [\\_M\\_reallocate\\_map\(\)](#).

**operator=()** [1/3]

```
template<typename _Tp, typename _Alloc>
deque< _Tp, _Alloc > & deque::operator= (
    const deque< _Tp, _Alloc > & __x)
```

Deque assignment operator.

## Parameters

|                                              |                                                   |
|----------------------------------------------|---------------------------------------------------|
| <a href="#"><math>\leftrightarrow</math></a> | A deque of identical element and allocator types. |
| <a href="#">__x</a>                          |                                                   |

All the elements of *x* are copied.

The newly-created deque uses a copy of the allocator object used by [\\_\\_x](#) (unless the allocator traits dictate a different object).

References [deque\(\)](#), [std::\\_\\_addressof\(\)](#), [begin\(\)](#), [end\(\)](#), [get\\_allocator\(\)](#), [size\(\)](#), and [std::size\(\)](#).

**operator=()** [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
deque & std::deque<_Tp, _Alloc >::operator= (
    deque<_Tp, _Alloc > && __x) [inline], [noexcept]
```

Deque move assignment operator.

## Parameters

|                                              |                                                   |
|----------------------------------------------|---------------------------------------------------|
| <a href="#"><math>\leftrightarrow</math></a> | A deque of identical element and allocator types. |
| <a href="#">__x</a>                          |                                                   |

The contents of [\\_\\_x](#) are moved into this deque (without copying, if the allocators permit it). [\\_\\_x](#) is a valid, but unspecified deque.

**operator=()** [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
deque & std::deque<_Tp, _Alloc >::operator= (
    initializer_list<value_type> & __l) [inline]
```

Assigns an initializer list to a deque.

## Parameters

|                   |                      |
|-------------------|----------------------|
| <a href="#">↩</a> | An initializer_list. |
| <a href="#">↩</a> |                      |
| <a href="#">↩</a> |                      |
| <a href="#">↩</a> |                      |
| <a href="#">/</a> |                      |

This function fills a deque with copies of the elements in the initializer\_list [\\_\\_l](#).

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

**operator[]()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque<_Tp, _Alloc >::operator[] (
    size_type __n) const [inline], [nodiscard], [noexcept]
```

Subscript access to the data contained in the deque.

## Parameters

|                                              |                                                             |
|----------------------------------------------|-------------------------------------------------------------|
| <a href="#"><math>\leftrightarrow</math></a> | The index of the element for which data should be accessed. |
| <a href="#">__n</a>                          |                                                             |

### Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

### `operator[]()` [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::deque< _Tp, _Alloc >::operator[] (
    size_type __n) [inline], [nodiscard], [noexcept]
```

Subscript access to the data contained in the deque.

### Parameters

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| <code>__n</code> | The index of the element for which data should be accessed. |
|------------------|-------------------------------------------------------------|

### Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

### `pop_back()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::pop_back () [inline], [noexcept]
```

Removes last element.

This is a typical stack operation. It shrinks the deque by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

### `pop_front()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::pop_front () [inline], [noexcept]
```

Removes first element.

This is a typical stack operation. It shrinks the deque by one.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

### `push_back()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::push_back (
    const value_type & __x) [inline]
```

Add data to the end of the deque.

## Parameters

|                                  |                   |
|----------------------------------|-------------------|
| <a href="#"><code>_↔</code></a>  | Data to be added. |
| <a href="#"><code>__x</code></a> |                   |

This is a typical stack operation. The function creates an element at the end of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.

Referenced by [\\_M\\_range\\_initialize\(\)](#), and [insert\(\)](#).

**push\_front()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque<_Tp, _Alloc>::push_front (
    const value_type & __x) [inline]
```

Add data to the front of the deque.

## Parameters

|                                  |                   |
|----------------------------------|-------------------|
| <a href="#"><code>_↔</code></a>  | Data to be added. |
| <a href="#"><code>__x</code></a> |                   |

This is a typical stack operation. The function creates an element at the front of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.

Referenced by [insert\(\)](#).

**rbegin()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque<_Tp, _Alloc>::rbegin () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

**rbegin()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::deque<_Tp, _Alloc>::rbegin () [inline], [nodiscard], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

**rend()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque<_Tp, _Alloc>::rend () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

**rend()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::deque<_Tp, _Alloc>::rend () [inline], [nodiscard], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

**resize()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>>
void std::deque<_Tp, _Alloc>::resize (
    size_type __new_size) [inline]
```

Resizes the deque to the specified number of elements.

**Parameters**

|                         |                                              |
|-------------------------|----------------------------------------------|
| <code>__new_size</code> | Number of elements the deque should contain. |
|-------------------------|----------------------------------------------|

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise default constructed elements are appended.

**resize()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>>
void std::deque<_Tp, _Alloc>::resize (
    size_type __new_size,
    const value_type & __x) [inline]
```

Resizes the deque to the specified number of elements.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__new_size</code> | Number of elements the deque should contain.      |
| <code>__x</code>        | Data with which new elements should be populated. |

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise the deque is extended and new elements are populated with given data.

**shrink\_to\_fit()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>>
void std::deque<_Tp, _Alloc>::shrink_to_fit () [inline], [noexcept]
```

A non-binding request to reduce memory use.

**size()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>>
size_type std::deque<_Tp, _Alloc>::size () const [inline], [nodiscard], [noexcept]
```

Returns the number of elements in the deque.

Referenced by `std::deque<_Tp, polymorphic_allocator<_Tp>>::M_range_check()`, `std::operator<=>()`, `operator=()`, `std::deque<_Tp, polymorphic_allocator<_Tp>>::resize()`, and `std::deque<_Tp, polymorphic_allocator<_Tp>>::resize()`.

**swap()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>>
void std::deque<_Tp, _Alloc>::swap (
    deque<_Tp, _Alloc> & __x) [inline], [noexcept]
```

Swaps data with another deque.

**Parameters**

|                  |                                                  |
|------------------|--------------------------------------------------|
| <code>__x</code> | A deque of the same element and allocator types. |
|------------------|--------------------------------------------------|

---

This exchanges the elements between two deques in constant time. (Four pointers, so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(d1,d2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

## 6.383 `std::destroying_delete_t` Struct Reference

```
#include <new>
```

### 6.383.1 Detailed Description

Tag type used to declare a class-specific operator delete that can invoke the destructor before deallocating the memory.

The documentation for this struct was generated from the following file:

- [new](#)

## 6.384 `std::tr2::direct_bases<_Tp>` Struct Template Reference

```
#include <type_traits>
```

### Public Types

- typedef [\\_\\_reflection\\_typelist](#)< `__direct_bases(_Tp)...` > `type`

### 6.384.1 Detailed Description

```
template<typename _Tp>  
struct std::tr2::direct_bases<_Tp>
```

Enumerate all the direct base classes of a class. Form of a typelist.

The documentation for this struct was generated from the following file:

- [tr2/type\\_traits](#)

## 6.385 `__gnu_pbds::direct_mask_range_hashing<Size_Type>` Class Template Reference

```
#include <hash_policy.hpp>
```

Inheritance diagram for `__gnu_pbds::direct_mask_range_hashing< Size_Type >`:

### Public Types

- typedef `Size_Type` **size\_type**

### Public Member Functions

- void **swap** ([direct\\_mask\\_range\\_hashing](#)< `Size_Type` > &other)

### Protected Member Functions

- size\_type [operator\(\)](#) (size\_type hash) const
- size\_type **range\_hash** (size\_type hash) const
- void **swap** (mask\_based\_range\_hashing &other)

#### 6.385.1 Detailed Description

```
template<typename Size_Type = std::size_t>
class __gnu_pbds::direct_mask_range_hashing< Size_Type >
```

A mask range-hashing class (uses a bitmask).

#### 6.385.2 Member Function Documentation

##### **operator()()**

```
template<typename Size_Type>
direct\_mask\_range\_hashing< Size_Type >::size_type \_\_gnu\_pbds::direct\_mask\_range\_hashing< Size_Type >::operator() (
    size_type hash) const [inline], [protected]
```

Transforms the `__hash` value hash into a ranged-hash value (using a bit-mask).

The documentation for this class was generated from the following file:

- [hash\\_policy.hpp](#)

**6.386 `__gnu_pbds::direct_mod_range_hashing< Size_Type >` Class Template Reference**

```
#include <hash_policy.hpp>
```

Inheritance diagram for `__gnu_pbds::direct_mod_range_hashing< Size_Type >`:

**Public Types**

- typedef `Size_Type` **size\_type**

**Public Member Functions**

### 6.389.1 Detailed Description

template<typename \_RandomNumberEngine, size\_t \_\_p, size\_t \_\_r>  
class std::discard\_block\_engine< \_RandomNumberEngine, \_\_p, \_\_r >

Produces random numbers from some base engine by discarding blocks of data.

Precondition

$$0 \leq r \leq p$$

Since

C++11

### 6.389.2 Member Typedef Documentation

#### result\_type

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
typedef _RandomNumberEngine::result_type std::discard_block_engine< _RandomNumberEngine, __p, __r
>::result_type
```

The type of the generated random value.

### 6.389.3 Constructor & Destructor Documentation

#### discard\_block\_engine() [1/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine () [inline]
```

Constructs a default discard\_block\_engine engine.

The underlying engine is default constructed as well.

#### discard\_block\_engine() [2/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
    const _RandomNumberEngine & __rng) [inline], [explicit]
```

Copy constructs a discard\_block\_engine engine.

Copies an existing base class random number generator.

**Parameters**

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__rng</code> | An existing (base class) engine object. |
|--------------------|-----------------------------------------|

**discard\_block\_engine() [3/5]**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
    _RandomNumberEngine && __rng) [inline], [explicit]
```

Move constructs a `discard_block_engine` engine.

Copies an existing base class random number generator.

**Parameters**

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__rng</code> | An existing (base class) engine object. |
|--------------------|-----------------------------------------|

**discard\_block\_engine() [4/5]**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
    result_type __s) [inline], [explicit]
```

Seed constructs a `discard_block_engine` engine.

Constructs the underlying generator engine seeded with `__s`.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A seed value for the base class engine. |
|------------------|-----------------------------------------|

**discard\_block\_engine() [5/5]**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
    _Sseq & __q) [inline], [explicit]
```

Generator construct a `discard_block_engine` engine.

**Parameters**

|                  |                  |
|------------------|------------------|
| <code>__q</code> | A seed sequence. |
|------------------|------------------|

**6.389.4 Member Function Documentation****base()**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
const _RandomNumberEngine & std::discard_block_engine< _RandomNumberEngine, __p, __r >::base ()
const [inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

**discard()**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
void std::discard_block_engine<_RandomNumberEngine, __p, __r>::discard (
    unsigned long long __z) [inline]
```

Discard a sequence of random numbers.

**max()**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
constexpr result_type std::discard_block_engine<_RandomNumberEngine, __p, __r>::max () [inline],
[static], [constexpr]
```

Gets the maximum value in the generated random number range.

**min()**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
constexpr result_type std::discard_block_engine<_RandomNumberEngine, __p, __r>::min () [inline],
[static], [constexpr]
```

Gets the minimum value in the generated random number range.

**operator()()**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
discard_block_engine<_RandomNumberEngine, __p, __r>::result_type std::discard_block_engine<_↵
RandomNumberEngine, __p, __r>::operator() ()
```

Gets the next value in the generated random number sequence.

**seed()** [1/3]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
void std::discard_block_engine<_RandomNumberEngine, __p, __r>::seed () [inline]
```

Reseeds the discard\_block\_engine object with the default seed for the underlying base class generator engine.

**seed()** [2/3]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
template<typename _Sseq>
_If_seed_seq<_Sseq> std::discard_block_engine<_RandomNumberEngine, __p, __r>::seed (
    _Sseq & __q) [inline]
```

Reseeds the discard\_block\_engine object with the given seed sequence.

**Parameters**

|                 |                            |
|-----------------|----------------------------|
| <code>_↵</code> | A seed generator function. |
| <code>_q</code> |                            |

**seed()** [3/3]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
void std::discard_block_engine<_RandomNumberEngine, __p, __r>::seed (
    result_type __s) [inline]
```

Reseeds the discard\_block\_engine object with the default seed for the underlying base class generator engine.

## 6.389.5 Friends And Related Symbol Documentation

### operator<<

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
template<typename _RandomNumberEngine1, size_t __p1, size_t __r1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::discard_block_engine< _RandomNumberEngine1, __p1, __r1 > & __x) [friend]
Inserts the current state of a discard_block_engine random number generator engine __x into the output stream __os.
```

#### Parameters

|                   |                                                        |
|-------------------|--------------------------------------------------------|
| <code>__os</code> | An output stream.                                      |
| <code>__x</code>  | A discard_block_engine random number generator engine. |

#### Returns

The output stream with the state of `__x` inserted or in an error state.

### operator==

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
bool operator== (
    const std::discard_block_engine< _RandomNumberEngine, __p, __r > & __lhs,
    const std::discard_block_engine< _RandomNumberEngine, __p, __r > & __rhs) [friend]
Compares two discard_block_engine random number generator objects of the same type for equality.
```

#### Parameters

|                    |                                                              |
|--------------------|--------------------------------------------------------------|
| <code>__lhs</code> | A discard_block_engine random number generator object.       |
| <code>__rhs</code> | Another discard_block_engine random number generator object. |

#### Returns

true if the infinite sequences of generated values would be equal, false otherwise.

### operator>>

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
template<typename _RandomNumberEngine1, size_t __p1, size_t __r1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::discard_block_engine< _RandomNumberEngine1, __p1, __r1 > & __x) [friend]
Extracts the current state of a % subtract_with_carry_engine random number generator engine __x from the input stream __is.
```

#### Parameters

|                   |                  |
|-------------------|------------------|
| <code>__is</code> | An input stream. |
|-------------------|------------------|

|                 |                                                        |
|-----------------|--------------------------------------------------------|
| <code>_↵</code> | A discard_block_engine random number generator engine. |
| <code>_X</code> |                                                        |

### Returns

The input stream with the state of `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

### 6.390.1 Detailed Description

```
template<typename _IntType = int>  
class std::discrete_distribution< _IntType >
```

A `discrete_distribution` random number distribution.

This distribution produces random numbers  $i, 0 \leq i < n$ , distributed according to the probability mass function  $p(i|p_0, \dots, p_{n-1}) = p_i$ .

Since

C++11

### 6.390.2 Member Typedef Documentation

#### result\_type

```
template<typename _IntType = int>  
typedef _IntType std::discrete_distribution< _IntType >::result_type  
The type of the range of the distribution.
```

### 6.390.3 Member Function Documentation

#### max()

```
template<typename _IntType = int>  
result_type std::discrete_distribution< _IntType >::max () const [inline]  
Returns the least upper bound value of the distribution.
```

#### min()

```
template<typename _IntType = int>  
result_type std::discrete_distribution< _IntType >::min () const [inline]  
Returns the greatest lower bound value of the distribution.
```

#### operator>()

```
template<typename _IntType = int>  
template<typename _UniformRandomNumberGenerator>  
result_type std::discrete_distribution< _IntType >::operator() (  
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by `operator()()`.

**param()** [1/2]

```
template<typename _IntType = int>
param_type std::discrete_distribution< _IntType >::param () const [inline]
```

Returns the parameter set of the distribution.

**param()** [2/2]

```
template<typename _IntType = int>
void std::discrete_distribution< _IntType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**probabilities()**

```
template<typename _IntType = int>
std::vector< double > std::discrete_distribution< _IntType >::probabilities () const [inline]
```

Returns the probabilities of the distribution.

**reset()**

```
template<typename _IntType = int>
void std::discrete_distribution< _IntType >::reset () [inline]
```

Resets the distribution state.

**6.390.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::discrete_distribution< _IntType1 > & __x) [friend]
```

Inserts a discrete\_distribution random number distribution `__x` into the output stream `__os`.

**Parameters**

|                   |                                                     |
|-------------------|-----------------------------------------------------|
| <code>__os</code> | An output stream.                                   |
| <code>__x</code>  | A discrete_distribution random number distribution. |

**Returns**

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _IntType = int>
bool operator== (
    const discrete\_distribution< _IntType > & __d1,
    const discrete\_distribution< _IntType > & __d2) [friend]
```

Return true if two discrete distributions have the same parameters.

**operator>>**

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic\_istream< _CharT, _Traits > & operator>> (
    std::basic\_istream< _CharT, _Traits > & __is,
    std::discrete\_distribution< _IntType1 > & __x) [friend]
```

Extracts a [discrete\\_distribution](#) random number distribution \_\_x from the input stream \_\_is.

**Parameters**

|                      |                                                                         |
|----------------------|-------------------------------------------------------------------------|
| <a href="#">__is</a> | An input stream.                                                        |
| <a href="#">__x</a>  | A <a href="#">discrete_distribution</a> random number generator engine. |

**Returns**

The input stream with \_\_x extracted or in an error state.

### 6.397.1 Detailed Description

**template<typename \_WordT = unsigned long long, typename \_Alloc = std::allocator<\_WordT>>**  
**class std::tr2::dynamic\_bitset<\_WordT, \_Alloc >**

The `dynamic_bitset` class represents a sequence of bits.

See N2050, Proposal to Add a Dynamically Sizeable Bitset to the Standard Library. <http://www.open-std.org/jtc1/sc22/wg21/docs/papers/2006/n2050.pdf>

In the general unoptimized case, storage is allocated in word-sized blocks. Let B be the number of bits in a word, then  $(Nb + (B - 1)) / B$  words will be used for storage. B - NbB bits are unused. (They are the high-order bits in the highest word.) It is a class invariant that those unused bits are always zero.

If you think of `dynamic_bitset` as "a simple array of bits," be aware that your mental picture is reversed: a `dynamic_bitset` behaves the same way as bits in integers do, with the bit at index 0 in the "least significant / right-hand" position, and the bit at index Nb-1 in the "most significant / left-hand" position. Thus, unlike other containers, a `dynamic_bitset`'s index "counts from right to left," to put it very loosely.

This behavior is preserved when translating to and from strings. For example, the first line of the following program probably prints "b('a') is 0001100001" on a modern ASCII system.

```
#include <dynamic_bitset>
#include <iostream>
#include <sstream>

using namespace std;

int main()
{
    long    a = 'a';
    dynamic_bitset<> b(a);

    cout << "b('a') is " << b << endl;

    ostringstream s;
    s << b;
    string str = s.str();
    cout << "index 3 in the string is " << str[3] << " but\n"
         << "index 3 in the bitset is " << b[3] << endl;
}
```

Most of the actual code isn't contained in `dynamic_bitset<>` itself, but in the base class `__dynamic_bitset_base`. The base class works with whole words, not with individual bits. This allows us to specialize `__dynamic_bitset_base` for the important special case where the `dynamic_bitset` is only a single word.

Extra confusion can result due to the fact that the storage for `__dynamic_bitset_base` is a vector, and is indexed as such. This is carefully encapsulated.

## 6.397.2 Constructor & Destructor Documentation

### dynamic\_bitset() [1/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset<_WordT, _Alloc >::dynamic_bitset () [default]
```

All bits set to zero.

Referenced by [dynamic\\_bitset\(\)](#), [dynamic\\_bitset\(\)](#), [operator&=\(\)](#), [operator&=\(\)](#), [operator-=\(\)](#), [operator<<\(\)](#), [operator<<=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator>>\(\)](#), [operator^=\(\)](#), [operator|=\(\)](#), [operator~\(\)](#), and [swap\(\)](#).

### dynamic\_bitset() [2/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset<_WordT, _Alloc >::dynamic_bitset (
    const allocator_type & __alloc) [inline], [explicit]
```

All bits set to zero.

### dynamic\_bitset() [3/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset<_WordT, _Alloc >::dynamic_bitset (
    size_type __nbits,
    unsigned long long __val = 0ULL,
    const allocator_type & __alloc = allocator_type()) [inline], [explicit]
```

Initial bits bitwise-copied from a single word (others set to zero).

### dynamic\_bitset() [4/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
template<typename _CharT, typename _Traits, typename _Alloc1>
std::tr2::dynamic_bitset<_WordT, _Alloc >::dynamic_bitset (
    const std::basic_string<_CharT, _Traits, _Alloc1 > & __str,
    typename basic_string<_CharT, _Traits, _Alloc1 >::size_type __pos = 0,
    typename basic_string<_CharT, _Traits, _Alloc1 >::size_type __n = std::basic_string<_CharT, _Traits, _Alloc1>::npos,
    _CharT __zero = _CharT('0'),
    _CharT __one = _CharT('1'),
    const allocator_type & __alloc = allocator_type()) [inline], [explicit]
```

Use a subset of a string.

#### Parameters

|                      |                                                            |
|----------------------|------------------------------------------------------------|
| <code>__str</code>   | A string of '0' and '1' characters.                        |
| <code>__pos</code>   | Index of the first character in <code>__str</code> to use. |
| <code>__n</code>     | The number of characters to copy.                          |
| <code>__zero</code>  | The character to use for unset bits.                       |
| <code>__one</code>   | The character to use for set bits.                         |
| <code>__alloc</code> | An allocator.                                              |

#### Exceptions

|                                    |                                                                    |
|------------------------------------|--------------------------------------------------------------------|
| <code>std::out_of_range</code>     | If <code>__pos</code> is bigger the size of <code>__str</code> .   |
| <code>std::invalid_argument</code> | If a character appears in the string which is neither '0' nor '1'. |

References [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::npos](#), and [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::size\(\)](#).

### **dynamic\_bitset()** [5/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
    const char * __str,
    const allocator_type & __alloc = allocator_type()) [inline], [explicit]
```

Construct from a string.

#### Parameters

|                      |                                     |
|----------------------|-------------------------------------|
| <code>__str</code>   | A string of '0' and '1' characters. |
| <code>__alloc</code> | An allocator.                       |

#### Exceptions

|                                    |                                                                    |
|------------------------------------|--------------------------------------------------------------------|
| <code>std::invalid_argument</code> | If a character appears in the string which is neither '0' nor '1'. |
|------------------------------------|--------------------------------------------------------------------|

### **dynamic\_bitset()** [6/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
    const dynamic_bitset< _WordT, _Alloc > & ) [default]
```

Copy constructor.

References [dynamic\\_bitset\(\)](#).

### **dynamic\_bitset()** [7/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
    dynamic_bitset< _WordT, _Alloc > && __b) [inline], [noexcept]
```

Move constructor.

References [dynamic\\_bitset\(\)](#), and [std::move\(\)](#).

## **6.397.3 Member Function Documentation**

### **all()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::all () const [inline]
```

Tests whether all the bits are on.

#### Returns

True if all the bits are set.

**any()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::any () const [inline]
```

Tests whether any of the bits are on.

**Returns**

True if at least one bit is set.

**append()** [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
template<typename _BlockInputIterator>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::append (
    _BlockInputIterator __first,
    _BlockInputIterator __last) [inline]
```

Append an iterator range of blocks.

References [append\(\)](#).

**append()** [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::append (
    block_type __block) [inline]
```

Append a block.

Referenced by [append\(\)](#).

**clear()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::clear () [inline]
```

Clear the bitset.

**count()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::count () const [inline], [noexcept]
```

Returns the number of bits which are set.

**empty()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the dynamic\_bitset is empty.

**find\_first()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::find_first () const [inline]
```

Finds the index of the first "on" bit.

**Returns**

The index of the first bit set, or size() if not found.

**See also**

[find\\_next](#)

**find\_next()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic\_bitset< _WordT, _Alloc >::find_next (
    size_t __prev) const [inline]
```

Finds the index of the next "on" bit after prev.

**Returns**

The index of the next bit set, or size() if not found.

**Parameters**

|                     |                           |
|---------------------|---------------------------|
| <code>__prev</code> | Where to start searching. |
|---------------------|---------------------------|

**See also**

[find\\_first](#)

**flip() [1/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic\_bitset & std::tr2::dynamic\_bitset< _WordT, _Alloc >::flip () [inline]
```

Toggles every bit to its opposite value.

Referenced by [operator~\(\)](#).

**flip() [2/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic\_bitset & std::tr2::dynamic\_bitset< _WordT, _Alloc >::flip (
    size_type __pos) [inline]
```

Toggles a given bit to its opposite value.

**Parameters**

|                    |                       |
|--------------------|-----------------------|
| <code>__pos</code> | The index of the bit. |
|--------------------|-----------------------|

**Exceptions**

|                                |                                                      |
|--------------------------------|------------------------------------------------------|
| <code>std::out_of_range</code> | If <code>__pos</code> is bigger the size of the set. |
|--------------------------------|------------------------------------------------------|

**get\_allocator()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
allocator_type std::tr2::dynamic\_bitset< _WordT, _Alloc >::get_allocator () const [inline],
[noexcept]
```

Return the allocator for the bitset.

Referenced by [operator=\(\)](#).

**max\_size()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset<_WordT, _Alloc >::max_size () [inline], [constexpr], [noexcept]
```

Returns the maximum size of a dynamic\_bitset object having the same type as \*this. The real answer is max() \* bits\_per\_block but is likely to overflow.  
References [std::numeric\\_limits<\\_Tp>::max\(\)](#).

**none()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset<_WordT, _Alloc >::none () const [inline]
```

Tests whether any of the bits are on.

**Returns**

True if none of the bits are set.

**num\_blocks()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset<_WordT, _Alloc >::num_blocks () const [inline], [noexcept]
```

Returns the total number of blocks.

**operator&=() [1/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset<_WordT, _Alloc >::operator&= (
    const dynamic_bitset<_WordT, _Alloc > & __rhs) [inline]
```

Operations on dynamic\_bitsets.

**Parameters**

|                    |                              |
|--------------------|------------------------------|
| <code>__rhs</code> | A same-sized dynamic_bitset. |
|--------------------|------------------------------|

These should be self-explanatory.

References [dynamic\\_bitset\(\)](#).

**operator&=() [2/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset<_WordT, _Alloc >::operator&= (
    dynamic_bitset<_WordT, _Alloc > && __rhs) [inline]
```

Operations on dynamic\_bitsets.

**Parameters**

|                    |                              |
|--------------------|------------------------------|
| <code>__rhs</code> | A same-sized dynamic_bitset. |
|--------------------|------------------------------|

These should be self-explanatory.

References [dynamic\\_bitset\(\)](#), and [std::move\(\)](#).

**operator-=()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator-= (
    const dynamic_bitset< _WordT, _Alloc > & __rhs) [inline]
```

Operations on dynamic\_bitsets.

**Parameters**

|                    |                              |
|--------------------|------------------------------|
| <code>__rhs</code> | A same-sized dynamic_bitset. |
|--------------------|------------------------------|

These should be self-explanatory.

References [dynamic\\_bitset\(\)](#).

**operator<<()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset std::tr2::dynamic_bitset< _WordT, _Alloc >::operator<< (
    size_type __pos) const [inline]
```

Self-explanatory.

References [dynamic\\_bitset\(\)](#).

**operator<<=()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator<<= (
    size_type __pos) [inline]
```

Operations on dynamic\_bitsets.

**Parameters**

|                    |                                |
|--------------------|--------------------------------|
| <code>__pos</code> | The number of places to shift. |
|--------------------|--------------------------------|

These should be self-explanatory.

References [dynamic\\_bitset\(\)](#).

**operator=() [1/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator= (
    const dynamic_bitset< _WordT, _Alloc > & ) [default]
```

Copy assignment operator.

References [dynamic\\_bitset\(\)](#).

**operator=() [2/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator= (
    dynamic_bitset< _WordT, _Alloc > && __b) [inline], [noexcept]
```

Move assignment operator.

References [dynamic\\_bitset\(\)](#), and [get\\_allocator\(\)](#).

**operator>>()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset std::tr2::dynamic_bitset< _WordT, _Alloc >::operator>> (
    size_type __pos) const [inline]
```

Self-explanatory.

References [dynamic\\_bitset\(\)](#).

**operator>>=()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator>>= (
    size_type __pos) [inline]
```

Operations on dynamic\_bitsets.

**Parameters**

|                    |                                |
|--------------------|--------------------------------|
| <code>__pos</code> | The number of places to shift. |
|--------------------|--------------------------------|

These should be self-explanatory.

**operator[]() [1/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
reference std::tr2::dynamic_bitset< _WordT, _Alloc >::operator[] (
    size_type __pos) [inline]
```

Array-indexing support.

**Parameters**

|                    |                                |
|--------------------|--------------------------------|
| <code>__pos</code> | Index into the dynamic_bitset. |
|--------------------|--------------------------------|

**Returns**

A bool for a 'const dynamic\_bitset'. For non-const bitsets, an instance of the reference proxy class.

**Note**

These operators do no range checking and throw no exceptions, as required by DR 11 to the standard.

**operator[]() [2/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
const_reference std::tr2::dynamic_bitset< _WordT, _Alloc >::operator[] (
    size_type __pos) const [inline]
```

Array-indexing support.

**Parameters**

|                    |                                |
|--------------------|--------------------------------|
| <code>__pos</code> | Index into the dynamic_bitset. |
|--------------------|--------------------------------|

**Returns**

A bool for a 'const dynamic\_bitset'. For non-const bitsets, an instance of the reference proxy class.

**Note**

These operators do no range checking and throw no exceptions, as required by DR 11 to the standard.

**operator^=()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator^= (
    const dynamic_bitset< _WordT, _Alloc > & __rhs) [inline]
```

Operations on dynamic\_bitsets.

**Parameters**

|                    |                              |
|--------------------|------------------------------|
| <code>__rhs</code> | A same-sized dynamic_bitset. |
|--------------------|------------------------------|

These should be self-explanatory.

References [dynamic\\_bitset\(\)](#).

**operator" |=()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator|= (
    const dynamic_bitset< _WordT, _Alloc > & __rhs) [inline]
```

Operations on dynamic\_bitsets.

**Parameters**

|                    |                              |
|--------------------|------------------------------|
| <code>__rhs</code> | A same-sized dynamic_bitset. |
|--------------------|------------------------------|

These should be self-explanatory.

References [dynamic\\_bitset\(\)](#).

**operator~()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset std::tr2::dynamic_bitset< _WordT, _Alloc >::operator~ () const [inline]
```

See the no-argument [flip\(\)](#).

References [dynamic\\_bitset\(\)](#), and [flip\(\)](#).

**push\_back()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::push_back (
    bool __bit) [inline]
```

Push a bit onto the high end of the bitset.

References [size\(\)](#).

**reset() [1/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::reset () [inline]
```

Sets every bit to false.

**reset()** [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::reset (
    size_type __pos) [inline]
```

Sets a given bit to false.

**Parameters**

|                    |                       |
|--------------------|-----------------------|
| <code>__pos</code> | The index of the bit. |
|--------------------|-----------------------|

**Exceptions**

|                                |                                                      |
|--------------------------------|------------------------------------------------------|
| <code>std::out_of_range</code> | If <code>__pos</code> is bigger the size of the set. |
|--------------------------------|------------------------------------------------------|

Same as writing `set (__pos, false)`.

**resize()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::resize (
    size_type __nbits,
    bool __value = false) [inline]
```

Resize the bitset.

Referenced by `std::tr2::operator>>()`.

**set()** [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::set () [inline]
```

Sets every bit to true.

**set()** [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::set (
    size_type __pos,
    bool __val = true) [inline]
```

Sets a given bit to a particular value.

**Parameters**

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__pos</code> | The index of the bit.                   |
| <code>__val</code> | Either true or false, defaults to true. |

**Exceptions**

|                                |                                                      |
|--------------------------------|------------------------------------------------------|
| <code>std::out_of_range</code> | If <code>__pos</code> is bigger the size of the set. |
|--------------------------------|------------------------------------------------------|

**size()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::size () const [inline], [noexcept]
```

Returns the total number of bits.

Referenced by [std::tr2::operator>>\(\)](#), and [push\\_back\(\)](#).

**swap()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::swap (
    dynamic_bitset< _WordT, _Alloc > & __b) [inline], [noexcept]
```

Swap with another bitset.

References [dynamic\\_bitset\(\)](#).

**test()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::test (
    size_type __pos) const [inline]
```

Tests the value of a bit.

**Parameters**

|                    |                     |
|--------------------|---------------------|
| <code>__pos</code> | The index of a bit. |
|--------------------|---------------------|

**Returns**

The value at `__pos`.

**Exceptions**

|                                |                                                      |
|--------------------------------|------------------------------------------------------|
| <code>std::out_of_range</code> | If <code>__pos</code> is bigger the size of the set. |
|--------------------------------|------------------------------------------------------|

**to\_string()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
template<typename _CharT = char, typename _Traits = std::char_traits<_CharT>, typename _Alloc1 =
std::allocator<_CharT>>
std::basic_string< _CharT, _Traits, _Alloc1 > std::tr2::dynamic_bitset< _WordT, _Alloc >::to_↵
string (
    _CharT __zero = _CharT('0'),
    _CharT __one = _CharT('1')) const [inline]
```

Returns a character interpretation of the `dynamic_bitset`.

**Returns**

The string equivalent of the bits.

Note the ordering of the bits: decreasing character positions correspond to increasing bit positions (see the main class notes for an example).

**to\_ulong()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
unsigned long long std::tr2::dynamic_bitset<_WordT, _Alloc>::to_ulong () const [inline]
```

Returns a numerical interpretation of the `dynamic_bitset`.

**Returns**

The integral equivalent of the bits.

**Exceptions**

|                                  |                                                                   |
|----------------------------------|-------------------------------------------------------------------|
| <code>std::overflow_error</code> | If there are too many bits to be represented in an unsigned long. |
|----------------------------------|-------------------------------------------------------------------|

**to\_ulong()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
unsigned long std::tr2::dynamic_bitset<_WordT, _Alloc>::to_ulong () const [inline]
```

Returns a numerical interpretation of the `dynamic_bitset`.

**Returns**

The integral equivalent of the bits.

**Exceptions**

|                                  |                                                                   |
|----------------------------------|-------------------------------------------------------------------|
| <code>std::overflow_error</code> | If there are too many bits to be represented in an unsigned long. |
|----------------------------------|-------------------------------------------------------------------|

The documentation for this class was generated from the following files:

**6.398 `std::ranges::empty_view<_Tp>` Class Template Reference**

```
#include <ranges>
```

Inheritance diagram for `std::ranges::empty_view<_Tp>`:

### Public Member Functions

- constexpr decltype(auto) **back** ()
- constexpr decltype(auto) **front** ()
- constexpr **operator bool** () noexcept(noexcept(ranges::empty(\_M\_derived())))
- constexpr decltype(auto) **operator[]** (range\_difference\_t<\_Range> \_\_n)

### Static Public Member Functions

- static constexpr \_Tp \* **begin** () noexcept
- static constexpr \_Tp \* **data** () noexcept
- static constexpr bool **empty** () noexcept
- static constexpr \_Tp \* **end** () noexcept
- static constexpr size\_t **size** () noexcept

#### 6.398.1 Detailed Description

```
template<typename _Tp>
requires is_object_v<_Tp>
class std::ranges::empty_view<_Tp>
```

A view that contains no elements.

The documentation for this class was generated from the following file:

- [ranges](#)

#### 6.399 std::enable\_if< bool, \_Tp > Struct Template Reference

```
#include <type_traits>
```

##### 6.399.1 Detailed Description

```
template<bool, typename _Tp = void>
struct std::enable_if< bool, _Tp >
```

Define a member typedef `type` only if a boolean constant is true.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 6.400 std::enable\_shared\_from\_this< \_Tp > Class Template Reference

```
#include <memory>
```

### Public Member Functions

- [shared\\_ptr](#)<\_Tp> **shared\_from\_this** ()
- [shared\\_ptr](#)<const \_Tp> **shared\_from\_this** () const

### Protected Member Functions

- **enable\_shared\_from\_this** (const [enable\\_shared\\_from\\_this](#) &) noexcept
- [enable\\_shared\\_from\\_this](#) & **operator=** (const [enable\\_shared\\_from\\_this](#) &) noexcept

## Friends

- const [enable\\_shared\\_from\\_this](#) \* `__enable_shared_from_this_base` (const `__shared_count<>` &, const `enable_shared_from_this` \*\_\_p)
- template<typename, \_Lock\_policy>  
class `__shared_ptr`

### 6.400.1 Detailed Description

```
template<typename _Tp>
class std::enable_shared_from_this<_Tp>
```

Base class allowing use of the member function `shared_from_this`.

Since

C++11

The documentation for this class was generated from the following file:

- [bits/shared\\_ptr.h](#)

## 6.401 `__gnu_cxx::enc_filebuf<_CharT>` Class Template Reference

```
#include <enc_filebuf.h>
```

Inheritance diagram for `__gnu_cxx::enc_filebuf<_CharT>`:

## Public Types

- typedef `codecvt<char_type, char, __state_type>` `__codecvt_type`
- typedef `__basic_file<char>` `__file_type`

- typedef `basic_filebuf`< `char_type`, `traits_type` > `__filebuf_type`

- bool `_M_writing`
- `char_type` `_M_pback`
- `char_type` \* `_M_pback_cur_save`
- `char_type` \* `_M_pback_end_save`
- bool `_M_pback_init`

### 6.401.1 Detailed Description

```
template<typename _CharT>
class __gnu_cxx::enc_filebuf< _CharT >
```

class enc\_filebuf.

### 6.401.2 Member Function Documentation

#### M\_create\_pback()

```
void std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_create_pback () [inline],
[protected], [inherited]
```

Initializes pback buffers, and moves normal buffers to safety. Assumptions: `_M_in_cur` has already been moved back

#### M\_destroy\_pback()

```
void std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_destroy_pback () throw ( )
[inline], [protected], [inherited]
```

Deactivates pback buffer contents, and restores normal buffer. Assumptions: The pback buffer has only moved forward.

#### M\_set\_buffer()

```
void std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_set_buffer (
    streamsize __off) [inline], [protected], [inherited]
```

This function sets the pointers of the internal buffer, both get and put areas. Typically:

`__off == egptr() - eback()` upon underflow/uflow (**read** mode); `__off == 0` upon overflow (**write** mode); `__off == -1` upon open, setbuf, seekoff/pos (**uncommitted** mode).

NB: `egptr() - pbase() == _M_buf_size - 1`, since `_M_buf_size` reflects the actual allocated memory and the last cell is reserved for the overflow char of a full put area.

Referenced by [seekpos\(\)](#), and [setbuf\(\)](#).

#### close()

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::__filebuf_type * std::basic_filebuf< ↵
    _CharT, encoding_char_traits< _CharT > >::close () [inherited]
```

Closes the currently associated file.

#### Returns

`this` on success, NULL on failure

If no file is currently open, this function immediately fails.

If a *put buffer area* exists, `overflow(eof)` is called to flush all the characters. The file is then closed.

If any operations fail, this function also fails.

#### eback()

```
char_type * std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::eback () const [inline],
[protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

**egptr()**

```
char_type * std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::egptr () const [inline],
[protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

**epptr()**

```
char_type * std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::epptr () const [inline],
[protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

**gbump()**

```
void std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::gbump (
    int __n) [inline], [protected], [inherited]
```

Moving the read position.

**Parameters**

|                  |                             |
|------------------|-----------------------------|
| <code>__↔</code> | The delta by which to move. |
| <code>__n</code> |                             |

This just advances the read position without returning any data.

**getloc()**

```
locale std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::getloc () const [inline],
[inherited]
```

Locale access.

**Returns**

The current locale in effect.

If `pubimbue(loc)` has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.

**gptr()**

```
char_type * std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::gptr () const [inline],  
[protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

**imbue()**

```
void std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::imbue (  
    const locale & __loc) [protected], [virtual], [inherited]
```

Changes translations.

**Parameters**

|                    |               |
|--------------------|---------------|
| <code>__loc</code> | A new locale. |
|--------------------|---------------|

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

**Note**

Base class version does nothing.

Reimplemented from `std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >`.

**in\_avail()**

```
streamsize std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::in_avail () [inline],  
[inherited]
```

Looking ahead into the stream.

**Returns**

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

**is\_open()**

```
bool std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::is_open () const throw ( )  
[inline], [nodiscard], [inherited]
```

Returns true if the external file is open.

**open()**

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::__filebuf_type * std::basic_filebuf< ↵  
_CharT, encoding_char_traits< _CharT > >::open (  
    const char * __s,  
    ios_base::openmode __mode) [inherited]
```

Opens an external file.

## Parameters

|                     |                       |
|---------------------|-----------------------|
| <code>__s</code>    | The name of the file. |
| <code>__mode</code> | The open mode flags.  |

## Returns

`this` on success, `NULL` on failure

If a file is already open, this function immediately fails. Otherwise it tries to open the file named `__s` using the flags given in `__mode`.

Table 92, adapted here, gives the relation between openmode combinations and the equivalent `fopen()` flags. (NB: lines `app`, `in|out|app`, `in|app`, `binary|app`, `binary|in|out|app`, and `binary|in|app` per DR 596)

| ios_base Flag combination |    |     |       |     | stdio equivalent |
|---------------------------|----|-----|-------|-----|------------------|
| binary                    | in | out | trunc | app |                  |
| -----                     |    |     |       |     |                  |
|                           |    | +   |       |     | w                |
|                           |    | +   |       | +   | a                |
|                           |    |     |       | +   | a                |
|                           |    | +   | +     |     | w                |
|                           | +  |     |       |     | r                |
|                           | +  | +   |       |     | r+               |
|                           | +  | +   | +     |     | w+               |
|                           | +  | +   |       | +   | a+               |
|                           | +  |     |       | +   | a+               |
| -----                     |    |     |       |     |                  |
| +                         |    | +   |       |     | wb               |
| +                         |    | +   |       | +   | ab               |
| +                         |    |     |       | +   | ab               |
| +                         |    | +   | +     |     | wb               |
| +                         | +  |     |       |     | rb               |
| +                         | +  | +   |       |     | r+b              |
| +                         | +  | +   | +     |     | w+b              |
| +                         | +  | +   |       | +   | a+b              |
| +                         | +  |     |       | +   | a+b              |
| -----                     |    |     |       |     |                  |

**overflow()**

```
basic_filebuf<_CharT, encoding_char_traits<_CharT> >::int_type std::basic_filebuf<_CharT,
encoding_char_traits<_CharT> >::overflow (
    int_type __c = _Traits::eof()) [protected], [virtual], [inherited]
```

Consumes data from the buffer; writes to the controlled sequence.

## Parameters

|                  |                                     |
|------------------|-------------------------------------|
| <code>__c</code> | An additional character to consume. |
|------------------|-------------------------------------|

**Returns**

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character *c* is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>`.

References `_M_ext_buf`, `_M_ext_next`, and `eback()`.

**pbackfail()**

```
basic_filebuf<_CharT, encoding_char_traits<_CharT>>::int_type std::basic_filebuf<_CharT,
encoding_char_traits<_CharT>>::pbackfail (
    int_type __c = _Traits::eof()) [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

**Parameters**

|                  |                                                      |
|------------------|------------------------------------------------------|
| <code>__c</code> | The character to be inserted back into the sequence. |
|------------------|------------------------------------------------------|

**Returns**

`eof()` on failure, *some other value* on success

**Postcondition**

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>`.

References `_M_ext_buf`, `_M_ext_next`, and `eback()`.

**pbase()**

```
char_type * std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::pbase () const [inline],
[protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `eptr()` returns the end pointer for the output sequence

**pbump()**

```
void std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::pbump (
    int __n) [inline], [protected], [inherited]
```

Moving the write position.

## Parameters

|                      |                             |
|----------------------|-----------------------------|
| <code>__delta</code> | The delta by which to move. |
| <code>__n</code>     |                             |

This just advances the write position without returning any data.

**pptr()**

```
char_type * std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::pptr () const [inline],
[protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

**pubimbue()**

```
locale std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::pubimbue (
    const locale & __loc) [inline], [inherited]
```

Entry point for imbue().

## Parameters

|                    |                 |
|--------------------|-----------------|
| <code>__loc</code> | The new locale. |
|--------------------|-----------------|

## Returns

The previous locale.

Calls the derived `imbue(__loc)`.

**pubseekoff()**

```
pos_type std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::pubseekoff (
    off_type __off,
    ios_base::seekdir __way,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

## Parameters

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__off</code>  | Offset.                                     |
| <code>__way</code>  | Value for <code>ios_base::seekdir</code> .  |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual `seekoff` function.

**pubseekpos()**

```
pos_type std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::pubseekpos (
    pos_type __sp,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

**Parameters**

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__sp</code>   | Position                                    |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual `seekpos` function.

**pubsetbuf()**

```
basic_streambuf * std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::pubsetbuf (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

**pubsync()**

```
int std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::pubsync () [inline], [inherited]
```

Calls virtual `sync` function.

**sbumpc()**

```
int_type std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::sbumpc () [inline],
[inherited]
```

Getting the next character.

**Returns**

The next character, or `eof`.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `ufLOW()`.

**seekoff()**

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::pos_type std::basic_filebuf< _CharT,
encoding_char_traits< _CharT > >::seekoff (
    off_type __off,
    ios_base::seekdir __way,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from `std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >`.

References `gptr()`.

**seekpos()**

```
basic_filebuf<_CharT, encoding_char_traits<_CharT> >::pos_type std::basic_filebuf<_CharT,
encoding_char_traits<_CharT> >::seekpos (
    pos_type __pos,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from `std::basic_streambuf<_CharT, encoding_char_traits<_CharT> >`.

References `_M_reading`, and `_M_set_buffer()`.

**setbuf()**

```
basic_filebuf<_CharT, encoding_char_traits<_CharT> >::__streambuf_type * std::basic_filebuf<
_CharT, encoding_char_traits<_CharT> >::setbuf (
    char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Manipulates the buffer.

**Parameters**

|                  |                            |
|------------------|----------------------------|
| <code>__s</code> | Pointer to a buffer area.  |
| <code>__n</code> | Size of <code>__s</code> . |

**Returns**

`this`

If no file has been opened, and both `__s` and `__n` are zero, then the stream becomes unbuffered. Otherwise, `__s` is used as a buffer; see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering> for more.

Reimplemented from `std::basic_streambuf<_CharT, encoding_char_traits<_CharT> >`.

References `_M_reading`, and `_M_set_buffer()`.

**setg()**

```
void std::basic_streambuf<_CharT, encoding_char_traits<_CharT> >::setg (
    char_type * __gbeg,
    char_type * __gnext,
    char_type * __gend) [inline], [protected], [inherited]
```

Setting the three read area pointers.

**Parameters**

|                      |            |
|----------------------|------------|
| <code>__gbeg</code>  | A pointer. |
| <code>__gnext</code> | A pointer. |
| <code>__gend</code>  | A pointer. |

**Postcondition**

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

**setp()**

```
void std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::setp (
    char_type * __pbeg,
    char_type * __pend) [inline], [protected], [inherited]
```

Setting the three write area pointers.

**Parameters**

|                     |            |
|---------------------|------------|
| <code>__pbeg</code> | A pointer. |
| <code>__pend</code> | A pointer. |

**Postcondition**

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == epptr()`

**sgetc()**

```
int_type std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::sgetc () [inline],
[inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

**sgetn()**

```
streamsize std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::sgetn (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for `xsgetn`.

**Parameters**

|                  |                |
|------------------|----------------|
| <code>__s</code> | A buffer area. |
| <code>__n</code> | A count.       |

Returns `xsgetn(__s,__n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

**showmanyc()**

```
streamsize std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::showmanyc () [protected],
[virtual], [inherited]
```

Investigating the data available.

### Returns

An estimate of the number of characters available in the input sequence, or -1.

*If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail.* [27.5.2.4.3]/1

### Note

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to `underflow` or `uflow`] will not return `eof()` but that they will return immediately.*

The standard adds that *the morphemes of `showmanyc` are **es-how-many-see**, not **show-manic**.*

Reimplemented from `std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>`.

### `snextc()`

```
int_type std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::snextc() [inline],
[inherited]
```

Getting the next character.

### Returns

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

### `sputbackc()`

```
int_type std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::sputbackc (
    char_type __c) [inline], [inherited]
```

Pushing characters back into the input stream.

### Parameters

|                  |                             |
|------------------|-----------------------------|
| <code>__c</code> | The character to push back. |
|------------------|-----------------------------|

### Returns

The previous character, if possible.

Similar to `sungetc()`, but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

### `sputc()`

```
int_type std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::sputc (
    char_type __c) [inline], [inherited]
```

Entry point for all single-character output functions.

### Parameters

|                  |                        |
|------------------|------------------------|
| <code>__c</code> | A character to output. |
|------------------|------------------------|

**Returns**

`__c`, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores `__c` in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(↵__c)`.

**sputn()**

```
streamsize std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::sputn (
    const char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|                        |                     |
|------------------------|---------------------|
| <code>↵<br/>__s</code> | A buffer read area. |
| <code>↵<br/>__n</code> | A count.            |

One of two public output functions.

Returns `xspn(__s, __n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

**sungetc()**

```
int_type std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::sungetc () [inline],
[inherited]
```

Moving backwards in the input stream.

**Returns**

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbackfail()`. The effect is to *unget* the last character *gotten*.

**sync()**

```
int std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::sync () [protected], [virtual],
[inherited]
```

Synchronizes the buffer arrays with the controlled sequences.

**Returns**

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

**Note**

Base class version does nothing, returns zero.

Reimplemented from `std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >`.

**uflow()**

```
virtual int_type std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::uflow () [inline],
[protected], [virtual], [inherited]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

**underflow()**

```
basic_filebuf<_CharT, encoding_char_traits<_CharT>>::int_type std::basic_filebuf<_CharT,
encoding_char_traits<_CharT>>::underflow () [protected], [virtual], [inherited]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>`.

**xsgetn()**

```
streamsize std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::xsgetn (
    char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character extraction.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A buffer area.                          |
| <code>__n</code> | Maximum number of characters to assign. |

**Returns**

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented from `std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>`.

**xspn()**

```
streamsize std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::xspn (
    const char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character insertion.

**Parameters**

|                  |                                        |
|------------------|----------------------------------------|
| <code>__s</code> | A buffer area.                         |
| <code>__n</code> | Maximum number of characters to write. |

**Returns**

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented from `std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >`.

**6.401.3 Member Data Documentation****`_M_buf`**

```
char_type* std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_buf [protected],
[inherited]
```

Pointer to the beginning of internal buffer.

**`_M_buf_locale`**

```
locale std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::_M_buf_locale [protected],
[inherited]
```

Current locale setting.

**`_M_buf_size`**

```
size_t std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_buf_size [protected],
[inherited]
```

Actual size of internal buffer. This number is equal to the size of the put area + 1 position, reserved for the overflow char of a full area.

**`_M_ext_buf`**

```
char* std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_ext_buf [protected],
[inherited]
```

Buffer for external characters. Used for input when `codecvt::always_noconv() == false`. When valid, this corresponds to `eback()`.

Referenced by `overflow()`, and `pbackfail()`.

**`_M_ext_buf_size`**

```
streamsize std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_ext_buf_size [protected],
[inherited]
```

Size of buffer held by `_M_ext_buf`.

### `_M_ext_next`

```
const char* std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_ext_next [protected],  
[inherited]
```

Pointers into the buffer held by `_M_ext_buf` that delimit a subsequence of bytes that have been read but not yet converted. When valid, `_M_ext_next` corresponds to `egptr()`.

Referenced by [overflow\(\)](#), and [pbackfail\(\)](#).

### `_M_in_beg`

```
char_type* std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::_M_in_beg [protected],  
[inherited]
```

Start of get area.

### `_M_in_cur`

```
char_type* std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::_M_in_cur [protected],  
[inherited]
```

Current read area.

### `_M_in_end`

```
char_type* std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::_M_in_end [protected],  
[inherited]
```

End of get area.

### `_M_mode`

```
ios_base::openmode std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_mode [protected],  
[inherited]
```

Place to stash in || out || in | out settings for current filebuf.

### `_M_out_beg`

```
char_type* std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::_M_out_beg [protected],  
[inherited]
```

Start of put area.

### `_M_out_cur`

```
char_type* std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::_M_out_cur [protected],  
[inherited]
```

Current put area.

### `_M_out_end`

```
char_type* std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::_M_out_end [protected],  
[inherited]
```

End of put area.

### `_M_pback`

```
char_type std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_pback [protected],  
[inherited]
```

Necessary bits for putback buffer management.

**Note**

pbacks of over one character are not currently supported.

**`_M_pback_cur_save`**

```
char_type* std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_pback_cur_save [protected],  
[inherited]
```

Necessary bits for putback buffer management.

**Note**

pbacks of over one character are not currently supported.

**`_M_pback_end_save`**

```
char_type* std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_pback_end_save [protected],  
[inherited]
```

Necessary bits for putback buffer management.

**Note**

pbacks of over one character are not currently supported.

**`_M_pback_init`**

```
bool std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_pback_init [protected],  
[inherited]
```

Necessary bits for putback buffer management.

**Note**

pbacks of over one character are not currently supported.

**`_M_reading`**

```
bool std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_reading [protected],  
[inherited]
```

`_M_reading == false` && `_M_writing == false` for **uncommitted** mode; `_M_reading == true` for **read** mode; `_M_writing == true` for **write** mode;

NB: `_M_reading == true` && `_M_writing == true` is unused.

Referenced by [seekpos\(\)](#), and [setbuf\(\)](#).

The documentation for this class was generated from the following file:

- [enc\\_filebuf.h](#)

**6.402 `__gnu_cxx::encoding_char_traits< _CharT >` Struct Template Reference**

### 6.416.1 Detailed Description

Abstract base class for types defining a category of error codes.

An error category defines a context that gives meaning to the integer stored in an [error\\_code](#) or [error\\_condition](#) object. For example, the standard `errno` constants such as `EINVAL` and `ENOMEM` are associated with the "generic" category and other OS-specific error numbers are associated with the "system" category, but a user-defined category might give different meanings to the same numerical values.

A user-defined category can override the `equivalent` member functions to define correspondence between errors in different categories. For example, a category for errors from disk I/O could consider some of its error numbers equivalent to `ENOSPC` and `ENOENT` in the generic category.

Since

C++11

### 6.416.2 Member Function Documentation

#### **default\_error\_condition()**

```
virtual error\_condition std::error_category::default_error_condition (
    int __i) const [virtual], [noexcept]
```

Return an [error\\_condition](#) corresponding to `i` in this category.

#### **equivalent()** [1/2]

```
virtual bool std::error_category::equivalent (
    const error\_code & __code,
    int __i) const [virtual], [noexcept]
```

Test whether `code` corresponds to `i` for this category.

#### **equivalent()** [2/2]

```
virtual bool std::error_category::equivalent (
    int __i,
    const error\_condition & __cond) const [virtual], [noexcept]
```

Test whether `cond` corresponds to `i` for this category.

**message()**

```
virtual string std::error_category::message (
    int ) const [pure virtual]
```

A description of the error condition corresponding to the number.

References [message\(\)](#).

Referenced by [message\(\)](#), [std::error\\_code::message\(\)](#), and [std::error\\_condition::message\(\)](#).

**name()**

```
virtual const char * std::error_category::name () const [pure virtual], [noexcept]
```

A string that identifies the error category.

**operator<=>()**

```
strong_ordering std::error_category::operator<=> (
    const error_category & __rhs) const [inline], [nodiscard], [noexcept]
```

Ordered comparison that defines a total order for error categories.

References [operator<=>\(\)](#).

Referenced by [operator<=>\(\)](#).

**operator==()**

```
bool std::error_category::operator== (
    const error_category & __other) const [inline], [noexcept]
```

An error\_category only compares equal to itself.

The documentation for this class was generated from the following file:

### 6.417.1 Detailed Description

Class `error_code`

This class is a value type storing an integer error number and a category that gives meaning to the error number. Typically this is done close to the point where the error happens, to capture the original error value.

An `error_code` object can be used to store the original error value emitted by some subsystem, with a category relevant to the subsystem. For example, errors from POSIX library functions can be represented by an `errno` value and the "generic" category, but errors from an HTTP library might be represented by an HTTP response status code (e.g. 404) and a custom category defined by the library.

Since

C++11

### 6.417.2 Constructor & Destructor Documentation

#### `error_code()`

```
template<typename _ErrorCodeEnum, typename = _Check<_ErrorCodeEnum>>
std::error_code::error_code (
    _ErrorCodeEnum __e) [inline], [noexcept]
```

Initialize with a user-defined type, by calling `make_error_code`.

References `make_error_code()`.

### 6.417.3 Member Function Documentation

#### `category()`

```
const error_category & std::error_code::category () const [inline], [noexcept]
```

The error category that this error belongs to.

Referenced by `message()`.

#### `default_error_condition()`

```
error_condition std::error_code::default_error_condition () const [noexcept]
```

An `error_condition` for this error's category and value.

#### `message()`

```
string std::error_code::message () const [inline]
```

The category's description of the value.

References `category()`, `std::error_category::message()`, `message()`, and `value()`.

Referenced by `message()`.

#### `operator bool()`

```
std::error_code::operator bool () const [inline], [explicit], [noexcept]
```

Test whether `value()` is non-zero.

**value()**

```
int std::error_code::value () const [inline], [noexcept]
```

The error value.

Referenced by [message\(\)](#).

The documentation for this class was generated from the following file:

- bool [operator==](#) (const [error\\_condition](#) &\_\_lhs, const [error\\_condition](#) &\_\_rhs) noexcept

**6.418.1 Detailed Description**

Class [error\\_condition](#)

This class represents error conditions that may be visible at an API boundary. Different [error\\_code](#) values that can occur within a library or module might map to the same [error\\_condition](#).

An [error\\_condition](#) represents something that the program can test for, and subsequently take appropriate action.

Since

C++11

**6.418.2 Constructor & Destructor Documentation****error\_condition()** [1/3]

```
std::error_condition::error_condition () [inline], [noexcept]
```

Initialize with a zero (no error) value and the generic category.

References [std::generic\\_category\(\)](#).

Referenced by [make\\_error\\_condition\(\)](#), [operator<=>\(\)](#), [operator==\(\)](#), and [operator==\(\)](#).

**error\_condition()** [2/3]

```
std::error_condition::error_condition (
    int __v,
    const error\_category & __cat) [inline], [noexcept]
```

Initialize with the specified value and category.

**error\_condition()** [3/3]

```
template<typename _ErrorConditionEnum, typename = _Check<_ErrorConditionEnum>>
std::error_condition::error_condition (
    _ErrorConditionEnum __e) [inline], [noexcept]
```

Initialize with a user-defined type, by calling `make_error_condition`.

References [make\\_error\\_condition\(\)](#).

**6.418.3 Member Function Documentation****assign()**

```
void std::error_condition::assign (
    int __v,
    const error\_category & __cat) [inline], [noexcept]
```

Set the value and category.

Referenced by [clear\(\)](#).

**category()**

```
const error\_category & std::error_condition::category () const [inline], [noexcept]
```

The error category that this error belongs to.

Referenced by [message\(\)](#).

**clear()**

```
void std::error_condition::clear () [inline], [noexcept]
```

Reset the value and category to the default-constructed state.

References [assign\(\)](#), and [std::generic\\_category\(\)](#).

**message()**

```
string std::error_condition::message () const [inline]
```

The category's description of the value.

References [category\(\)](#), [std::error\\_category::message\(\)](#), and [value\(\)](#).

**operator bool()**

```
std::error_condition::operator bool () const [inline], [explicit], [noexcept]
```

Test whether `value()` is non-zero.

**value()**

```
int std::error_condition::value () const [inline], [noexcept]
```

The error value.

Referenced by [message\(\)](#).

- `_GLIBCXX26_CONSTEXPR exception & operator= (exception &&)=default`
- `virtual const char * what () const noexcept`

#### 6.420.1 Detailed Description

Base class for all library exceptions.

This is the base class for all exceptions thrown by the standard library, and by certain language expressions. You are free to derive your own exception classes, or use a different hierarchy, or to throw non-class data (e.g., fundamental types).

## 6.420.2 Member Function Documentation

### what()

```
virtual const char * std::exception::what () const [virtual], [noexcept]
```

Returns a C-style character string describing the general cause of the current error.

Reimplemented in [std::bad\\_alloc](#), [std::bad\\_cast](#), [std::bad\\_exception](#), [std::bad\\_function\\_call](#), [std::bad\\_typeid](#), [std::bad\\_weak\\_ptr](#), [std::experimental::filesystem::v1::filesystem\\_error](#), [std::experimental::fundamentals\\_v1::bad\\_any\\_cast](#), [std::filesystem::filesystem\\_error](#), [std::future\\_error](#), [std::logic\\_error](#), and [std::runtime\\_error](#).

### 6.423.1 Detailed Description

```
template<typename _RealType = double>
class std::exponential_distribution< _RealType >
```

An exponential continuous distribution for random numbers.

The formula for the exponential probability density function is  $p(x|\lambda) = \lambda e^{-\lambda x}$ .

**Table 2299 Distribution Statistics**

|                    |                         |
|--------------------|-------------------------|
| Mean               | $\frac{1}{\lambda}$     |
| Median             | $\frac{\ln 2}{\lambda}$ |
| Mode               | <i>zero</i>             |
| Range              | $[0, \infty]$           |
| Standard Deviation | $\frac{1}{\lambda}$     |

Since

C++11

### 6.423.2 Member Typedef Documentation

#### result\_type

```
template<typename _RealType = double>
typedef _RealType std::exponential\_distribution< _RealType >::result_type
```

The type of the range of the distribution.

### 6.423.3 Constructor & Destructor Documentation

#### exponential\_distribution() [1/2]

```
template<typename _RealType = double>
std::exponential_distribution< _RealType >::exponential_distribution () [inline]
```

Constructs an exponential distribution with inverse scale parameter 1.0.

#### exponential\_distribution() [2/2]

```
template<typename _RealType = double>
std::exponential_distribution< _RealType >::exponential_distribution (
    _RealType __lambda) [inline], [explicit]
```

Constructs an exponential distribution with inverse scale parameter  $\lambda$ .

### 6.423.4 Member Function Documentation

#### lambda()

```
template<typename _RealType = double>
_RealType std::exponential_distribution< _RealType >::lambda () const [inline]
```

Returns the inverse scale parameter of the distribution.

#### max()

```
template<typename _RealType = double>
result_type std::exponential_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### min()

```
template<typename _RealType = double>
result_type std::exponential_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

#### operator>()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::exponential_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

#### param() [1/2]

```
template<typename _RealType = double>
param_type std::exponential_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Referenced by [std::operator>>\(\)](#).

#### param() [2/2]

```
template<typename _RealType = double>
void std::exponential_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

## Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _RealType = double>
void std::exponential_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.  
Has no effect on exponential distributions.

**6.423.5 Friends And Related Symbol Documentation****operator==**

```
template<typename _RealType = double>
bool operator== (
    const exponential_distribution< _RealType > & __d1,
    const exponential_distribution< _RealType > & __d2) [friend]
```

Return true if two exponential distributions have the same parameters.

### 6.425.1 Detailed Description

```
template<typename _RealType = double>
class std::extreme_value_distribution< _RealType >
```

A `extreme_value_distribution` random number distribution.  
The formula for the normal probability mass function is

$$p(x|a,b) = \frac{1}{b} \exp\left(\frac{a-x}{b} - \exp\left(\frac{a-x}{b}\right)\right)$$

Since

C++11

### 6.425.2 Member Typedef Documentation

#### `result_type`

```
template<typename _RealType = double>
typedef _RealType std::extreme_value_distribution< _RealType >::result_type
```

The type of the range of the distribution.

### 6.425.3 Member Function Documentation

#### `a()`

```
template<typename _RealType = double>
_RealType std::extreme_value_distribution< _RealType >::a () const [inline]
```

Return the *a* parameter of the distribution.

#### `b()`

```
template<typename _RealType = double>
_RealType std::extreme_value_distribution< _RealType >::b () const [inline]
```

Return the *b* parameter of the distribution.

#### `max()`

```
template<typename _RealType = double>
result_type std::extreme_value_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### `min()`

```
template<typename _RealType = double>
result_type std::extreme_value_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

**operator()()**

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::extreme_value_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

**param() [1/2]**

```
template<typename _RealType = double>
param_type std::extreme_value_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Referenced by [std::operator>>\(\)](#).

**param() [2/2]**

```
template<typename _RealType = double>
void std::extreme_value_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _RealType = double>
void std::extreme_value_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

**6.425.4 Friends And Related Symbol Documentation****operator==**

```
template<typename _RealType = double>
bool operator== (
    const extreme_value_distribution< _RealType > & __d1,
    const extreme_value_distribution< _RealType > & __d2) [friend]
```

Return true if two extreme value distributions have the same parameters.

The documentation for this class was generated from the following files:

- static `__c_locale _S_lc_ctype_c_locale (__c_locale __cloc, const char * __s)`

### Friends

- class `locale`
- class `locale::_Impl`

## 6.426.1 Detailed Description

Localization functionality base class.

The facet class is the base class for a localization feature, such as money, time, and number printing. It provides common support for facets and reference management.

Facets may not be copied or assigned.

## 6.426.2 Constructor & Destructor Documentation

### `facet()`

```
std::locale::facet::facet (
    size_t __refs = 0) throw ( )    [inline], [explicit], [protected]
```

Facet constructor.

This is the constructor provided by the standard. If refs is 0, the facet is destroyed when the last referencing locale is destroyed. Otherwise the facet will never be destroyed.

#### Parameters

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__refs</code> | The initial value for reference count. |
|---------------------|----------------------------------------|

Referenced by `std::__cxx11::collate<_CharT>::collate()`, `std::__cxx11::collate<_CharT>::collate()`, `std::messages<_CharT>::messages()`, `std::messages<_CharT>::messages()`, `std::money_get<_CharT, _InIter>::money_get()`, `std::money_put<_CharT, _OutIter>::money_put()`, `std::moneypunct<_CharT, _Intl>::moneypunct()`, `std::moneypunct<_CharT, _Intl>::moneypunct()`, `std::moneypunct<_CharT, _Intl>::moneypunct()`, `std::num_get<_CharT, istreambuf_iterator<_CharT, _Traits>>::num_get()`, `std::num_put<_CharT, ostreambuf_iterator<_CharT, _Traits>>::num_put()`, `std::num_punct<_CharT>::num_punct()`, `std::num_punct<_CharT>::num_punct()`, `std::num_punct<_CharT>::num_punct()`, `std::time_get<_CharT, _InIter>::time_get()`, `std::time_put<_CharT, _OutIter>::time_put()`, and `~facet()`.

### `~facet()`

```
virtual std::locale::facet::~~facet ()    [protected], [virtual]
```

Facet destructor.

References `facet()`.

**6.431.1 Detailed Description**

**template<typename \_RealType = double>**  
**class std::fisher\_f\_distribution<\_RealType>**

A fisher\_f\_distribution random number distribution.

The formula for the normal probability mass function is

$$p(x|m, n) = \frac{\Gamma((m+n)/2)}{\Gamma(m/2)\Gamma(n/2)} \left(\frac{m}{n}\right)^{m/2} x^{(m/2)-1} \left(1 + \frac{mx}{n}\right)^{-(m+n)/2}$$

Since

C++11

### 6.431.2 Member Typedef Documentation

#### result\_type

```
template<typename _RealType = double>
typedef _RealType std::fisher_f_distribution< _RealType >::result_type
```

The type of the range of the distribution.

### 6.431.3 Member Function Documentation

#### max()

```
template<typename _RealType = double>
result_type std::fisher_f_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### min()

```
template<typename _RealType = double>
result_type std::fisher_f_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

#### operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::fisher_f_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

#### param() [1/2]

```
template<typename _RealType = double>
param_type std::fisher_f_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

#### param() [2/2]

```
template<typename _RealType = double>
void std::fisher_f_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

#### Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

#### reset()

```
template<typename _RealType = double>
void std::fisher_f_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

#### 6.431.4 Friends And Related Symbol Documentation

##### operator<<

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream<_CharT, _Traits> & operator<< (
    std::basic_ostream<_CharT, _Traits> & __os,
    const std::fisher_f_distribution<_RealType1> & __x) [friend]
```

Inserts a fisher\_f\_distribution random number distribution \_\_x into the output stream \_\_os.

##### Parameters

|                   |                                                     |
|-------------------|-----------------------------------------------------|
| <code>__os</code> | An output stream.                                   |
| <code>__x</code>  | A fisher_f_distribution random number distribution. |

##### Returns

The output stream with the state of \_\_x inserted or in an error state.

##### operator==

```
template<typename _RealType = double>
bool operator== (
    const fisher_f_distribution<_RealType> & __d1,
    const fisher_f_distribution<_RealType> & __d2) [friend]
```

Return true if two Fisher f distributions have the same parameters and the sequences that would be generated are equal.

##### operator>>

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream<_CharT, _Traits> & operator>> (
    std::basic_istream<_CharT, _Traits> & __is,
    std::fisher_f_distribution<_RealType1> & __x) [friend]
```

Extracts a fisher\_f\_distribution random number distribution \_\_x from the input stream \_\_is.

##### Parameters

|                   |                                                         |
|-------------------|---------------------------------------------------------|
| <code>__is</code> | An input stream.                                        |
| <code>__x</code>  | A fisher_f_distribution random number generator engine. |

##### Returns

The input stream with \_\_x extracted or in an error state.

The documentation for this class was generated from the following files:

### 6.435.1 Detailed Description

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
class std::forward_list< _Tp, _Alloc >
```

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

Since

C++11

#### Template Parameters

|                     |                                                                 |
|---------------------|-----------------------------------------------------------------|
| <code>_Tp</code>    | Type of element.                                                |
| <code>_Alloc</code> | Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> . |

Meets the requirements of a [container](#), a [sequence](#), including the [optional sequence requirements](#) with the exception of `at` and `operator[]`.

This is a *singly linked* list. Traversal up the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike `std::vector` and `std::deque`, random-access iterators are not provided, so subscripting (`[]`) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.

Also unlike the other standard containers, `std::forward_list` provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

### 6.435.2 Constructor & Destructor Documentation

#### forward\_list() [1/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list () [default]
```

Creates a forward\_list with no elements.

Referenced by [insert\\_after\(\)](#), [insert\\_after\(\)](#), [merge\(\)](#), [operator=\(\)](#), [remove\(\)](#), [resize\(\)](#), [resize\(\)](#), [sort\(\)](#), and [splice\\_after\(\)](#).

#### forward\_list() [2/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    const _Alloc & __al) [inline], [explicit], [noexcept]
```

Creates a forward\_list with no elements.

##### Parameters

|                                   |                      |
|-----------------------------------|----------------------|
| <a href="#"><code>__al</code></a> | An allocator object. |
|-----------------------------------|----------------------|

#### forward\_list() [3/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    const forward_list< _Tp, _Alloc > & __list,
    const __type_identity_t< _Alloc > & __al) [inline]
```

Copy constructor with allocator argument.

##### Parameters

|                                     |                      |
|-------------------------------------|----------------------|
| <a href="#"><code>__list</code></a> | Input list to copy.  |
| <a href="#"><code>__al</code></a>   | An allocator object. |

#### forward\_list() [4/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    forward_list< _Tp, _Alloc > && __list,
    const __type_identity_t< _Alloc > & __al) [inline], [noexcept]
```

Move constructor with allocator argument.

##### Parameters

|                                     |                      |
|-------------------------------------|----------------------|
| <a href="#"><code>__list</code></a> | Input list to move.  |
| <a href="#"><code>__al</code></a>   | An allocator object. |

#### forward\_list() [5/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
```

```

size_type __n,
const _Alloc & __al = _Alloc()) [inline], [explicit]

```

Creates a `forward_list` with default constructed elements.

#### Parameters

|                   |                                             |
|-------------------|---------------------------------------------|
| <code>__n</code>  | The number of elements to initially create. |
| <code>__al</code> | An allocator object.                        |

This constructor creates the `forward_list` with `__n` default constructed elements.

#### `forward_list()` [6/10]

```

template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    size_type __n,
    const _Tp & __value,
    const _Alloc & __al = _Alloc()) [inline]

```

Creates a `forward_list` with copies of an exemplar element.

#### Parameters

|                      |                                             |
|----------------------|---------------------------------------------|
| <code>__n</code>     | The number of elements to initially create. |
| <code>__value</code> | An element to copy.                         |
| <code>__al</code>    | An allocator object.                        |

This constructor fills the `forward_list` with `__n` copies of `__value`.

#### `forward_list()` [7/10]

```

template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
std::forward_list< _Tp, _Alloc >::forward_list (
    _InputIterator __first,
    _InputIterator __last,
    const _Alloc & __al = _Alloc()) [inline]

```

Builds a `forward_list` from a range.

#### Parameters

|                      |                      |
|----------------------|----------------------|
| <code>__first</code> | An input iterator.   |
| <code>__last</code>  | An input iterator.   |
| <code>__al</code>    | An allocator object. |

Create a `forward_list` consisting of copies of the elements from `[__first, __last)`. This is linear in `N` (where `N` is `distance(__first, __last)`).

#### `forward_list()` [8/10]

```

template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    const forward_list< _Tp, _Alloc > & __list) [inline]

```

The `forward_list` copy constructor.

**Parameters**

|                     |                                                          |
|---------------------|----------------------------------------------------------|
| <code>__list</code> | A forward_list of identical element and allocator types. |
|---------------------|----------------------------------------------------------|

**forward\_list()** [9/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    forward_list< _Tp, _Alloc > && ) [default]
```

The forward\_list move constructor.

**Parameters**

|                     |                                                          |
|---------------------|----------------------------------------------------------|
| <code>__list</code> | A forward_list of identical element and allocator types. |
|---------------------|----------------------------------------------------------|

The newly-created forward\_list contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified forward\_list.

**forward\_list()** [10/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    std::initializer_list< _Tp > __il,
    const _Alloc & __al = _Alloc()) [inline]
```

Builds a forward\_list from an initializer\_list.

**Parameters**

|                   |                                    |
|-------------------|------------------------------------|
| <code>__il</code> | An initializer_list of value_type. |
| <code>__al</code> | An allocator object.               |

Create a forward\_list consisting of copies of the elements in the initializer\_list `__il`. This is linear in `__il.size()`.

**~forward\_list()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::~forward_list () [inline], [noexcept]
```

The forward\_list dtor.

**6.435.3 Member Function Documentation****assign()** [1/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
void std::forward_list< _Tp, _Alloc >::assign (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Assigns a range to a forward\_list.

## Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

This function fills a `forward_list` with copies of the elements in the range `[ __first, __last)`.

Note that the assignment completely changes the `forward_list` and that the number of elements of the resulting `forward_list` is the same as the number of elements assigned.

Referenced by `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::assign()`, `operator=()`, `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::operator=()` and `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::operator=()`.

**assign()** [2/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::assign (
    size_type __n,
    const _Tp & __val) [inline]
```

Assigns a given value to a `forward_list`.

## Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Number of elements to be assigned. |
| <code>__val</code> | Value to be assigned.              |

This function fills a `forward_list` with `__n` copies of the given value. Note that the assignment completely changes the `forward_list`, and that the resulting `forward_list` has `__n` elements.

**assign()** [3/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::assign (
    std::initializer_list< _Tp > __il) [inline]
```

Assigns an `initializer_list` to a `forward_list`.

## Parameters

|                   |                                                               |
|-------------------|---------------------------------------------------------------|
| <code>__il</code> | An <code>initializer_list</code> of <code>value_type</code> . |
|-------------------|---------------------------------------------------------------|

Replace the contents of the `forward_list` with copies of the elements in the `initializer_list` `__il`. This is linear in `__il.size()`.

**before\_begin()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list< _Tp, _Alloc >::before_begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points before the first element in the `forward_list`. Iteration is done in ordinary element order.

**before\_begin()** [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::before_begin () [inline], [noexcept]
```

Returns a read/write iterator that points before the first element in the `forward_list`. Iteration is done in ordinary element order.

Referenced by `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::assign()`, `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::insert_after()`, `insert_after()`, `resize()`, and `resize()`.

### **begin()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list<_Tp, _Alloc>::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

### **begin()** [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list<_Tp, _Alloc>::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

Referenced by `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::assign()`, and `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::push_back()`.

### **cbegin\_begin()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list<_Tp, _Alloc>::cbegin_begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points before the first element in the `forward_list`. Iteration is done in ordinary element order.

Referenced by `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::assign()`, `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::emplace_front()`, `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::push_back()`, and `remove()`.

### **cbegin()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list<_Tp, _Alloc>::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

Referenced by `std::operator==()`.

### **cend()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list<_Tp, _Alloc>::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `forward_list`. Iteration is done in ordinary element order.

Referenced by `std::operator==()`.

### **clear()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list<_Tp, _Alloc>::clear () [inline], [noexcept]
```

Erases all the elements.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Referenced by `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::assign()`, `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::operator=()`, and `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::operator=()`.

**emplace\_after()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename... _Args>
iterator std::forward_list<_Tp, _Alloc >::emplace_after (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Constructs object in forward\_list after the specified iterator.

**Parameters**

|                     |                                         |
|---------------------|-----------------------------------------|
| <code>__pos</code>  | A const_iterator into the forward_list. |
| <code>__args</code> | Arguments.                              |

**Returns**

An iterator that points to the inserted data.

This function will insert an object of type T constructed with `T(std::forward<Args>(args) ...)` after the specified location. Due to the nature of a forward\_list this operation can be done in constant time, and does not invalidate iterators and references.

**emplace\_front()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename... _Args>
reference std::forward_list<_Tp, _Alloc >::emplace_front (
    _Args &&... __args) [inline]
```

Constructs object in forward\_list at the front of the list.

**Parameters**

|                     |            |
|---------------------|------------|
| <code>__args</code> | Arguments. |
|---------------------|------------|

This function will insert an object of type Tp constructed with `Tp(std::forward<Args>(args) ...)` at the front of the list Due to the nature of a forward\_list this operation can be done in constant time, and does not invalidate iterators and references.

**empty()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
bool std::forward_list<_Tp, _Alloc >::empty () const [inline], [noexcept]
```

Returns true if the forward\_list is empty. (Thus begin() would equal end().)  
Referenced by [insert\\_after\(\)](#), and [sort\(\)](#).

**end()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list<_Tp, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only iterator that points one past the last element in the forward\_list. Iteration is done in ordinary element order.

**end()** [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the `forward_list`. Iteration is done in ordinary element order.

Referenced by `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::assign()`, `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::insert_after()`, `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::insert_after()`, `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::resize()`, and `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::resize()`.

**erase\_after()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::erase_after (
    const_iterator __pos) [inline]
```

Removes the element pointed to by the iterator following `pos`.

**Parameters**

|                    |                                                |
|--------------------|------------------------------------------------|
| <code>__pos</code> | Iterator pointing before element to be erased. |
|--------------------|------------------------------------------------|

**Returns**

An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

This function will erase the element at the given position and thus shorten the `forward_list` by one.

Due to the nature of a `forward_list` this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Referenced by `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::assign()`, `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::insert_after()`, `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::insert_after()`, `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::resize()`, and `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::resize()`.

**erase\_after()** [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::erase_after (
    const_iterator __pos,
    const_iterator __last) [inline]
```

Remove a range of elements.

**Parameters**

|                     |                                                              |
|---------------------|--------------------------------------------------------------|
| <code>__pos</code>  | Iterator pointing before the first element to be erased.     |
| <code>__last</code> | Iterator pointing to one past the last element to be erased. |

**Returns**

`__last`

This function will erase the elements in the range `(__pos, __last)` and shorten the `forward_list` accordingly.

This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed.

The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**front()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
reference std::forward\_list<\_Tp, \_Alloc>::front\(\) [inline]
```

Returns a read/write reference to the data at the first element of the `forward_list`.  
Referenced by [std::forward\\_list<\\_Tp, polymorphic\\_allocator<\\_Tp>>::emplace\\_front\(\)](#).

**front()** [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_reference std::forward\_list<\_Tp, \_Alloc>::front\(\) const [inline]
```

Returns a read-only (constant) reference to the data at the first element of the `forward_list`.

**get\_allocator()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
allocator_type std::forward\_list<\_Tp, \_Alloc>::get\_allocator\(\) const [inline], [noexcept]
```

Get a copy of the memory allocation object.  
Referenced by [insert\\_after\(\)](#), [insert\\_after\(\)](#), and [remove\(\)](#).

**insert\_after()** [1/4]

```
template<typename _Tp, typename _Alloc>
template<typename _InputIterator, typename>
forward\_list<\_Tp, \_Alloc>::iterator forward\_list::insert\_after (
    const_iterator __pos,
    _InputIterator __first,
    _InputIterator __last)
```

Inserts a range into the `forward_list`.

**Parameters**

|                      |                                                  |
|----------------------|--------------------------------------------------|
| <code>__pos</code>   | An iterator into the <code>forward_list</code> . |
| <code>__first</code> | An input iterator.                               |
| <code>__last</code>  | An input iterator.                               |

**Returns**

An iterator pointing to the last inserted element or `__pos` if `__first == __last`.

This function will insert copies of the data in the range `[ __first, __last)` into the `forward_list` after the location specified by `__pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

References [forward\\_list\(\)](#), [before\\_begin\(\)](#), [empty\(\)](#), [end\(\)](#), and [get\\_allocator\(\)](#).

**insert\_after()** [2/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward\_list<\_Tp, \_Alloc>::insert\_after (
    const_iterator __pos,
    const _Tp & __val) [inline]
```

Inserts given value into `forward_list` after specified iterator.

**Parameters**

|                    |                                                  |
|--------------------|--------------------------------------------------|
| <code>__pos</code> | An iterator into the <code>forward_list</code> . |
| <code>__val</code> | Data to be inserted.                             |

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given value after the specified location. Due to the nature of a `forward_list` this operation can be done in constant time, and does not invalidate iterators and references.

Referenced by [std::forward\\_list<\\_Tp, polymorphic\\_allocator<\\_Tp>>::assign\(\)](#), [std::forward\\_list<\\_Tp, polymorphic\\_allocator<\\_Tp>>::insert\\_after\(\)](#), and [resize\(\)](#).

**insert\_after()** [3/4]

```
template<typename _Tp, typename _Alloc>
forward_list<_Tp, _Alloc>::iterator forward_list::insert_after (
    const_iterator __pos,
    size_type __n,
    const _Tp & __val)
```

Inserts a number of copies of given data into the `forward_list`.

**Parameters**

|                    |                                                  |
|--------------------|--------------------------------------------------|
| <code>__pos</code> | An iterator into the <code>forward_list</code> . |
| <code>__n</code>   | Number of elements to be inserted.               |
| <code>__val</code> | Data to be inserted.                             |

**Returns**

An iterator pointing to the last inserted copy of `val` or `pos` if `n == 0`.

This function will insert a specified number of copies of the given data after the location specified by `pos`. This operation is linear in the number of elements inserted and does not invalidate iterators and references. References [forward\\_list\(\)](#), [before\\_begin\(\)](#), [end\(\)](#), and [get\\_allocator\(\)](#).

**insert\_after()** [4/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list<_Tp, _Alloc>::insert_after (
    const_iterator __pos,
    std::initializer_list<_Tp> __il) [inline]
```

Inserts the contents of an `initializer_list` into `forward_list` after the specified iterator.

**Parameters**

|                    |                                                               |
|--------------------|---------------------------------------------------------------|
| <code>__pos</code> | An iterator into the <code>forward_list</code> .              |
| <code>__il</code>  | An <code>initializer_list</code> of <code>value_type</code> . |

**Returns**

An iterator pointing to the last inserted element or `__pos` if `__il` is empty.

This function will insert copies of the data in the `initializer_list` `__il` into the `forward_list` before the location specified by `__pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

**max\_size()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
size_type std::forward_list< _Tp, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the largest possible number of elements of forward\_list.

**merge()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::merge (
    forward_list< _Tp, _Alloc > && __list) [inline]
```

Merge sorted lists.

**Parameters**

|                     |                       |
|---------------------|-----------------------|
| <code>__list</code> | Sorted list to merge. |
|---------------------|-----------------------|

Assumes that both `__list` and this list are sorted according to operator<(). Merges elements of `__list` into this list in sorted order, leaving `__list` empty when complete. Elements in this list precede elements in `__list` that are equal.

Referenced by `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::merge()`.

**merge()** [2/2]

```
template<typename _Tp, typename _Alloc>
template<typename _Comp>
void forward_list::merge (
    forward_list< _Tp, _Alloc > && __list,
    _Comp __comp)
```

Merge sorted lists according to comparison function.

**Parameters**

|                     |                                          |
|---------------------|------------------------------------------|
| <code>__list</code> | Sorted list to merge.                    |
| <code>__comp</code> | Comparison function defining sort order. |

Assumes that both `__list` and this list are sorted according to comp. Merges elements of `__list` into this list in sorted order, leaving `__list` empty when complete. Elements in this list precede elements in `__list` that are equivalent according to comp().

References `forward_list()`, `std::__addressof()`, and `std::move()`.

**operator=()** [1/3]

```
template<typename _Tp, typename _Alloc>
forward_list< _Tp, _Alloc > & forward_list::operator= (
    const forward_list< _Tp, _Alloc > & __list)
```

The forward\_list assignment operator.

**Parameters**

|                     |                                                          |
|---------------------|----------------------------------------------------------|
| <code>__list</code> | A forward_list of identical element and allocator types. |
|---------------------|----------------------------------------------------------|

All the elements of `__list` are copied.

Whether the allocator is copied depends on the allocator traits.

References `forward_list()`, `std::__addressof()`, `assign()`, and `clear()`.

**operator=()** [2/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
forward_list & std::forward_list< _Tp, _Alloc >::operator= (
    forward_list< _Tp, _Alloc > && __list) [inline], [noexcept]
```

The forward\_list move assignment operator.

**Parameters**

|                     |                                                          |
|---------------------|----------------------------------------------------------|
| <code>__list</code> | A forward_list of identical element and allocator types. |
|---------------------|----------------------------------------------------------|

The contents of `__list` are moved into this forward\_list (without copying, if the allocators permit it).

Afterwards `__list` is a valid, but unspecified forward\_list

Whether the allocator is moved depends on the allocator traits.

**operator=()** [3/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
forward_list & std::forward_list< _Tp, _Alloc >::operator= (
    std::initializer_list< _Tp > __il) [inline]
```

The forward\_list initializer list assignment operator.

**Parameters**

|                   |                                    |
|-------------------|------------------------------------|
| <code>__il</code> | An initializer_list of value_type. |
|-------------------|------------------------------------|

Replace the contents of the forward\_list with copies of the elements in the initializer\_list `__il`. This is linear in `__il.size()`.

**pop\_front()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::pop_front () [inline]
```

Removes first element.

This is a typical stack operation. It shrinks the forward\_list by one. Due to the nature of a forward\_list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

**push\_front()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::push_front (
    const _Tp & __val) [inline]
```

Add data to the front of the forward\_list.

**Parameters**

|                    |                   |
|--------------------|-------------------|
| <code>__val</code> | Data to be added. |
|--------------------|-------------------|

This is a typical stack operation. The function creates an element at the front of the forward\_list and assigns the given data to it. Due to the nature of a forward\_list this operation can be done in constant time, and does not invalidate iterators and references.

**remove()**

```
template<typename _Tp, typename _Alloc>
auto forward_list::remove (
    const _Tp & __val)
```

Remove all elements equal to value.

**Parameters**

|                    |                      |
|--------------------|----------------------|
| <code>__val</code> | The value to remove. |
|--------------------|----------------------|

Removes every element in the list equal to `__val`. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [forward\\_list\(\)](#), [cbefore\\_begin\(\)](#), [get\\_allocator\(\)](#), and [splice\\_after\(\)](#).

**remove\_if()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename _Pred>
__remove_return_type std::forward_list<_Tp, _Alloc >::remove_if (
    _Pred __pred)
```

Remove all elements satisfying a predicate.

**Parameters**

|                     |                                     |
|---------------------|-------------------------------------|
| <code>__pred</code> | Unary predicate function or object. |
|---------------------|-------------------------------------|

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**resize()** [1/2]

```
template<typename _Tp, typename _Alloc>
void forward_list::resize (
    size_type __sz)
```

Resizes the `forward_list` to the specified number of elements.

**Parameters**

|                   |                                                                  |
|-------------------|------------------------------------------------------------------|
| <code>__sz</code> | Number of elements the <code>forward_list</code> should contain. |
|-------------------|------------------------------------------------------------------|

This function will resize the `forward_list` to the specified number of elements. If the number is smaller than the `forward_list`'s current number of elements the `forward_list` is truncated, otherwise the `forward_list` is extended and the new elements are default constructed.

References [forward\\_list\(\)](#), [before\\_begin\(\)](#), [end\(\)](#), and [erase\\_after\(\)](#).

**resize()** [2/2]

```
template<typename _Tp, typename _Alloc>
void forward_list::resize (
    size_type __sz,
    const value_type & __val)
```

Resizes the `forward_list` to the specified number of elements.

## Parameters

|                    |                                                                  |
|--------------------|------------------------------------------------------------------|
| <code>__sz</code>  | Number of elements the <code>forward_list</code> should contain. |
| <code>__val</code> | Data with which new elements should be populated.                |

This function will resize the `forward_list` to the specified number of elements. If the number is smaller than the `forward_list`'s current number of elements the `forward_list` is truncated, otherwise the `forward_list` is extended and new elements are populated with given data.

References [forward\\_list\(\)](#), [before\\_begin\(\)](#), [end\(\)](#), [erase\\_after\(\)](#), and [insert\\_after\(\)](#).

**reverse()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::reverse () [inline], [noexcept]
```

Reverse the elements in list.

Reverse the order of elements in the list in linear time.

**sort()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::sort () [inline]
```

Sort the elements of the list.

Sorts the elements of this list in  $N\log N$  time. Equivalent elements remain in list order.

Referenced by [std::forward\\_list< \\_Tp, polymorphic\\_allocator< \\_Tp > >::sort\(\)](#).

**sort()** [2/2]

```
template<typename _Tp, class _Alloc>
template<typename _Comp>
void forward_list::sort (
    _Comp __comp)
```

Sort the `forward_list` using a comparison function.

Sorts the elements of this list in  $N\log N$  time. Equivalent elements remain in list order.

References [forward\\_list\(\)](#), and [empty\(\)](#).

**splice\_after()** [1/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::splice_after (
    const_iterator __pos,
    forward_list< _Tp, _Alloc > && ,
    const_iterator __before,
    const_iterator __last) [inline], [noexcept]
```

Insert range from another `forward_list`.

## Parameters

|                       |                                                                         |
|-----------------------|-------------------------------------------------------------------------|
| <code>__pos</code>    | Iterator referencing the element to insert after.                       |
| <code>__list</code>   | Source list.                                                            |
| <code>__before</code> | Iterator referencing before the start of range in <code>__list</code> . |
| <code>__last</code>   | Iterator referencing the end of range in <code>__list</code> .          |

Removes elements in the range `(__before, __last)` and inserts them after `__pos` in constant time.

Undefined if `__pos` is in `(__before, __last)`.

**splice\_after()** [2/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list<_Tp, _Alloc >::splice_after (
    const_iterator __pos,
    forward_list<_Tp, _Alloc > && __list) [inline], [noexcept]
```

Insert contents of another forward\_list.

**Parameters**

|                     |                                                   |
|---------------------|---------------------------------------------------|
| <code>__pos</code>  | Iterator referencing the element to insert after. |
| <code>__list</code> | Source list.                                      |

The elements of `list` are inserted in constant time after the element referenced by `pos`. `list` becomes an empty list.

Requires `this != &x`.

Referenced by [remove\(\)](#), and [std::forward\\_list<\\_Tp, polymorphic\\_allocator<\\_Tp> >::splice\\_after\(\)](#).

**splice\_after()** [3/4]

```
template<typename _Tp, typename _Alloc>
void forward_list::splice_after (
    const_iterator __pos,
    forward_list<_Tp, _Alloc > && __list,
    const_iterator __i) [noexcept]
```

Insert element from another forward\_list.

**Parameters**

|                     |                                                              |
|---------------------|--------------------------------------------------------------|
| <code>__pos</code>  | Iterator referencing the element to insert after.            |
| <code>__list</code> | Source list.                                                 |
| <code>__i</code>    | Iterator referencing the element before the element to move. |

Removes the element in `list` referenced by `__i` and inserts it into the current list after `__pos`.

References [forward\\_list\(\)](#).

**splice\_after()** [4/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list<_Tp, _Alloc >::splice_after (
    const_iterator __pos,
    forward_list<_Tp, _Alloc > & ,
    const_iterator __before,
    const_iterator __last) [inline], [noexcept]
```

Insert range from another forward\_list.

**Parameters**

|                       |                                                                         |
|-----------------------|-------------------------------------------------------------------------|
| <code>__pos</code>    | Iterator referencing the element to insert after.                       |
| <code>__list</code>   | Source list.                                                            |
| <code>__before</code> | Iterator referencing before the start of range in <code>__list</code> . |
| <code>__last</code>   | Iterator referencing the end of range in <code>__list</code> .          |

Removes elements in the range `(__before, __last)` and inserts them after `__pos` in constant time.

Undefined if `__pos` is in `(__before, __last)`.

**swap()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::swap (
    forward_list< _Tp, _Alloc > & __list) [inline], [noexcept]
```

Swaps data with another forward\_list.

**Parameters**

|                     |                                                         |
|---------------------|---------------------------------------------------------|
| <code>__list</code> | A forward_list of the same element and allocator types. |
|---------------------|---------------------------------------------------------|

This exchanges the elements between two lists in constant time. Note that the global `std::swap()` function is overloaded such that `std::swap(l1, l2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

**unique()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
__remove_return_type std::forward_list< _Tp, _Alloc >::unique () [inline]
```

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Referenced by `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::unique()`.

**unique()** [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename _BinPred>
__remove_return_type std::forward_list< _Tp, _Alloc >::unique (
    _BinPred __binary_pred)
```

Remove consecutive elements satisfying a predicate.

**Parameters**

|                            |                                      |
|----------------------------|--------------------------------------|
| <code>__binary_pred</code> | Binary predicate function or object. |
|----------------------------|--------------------------------------|

For each consecutive set of elements `[first,last)` that satisfy `predicate(first,i)` where `i` is an iterator in `[first,last)`, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

The documentation for this class was generated from the following files:

**6.436 std::fpos< \_StateT > Class Template Reference**

```
#include <postypes.h>
```

**Public Member Functions**

- `fpos` (const `fpos` &)=default
- `fpos` (streamoff \_\_off)
- `operator streamoff` () const

- `fpos operator+ (streamoff __off) const`
- `fpos & operator+= (streamoff __off)`
- `streamoff operator- (const fpos & __other) const`
- `fpos operator- (streamoff __off) const`
- `fpos & operator-= (streamoff __off)`
- `fpos & operator= (const fpos &)=default`
- `_StateT state () const`
- `void state (_StateT __st)`

### 6.436.1 Detailed Description

```
template<typename _StateT>
class std::fpos<_StateT>
```

Class representing stream positions.

The standard places no requirements upon the template parameter StateT. In this implementation StateT must be DefaultConstructible, CopyConstructible and Assignable. The standard only requires that fpos should contain a member of type StateT. In this implementation it also contains an offset stored as a signed integer.

#### Parameters

|               |                                           |
|---------------|-------------------------------------------|
| <i>StateT</i> | Type passed to and returned from state(). |
|---------------|-------------------------------------------|

### 6.436.2 Constructor & Destructor Documentation

#### fpos()

```
template<typename _StateT>
std::fpos<_StateT>::fpos (
    streamoff __off) [inline]
```

Construct position from offset.

### 6.436.3 Member Function Documentation

#### operator streamoff()

```
template<typename _StateT>
std::fpos<_StateT>::operator streamoff () const [inline]
```

Convert to streamoff.

#### operator+()

```
template<typename _StateT>
fpos std::fpos<_StateT>::operator+ (
    streamoff __off) const [inline]
```

Add position and offset.

#### operator+=()

```
template<typename _StateT>
fpos & std::fpos<_StateT>::operator+= (
    streamoff __off) [inline]
```

Add offset to this position.

**operator-() [1/2]**

```
template<typename _StateT>
streamoff std::fpos< _StateT >::operator- (
    const fpos< _StateT > & __other) const [inline]
```

Subtract position to return offset.

**operator-() [2/2]**

```
template<typename _StateT>
fpos std::fpos< _StateT >::operator- (
    streamoff __off) const [inline]
```

Subtract offset from position.

**operator-=()**

```
template<typename _StateT>
fpos & std::fpos< _StateT >::operator-= (
    streamoff __off) [inline]
```

Subtract offset from this position.

**state() [1/2]**

```
template<typename _StateT>
_StateT std::fpos< _StateT >::state () const [inline]
```

Return the last set value of *st*.

**state() [2/2]**

```
template<typename _StateT>
void std::fpos< _StateT >::state (
    _StateT __st) [inline]
```

Remember the value of *st*.

The documentation for this class was generated from the following file:

- [postypes.h](#)

**6.437 \_\_gnu\_cxx::free\_list Class Reference**

```
#include <bitmap_allocator.h>
```

Inheritance diagram for `__gnu_cxx::free_list`:

## Public Types

- typedef `__mutex` `__mutex_type`
- typedef `vector_type::iterator` `iterator`
- typedef `std::size_t * value_type`
- typedef `__detail::__mini_vector` `< value_type > vector_type`

## Public Member Functions

- void `_M_clear` ()
- `std::size_t * _M_get` (`std::size_t __sz`)
- void `_M_insert` (`std::size_t * __addr`) throw ()

### 6.437.1 Detailed Description

The free list class for managing chunks of memory to be given to and returned by the `bitmap_allocator`.

### 6.437.2 Member Function Documentation

#### `_M_clear()`

```
void __gnu_cxx::free_list::_M_clear ()
```

This function just clears the internal Free List, and gives back all the memory to the OS.

#### `_M_get()`

```
std::size_t * __gnu_cxx::free_list::_M_get (
    std::size_t __sz)
```

This function gets a block of memory of the specified size from the free list.

#### Parameters

|                   |                                           |
|-------------------|-------------------------------------------|
| <code>__sz</code> | The size in bytes of the memory required. |
|-------------------|-------------------------------------------|

#### Returns

A pointer to the new memory block of size at least equal to that requested.

#### `_M_insert()`

```
void __gnu_cxx::free_list::_M_insert (
    std::size_t * __addr) throw ( ) [inline]
```

This function returns the block of memory to the internal free list.

#### Parameters

|                     |                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------|
| <code>__addr</code> | The pointer to the memory block that was given by a call to the <code>_M_get</code> function. |
|---------------------|-----------------------------------------------------------------------------------------------|

Referenced by `__gnu_cxx::bitmap_allocator< _Tp1 >::_M_deallocate_single_object()`.

- `typedef output_iterator_tag iterator_category`
- `typedef void pointer`
- `typedef void reference`
- `typedef void value_type`

## Public Member Functions

- constexpr [front\\_insert\\_iterator](#) ([\\_Container](#) &\_\_x)
- constexpr [front\\_insert\\_iterator](#) & [operator\\*](#) ()
- constexpr [front\\_insert\\_iterator](#) & [operator++](#) ()
- constexpr [front\\_insert\\_iterator](#) [operator++](#) (int)
- constexpr [front\\_insert\\_iterator](#) & [operator=](#) (const typename [\\_Container](#)::value\_type &\_\_value)
- constexpr [front\\_insert\\_iterator](#) & [operator=](#) (typename [\\_Container](#)::value\_type &&\_\_value)

## Protected Attributes

- [\\_Container](#) \* **container**

### 6.439.1 Detailed Description

```
template<typename _Container>
class std::front_insert_iterator<_Container>
```

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator prepends it to the container using `push_front`.

Tip: Using the `front_inserter` function to create these iterators can save typing.

### 6.439.2 Member Typedef Documentation

#### container\_type

```
template<typename _Container>
typedef _Container std::front_insert_iterator<_Container>::container_type
```

A nested typedef for the type of whatever container you used.

#### iterator\_category

```
typedef output_iterator_tag std::iterator< output_iterator_tag, void, void, void, void >::iterator_category [inherited]
```

One of the [tag types](#).

#### pointer

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::pointer [inherited]
```

This type represents a pointer-to-value\_type.

#### reference

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::reference [inherited]
```

This type represents a reference-to-value\_type.

#### value\_type

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type [inherited]
```

The type "pointed to" by the iterator.

### 6.439.3 Constructor & Destructor Documentation

#### front\_insert\_iterator()

```
template<typename _Container>
std::front_insert_iterator< _Container >::front_insert_iterator (
    _Container & __x) [inline], [explicit], [constexpr]
```

The only way to create this iterator is with a container.

References [std::\\_\\_addressof\(\)](#).

### 6.439.4 Member Function Documentation

#### operator\*()

```
template<typename _Container>
front_insert_iterator & std::front_insert_iterator< _Container >::operator* () [inline], [nodiscard],
[constexpr]
```

Simply returns *\*this*.

#### operator++() [1/2]

```
template<typename _Container>
front_insert_iterator & std::front_insert_iterator< _Container >::operator++ () [inline], [constexpr]
```

Simply returns *\*this*. (This iterator does not *move*.)

#### operator++() [2/2]

```
template<typename _Container>
front_insert_iterator std::front_insert_iterator< _Container >::operator++ (
    int ) [inline], [constexpr]
```

Simply returns *\*this*. (This iterator does not *move*.)

#### operator=()

```
template<typename _Container>
front_insert_iterator & std::front_insert_iterator< _Container >::operator= (
    const typename _Container::value_type & __value) [inline], [constexpr]
```

#### Parameters

|                      |                                                                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__value</code> | An instance of whatever type <code>container_type::const_reference</code> is; presumably a reference-to-const T for <code>container&lt;T&gt;</code> . |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Returns

This iterator, for chained operations.

This kind of iterator doesn't really have a *position* in the container (you can think of the position as being permanently at the front, if you like). Assigning a value to the iterator will always prepend the value to the front of the container.

The documentation for this class was generated from the following file:

### 6.440.1 Detailed Description

```
template<typename _Res, typename... _ArgTypes>
class std::function< _Res(_ArgTypes...)>
```

Polymorphic function wrapper.

Since

C++11

### 6.440.2 Constructor & Destructor Documentation

#### function() [1/5]

```
template<typename _Res, typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::function () [inline], [noexcept]
Default construct creates an empty function call wrapper.
```

#### Postcondition

```
!(bool)*this
```

References [function\(\)](#).

Referenced by [function\(\)](#), [function\(\)](#), [function\(\)](#), [function\(\)](#), [function\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [swap\(\)](#), and [target\(\)](#).

#### function() [2/5]

```
template<typename _Res, typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::function (
    nullptr_t ) [inline], [noexcept]
```

Creates an empty function call wrapper.

#### Postcondition

```
!(bool)*this
```

References [function\(\)](#).

#### function() [3/5]

```
template<typename _Res, typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::function (
    const function< _Res(_ArgTypes...)> & __x) [inline]
```

Function copy constructor.

#### Parameters

|                     |                                                  |
|---------------------|--------------------------------------------------|
| <a href="#">__x</a> | A function object with identical call signature. |
|---------------------|--------------------------------------------------|

#### Postcondition

```
bool(*this) == bool(__x)
```

The newly-created function contains a copy of the target of `__x` (if it has one).

References [function\(\)](#).

**function()** [4/5]

```
template<typename _Res, typename... _ArgTypes>
std::function<_Res(_ArgTypes...)>::function (
    function<_Res(_ArgTypes...)> && __x) [inline], [noexcept]
```

Function move constructor.

**Parameters**

|                                                                                                    |                                                         |
|----------------------------------------------------------------------------------------------------|---------------------------------------------------------|
|                   | A function object rvalue with identical call signature. |
|  <code>__x</code> |                                                         |

The newly-created function contains the target of `__x` (if it has one).

References [function\(\)](#).

**function()** [5/5]

```
template<typename _Res, typename... _ArgTypes>
template<typename _Functor, typename _Constraints = _Requires<_Callable<_Functor>>>
std::function<_Res(_ArgTypes...)>::function (
    _Functor && __f) [inline], [noexcept]
```

Builds a function that targets a copy of the incoming function object.

**Parameters**

|                                                                                                    |                                                                                                                                           |
|----------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
|                   | A function object that is callable with parameters of type <code>ArgTypes...</code> and returns a value convertible to <code>Res</code> . |
|                  |                                                                                                                                           |
|                 |                                                                                                                                           |
|                 |                                                                                                                                           |
|  <code>f</code> |                                                                                                                                           |

The newly-created function object will target a copy of `__f`. If `__f` is `reference_wrapper<F>`, then this function object will contain a reference to the function object `__f.get()`. If `__f` is a null function pointer, null pointer-to-member, or empty `std::function`, the newly-created object will be empty.

If `__f` is a non-null function pointer or an object of type `reference_wrapper<F>`, this function will not throw.

References [function\(\)](#), and [std::forward\(\)](#).

**6.440.3 Member Function Documentation****operator bool()**

```
template<typename _Res, typename... _ArgTypes>
std::function<_Res(_ArgTypes...)>::operator bool () const [inline], [explicit], [noexcept]
```

Determine if the function wrapper has a target.

**Returns**

`true` when this function object contains a target, or `false` when it is empty.

This function will not throw exceptions.

**operator()()**

```
template<typename _Res, typename... _ArgTypes>
_Res std::function<_Res(_ArgTypes...)>::operator() (
    _ArgTypes... __args) const [inline]
```

Invokes the function targeted by `*this`.

**Returns**

the result of the target.

**Exceptions**

|                                  |                                |
|----------------------------------|--------------------------------|
| <code>`bad_function_call`</code> | when <code>!(bool)*this</code> |
|----------------------------------|--------------------------------|

The function call operator invokes the target function object stored by `this`.

References [std::forward\(\)](#), and [operator\(\)](#).

Referenced by [operator\(\)](#).

**operator=()** [1/5]

```
template<typename _Res, typename... _ArgTypes>
template<typename _Functor>
_requires<_Callable<_Functor>, function &> std::function<_Res(_ArgTypes...)>::operator= (
    _Functor && __f) [inline], [noexcept]
```

Function assignment to a new target.

**Parameters**

|                |                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| ↩              | A function object that is callable with parameters of type <code>_ArgTypes...</code> and returns a value convertible to |
| ↩              | <code>_Res</code> .                                                                                                     |
| ↩              |                                                                                                                         |
| ↩              |                                                                                                                         |
| <code>f</code> |                                                                                                                         |

**Returns**

`*this`

**Since**

C++11

This function object wrapper will target a copy of `__f`. If `__f` is `reference_wrapper<F>`, then this function object will contain a reference to the function object `__f.get()`. If `__f` is a null function pointer or null pointer-to-member, this object will be empty.

If `__f` is a non-null function pointer or an object of type `reference_wrapper<F>`, this function will not throw.

References [function\(\)](#), [std::forward\(\)](#), and [operator=\(\)](#).

**operator=()** [2/5]

```
template<typename _Res, typename... _ArgTypes>
function & std::function<_Res(_ArgTypes...)>::operator= (
    const function<_Res(_ArgTypes...)> & __x) [inline]
```

Function assignment operator.

**Parameters**

|                |                                           |
|----------------|-------------------------------------------|
| ↩              | A function with identical call signature. |
| <code>x</code> |                                           |

**Postcondition**

```
(bool)*this == (bool)x
```

**Returns**

```
*this
```

The target of `__x` is copied to `*this`. If `__x` has no target, then `*this` will be empty.

If `__x` targets a function pointer or a reference to a function object, then this operation will not throw an exception.

References [function\(\)](#), and [operator=\(\)](#).

Referenced by [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), and [operator=\(\)](#).

**operator=()** [3/5]

```
template<typename _Res, typename... _ArgTypes>
function & std::function<_Res(_ArgTypes...)>::operator= (
    function<_Res(_ArgTypes...)> && __x) [inline], [noexcept]
```

Function move-assignment operator.

**Parameters**

|                  |                                                  |
|------------------|--------------------------------------------------|
| <code>__x</code> | A function rvalue with identical call signature. |
|------------------|--------------------------------------------------|

**Returns**

```
*this
```

The target of `__x` is moved to `*this`. If `__x` has no target, then `*this` will be empty.

If `__x` targets a function pointer or a reference to a function object, then this operation will not throw an exception.

References [function\(\)](#), [std::move\(\)](#), and [operator=\(\)](#).

**operator=()** [4/5]

```
template<typename _Res, typename... _ArgTypes>
function & std::function<_Res(_ArgTypes...)>::operator= (
    nullptr_t ) [inline], [noexcept]
```

Function assignment to empty.

**Postcondition**

```
!(bool)*this
```

**Returns**

```
*this
```

The target of `*this` is deallocated, leaving it empty.

References [function\(\)](#), and [operator=\(\)](#).

**operator=()** [5/5]

```
template<typename _Res, typename... _ArgTypes>
template<typename _Functor>
function & std::function<_Res(_ArgTypes...)>::operator= (
    reference_wrapper<_Functor> & __f) [inline], [noexcept]
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

References [function\(\)](#), and [operator=\(\)](#).

**swap()**

```
template<typename _Res, typename... _ArgTypes>
void std::function< _Res(_ArgTypes...)>::swap (
    function< _Res(_ArgTypes...)> & __x) [inline], [noexcept]
```

Swap the targets of two function objects.

**Parameters**

|                  |                                           |
|------------------|-------------------------------------------|
| <code>__x</code> | A function with identical call signature. |
|------------------|-------------------------------------------|

Swap the targets of `this` function object and `__f`. This function will not throw exceptions.

References [function\(\)](#), and [swap\(\)](#).

Referenced by [swap\(\)](#).

**target() [1/2]**

```
template<typename _Res, typename... _ArgTypes>
template<typename _Functor>
const _Functor * std::function< _Res(_ArgTypes...)>::target () const [inline], [noexcept]
```

Access the stored target function object.

**Returns**

Returns a pointer to the stored target function object, if `typeid(_Functor).equals(target_type())`; otherwise, a null pointer.

This function does not throw exceptions.

References [target\(\)](#), and [target\\_type\(\)](#).

**target() [2/2]**

```
template<typename _Res, typename... _ArgTypes>
template<typename _Functor>
_Functor * std::function< _Res(_ArgTypes...)>::target () [inline], [noexcept]
```

Access the stored target function object.

**Returns**

Returns a pointer to the stored target function object, if `typeid(_Functor).equals(target_type())`; otherwise, a null pointer.

This function does not throw exceptions.

References [function\(\)](#), and [target\(\)](#).

Referenced by [target\(\)](#), and [target\(\)](#).

**target\_type()**

```
template<typename _Res, typename... _ArgTypes>
const type\_info & std::function< _Res(_ArgTypes...)>::target_type () const [inline], [noexcept]
```

Determine the type of the target of this function object wrapper.

## Returns

the type identifier of the target function object, or `typeid(void)` if `!(bool)*this`.

This function will not throw exceptions.

References [target\\_type\(\)](#).

Referenced by [target\(\)](#), and [target\\_type\(\)](#).

## 6.441.1 Detailed Description

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
class std::function_ref<_Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>
```

Non-owning polymorphic function wrapper.

Since

C++26

The `std::function_ref` class template is a non-owning call wrapper, that refers to a bound object. Using `function_ref` outside of the lifetime of the bound object has undefined behavior.

It supports const-qualification and no-throw guarantees. The qualifications and exception-specification of the signature are respected when invoking the reference function.

### 6.441.2 Constructor & Destructor Documentation

#### function\_ref() [1/5]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Fn>
requires is_function_v<_Fn> && __is_invocable_using<_Fn*>
std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref (
    _Fn * __fn) [inline], [noexcept]
```

Target and bound object is function pointed by parameter.

#### function\_ref() [2/5]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Fn, typename _Vt = remove_reference_t<_Fn>>
requires (!is_same_v<remove_cv_t<_Vt>, function_ref>) && (!is_member_pointer_v<_Vt>) && (!is_
function_v<_Vt>) && __is_invocable_using<_Vt _GLIBCXX_MOF_CV&>
std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref (
    _Fn && __f) [inline], [constexpr], [noexcept]
```

Target and bound object is object referenced by parameter.

References [std::addressof\(\)](#).

#### function\_ref() [3/5]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<auto __fn>
requires __is_invocable_using<const decltype(__fn)&>
std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref (
    nontype_t< __fn > ) [inline], [constexpr], [noexcept]
```

Target object is \_\_fn. There is no bound object.

#### function\_ref() [4/5]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<auto __fn, typename _Up, typename _Td = remove_reference_t<_Up>>
requires (!is_rvalue_reference_v<_Up&&>) && __is_invocable_using<const decltype(__fn)&, _Td &
GLIBCXX_MOF_CV&>
std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref (
    nontype_t< __fn > ,
    _Up && __ref) [inline], [constexpr], [noexcept]
```

Target object is equivalent to `std::bind_front<_fn>(std::ref(__ref))`. Bound object is object referenced by second parameter.

References [std::addressof\(\)](#).

#### function\_ref() [5/5]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<auto __fn, typename _Td>
requires __is_invocable_using<const decltype(__fn)&, _Td _GLIBCXX_MOF_CV*>
std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref (
    nontype_t< __fn > ,
    _Td _GLIBCXX_MOF_CV * __ptr) [inline], [constexpr], [noexcept]
```

Target object is equivalent to `std::bind_front<_fn>(__ptr)`. Bound object is object pointed by second parameter (if any).

### 6.441.3 Member Function Documentation

#### operator>()

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
_Res std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator() (
    _ArgTypes... __args) const [inline], [noexcept]
```

Invoke the target object.

The bound object will be invoked using the supplied arguments, and as const or non-const, as dictated by the template arguments of the `function_ref` specialization.

References [std::forward\(\)](#).

### 6.445 `std::future_error` Class Reference

```
#include <future>
```

Inheritance diagram for `std::future_error`:

#### Public Member Functions

- `future_error` (`future_errc` `__errc`)
- `const error_code & code` () `const noexcept`
- `virtual const char * what` () `const noexcept`

#### Friends

- `void __throw_future_error` (int)

#### 6.445.1 Detailed Description

Exception type thrown by futures.

Since

C++11

#### 6.445.2 Member Function Documentation

##### `what()`

```
virtual const char * std::future_error::what () const [virtual], [noexcept]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from `std::logic_error`.

The documentation for this class was generated from the following file:

- `future`

### 6.446 `std::gamma_distribution<_RealType>` Class Template Reference

### 6.446.1 Detailed Description

**template<typename \_RealType = double>**  
**class std::gamma\_distribution<\_RealType>**

A gamma continuous distribution for random numbers.  
 The formula for the gamma probability density function is:

$$p(x|\alpha, \beta) = \frac{1}{\beta\Gamma(\alpha)} (x/\beta)^{\alpha-1} e^{-x/\beta}$$

Since

C++11

### 6.446.2 Member Typedef Documentation

#### result\_type

```
template<typename _RealType = double>
typedef _RealType std::gamma_distribution< _RealType >::result_type
```

The type of the range of the distribution.

### 6.446.3 Constructor & Destructor Documentation

#### gamma\_distribution() [1/2]

```
template<typename _RealType = double>
std::gamma_distribution< _RealType >::gamma_distribution () [inline]
```

Constructs a gamma distribution with parameters 1 and 1.

#### gamma\_distribution() [2/2]

```
template<typename _RealType = double>
std::gamma_distribution< _RealType >::gamma_distribution (
    _RealType __alpha_val,
    _RealType __beta_val = _RealType(1)) [inline], [explicit]
```

Constructs a gamma distribution with parameters  $\alpha$  and  $\beta$ .

### 6.446.4 Member Function Documentation

#### alpha()

```
template<typename _RealType = double>
_RealType std::gamma_distribution< _RealType >::alpha () const [inline]
```

Returns the  $\alpha$  of the distribution.

#### beta()

```
template<typename _RealType = double>
_RealType std::gamma_distribution< _RealType >::beta () const [inline]
```

Returns the  $\beta$  of the distribution.

#### max()

```
template<typename _RealType = double>
result_type std::gamma_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### min()

```
template<typename _RealType = double>
result_type std::gamma_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

**operator>() [1/2]**

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::gamma_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

**operator>() [2/2]**

```
template<typename _RealType>
template<typename _UniformRandomNumberGenerator>
gamma_distribution< _RealType >::result_type std::gamma_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng,
    const param_type & __param)
```

Marsaglia, G. and Tsang, W. W. "A Simple Method for Generating Gamma Variables" ACM Transactions on Mathematical Software, 26, 3, 363-372, 2000.

References [std::log\(\)](#), and [std::pow\(\)](#).

**param() [1/2]**

```
template<typename _RealType = double>
param_type std::gamma_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

**param() [2/2]**

```
template<typename _RealType = double>
void std::gamma_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _RealType = double>
void std::gamma_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

**6.446.5 Friends And Related Symbol Documentation****operator<<**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::gamma_distribution< _RealType1 > & __x) [friend]
```

Inserts a gamma\_distribution random number distribution \_\_x into the output stream \_\_os.

**Parameters**

|                   |                                                               |
|-------------------|---------------------------------------------------------------|
| <code>__os</code> | An output stream.                                             |
| <code>__x</code>  | A <code>gamma_distribution</code> random number distribution. |

**Returns**

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _RealType = double>
bool operator== (
    const gamma\_distribution< _RealType > & __d1,
    const gamma\_distribution< _RealType > & __d2) [friend]
```

Return true if two gamma distributions have the same parameters and the sequences that would be generated are equal.

**operator>>**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic\_istream< _CharT, _Traits > & operator>> (
    std::basic\_istream< _CharT, _Traits > & __is,
    std::gamma\_distribution< _RealType1 > & __x) [friend]
```

Extracts a `gamma_distribution` random number distribution `__x` from the input stream `__is`.

**Parameters**

|                   |                                                                   |
|-------------------|-------------------------------------------------------------------|
| <code>__is</code> | An input stream.                                                  |
| <code>__x</code>  | A <code>gamma_distribution</code> random number generator engine. |

**Returns**

The input stream with `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

**6.447.1 Detailed Description**

```
template<typename _IntType = int>
class std::geometric_distribution< _IntType >
```

A discrete geometric random number distribution.

The formula for the geometric probability density function is  $p(i|p) = p(1 - p)^i$  where  $p$  is the parameter of the distribution.

Since

C++11

**6.447.2 Member Typedef Documentation****result\_type**

```
template<typename _IntType = int>
typedef _IntType std::geometric\_distribution< _IntType >::result_type
```

The type of the range of the distribution.

**6.447.3 Member Function Documentation****max()**

```
template<typename _IntType = int>
result\_type std::geometric\_distribution< _IntType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

**min()**

```
template<typename _IntType = int>
result_type std::geometric_distribution< _IntType >::min () const [inline]
Returns the greatest lower bound value of the distribution.
```

**operator()()**

```
template<typename _IntType = int>
template<typename _UniformRandomNumberGenerator>
result_type std::geometric_distribution< _IntType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

**p()**

```
template<typename _IntType = int>
double std::geometric_distribution< _IntType >::p () const [inline]
Returns the distribution parameter p.
```

**param() [1/2]**

```
template<typename _IntType = int>
param_type std::geometric_distribution< _IntType >::param () const [inline]
Returns the parameter set of the distribution.
Referenced by std::operator>>\(\).
```

**param() [2/2]**

```
template<typename _IntType = int>
void std::geometric_distribution< _IntType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _IntType = int>
void std::geometric_distribution< _IntType >::reset () [inline]
Resets the distribution state.
Does nothing for the geometric distribution.
```

**6.447.4 Friends And Related Symbol Documentation****operator==**

```
template<typename _IntType = int>
bool operator== (
    const geometric_distribution< _IntType > & __d1,
    const geometric_distribution< _IntType > & __d2) [friend]
```

Return true if two geometric distributions have the same parameters.

The documentation for this class was generated from the following files:

### 6.448.1 Detailed Description

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn = detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
class __gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy, Store_Hash, _Alloc >
```

A general-probing hash-based associative container.

#### Template Parameters

|                      |                                                                                                                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Key</i>           | Key type.                                                                                                                                                                                        |
| <i>Mapped</i>        | Map type.                                                                                                                                                                                        |
| <i>Hash_Fn</i>       | Hashing functor.                                                                                                                                                                                 |
| <i>Eq_Fn</i>         | Equal functor.                                                                                                                                                                                   |
| <i>Comb_Probe_Fn</i> | Combining probe functor. If Hash_Fn is not null_type, then this is the ranged-probe functor; otherwise, this is the range-hashing functor. XXX See Design::Hash-Based Containers::Hash Policies. |
| <i>Probe_Fn</i>      | Probe functor.                                                                                                                                                                                   |
| <i>Resize_Policy</i> | Resizes hash.                                                                                                                                                                                    |
| <i>Store_Hash</i>    | Indicates whether the hash value will be stored along with each key. If Hash_Fn is null_type, then the container will not compile if this value is true                                          |
| <i>_Alloc</i>        | Allocator type.                                                                                                                                                                                  |

Base tag choices are: `gp_hash_tag`.

Base is `basic_hash_table`.

### 6.448.2 Constructor & Destructor Documentation

#### `gp_hash_table()` [1/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn = detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy, Store_Hash, _Alloc >::gp_hash_table () [inline]
```

Default constructor.

**gp\_hash\_table()** [2/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type,
typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type,
typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash =
detail::default_store_hash, typename _Alloc = std::allocator<char>>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    const hash_fn & h) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object.

**gp\_hash\_table()** [3/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type,
typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type,
typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash =
detail::default_store_hash, typename _Alloc = std::allocator<char>>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    const hash_fn & h,
    const eq_fn & e) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, and `r_eq_fn` will be copied by the `eq_fn` object of the container object.

**gp\_hash\_table()** [4/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type,
typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type,
typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash =
detail::default_store_hash, typename _Alloc = std::allocator<char>>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    const hash_fn & h,
    const eq_fn & e,
    const comb_probe_fn & cp) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, `r_eq_fn` will be copied by the `eq_fn` object of the container object, and `r_comb_probe_fn` will be copied by the `comb_probe_fn` object of the container object.

**gp\_hash\_table()** [5/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type,
typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type,
typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash =
detail::default_store_hash, typename _Alloc = std::allocator<char>>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    const hash_fn & h,
    const eq_fn & e,
    const comb_probe_fn & cp,
    const probe_fn & p) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, `r_eq_fn` will be copied by the `eq_fn` object of the container object, `r_comb_probe_fn` will be copied by the `comb_probe_fn` object of the container object, and `r_probe_fn` will be copied by the `probe_fn` object of the container object.

#### **gp\_hash\_table()** [6/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_↵
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>↵
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    const hash_fn & h,
    const eq_fn & e,
    const comb_probe_fn & cp,
    const probe_fn & p,
    const resize_policy & rp) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, `r_eq_fn` will be copied by the `eq_fn` object of the container object, `r_comb_probe_fn` will be copied by the `comb_probe_fn` object of the container object, `r_probe_fn` will be copied by the `probe_fn` object of the container object, and `r_resize_policy` will be copied by the `Resize_Policy` object of the container object.

#### **gp\_hash\_table()** [7/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_↵
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>↵
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    It first,
    It last) [inline]
```

Constructor taking `__iterators` to a range of `value_types`. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

#### **gp\_hash\_table()** [8/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_↵
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>↵
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    It first,
    It last,
    const hash_fn & h) [inline]
```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and `last_it` will be inserted into the container object. `r_hash_fn` will be copied by the `hash_fn` object of the container object.

**gp\_hash\_table()** [9/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<←
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_←
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>←
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    It first,
    It last,
    const hash_fn & h,
    const eq_fn & e) [inline]
```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and `last_it` will be inserted into the container object. `r_hash_fn` will be copied by the `hash_fn` object of the container object, and `r_eq_fn` will be copied by the `eq_fn` object of the container object.

**gp\_hash\_table()** [10/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<←
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_←
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>←
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    It first,
    It last,
    const hash_fn & h,
    const eq_fn & e,
    const comb_probe_fn & cp) [inline]
```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and `last_it` will be inserted into the container object. `r_hash_fn` will be copied by the `hash_fn` object of the container object, `r_eq_fn` will be copied by the `eq_fn` object of the container object, and `r_comb_probe_fn` will be copied by the `comb_probe_fn` object of the container object.

**gp\_hash\_table()** [11/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<←
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_←
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>←
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    It first,
    It last,
    const hash_fn & h,
    const eq_fn & e,
    const comb_probe_fn & cp,
    const probe_fn & p) [inline]
```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and

last\_it will be inserted into the container object. r\_hash\_fn will be copied by the hash\_fn object of the container object, r\_eq\_fn will be copied by the eq\_fn object of the container object, r\_comb\_probe\_fn will be copied by the comb\_probe\_fn object of the container object, and r\_probe\_fn will be copied by the probe\_fn object of the container object.

### gp\_hash\_table() [12/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_↵
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>↵
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    It first,
    It last,
    const hash_fn & h,
    const eq_fn & e,
    const comb_probe_fn & cp,
    const probe_fn & p,
    const resize_policy & rp) [inline]
```

Constructor taking \_\_iterators to a range of value\_types and some policy objects. The value\_types between first\_it and last\_it will be inserted into the container object. r\_hash\_fn will be copied by the hash\_fn object of the container object, r\_eq\_fn will be copied by the eq\_fn object of the container object, r\_comb\_probe\_fn will be copied by the comb\_↵probe\_fn object of the container object, r\_probe\_fn will be copied by the probe\_fn object of the container object, and r\_resize\_policy will be copied by the resize\_policy object of the container object.

### 6.450.1 Detailed Description

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
class __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_Fn,
Probe_Fn, Resize_Policy >
```

A general-probing hash-based container.

#### Template Parameters

|                      |                                                                                                                                                                                                                                                          |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Key</i>           | Key type.                                                                                                                                                                                                                                                |
| <i>Mapped</i>        | Map type.                                                                                                                                                                                                                                                |
| <i>Hash_Fn</i>       | Hashing functor. Default is <code>__gnu_cxx::hash</code> .                                                                                                                                                                                               |
| <i>Eq_Fn</i>         | Equal functor. Default <code>std::equal_to&lt;Key&gt;</code>                                                                                                                                                                                             |
| <i>_Alloc</i>        | Allocator type.                                                                                                                                                                                                                                          |
| <i>Store_Hash</i>    | If key type stores extra metadata. Defaults to false.                                                                                                                                                                                                    |
| <i>Comb_Probe_Fn</i> | Combining probe functor. If <i>Hash_Fn</i> is not null_type, then this is the ranged-probe functor; otherwise, this is the range-hashing functor. XXX See Design::Hash-Based Containers::Hash Policies. Default <code>direct_mask_range_hashing</code> . |
| <i>Probe_Fn</i>      | Probe functor. Defaults to <code>linear_probe_fn</code> , also <code>quadratic_probe_fn</code> .                                                                                                                                                         |
| <i>Resize_Policy</i> | Resizes hash. Defaults to <code>hash_standard_resize_policy</code> , using <code>hash_exponential_size_policy</code> and <code>hash_load_check_resize_trigger</code> .                                                                                   |

Bases are: `detail::hash_eq_fn`, `Resize_Policy`, `detail::ranged_probe_fn`, `detail::types_traits`. (Optional: `detail::debug_map_base`.)

### 6.450.2 Member Enumeration Documentation

#### anonymous enum

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
anonymous enum
Value stores hash, true or false.
```

### 6.450.3 Member Function Documentation

#### empty()

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
bool __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_↵
Fn, Probe_Fn, Resize_Policy >::empty () const [inline], [nodiscard]
True if size() == 0.
```

#### get\_comb\_probe\_fn() [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
Comb_Probe_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_comb_probe_fn ()
Return current comb_probe_fn.
```

**get\_comb\_probe\_fn()** [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>

Hash, Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_comb_probe_fn () const
Return current const comb_probe_fn.
```

**get\_eq\_fn()** [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
Eq_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_↵
Probe_Fn, Probe_Fn, Resize_Policy >::get_eq_fn ()
Return current eq_fn.
```

**get\_eq\_fn()** [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
const Eq_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_eq_fn () const
Return current const eq_fn.
```

**get\_hash\_fn()** [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
Hash_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_↵
Probe_Fn, Probe_Fn, Resize_Policy >::get_hash_fn ()
Return current hash_fn.
```

**get\_hash\_fn()** [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
const Hash_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_hash_fn () const
Return current const hash_fn.
```

**get\_probe\_fn()** [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
Probe_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_↵
Probe_Fn, Probe_Fn, Resize_Policy >::get_probe_fn ()
Return current probe_fn.
```

**get\_probe\_fn()** [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
const Probe_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_probe_fn () const
Return current const probe_fn.
```

**get\_resize\_policy()** [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
Resize_Policy & \_\_gnu\_pbds::detail::gp\_ht\_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_resize_policy ()
Return current resize_policy.
```

**get\_resize\_policy()** [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
const Resize_Policy & \_\_gnu\_pbds::detail::gp\_ht\_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_↵
Hash, Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_resize_policy () const
Return current const resize_policy.
```

class [valarray](#)

#### 6.460.1 Detailed Description

Class defining multi-dimensional subset of an array.

The slice class represents a multi-dimensional subset of an array, specified by three parameter sets: start offset, size array, and stride array. The start offset is the index of the first element of the array that is part of the subset. The size and stride array describe each dimension of the slice. Size is the number of elements in that dimension, and stride is the distance in the array between successive elements in that dimension. Each dimension's size and stride is taken to begin at an array element described by the previous dimension. The size array and stride array must be the same size. For example, if you have offset==3, stride[0]==11, size[1]==3, stride[1]==3, then slice[0,0]==array[3], slice[0,1]==array[6], slice[0,2]==array[9], slice[1,0]==array[14], slice[1,1]==array[17], slice[1,2]==array[20].

## Friends

- class `valarray`< \_Tp >

### 6.461.1 Detailed Description

`template<typename _Tp>`  
`class std::gslice_array< _Tp >`

Reference to multi-dimensional subset of an array.

A `gslice_array` is a reference to the actual elements of an array specified by a `gslice`. The way to get a `gslice_array` is to call `operator[]`(`gslice`) on a `valarray`. The returned `gslice_array` then permits carrying operations out on the referenced subset of elements in the original `valarray`. For example, `operator+=(valarray)` will add values to the subset of elements in the underlying `valarray` this `gslice_array` refers to.

#### Parameters

|           |               |
|-----------|---------------|
| <i>Tp</i> | Element type. |
|-----------|---------------|

### 6.461.2 Member Function Documentation

#### `operator%=( )`

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator%= (
    const valarray< _Tp > & ) const
```

Modulo slice elements by corresponding elements of *v*.

**operator&=()**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator&= (
    const valarray< _Tp > & ) const
```

Logical and slice elements with corresponding elements of *v*.

**operator\*=()**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator*= (
    const valarray< _Tp > & ) const
```

Multiply slice elements by corresponding elements of *v*.

**operator+=()**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator+= (
    const valarray< _Tp > & ) const
```

Add corresponding elements of *v* to slice elements.

**operator-=()**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator-= (
    const valarray< _Tp > & ) const
```

Subtract corresponding elements of *v* from slice elements.

**operator/=(**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator/= (
    const valarray< _Tp > & ) const
```

Divide slice elements by corresponding elements of *v*.

**operator<<=()**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator<<= (
    const valarray< _Tp > & ) const
```

Left shift slice elements by corresponding elements of *v*.

**operator>>=()**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator>>= (
    const valarray< _Tp > & ) const
```

Right shift slice elements by corresponding elements of *v*.

**operator^=()**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator^= (
    const valarray< _Tp > & ) const
```

Logical xor slice elements with corresponding elements of *v*.

**operator" | =()**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator|= (
    const valarray< _Tp > & ) const
```

Logical or slice elements with corresponding elements of v.

### Public Member Functions

- `size_t operator() (unsigned short __val) const` noexcept

#### 6.503.1 Detailed Description

Explicit specialization for unsigned short.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 6.504 `std::hash< wchar_t >` Struct Reference

```
#include <functional_hash.h>
```

### Public Member Functions

- `size_t operator() (wchar_t __val) const` noexcept

#### 6.504.1 Detailed Description

Explicit specialization for wchar\_t.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 6.505 `std::hash<::bitset<_Nb>>` Struct Template Reference

```
#include <bitset>
```

### Public Member Functions

- `size_t operator()` (`const ::bitset<_Nb> &__b`) `const noexcept`

#### 6.505.1 Detailed Description

```
template<size_t _Nb>
```

```
struct std::hash<::bitset<_Nb>>
```

`std::hash` specialization for `bitset`.

The documentation for this struct was generated from the following file:

- [bitset](#)

## 6.506 `std::hash<::vector<bool,_Alloc>>` Struct Template Reference

```
#include <stl_bvector.h>
```

### Public Member Functions

- `size_t operator()` (`const ::vector<bool,_Alloc> &`) `const noexcept`

#### 6.506.1 Detailed Description

```
template<typename _Alloc>
```

```
struct std::hash<::vector<bool,_Alloc>>
```

`std::hash` specialization for `vector<bool>`.

The documentation for this struct was generated from the following files:

- [stl\\_bvector.h](#)
- [vector.tcc](#)

## 6.507 `__gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, Store_Hash >` Struct Template Reference

Inheritance diagram for `__gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, Store_Hash >`:

### 6.507.1 Detailed Description

```
template<typename Key, typename Eq_Fn, typename _Alloc, bool Store_Hash>
struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, Store_Hash >
```

Primary template.

The documentation for this struct was generated from the following file:

- [hash\\_eq\\_fn.hpp](#)

## 6.508 `__gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, false >` Struct Template Reference

```
#include <hash_eq_fn.hpp>
```

### Public Types

- typedef Eq\_Fn `eq_fn_base`

- typedef [rebind\\_traits](#)< \_Alloc, Key >::const\_reference **key\_const\_reference**

#### Public Member Functions

- **hash\_eq\_fn** (const Eq\_Fn &r\_eq\_fn)
- bool **operator()** (key\_const\_reference r\_lhs\_key, key\_const\_reference r\_rhs\_key) const
- void **swap** (const [hash\\_eq\\_fn](#) &other)

#### 6.508.1 Detailed Description

```
template<typename Key, typename Eq_Fn, typename _Alloc>
struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, false >
```

Specialization 1 - The client requests that hash values not be stored.  
The documentation for this struct was generated from the following file:

- [hash\\_eq\\_fn.hpp](#)

#### 6.509 \_\_gnu\_pbds::detail::hash\_eq\_fn< Key, Eq\_Fn, \_Alloc, true > Struct Template Reference

```
#include <hash_eq_fn.hpp>
```

#### Public Types

- typedef Eq\_Fn **eq\_fn\_base**
- typedef [rebind\\_traits](#)< \_Alloc, Key >::const\_reference **key\_const\_reference**
- typedef \_Alloc::size\_type **size\_type**

#### Public Member Functions

- **hash\_eq\_fn** (const Eq\_Fn &r\_eq\_fn)
- bool **operator()** (key\_const\_reference r\_lhs\_key, size\_type lhs\_hash, key\_const\_reference r\_rhs\_key, size\_type rhs\_hash) const
- void **swap** (const [hash\\_eq\\_fn](#) &other)

#### 6.509.1 Detailed Description

```
template<typename Key, class Eq_Fn, class _Alloc>
struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, true >
```

Specialization 2 - The client requests that hash values be stored.  
The documentation for this struct was generated from the following file:

- [hash\\_eq\\_fn.hpp](#)

#### 6.510 \_\_gnu\_pbds::hash\_exponential\_size\_policy< Size\_Type > Class Template Reference

```
#include <hash_policy.hpp>
```

Inheritance diagram for `__gnu_pbds::hash_exponential_size_policy< Size_Type >`:

## Public Types

- typedef `Size_Type` **size\_type**

## Public Member Functions

- [hash\\_exponential\\_size\\_policy](#) (`size_type start_size=8, size_type grow_factor=2`)
- void **swap** ([hash\\_exponential\\_size\\_policy](#) `< Size_Type > &other`)

## Protected Member Functions

- `size_type` **get\_nearest\_larger\_size** (`size_type size`) const
- `size_type` **get\_nearest\_smaller\_size** (`size_type size`) const

### 6.510.1 Detailed Description

```
template<typename Size_Type = std::size_t>
class __gnu_pbds::hash_exponential_size_policy< Size_Type >
```

A size policy whose sequence of sizes form an exponential sequence (typically powers of 2).

### 6.510.2 Constructor & Destructor Documentation

**hash\_exponential\_size\_policy()**

```
template<typename Size_Type>
__gnu_pbds::hash_exponential_size_policy< Size_Type >::hash_exponential_size_policy (
    size_type start_size = 8,
    size_type grow_factor = 2)
```

Default constructor, or onstructor taking a `start_size`, or constructor taking a `start_size` and `grow_factor`. The policy will use the sequence of sizes `start_size`, `start_size* grow_factor`, `start_size* grow_factor^2`, ...

The documentation for this class was generated from the following file:

- [hash\\_policy.hpp](#)

## 6.511 `__gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >` Class Template Reference

```
#include <hash_policy.hpp>
```

Inheritance diagram for `__gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >`:

## Public Types

- enum { [external\\_load\\_access](#) }
- typedef `Size_Type` **size\_type**

## Public Member Functions

- [hash\\_load\\_check\\_resize\\_trigger](#) (float load\_min=0.125, float load\_max=0.5)
- `std::pair< float, float >` [get\\_loads](#) () const
- void [set\\_loads](#) (`std::pair< float, float >` load\_pair)
- void **swap** ([hash\\_load\\_check\\_resize\\_trigger](#) &other)

## Protected Member Functions

- void **notify\_erase\_search\_end** ()
- void **notify\_erase\_search\_start** ()
- void **notify\_erased** (size\_type num\_entries)
- void **notify\_externally\_resized** (size\_type new\_size)
- void **notify\_find\_search\_collision** ()
- void **notify\_find\_search\_end** ()
- void **notify\_find\_search\_start** ()
- void **notify\_insert\_search\_collision** ()
- void **notify\_insert\_search\_end** ()
- void **notify\_insert\_search\_start** ()
- void [notify\\_inserted](#) (size\_type num\_entries)
- void [notify\\_resized](#) (size\_type new\_size)

### 6.511.1 Detailed Description

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
class __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >
```

A resize trigger policy based on a load check. It keeps the load factor between some load factors `load_min` and `load_max`.

## 6.511.2 Member Enumeration Documentation

### anonymous enum

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
anonymous enum
```

#### Enumerator

|                      |                                                                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| external_load_access | Specifies whether the load factor can be accessed externally. The two options have different trade-offs in terms of flexibility, genericity, and encapsulation. |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 6.511.3 Constructor & Destructor Documentation

### hash\_load\_check\_resize\_trigger()

```
template<bool External_Load_Access, typename Size_Type>
__gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::hash_load_check_↵
resize_trigger (
    float load_min = 0.125,
    float load_max = 0.5)
```

Default constructor, or constructor taking load\_min and load\_max load factors between which this policy will keep the actual load.

## 6.511.4 Member Function Documentation

### get\_loads()

```
template<bool External_Load_Access, typename Size_Type>
std::pair< float, float > __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_↵
_Type >::get_loads () const [inline]
```

Returns a pair of the minimal and maximal loads, respectively.

### notify\_cleared()

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::notify_↵
cleared () [protected]
```

Notifies the table was cleared.

### notify\_inserted()

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::notify_↵
inserted (
    size_type num_entries) [inline], [protected]
```

Notifies an element was inserted. The total number of entries in the table is num\_entries.

### notify\_resized()

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::notify_↵
resized (
    size_type new_size) [protected]
```

Notifies the table was resized as a result of this object's signifying that a resize is needed.

References [notify\\_resized\(\)](#).  
 Referenced by [notify\\_resized\(\)](#).

### set\_loads()

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::set_loads (
    std::pair< float, float > load_pair)
```

Sets the loads through a pair of the minimal and maximal loads, respectively.  
 The documentation for this class was generated from the following file:

- [hash\\_policy.hpp](#)

## 6.512 \_\_gnu\_pbds::detail::hash\_load\_check\_resize\_trigger\_size\_base< Size\_Type, Hold\_Size > Class Template Reference

Inheritance diagram for \_\_gnu\_pbds::detail::hash\_load\_check\_resize\_trigger\_size\_base< Size\_Type, Hold\_Size >:

### 6.512.1 Detailed Description

```
template<typename Size_Type, bool Hold_Size>
class __gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, Hold_Size >
```

Primary template.

The documentation for this class was generated from the following file:

- [hash\\_load\\_check\\_resize\\_trigger\\_size\\_base.hpp](#)

## 6.513 \_\_gnu\_pbds::detail::hash\_load\_check\_resize\_trigger\_size\_base< Size\_Type, true > Class Template Reference

```
#include <hash_load_check_resize_trigger_size_base.hpp>
```

### Protected Types

#### 6.517.1 Detailed Description

A size policy whose sequence of sizes form a nearly-exponential sequence of primes.

#### 6.517.2 Member Typedef Documentation

##### **size\_type**

```
typedef std::size_t __gnu_pbds::hash_prime_size_policy::size_type
```

Size type.

#### 6.517.3 Constructor & Destructor Documentation

##### **hash\_prime\_size\_policy()**

```
__gnu_pbds::hash_prime_size_policy::hash_prime_size_policy (  
    size\_type start_size = 8) [inline]
```

Default constructor, or onstructor taking a start\_size The policy will use the sequence of sizes approximately start\_size, start\_size\* 2, start\_size\* 2^2, ...

The documentation for this class was generated from the following file:

#### 6.519.1 Detailed Description

```
template<typename Size_Policy = hash_exponential_size_policy<>, typename Trigger_Policy = hash_load_
check_resize_trigger<>, bool External_Size_Access = false, typename Size_Type = std::size_t>
class __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_
Type >
```

A resize policy which delegates operations to size and trigger policies.

#### 6.519.2 Member Enumeration Documentation

##### anonymous enum

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
anonymous enum [inherited]
```

##### Enumerator

|                                   |                                                                                                                                                                 |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>external_load_access</code> | Specifies whether the load factor can be accessed externally. The two options have different trade-offs in terms of flexibility, genericity, and encapsulation. |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 6.519.3 Constructor & Destructor Documentation

#### hash\_standard\_resize\_policy() [1/3]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↵
_Type>
__gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size↵
_Type >::hash_standard_resize_policy ()
```

Default constructor.

#### hash\_standard\_resize\_policy() [2/3]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↵
_Type>
__gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size↵
_Type >::hash_standard_resize_policy (
    const Size_Policy & r_size_policy)
```

constructor taking some policies r\_size\_policy will be copied by the Size\_Policy object of this object.

#### hash\_standard\_resize\_policy() [3/3]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↵
_Type>
__gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size↵
_Type >::hash_standard_resize_policy (
    const Size_Policy & r_size_policy,
    const Trigger_Policy & r_trigger_policy)
```

constructor taking some policies. r\_size\_policy will be copied by the Size\_Policy object of this object. r\_trigger\_policy will be copied by the Trigger\_Policy object of this object.

### 6.519.4 Member Function Documentation

#### get\_actual\_size()

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↵
_Type>
hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_Type >↵
::size_type __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size↵
Access, Size_Type >::get_actual_size () const [inline]
```

Returns the actual size of the container.

#### get\_loads()

```
template<bool External_Load_Access, typename Size_Type>
std::pair< float, float > __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size↵
_Type >::get_loads () const [inline], [inherited]
```

Returns a pair of the minimal and maximal loads, respectively.

#### get\_new\_size()

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↵
_Type>
hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_Type >↵
::size_type __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size↵
Access, Size_Type >::get_new_size (
```

```
size_type size,
size_type num_used_e) const [protected]
```

Queries what the new size should be, when the container is resized naturally. The current `__size` of the container is `size`, and the number of used entries within the container is `num_used_e`.

### `get_size_policy()` [1/2]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size_↵
_Type>
Size_Policy & __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_↵
Size_Access, Size_Type >::get_size_policy ()
```

Access to the `Size_Policy` object used.

### `get_size_policy()` [2/2]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size_↵
_Type>
const Size_Policy & __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_↵
_Size_Access, Size_Type >::get_size_policy () const
```

Const access to the `Size_Policy` object used.

### `get_trigger_policy()` [1/2]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size_↵
_Type>
Trigger_Policy & __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_↵
Size_Access, Size_Type >::get_trigger_policy ()
```

Access to the `Trigger_Policy` object used.

### `get_trigger_policy()` [2/2]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size_↵
_Type>
const Trigger_Policy & __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy,
External_Size_Access, Size_Type >::get_trigger_policy () const
```

Access to the `Trigger_Policy` object used.

### `resize()`

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size_↵
_Type>
void __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access,
Size_Type >::resize (
```

```
size_type suggested_new_size)
```

Resizes the container to `suggested_new_size`, a suggested size (the actual size will be determined by the `Size_Policy` object).

### `set_loads()`

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::set_loads (
std::pair< float, float > load_pair) [inherited]
```

Sets the loads through a pair of the minimal and maximal loads, respectively.

The documentation for this class was generated from the following file:

- [hash\\_policy.hpp](#)

## 6.520 `std::chrono::hh_mm_ss<_Duration>` Class Template Reference

```
#include <chrono>
```

### Public Types

- using **precision**

### Public Member Functions

- constexpr **hh\_mm\_ss** (`_Duration __d`)
- constexpr `chrono::hours` **hours** () const noexcept
- constexpr bool **is\_negative** () const noexcept
- constexpr `chrono::minutes` **minutes** () const noexcept
- constexpr **operator precision** () const noexcept
- constexpr `chrono::seconds` **seconds** () const noexcept
- constexpr **precision** **subseconds** () const noexcept
- constexpr **precision** **to\_duration** () const noexcept

### Static Public Attributes

- static constexpr unsigned **fractional\_width**

#### 6.520.1 Detailed Description

```
template<typename _Duration>
class std::chrono::hh_mm_ss<_Duration>
```

Utility for splitting a duration into hours, minutes, and seconds

This is a convenience type that provides accessors for the constituent parts (hours, minutes, seconds and subseconds) of a duration.

Since

C++20

The documentation for this class was generated from the following file:

- [chrono](#)

## 6.521 `std::locale::id` Class Reference

```
#include <locale_classes.h>
```

### Public Member Functions

- `id` ()
- `size_t _M_id` () const throw ()

### Friends

- template<typename \_Facet>  
const \_Facet \* **\_\_try\_use\_facet** (const `locale` &\_\_loc)
- template<typename \_Facet>  
bool **has\_facet** (const `locale` &\_\_loc) throw ()
- class **locale**
- class **locale::\_Impl**
- template<typename \_Facet>  
const \_Facet & **use\_facet** (const `locale` &\_\_loc)

### 6.521.1 Detailed Description

Facet ID class.

The ID class provides facets with an index used to identify them. Every facet class must define a public static member `locale::id`, or be derived from a facet that provides this member, otherwise the facet cannot be used in a locale. The `locale::id` ensures that each class type gets a unique identifier.

### 6.521.2 Constructor & Destructor Documentation

#### id()

```
std::locale::id::id () [inline]
```

Constructor.

### 6.521.3 Friends And Related Symbol Documentation

#### has\_facet

```
template<typename _Facet>
bool has_facet (
    const locale & __loc) throw ( ) [friend]
```

Test for the presence of a facet.

`has_facet` tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

#### Template Parameters

|                     |                                         |
|---------------------|-----------------------------------------|
| <code>_Facet</code> | The facet type to test the presence of. |
|---------------------|-----------------------------------------|

#### Parameters

|                    |                     |
|--------------------|---------------------|
| <code>__loc</code> | The locale to test. |
|--------------------|---------------------|

#### Returns

true if `__loc` contains a facet of type `_Facet`, else false.

#### use\_facet

```
template<typename _Facet>
const _Facet & use_facet (
    const locale & __loc) [friend]
```

Return a facet.

`use_facet` looks for and returns a reference to a facet of type `Facet` where `Facet` is the template parameter. If `has_facet(locale)` is true, there is a suitable facet to return. It throws `std::bad_cast` if the locale doesn't contain a facet of type `Facet`.

#### Template Parameters

|                     |                           |
|---------------------|---------------------------|
| <code>_Facet</code> | The facet type to access. |
|---------------------|---------------------------|

#### Parameters

|                    |                    |
|--------------------|--------------------|
| <code>__loc</code> | The locale to use. |
|--------------------|--------------------|

#### Returns

Reference to facet of type `Facet`.

#### Exceptions

|                            |                                                                             |
|----------------------------|-----------------------------------------------------------------------------|
| <code>std::bad_cast</code> | if <code>__loc</code> doesn't contain a facet of type <code>_Facet</code> . |
|----------------------------|-----------------------------------------------------------------------------|

The documentation for this class was generated from the following file:

- [locale\\_classes.h](#)

## 6.522 std::thread::id Class Reference

```
#include <thread>
```

### Public Member Functions

### 6.525.1 Detailed Description

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
class std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >
```

Produces random numbers by combining random numbers from some base engine to produce random numbers with a specified number of bits \_\_w.

Since

C++11

### 6.525.2 Member Typedef Documentation

#### result\_type

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
typedef _UIntType std::independent\_bits\_engine< _RandomNumberEngine, __w, _UIntType >::result_type
```

The type of the generated random value.

### 6.525.3 Constructor & Destructor Documentation

#### independent\_bits\_engine() [1/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
std::independent\_bits\_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine ()
[inline]
```

Constructs a default [independent\\_bits\\_engine](#) engine.

The underlying engine is default constructed as well.

Referenced by [operator==](#).

#### independent\_bits\_engine() [2/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
std::independent\_bits\_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
    const _RandomNumberEngine & __rng) [inline], [explicit]
```

Copy constructs a [independent\\_bits\\_engine](#) engine.

Copies an existing base class random number generator.

#### Parameters

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__rng</code> | An existing (base class) engine object. |
|--------------------|-----------------------------------------|

**independent\_bits\_engine()** [3/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
    _RandomNumberEngine && __rng) [inline], [explicit]
```

Move constructs a independent\_bits\_engine engine.

Copies an existing base class random number generator.

**Parameters**

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__rng</code> | An existing (base class) engine object. |
|--------------------|-----------------------------------------|

References [std::move\(\)](#).

**independent\_bits\_engine()** [4/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
    result_type __s) [inline], [explicit]
```

Seed constructs a independent\_bits\_engine engine.

Constructs the underlying generator engine seeded with \_\_s.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A seed value for the base class engine. |
|------------------|-----------------------------------------|

**independent\_bits\_engine()** [5/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
    _Sseq & __q) [inline], [explicit]
```

Generator construct a independent\_bits\_engine engine.

**Parameters**

|                  |                  |
|------------------|------------------|
| <code>__q</code> | A seed sequence. |
|------------------|------------------|

**6.525.4 Member Function Documentation****base()**

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
const _RandomNumberEngine & std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::
base () const [inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

**discard()**

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::discard (
    unsigned long long __z) [inline]
```

Discard a sequence of random numbers.

**max()**

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
constexpr result\_type std::independent\_bits\_engine< _RandomNumberEngine, __w, _UIntType >::max ()
[inline], [static], [constexpr]
```

Gets the maximum value in the generated random number range.

**min()**

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
constexpr result\_type std::independent\_bits\_engine< _RandomNumberEngine, __w, _UIntType >::min ()
[inline], [static], [constexpr]
```

Gets the minimum value in the generated random number range.

**operator()()**

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
independent\_bits\_engine< _RandomNumberEngine, __w, _UIntType >::result_type std::independent\_bits\_engine<
_RandomNumberEngine, __w, _UIntType >::operator() ()
```

Gets the next value in the generated random number sequence.

References [std::\\_\\_lg\(\)](#), [std::\\_\\_numeric\\_limits\\_base::digits](#), and [std::numeric\\_limits<\\_Tp>::max\(\)](#).

**seed()** [1/3]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
void std::independent\_bits\_engine< _RandomNumberEngine, __w, _UIntType >::seed () [inline]
```

Reseeds the `independent_bits_engine` object with the default seed for the underlying base class generator engine.

**seed()** [2/3]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
template<typename _Sseq>
_If_seed_seq< _Sseq > std::independent\_bits\_engine< _RandomNumberEngine, __w, _UIntType >::seed
(
    _Sseq & __q) [inline]
```

Reseeds the `independent_bits_engine` object with the given seed sequence.

**Parameters**

|                  |                            |
|------------------|----------------------------|
| <code>__q</code> | A seed generator function. |
|------------------|----------------------------|

**seed()** [3/3]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
void std::independent\_bits\_engine< _RandomNumberEngine, __w, _UIntType >::seed (
    result\_type __s) [inline]
```

Reseeds the `independent_bits_engine` object with the default seed for the underlying base class generator engine.

**6.525.5 Friends And Related Symbol Documentation****operator==**

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
bool operator== (
```

```
const independent_bits_engine<_RandomNumberEngine, __w, _UIntType> & __lhs,
const independent_bits_engine<_RandomNumberEngine, __w, _UIntType> & __rhs) [friend]
```

Compares two independent\_bits\_engine random number generator objects of the same type for equality.

#### Parameters

|                    |                                                                 |
|--------------------|-----------------------------------------------------------------|
| <code>__lhs</code> | A independent_bits_engine random number generator object.       |
| <code>__rhs</code> | Another independent_bits_engine random number generator object. |

#### Returns

true if the infinite sequences of generated values would be equal, false otherwise.

References [independent\\_bits\\_engine\(\)](#).

#### operator>>

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
template<typename _CharT, typename _Traits>
std::basic_istream<_CharT, _Traits> & operator>> (
    std::basic_istream<_CharT, _Traits> & __is,
    std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType> & __x) [friend]
```

Extracts the current state of a % subtract\_with\_carry\_engine random number generator engine `__x` from the input stream `__is`.

#### Parameters

|                   |                                                           |
|-------------------|-----------------------------------------------------------|
| <code>__is</code> | An input stream.                                          |
| <code>__x</code>  | A independent_bits_engine random number generator engine. |

#### Returns

The input stream with the state of `__x` extracted or in an error state.

## Friends

- `class gslice\_array< _Tp >`
- `class valarray< _Tp >`

### 6.526.1 Detailed Description

`template<class _Tp>`

`class std::indirect\_array< _Tp >`

Reference to arbitrary subset of an array.

An `indirect_array` is a reference to the actual elements of an array specified by an ordered array of indices. The way to get an `indirect_array` is to call `operator[](valarray<size_t>)` on a `valarray`. The returned `indirect_array` then permits carrying operations out on the referenced subset of elements in the original `valarray`.

For example, if an `indirect_array` is obtained using the array (4,2,0) as an argument, and then assigned to an array containing (1,2,3), then the underlying array will have `array[0]==3`, `array[2]==2`, and `array[4]==1`.

#### Parameters

|           |               |
|-----------|---------------|
| <i>Tp</i> | Element type. |
|-----------|---------------|

### 6.526.2 Member Function Documentation

#### operator%=( )

```
template<class _Tp>
void std::indirect_array< _Tp >::operator%= (
    const valarray< _Tp > & ) const
```

Modulo slice elements by corresponding elements of *v*.

#### operator&=( )

```
template<class _Tp>
void std::indirect_array< _Tp >::operator&= (
    const valarray< _Tp > & ) const
```

Logical and slice elements with corresponding elements of *v*.

#### operator\*=( )

```
template<class _Tp>
void std::indirect_array< _Tp >::operator*= (
    const valarray< _Tp > & ) const
```

Multiply slice elements by corresponding elements of *v*.

#### operator+=( )

```
template<class _Tp>
void std::indirect_array< _Tp >::operator+= (
    const valarray< _Tp > & ) const
```

Add corresponding elements of *v* to slice elements.

#### operator-=( )

```
template<class _Tp>
void std::indirect_array< _Tp >::operator-= (
    const valarray< _Tp > & ) const
```

Subtract corresponding elements of *v* from slice elements.

#### operator/=( )

```
template<class _Tp>
void std::indirect_array< _Tp >::operator/= (
    const valarray< _Tp > & ) const
```

Divide slice elements by corresponding elements of *v*.

#### operator<<=( )

```
template<class _Tp>
void std::indirect_array< _Tp >::operator<<= (
    const valarray< _Tp > & ) const
```

Left shift slice elements by corresponding elements of *v*.

#### operator>>=( )

```
template<class _Tp>
void std::indirect_array< _Tp >::operator>>= (
    const valarray< _Tp > & ) const
```

Right shift slice elements by corresponding elements of *v*.

#### **operator^=()**

```
template<class _Tp>
void std::indirect_array< _Tp >::operator^= (
    const valarray< _Tp > & ) const
```

Logical xor slice elements with corresponding elements of *v*.

#### **operator" |=()**

```
template<class _Tp>
void std::indirect_array< _Tp >::operator|= (
    const valarray< _Tp > & ) const
```

Logical or slice elements with corresponding elements of *v*.

The documentation for this class was generated from the following files:

- [valarray](#)
- [indirect\\_array.h](#)

### **6.527 std::initializer\_list< \_E > Class Template Reference**

```
#include <initializer_list>
```

#### **Public Types**

- typedef const \_E \* **const\_iterator**
- typedef const \_E & **const\_reference**
- typedef const \_E \* **iterator**
- typedef const \_E & **reference**
- typedef size\_t **size\_type**
- typedef \_E **value\_type**

#### **Public Member Functions**

constexpr const \_Tp \* **begin** (initializer\_list< \_Tp > \_\_ils) noexcept
- template<class \_Tp>  
constexpr const \_Tp \* **end** (initializer\_list< \_Tp > \_\_ils) noexcept

#### **6.527.1 Detailed Description**

```
template<class _E>
```

```
class std::initializer_list< _E >
```

```
initializer_list
```

### 6.527.2 Friends And Related Symbol Documentation

#### begin()

```
template<class _Tp>
const _Tp * begin (
    initializer_list< _Tp > __ils) [related]
```

Return an iterator pointing to the first element of the initializer\_list.

#### Parameters

|                                   |                   |
|-----------------------------------|-------------------|
| $\leftrightarrow$<br><i>__ils</i> | Initializer list. |
|-----------------------------------|-------------------|

#### end()

```
template<class _Tp>
const _Tp * end (
    initializer_list< _Tp > __ils) [related]
```

Return an iterator pointing to one past the last element of the initializer\_list.

#### Parameters

|                                   |                   |
|-----------------------------------|-------------------|
| $\leftrightarrow$<br><i>__ils</i> | Initializer list. |
|-----------------------------------|-------------------|

## 6.528 std::input\_iterator\_tag Struct Reference

```
#include <stl_iterator_base_types.h>
```

Inheritance diagram for `std::input_iterator_tag`:

#### 6.528.1 Detailed Description

Marking input iterators.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

#### 6.529 `__gnu_pbds::insert_error` Struct Reference

```
#include <exception.hpp>
```

Inheritance diagram for `__gnu_pbds::insert_error`:

### Public Member Functions

- virtual const char \* [what](#) () const noexcept

#### 6.529.1 Detailed Description

An entry cannot be inserted into a container object for logical reasons (not, e.g., if memory is unavailable, in which case the `allocator_type`'s exception will be thrown).

#### 6.529.2 Member Function Documentation

##### `what()`

```
virtual const char * std::logic_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this struct was generated from the following file:

- [exception.hpp](#)

### 6.530 `std::insert_iterator<_Container>` Class Template Reference

```
#include <stl_iterator.h>
```

Inheritance diagram for `std::insert_iterator< _Container >`:

### Public Types

- typedef `_Container` `container_type`
- using `difference_type`
- typedef `output_iterator_tag` `iterator_category`
- typedef void `pointer`
- typedef void `reference`
- typedef void `value_type`

### Public Member Functions

- constexpr `insert_iterator` (`_Container &__x`, `_Iter __i`)
- constexpr `insert_iterator` & `operator*` ()
- constexpr `insert_iterator` & `operator++` ()
- constexpr `insert_iterator` & `operator++` (int)
- constexpr `insert_iterator` & `operator=` (const typename `_Container::value_type` &\_\_value)
- constexpr `insert_iterator` & `operator=` (typename `_Container::value_type` &&\_\_value)

### Protected Attributes

- `_Container *` `container`
- `_Iter` `iter`

#### 6.530.1 Detailed Description

```
template<typename _Container>
class std::insert_iterator< _Container >
```

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator inserts it in the container at the iterator's position, rather than overwriting the value at that position.

(Sequences will actually insert a *copy* of the value before the iterator's position.)

Tip: Using the inserter function to create these iterators can save typing.

### 6.530.2 Member Typedef Documentation

#### container\_type

```
template<typename _Container>
typedef _Container std::insert_iterator< _Container >::container_type
```

A nested typedef for the type of whatever container you used.

#### iterator\_category

```
typedef output_iterator_tag std::iterator< output_iterator_tag, void, void, void, void >::iterator_category [inherited]
```

One of the [tag types](#).

#### pointer

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::pointer [inherited]
```

This type represents a pointer-to-value\_type.

#### reference

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::reference [inherited]
```

This type represents a reference-to-value\_type.

#### value\_type

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type [inherited]
```

The type "pointed to" by the iterator.

### 6.530.3 Constructor & Destructor Documentation

#### insert\_iterator()

```
template<typename _Container>
std::insert_iterator< _Container >::insert_iterator (
    _Container & __x,
    _Iter __i) [inline], [constexpr]
```

The only way to create this iterator is with a container and an initial position (a normal iterator into the container).

References [std::\\_\\_addressof\(\)](#).

### 6.530.4 Member Function Documentation

#### operator\*()

```
template<typename _Container>
insert_iterator & std::insert_iterator< _Container >::operator* () [inline], [nodiscard], [constexpr]
```

Simply returns \*this.

#### operator++() [1/2]

```
template<typename _Container>
insert_iterator & std::insert_iterator< _Container >::operator++ () [inline], [constexpr]
```

Simply returns \*this. (This iterator does not *move*.)

**operator++()** [2/2]

```
template<typename _Container>
insert_iterator & std::insert_iterator< _Container >::operator++ (
    int ) [inline], [constexpr]
```

Simply returns \*this. (This iterator does not *move*.)

**operator=()**

```
template<typename _Container>
insert_iterator & std::insert_iterator< _Container >::operator= (
    const typename _Container::value_type & __value) [inline], [constexpr]
```

**Parameters**

|                      |                                                                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__value</code> | An instance of whatever type <code>container_type::const_reference</code> is; presumably a reference-to-const T for <code>container&lt;T&gt;</code> . |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|

**Returns**

This iterator, for chained operations.

This kind of iterator maintains its own position in the container. Assigning a value to the iterator will insert the value into the container at the place before the iterator.

The position is maintained such that subsequent assignments will insert values immediately after one another. For example,

```
// vector v contains A and Z
insert_iterator i (v, ++v.begin());
i = 1;
i = 2;
i = 3;
```

```
// vector v contains A, 1, 2, 3, and Z
```

#### 6.534.1 Detailed Description

The base of the I/O class hierarchy.

This class defines everything that can be defined about I/O that does not depend on the type of characters being input or output. Most people will only see `ios_base` when they need to specify the full name of the various I/O flags (e.g., the openmodes).

#### 6.534.2 Member Typedef Documentation

##### `event_callback`

```
typedef void(* std::ios_base::event_callback) (event __e, ios\_base &__b, int __i)
```

The type of an event callback function.

**Parameters**

|                 |                                                        |
|-----------------|--------------------------------------------------------|
| <code>_e</code> | One of the members of the event enum.                  |
| <code>_b</code> | Reference to the <code>ios_base</code> object.         |
| <code>_i</code> | The integer provided when the callback was registered. |

Event callbacks are user defined functions that get called during several `ios_base` and `basic_ios` functions, specifically `imbue()`, `copyfmt()`, and `~ios()`.

**istate**

```
typedef _Ios_Iostate std::ios_base::istate
```

This is a bitmask type.

`_Ios_Iostate` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type `istate` are:

- `badbit`
- `eofbit`
- `failbit`
- `goodbit`

**openmode**

```
typedef _Ios_Openmode std::ios_base::openmode
```

This is a bitmask type.

`_Ios_Openmode` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type `openmode` are:

- `app`
- `ate`
- `binary`
- `in`
- `out`
- `trunc`

**seekdir**

```
typedef _Ios_Seekdir std::ios_base::seekdir
```

This is an enumerated type.

`_Ios_Seekdir` is implementation-defined. Defined values of type `seekdir` are:

- `beg`
- `cur`, equivalent to `SEEK_CUR` in the C standard library.
- `end`, equivalent to `SEEK_END` in the C standard library.

### 6.534.3 Member Enumeration Documentation

#### event

```
enum std::ios_base::event
```

The set of events that may be passed to an event callback.

erase\_event is used during ~ios() and copyfmt(). imbue\_event is used during imbue(). copyfmt\_event is used during copyfmt().

### 6.534.4 Constructor & Destructor Documentation

#### ~ios\_base()

```
virtual std::ios_base::~~ios_base () [virtual]
```

Invokes each callback with erase\_event. Destroys local storage.

Note that the ios\_base object for the standard streams never gets destroyed. As a result, any callbacks registered with the standard streams will not get invoked with erase\_event (unless copyfmt is used).

### 6.534.5 Member Function Documentation

#### \_M\_getloc()

```
const locale & std::ios_base::_M_getloc () const [inline]
```

Locale access.

#### Returns

A reference to the current locale.

Like getloc above, but returns a reference instead of generating a copy.

Referenced by [std::money\\_get<\\_CharT, \\_InIter>::do\\_get\(\)](#), [std::num\\_get<\\_CharT, \\_InIter>::do\\_get\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::do\\_get\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::do\\_get\\_date\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::do\\_get\\_monthname\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::do\\_get\\_weekday\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::do\\_get\\_year\(\)](#), [std::num\\_put<\\_CharT, \\_OutIter>::do\\_put\(\)](#), [std::time\\_put<\\_CharT, \\_OutIter>::do\\_put\(\)](#), and [std::time\\_put<\\_CharT, \\_OutIter>::put\(\)](#).

#### flags() [1/2]

```
fmtflags std::ios_base::flags () const [inline], [nodiscard]
```

Access to format flags.

#### Returns

The format control flags for both input and output.

Referenced by [std::basic\\_ios<\\_CharT, \\_Traits>::copyfmt\(\)](#), [std::num\\_get<\\_CharT, \\_InIter>::do\\_get\(\)](#), [std::num\\_get<\\_CharT, \\_InIter>::do\\_put\(\)](#), [std::num\\_put<\\_CharT, \\_OutIter>::do\\_put\(\)](#), [std::chrono::operator<<\(\)](#), [std::operator<<\(\)](#), [std::\\_\\_detail::operator>>\(\)](#), [std::operator>>\(\)](#), [std::operator>>\(\)](#), [std::operator>>\(\)](#), [std::operator>>\(\)](#), and [std::operator>>\(\)](#).

#### flags() [2/2]

```
fmtflags std::ios_base::flags (
    fmtflags __fmtfl) [inline]
```

Setting new format flags all at once.

#### Parameters

|                      |                       |
|----------------------|-----------------------|
| <code>__fmtfl</code> | The new flags to set. |
|----------------------|-----------------------|

**Returns**

The previous format control flags.

This function overwrites all the format flags with `__fmtfl`.

References [fmtflags](#).

**getloc()**

```
locale std::ios_base::getloc () const [inline], [nodiscard]
```

Locale access.

**Returns**

A copy of the current locale.

If `imbue(loc)` has previously been called, then this function returns `loc`. Otherwise, it returns a copy of `std::locale()`, the global C++ locale.

Referenced by [std::basic\\_ios<\\_CharT, \\_Traits>::copyfmt\(\)](#), [std::money\\_put<\\_CharT, \\_OutIter>::do\\_put\(\)](#), [std::basic\\_ios<\\_CharT, \\_Traits>::do\\_get\(\)](#), [std::chrono::operator<<\(\)](#), [std::operator>>\(\)](#), [std::operator>>\(\)](#), and [std::ws\(\)](#).

**imbue()**

```
locale std::ios_base::imbue (
    const locale & __loc) throw ( )
```

Setting a new locale.

**Parameters**

|                    |                 |
|--------------------|-----------------|
| <code>__loc</code> | The new locale. |
|--------------------|-----------------|

**Returns**

The previous locale.

Sets the new locale for this stream, and then invokes each callback with `imbue_event`.

Referenced by [std::basic\\_ios<\\_CharT, \\_Traits>::imbue\(\)](#).

**word()**

```
long & std::ios_base::word (
    int __ix) [inline]
```

Access to integer array.

**Parameters**

|                   |                       |
|-------------------|-----------------------|
| <code>__ix</code> | Index into the array. |
|-------------------|-----------------------|

**Returns**

A reference to an integer associated with the index.

The `word` function provides access to an array of integers that can be used for any purpose. The array grows as required to hold the supplied index. All integers in the array are initialized to 0.

The implementation reserves several indices. You should use `xalloc` to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

References [word\(\)](#).

Referenced by [word\(\)](#).

**precision()** [1/2]

```
streamsize std::ios_base::precision () const [inline], [nodiscard]
```

Flags access.

**Returns**

The precision to generate on certain output operations.

Be careful if you try to give a definition of *precision* here; see DR 189.

Referenced by [std::basic\\_ios<\\_CharT, \\_Traits>::copyfmt\(\)](#), and [std::chrono::operator<<\(\)](#).

**precision()** [2/2]

```
streamsize std::ios_base::precision (
    streamsize __prec) [inline]
```

Changing flags.

**Parameters**

|                     |                          |
|---------------------|--------------------------|
| <code>__prec</code> | The new precision value. |
|---------------------|--------------------------|

**Returns**

The previous value of `precision()`.

**pword()**

```
void *& std::ios_base::pword (
    int __ix) [inline]
```

Access to void pointer array.

**Parameters**

|                   |                       |
|-------------------|-----------------------|
| <code>__ix</code> | Index into the array. |
|-------------------|-----------------------|

**Returns**

A reference to a `void*` associated with the index.

The `pword` function provides access to an array of pointers that can be used for any purpose. The array grows as required to hold the supplied index. All pointers in the array are initialized to 0.

The implementation reserves several indices. You should use `xalloc` to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

**register\_callback()**

```
void std::ios_base::register_callback (
    event_callback __fn,
    int __index)
```

Add the callback `__fn` with parameter `__index`.

**Parameters**

|                   |                      |
|-------------------|----------------------|
| <code>__fn</code> | The function to add. |
|-------------------|----------------------|

|                      |                                                   |
|----------------------|---------------------------------------------------|
| <code>__index</code> | The integer to pass to the function when invoked. |
|----------------------|---------------------------------------------------|

Registers a function as an event callback with an integer parameter to be passed to the function when invoked. Multiple copies of the function are allowed. If there are multiple callbacks, they are invoked in the order they were registered. References [fmtflags](#).

#### **setf()** [1/2]

```
fmtflags std::ios_base::setf (
    fmtflags __fmtfl) [inline]
```

Setting new format flags.

##### Parameters

|                      |                          |
|----------------------|--------------------------|
| <code>__fmtfl</code> | Additional flags to set. |
|----------------------|--------------------------|

##### Returns

The previous format control flags.

This function sets additional flags in format control. Flags that were previously set remain set.

References [fmtflags](#).

Referenced by [std::\\_\\_detail::operator>>\(\)](#).

#### **setf()** [2/2]

```
fmtflags std::ios_base::setf (
    fmtflags __fmtfl,
    fmtflags __mask) [inline]
```

Setting new format flags.

##### Parameters

|                      |                                   |
|----------------------|-----------------------------------|
| <code>__fmtfl</code> | Additional flags to set.          |
| <code>__mask</code>  | The flags mask for <i>fmtfl</i> . |

##### Returns

The previous format control flags.

This function clears *mask* in the format flags, then sets *fmtfl* & *mask*. An example mask is `ios_base::adjustfield`.

References [fmtflags](#).

#### **sync\_with\_stdio()**

```
bool std::ios_base::sync_with_stdio (
    bool __sync = true) [static]
```

Interaction with the standard C I/O objects.

##### Parameters

|                     |                                |
|---------------------|--------------------------------|
| <code>__sync</code> | Whether to synchronize or not. |
|---------------------|--------------------------------|

**Returns**

True if the standard streams were previously synchronized.

The synchronization referred to is *only* that between the standard C facilities (e.g., stdout) and the standard C++ objects (e.g., cout). User-declared streams are unaffected. See <https://gcc.gnu.org/onlinedocs/libstdc++/manual/fstream.html#std.io.filestreams.binary>

**unsetf()**

```
void std::ios_base::unsetf (
    fmtflags __mask) [inline]
```

Clearing format flags.

**Parameters**

|                     |                     |
|---------------------|---------------------|
| <code>__mask</code> | The flags to unset. |
|---------------------|---------------------|

This function clears `__mask` in the format flags.

References [fmtflags](#).

**width()** [1/2]

```
streamsize std::ios_base::width () const [inline], [nodiscard]
```

Flags access.

**Returns**

The minimum field width to generate on output operations.

*Minimum field width* refers to the number of characters.

Referenced by [std::basic\\_ios<\\_CharT, \\_Traits>::copyfmt\(\)](#), [std::num\\_put<\\_CharT, \\_Outiter>::do\\_put\(\)](#), [std::operator>>\(\)](#), and [std::operator>>\(\)](#).

**width()** [2/2]

```
streamsize std::ios_base::width (
    streamsize __wide) [inline]
```

Changing flags.

**Parameters**

|                     |                      |
|---------------------|----------------------|
| <code>__wide</code> | The new width value. |
|---------------------|----------------------|

**Returns**

The previous value of `width()`.

**xalloc()**

```
int std::ios_base::xalloc () throw ( ) [static]
```

Access to unique indices.

## Returns

An integer different from all previous calls.

This function returns a unique integer every time it is called. It can be used for any purpose, but is primarily intended to be a unique index for the `iword` and `pword` functions. The expectation is that an application calls `xalloc` in order to obtain an index in the `iword` and `pword` arrays that can be used without fear of conflict.

The implementation maintains a static variable that is incremented and returned on each invocation. `xalloc` is guaranteed to return an index that is safe to use in the `iword` and `pword` arrays.

## 6.534.6 Member Data Documentation

### **adjustfield**

```
const fmtflags std::ios_base::adjustfield [static]
```

A mask of `left|right|internal`. Useful for the 2-arg form of `setf`.

Referenced by `std::num_put<_CharT, _OutIter>::do_put()`, `std::internal()`, `std::left()`, and `std::right()`.

### **app**

```
const openmode std::ios_base::app [static]
```

Seek to end before each write.

Referenced by `std::basic_filebuf<char_type, traits_type>::_M_set_buffer()`, `std::basic_filebuf<_CharT, _Traits>::overflow()`, and `std::basic_filebuf<_CharT, _Traits>::xsputn()`.

### **ate**

```
const openmode std::ios_base::ate [static]
```

Open and seek to end immediately after opening.

Referenced by `std::basic_filebuf<_CharT, _Traits>::open()`.

### **badbit**

```
const iostate std::ios_base::badbit [static]
```

Indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file).

Referenced by `std::basic_istream<_CharT, _Traits>::sentry::sentry()`, `std::basic_ostream<_CharT, _Traits>::sentry::~~sentry()`, `std::basic_ios<_CharT, _Traits>::clear()`, `std::basic_ostream<_CharT, _Traits>::flush()`, `std::basic_iostream<char_type, traits_type>::clear()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_iostream<char_type, traits_type>::get()`, `std::basic_ostream<_CharT, _Traits>::operator<<()`, `std::basic_istream<_CharT, _Traits>::operator>>()`, `std::operator>>()`, `std::basic_ostream<_CharT, _Traits>::put()`, `std::basic_istream<_CharT, _Traits>::putback()`, `std::basic_istream<_CharT, _Traits>::read()`, `std::basic_istream<_CharT, char_traits<_CharT>>::read()`, `std::basic_istream<_CharT, _Traits>::readsome()`, `std::basic_istream<_CharT, _Traits>::seekg()`, `std::basic_istream<_CharT, _Traits>::seekg()`, `std::basic_istream<_CharT, _Traits>::seekg()`, `std::basic_istream<_CharT, _Traits>::tellg()`, `std::basic_istream<_CharT, _Traits>::tellg()`, and `std::ws()`.

### **basefield**

```
const fmtflags std::ios_base::basefield [static]
```

A mask of `dec|oct|hex`. Useful for the 2-arg form of `setf`.

Referenced by `std::dec()`, `std::num_get<_CharT, _InIter>::do_get()`, `std::num_put<_CharT, _OutIter>::do_put()`, `std::hex()`, and `std::oct()`.

### **beg**

```
const seekdir std::ios_base::beg [static]
```

Request a seek relative to the beginning of the stream.

Referenced by `std::basic_filebuf<_CharT, _Traits>::seekpos()`.

**binary**

```
const openmode std::ios_base::binary [static]
```

Perform input and output in binary mode (as opposed to text mode). This is probably not what you think it is; see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/fstreams.html#std.io.↔filestreams.binary>.

Referenced by `std::basic_filebuf< _CharT, _Traits >::showmanyc()`.

**boolalpha**

```
const fmtflags std::ios_base::boolalpha [static]
```

Insert/extract `bool` in alphabetic rather than numeric format.

Referenced by `std::boolalpha()`, `std::num_get< _CharT, _InIter >::do_get()`, `std::num_put< _CharT, _OutIter >::do_put()`, and `std::noboolalpha()`.

**cur**

```
const seekdir std::ios_base::cur [static]
```

Request a seek relative to the current position within the sequence.

Referenced by `std::basic_filebuf< _CharT, _Traits >::imbue()`, `std::basic_filebuf< _CharT, _Traits >::overflow()`, `std::basic_filebuf< _CharT, _Traits >::pbackfail()`, `std::basic_filebuf< _CharT, _Traits >::seekoff()`, `std::basic_stringbuf< _CharT, _Traits, std::basic_istream< _CharT, _Traits >::tellg()`, and `std::basic_ostream< _CharT, _Traits >::tellp()`.

**dec**

```
const fmtflags std::ios_base::dec [static]
```

Converts integer input or generates integer output in decimal base.

Referenced by `std::dec()`.

**end**

```
const seekdir std::ios_base::end [static]
```

Request a seek relative to the current end of the sequence.

Referenced by `std::basic_filebuf< _CharT, _Traits >::open()`, and `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`.

**eofbit**

```
const iostate std::ios_base::eofbit [static]
```

Indicates that an input operation reached the end of an input sequence.

Referenced by `std::num_get< _CharT, _InIter >::do_get()`, `std::num_get< _CharT, _InIter >::do_get()`, `std::num_get< _CharT, _InIter >::do_get()`, `std::time_get< _CharT, _InIter >::do_get()`, `std::time_get< _CharT, _InIter >::do_get_date()`, `std::time_get< _CharT, _InIter >::do_get_monthname()`, `std::time_get< _CharT, _InIter >::do_get_time()`, `std::time_get< _CharT, _InIter >::do_get_year()`, `std::basic_istream< _CharT, _Traits >::get()`, `std::basic_istream< _CharT, _Traits >::get()`, `std::time_get< _CharT, _InIter >::get()`, `std::basic_istream< _CharT, _Traits >::ignore()`, `std::basic_istream< _CharT, _Traits >::operator>>()`, `std::operator>>()`, `std::basic_istream< _CharT, char_traits< _CharT > >::peek()`, `std::basic_istream< _CharT, _Traits >::putback()`, `std::basic_istream< _CharT, _Traits >::read()`, `std::basic_istream< _CharT, _Traits >::readsome()`, `std::basic_istream< _CharT, _Traits >::seekg()`, `std::basic_istream< _CharT, char_traits< _CharT > >::seekg()`, `std::basic_istream< _CharT, _Traits >::seekg()`, `std::basic_istream< _CharT, _Traits >::unget()`, `std::basic_istream< _CharT, char_traits< _CharT > >::unget()`, and `std::ws()`.

**failbit**

```
const iostate std::ios_base::failbit [static]
```

Indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.

std::basic\_ifstream< char >::open(), std::basic\_stringbuf< \_CharT, \_Traits, \_Alloc >::overflow(), std::basic\_filebuf< \_CharT, \_Traits >::p  
std::basic\_streambuf< char\_type, traits\_type >::pubseekoff(), std::basic\_streambuf< char\_type, traits\_type >::pubseekpos(),  
std::basic\_istream< \_CharT, \_Traits >::seekg(), std::basic\_istream< \_CharT, \_Traits >::seekg(), std::basic\_streambuf< char\_type, traits  
std::basic\_stringbuf< \_CharT, \_Traits, \_Alloc >::seekoff(), std::basic\_stringbuf< char >::seekoff(), std::basic\_streambuf< char\_type, trait  
std::basic\_stringbuf< \_CharT, \_Traits, \_Alloc >::seekpos(), std::basic\_stringbuf< char >::seekpos(), std::basic\_filebuf< \_CharT, \_Traits >  
std::basic\_stringbuf< char >::showmanyc(), std::basic\_istream< \_CharT, \_Traits >::tellg(), std::basic\_filebuf< \_CharT, \_Traits >::underfl  
std::basic\_stringbuf< \_CharT, \_Traits, \_Alloc >::underflow(), and std::basic\_filebuf< \_CharT, \_Traits >::xsgetn().

**internal**

```
const fmtflags std::ios_base::internal [static]
```

Adds fill characters at a designated internal point in certain generated output, or identical to `right` if no such point is designated.

Referenced by [std::internal\(\)](#).

**left**

```
const fmtflags std::ios_base::left [static]
```

Adds fill characters on the right (final positions) of certain generated output. (I.e., the thing you print is flush left.)

Referenced by `std::num_put<_CharT, _OutIter>::do_put()`, and `std::left()`.

**oct**

```
const fmtflags std::ios_base::oct [static]
```

Converts integer input or generates integer output in octal base.

Referenced by [std::oct\(\)](#).

**out**

```
const openmode std::ios_base::out [static]
```

Open for output. Default for `ofstream` and `fstream`.

Referenced by std::basic\_fstream< char >::basic\_fstream(), std::basic\_fstream< char >::basic\_fstream(), std::basic\_fstream< char >::basic\_ofstream< char >::basic\_ofstream(), std::basic\_ofstream< char >::basic\_ofstream(), std::basic\_ofstream< char >::basic\_ofstream(), std::basic\_ostringstream< char >::basic\_ostringstream(), std::basic\_stringbuf< char >::basic\_stringbuf(), std::basic\_stringstream< char >::basic\_stringstream(), std::basic\_filebuf< char\_type, traits\_type >::M\_set\_buffer(), std::basic\_fstream< char >::open(), std::basic\_fstream< char >::open(), std::basic\_fstream< char >::open(), std::basic\_ofstream< char >::open(), std::basic\_ofstream< char >::open(), std::basic\_ofstream< char >::open(), std::basic\_filebuf< \_CharT, \_Traits >::overflow(), std::basic\_stringbuf< \_CharT, \_Traits, \_Alloc >::pubseekoff(), std::basic\_stringbuf< \_CharT, \_Traits, \_Alloc >::pbackfail(), std::basic\_streambuf< char\_type, traits\_type >::pubseekoff(), std::basic\_streambuf< char\_type, traits\_type >::pubseekpos(), std::basic\_streambuf< char\_type, traits\_type >::seekoff(), std::basic\_streambuf< \_CharT, \_Traits, \_Alloc >::seekoff(), std::basic\_stringbuf< char >::seekoff(), std::basic\_ostringstream< \_CharT, \_Traits >::seekp(), std::basic\_streambuf< char\_type, traits\_type >::seekpos(), std::basic\_stringbuf< \_CharT, \_Traits >::seekp(), std::basic\_stringbuf< char >::seekpos(), std::basic\_ostringstream< \_CharT, \_Traits >::tellp(), and std::basic\_filebuf< \_CharT, \_Traits >::xsputn.

**right**

```
const fmtflags std::ios_base::right [static]
```

Adds fill characters on the left (initial positions) of certain generated output. (I.e., the thing you print is flush right.)

Referenced by [std::right\(\)](#).

**scientific**

```
const fmtflags std::ios_base::scientific [static]
```

Generates floating-point output in scientific notation.

Referenced by `std::hexfloat()`, and `std::scientific()`.

**showbase**

```
const fmtflags std::ios_base::showbase [static]
```

Generates a prefix indicating the numeric base of generated integer output.

Referenced by [std::num\\_put<\\_CharT, \\_Outiter >::do\\_put\(\)](#), [std::noshowbase\(\)](#), and [std::showbase\(\)](#).

**showpoint**

```
const fmtflags std::ios_base::showpoint [static]
```

Generates a decimal-point character unconditionally in generated floating-point output.

Referenced by [std::noshowpoint\(\)](#), and [std::showpoint\(\)](#).

**showpos**

```
const fmtflags std::ios_base::showpos [static]
```

Generates a + sign in non-negative generated numeric output.

Referenced by [std::noshowpos\(\)](#), and [std::showpos\(\)](#).

**skipws**

```
const fmtflags std::ios_base::skipws [static]
```

Skips leading white space before certain input operations.

Referenced by [std::noskipws\(\)](#), [std::\\_\\_detail::operator>>\(\)](#), and [std::skipws\(\)](#).

**trunc**

```
const openmode std::ios_base::trunc [static]
```

Truncate an existing stream when opening. Default for ofstream.

**unitbuf**

```
const fmtflags std::ios_base::unitbuf [static]
```

Flushes output after each output operation.

Referenced by [std::basic\\_ostream<\\_CharT, \\_Traits >::sentry::~~sentry\(\)](#), [std::nounitbuf\(\)](#), and [std::unitbuf\(\)](#).

**uppercase**

```
const fmtflags std::ios_base::uppercase [static]
```

Replaces certain lowercase letters with their uppercase equivalents in generated output.

Referenced by [std::num\\_put<\\_CharT, \\_Outiter >::do\\_put\(\)](#), [std::nouppercase\(\)](#), and [std::uppercase\(\)](#).

```

### 6.541.1 Detailed Description

```
template<typename _Signature>
struct std::is_bind_expression< _Bind< _Signature > >
```

Class template `_Bind` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

## 6.542 `std::is_bind_expression< _Bind_result< _Result, _Signature > >` Struct Template Reference

```
#include <functional>
```

### 6.542.1 Detailed Description

```
template<typename _Result, typename _Signature>
struct std::is_bind_expression< _Bind_result< _Result, _Signature > >
```

Class template `_Bind_result` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

## 6.543 `std::is_bind_expression< const _Bind< _Signature > >` Struct Template Reference

```
#include <functional>
```

### 6.543.1 Detailed Description

```
template<typename _Signature>
struct std::is_bind_expression< const _Bind< _Signature > >
```

Class template `_Bind` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

## 6.544 `std::is_bind_expression< const _Bind_result< _Result, _Signature > >` Struct Template Reference

```
#include <functional>
```

### 6.544.1 Detailed Description

```
template<typename _Result, typename _Signature>
struct std::is_bind_expression< const _Bind_result< _Result, _Signature > >
```

Class template `_Bind_result` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

## 6.545 `std::is_bind_expression< const volatile _Bind< _Signature > >` Struct Template Reference

```
#include <functional>
```

### 6.545.1 Detailed Description

```
template<typename _Signature>
struct std::is_bind_expression< const volatile _Bind< _Signature > >
```

Class template `_Bind` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

## 6.546 `std::is_bind_expression< const volatile _Bind_result< _Result, _Signature > >` Struct Template Reference

```
#include <functional>
```

### 6.546.1 Detailed Description

```
template<typename _Result, typename _Signature>
struct std::is_bind_expression< const volatile _Bind_result< _Result, _Signature > >
```

Class template `_Bind_result` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

## 6.547 `std::is_bind_expression< volatile _Bind< _Signature > >` Struct Template Reference

```
#include <functional>
```

### 6.547.1 Detailed Description

```
template<typename _Signature>
struct std::is_bind_expression< volatile _Bind< _Signature > >
```

Class template `_Bind` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

## 6.548 `std::is_bind_expression< volatile _Bind_result< _Result, _Signature > > >` Struct Template Reference

```
#include <functional>
```

### 6.548.1 Detailed Description

```
template<typename _Result, typename _Signature>
struct std::is_bind_expression< volatile _Bind_result< _Result, _Signature > >
```

Class template `_Bind_result` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

## 6.549 `std::is_class< _Tp >` Struct Template Reference

```
#include <type_traits>
```

### 6.549.1 Detailed Description

```
template<typename _Tp>
struct std::is_class< _Tp >
```

`is_class`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.550 `std::is_compound< _Tp >` Struct Template Reference

```
#include <type_traits>
```

### 6.550.1 Detailed Description

```
template<typename _Tp>
struct std::is_compound< _Tp >
```

`is_compound`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.551 `std::is_const< _Tp >` Struct Template Reference

```
#include <type_traits>
```

### 6.551.1 Detailed Description

```
template<typename _Tp>
struct std::is_const< _Tp >
```

`is_const`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.552 `std::is_constructible<_Tp, _Args>` Struct Template Reference

```
#include <type_traits>
```

### 6.552.1 Detailed Description

```
template<typename _Tp, typename... _Args>  
struct std::is_constructible<_Tp, _Args>
```

`is_constructible`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.553 `std::is_copy_assignable<_Tp>` Struct Template Reference

```
#include <type_traits>
```

### 6.553.1 Detailed Description

```
template<typename _Tp>  
struct std::is_copy_assignable<_Tp>
```

`is_copy_assignable`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.554 `std::is_copy_constructible<_Tp>` Struct Template Reference

```
#include <type_traits>
```

### 6.554.1 Detailed Description

```
template<typename _Tp>  
struct std::is_copy_constructible<_Tp>
```

`is_copy_constructible`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.555 `std::is_default_constructible<_Tp>` Struct Template Reference

```
#include <type_traits>
```

### 6.555.1 Detailed Description

```
template<typename _Tp>  
struct std::is_default_constructible<_Tp>
```

`is_default_constructible`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.556 `std::is_destructible<_Tp>` Struct Template Reference

```
#include <type_traits>
```

#### 6.556.1 Detailed Description

```
template<typename _Tp>
struct std::is_destructible< _Tp >
```

is\_destructible

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 6.557 std::is\_empty< \_Tp > Struct Template Reference

```
#include <type_traits>
```

##### 6.557.1 Detailed Description

```
template<typename _Tp>
struct std::is_empty< _Tp >
```

is\_empty

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 6.558 std::is\_enum< \_Tp > Struct Template Reference

```
#include <type_traits>
```

##### 6.558.1 Detailed Description

```
template<typename _Tp>
struct std::is_enum< _Tp >
```

is\_enum

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

#### 6.559 std::is\_error\_code\_enum< \_Tp > Struct Template Reference

```
#include <system_error>
```

##### 6.559.1 Detailed Description

```
template<typename _Tp>
struct std::is_error_code_enum< _Tp >
```

is\_error\_code\_enum

The documentation for this struct was generated from the following file:

- [system\\_error](#)

#### 6.560 std::is\_error\_code\_enum< future\_errc > Struct Reference

```
#include <future>
```

**6.560.1 Detailed Description**

Specialization that allows `future_errc` to convert to `error_code`.  
 The documentation for this struct was generated from the following file:

- [future](#)

**6.561 `std::is_error_condition_enum< _Tp >` Struct Template Reference**

```
#include <system_error>
```

**6.561.1 Detailed Description**

```
template<typename _Tp>
struct std::is_error_condition_enum< _Tp >
```

`is_error_condition_enum`

The documentation for this struct was generated from the following file:

- [system\\_error](#)

**6.562 `std::is_floating_point< _Tp >` Struct Template Reference**

```
#include <type_traits>
```

Inheritance diagram for `std::is_floating_point< _Tp >`:

**6.562.1 Detailed Description**

```
template<typename _Tp>
struct std::is_floating_point< _Tp >
```

`is_floating_point`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

**6.563 `std::is_function< _Tp >` Struct Template Reference**

```
#include <type_traits>
```

### 6.563.1 Detailed Description

```
template<typename _Tp>
struct std::is_function< _Tp >
```

is\_function

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.564 std::is\_fundamental< \_Tp > Struct Template Reference

```
#include <type_traits>
```

### 6.564.1 Detailed Description

```
template<typename _Tp>
struct std::is_fundamental< _Tp >
```

is\_fundamental

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.565 std::is\_integral< \_Tp > Struct Template Reference

```
#include <type_traits>
```

### 6.565.1 Detailed Description

```
template<typename _Tp>
struct std::is_integral< _Tp >
```

is\_integral

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.566 std::is\_layout\_compatible< \_Tp, \_Up > Struct Template Reference

```
#include <type_traits>
```

### 6.566.1 Detailed Description

```
template<typename _Tp, typename _Up>
struct std::is_layout_compatible< _Tp, _Up >
```

- Remove references and cv-qualifiers.

Since

C++20

C++20

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.567 `std::is_literal_type< _Tp >` Struct Template Reference

```
#include <type_traits>
```

### 6.567.1 Detailed Description

```
template<typename _Tp>  
struct std::is_literal_type< _Tp >
```

`is_literal_type`

**Deprecated** Deprecated in C++17, removed in C++20. The idea of a literal type isn't useful.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.568 `std::is_lvalue_reference< typename >` Struct Template Reference

```
#include <type_traits>
```

### 6.568.1 Detailed Description

```
template<typename>  
struct std::is_lvalue_reference< typename >
```

`is_lvalue_reference`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.569 `std::is_member_function_pointer< _Tp >` Struct Template Reference

```
#include <type_traits>
```

### 6.569.1 Detailed Description

```
template<typename _Tp>  
struct std::is_member_function_pointer< _Tp >
```

`is_member_function_pointer`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.570 `std::is_member_object_pointer< _Tp >` Struct Template Reference

```
#include <type_traits>
```

### 6.570.1 Detailed Description

```
template<typename _Tp>  
struct std::is_member_object_pointer< _Tp >
```

`is_member_object_pointer`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

**6.571 std::is\_member\_pointer< \_Tp > Struct Template Reference**

```
#include <type_traits>
```

**6.571.1 Detailed Description**

```
template<typename _Tp>
struct std::is_member_pointer< _Tp >
```

is\_member\_pointer

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

**6.572 std::is\_move\_assignable< \_Tp > Struct Template Reference**

```
#include <type_traits>
```

**6.572.1 Detailed Description**

```
template<typename _Tp>
struct std::is_move_assignable< _Tp >
```

is\_move\_assignable

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

**6.573 std::is\_move\_constructible< \_Tp > Struct Template Reference**

```
#include <type_traits>
```

**6.573.1 Detailed Description**

```
template<typename _Tp>
struct std::is_move_constructible< _Tp >
```

is\_move\_constructible

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

**6.574 std::is\_nothrow\_assignable< \_Tp, \_Up > Struct Template Reference**

```
#include <type_traits>
```

**6.574.1 Detailed Description**

```
template<typename _Tp, typename _Up>
struct std::is_nothrow_assignable< _Tp, _Up >
```

is\_nothrow\_assignable

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

**6.575 std::is\_nothrow\_constructible< \_Tp, \_Args > Struct Template Reference**

```
#include <type_traits>
```

#### 6.575.1 Detailed Description

```
template<typename _Tp, typename... _Args>
struct std::is_nothrow_constructible<_Tp, _Args>
```

`is_nothrow_constructible`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

### 6.576 `std::is_nothrow_copy_assignable<_Tp>` Struct Template Reference

```
#include <type_traits>
```

#### 6.576.1 Detailed Description

```
template<typename _Tp>
struct std::is_nothrow_copy_assignable<_Tp>
```

`is_nothrow_copy_assignable`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

### 6.577 `std::is_nothrow_copy_constructible<_Tp>` Struct Template Reference

```
#include <type_traits>
```

#### 6.577.1 Detailed Description

```
template<typename _Tp>
struct std::is_nothrow_copy_constructible<_Tp>
```

`is_nothrow_copy_constructible`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

### 6.578 `std::is_nothrow_default_constructible<_Tp>` Struct Template Reference

```
#include <type_traits>
```

#### 6.578.1 Detailed Description

```
template<typename _Tp>
struct std::is_nothrow_default_constructible<_Tp>
```

`is_nothrow_default_constructible`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

### 6.579 `std::is_nothrow_destructible<_Tp>` Struct Template Reference

```
#include <type_traits>
```

### 6.579.1 Detailed Description

```
template<typename _Tp>
struct std::is_nothrow_destructible< _Tp >
```

is\_nothrow\_destructible

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.580 std::is\_nothrow\_move\_assignable< \_Tp > Struct Template Reference

```
#include <type_traits>
```

### 6.580.1 Detailed Description

```
template<typename _Tp>
struct std::is_nothrow_move_assignable< _Tp >
```

is\_nothrow\_move\_assignable

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.581 std::is\_nothrow\_move\_constructible< \_Tp > Struct Template Reference

```
#include <type_traits>
```

### 6.581.1 Detailed Description

```
template<typename _Tp>
struct std::is_nothrow_move_constructible< _Tp >
```

is\_nothrow\_move\_constructible

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.582 std::is\_object< \_Tp > Struct Template Reference

```
#include <type_traits>
```

### 6.582.1 Detailed Description

```
template<typename _Tp>
struct std::is_object< _Tp >
```

is\_object

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.583 std::is\_placeholder< \_Tp > Struct Template Reference

```
#include <functional>
```

Inheritance diagram for `std::is_placeholder<_Tp>`:

### Public Types

- using **type**
- using **value\_type**

### Public Member Functions

- constexpr **operator value\_type** () const noexcept

### Static Public Attributes

- static constexpr int **value**

#### 6.583.1 Detailed Description

```
template<typename _Tp>
struct std::is_placeholder<_Tp>
```

Determines if the given type `_Tp` is a placeholder in a `bind()` expression and, if so, which placeholder it is.  
C++11 [func.bind.isplace].

Since

C++11

The documentation for this struct was generated from the following file:

- [functional](#)

## 6.584 `std::is_placeholder<_Placeholder<_Num>>` Struct Template Reference

```
#include <functional>
```

Inheritance diagram for `std::is_placeholder<_Placeholder<_Num>>`:

### Public Types

- using **type**
- using **value\_type**

### Public Member Functions

- constexpr **operator value\_type** () const noexcept

### Static Public Attributes

- static constexpr int **value**

#### 6.584.1 Detailed Description

```
template<int _Num>
struct std::is_placeholder<_Placeholder<_Num>>
```

Partial specialization of `is_placeholder` that provides the placeholder number for the placeholder objects defined by `libstdc++`.

Since

C++11

The documentation for this struct was generated from the following file:

- [functional](#)

### 6.585 std::is\_pod<\_Tp> Struct Template Reference

```
#include <type_traits>
```

#### 6.585.1 Detailed Description

```
template<typename _Tp>
struct std::is_pod<_Tp>
```

`is_pod`

**Deprecated** Deprecated in C++20. Use `is_standard_layout` && `is_trivial` instead.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.586 `std::is_pointer< _Tp >` Struct Template Reference

```
#include <type_traits>
```

### 6.586.1 Detailed Description

```
template<typename _Tp>
struct std::is_pointer< _Tp >
```

`is_pointer`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.587 `std::is_pointer_interconvertible_base_of< _Base, _Derived >` Struct Template Reference

```
#include <type_traits>
```

### 6.587.1 Detailed Description

```
template<typename _Base, typename _Derived>
struct std::is_pointer_interconvertible_base_of< _Base, _Derived >
```

True if `_Derived` is standard-layout and has a base class of type `_Base`

Since

C++20

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.588 `std::is_polymorphic< _Tp >` Struct Template Reference

```
#include <type_traits>
```

### 6.588.1 Detailed Description

```
template<typename _Tp>
struct std::is_polymorphic< _Tp >
```

`is_polymorphic`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.589 `std::is_reference< _Tp >` Struct Template Reference

```
#include <type_traits>
```

### 6.589.1 Detailed Description

```
template<typename _Tp>
struct std::is_reference< _Tp >
```

is\_reference

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.590 std::is\_rvalue\_reference< typename > Struct Template Reference

```
#include <type_traits>
```

### 6.590.1 Detailed Description

```
template<typename>
struct std::is_rvalue_reference< typename >
```

is\_rvalue\_reference

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.591 std::is\_same< \_Tp, \_Up > Struct Template Reference

```
#include <type_traits>
```

### 6.591.1 Detailed Description

```
template<typename _Tp, typename _Up>
struct std::is_same< _Tp, _Up >
```

is\_same

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.592 std::is\_scalar< \_Tp > Struct Template Reference

```
#include <type_traits>
```

### 6.592.1 Detailed Description

```
template<typename _Tp>
struct std::is_scalar< _Tp >
```

is\_scalar

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.593 std::is\_signed< \_Tp > Struct Template Reference

```
#include <type_traits>
```

### 6.593.1 Detailed Description

```
template<typename _Tp>
struct std::is_signed< _Tp >
```

`is_signed`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.594 `std::is_standard_layout< _Tp >` Struct Template Reference

```
#include <type_traits>
```

### 6.594.1 Detailed Description

```
template<typename _Tp>
struct std::is_standard_layout< _Tp >
```

`is_standard_layout`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.595 `std::is_trivial< _Tp >` Struct Template Reference

```
#include <type_traits>
```

### 6.595.1 Detailed Description

```
template<typename _Tp>
struct std::is_trivial< _Tp >
```

`is_trivial`

**Deprecated** Deprecated in C++26. Use a combination of one or more more specialized type traits instead, such as `is_trivially_default_constructible`, `is_trivially_copy_constructible`, `is_trivially_copy_assignable`, etc., depending on the exact check(s) needed.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.596 `std::is_trivially_assignable< _Tp, _Up >` Struct Template Reference

```
#include <type_traits>

- bool **operator==** (const `istream_iterator` &\_\_x, const `istream_iterator` &\_\_y) noexcept

### 6.609.1 Detailed Description

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename _Dist = ptrdiff_t>
```

```
class std::istream_iterator< _Tp, _CharT, _Traits, _Dist >
```

Provides input iterator semantics for streams.

### 6.609.2 Member Typedef Documentation

#### difference\_type

```
typedef ptrdiff_t std::iterator< input_iterator_tag, _Tp, ptrdiff_t, const _Tp *, const _Tp & >::difference_type [inherited]
```

Distance between iterators is represented as this type.

#### iterator\_category

```
typedef input_iterator_tag std::iterator< input_iterator_tag, _Tp, ptrdiff_t, const _Tp *, const _Tp & >::iterator_category [inherited]
```

One of the [tag types](#).

#### pointer

```
typedef const _Tp * std::iterator< input_iterator_tag, _Tp, ptrdiff_t, const _Tp *, const _Tp & >::pointer [inherited]
```

This type represents a pointer-to-value\_type.

#### reference

```
typedef const _Tp & std::iterator< input_iterator_tag, _Tp, ptrdiff_t, const _Tp *, const _Tp & >::reference [inherited]
```

This type represents a reference-to-value\_type.

#### value\_type

```
typedef _Tp std::iterator< input_iterator_tag, _Tp, ptrdiff_t, const _Tp *, const _Tp & >::value_type [inherited]
```

The type "pointed to" by the iterator.

### 6.609.3 Constructor & Destructor Documentation

#### istream\_iterator() [1/2]

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename _Dist = ptrdiff_t>
```

```
std::istream_iterator< _Tp, _CharT, _Traits, _Dist >::istream_iterator () [inline], [constexpr], [noexcept]
```

Construct end of input stream iterator.

Referenced by [operator==](#).

#### istream\_iterator() [2/2]

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename _Dist = ptrdiff_t>
```

```
std::istream_iterator< _Tp, _CharT, _Traits, _Dist >::istream_iterator (istream_type & __s) [inline]
```

Construct start of input stream iterator.

References [std::\\_\\_addressof\(\)](#).

#### 6.609.4 Friends And Related Symbol Documentation

##### operator==

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename
_Dist = ptrdiff_t>
bool operator== (
    const istream_iterator< _Tp, _CharT, _Traits, _Dist > & __x,
    const istream_iterator< _Tp, _CharT, _Traits, _Dist > & __y) [friend]
```

Return true if the iterators refer to the same stream, or are both at end-of-stream.

References [istream\\_iterator\(\)](#).

The documentation for this class was generated from the following file:

- [stream\\_iterator.h](#)

## 6.610 std::istreambuf\_iterator< \_CharT, \_Traits > Class Template Reference

### 6.610.1 Detailed Description

```
template<typename _CharT, typename _Traits>
class std::istreambuf_iterator< _CharT, _Traits >
```

Provides input iterator semantics for streambufs.

### 6.610.2 Member Typedef Documentation

#### char\_type

```
template<typename _CharT, typename _Traits>
typedef _CharT std::istreambuf\_iterator< _CharT, _Traits >::char_type
```

Public typedefs.

#### difference\_type

```
typedef _Traits::off_type std::iterator< input\_iterator\_tag, _CharT, _Traits::off_type, _CharT *,
_Chart >::difference_type [inherited]
```

Distance between iterators is represented as this type.

**int\_type**

```
template<typename _CharT, typename _Traits>
typedef _Traits::int_type std::istreambuf_iterator< _CharT, _Traits >::int_type
Public typedefs.
```

**istream\_type**

```
template<typename _CharT, typename _Traits>
typedef basic_istream<_CharT, _Traits> std::istreambuf_iterator< _CharT, _Traits >::istream_type
Public typedefs.
```

**iterator\_category**

```
typedef input_iterator_tag std::iterator< input_iterator_tag, _CharT, _Traits::off_type, _CharT *,
_Chart >::iterator_category [inherited]
One of the tag types.
```

**pointer**

```
template<typename _CharT, typename _Traits>
using std::istreambuf_iterator< _CharT, _Traits >::pointer
Public typedefs.
```

**reference**

```
typedef _CharT std::iterator< input_iterator_tag, _CharT, _Traits::off_type, _CharT *, _CharT >↵
::reference [inherited]
This type represents a reference-to-value_type.
```

**streambuf\_type**

```
template<typename _CharT, typename _Traits>
typedef basic_streambuf<_CharT, _Traits> std::istreambuf_iterator< _CharT, _Traits >::streambuf↵
_type
Public typedefs.
```

**traits\_type**

```
template<typename _CharT, typename _Traits>
typedef _Traits std::istreambuf_iterator< _CharT, _Traits >::traits_type
Public typedefs.
```

**value\_type**

```
typedef _CharT std::iterator< input_iterator_tag, _CharT, _Traits::off_type, _CharT *, _CharT >↵
::value_type [inherited]
The type "pointed to" by the iterator.
```

**6.610.3 Constructor & Destructor Documentation****istreambuf\_iterator() [1/3]**

```
template<typename _CharT, typename _Traits>
std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator () [inline], [constexpr], [noexcept]
Construct end of input stream iterator.
Referenced by equal\(\), and operator++\(\).
```

**istreambuf\_iterator()** [2/3]

```
template<typename _CharT, typename _Traits>
std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator (
    istream_type & __s) [inline], [noexcept]
```

Construct start of input stream iterator.

**istreambuf\_iterator()** [3/3]

```
template<typename _CharT, typename _Traits>
std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator (
    streambuf_type * __s) [inline], [noexcept]
```

Construct start of streambuf iterator.

**6.610.4 Member Function Documentation****equal()**

```
template<typename _CharT, typename _Traits>
bool std::istreambuf_iterator< _CharT, _Traits >::equal (
    const istreambuf_iterator< _CharT, _Traits > & __b) const [inline], [nodiscard]
```

Return true both iterators are end or both are not end.

References [istreambuf\\_iterator\(\)](#).

**operator\*()**

```
template<typename _CharT, typename _Traits>
char_type std::istreambuf_iterator< _CharT, _Traits >::operator* () const [inline], [nodiscard]
```

Return the current character pointed to by iterator. This returns streambuf.sgetc(). It cannot be assigned. NB: The result of operator\*() on an end of stream is undefined.

**operator++()** [1/2]

```
template<typename _CharT, typename _Traits>
istreambuf_iterator & std::istreambuf_iterator< _CharT, _Traits >::operator++ () [inline]
```

Advance the iterator. Calls streambuf.sbumpc().

**operator++()** [2/2]

```
template<typename _CharT, typename _Traits>
istreambuf_iterator std::istreambuf_iterator< _CharT, _Traits >::operator++ (
    int ) [inline]
```

Advance the iterator. Calls streambuf.sbumpc().

References [istreambuf\\_iterator\(\)](#).

The documentation for this class was generated from the following files:

- [iosfwd](#)
- [streambuf\\_iterator.h](#)

**6.611 \_\_gnu\_pbds::detail::pat\_trie\_base::\_Inode< \_ATraits, Metadata >::iterator Struct Reference**

```

- bool `operator==` (const `iterator` &\_\_lhs, const `iterator` &\_\_rhs) noexcept
- class `path`

**6.613.1 Detailed Description**

An iterator for the components of a path.

Since

C++17

The documentation for this class was generated from the following file:

- [bits/fs\\_path.h](#)

**6.614 `std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >` Struct Template Reference**

```
#include <stl_iterator_base_types.h>
```

Inheritance diagram for `std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >`:

## Public Types

- typedef `_Distance` [difference\\_type](#)
- typedef `_Category` [iterator\\_category](#)
- typedef `_Pointer` [pointer](#)
- typedef `_Reference` [reference](#)
- typedef `_Tp` [value\\_type](#)

### 6.614.1 Detailed Description

**template**<typename `_Category`, typename `_Tp`, typename `_Distance` = `ptrdiff_t`, typename `_Pointer` = `_Tp*`, typename `_Reference` = `_Tp&`>

**struct** `std::iterator`< `_Category`, `_Tp`, `_Distance`, `_Pointer`, `_Reference` >

Common iterator class.

This class does nothing but define nested typedefs. Iterator classes can inherit from this class to save some work. The typedefs are then used in specializations and overloading.

In particular, there are no default implementations of requirements such as `operator++` and the like. (How could there be?)

### 6.614.2 Member Typedef Documentation

#### `difference_type`

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,
typename _Reference = _Tp&>
```

```
typedef _Distance std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::difference_type
```

Distance between iterators is represented as this type.

#### `iterator_category`

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,
typename _Reference = _Tp&>
```

```
typedef _Category std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::iterator_category
```

One of the [tag types](#).

#### `pointer`

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,
typename _Reference = _Tp&>
```

```
typedef _Pointer std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::pointer
```

This type represents a pointer-to-value\_type.

#### `reference`

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,
typename _Reference = _Tp&>
```

```
typedef _Reference std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::reference
```

This type represents a reference-to-value\_type.

#### `value_type`

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,
typename _Reference = _Tp&>
```

```
typedef _Tp std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::value_type
```

The type "pointed to" by the iterator.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

## 6.615 `std::iterator_traits<_Iterator>` Struct Template Reference

### 6.615.1 Detailed Description

**template**<typename `_Iterator`>

**struct** `std::iterator_traits<_Iterator>`

Traits class for iterators.

This class does nothing but define nested typedefs. The general version simply *forwards* the nested typedefs from the `Iterator` argument. Specialized versions for pointers and pointers-to-const provide tighter, more correct semantics.

The documentation for this struct was generated from the following file:

- [iterator\\_concepts.h](#)

## 6.616 `std::iterator_traits<_Tp*>` Struct Template Reference

```
#include <stl_iterator_base_types.h>
```

### Public Types

- using `difference_type`
- using `iterator_category`
- using `iterator_concept`
- using `pointer`
- using `reference`
- using `value_type`

### 6.616.1 Detailed Description

**template**<typename `_Tp`>

**requires** `is_object_v<_Tp>`

**struct** `std::iterator_traits<_Tp*>`

Partial specialization for object pointer types.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

## 6.617 `__gnu_pbds::join_error` Struct Reference

```
#include <exception.hpp>
```

Inheritance diagram for `__gnu_pbds::join_error`:

### Public Member Functions

- virtual const char \* [what](#) () const noexcept

#### 6.617.1 Detailed Description

A join cannot be performed logical reasons (i.e., the ranges of the two container objects being joined overlaps.

#### 6.617.2 Member Function Documentation

##### what()

```
virtual const char * std::logic_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this struct was generated from the following file:

- [exception.hpp](#)

#### 6.618 `__gnu_pbds::detail::left_child_next_sibling_heap< Value_Type, Cmp_Fn, Node_Metadata, _Alloc >` Class Template Reference

### 6.619.1 Detailed Description

template<typename Node, typename \_Alloc>

class \_\_gnu\_pbds::detail::left\_child\_next\_sibling\_heap\_const\_iterator\_< Node, \_Alloc >

Const point-type iterator.

### 6.619.2 Member Typedef Documentation

#### const\_pointer

template<typename Node, typename \_Alloc>

typedef [base\\_type::const\\_pointer](#) [\\_\\_gnu\\_pbds::detail::left\\_child\\_next\\_sibling\\_heap\\_const\\_iterator\\_](#)< Node, \_Alloc >::const\_pointer

Iterator's const pointer type.

#### const\_reference

template<typename Node, typename \_Alloc>

typedef [base\\_type::const\\_reference](#) [\\_\\_gnu\\_pbds::detail::left\\_child\\_next\\_sibling\\_heap\\_const\\_iterator\\_](#)< Node, \_Alloc >::const\_reference

Iterator's const reference type.

**difference\_type**

```
template<typename Node, typename _Alloc>
typedef _Alloc::difference_type __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::difference_type
Difference type.
```

**iterator\_category**

```
template<typename Node, typename _Alloc>
typedef std::forward_iterator_tag __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::iterator_category
Category.
```

**pointer**

```
template<typename Node, typename _Alloc>
typedef base_type::pointer __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::pointer
Iterator's pointer type.
```

**reference**

```
template<typename Node, typename _Alloc>
typedef base_type::reference __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::reference
Iterator's reference type.
```

**value\_type**

```
template<typename Node, typename _Alloc>
typedef base_type::value_type __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::value_type
Iterator's value type.
```

**6.619.3 Constructor & Destructor Documentation****left\_child\_next\_sibling\_heap\_const\_iterator\_()** [1/2]

```
template<typename Node, typename _Alloc>
__gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >::left_child_↵
next_sibling_heap_const_iterator_ () [inline]
Default constructor.
```

**left\_child\_next\_sibling\_heap\_const\_iterator\_()** [2/2]

```
template<typename Node, typename _Alloc>
__gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >::left_child_↵
next_sibling_heap_const_iterator_ (
    const left_child_next_sibling_heap_const_iterator_< Node, _Alloc > & other) [inline]
Copy constructor.
```

**6.619.4 Member Function Documentation****operator"!="()** [1/2]

```
template<typename Node, typename _Alloc>
```

```
bool __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >::operator!=
(
    const left_child_next_sibling_heap_const_iterator_< Node, _Alloc > & other) const
[inline]
```

Compares content (negatively) to a different iterator object.

#### **operator"!=()" [2/2]**

```
template<typename Node, typename _Alloc>
bool __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc
>::operator!= (
    const left_child_next_sibling_heap_node_point_const_iterator_< Node, _Alloc > &
other) const [inline], [inherited]
```

Compares content (negatively) to a different iterator object.

#### **operator\*()**

```
template<typename Node, typename _Alloc>
const_reference __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_<
Node, _Alloc >::operator* () const [inline], [inherited]
```

Access.

#### **operator->()**

```
template<typename Node, typename _Alloc>
const_pointer __gnu_pbds::detail::left_child_next_sibling_heap_node_point_const_iterator_< Node,

### 6.630.1 Detailed Description

`template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>`  
`class std::linear_congruential_engine<_UIntType, __a, __c, __m>`

A model of a linear congruential random number generator.

A random number generator that produces pseudorandom numbers via linear function:

$$x_{i+1} \leftarrow (ax_i + c) \bmod m$$

The template parameter `_UIntType` must be an unsigned integral type large enough to store values up to (`__m-1`). If the template parameter `__m` is 0, the modulus `__m` used is `std::numeric_limits<_UIntType>::max()` plus 1. Otherwise, the template parameters `__a` and `__c` must be less than `__m`.

The size of the state is 1.

Since

C++11

### 6.630.2 Member Typedef Documentation

#### result\_type

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
typedef _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::result_type
```

The type of the generated random value.

### 6.630.3 Constructor & Destructor Documentation

#### linear\_congruential\_engine() [1/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine () [inline]
```

Constructs a linear\_congruential\_engine random number generator engine with seed 1.

#### linear\_congruential\_engine() [2/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine (
    result_type __s) [inline], [explicit]
```

Constructs a linear\_congruential\_engine random number generator engine with seed \_\_s. The default seed value is 1.

##### Parameters

<code>__s</code>	The initial seed value.
------------------	-------------------------

#### linear\_congruential\_engine() [3/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine (
    _Sseq & __q) [inline], [explicit]
```

Constructs a linear\_congruential\_engine random number generator engine seeded from the seed sequence \_\_q.

##### Parameters

<code>__q</code>	the seed sequence.
------------------	--------------------

### 6.630.4 Member Function Documentation

#### discard()

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
void std::linear_congruential_engine< _UIntType, __a, __c, __m >::discard (
    unsigned long long __z) [inline]
```

Discard a sequence of random numbers.

**max()**

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
constexpr result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::max () [inline],
[static], [constexpr]
```

Gets the largest possible value in the output range.

**min()**

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
constexpr result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::min () [inline],
[static], [constexpr]
```

Gets the smallest possible value in the output range.

The minimum depends on the `__c` parameter: if it is zero, the minimum generated must be  $> 0$ , otherwise 0 is allowed.

**operator()()**

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::operator() () [inline]
```

Gets the next random number in the sequence.

**seed()** [1/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq>
_If_seed_seq< _Sseq > std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed (
    _Sseq & __q)
```

Reseeds the `linear_congruential_engine` random number generator engine sequence using values from the seed sequence `__q`.

**Parameters**

<code>__q</code>	the seed sequence.
------------------	--------------------

**seed()** [2/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq>
auto std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed (
    _Sseq & __q) -> _If_seed_seq<_Sseq>
```

Seeds the LCR engine with a value generated by `__q`.

**seed()** [3/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
void std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed (
    result_type __s = default_seed)
```

Reseeds the `linear_congruential_engine` random number generator engine sequence to the seed `__s`.

**Parameters**

<code>__s</code>	The new seed.
------------------	---------------

Seeds the LCR with integral value \_\_s, adjusted so that the ring identity is never a member of the convergence set.

Referenced by [std::linear\\_congruential\\_engine< uint\\_fast32\\_t, 16807UL, 0UL, 2147483647UL >::linear\\_congruential\\_engine\(\)](#), and [std::linear\\_congruential\\_engine< uint\\_fast32\\_t, 16807UL, 0UL, 2147483647UL >::linear\\_congruential\\_engine\(\)](#).

### 6.630.5 Friends And Related Symbol Documentation

#### operator<<

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _UIntType1, _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT,
typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::linear_congruential_engine< _UIntType1, __a1, __c1, __m1 > & __lcr) [friend]
```

Writes the textual representation of the state x(i) of x to \_\_os.

#### Parameters

<code>__os</code>	The output stream.
<code>__lcr</code>	A % linear_congruential_engine random number generator.

#### Returns

`__os`.

#### operator==

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
bool operator== (
    const linear_congruential_engine< _UIntType, __a, __c, __m > & __lhs,
    const linear_congruential_engine< _UIntType, __a, __c, __m > & __rhs) [friend]
```

Compares two linear congruential random number generator objects of the same type for equality.

#### Parameters

<code>__lhs</code>	A linear congruential random number generator object.
<code>__rhs</code>	Another linear congruential random number generator object.

#### Returns

true if the infinite sequences of generated values would be equal, false otherwise.

#### operator>>

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _UIntType1, _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT,
typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::linear_congruential_engine< _UIntType1, __a1, __c1, __m1 > & __lcr) [friend]
```

Sets the state of the engine by reading its textual representation from `__is`.

The textual representation must have been previously written using an output stream whose imbued locale and whose type's template specialization arguments `_CharT` and `_Traits` were the same as those of `__is`.

## Parameters

<code>__is</code>	The input stream.
<code>__lcr</code>	A % linear_congruential_engine random number generator.

## Returns

`__is`.

## 6.630.6 Member Data Documentation

## increment

```
template<typename UIntType, UIntType __a, UIntType __c, UIntType __m>
result_type std::linear_congruential_engine< UIntType, __a, __c, __m >::increment [static],
[constexpr]
An increment.
```

## modulus

```
template<typename UIntType, UIntType __a, UIntType __c, UIntType __m>
result_type std::linear_congruential_engine< UIntType, __a, __c, __m >::modulus [static], [constexpr]
The modulus.
```

## multiplier

```
template<typename UIntType, UIntType __a, UIntType __c, UIntType __m>
result_type std::linear_congruential_engine< UIntType, __a, __c, __m >::multiplier [static],
[constexpr]
The multiplier.
```

### 6.633.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::list< _Tp, _Alloc >
```

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

#### Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `at` and `operator[]`.

This is a *doubly linked* list. Traversal up and down the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike `std::vector` and `std::deque`, random-access iterators are not provided, so subscripting (`[]`) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.

Also unlike the other standard containers, `std::list` provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

A couple points on memory allocation for `list<Tp>`:

First, we never actually allocate a `Tp`, we allocate `List_node<Tp>`'s and trust [20.1.5]/4 to DTRT. This is to ensure that after elements from `list<X,Alloc1>` are spliced into `list<X,Alloc2>`, destroying the memory of the second list is a valid operation, i.e., `Alloc1` giveth and `Alloc2` taketh away.

Second, a list conceptually represented as

```
A <---> B <---> C <---> D
```

is actually circular; a link exists between A and D. The list class holds (as its only data member) a private `list::iterator` pointing to *D*, not to *A*! To get to the head of the list, we start at the tail and move forward by one. When this member iterator's `next/previous` pointers refer to itself, the list is empty.

### 6.633.2 Constructor & Destructor Documentation

#### `list()` [1/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list () [default]
```

Creates a list with no elements.

Referenced by [erase\(\)](#), [insert\(\)](#), [insert\(\)](#), [insert\(\)](#), [merge\(\)](#), [merge\(\)](#), [operator=\(\)](#), [remove\(\)](#), [remove\\_if\(\)](#), [unique\(\)](#), and [unique\(\)](#).

#### `list()` [2/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
    const allocator_type & __a) [inline], [explicit], [noexcept]
```

Creates a list with no elements.

#### Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

**list()** [3/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc >::list (
    size_type __n,
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a list with default constructed elements.

**Parameters**

 <code>__n</code>	The number of elements to initially create.
 <code>__a</code>	An allocator object.

This constructor fills the list with `__n` default constructed elements.

**list()** [4/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc >::list (
    size_type __n,
    const value_type & __value,
    const allocator_type & __a = allocator_type()) [inline]
```

Creates a list with copies of an exemplar element.

**Parameters**

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__a</code>	An allocator object.

This constructor fills the list with `__n` copies of `__value`.

**list()** [5/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc >::list (
    const list<_Tp, _Alloc > & __x) [inline]
```

List copy constructor.

**Parameters**

 <code>__x</code>	A list of identical element and allocator types.
--	--

The newly-created list uses a copy of the allocation object used by `__x` (unless the allocator traits dictate a different object).

**list()** [6/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc >::list (
    list<_Tp, _Alloc > && ) [default]
```

List move constructor.

The newly-created list contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified list.

#### **list()** [7/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
    initializer_list< value_type > __l,
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a list from an initializer\_list.

##### Parameters

 <code>__l</code>	An initializer_list of value_type.
 <code>__a</code>	An allocator object.

Create a list consisting of copies of the elements in the initializer\_list `__l`. This is linear in `__l.size()`.

#### **list()** [8/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
std::list< _Tp, _Alloc >::list (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a list from a range.

##### Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__a</code>	An allocator object.

Create a list consisting of copies of the elements from `[__first, __last)`. This is linear in `N` (where `N` is `distance(__first, __last)`).

#### **~list()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::~~list () [default]
```

No explicit dtor needed as the `_Base` dtor takes care of things. The `_Base` dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

### 6.633.3 Member Function Documentation

#### **\_M\_create\_node()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename... _Args>
```

```
_Node_ptr std::list<_Tp, _Alloc>::_M_create_node (  
    _Args &&... __args) [inline], [protected]
```

## Parameters

<code>__args</code>	An instance of user data.
---------------------	---------------------------

Allocates space for a new node and constructs a copy of `__args` in it.  
Referenced by [emplace\(\)](#), and [insert\(\)](#).

**assign()** [1/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
void std::list< _Tp, _Alloc >::assign (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Assigns a range to a list.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a list with copies of the elements in the range `[__first,__last)`.

Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned.

**assign()** [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::assign (
    initializer_list< value_type > __l) [inline]
```

Assigns an `initializer_list` to a list.

## Parameters

<code>↵</code>	An <code>initializer_list</code> of <code>value_type</code> .
<code>__↵</code>	
<code>↵</code>	
<code>__↵</code>	
<code>l</code>	

Replace the contents of the list with copies of the elements in the `initializer_list __l`. This is linear in `__l.size()`.

**assign()** [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::assign (
    size_type __n,
    const value_type & __val) [inline]
```

Assigns a given value to a list.

## Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

---

This function fills a list with `__n` copies of the given value. Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned.

**back()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::list<_Tp, _Alloc>::back () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the list.

**back()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::list<_Tp, _Alloc>::back () [inline], [nodiscard], [noexcept]
```

Returns a read/write reference to the data at the last element of the list.

**begin()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::list<_Tp, _Alloc>::begin () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

**begin()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list<_Tp, _Alloc>::begin () [inline], [nodiscard], [noexcept]
```

Returns a read/write iterator that points to the first element in the list. Iteration is done in ordinary element order. Referenced by `std::list<_Tp, polymorphic_allocator<_Tp>>::list()`, `insert()`, `insert()`, `merge()`, `merge()`, `std::operator<=>()`, `operator=()`, `std::list<_Tp, polymorphic_allocator<_Tp>>::operator=()`, `remove()`, `remove_if()`, `std::list<_Tp, polymorphic_allocator<_Tp>>::unique()`, and `unique()`.

**cbegin()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::list<_Tp, _Alloc>::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

**cend()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::list<_Tp, _Alloc>::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

**clear()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::clear () [inline], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility. Referenced by `operator=()`.

**crbegin()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list< _Tp, _Alloc >::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

**crend()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list< _Tp, _Alloc >::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

**emplace()**

```
template<typename _Tp, typename _Alloc>
template<typename... _Args>
list< _Tp, _Alloc >::iterator list::emplace (
    const_iterator __position,
    _Args &&... __args)
```

Constructs object in list before specified iterator.

**Parameters**

<code>__position</code>	A <code>const_iterator</code> into the list.
<code>__args</code>	Arguments.

**Returns**

An iterator that points to the inserted data.

This function will insert an object of type `T` constructed with `T(std::forward<Args>(args)...) before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references. References \_M\_create\_node\(\), and std::forward\(\).`

**empty()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
bool std::list< _Tp, _Alloc >::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the list is empty. (Thus `begin()` would equal `end()`.)

Referenced by [insert\(\)](#), and [std::list< \\_Tp, polymorphic\\_allocator< \\_Tp > >::splice\(\)](#).

**end()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::list< _Tp, _Alloc >::end () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

**end()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::end () [inline], [nodiscard], [noexcept]
```

Returns a read/write iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Referenced by [std::list< \\_Tp, polymorphic\\_allocator< \\_Tp > >::list\(\)](#), [merge\(\)](#), [merge\(\)](#), [std::operator<=>\(\)](#), [operator=\(\)](#), [std::list< \\_Tp, polymorphic\\_allocator< \\_Tp > >::operator=\(\)](#), and [std::list< \\_Tp, polymorphic\\_allocator< \\_Tp > >::splice\(\)](#).

**erase()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list<_Tp, _Alloc>::erase (
    const_iterator __first,
    const_iterator __last) [inline], [noexcept]
```

Remove a range of elements.

**Parameters**

<code>__first</code>	Iterator pointing to the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

**Returns**

An iterator pointing to the element pointed to by *last* prior to erasing (or `end()`).

This function will erase the elements in the range `[first,last)` and shorten the list accordingly.

This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [2/2]

```
template<typename _Tp, typename _Alloc>
list<_Tp, _Alloc>::iterator list::erase (
    const_iterator __position) [noexcept]
```

Remove element at given position.

**Parameters**

<code>__position</code>	Iterator pointing to element to be erased.
-------------------------	--

**Returns**

An iterator pointing to the next element (or `end()`).

This function will erase the element at the given position and thus shorten the list by one.

Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [list\(\)](#), and [erase\(\)](#).

Referenced by [erase\(\)](#), [resize\(\)](#), and [resize\(\)](#).

**front()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::list<_Tp, _Alloc>::front () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the list.

**front()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::list<_Tp, _Alloc>::front () [inline], [nodiscard], [noexcept]
```

Returns a read/write reference to the data at the first element of the list.

**get\_allocator()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
allocator_type std::list< _Tp, _Alloc >::get_allocator () const [inline], [noexcept]
```

Get a copy of the memory allocation object.

Referenced by [insert\(\)](#), [insert\(\)](#), [remove\(\)](#), [remove\\_if\(\)](#), [unique\(\)](#), and [unique\(\)](#).

**insert()** [1/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::insert (
    const_iterator __p,
    initializer_list< value_type > __l) [inline]
```

Inserts the contents of an `initializer_list` into list before specified `const_iterator`.

**Parameters**

<code>__p</code>	A <code>const_iterator</code> into the list.
<code>__l</code>	An <code>initializer_list</code> of <code>value_type</code> .

**Returns**

An iterator pointing to the first element inserted (or `__p`).

This function will insert copies of the data in the `initializer_list __l` into the list before the location specified by `__p`. This operation is linear in the number of elements inserted and does not invalidate iterators and references.

**insert()** [2/5]

```
template<typename _Tp, typename _Alloc>
template<typename _InputIterator, typename>
list< _Tp, _Alloc >::iterator list::insert (
    const_iterator __position,
    _InputIterator __first,
    _InputIterator __last)
```

Inserts a range into the list.

**Parameters**

<code>__position</code>	An iterator into the list.
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

**Returns**

Since C++11, an iterator pointing to the first element inserted (or `__position`). In C++98 this returns void.

This function will insert copies of the data in the range `[__first, __last)` into the list before the location specified by `__position`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

References [list\(\)](#), [begin\(\)](#), [empty\(\)](#), [get\\_allocator\(\)](#), and [splice\(\)](#).

**insert()** [3/5]

```
template<typename _Tp, typename _Alloc>
list< _Tp, _Alloc >::iterator list::insert (
    const_iterator __position,
    const value_type & __x)
```

Inserts given value into list before specified iterator.

**Parameters**

<code>__position</code>	An iterator into the list.
<code>__x</code>	Data to be inserted.

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

References [list\(\)](#), [\\_M\\_create\\_node\(\)](#), and [insert\(\)](#).

Referenced by [insert\(\)](#), and [resize\(\)](#).

**insert()** [4/5]

```
template<typename _Tp, typename _Alloc>
list< _Tp, _Alloc >::iterator list::insert (
    const_iterator __position,
    size_type __n,
    const value_type & __x)
```

Inserts a number of copies of given data into the list.

**Parameters**

<code>__position</code>	An iterator into the list.
<code>__n</code>	Number of elements to be inserted.
<code>__x</code>	Data to be inserted.

**Returns**

Since C++11, an iterator pointing to the first element inserted (or `__position`). In C++98 this returns void.

This function will insert a specified number of copies of the given data before the location specified by `__position`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

References [list\(\)](#), [begin\(\)](#), [get\\_allocator\(\)](#), and [splice\(\)](#).

**insert()** [5/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::insert (
    const_iterator __position,
    value_type && __x) [inline]
```

Inserts given value into list before specified iterator.

**Parameters**

<code>__position</code>	An iterator into the list.
<code>__x</code>	Data to be inserted.

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

**max\_size()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::list< _Tp, _Alloc >::max_size () const [inline], [nodiscard], [noexcept]
```

Returns the size() of the largest possible list.

**merge()** [1/2]

```
template<typename _Tp, typename _Alloc>
void list::merge (
    list< _Tp, _Alloc > && __x)
```

Merge sorted lists.

**Parameters**

<code>__x</code>	Sorted list to merge.
------------------	-----------------------

Assumes that both `__x` and this list are sorted according to operator<(). Merges elements of `__x` into this list in sorted order, leaving `__x` empty when complete. Elements in this list precede elements in `__x` that are equal.

References [list\(\)](#), [std::\\_\\_addressof\(\)](#), [std::begin\(\)](#), [begin\(\)](#), [std::end\(\)](#), [end\(\)](#), and [merge\(\)](#).

Referenced by [merge\(\)](#), and [merge\(\)](#).

**merge()** [2/2]

```
template<typename _Tp, typename _Alloc>
template<typename _StrictWeakOrdering>
void list::merge (
    list< _Tp, _Alloc > && __x,
    _StrictWeakOrdering __comp)
```

Merge sorted lists according to comparison function.

**Template Parameters**

<code>_StrictWeakOrdering</code>	Comparison function defining sort order.
----------------------------------	--

**Parameters**

<code>__x</code>	Sorted list to merge.
<code>__comp</code>	Comparison functor.

Assumes that both `__x` and this list are sorted according to `StrictWeakOrdering`. Merges elements of `__x` into this list in sorted order, leaving `__x` empty when complete. Elements in this list precede elements in `__x` that are equivalent according to `StrictWeakOrdering()`.

References [list\(\)](#), [std::\\_\\_addressof\(\)](#), [std::begin\(\)](#), [begin\(\)](#), [std::end\(\)](#), [end\(\)](#), and [merge\(\)](#).

### operator=() [1/3]

```
template<typename _Tp, typename _Alloc>
list<_Tp, _Alloc> & list::operator= (
    const list<_Tp, _Alloc> & __x)
```

List assignment operator.

#### Parameters

<code>__x</code>	A list of identical element and allocator types.
------------------	--

All the elements of `__x` are copied.

Whether the allocator is copied depends on the allocator traits.

References [list\(\)](#), [std::\\_\\_addressof\(\)](#), [begin\(\)](#), [clear\(\)](#), and [end\(\)](#).

### operator=() [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
list & std::list<_Tp, _Alloc>::operator= (
    initializer_list<value_type> __l) [inline]
```

List initializer list assignment operator.

#### Parameters

<code>__l</code>	An initializer_list of value_type.
------------------	------------------------------------

Replace the contents of the list with copies of the elements in the initializer\_list `__l`. This is linear in `l.size()`.

### operator=() [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
list & std::list<_Tp, _Alloc>::operator= (
    list<_Tp, _Alloc> && __x) [inline], [noexcept]
```

List move assignment operator.

#### Parameters

<code>__x</code>	A list of identical element and allocator types.
------------------	--

The contents of `__x` are moved into this list (without copying).

Afterwards `__x` is a valid, but unspecified list

Whether the allocator is moved depends on the allocator traits.

**pop\_back()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc >::pop_back () [inline], [noexcept]
```

Removes last element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

**pop\_front()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc >::pop_front () [inline], [noexcept]
```

Removes first element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

**push\_back()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc >::push_back (
    const value_type & __x) [inline]
```

Add data to the end of the list.

**Parameters**

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the end of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

**push\_front()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc >::push_front (
    const value_type & __x) [inline]
```

Add data to the front of the list.

**Parameters**

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the front of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

**rbegin()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list<_Tp, _Alloc>::rbegin () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

**rbegin()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::list<_Tp, _Alloc>::rbegin () [inline], [nodiscard], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

**remove()**

```
template<typename _Tp, typename _Alloc>
list<_Tp, _Alloc>::__remove_return_type list::remove (
    const _Tp & __value)
```

Remove all elements equal to *value*.

**Parameters**

<code>__value</code>	The value to remove.
----------------------	----------------------

Removes every element in the list equal to *value*. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.  
References [list\(\)](#), [std::begin\(\)](#), [begin\(\)](#), [std::end\(\)](#), [get\\_allocator\(\)](#), [size\(\)](#), and [splice\(\)](#).

**remove\_if()**

```
template<typename _Tp, typename _Alloc>
template<typename _Predicate>
list<_Tp, _Alloc>::__remove_return_type list::remove_if (
    _Predicate __pred)
```

Remove all elements satisfying a predicate.

**Template Parameters**

<code>_Predicate</code>	Unary predicate function or object.
-------------------------	-------------------------------------

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.  
References [list\(\)](#), [std::begin\(\)](#), [begin\(\)](#), [std::end\(\)](#), [get\\_allocator\(\)](#), [size\(\)](#), and [splice\(\)](#).

**rend()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list<_Tp, _Alloc>::rend () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

**rend()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::list< _Tp, _Alloc >::rend () [inline], [nodiscard], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

**resize()** [1/2]

```
template<typename _Tp, typename _Alloc>
void list::resize (
    size_type __new_size)
```

Resizes the list to the specified number of elements.

**Parameters**

<code>__new_size</code>	Number of elements the list should contain.
-------------------------	---

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise default constructed elements are appended.

References [std::end\(\)](#), and [erase\(\)](#).

**resize()** [2/2]

```
template<typename _Tp, typename _Alloc>
void list::resize (
    size_type __new_size,
    const value_type & __x)
```

Resizes the list to the specified number of elements.

**Parameters**

<code>__new_size</code>	Number of elements the list should contain.
<code>__x</code>	Data with which new elements should be populated.

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise the list is extended and new elements are populated with given data.

References [std::end\(\)](#), [erase\(\)](#), and [insert\(\)](#).

**reverse()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::reverse () [inline], [noexcept]
```

Reverse the elements in list.

Reverse the order of elements in the list in linear time.

**size()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::list< _Tp, _Alloc >::size () const [inline], [nodiscard], [noexcept]
```

Returns the number of elements in the list.

Referenced by [std::operator<=>\(\)](#), [remove\(\)](#), [remove\\_if\(\)](#), [unique\(\)](#), and [unique\(\)](#).

**sort()** [1/2]

```
template<typename _Tp, typename _Alloc>
void list::sort ()
```

Sort the elements.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

References [std::begin\(\)](#), [std::empty\(\)](#), and [std::end\(\)](#).

**sort()** [2/2]

```
template<typename _Tp, typename _Alloc>
template<typename _StrictWeakOrdering>
void list::sort (
    _StrictWeakOrdering __comp)
```

Sort the elements according to comparison function.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

References [std::begin\(\)](#), [std::empty\(\)](#), and [std::end\(\)](#).

**splice()** [1/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc >::splice (
    const_iterator __position,
    list<_Tp, _Alloc > && __x) [inline], [noexcept]
```

Insert contents of another list.

**Parameters**

<code>__position</code>	Iterator referencing the element to insert before.
<code>__x</code>	Source list.

The elements of `__x` are inserted in constant time in front of the element referenced by `__position`. `__x` becomes an empty list.

Requires this != `__x`.

Referenced by [insert\(\)](#), [insert\(\)](#), [remove\(\)](#), [remove\\_if\(\)](#), [unique\(\)](#), and [unique\(\)](#).

**splice()** [2/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc >::splice (
    const_iterator __position,
    list<_Tp, _Alloc > && __x,
    const_iterator __first,
    const_iterator __last) [inline], [noexcept]
```

Insert range from another list.

**Parameters**

<code>__position</code>	Iterator referencing the element to insert before.
<code>__x</code>	Source list.
<code>__first</code>	Iterator referencing the start of range in x.
<code>__last</code>	Iterator referencing the end of range in x.

Removes elements in the range [`__first`,`__last`) and inserts them before `__position` in constant time.

Undefined if `__position` is in [`__first`,`__last`).

**splice()** [3/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
    const_iterator __position,
    list< _Tp, _Alloc > && __x,
    const_iterator __i) [inline], [noexcept]
```

Insert element from another list.

**Parameters**

<code>__position</code>	Iterator referencing the element to insert before.
<code>__x</code>	Source list.
<code>__i</code>	Iterator referencing the element to move.

Removes the element in list `__x` referenced by `__i` and inserts it into the current list before `__position`.

**splice()** [4/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
    const_iterator __position,
    list< _Tp, _Alloc > & __x,
    const_iterator __first,
    const_iterator __last) [inline], [noexcept]
```

Insert range from another list.

**Parameters**

<code>__position</code>	Const_iterator referencing the element to insert before.
<code>__x</code>	Source list.
<code>__first</code>	Const_iterator referencing the start of range in x.
<code>__last</code>	Const_iterator referencing the end of range in x.

Removes elements in the range `[__first,__last)` and inserts them before `__position` in constant time.  
Undefined if `__position` is in `[__first,__last)`.

**splice()** [5/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
    const_iterator __position,
    list< _Tp, _Alloc > & __x,
    const_iterator __i) [inline], [noexcept]
```

Insert element from another list.

**Parameters**

<code>__position</code>	Iterator referencing the element to insert before.
<code>__x</code>	Source list.
<code>__i</code>	Iterator referencing the element to move.

Removes the element in list `__x` referenced by `__i` and inserts it into the current list before `__position`.

**swap()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::swap (
    list<_Tp, _Alloc> & __x) [inline], [noexcept]
```

Swaps data with another list.

**Parameters**

<code>__x</code>	A list of the same element and allocator types.
------------------	---

This exchanges the elements between two lists in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(l1,l2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

**unique() [1/2]**

```
template<typename _Tp, typename _Alloc>
list<_Tp, _Alloc>::__remove_return_type list::unique ()
```

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [list\(\)](#), [std::begin\(\)](#), [begin\(\)](#), [std::end\(\)](#), [get\\_allocator\(\)](#), [size\(\)](#), and [splice\(\)](#).

**unique() [2/2]**

```
template<typename _Tp, typename _Alloc>
template<typename _BinaryPredicate>
list<_Tp, _Alloc>::__remove_return_type list::unique (
    _BinaryPredicate __binary_pred)
```

Remove consecutive elements satisfying a predicate.

**Template Parameters**

<code>_BinaryPredicate</code>	Binary predicate function or object.
-------------------------------	--------------------------------------

For each consecutive set of elements `[first,last)` that satisfy `predicate(first,i)` where `i` is an iterator in `[first,last)`, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [list\(\)](#), [std::begin\(\)](#), [begin\(\)](#), [std::end\(\)](#), [get\\_allocator\(\)](#), [size\(\)](#), and [splice\(\)](#).

## 6.634 `__gnu_pbds::list_update< Key, Mapped, Eq_Fn, Update_Policy, _Alloc >` Class Template Reference

```
#include <assoc_container.hpp>
```

## Public Types

- typedef [list\\_update\\_tag](#) **container\_category**
- typedef Eq\_Fn **eq\_fn**
- typedef Update\_Policy **update\_policy**

## Public Member Functions

- **list\_update** (const [list\\_update](#) &other)
- template<typename It>  
[list\\_update](#) (It first, It last)
- **list\_update** & **operator=** (const [list\\_update](#) &other)
- void **swap** ([list\\_update](#) &other)

### 6.634.1 Detailed Description

```
template<typename Key, typename Mapped, class Eq_Fn = typename detail::default_eq_fn<Key>::type, class
Update_Policy = detail::default_update_policy::type, class _Alloc = std::allocator<char>>
class __gnu_pbds::list_update< Key, Mapped, Eq_Fn, Update_Policy, _Alloc >
```

A list-update based associative container.

#### Template Parameters

<i>Key</i>	Key type.
<i>Mapped</i>	Map type.
<i>Eq_Fn</i>	Equal functor.
<i>Update_Policy</i>	Update policy, determines when an element will be moved to the front of the list.
<i>_Alloc</i>	Allocator type.

Base is detail::lu\_map.

### 6.634.2 Constructor & Destructor Documentation

#### **list\_update()**

```
template<typename Key, typename Mapped, class Eq_Fn = typename detail::default_eq_fn<Key>::type,
class Update_Policy = detail::default_update_policy::type, class _Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::list_update< Key, Mapped, Eq_Fn, Update_Policy, _Alloc >::list_update (
    It first,
    It last) [inline]
```

Constructor taking \_\_iterators to a range of value\_types. The value\_types between first\_it and last\_it will be inserted into the container object.

#### 6.636.1 Detailed Description

Container class for localization functionality.

The locale class is first a class wrapper for C library locales. It is also an extensible container for user-defined localization. A locale is a collection of facets that implement various localization features such as money, time, and number printing. Constructing C++ locales does not change the C library locale.

This library supports efficient construction and copying of locales through a reference counting implementation of the locale class.

### 6.636.2 Member Typedef Documentation

#### category

```
typedef int std::locale::category
```

Definition of locale::category.

### 6.636.3 Constructor & Destructor Documentation

#### locale() [1/8]

```
std::locale::locale () throw ( )
```

Default constructor.

Constructs a copy of the global locale. If no locale has been explicitly set, this is the C locale.

Referenced by [locale\(\)](#), [locale\(\)](#), [locale\(\)](#), [locale\(\)](#), [locale\(\)](#), [locale\(\)](#), [locale\(\)](#), [~locale\(\)](#), [combine\(\)](#), [global\(\)](#), [has\\_facet\(\)](#), [operator\(\)](#), [operator=\(\)](#), [operator==\(\)](#), and [use\\_facet\(\)](#).

#### locale() [2/8]

```
std::locale::locale (
    const locale & __other) throw ( )
```

Copy constructor.

Constructs a copy of *other*.

#### Parameters

<code>__other</code>	The locale to copy.
----------------------	---------------------

References [locale\(\)](#).

#### locale() [3/8]

```
std::locale::locale (
    const char * __s) [explicit]
```

Named locale constructor.

Constructs a copy of the named C library locale.

#### Parameters

<code>__s</code>	Name of the locale to construct.
------------------	----------------------------------

#### Exceptions

<code>std::runtime_error</code>	if <code>__s</code> is null or an undefined locale.
---------------------------------	---

References [locale\(\)](#).

#### locale() [4/8]

```
std::locale::locale (
    const locale & __base,
    const char * __s,
    category __cat)
```

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If *base* is named, this locale instance will also be named.

#### Parameters

<code>__base</code>	The locale to copy.
<code>__s</code>	Name of the locale to use facets from.
<code>__cat</code>	Set of categories defining the facets to use from <code>__s</code> .

#### Exceptions

<code>std::runtime_error</code>	if <code>__s</code> is null or an undefined locale.
---------------------------------	---

References [locale\(\)](#).

#### **locale()** [5/8]

```
std::locale::locale (
    const std::string & __s) [inline], [explicit]
```

Named locale constructor.

Constructs a copy of the named C library locale.

#### Parameters

<code>__s</code>	Name of the locale to construct.
------------------	----------------------------------

#### Exceptions

<code>std::runtime_error</code>	if <code>__s</code> is an undefined locale.
---------------------------------	---

References [locale\(\)](#).

#### **locale()** [6/8]

```
std::locale::locale (
    const locale & __base,
    const std::string & __s,
    category __cat) [inline]
```

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If *base* is named, this locale instance will also be named.

#### Parameters

<code>__base</code>	The locale to copy.
<code>__s</code>	Name of the locale to use facets from.
<code>__cat</code>	Set of categories defining the facets to use from <code>__s</code> .

## Exceptions

<code>std::runtime_error</code>	if <code>__s</code> is an undefined locale.
---------------------------------	---

References [locale\(\)](#).

**locale()** [7/8]

```
std::locale::locale (
    const locale & __base,
    const locale & __add,
    category __cat)
```

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale *add*. If *base* and *add* are named, this locale instance will also be named.

## Parameters

<code>__base</code>	The locale to copy.
<code>__add</code>	The locale to use facets from.
<code>__cat</code>	Set of categories defining the facets to use from add.

References [locale\(\)](#).

**locale()** [8/8]

```
template<typename _Facet>
std::locale::locale (
    const locale & __other,
    _Facet * __f)
```

Construct locale with another facet.

Constructs a copy of the locale *\_\_other*. The facet *\_\_f* is added to *\_\_other*, replacing an existing facet of type *Facet* if there is one. If *\_\_f* is null, this locale is a copy of *\_\_other*.

## Parameters

<code>__other</code>	The locale to copy.
<code>__f</code>	The facet to add in.

References [locale\(\)](#).

**~locale()**

```
std::locale::~~locale () throw ( )
```

Locale destructor.

References [locale\(\)](#).

**6.636.4 Member Function Documentation****classic()**

```
const locale & std::locale::classic () [static], [nodiscard]
```

Return reference to the C locale.

**combine()**

```
template<typename _Facet>
locale std::locale::combine (
    const locale & __other) const [nodiscard]
```

Construct locale with another facet.

Constructs and returns a new copy of this locale. Adds or replaces an existing facet of type `Facet` from the locale *other* into the new locale.

**Template Parameters**

<code>_Facet</code>	The facet type to copy from other
---------------------	-----------------------------------

**Parameters**

<code>__other</code>	The locale to copy from.
----------------------	--------------------------

**Returns**

Newly constructed locale.

**Exceptions**

<code>std::runtime_error</code>	if <code>__other</code> has no facet of type <code>_Facet</code> .
---------------------------------	--

References [locale\(\)](#).

Referenced by [operator=\(\)](#).

**global()**

```
locale std::locale::global (
    const locale & __loc) [static]
```

Set global locale.

This function sets the global locale to the argument and returns a copy of the previous global locale. If the argument has a name, it will also call `std::setlocale(LC_ALL, loc.name())`.

**Parameters**

<code>__loc</code>	The new locale to make global.
--------------------	--------------------------------

**Returns**

Copy of the old global locale.

References [locale\(\)](#).

**name()**

```
string std::locale::name () const [nodiscard]
```

Return locale name.

**Returns**

Locale name or "\*" if unnamed.

References [name\(\)](#).

Referenced by [name\(\)](#).

**operator()()**

```
template<typename _Char, typename _Traits, typename _Alloc>
bool std::locale::operator() (
    const basic_string< _Char, _Traits, _Alloc > & __s1,
    const basic_string< _Char, _Traits, _Alloc > & __s2) const [nodiscard]
```

Compare two strings according to collate.

Template operator to compare two strings using the compare function of the collate facet in this locale. One use is to provide the locale to the sort function. For example, a vector *v* of strings could be sorted according to locale *loc* by doing:

```
std::sort(v.begin(), v.end(), loc);
```

**Parameters**

<code>__s1</code>	First string to compare.
<code>__s2</code>	Second string to compare.

**Returns**

True if `collate<_Char> facet` compares `__s1 < __s2`, else false.

References [locale\(\)](#).

**operator=()**

```
const locale & std::locale::operator= (
    const locale & __other) throw ( )
```

Assignment operator.

Set this locale to be a copy of *other*.

**Parameters**

<code>__other</code>	The locale to copy.
----------------------	---------------------

**Returns**

A reference to this locale.

References [locale\(\)](#), and [combine\(\)](#).

**operator==( )**

```
bool std::locale::operator== (
    const locale & __other) const throw ( ) [nodiscard]
```

Locale equality.

**Parameters**

<code>__other</code>	The locale to compare against.
----------------------	--------------------------------

**Returns**

True if *other* and this refer to the same locale instance, are copies, or have the same name. False otherwise.

References [locale\(\)](#), and [operator==\( \)](#).

Referenced by [operator==\( \)](#).

### 6.636.5 Friends And Related Symbol Documentation

#### has\_facet

```
template<typename _Facet>
bool has_facet (
    const locale & __loc) throw ( )    [friend]
```

Test for the presence of a facet.

has\_facet tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

#### Template Parameters

<code>_Facet</code>	The facet type to test the presence of.
---------------------	---

#### Parameters

<code>__loc</code>	The locale to test.
--------------------	---------------------

#### Returns

true if `__loc` contains a facet of type `_Facet`, else false.

References [locale\(\)](#).

#### use\_facet

```
template<typename _Facet>
const _Facet & use_facet (
    const locale & __loc)    [friend]
```

Return a facet.

use\_facet looks for and returns a reference to a facet of type `Facet` where `Facet` is the template parameter. If `has_↔  
facet(locale)` is true, there is a suitable facet to return. It throws `std::bad_cast` if the locale doesn't contain a facet of type `Facet`.

#### Template Parameters

<code>_Facet</code>	The facet type to access.
---------------------	---------------------------

#### Parameters

<code>__loc</code>	The locale to use.
--------------------	--------------------

#### Returns

Reference to facet of type `Facet`.

#### Exceptions

<code>std::bad_cast</code>	if <code>__loc</code> doesn't contain a facet of type <code>_Facet</code> .
----------------------------	---

References [locale\(\)](#).

### 6.636.6 Member Data Documentation

#### all

```
const category std::locale::all [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

#### collate

```
const category std::locale::collate [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

#### ctype

```
const category std::locale::ctype [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

#### messages

```
const category std::locale::messages [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

#### monetary

```
const category std::locale::monetary [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

#### none

```
const category std::locale::none [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

#### numeric

```
const category std::locale::numeric [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

## time

```
const category std::locale::time [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

- **lock\_guard** (mutex\_type &\_\_m, [adopt\\_lock\\_t](#)) noexcept
- **lock\_guard** & **operator=** (const [lock\\_guard](#) &)=delete

### 6.637.1 Detailed Description

```
template<typename _Mutex>  
class std::lock_guard<_Mutex>
```

A simple scoped lock type.

A `lock_guard` controls mutex ownership within a scope, releasing ownership in the destructor.

Since

C++11

The documentation for this class was generated from the following file:

- [std\\_mutex.h](#)

## 6.638 std::logic\_error Class Reference

```
#include <stdexcept_except.h>
```

Inheritance diagram for std::logic\_error:

## Public Member Functions

- **logic\_error** (const char \*)
- **logic\_error** (const [logic\\_error](#) &) noexcept
- **logic\_error** (const [string](#) &\_\_arg)
- **logic\_error** ([logic\\_error](#) &&) noexcept
- **logic\_error** & **operator=** (const [logic\\_error](#) &) noexcept
- **logic\_error** & **operator=** ([logic\\_error](#) &&) noexcept
- virtual const char \* **what** () const noexcept

### 6.638.1 Detailed Description

One of two subclasses of exception.

Logic errors represent problems in the internal logic of a program; in theory, these are preventable, and even detectable before the program runs (e.g., violations of class invariants).

### 6.638.2 Constructor & Destructor Documentation

#### logic\_error()

```
std::logic_error::logic_error (
    const string & __arg) [explicit]
```

Takes a character string describing the error.

References [logic\\_error\(\)](#).

Referenced by [logic\\_error\(\)](#).

### 6.638.3 Member Function Documentation

#### what()

```
virtual const char * std::logic_error::what () const [virtual], [noexcept]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this class was generated from the following file:

std::lognormal_distribution< _RealType1 > &__x)`

### 6.645.1 Detailed Description

`template<typename _RealType = double>`  
**class** `std::lognormal_distribution< _RealType >`

A lognormal\_distribution random number distribution.  
 The formula for the normal probability mass function is

$$p(x|m, s) = \frac{1}{sx\sqrt{2\pi}} \exp - \frac{(\ln x - m)^2}{2s^2}$$

Since

C++11

### 6.645.2 Member Typedef Documentation

#### result\_type

`template<typename _RealType = double>`  
`typedef _RealType std::lognormal_distribution< _RealType >::result_type`  
 The type of the range of the distribution.

### 6.645.3 Member Function Documentation

#### max()

`template<typename _RealType = double>`  
`result_type std::lognormal_distribution< _RealType >::max () const [inline]`  
 Returns the least upper bound value of the distribution.

#### min()

`template<typename _RealType = double>`  
`result_type std::lognormal_distribution< _RealType >::min () const [inline]`  
 Returns the greatest lower bound value of the distribution.

**operator()()**

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::lognormal_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

**param() [1/2]**

```
template<typename _RealType = double>
param_type std::lognormal_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

**param() [2/2]**

```
template<typename _RealType = double>
void std::lognormal_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

**reset()**

```
template<typename _RealType = double>
void std::lognormal_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

**6.645.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::lognormal_distribution< _RealType1 > & __x) [friend]
```

Inserts a `lognormal_distribution` random number distribution `__x` into the output stream `__os`.

**Parameters**

<code>__os</code>	An output stream.
<code>__x</code>	A <code>lognormal_distribution</code> random number distribution.

**Returns**

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _RealType = double>
bool operator== (
    const lognormal_distribution< _RealType > & __d1,
    const lognormal_distribution< _RealType > & __d2) [friend]
```

Return true if two lognormal distributions have the same parameters and the sequences that would be generated are equal.

**operator>>**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::lognormal_distribution< _RealType1 > & __x) [friend]
```

Extracts a lognormal\_distribution random number distribution \_\_x from the input stream \_\_is.

**Parameters**

<code>__is</code>	An input stream.
<code>__x</code>	A lognormal_distribution random number generator engine.

**Returns**

The input stream with \_\_x extracted or in an error state.

The documentation for this class was generated from the following files:

#### 6.647.1 Detailed Description

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
class __gnu_pbds::lu_counter_policy< Max_Count, _Alloc >
```

A list-update policy that moves elements to the front of the list based on the counter algorithm.

#### 6.647.2 Member Typedef Documentation

##### `metadata_reference`

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
typedef detail::rebind_traits<_Alloc, metadata_type>::reference __gnu_pbds::lu_counter_policy<
Max_Count, _Alloc >::metadata_reference
```

Reference to metadata on which this functor operates.

### metadata\_type

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
typedef detail::lu\_counter\_metadata<size_type> \_\_gnu\_pbds::lu\_counter\_policy< Max_Count, _Alloc
>::metadata_type
```

Metadata on which this functor operates.

## 6.647.3 Member Enumeration Documentation

### anonymous enum

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
anonymous enum
```

#### Enumerator

<code>max_count</code>	When some element is accessed this number of times, it will be moved to the front of the list.
------------------------	--

## 6.647.4 Member Function Documentation

### operator>() [1/2]

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
metadata\_type \_\_gnu\_pbds::lu\_counter\_policy< Max_Count, _Alloc >::operator() () const [inline]
```

Creates a metadata object.

References [max\\_count](#).

### operator>() [2/2]

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
bool \_\_gnu\_pbds::lu\_counter\_policy< Max_Count, _Alloc >::operator() (
    metadata\_reference r_data) const [inline]
```

Decides whether a metadata object should be moved to the front of the list.

References [max\\_count](#).

### 6.649.1 Detailed Description

```
template<typename Key, typename Mapped, typename Eq_Fn, typename _Alloc, typename Update_Policy>
class __gnu_pbds::detail::lu_map< Key, Mapped, Eq_Fn, _Alloc, Update_Policy >
```

list-based (with updates) associative container. Skip to the lu, my darling.  
 The documentation for this class was generated from the following file:

- [lu\\_map.hpp](#)

## 6.650 `__gnu_pbds::lu_move_to_front_policy<_Alloc>` Class Template Reference

```
#include <list_update_policy.hpp>
```

### Public Types

- typedef `_Alloc allocator_type`
- typedef `detail::rebind_traits<_Alloc, metadata_type>::reference metadata_reference`
- typedef `null_type metadata_type`

### Public Member Functions

- `metadata_type operator() () const`
- `bool operator() (metadata_reference r_metadata) const`

### 6.650.1 Detailed Description

```
template<typename _Alloc = std::allocator<char>>
class __gnu_pbds::lu_move_to_front_policy<_Alloc>
```

A list-update policy that unconditionally moves elements to the front of the list. A null type means that each link in a list-based container does not actually need metadata.

### 6.650.2 Member Typedef Documentation

#### `metadata_reference`

```
template<typename _Alloc = std::allocator<char>>
typedef detail::rebind_traits<_Alloc, metadata_type>::reference __gnu_pbds::lu_move_to_front_policy<
_Alloc>::metadata_reference
```

Reference to metadata on which this functor operates.

#### `metadata_type`

```
template<typename _Alloc = std::allocator<char>>
typedef null_type __gnu_pbds::lu_move_to_front_policy<_Alloc>::metadata_type
```

Metadata on which this functor operates.

### 6.650.3 Member Function Documentation

#### `operator()()` [1/2]

```
template<typename _Alloc = std::allocator<char>>
metadata_type __gnu_pbds::lu_move_to_front_policy<_Alloc>::operator() () const [inline]
```

Creates a metadata object.

**operator>() [2/2]**

```
template<typename _Alloc = std::allocator<char>>
bool __gnu_pbds::lu_move_to_front_policy< _Alloc >::operator() (
    metadata_reference r_metadata) const [inline]
```

Decides whether a metadata object should be moved to the front of the list.

The documentation for this class was generated from the following file:

- [list\\_update\\_policy.hpp](#)

### 6.655.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::
::allocator<std::pair<const _Key, _Tp> >>
class std::map<_Key, _Tp, _Compare, _Alloc >
```

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

Since

C++98

## Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Compare</code>	Comparison function object type, defaults to <code>less&lt;_Key&gt;</code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;pair&lt;const _Key, _Tp&gt;&gt;</code> .

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys). For a `map<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `std::pair<const Key, T>`.

Maps support bidirectional iterators.

The private tree data is declared exactly the same way for `map` and `multimap`; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

## 6.655.2 Constructor &amp; Destructor Documentation

**map()** [1/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::map< _Key, _Tp, _Compare, _Alloc >::map () [default]
```

Default constructor creates no elements.

**map()** [2/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a map with no elements.

## Parameters

<code>__comp</code>	A comparison object.
<code>__a</code>	An allocator object.

**map()** [3/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    const map< _Key, _Tp, _Compare, _Alloc > & ) [default]
```

Map copy constructor.

Whether the allocator is copied depends on the allocator traits.

**map()** [4/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    map< _Key, _Tp, _Compare, _Alloc > && ) [default]
```

Map move constructor.

The newly-created map contains the exact contents of the moved instance. The moved instance is a valid, but unspecified, map.

#### map() [5/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    initializer_list< value_type > __l,
    const _Compare & __comp = _Compare(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a map from an initializer\_list.

##### Parameters

<code>__l</code>	An initializer_list.
<code>__comp</code>	A comparison object.
<code>__a</code>	An allocator object.

Create a map consisting of copies of the elements in the initializer\_list `__l`. This is linear in N if the range is already sorted, and NlogN otherwise (where N is `__l.size()`).

#### map() [6/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    const allocator_type & __a) [inline], [explicit]
```

Allocator-extended default constructor.

#### map() [7/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    const map< _Key, _Tp, _Compare, _Alloc > & __m,
    const __type_identity_t< allocator_type > & __a) [inline]
```

Allocator-extended copy constructor.

#### map() [8/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    map< _Key, _Tp, _Compare, _Alloc > && __m,
    const __type_identity_t< allocator_type > & __a) [inline], [noexcept]
```

Allocator-extended move constructor.

#### map() [9/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    initializer_list< value_type > __l,
    const allocator_type & __a) [inline]
```

Allocator-extended initializer-list constructor.

#### map() [10/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::map<_Key, _Tp, _Compare, _Alloc >::map (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a) [inline]
```

Allocator-extended range constructor.

#### map() [11/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::map<_Key, _Tp, _Compare, _Alloc >::map (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Builds a map from a range.

#### Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a map consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

#### map() [12/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::map<_Key, _Tp, _Compare, _Alloc >::map (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a map from a range.

#### Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a map consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

**~map()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
std::map< _Key, _Tp, _Compare, _Alloc >::~~map () [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**6.655.3 Member Function Documentation****\_\_attribute()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
std::map< _Key, _Tp, _Compare, _Alloc >::__attribute (
    (__abi_tag__("cxx11")) ) [inline]
```

Erases an element from a map.

**Parameters**

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**at()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
mapped_type & std::map< _Key, _Tp, _Compare, _Alloc >::at (
    const key_type & __k) [inline]
```

Access to map data.

**Parameters**

<code>__k</code>	The key for which data should be retrieved.
------------------	---

**Returns**

A reference to the data whose key is equivalent to `__k`, if such a data is present in the map.

**Exceptions**

<code>std::out_of_range</code>	If no such data is present.
--------------------------------	-----------------------------

**begin()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

**begin()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
iterator std::map<_Key, _Tp, _Compare, _Alloc>::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

**cbegin()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

**cend()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

**clear()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
void std::map<_Key, _Tp, _Compare, _Alloc>::clear () [inline], [noexcept]
```

Erases all elements in a map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
template<typename _Kt>
```

```
auto std::map<_Key, _Tp, _Compare, _Alloc>::contains (
    const _Kt & __x) const -> decltype(_M_t._M_find_tr(__x), void(), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

 <code>__x</code>	Key of (key, value) pairs to be located.
--	--

**Returns**

True if there is an element with the specified key.

**contains()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
bool std::map<_Key, _Tp, _Compare, _Alloc >::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

 <code>_x</code>	Key of (key, value) pairs to be located.
---	--

**Returns**

True if there is an element with the specified key.

**count()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map<_Key, _Tp, _Compare, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements with given key.

**Parameters**

 <code>_x</code>	Key of (key, value) pairs to be located.
---	--

**Returns**

Number of elements with specified key.

This function only makes sense for multimaps; for map the result will either be 0 (not present) or 1 (present).

**crbegin()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc >::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

**crend()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc >::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

**emplace()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
std::pair< iterator, bool > std::map< _Key, _Tp, _Compare, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the map.

**Parameters**

<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).
---------------------	---

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

**emplace\_hint()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the map.

**Parameters**

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).

**Returns**

An iterator that points to the element with key of the std::pair built from \_\_args (may or may not be that std::pair).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument emplace() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Referenced by `std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::emplace()`, `std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert()`, `std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert_or_assign()`, and `std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert_or_assign()`.

**empty()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
bool std::map<_Key, _Tp, _Compare, _Alloc >::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the map is empty. (Thus `begin()` would equal `end()`.)

**end() [1/2]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map<_Key, _Tp, _Compare, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

**end() [2/2]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map<_Key, _Tp, _Compare, _Alloc >::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Referenced by `std::map<_Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::at()`, `std::map<_Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert()`, `std::map<_Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::operator[]()` and `std::map<_Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::operator[]()`.

**equal\_range() [1/2]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair< iterator, iterator > std::map<_Key, _Tp, _Compare, _Alloc >::equal_range (
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

**equal\_range() [2/2]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair< const_iterator, const_iterator > std::map<_Key, _Tp, _Compare, _Alloc >::equal_range
(
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>_↔</code>	Key of (key, value) pairs to be located.
<code>_X</code>	

**Returns**

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

**erase() [1/3]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map<_Key, _Tp, _Compare, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

<code>_↔</code>	Key of element to be erased.
<code>_X</code>	

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase() [2/3]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map<_Key, _Tp, _Compare, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [first,last) range of elements from a map.

**Parameters**

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

**Returns**

The iterator `__last`.

This function erases a sequence of elements from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [3/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map<_Key, _Tp, _Compare, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from a map.

**Parameters**

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map<_Key, _Tp, _Compare, _Alloc >::find (
    const key_type & __x) [inline]
```

Tries to locate an element in a map.

**Parameters**

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

**find()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map<_Key, _Tp, _Compare, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in a map.

**Parameters**

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

**Returns**

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**get\_allocator()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
allocator_type std::map< _Key, _Tp, _Compare, _Alloc >::get_allocator () const [inline], [noexcept]
```

Get a copy of the memory allocation object.

**insert() [1/8]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
void std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Template function that attempts to insert a range of elements.

**Parameters**

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

**insert() [2/8]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair >::value, pair< iterator, bool > > std::map<
_Key, _Tp, _Compare, _Alloc >::insert (
    _Pair && __x) [inline]
```

Attempts to insert a `std::pair` into the map.

**Parameters**

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

**insert()** [3/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::pair< iterator, bool > std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    const value_type & __x) [inline]
```

Attempts to insert a std::pair into the map.

**Parameters**

<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).
------------------	--

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

Referenced by `std::map<_Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp >>>::insert()`, and `std::map<_Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp >>>::operator[]()`.

**insert()** [4/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair >::value, iterator > std::map< _Key, _Tp, _Cmp,
_Compare, _Alloc >::insert (
    const_iterator __position,
    _Pair && __x) [inline]
```

Attempts to insert a std::pair into the map.

**Parameters**

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

**insert()** [5/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
iterator std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    const_iterator __position,
    const value_type & __x) [inline]
```

Attempts to insert a std::pair into the map.

#### Parameters

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

#### Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

#### insert() [6/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    const_iterator __position,
    value_type && __x) [inline]
```

Attempts to insert a std::pair into the map.

#### Parameters

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

#### Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

#### insert() [7/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    std::initializer_list< value_type > __list) [inline]
```

Attempts to insert a list of std::pairs into the map.

## Parameters

<code>__list</code>	A std::initializer_list<value_type> of pairs to be inserted.
---------------------	--

Complexity similar to that of the range constructor.

**insert()** [8/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::pair< iterator, bool > std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    value_type && __x) [inline]
```

Attempts to insert a std::pair into the map.

## Parameters

<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).
------------------	--

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

**insert\_or\_assign()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
template<typename _Obj>
pair< iterator, bool > std::map< _Key, _Tp, _Compare, _Alloc >::insert_or_assign (
    const key_type & __k,
    _Obj && __obj) [inline]
```

Attempts to insert or assign a std::pair into the map.

## Parameters

<code>__k</code>	Key to use for finding a possibly existing pair in the map.
<code>__obj</code>	Argument used to generate the .second for a pair instance.

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map. If the pair was already in the map, the .second of the pair is assigned from \_\_obj.

Insertion requires logarithmic time.

**insert\_or\_assign()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Obj>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::insert_or_assign (
    const_iterator __hint,
    const key_type & __k,
    _Obj && __obj) [inline]
```

Attempts to insert or assign a `std::pair` into the map.

**Parameters**

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__k</code>	Key to use for finding a possibly existing pair in the map.
<code>__obj</code>	Argument used to generate the .second for a pair instance.

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map. If the pair was already in the map, the .second of the pair is assigned from `__obj`.

Insertion requires logarithmic time.

**key\_comp()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
key_compare std::map< _Key, _Tp, _Compare, _Alloc >::key_comp () const [inline]
```

Returns the key comparison object out of which the map was constructed.

Referenced by `std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::at()`, `std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert()`, `std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::operator[]()`, and `std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::operator[]()`.

**lower\_bound()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
    const key_type & __x) [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Referenced by [std::map< \\_Key, \\_Tp, \\_Cmp, polymorphic\\_allocator< pair< const \\_Key, \\_Tp > > >::at\(\)](#), [std::map< \\_Key, \\_Tp, \\_Cmp, polymorphic\\_allocator< pair< const \\_Key, \\_Tp > > >::insert\(\)](#), [std::map< \\_Key, \\_Tp, \\_Cmp, polymorphic\\_allocator< pair< const \\_Key, \\_Tp > > >::operator\[\]\(\)](#).

**lower\_bound()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
    const key_type & __x) const [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

 <code>__x</code>	Key of (key, value) pair to be located.
--	---

**Returns**

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

**max\_size()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map< _Key, _Tp, _Compare, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the maximum size of the map.

**operator=()** [1/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
map & std::map< _Key, _Tp, _Compare, _Alloc >::operator= (
    const map< _Key, _Tp, _Compare, _Alloc > & ) [default]
```

Map assignment operator.

Whether the allocator is copied depends on the allocator traits.

**operator=()** [2/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
map & std::map< _Key, _Tp, _Compare, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Map list assignment operator.

**Parameters**

↩	An initializer_list.
_↩	
↩	
_↩	
/	

This function fills a map with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the map and that the resulting map's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
map & std::map< _Key, _Tp, _Compare, _Alloc >::operator= (
    map< _Key, _Tp, _Compare, _Alloc > && ) [default]
```

Move assignment operator.

**operator[]()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
mapped_type & std::map< _Key, _Tp, _Compare, _Alloc >::operator[] (
    const key_type & __k) [inline]
```

Subscript ( [] ) access to map data.

**Parameters**

_↩	The key for which data should be retrieved.
_k	

**Returns**

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ( [] ) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires logarithmic time.

**rbegin()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

**rbegin()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rbegin () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

**rend()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc >::rend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

**rend()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc >::rend () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

**size()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map<_Key, _Tp, _Compare, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the map.

**swap()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::map<_Key, _Tp, _Compare, _Alloc >::swap (
    map<_Key, _Tp, _Compare, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another map.

**Parameters**

	A map of the same element and allocator types.
	

This exchanges the elements between two maps in constant time. (It is only swapping a pointer, an integer, and an instance of the Compare type (which itself is often stateless and empty), so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function. Whether the allocators are swapped depends on the allocator traits.

**upper\_bound()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map<_Key, _Tp, _Compare, _Alloc >::upper_bound (
    const key_type & __x) [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

	Key of (key, value) pair to be located.
	

**Returns**

Iterator pointing to the first element greater than key, or end().

**upper\_bound()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (
    const key_type & __x) const [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

 <code>__x</code>	Key of (key, value) pair to be located.
--	---

**Returns**

Read-only (constant) iterator pointing to first iterator greater than key, or end().

**value\_comp()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
value_compare std::map< _Key, _Tp, _Compare, _Alloc >::value_comp () const [inline]
```

Returns a value comparison object, built from the key comparison object out of which the map was constructed.

### 6.656.1 Detailed Description

template<class \_Tp>

class std::mask\_array< \_Tp >

Reference to selected subset of an array.

A mask\_array is a reference to the actual elements of an array specified by a bitmask in the form of an array of bool. The way to get a mask\_array is to call operator[](valarray<bool>) on a valarray. The returned mask\_array then permits carrying operations out on the referenced subset of elements in the original valarray.

For example, if a mask\_array is obtained using the array (false, true, false, true) as an argument, the mask array has two elements referring to array[1] and array[3] in the underlying array.

#### Parameters

<i>Tp</i>	Element type.
-----------	---------------

### 6.656.2 Member Function Documentation

#### operator%=( )

template<class \_Tp>

```
void std::mask_array< _Tp >::operator%=(
    const valarray< _Tp > & ) const
```

Modulo slice elements by corresponding elements of v.

**operator&=()**

```
template<class _Tp>
void std::mask_array< _Tp >::operator&= (
    const valarray< _Tp > & ) const
```

Logical and slice elements with corresponding elements of *v*.

**operator\*=()**

```
template<class _Tp>
void std::mask_array< _Tp >::operator*= (
    const valarray< _Tp > & ) const
```

Multiply slice elements by corresponding elements of *v*.

**operator+=()**

```
template<class _Tp>
void std::mask_array< _Tp >::operator+= (
    const valarray< _Tp > & ) const
```

Add corresponding elements of *v* to slice elements.

**operator-=()**

```
template<class _Tp>
void std::mask_array< _Tp >::operator-= (
    const valarray< _Tp > & ) const
```

Subtract corresponding elements of *v* from slice elements.

**operator/=(**

```
template<class _Tp>
void std::mask_array< _Tp >::operator/= (
    const valarray< _Tp > & ) const
```

Divide slice elements by corresponding elements of *v*.

**operator<<=()**

```
template<class _Tp>
void std::mask_array< _Tp >::operator<<= (
    const valarray< _Tp > & ) const
```

Left shift slice elements by corresponding elements of *v*.

**operator>>=()**

```
template<class _Tp>
void std::mask_array< _Tp >::operator>>= (
    const valarray< _Tp > & ) const
```

Right shift slice elements by corresponding elements of *v*.

**operator^=()**

```
template<class _Tp>
void std::mask_array< _Tp >::operator^= (
    const valarray< _Tp > & ) const
```

Logical xor slice elements with corresponding elements of *v*.

**operator" |=()**

```
template<class _Tp>
void std::mask_array< _Tp >::operator|= (
    const valarray< _Tp > & ) const
```

Logical or slice elements with corresponding elements of v.

### 6.658.1 Detailed Description

`template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>`  
`class std::match_results< _Bi_iter, _Alloc >`

The results of a match or search operation.

A collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template `match_results`.

This class satisfies the Sequence requirements, with the exception that only the operations defined for a const-qualified Sequence are supported.

The `sub_match` object stored at index 0 represents sub-expression 0, i.e. the whole match. In this case the `sub_↵` match member `matched` is always true. The `sub_match` object stored at index `n` denotes what matched the marked sub-expression `n` within the matched expression. If the sub-expression `n` participated in a regular expression match then the `sub_match` member `matched` evaluates to true, and members `first` and `second` denote the range of characters (`first`, `second`) which formed that match. Otherwise `matched` is false, and members `first` and `second` point to the end of the sequence that was searched.

Since

C++11

### 6.658.2 Constructor & Destructor Documentation

#### **match\_results()** [1/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results () [inline]
```

Constructs a default `match_results` container.

#### Postcondition

`size()` returns 0 and `str()` returns an empty string.

#### **match\_results()** [2/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
    const _Alloc & __a) [inline], [explicit], [noexcept]
```

Constructs a default `match_results` container.

#### Postcondition

`size()` returns 0 and `str()` returns an empty string.

**match\_results()** [3/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results<_Bi_iter, _Alloc >::match_results (
    const match_results<_Bi_iter, _Alloc > & ) [default]
```

Copy constructs a match\_results.

**match\_results()** [4/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results<_Bi_iter, _Alloc >::match_results (
    match_results<_Bi_iter, _Alloc > && ) [default], [noexcept]
```

Move constructs a match\_results.

**~match\_results()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results<_Bi_iter, _Alloc >::~~match_results () [default]
```

Destroys a match\_results object.

**match\_results()** [5/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results<_Bi_iter, _Alloc >::match_results (
    const match_results<_Bi_iter, _Alloc > & __m,
    const _Alloc & __a) [inline]
```

Constructs a default match\_results container.

**Postcondition**

size() returns 0 and str() returns an empty string.

**match\_results()** [6/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results<_Bi_iter, _Alloc >::match_results (
    match_results<_Bi_iter, _Alloc > && __m,
    const _Alloc & __a) [inline], [noexcept]
```

Constructs a default match\_results container.

**Postcondition**

size() returns 0 and str() returns an empty string.

**6.658.3 Member Function Documentation****begin()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results<_Bi_iter, _Alloc >::begin () const [inline], [noexcept]
```

Gets an iterator to the start of the sub\_match collection.

Referenced by `std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>>::const char*` and `std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>>::const char*>::operator`

**cbegin()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results<_Bi_iter, _Alloc >::cbegin () const [inline], [noexcept]
```

Gets an iterator to the start of the sub\_match collection.

**cend()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results<_Bi_iter, _Alloc >::cend () const [inline], [noexcept]
```

Gets an iterator to one-past-the-end of the collection.

**empty()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
bool std::match_results<_Bi_iter, _Alloc >::empty () const [inline], [nodiscard], [noexcept]
```

Indicates if the match\_results contains no results.

**Return values**

<i>true</i>	The match_results object is empty.
<i>false</i>	The match_results object is not empty.

Referenced by [std::match\\_results<\\_BidirectionalIterator, polymorphic\\_allocator<sub\\_match<\\_BidirectionalIterator>>><const char\\*>::prefix\(\)](#),  
[std::match\\_results<\\_BidirectionalIterator, polymorphic\\_allocator<sub\\_match<\\_BidirectionalIterator>>><const char\\*>::suffix\(\)](#),  
and [std::match\\_results<\\_BidirectionalIterator, polymorphic\\_allocator<sub\\_match<\\_BidirectionalIterator>>><const char\\*>::operator\[\]](#)

**end()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results<_Bi_iter, _Alloc >::end () const [inline], [noexcept]
```

Gets an iterator to one-past-the-end of the collection.

Referenced by [std::match\\_results<\\_BidirectionalIterator, polymorphic\\_allocator<sub\\_match<\\_BidirectionalIterator>>><const char\\*>::prefix\(\)](#),  
and [std::match\\_results<\\_BidirectionalIterator, polymorphic\\_allocator<sub\\_match<\\_BidirectionalIterator>>><const char\\*>::operator\[\]](#)

**format() [1/4]**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
template<typename _Out_iter, typename _St, typename _Sa>
_Out_iter std::match_results<_Bi_iter, _Alloc >::format (
    _Out_iter __out,
    const basic_string<char_type, _St, _Sa> & __fmt,
    match_flag_type __flags = regex_constants::format_default) const [inline]
```

**Precondition**

ready() == true

**format() [2/4]**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
template<typename _Out_iter>
_Out_iter std::match_results<_Bi_iter, _Alloc >::format (
    _Out_iter __out,
    const char_type * __fmt_first,
    const char_type * __fmt_last,
    match_flag_type __flags = regex_constants::format_default) const
```

**Precondition**

ready() == true

Referenced by `std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>><const char*>::format()`, `std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>><const char*>::format()`, and `std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>><const char*>::format()`.

**format() [3/4]**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>>>
template<typename _St, typename _Sa>
basic_string<char_type, _St, _Sa> std::match_results<_Bi_iter, _Alloc>::format (
    const basic_string<char_type, _St, _Sa> & __fmt,
    match_flag_type __flags = regex_constants::format_default) const [inline]
```

**Precondition**

ready() == true

**format() [4/4]**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>>>
string_type std::match_results<_Bi_iter, _Alloc>::format (
    const char_type * __fmt,
    match_flag_type __flags = regex_constants::format_default) const [inline]
```

**Precondition**

ready() == true

**get\_allocator()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>>>
allocator_type std::match_results<_Bi_iter, _Alloc>::get_allocator () const [inline], [noexcept]
```

Gets a copy of the allocator.

**length()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>>>
difference_type std::match_results<_Bi_iter, _Alloc>::length (
    size_type __sub = 0) const [inline]
```

Gets the length of the indicated submatch.

**Parameters**

<code>__sub</code>	indicates the submatch.
--------------------	-------------------------

**Precondition**

ready() == true

This function returns the length of the indicated submatch, or the length of the entire match if `__sub` is zero (the default).

**max\_size()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
size_type std::match_results< _Bi_iter, _Alloc >::max_size () const [inline], [noexcept]
```

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or mark\_count() + 1 if a match was successful. Some matches may be empty.

**Returns**

the number of matches found.

**operator=()** [1/2]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
match_results & std::match_results< _Bi_iter, _Alloc >::operator= (
    const match_results< _Bi_iter, _Alloc > & ) [default]
```

Assigns rhs to \*this.

**operator=()** [2/2]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
match_results & std::match_results< _Bi_iter, _Alloc >::operator= (
    match_results< _Bi_iter, _Alloc > && ) [default]
```

Move-assigns rhs to \*this.

**operator[]()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_reference std::match_results< _Bi_iter, _Alloc >::operator[] (
    size_type __sub) const [inline]
```

Gets a sub\_match reference for the match or submatch.

**Parameters**

<code>__sub</code>	indicates the submatch.
--------------------	-------------------------

**Precondition**

ready() == true

This function gets a reference to the indicated submatch, or the entire match if \_\_sub is zero.

If \_\_sub >= size() then this function returns a sub\_match with a special value indicating no submatch.

**position()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
difference_type std::match_results< _Bi_iter, _Alloc >::position (
    size_type __sub = 0) const [inline]
```

Gets the offset of the beginning of the indicated submatch.

**Parameters**

<code>__sub</code>	indicates the submatch.
--------------------	-------------------------

**Precondition**

ready() == true

This function returns the offset from the beginning of the target sequence to the beginning of the submatch, unless the value of `__sub` is zero (the default), in which case this function returns the offset from the beginning of the target sequence to the beginning of the match.

**prefix()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_reference std::match_results<_Bi_iter, _Alloc >::prefix () const [inline]
```

Gets a sub\_match representing the match prefix.

**Precondition**

ready() == true

This function gets a reference to a sub\_match object representing the part of the target range between the start of the target range and the start of the match.

Referenced by [std::match\\_results<\\_BidirectionalIterator, polymorphic\\_allocator<sub\\_match<\\_BidirectionalIterator>>><const char\\*>::operator](#)

**ready()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
bool std::match_results<_Bi_iter, _Alloc >::ready () const [inline], [noexcept]
```

Indicates if the match\_results is ready.

**Return values**

<i>true</i>	The object has a fully-established result state.
<i>false</i>	The object is not ready.

Referenced by [std::match\\_results<\\_BidirectionalIterator, polymorphic\\_allocator<sub\\_match<\\_BidirectionalIterator>>><const char\\*>::operator](#), [std::match\\_results<\\_BidirectionalIterator, polymorphic\\_allocator<sub\\_match<\\_BidirectionalIterator>>><const char\\*>::operator](#), [std::match\\_results<\\_BidirectionalIterator, polymorphic\\_allocator<sub\\_match<\\_BidirectionalIterator>>><const char\\*>::prefix\(\)](#), and [std::match\\_results<\\_BidirectionalIterator, polymorphic\\_allocator<sub\\_match<\\_BidirectionalIterator>>><const char\\*>::suffix\(\)](#)

**size()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
size_type std::match_results<_Bi_iter, _Alloc >::size () const [inline], [noexcept]
```

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or `mark_count() + 1` if a match was successful. Some matches may be empty.

**Returns**

the number of matches found.

Referenced by [std::match\\_results<\\_BidirectionalIterator, polymorphic\\_allocator<sub\\_match<\\_BidirectionalIterator>>><const char\\*>::operator](#) and [std::match\\_results<\\_BidirectionalIterator, polymorphic\\_allocator<sub\\_match<\\_BidirectionalIterator>>><const char\\*>::operator](#)

**str()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
string_type std::match_results<_Bi_iter, _Alloc >::str (
    size_type __sub = 0) const [inline]
```

Gets the match or submatch converted to a string type.

**Parameters**

<code>__sub</code>	indicates the submatch.
--------------------	-------------------------

**Precondition**

`ready() == true`

This function gets the submatch (or match, if `__sub` is zero) extracted from the target range and converted to the associated string type.

**suffix()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_reference std::match_results<_Bi_iter, _Alloc >::suffix () const [inline]
```

Gets a `sub_match` representing the match suffix.

**Precondition**

`ready() == true`

This function gets a reference to a `sub_match` object representing the part of the target range between the end of the match and the end of the target range.

Referenced by [std::match\\_results<\\_BidirectionalIterator, polymorphic\\_allocator<sub\\_match<\\_BidirectionalIterator>>><const char\\*](#)

**swap()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
void std::match_results<_Bi_iter, _Alloc >::swap (
    match_results<_Bi_iter, _Alloc > & __that) [inline], [noexcept]
```

Swaps the contents of two `match_results`.

Referenced by [std::match\\_results<\\_BidirectionalIterator, polymorphic\\_allocator<sub\\_match<\\_BidirectionalIterator>>><const char\\*](#)

### 6.666.1 Detailed Description

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
class std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f
>
```

A generalized feedback shift register discrete random number generator.

This algorithm avoids multiplication and division and is designed to be friendly to a pipelined architecture. If the parameters are chosen correctly, this generator will produce numbers with a very long period and fairly good apparent entropy, although still not cryptographically strong.

The best way to use this generator is with the predefined mt19937 class.

This algorithm was originally invented by Makoto Matsumoto and Takuji Nishimura.

#### Template Parameters

<code>__w</code>	Word size, the number of bits in each element of the state vector.
<code>__n</code>	The degree of recursion.
<code>__m</code>	The period parameter.
<code>__r</code>	The separation point bit index.
<code>__a</code>	The last row of the twist matrix.
<code>__u</code>	The first right-shift tempering matrix parameter.
<code>__d</code>	The first right-shift tempering matrix mask.
<code>__s</code>	The first left-shift tempering matrix parameter.
<code>__b</code>	The first left-shift tempering matrix mask.
<code>__t</code>	The second left-shift tempering matrix parameter.
<code>__c</code>	The second left-shift tempering matrix mask.
<code>__l</code>	The second right-shift tempering matrix parameter.
<code>__f</code>	Initialization multiplier.

Since

C++11

### 6.666.2 Member Typedef Documentation

#### result\_type

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType
```

```
__f>
typedef _UIntType std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __↵
s, __b, __t, __c, __l, __f >::result_type
The type of the generated random value.
```

### 6.666.3 Constructor & Destructor Documentation

#### mersenne\_twister\_engine()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t↵
__t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType
__f>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, ↵
__l, __f >::mersenne_twister_engine (
    _Sseq & __q) [inline], [explicit]
```

Constructs a mersenne\_twister\_engine random number generator engine seeded from the seed sequence \_\_q.

#### Parameters

__↵ __q	the seed sequence.
------------	--------------------

### 6.666.4 Member Function Documentation

#### discard()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t↵
__t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType
__f>
void std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, ↵
__c, __l, __f >::discard (
    unsigned long long __z)
```

Discard a sequence of random numbers.

#### max()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t↵
__t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType
__f>
constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d,
__s, __b, __t, __c, __l, __f >::max () [inline], [static], [constexpr]
```

Gets the largest possible value in the output range.

#### min()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t↵
__t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType
__f>
constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d,
__s, __b, __t, __c, __l, __f >::min () [inline], [static], [constexpr]
```

Gets the smallest possible value in the output range.

### 6.666.5 Friends And Related Symbol Documentation

#### operator<<

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
template<typename _UIntType1, size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::mersenne_twister_engine< _UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1, __f1 > & __x) [friend]
```

Inserts the current state of a % mersenne\_twister\_engine random number generator engine \_\_x into the output stream \_\_os.

#### Parameters

__os	An output stream.
__x	A % mersenne_twister_engine random number generator engine.

#### Returns

The output stream with the state of \_\_x inserted or in an error state.

#### operator==

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
bool operator== (
    const mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & __lhs,
    const mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & __rhs) [friend]
```

Compares two % mersenne\_twister\_engine random number generator objects of the same type for equality.

#### Parameters

__lhs	A % mersenne_twister_engine random number generator object.
__rhs	Another % mersenne_twister_engine random number generator object.

#### Returns

true if the infinite sequences of generated values would be equal, false otherwise.

#### operator>>

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
```

```
template<typename _UIntType1, size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 <
__a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1,
size_t __l1, _UIntType1 __f1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::mersenne_twister_engine< _UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1,
__s1, __b1, __t1, __c1, __l1, __f1 > & __x) [friend]
```

Extracts the current state of a % mersenne\_twister\_engine random number generator engine \_\_x from the input stream \_\_is.

#### Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A % mersenne_twister_engine random number generator engine.

#### Returns

The input stream with the state of \_\_x extracted or in an error state.

#### 6.667.1 Detailed Description

`template<typename _CharT>`  
`class std::messages<_CharT>`

Primary class template `messages`.

This facet encapsulates the code to retrieve messages from message catalogs. The only thing defined by the standard for this facet is the interface. All underlying functionality is implementation-defined.

This library currently implements 3 versions of the message facet. The first version (gnu) is a wrapper around gettext, provided by libintl. The second version (ieee) is a wrapper around catgets. The final version (default) does no actual translation. These implementations are only provided for char and wchar\_t instantiations.

The messages template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the messages facet.

### 6.667.2 Member Typedef Documentation

#### char\_type

```
template<typename _CharT>
typedef _CharT std::messages< _CharT >::char_type
Public typedefs.
```

#### string\_type

```
template<typename _CharT>
typedef basic_string<_CharT> std::messages< _CharT >::string_type
Public typedefs.
```

### 6.667.3 Constructor & Destructor Documentation

#### messages() [1/2]

```
template<typename _CharT>
std::messages< _CharT >::messages (
    size_t __refs = 0) [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

##### Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

References [std::locale::facet::facet\(\)](#).

#### messages() [2/2]

```
template<typename _CharT>
std::messages< _CharT >::messages (
    __c_locale __cloc,
    const char * __s,
    size_t __refs = 0) [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

##### Parameters

<code>__cloc</code>	The C locale.
<code>__s</code>	The name of a locale.
<code>__refs</code>	RefCount to pass to the base class.

References [std::locale::facet::facet\(\)](#).

**~messages()**

```
template<typename _CharT>
std::messages< _CharT >::~~messages () [protected], [virtual]
Destructor.
```

**6.667.4 Member Function Documentation****do\_get()**

```
string std::messages< char >::do_get (
    catalog ,
    int ,
    int ,
    const string & ) const [protected]
```

Specializations for required instantiations.

**6.667.5 Member Data Documentation****id**

```
template<typename _CharT>
locale::id std::messages< _CharT >::id [static]
```

Numpunct facet id.

### Static Public Attributes

- static const char \* **\_S\_atoms**
- static const pattern **\_S\_default\_pattern**

#### 6.675.1 Detailed Description

Money format ordering data.

This class contains an ordered array of 4 fields to represent the pattern for formatting a money amount. Each field may contain one entry from the part enum. symbol, sign, and value must be present and the remaining field must contain either none or space.

See also

money\_punct::pos\_format() and money\_punct::neg\_format() for details of how these fields are interpreted.

The documentation for this class was generated from the following file:

- [locale\\_facets\\_nonio.h](#)

#### 6.676.1 Detailed Description

template<typename \_CharT, typename \_InIter>  
class std::money\_get< \_CharT, \_InIter >

Primary class template money\_get.

This facet encapsulates the code to parse and return a monetary amount from a string.

The money\_get template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the money\_get facet.

#### 6.676.2 Member Typedef Documentation

##### char\_type

```
template<typename _CharT, typename _InIter>
typedef _CharT std::money_get< _CharT, _InIter >::char_type
```

Public typedefs.

##### iter\_type

```
template<typename _CharT, typename _InIter>
typedef _InIter std::money_get< _CharT, _InIter >::iter_type
```

Public typedefs.

##### string\_type

```
template<typename _CharT, typename _InIter>
typedef basic_string<_CharT> std::money_get< _CharT, _InIter >::string_type
```

Public typedefs.

#### 6.676.3 Constructor & Destructor Documentation

##### money\_get()

```
template<typename _CharT, typename _InIter>
std::money_get< _CharT, _InIter >::money_get (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

##### Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

References [std::locale::facet::facet\(\)](#).

**~money\_get()**

```
template<typename _CharT, typename _InIter>
virtual std::money_get< _CharT, _InIter >::~~money_get () [inline], [protected], [virtual]
Destructor.
```

**6.676.4 Member Function Documentation****do\_get()** [1/2]

```
template<typename _CharT, typename _InIter>
_InIter std::money_get< _CharT, _InIter >::do_get (
    iter_type __s,
    iter_type __end,
    bool __intl,
    ios_base & __io,
    ios_base::iostate & __err,
    long double & __units) const [protected], [virtual]
```

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for details.

References [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::c\\_str\(\)](#).

Referenced by [get\(\)](#), and [get\(\)](#).

**do\_get()** [2/2]

```
template<typename _CharT, typename _InIter>
_InIter std::money_get< _CharT, _InIter >::do_get (
    iter_type __s,
    iter_type __end,
    bool __intl,
    ios_base & __io,
    ios_base::iostate & __err,
    string_type & __digits) const [protected], [virtual]
```

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for details.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::use\\_facet\(\)](#), and [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >::widen\(\)](#).

**get()** [1/2]

```
template<typename _CharT, typename _InIter>
iter_type std::money_get< _CharT, _InIter >::get (
    iter_type __s,
    iter_type __end,
    bool __intl,
    ios_base & __io,
```

```

    ios_base::iostate & __err,
    long double & __units) const [inline]

```

Read and parse a monetary value.

This function reads characters from `__s`, interprets them as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and returns the result in `units` as an integral value `moneypunct::frac_digits() * the actual amount`. For example, the string \$10.01 in a US locale would store 1001 in `units`.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets `err=(err|io.failbit)`. If the stream is consumed before finishing parsing, sets `err=(err|io.failbit|io.eofbit)`. `units` is unchanged if parsing fails.

This function works by returning the result of `do_get()`.

#### Parameters

<code>__s</code>	Start of characters to parse.
<code>__end</code>	End of characters to parse.
<code>__intl</code>	Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt; &gt;</code> .
<code>__io</code>	Source of facets and io state.
<code>__err</code>	Error field to set if parsing fails.
<code>__units</code>	Place to store result of parsing.

#### Returns

Iterator referencing first character beyond valid money amount.

References `do_get()`.

#### get() [2/2]

```

template<typename _CharT, typename _InIter>
iter_type std::money_get< _CharT, _InIter >::get (
    iter_type __s,
    iter_type __end,
    bool __intl,
    ios_base & __io,
    ios_base::iostate & __err,
    string_type & __digits) const [inline]

```

Read and parse a monetary value.

This function reads characters from `__s`, interprets them as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and returns the result in `digits`. For example, the string \$10.01 in a US locale would store 1001 in `digits`.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets `err=(err|io.failbit)`. If the stream is consumed before finishing parsing, sets `err=(err|io.failbit|io.eofbit)`.

This function works by returning the result of `do_get()`.

#### Parameters

<code>__s</code>	Start of characters to parse.
<code>__end</code>	End of characters to parse.
<code>__intl</code>	Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt; &gt;</code> .
<code>__io</code>	Source of facets and io state.
<code>__err</code>	Error field to set if parsing fails.
<code>__digits</code>	Place to store result of parsing.

**Returns**

Iterator referencing first character beyond valid money amount.

References [do\\_get\(\)](#).

### 6.677.1 Detailed Description

template<typename \_CharT, typename \_OutIter>

class std::money\_put<\_CharT, \_OutIter>

Primary class template money\_put.

This facet encapsulates the code to format and output a monetary amount.

The money\_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the money\_put facet.

### 6.677.2 Member Typedef Documentation

#### char\_type

```
template<typename _CharT, typename _OutIter>
typedef _CharT std::money_put<_CharT, _OutIter>::char_type
```

Public typedefs.

#### iter\_type

```
template<typename _CharT, typename _OutIter>
typedef _OutIter std::money_put<_CharT, _OutIter>::iter_type
```

Public typedefs.

#### string\_type

```
template<typename _CharT, typename _OutIter>
typedef basic_string<_CharT> std::money_put<_CharT, _OutIter>::string_type
```

Public typedefs.

### 6.677.3 Constructor & Destructor Documentation

#### money\_put()

```
template<typename _CharT, typename _OutIter>
std::money_put< _CharT, _OutIter >::money_put (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

#### Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

References [std::locale::facet::facet\(\)](#).

#### ~money\_put()

```
template<typename _CharT, typename _OutIter>
virtual std::money_put< _CharT, _OutIter >::~money_put () [inline], [protected], [virtual]
Destructor.
```

### 6.677.4 Member Function Documentation

#### do\_put() [1/2]

```
template<typename _CharT, typename _OutIter>
_OutIter std::money_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    bool __intl,
    ios_base & __io,
    char_type __fill,
    const string_type & __digits) const [protected], [virtual]
```

Format and output a monetary value.

This function formats *digits* as a monetary value according to moneypunct and ctype facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the string `1001` in a US locale would write `$10.01` to `__s`.

This function is a hook for derived classes to change the value returned.

#### See also

`put()`.

#### Parameters

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt;&gt;</code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__digits</code>	Place to store result of parsing.

#### Returns

Iterator after writing.

**do\_put()** [2/2]

```
template<typename _CharT, typename _OutIter>
_OutIter std::money_put<_CharT, _OutIter >::do_put (
    iter_type __s,
    bool __intl,
    ios_base & __io,
    char_type __fill,
    long double __units) const [protected], [virtual]
```

Format and output a monetary value.

This function formats *units* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to \_\_s. For example, the value 1001 in a US locale would write \$10.01 to \_\_s.

This function is a hook for derived classes to change the value returned.

See also

put().

**Parameters**

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use_facet<moneypunct<CharT,intl> >.
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	char_type to use for padding.
<code>__units</code>	Place to store result of parsing.

**Returns**

Iterator after writing.

References [std::ios\\_base::getloc\(\)](#), [std::use\\_facet\(\)](#), and [std::\\_\\_ctype\\_abstract\\_base<\\_CharT >::widen\(\)](#).

Referenced by [put\(\)](#), and [put\(\)](#).

**put()** [1/2]

```
template<typename _CharT, typename _OutIter>
iter_type std::money_put<_CharT, _OutIter >::put (
    iter_type __s,
    bool __intl,
    ios_base & __io,
    char_type __fill,
    const string_type & __digits) const [inline]
```

Format and output a monetary value.

This function formats *digits* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to \_\_s. For example, the string 1001 in a US locale would write \$10.01 to \_\_s.

This function works by returning the result of do\_put().

**Parameters**

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use_facet<moneypunct<CharT,intl> >.
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	char_type to use for padding.
<code>__digits</code>	Place to store result of parsing.

**Returns**

Iterator after writing.

References [do\\_put\(\)](#).

**put()** [2/2]

```
template<typename _CharT, typename _OutIter>
iter_type std::money_put< _CharT, _OutIter >::put (
    iter_type __s,
    bool __intl,
    ios_base & __io,
    char_type __fill,
    long double __units) const [inline]
```

Format and output a monetary value.

This function formats *units* as a monetary value according to moneypunct and ctype facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the value 1001 in a US locale would write \$10.01 to `__s`. This function works by returning the result of `do_put()`.

**Parameters**

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt; &gt;</code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__units</code>	Place to store result of parsing.

**Returns**

Iterator after writing.

References [do\\_put\(\)](#).

```
template<typename _CharT, bool _Intl>
typedef basic_string<_CharT> std::moneypunct<_CharT, _Intl>::string_type
Public typedefs.
```

**6.678.3 Constructor & Destructor Documentation****moneypunct()** [1/3]

```
template<typename _CharT, bool _Intl>
std::moneypunct<_CharT, _Intl>::moneypunct (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

**Parameters**

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

References [std::locale::facet::facet\(\)](#).

**moneypunct()** [2/3]

```
template<typename _CharT, bool _Intl>
std::moneypunct<_CharT, _Intl>::moneypunct (
    __cache_type * __cache,
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is an internal constructor.

**Parameters**

<code>__cache</code>	Cache for optimization.
<code>__refs</code>	Passed to the base facet class.

References [std::locale::facet::facet\(\)](#).

**moneypunct()** [3/3]

```
template<typename _CharT, bool _Intl>
std::moneypunct<_CharT, _Intl>::moneypunct (
    __c_locale __cloc,
    const char * __s,
    size_t __refs = 0) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

**Parameters**

<code>__cloc</code>	The C locale.
<code>__s</code>	The name of a locale.
<code>__refs</code>	Passed to the base facet class.

References [std::locale::facet::facet\(\)](#).

**~moneypunct()**

```
template<typename _CharT, bool _Intl>
virtual std::moneypunct< _CharT, _Intl >::~~moneypunct () [protected], [virtual]
Destructor.
```

**6.678.4 Member Function Documentation****curr\_symbol()**

```
template<typename _CharT, bool _Intl>
string\_type std::moneypunct< _CharT, _Intl >::curr_symbol () const [inline]
```

Return currency symbol string.

This function returns a [string\\_type](#) to use as a currency symbol. It does so by returning [moneypunct](#)<[char\\_type](#)>::do\_curr\_symbol().

**Returns**

*string\_type* representing a currency symbol.

References [do\\_curr\\_symbol\(\)](#).

**decimal\_point()**

```
template<typename _CharT, bool _Intl>
char\_type std::moneypunct< _CharT, _Intl >::decimal_point () const [inline]
```

Return decimal point character.

This function returns a [char\\_type](#) to use as a decimal point. It does so by returning [moneypunct](#)<[char\\_type](#)>::do\_decimal\_point().

**Returns**

*char\_type* representing a decimal point.

References [do\\_decimal\\_point\(\)](#).

**do\_curr\_symbol()**

```
template<typename _CharT, bool _Intl>
virtual string\_type std::moneypunct< _CharT, _Intl >::do_curr_symbol () const [inline], [protected],
[virtual]
```

Return currency symbol string.

This function returns a [string\\_type](#) to use as a currency symbol. This function is a hook for derived classes to change the value returned.

**See also**

[curr\\_symbol\(\)](#) for details.

**Returns**

*string\_type* representing a currency symbol.

Referenced by [curr\\_symbol\(\)](#).

**do\_decimal\_point()**

```
template<typename _CharT, bool _Intl>
virtual char\_type std::moneypunct< _CharT, _Intl >::do_decimal_point () const [inline], [protected],
[virtual]
```

Return decimal point character.

Returns a [char\\_type](#) to use as a decimal point. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a decimal point.

Referenced by [decimal\\_point\(\)](#).

**do\_frac\_digits()**

```
template<typename _CharT, bool _Intl>
virtual int std::moneypunct< _CharT, _Intl >::do_frac_digits () const [inline], [protected],
[virtual]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

**See also**

[frac\\_digits\(\)](#) for details.

**Returns**

Number of digits in amount fraction.

Referenced by [frac\\_digits\(\)](#).

**do\_grouping()**

```
template<typename _CharT, bool _Intl>
virtual string std::moneypunct< _CharT, _Intl >::do_grouping () const [inline], [protected],
[virtual]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

**See also**

[grouping\(\)](#) for details.

**Returns**

String representing grouping specification.

Referenced by [grouping\(\)](#).

**do\_neg\_format()**

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_neg_format () const [inline], [protected],
[virtual]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

**See also**

[neg\\_format\(\)](#) for details.

**Returns**

Pattern for money values.

Referenced by [neg\\_format\(\)](#).

**do\_negative\_sign()**

```
template<typename _CharT, bool _Intl>
virtual string\_type std::moneypunct< _CharT, _Intl >::do_negative_sign () const [inline], [protected],
[virtual]
```

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

**See also**

`negative_sign()` for details.

**Returns**

*string\_type* representing a negative sign.

Referenced by [negative\\_sign\(\)](#).

**do\_pos\_format()**

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_pos_format () const [inline], [protected],
[virtual]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

**See also**

`pos_format()` for details.

**Returns**

Pattern for money values.

Referenced by [pos\\_format\(\)](#).

**do\_positive\_sign()**

```
template<typename _CharT, bool _Intl>
virtual string\_type std::moneypunct< _CharT, _Intl >::do_positive_sign () const [inline], [protected],
[virtual]
```

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

**See also**

`positive_sign()` for details.

**Returns**

*string\_type* representing a positive sign.

Referenced by [positive\\_sign\(\)](#).

**do\_thousands\_sep()**

```
template<typename _CharT, bool _Intl>
virtual char\_type std::moneypunct<_CharT, _Intl>::do_thousands_sep () const [inline], [protected], [virtual]
```

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a thousands separator.

Referenced by [thousands\\_sep\(\)](#).

**frac\_digits()**

```
template<typename _CharT, bool _Intl>
int std::moneypunct<_CharT, _Intl>::frac_digits () const [inline]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning `returning moneypunct<char_type>::do_frac_digits()`.

The fractional part of a money amount is optional. But if it is present, there must be `frac_digits()` digits.

**Returns**

Number of digits in amount fraction.

References [do\\_frac\\_digits\(\)](#).

**grouping()**

```
template<typename _CharT, bool _Intl>
string std::moneypunct<_CharT, _Intl>::grouping () const [inline]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the `grouping()` returns `\003\002` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was 32, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `moneypunct<char_type>::do_grouping()`.

**Returns**

string representing grouping specification.

References [do\\_grouping\(\)](#).

**neg\_format()**

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct<_CharT, _Intl>::neg_format () const [inline]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `returning moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field. The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

#### Returns

Pattern for money values.

References [do\\_neg\\_format\(\)](#).

### negative\_sign()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct< _CharT, _Intl >::negative_sign () const [inline]
```

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. It does so by returning `moneypunct<char_type>::do_negative_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `neg_format()` and the remainder appear at the end of the formatted string.

#### Returns

*string\_type* representing a negative sign.

References [do\\_negative\\_sign\(\)](#).

### pos\_format()

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct< _CharT, _Intl >::pos_format () const [inline]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

#### Returns

Pattern for money values.

References [do\\_pos\\_format\(\)](#).

### positive\_sign()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct< _CharT, _Intl >::positive_sign () const [inline]
```

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. It does so by returning `money_punct<char_type>::do_positive_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `pos_format()` and the remainder appear at the end of the formatted string.

#### Returns

*string\_type* representing a positive sign.

References [do\\_positive\\_sign\(\)](#).

#### `thousands_sep()`

```
template<typename _CharT, bool _Intl>
```

```
char_type std::moneypunct<_CharT, _Intl>::thousands_sep () const [inline]
```

Return thousands separator character.

This function returns a `char_type` to use as a thousands separator. It does so by returning `money_punct<char_type>::do_thousands_sep()`.

#### Returns

`char_type` representing a thousands separator.

References [do\\_thousands\\_sep\(\)](#).

### 6.678.5 Member Data Documentation

#### `id`

```
template<typename _CharT, bool _Intl>
```

```
locale::id std::moneypunct<_CharT, _Intl>::id [static]
```

Numpunct facet id.

#### `intl`

```
template<typename _CharT, bool _Intl>
```

```
const bool std::moneypunct<_CharT, _Intl>::intl [static]
```

This value is provided by the standard, but no reason for its existence.

The documentation for this class was generated from the following file:

#### 6.679.1 Detailed Description

```
template<typename _CharT, bool _Intl>
class std::moneypunct_byname<_CharT, _Intl>
```

class moneypunct\_byname [22.2.6.4].

#### 6.679.2 Member Function Documentation

##### curr\_symbol()

```
template<typename _CharT, bool _Intl>
string\_type std::moneypunct<_CharT, _Intl>::curr_symbol () const [inline], [inherited]
```

Return currency symbol string.

This function returns a [string\\_type](#) to use as a currency symbol. It does so by returning returning moneypunct<char←\_type>::do\_curr\_symbol().

##### Returns

*string\_type* representing a currency symbol.

References [do\\_curr\\_symbol\(\)](#).

**decimal\_point()**

```
template<typename _CharT, bool _Intl>
char_type std::moneypunct< _CharT, _Intl >::decimal_point () const [inline], [inherited]
```

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `returning moneypunct<char_↵type>::do_decimal_point()`.

**Returns**

*char\_type* representing a decimal point.

References [do\\_decimal\\_point\(\)](#).

**do\_curr\_symbol()**

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_curr_symbol () const [inline], [protected],
[virtual], [inherited]
```

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. This function is a hook for derived classes to change the value returned.

**See also**

`curr_symbol()` for details.

**Returns**

*string\_type* representing a currency symbol.

Referenced by [curr\\_symbol\(\)](#).

**do\_decimal\_point()**

```
template<typename _CharT, bool _Intl>
virtual char_type std::moneypunct< _CharT, _Intl >::do_decimal_point () const [inline], [protected],
[virtual], [inherited]
```

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a decimal point.

Referenced by [decimal\\_point\(\)](#).

**do\_frac\_digits()**

```
template<typename _CharT, bool _Intl>
virtual int std::moneypunct< _CharT, _Intl >::do_frac_digits () const [inline], [protected],
[virtual], [inherited]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

**See also**

`frac_digits()` for details.

### Returns

Number of digits in amount fraction.

Referenced by [frac\\_digits\(\)](#).

### do\_grouping()

```
template<typename _CharT, bool _Intl>
virtual string std::moneypunct<_CharT, _Intl >::do_grouping () const [inline], [protected],
[virtual], [inherited]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

### See also

[grouping\(\)](#) for details.

### Returns

String representing grouping specification.

Referenced by [grouping\(\)](#).

### do\_neg\_format()

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct<_CharT, _Intl >::do_neg_format () const [inline], [protected],
[virtual], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

### See also

[neg\\_format\(\)](#) for details.

### Returns

Pattern for money values.

Referenced by [neg\\_format\(\)](#).

### do\_negative\_sign()

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct<_CharT, _Intl >::do_negative_sign () const [inline], [protected],
[virtual], [inherited]
```

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

### See also

[negative\\_sign\(\)](#) for details.

### Returns

*string\_type* representing a negative sign.

Referenced by [negative\\_sign\(\)](#).

**do\_pos\_format()**

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_pos_format () const [inline], [protected],
[virtual], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

**See also**

[pos\\_format\(\)](#) for details.

**Returns**

Pattern for money values.

Referenced by [pos\\_format\(\)](#).

**do\_positive\_sign()**

```
template<typename _CharT, bool _Intl>
virtual string\_type std::moneypunct< _CharT, _Intl >::do_positive_sign () const [inline], [protected],
[virtual], [inherited]
```

Return positive sign string.

This function returns a [string\\_type](#) to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

**See also**

[positive\\_sign\(\)](#) for details.

**Returns**

*string\_type* representing a positive sign.

Referenced by [positive\\_sign\(\)](#).

**do\_thousands\_sep()**

```
template<typename _CharT, bool _Intl>
virtual char\_type std::moneypunct< _CharT, _Intl >::do_thousands_sep () const [inline], [protected],
[virtual], [inherited]
```

Return thousands separator character.

Returns a [char\\_type](#) to use as a thousands separator. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a thousands separator.

Referenced by [thousands\\_sep\(\)](#).

**frac\_digits()**

```
template<typename _CharT, bool _Intl>
int std::moneypunct< _CharT, _Intl >::frac_digits () const [inline], [inherited]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning [std::moneypunct<char\\_type>::do\\_frac\\_digits\(\)](#).

The fractional part of a money amount is optional. But if it is present, there must be [frac\\_digits\(\)](#) digits.

**Returns**

Number of digits in amount fraction.

References [do\\_frac\\_digits\(\)](#).

**grouping()**

```
template<typename _CharT, bool _Intl>
string std::moneypunct<_CharT, _Intl>::grouping () const [inline], [inherited]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns \003\002 and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was 32, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling moneypunct<char\_type>::do\_grouping().

**Returns**

string representing grouping specification.

References [do\\_grouping\(\)](#).

**neg\_format()**

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct<_CharT, _Intl>::neg_format () const [inline], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning moneypunct<char\_type>::do\_pos\_format() or moneypunct<char\_type>::do\_neg\_format().

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of curr\_symbol() may be present. The sign field indicates that the value of positive\_sign() or negative\_sign() must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and pos\_format() pattern {symbol,sign,value,none}, curr\_symbol() == '\$' positive\_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is \$+10.01.

**Returns**

Pattern for money values.

References [do\\_neg\\_format\(\)](#).

**negative\_sign()**

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct<_CharT, _Intl>::negative_sign () const [inline], [inherited]
```

Return negative sign string.

This function returns a string\_type to use as a sign for negative amounts. It does so by returning returning moneypunct<char\_type>::do\_negative\_sign().

If the return value contains more than one character, the first character appears in the position indicated by neg\_format() and the remainder appear at the end of the formatted string.

**Returns**

*string\_type* representing a negative sign.

References [do\\_negative\\_sign\(\)](#).

**pos\_format()**

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct<_CharT, _Intl>::pos_format () const [inline], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

**Returns**

Pattern for money values.

References [do\\_pos\\_format\(\)](#).

**positive\_sign()**

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct<_CharT, _Intl>::positive_sign () const [inline], [inherited]
```

Return positive sign string.

This function returns a *string\_type* to use as a sign for positive amounts. It does so by returning `moneypunct<char_type>::do_positive_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `pos_format()` and the remainder appear at the end of the formatted string.

**Returns**

*string\_type* representing a positive sign.

References [do\\_positive\\_sign\(\)](#).

**thousands\_sep()**

```
template<typename _CharT, bool _Intl>
char_type std::moneypunct<_CharT, _Intl>::thousands_sep () const [inline], [inherited]
```

Return thousands separator character.

This function returns a *char\_type* to use as a thousands separator. It does so by returning `moneypunct<char_type>::do_thousands_sep()`.

**Returns**

*char\_type* representing a thousands separator.

References [do\\_thousands\\_sep\(\)](#).

### 6.680.1 Detailed Description

A memory resource that allocates from a fixed-size buffer.

The main feature of a `pmr::monotonic_buffer_resource` is that its `do_deallocate` does nothing. This makes it very fast because there is no need to manage a free list, and every allocation simply returns a new block of memory, rather than searching for a suitably-sized free block. Because deallocating is a no-op, the amount of memory used by the resource only grows until `release()` (or the destructor) is called to return all memory to upstream.

A `monotonic_buffer_resource` can be initialized with a buffer that will be used to satisfy all allocation requests, until the buffer is full. After that a new buffer will be allocated from the upstream resource. By using a stack buffer and `pmr::null_memory_resource()` as the upstream you can get a memory resource that only uses the stack and never dynamically allocates.

Since

C++17

### 6.680.2 Member Function Documentation

#### `do_allocate()`

```
void * std::pmr::monotonic_buffer_resource::do_allocate (
    size_t __bytes,
    size_t __alignment) [inline], [override], [protected], [virtual]
```

Implements [std::pmr::memory\\_resource](#).

#### `do_deallocate()`

```
void std::pmr::monotonic_buffer_resource::do_deallocate (
    void * ,
    size_t ,
    size_t ) [inline], [override], [protected], [virtual]
```

Implements [std::pmr::memory\\_resource](#).

#### `do_is_equal()`

```
bool std::pmr::monotonic_buffer_resource::do_is_equal (
    const memory\_resource & __other) const [inline], [override], [protected], [virtual],
[noexcept]
```

Implements [std::pmr::memory\\_resource](#).

The documentation for this class was generated from the following file:

### 6.681.1 Detailed Description

template<typename \_Iterator>  
class std::move\_iterator<\_Iterator>

An iterator adaptor that yields an rvalue reference.

Class template move\_iterator is an iterator adapter with the same behavior as the underlying iterator except that its dereference operator implicitly converts the value returned by the underlying iterator's dereference operator to an rvalue reference. Some generic algorithms can be called with move iterators to replace copying with moving.

The documentation for this class was generated from the following file:

- [bits/stl\\_iterator.h](#)

#### 6.682.1 Detailed Description

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
class std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>
```

Polymorphic function wrapper.

Since

C++23

The `std::move_only_function` class template is a call wrapper similar to `std::function`, but does not require the stored target function to be copyable.

It also supports const-qualification, ref-qualification, and no-throw guarantees. The qualifications and exception-specification of the `move_only_function::operator()` member function are respected when invoking the target function.

## 6.682.2 Constructor & Destructor Documentation

### `move_only_function()` [1/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::move_only_function<_Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
() [inline], [noexcept]
```

Creates an empty object.

References [move\\_only\\_function\(\)](#).

Referenced by [move\\_only\\_function\(\)](#), [move\\_only\\_function\(\)](#), [move\\_only\\_function\(\)](#), [move\\_only\\_function\(\)](#), [move\\_only\\_function\(\)](#), [move\\_only\\_function\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [swap\(\)](#), and [swap\(\)](#).

### `move_only_function()` [2/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::move_only_function<_Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
(
    nullptr_t ) [inline], [noexcept]
```

Creates an empty object.

References [move\\_only\\_function\(\)](#).

### `move_only_function()` [3/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::move_only_function<_Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
(
    move_only_function<_Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> && __x)
[inline], [noexcept]
```

Moves the target object, leaving the source empty.

References [move\\_only\\_function\(\)](#).

### `move_only_function()` [4/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Fn, typename _Vt = decay_t<_Fn>>
requires (!is_same_v<_Vt, move_only_function>) && (!__is_in_place_type_v<_Vt>) && __is_callable<
_from<_Vt>
std::move_only_function<_Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
(
    _Fn && __f) [inline], [noexcept]
```

Stores a target object initialized from the argument.

References [move\\_only\\_function\(\)](#), and [std::forward\(\)](#).

### `move_only_function()` [5/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Tp, typename... _Args>
```

```
requires is_constructible_v<_Tp, _Args...> && __is_callable_from<_Tp>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
(
    in_place_type_t< _Tp > ,
    _Args &&... __args) [inline], [explicit], [noexcept]
```

Stores a target object initialized from the arguments.

References [move\\_only\\_function\(\)](#), and [std::forward\(\)](#).

### move\_only\_function() [6/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Tp, typename _Up, typename... _Args>
requires is_constructible_v<_Tp, initializer_list<_Up>&, _Args...> && __is_callable_from<_Tp>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
(
    in_place_type_t< _Tp > ,
    initializer_list< _Up > __il,
    _Args &&... __args) [inline], [explicit], [noexcept]
```

Stores a target object initialized from the arguments.

References [move\\_only\\_function\(\)](#), and [std::forward\(\)](#).

## 6.682.3 Member Function Documentation

### operator bool()

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator bool ()
const [inline], [explicit], [noexcept]
```

True if a target object is present, false otherwise.

### operator()()

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
_Res std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator() (
    _ArgTypes... __args) [inline], [noexcept]
```

Invoke the target object.

The target object will be invoked using the supplied arguments, and as an lvalue or rvalue, and as const or non-const, as dictated by the template arguments of the `move_only_function` specialization.

#### Precondition

Must not be empty.

References [std::forward\(\)](#), and [operator\(\)\(\)](#).

Referenced by [operator\(\)\(\)](#).

### operator=() [1/3]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Fn>
requires is_constructible_v<move_only_function, _Fn>
move_only_function & std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator= (
    _Fn && __f) [inline], [noexcept]
```

Stores a new target object, initialized from the argument.

References [move\\_only\\_function\(\)](#), [std::forward\(\)](#), and [operator=\(\)](#).

### `operator=()` [2/3]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
move_only_function & std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator= (
    move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> && __x)
```

[inline], [noexcept]

Stores a new target object, leaving `x` empty.

References `move_only_function()`, `std::addressof()`, and `operator=()`.

Referenced by `operator=()`, `operator=()`, and `operator=()`.

### `operator=()` [3/3]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
move_only_function & std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator= (
    nullptr_t ) [inline], [noexcept]
```

Destroys the target object (if any).

References `move_only_function()`, and `operator=()`.

### `swap()`

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
void std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::swap (
    move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __x)
[inline], [noexcept]
```

Exchange the target objects (if any).

References `move_only_function()`, and `swap()`.

Referenced by `swap()`, and `swap`.

## 6.682.4 Friends And Related Symbol Documentation

### `operator==`

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
bool operator== (
    const move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __x,
    nullptr_t ) [friend]
```

Check for emptiness by comparing with `nullptr`.

References `move_only_function()`, and `operator==`.

Referenced by `operator==`.

### `swap`

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
void swap (
    move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __x,
    move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __y)
[friend]
```

Exchange the target objects (if any).

References `move_only_function()`, and `swap()`.

The documentation for this class was generated from the following file:

- `mofunc_impl.h`

## 6.683 `std::move_sentinel<_Sent >` Class Template Reference

```
#include <stl_iterator.h>
```

### Public Member Functions

### 6.685.1 Detailed Description

**template**<typename **\_Key**, typename **\_Tp**, typename **\_Compare** = **std::less**<**\_Key**>, typename **\_Alloc** = **std::allocator**<**std::pair**<**const \_Key**, **\_Tp**> >>  
**class** **std::multimap**< **\_Key**, **\_Tp**, **\_Compare**, **\_Alloc** >

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

Since

C++98

### Template Parameters

<b>_Key</b>	Type of key objects.
<b>_Tp</b>	Type of mapped objects.
<b>_Compare</b>	Comparison function object type, defaults to <b>less</b> < <b>_Key</b> >.
<b>_Alloc</b>	Allocator type, defaults to <b>allocator</b> < <b>pair</b> < <b>const _Key</b> , <b>_Tp</b> >.

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using equivalent keys). For a **multimap**<**Key**, **T**> the **key\_type** is **Key**, the **mapped\_type** is **T**, and the **value\_type** is **std::pair**<**const Key**,**T**>.

Multimaps support bidirectional iterators.

The private tree data is declared exactly the same way for **map** and **multimap**; the distinction is made entirely in how the tree functions are called (\***\_unique** versus \***\_equal**, same as the standard).

### 6.685.2 Constructor & Destructor Documentation

#### **multimap**() [1/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap () [default]
```

Default constructor creates no elements.

**multimap()** [2/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a multimap with no elements.

**Parameters**

<code>__comp</code>	A comparison object.
<code>__a</code>	An allocator object.

**multimap()** [3/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    const multimap< _Key, _Tp, _Compare, _Alloc > & ) [default]
```

Multimap copy constructor.

Whether the allocator is copied depends on the allocator traits.

**multimap()** [4/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    multimap< _Key, _Tp, _Compare, _Alloc > && ) [default]
```

Multimap move constructor.

The newly-created multimap contains the exact contents of the moved instance. The moved instance is a valid, but unspecified multimap.

**multimap()** [5/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    initializer_list< value_type > __l,
    const _Compare & __comp = _Compare(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a multimap from an initializer\_list.

**Parameters**

<code>__l</code>	An initializer_list.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multimap consisting of copies of the elements from the initializer\_list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is `__l.size()`).

**multimap()** [6/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap<_Key, _Tp, _Compare, _Alloc >::multimap (
    const allocator_type & __a) [inline], [explicit]
```

Allocator-extended default constructor.

**multimap()** [7/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap<_Key, _Tp, _Compare, _Alloc >::multimap (
    const multimap<_Key, _Tp, _Compare, _Alloc > & __m,
    const __type_identity_t< allocator_type > & __a) [inline]
```

Allocator-extended copy constructor.

**multimap()** [8/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap<_Key, _Tp, _Compare, _Alloc >::multimap (
    multimap<_Key, _Tp, _Compare, _Alloc > && __m,
    const __type_identity_t< allocator_type > & __a) [inline], [noexcept]
```

Allocator-extended move constructor.

**multimap()** [9/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap<_Key, _Tp, _Compare, _Alloc >::multimap (
    initializer_list< value_type > __l,
    const allocator_type & __a) [inline]
```

Allocator-extended initializer-list constructor.

**multimap()** [10/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::multimap<_Key, _Tp, _Compare, _Alloc >::multimap (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a) [inline]
```

Allocator-extended range constructor.

**multimap()** [11/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::multimap<_Key, _Tp, _Compare, _Alloc >::multimap (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Builds a multimap from a range.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a multimap consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is `distance(__first,__last)`).

**multimap() [12/12]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a multimap from a range.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multimap consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is `distance(__first,__last)`).

**~multimap()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::~~multimap () [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**6.685.3 Member Function Documentation****begin() [1/2]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

**begin() [2/2]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

**cbegin()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

**cend()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

**clear()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
void std::multimap<_Key, _Tp, _Compare, _Alloc>::clear () [inline], [noexcept]
```

Erases all elements in a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
template<typename _Kt>
auto std::multimap<_Key, _Tp, _Compare, _Alloc>::contains (
    const _Kt & __x) const -> decltype(_M_t._M_find_tr(__x), void()), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

	Key of (key, value) pairs to be located.
<code>__x</code>	

**Returns**

True if there is any element with the specified key.

**contains()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
bool std::multimap<_Key, _Tp, _Compare, _Alloc>::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

	Key of (key, value) pairs to be located.
<code>__x</code>	

**Returns**

True if there is any element with the specified key.

**count()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements with given key.

**Parameters**

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

**Returns**

Number of elements with specified key.

**crbegin()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::crbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

**crend()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::crend () const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

**emplace()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Build and insert a `std::pair` into the multimap.

**Parameters**

<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).
---------------------	--

**Returns**

An iterator that points to the inserted (key,value) pair.

This function builds and inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

**emplace\_hint()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Builds and inserts a std::pair into the multimap.

**Parameters**

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).

**Returns**

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

**empty()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
bool std::multimap< _Key, _Tp, _Compare, _Alloc >::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the multimap is empty.

**end() [1/2]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

**end() [2/2]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

**equal\_range()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair< iterator, iterator > std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_range (
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

**equal\_range()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair< const_iterator, const_iterator > std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

**Returns**

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

**erase()** [1/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

<code>_↔</code>	Key of element to be erased.
<code>_X</code>	

**Returns**

The number of elements erased.

This function erases all elements located by the given key from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase() [2/4]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [first,last) range of elements from a multimap.

**Parameters**

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased .

**Returns**

The iterator `__last`.

This function erases a sequence of elements from a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase() [3/4]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::erase (
    const_iterator __position) [inline]
```

Erases an element from a multimap.

**Parameters**

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [4/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
_GLIBCXX_ABI_TAG_CXX11 iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
    iterator __position) [inline]
```

Erases an element from a multimap.

**Parameters**

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::find (
    const key_type & __x) [inline]
```

Tries to locate an element in a multimap.

**Parameters**

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**find()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in a multimap.

**Parameters**

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

**Returns**

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**get\_allocator()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
allocator_type std::multimap<_Key, _Tp, _Compare, _Alloc>::get_allocator () const [inline],
[noexcept]
```

Get a copy of the memory allocation object.

**insert() [1/8]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator>
void std::multimap<_Key, _Tp, _Compare, _Alloc>::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

**Parameters**

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

**insert() [2/8]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair >::value, iterator > std::multimap<_Key, _Tp,
_Tp, _Compare, _Alloc>::insert (
    _Pair && __x) [inline]
```

Inserts a `std::pair` into the multimap.

**Parameters**

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

**Returns**

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

**insert()** [3/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    const value_type & __x) [inline]
```

Inserts a std::pair into the multimap.

**Parameters**

<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).
------------------	--

**Returns**

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

Referenced by `std::multimap< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert()`.

**insert()** [4/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::multimap< _Key,
_Tp, _Compare, _Alloc >::insert (
    const_iterator __position,
    _Pair && __x) [inline]
```

Inserts a std::pair into the multimap.

**Parameters**

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

**Returns**

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

**insert()** [5/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    const_iterator __position,
    const value_type & __x) [inline]
```

Inserts a std::pair into the multimap.

## Parameters

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

## Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

**insert()** [6/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    const_iterator __position,
    value_type && __x) [inline]
```

Inserts a `std::pair` into the multimap.

## Parameters

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

## Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

**insert()** [7/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
void std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of `std::pairs` into the multimap.

**Parameters**

	A <code>std::initializer_list&lt;value_type&gt;</code> of pairs to be inserted.
	
	
	
	

Complexity similar to that of the range constructor.

**insert()** [8/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    value_type && __x) [inline]
```

Inserts a `std::pair` into the multimap.

**Parameters**

	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
	

**Returns**

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

**key\_comp()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
key_compare std::multimap< _Key, _Tp, _Compare, _Alloc >::key_comp () const [inline]
```

Returns the key comparison object out of which the multimap was constructed.

**lower\_bound()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (
    const key_type & __x) [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

	Key of (key, value) pair to be located.
	

**Returns**

Iterator pointing to first element equal to or greater than key, or `end()`.

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or `end()` if no such element exists.

**lower\_bound()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (
    const key_type & __x) const [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

**Returns**

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful the iterator will point to the next greatest element or, if no such greater element exists, to end().

**max\_size()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the maximum size of the multimap.

**operator=()** [1/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
multimap & std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
    const multimap< _Key, _Tp, _Compare, _Alloc > & ) [default]
```

Multimap assignment operator.

Whether the allocator is copied depends on the allocator traits.

**operator=()** [2/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
multimap & std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Multimap list assignment operator.

**Parameters**

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills a multimap with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the multimap and that the resulting multimap's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
multimap & std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
    multimap< _Key, _Tp, _Compare, _Alloc > && ) [default]
```

Move assignment operator.

**rbegin()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

**rbegin()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rbegin () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

**rend()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rend () const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

**rend()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rend () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

**size()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the multimap.

**swap()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::multimap< _Key, _Tp, _Compare, _Alloc >::swap (
    multimap< _Key, _Tp, _Compare, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another `multimap`.

## Parameters

<a href="#"><code>_↔_X</code></a>	A multimap of the same element and allocator types.
-----------------------------------	---

This exchanges the elements between two multimaps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Referenced by [std::swap\(\)](#).

**upper\_bound()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
    const key_type & __x) [inline]
```

Finds the end of a subsequence matching given key.

## Parameters

<a href="#"><code>_↔_X</code></a>	Key of (key, value) pair to be located.
-----------------------------------	---

## Returns

Iterator pointing to the first element greater than key, or end().

**upper\_bound()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
    const key_type & __x) const [inline]
```

Finds the end of a subsequence matching given key.

## Parameters

<a href="#"><code>_↔_X</code></a>	Key of (key, value) pair to be located.
-----------------------------------	---

## Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

**value\_comp()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
value_compare std::multimap< _Key, _Tp, _Compare, _Alloc >::value_comp () const [inline]
```

Returns a value comparison object, built from the key comparison object out of which the multimap was constructed.

### 6.689.1 Detailed Description

**template<typename \_Key, typename \_Compare = std::less<\_Key>, typename \_Alloc = std::allocator<\_Key>>**  
**class std::multiset< \_Key, \_Compare, \_Alloc >**

A standard container made up of elements, which can be retrieved in logarithmic time.

Since

C++98

### Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Compare</code>	Comparison function object type, defaults to <code>less&lt;_Key&gt;</code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using equivalent keys). For a `multiset<Key>` the `key_type` and `value_type` are `Key`.

Multisets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

### 6.689.2 Constructor & Destructor Documentation

#### **multiset()** [1/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset () [default]
```

Default constructor creates no elements.

**multiset()** [2/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a multiset with no elements.

**Parameters**

<code>__comp</code>	Comparator to use.
<code>__a</code>	An allocator object.

**multiset()** [3/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Builds a multiset from a range.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a multiset consisting of copies of the elements from `[first,last)`. This is linear in  $N$  if the range is already sorted, and  $N\log N$  otherwise (where  $N$  is `distance(__first,__last)`).

**multiset()** [4/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a multiset from a range.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multiset consisting of copies of the elements from `[__first,__last)`. This is linear in  $N$  if the range is already sorted, and  $N\log N$  otherwise (where  $N$  is `distance(__first,__last)`).

**multiset()** [5/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc>::multiset (
    const multiset<_Key, _Compare, _Alloc> & ) [default]
```

Multiset copy constructor.

Whether the allocator is copied depends on the allocator traits.

**multiset()** [6/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc>::multiset (
    multiset<_Key, _Compare, _Alloc> && ) [default]
```

Multiset move constructor.

The newly-created multiset contains the exact contents of the moved instance. The moved instance is a valid, but unspecified multiset.

**multiset()** [7/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc>::multiset (
    initializer_list<value_type> & __l,
    const _Compare & __comp = _Compare(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a multiset from an initializer\_list.

**Parameters**

<code>__l</code>	An initializer_list.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multiset consisting of copies of the elements from the list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is `__l.size()`).

**multiset()** [8/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc>::multiset (
    const allocator_type & __a) [inline], [explicit]
```

Allocator-extended default constructor.

**multiset()** [9/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc>::multiset (
    const multiset<_Key, _Compare, _Alloc> & __m,
    const __type_identity_t<allocator_type> & __a) [inline]
```

Allocator-extended copy constructor.

**multiset()** [10/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    multiset< _Key, _Compare, _Alloc > && __m,
    const __type_identity_t< allocator_type > & __a) [inline], [noexcept]
```

Allocator-extended move constructor.

**multiset()** [11/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    initializer_list< value_type > __l,
    const allocator_type & __a) [inline]
```

Allocator-extended initializer-list constructor.

**multiset()** [12/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
template<typename _InputIterator>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a) [inline]
```

Allocator-extended range constructor.

**~multiset()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::multiset< _Key, _Compare, _Alloc >::~~multiset () [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**6.689.3 Member Function Documentation****begin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

**cbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

**cend()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
iterator std::multiset<_Key, _Compare, _Alloc>::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

**clear()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
void std::multiset<_Key, _Compare, _Alloc>::clear () [inline], [noexcept]
```

Erases all elements in a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
template<typename _Kt>
```

```
auto std::multiset<_Key, _Compare, _Alloc>::contains (
    const _Kt & __x) const -> decltype(_M_t._M_find_tr(__x), void(), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

<code>_Key</code>	Key of elements to be located.
<code>__x</code>	

**Returns**

True if there is any element with the specified key.

**contains()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
bool std::multiset<_Key, _Compare, _Alloc>::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

<code>_Key</code>	Key of elements to be located.
<code>__x</code>	

**Returns**

True if there is any element with the specified key.

**count()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements with given key.

**Parameters**

<code>__x</code>	Key of elements to be located.
------------------	--------------------------------

**Returns**

Number of elements with specified key.

**crbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

**crend()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

**emplace()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args>
```

```
iterator std::multiset< _Key, _Compare, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Builds and inserts an element into the multiset.

**Parameters**

<code>__args</code>	Arguments used to generate the element instance to be inserted.
---------------------	---

**Returns**

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

**emplace\_hint()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args>
iterator std::multiset<_Key, _Compare, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Builds and inserts an element into the multiset.

**Parameters**

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element instance to be inserted.

**Returns**

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

**empty()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
bool std::multiset<_Key, _Compare, _Alloc >::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the set is empty.

**end()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset<_Key, _Compare, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

**equal\_range()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair< iterator, iterator > std::multiset<_Key, _Compare, _Alloc >::equal_range (
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>__x</code>	Key to be located.
------------------	--------------------

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),  
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

**equal\_range()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>  
std::pair< const_iterator, const_iterator > std::multiset< _Key, _Compare, _Alloc >::equal_range  
(  
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>↵ __x</code>	Key to be located.
------------------------	--------------------

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),  
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

**erase()** [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>  
size_type std::multiset< _Key, _Compare, _Alloc >::erase (  
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

<code>↵ __x</code>	Key of element to be erased.
------------------------	------------------------------

**Returns**

The number of elements erased.

This function erases all elements located by the given key from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::multiset< _Key, _Compare, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [first,last) range of elements from a multiset.

**Parameters**

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

**Returns**

The iterator *last*.

This function erases a sequence of elements from a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::multiset< _Key, _Compare, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from a multiset.

**Parameters**

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::find (
    const key_type & __x) [inline]
```

Tries to locate an element in a set.

**Parameters**

<code>__x</code>	Element to be located.
------------------	------------------------

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

**find()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in a set.

**Parameters**

<code>__x</code>	Element to be located.
------------------	------------------------

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

**get\_allocator()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
allocator_type std::multiset< _Key, _Compare, _Alloc >::get_allocator () const [inline], [noexcept]
```

Returns the memory allocation object.

**insert()** [1/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator>
void std::multiset< _Key, _Compare, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that tries to insert a range of elements.

**Parameters**

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

**insert()** [2/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
iterator std::multiset<_Key, _Compare, _Alloc >::insert (  
    const value_type & __x) [inline]
```

Inserts an element into the multiset.

**Parameters**

<code>_↵</code>	Element to be inserted.
<code>_X</code>	

**Returns**

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

Referenced by [std::multiset< \\_Key, \\_Cmp, polymorphic\\_allocator< \\_Key > >::insert\(\)](#).

**insert() [3/4]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::insert (
    const_iterator __position,
    const value_type & __x) [inline]
```

Inserts an element into the multiset.

**Parameters**

<code>__position</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

**Returns**

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

**insert() [4/4]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
void std::multiset< _Key, _Compare, _Alloc >::insert (
    initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of elements into the multiset.

**Parameters**

<code>↵</code>	A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted.
<code>_↵</code>	
<code>↵</code>	
<code>_↵</code>	
<code>/</code>	

Complexity similar to that of the range constructor.

**key\_comp()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
key_compare std::multiset< _Key, _Compare, _Alloc >::key_comp () const [inline]
```

Returns the comparison object.

**lower\_bound()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound (
    const key_type & __x) [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

<code>_↵</code>	Key to be located.
<code>_X</code>	

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

**lower\_bound()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
const_iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound (
    const key_type & __x) const [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

<code>_↵</code>	Key to be located.
<code>_X</code>	

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

**max\_size()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
size_type std::multiset< _Key, _Compare, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the maximum size of the set.

**operator=()** [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
multiset & std::multiset< _Key, _Compare, _Alloc >::operator= (
    const multiset< _Key, _Compare, _Alloc > & ) [default]
```

Multiset assignment operator.

Whether the allocator is copied depends on the allocator traits.

**operator=()** [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
multiset & std::multiset< _Key, _Compare, _Alloc >::operator= (
    initializer_list< value_type > __l ) [inline]
```

Multiset list assignment operator.

**Parameters**

↵	An initializer_list.
↵	
↵	
↵	
/	

This function fills a multiset with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the multiset and that the resulting multiset's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
multiset & std::multiset< _Key, _Compare, _Alloc >::operator= (
    multiset< _Key, _Compare, _Alloc > && ) [default]
```

Move assignment operator.

**rbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

**rend()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

**size()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
size_type std::multiset< _Key, _Compare, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the set.

**swap()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
void std::multiset< _Key, _Compare, _Alloc >::swap (
    multiset< _Key, _Compare, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another multiset.

**Parameters**

<code>__x</code>	A multiset of the same element and allocator types.
------------------	---

This exchanges the elements between two multisets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Referenced by [std::swap\(\)](#).

**upper\_bound() [1/2]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
iterator std::multiset< _Key, _Compare, _Alloc >::upper_bound (
    const key_type & __x) [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

<code>__x</code>	Key to be located.
------------------	--------------------

**Returns**

Iterator pointing to the first element greater than key, or `end()`.

**upper\_bound() [2/2]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
const_iterator std::multiset< _Key, _Compare, _Alloc >::upper_bound (
    const key_type & __x) const [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

<code>__x</code>	Key to be located.
------------------	--------------------

**Returns**

Iterator pointing to the first element greater than key, or end().

**value\_comp()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
value_compare std::multiset< _Key, _Compare, _Alloc >::value_comp () const [inline]
```

Returns the comparison object.

### 6.696.1 Detailed Description

**template<typename `_IntType` = int>**

**class `std::negative_binomial_distribution< _IntType >`**

A `negative_binomial_distribution` random number distribution.

The formula for the negative binomial probability mass function is  $p(i) = \binom{n}{i} p^i (1-p)^{t-i}$  where  $t$  and  $p$  are the parameters of the distribution.

Since

C++11

## 6.696.2 Member Typedef Documentation

### result\_type

```
template<typename _IntType = int>
```

```
typedef _IntType std::negative_binomial_distribution< _IntType >::result_type
```

The type of the range of the distribution.

## 6.696.3 Member Function Documentation

### k()

```
template<typename _IntType = int>
```

```
_IntType std::negative_binomial_distribution< _IntType >::k () const [inline]
```

Return the  $k$  parameter of the distribution.

### max()

```
template<typename _IntType = int>
```

```
result_type std::negative_binomial_distribution< _IntType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

### min()

```
template<typename _IntType = int>
```

```
result_type std::negative_binomial_distribution< _IntType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

### operator>()

```
template<typename _IntType>
```

```
template<typename _UniformRandomNumberGenerator>
```

```
negative_binomial_distribution< _IntType >::result_type std::negative_binomial_distribution< _↵
```

```
_IntType >::operator() (
```

```
    _UniformRandomNumberGenerator & __urng)
```

Generating functions.

### p()

```
template<typename _IntType = int>
```

```
double std::negative_binomial_distribution< _IntType >::p () const [inline]
```

Return the  $p$  parameter of the distribution.

### param() [1/2]

```
template<typename _IntType = int>
```

```
param_type std::negative_binomial_distribution< _IntType >::param () const [inline]
```

Returns the parameter set of the distribution.

### param() [2/2]

```
template<typename _IntType = int>
```

```
void std::negative_binomial_distribution< _IntType >::param (
```

```
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

**reset()**

```
template<typename _IntType = int>
void std::negative_binomial_distribution< _IntType >::reset () [inline]
Resets the distribution state.
```

**6.696.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::negative_binomial_distribution< _IntType1 > & __x) [friend]
Inserts a negative_binomial_distribution random number distribution __x into the output stream __os.
```

**Parameters**

<code>__os</code>	An output stream.
<code>__x</code>	A negative_binomial_distribution random number distribution.

**Returns**

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _IntType = int>
bool operator== (
    const negative_binomial_distribution< _IntType > & __d1,
    const negative_binomial_distribution< _IntType > & __d2) [friend]
```

Return true if two negative binomial distributions have the same parameters and the sequences that would be generated are equal.

**operator>>**

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::negative_binomial_distribution< _IntType1 > & __x) [friend]
Extracts a negative_binomial_distribution random number distribution __x from the input stream __is.
```

**Parameters**

<code>__is</code>	An input stream.
-------------------	------------------

<code>_X</code>	A <code>negative_binomial_distribution</code> random number generator engine.
-----------------	---

**Returns**

The input stream with `__x` extracted or in an error state.

- void **deallocate** (`_Tp *``__p`, size\_type `__n`)

### 6.700.1 Detailed Description

template<typename `_Tp`>  
class `__gnu_cxx::new_allocator`< `_Tp` >

An allocator that uses global `new`, as per C++03 [20.4.1].  
This is precisely the allocator defined in the C++ Standard.

- all allocation calls `operator new`
- all deallocation calls `operator delete`

This is a non-standard extension that can be used to guarantee allocation from `new` even if the library has been configured to use a different implementation for `std::allocator`.

#### Template Parameters

<code>_Tp</code>	Type of allocated object.
------------------	---------------------------

The documentation for this class was generated from the following file:

- [ext/new\\_allocator.h](#)

### 6.703.1 Detailed Description

`template<typename _RealType = double>`  
**class** `std::normal_distribution<_RealType>`

A normal continuous distribution for random numbers.  
 The formula for the normal probability density function is

$$p(x|\mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{x-\mu}{2\sigma^2}}$$

Since

C++11

### 6.703.2 Member Typedef Documentation

#### result\_type

`template<typename _RealType = double>`  
`typedef _RealType std::normal_distribution< _RealType >::result_type`  
 The type of the range of the distribution.

### 6.703.3 Constructor & Destructor Documentation

#### normal\_distribution()

`template<typename _RealType = double>`  
`std::normal_distribution< _RealType >::normal_distribution (`  
`result_type __mean,`  
`result_type __stddev = result_type(1)) [inline], [explicit]`  
 Constructs a normal distribution with parameters *mean* and standard deviation.

### 6.703.4 Member Function Documentation

#### max()

`template<typename _RealType = double>`  
`result_type std::normal_distribution< _RealType >::max () const [inline]`  
 Returns the least upper bound value of the distribution.

#### mean()

`template<typename _RealType = double>`  
`_RealType std::normal_distribution< _RealType >::mean () const [inline]`  
 Returns the mean of the distribution.

**min()**

```
template<typename _RealType = double>
result_type std::normal_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

**operator>() [1/2]**

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::normal_distribution< _RealType >::operator() (

normal_distribution< _RealType >::result_type std::normal_distribution< _RealType >::operator()
(
    _UniformRandomNumberGenerator & __urng,
    const param_type & __param)
```

Polar method due to Marsaglia.

Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. V, Sect. 4.4.

References [std::log\(\)](#), and [std::sqrt\(\)](#).

**param() [1/2]**

```
template<typename _RealType = double>
param_type std::normal_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

**param() [2/2]**

```
template<typename _RealType = double>
void std::normal_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

**reset()**

```
template<typename _RealType = double>
void std::normal_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

**stddev()**

```
template<typename _RealType = double>
_RealType std::normal_distribution< _RealType >::stddev () const [inline]
```

Returns the standard deviation of the distribution.

### 6.703.5 Friends And Related Symbol Documentation

#### operator<<

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::normal_distribution< _RealType1 > & __x) [friend]
```

Inserts a normal\_distribution random number distribution \_\_x into the output stream \_\_os.

#### Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A normal_distribution random number distribution.

#### Returns

The output stream with the state of \_\_x inserted or in an error state.

#### operator==

```
template<typename _RealType = double>
template<typename _RealType1>
bool operator== (
    const std::normal_distribution< _RealType1 > & __d1,
    const std::normal_distribution< _RealType1 > & __d2) [friend]
```

Return true if two normal distributions have the same parameters and the sequences that would be generated are equal.

#### operator>>

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::normal_distribution< _RealType1 > & __x) [friend]
```

Extracts a normal\_distribution random number distribution \_\_x from the input stream \_\_is.

#### Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A normal_distribution random number generator engine.

#### Returns

The input stream with \_\_x extracted or in an error state.

The documentation for this class was generated from the following files:

## 6.704 std::not\_equal\_to< \_Tp > Struct Template Reference

```
#include <stl_function.h>
```

Inheritance diagram for std::not\_equal\_to< \_Tp >:

### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)
- typedef `bool` [result\\_type](#)
- typedef `_Tp` [second\\_argument\\_type](#)

### Public Member Functions

- constexpr `bool` **operator()** (const `_Tp` &\_\_x, const `_Tp` &\_\_y) const

#### 6.704.1 Detailed Description

```
template<typename _Tp>
struct std::not_equal_to< _Tp >
```

One of the [comparison functors](#).

#### 6.704.2 Member Typedef Documentation

##### first\_argument\_type

```
typedef _Tp std::binary_function< _Tp, _Tp, bool >::first_argument_type [inherited]
first_argument_type is the type of the first argument
```

##### result\_type

```
typedef bool std::binary_function< _Tp, _Tp, bool >::result_type [inherited]
result_type is the return type
```

##### second\_argument\_type

```
typedef _Tp std::binary_function< _Tp, _Tp, bool >::second_argument_type [inherited]
second_argument_type is the type of the second argument
The documentation for this struct was generated from the following file:
```

- [stl\\_function.h](#)

## 6.705 std::ranges::not\_equal\_to Struct Reference

```
#include <ranges_cmp.h>
```

### Public Types

- using `is_transparent`

### Static Public Member Functions

- `template<typename _Tp, typename _Up>`  
requires `equality_comparable_with<_Tp, _Up>`  
`static constexpr bool operator() (_Tp &&__t, _Up &&__u) noexcept(noexcept(std::declval<_Tp>()==std::declval<_Up>()))`

#### 6.705.1 Detailed Description

`ranges::not_equal_to` function object type.

The documentation for this struct was generated from the following file:

- [ranges\\_cmp.h](#)

## 6.706 std::not\_equal\_to< void > Struct Reference

```
#include <stl_function.h>
```

Inheritance diagram for `std::not_equal_to< void >`:

### Public Types

- typedef void [first\\_argument\\_type](#)
- typedef `__is_transparent` `is_transparent`
- typedef bool [result\\_type](#)
- typedef void [second\\_argument\\_type](#)

## Public Member Functions

- `template<typename _Tp, typename _Up>  
constexpr auto operator() (_Tp &&__t, _Up &&__u) const noexcept(noexcept(std::forward< _Tp >(__t) != std::forward< _Up >(__u))) -> decltype(std::forward< _Tp >(__t) != std::forward< _Up >(__u))`

### 6.706.1 Detailed Description

One of the [comparison functors](#).

### 6.706.2 Member Typedef Documentation

#### `first_argument_type`

`typedef void std::binary\_function< void, void, bool >::first_argument_type`  
`first_argument_type` is the type of the first argument

#### `result_type`

`typedef bool std::binary\_function< void, void, bool >::result_type`  
`result_type` is the return type

#### `second_argument_type`

`typedef void std::binary\_function< void, void, bool >::second_argument_type`  
`second_argument_type` is the type of the second argument  
 The documentation for this struct was generated from the following file:

## 6.707 `__gnu_pbds::null_node_update< _Tp1, _Tp2, _Tp3, _Tp4 >` Struct Template Reference

`#include <tag_and_trait.hpp>`

Inheritance diagram for `__gnu_pbds::null_node_update< _Tp1, _Tp2, _Tp3, _Tp4 >`:

### 6.707.1 Detailed Description

```
template<typename _Tp1, typename _Tp2, typename _Tp3, typename _Tp4>
struct __gnu_pbds::null_node_update< _Tp1, _Tp2, _Tp3, _Tp4 >
```

A null node updatator, indicating that no node updates are required.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.708 \_\_gnu\_pbds::null\_type Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for \_\_gnu\_pbds::null\_type:

### 6.708.1 Detailed Description

Represents no type, or absence of type, for template tricks.

In a mapped-policy, indicates that an associative container is a set.

In a list-update policy, indicates that each link does not need metadata.

In a hash policy, indicates that the combining hash function is actually a ranged hash function.

In a probe policy, indicates that the combining probe function is actually a ranged probe function.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.709 std::experimental::fundamentals\_v1::nullopt\_t Struct Reference

```
#include <optional>
```

### Public Types

- enum class **\_Construct** { **\_Token** }

### Public Member Functions

- constexpr **nullopt\_t** (**\_Construct**)

#### 6.709.1 Detailed Description

Tag type to disengage optional objects.

The documentation for this struct was generated from the following file:

- [experimental/optional](#)

## 6.710 std::num\_get<\_CharT, \_InIter > Class Template Reference

```
#include <locale_facets.h>
```

Inheritance diagram for std::num\_get<\_CharT, \_InIter >:

### 6.710.1 Detailed Description

```
template<typename _CharT, typename _InIter>
class std::num_get< _CharT, _InIter >
```

Primary class template `num_get`.

This facet encapsulates the code to parse and return a number from a string. It is used by the `istream` numeric extraction operators.

The `num_get` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `num_get` facet.

### 6.710.2 Member Typedef Documentation

#### `char_type`

```
template<typename _CharT, typename _InIter>
typedef _CharT std::num_get< _CharT, _InIter >::char_type
```

Public typedefs.

#### `iter_type`

```
template<typename _CharT, typename _InIter>
typedef _InIter std::num_get< _CharT, _InIter >::iter_type
```

Public typedefs.

### 6.710.3 Constructor & Destructor Documentation

#### `num_get()`

```
template<typename _CharT, typename _InIter>
std::num_get< _CharT, _InIter >::num_get (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

#### Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

#### `~num_get()`

```
template<typename _CharT, typename _InIter>
virtual std::num_get< _CharT, _InIter >::~num_get () [inline], [protected], [virtual]
```

Destructor.

#### 6.710.4 Member Function Documentation

##### do\_get() [1/11]

```
template<typename _CharT, typename _InIter>
virtual iter\_type std::num_get<_CharT, _InIter >::do_get (
    iter\_type __beg,
    iter\_type __end,
    ios\_base & __io,
    ios\_base::iostate & __err,
    long & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for more details.

##### Parameters

<a href="#">__beg</a>	Start of input stream.
<a href="#">__end</a>	End of input stream.
<a href="#">__io</a>	Source of locale and flags.
<a href="#">__err</a>	Error flags to set.
<a href="#">__v</a>	Value to format and insert.

##### Returns

Iterator after reading.

##### do\_get() [2/11]

```
template<typename _CharT, typename _InIter>
virtual iter\_type std::num_get<_CharT, _InIter >::do_get (
    iter\_type __beg,
    iter\_type __end,
    ios\_base & __io,
    ios\_base::iostate & __err,
    long long & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for more details.

##### Parameters

<a href="#">__beg</a>	Start of input stream.
<a href="#">__end</a>	End of input stream.
<a href="#">__io</a>	Source of locale and flags.
<a href="#">__err</a>	Error flags to set.
<a href="#">__v</a>	Value to format and insert.

**Returns**

Iterator after reading.

**do\_get()** [3/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned int & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

**See also**

get() for more details.

**Parameters**

<i>__beg</i>	Start of input stream.
<i>__end</i>	End of input stream.
<i>__io</i>	Source of locale and flags.
<i>__err</i>	Error flags to set.
<i>__v</i>	Value to format and insert.

**Returns**

Iterator after reading.

**do\_get()** [4/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned long & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

**See also**

get() for more details.

**Parameters**

<i>__beg</i>	Start of input stream.
<i>__end</i>	End of input stream.
<i>__io</i>	Source of locale and flags.

<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

**do\_get()** [5/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned long long & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

**See also**

`get()` for more details.

**Parameters**

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

**do\_get()** [6/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned short & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

**See also**

`get()` for more details.

**Parameters**

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

**do\_get()** [7/11]

```
template<typename _CharT, typename _InIter>
_InIter std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    bool & __v) const [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

**See also**

`get()` for more details.

**Parameters**

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

**get()** [1/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    bool & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the bool `v`. It does so by calling `num_get::do_get()`.

If `ios_base::boolalpha` is set, attempts to read `ctype<CharT>::truename()` or `ctype<CharT>::falsename()`. Sets `v` to true or false if successful. Sets `err` to `ios_base::failbit` if reading the string fails. Sets `err` to `ios_base::eofbit` if the stream is emptied.

If `ios_base::boolalpha` is not set, proceeds as with reading a long, except if the value is 1, sets `v` to true, if the value is 0, sets `v` to false, and otherwise set `err` to `ios_base::failbit`.

## Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

## Returns

Iterator after reading.

Referenced by [std::basic\\_istream<\\_CharT, \\_Traits >::operator>>\(\)](#).

**get()** [2/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    double & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf g` specifier. The matching type length modifier is also used.

The decimal point character used is `num_punct::decimal_point()`. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered.

Sets `err` to `ios_base::eofbit` if the stream is emptied.

#### Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

#### Returns

Iterator after reading.

#### **get()** [3/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    float & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf g` specifier. The matching type length modifier is also used.

The decimal point character used is `num_punct::decimal_point()`. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered.

Sets `err` to `ios_base::eofbit` if the stream is emptied.

#### Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

#### Returns

Iterator after reading.

**get()** [4/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num\_get::do\_get().

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of io.flags() & ios\_base::basefield. If equal to ios\_base::oct, parses like the scanf o specifier. Else if equal to ios\_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands\_sep(). If the pattern of digit groups isn't consistent, sets err to ios\_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios\_base::failbit and leaves *v* unaltered. Sets err to ios\_base::eofbit if the stream is emptied.

**Parameters**

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

**get()** [5/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long double & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num\_get::do\_get().

The input characters are parsed like the scanf g specifier. The matching type length modifier is also used.

The decimal point character used is numpunct::decimal\_point(). Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands\_sep(). If the pattern of digit groups isn't consistent, sets err to ios\_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios\_base::failbit and leaves *v* unaltered. Sets err to ios\_base::eofbit if the stream is emptied.

**Parameters**

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.

**Parameters**

<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

**get()** [6/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long long & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in `io`.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to `0`, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

**get()** [7/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned int & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num\_get::do\_get().

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of io.flags() & ios\_base::basefield. If equal to ios\_base::oct, parses like the scanf o specifier. Else if equal to ios\_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands\_sep(). If the pattern of digit groups isn't consistent, sets err to ios\_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios\_base::failbit and leaves *v* unaltered. Sets err to ios\_base::eofbit if the stream is emptied.

#### Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

#### Returns

Iterator after reading.

#### get() [8/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned long & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num\_get::do\_get().

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of io.flags() & ios\_base::basefield. If equal to ios\_base::oct, parses like the scanf o specifier. Else if equal to ios\_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands\_sep(). If the pattern of digit groups isn't consistent, sets err to ios\_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios\_base::failbit and leaves *v* unaltered. Sets err to ios\_base::eofbit if the stream is emptied.

#### Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

**get()** [9/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned long long & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

**get()** [10/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned short & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets *err* to `ios_base::failbit` and leaves *v* unaltered. Sets *err* to `ios_base::eofbit` if the stream is emptied.

#### Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

#### Returns

Iterator after reading.

#### get() [11/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    void *& __v) const [inline]
```

Numeric parsing.

Parses the input stream into the pointer variable *v*. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf p` specifier.

Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets *err* to `ios_base::failbit`.

Note that the digit grouping effect for pointers is a bit ambiguous in the standard and shouldn't be relied on. See DR 344.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets *err* to `ios_base::failbit` and leaves *v* unaltered. Sets *err* to `ios_base::eofbit` if the stream is emptied.

#### Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

#### Returns

Iterator after reading.

### 6.711.1 Detailed Description

```
template<typename _CharT, typename _OutIter>
class std::num_put<_CharT, _OutIter>
```

Primary class template num\_put.

This facet encapsulates the code to convert a number to a string. It is used by the ostream numeric insertion operators. The num\_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the num\_put facet.

### 6.711.2 Member Typedef Documentation

#### char\_type

```
template<typename _CharT, typename _OutIter>
typedef _CharT std::num_put<_CharT, _OutIter>::char_type
```

Public typedefs.

**iter\_type**

```
template<typename _CharT, typename _OutIter>
typedef _OutIter std::num_put< _CharT, _OutIter >::iter_type
Public typedefs.
```

**6.711.3 Constructor & Destructor Documentation****num\_put()**

```
template<typename _CharT, typename _OutIter>
std::num_put< _CharT, _OutIter >::num_put (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

**Parameters**

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

**~num\_put()**

```
template<typename _CharT, typename _OutIter>
virtual std::num_put< _CharT, _OutIter >::~~num_put () [inline], [protected], [virtual]
```

Destructor.

**6.711.4 Member Function Documentation****do\_put()** [1/8]

```
template<typename _CharT, typename _OutIter>
_OutIter std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    bool __v) const [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after writing.

Referenced by [std::num\\_put< \\_CharT, ostreambuf\\_iterator< \\_CharT, \\_Traits > >::put\(\)](#), [std::num\\_put< \\_CharT, ostreambuf\\_iterator< \\_CharT, \\_Traits > >::put\(\)](#), [std::num\\_put< \\_CharT, ostreambuf\\_iterator< \\_CharT, \\_Traits > >::put\(\)](#), [std::num\\_put< \\_CharT, ostreambuf\\_iterator< \\_CharT, \\_Traits > >::put\(\)](#), [std::num\\_put< \\_CharT, ostreambuf\\_iterator< \\_CharT, \\_Traits > >::put\(\)](#), and [std::num\\_put< \\_CharT, ostreambuf\\_iterator< \\_CharT, \\_Traits > >::put\(\)](#).

**do\_put()** [2/8]

```
template<typename _CharT, typename _OutIter>
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long __v) const [inline], [protected], [virtual]
```

**Numeric formatting.**

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

<a href="#"></a> <code>__s</code>	Stream to write to.
<a href="#"></a> <code>__io</code>	Source of locale and flags.
<a href="#"></a> <code>__fill</code>	Char_type to use for filling.
<a href="#"></a> <code>__v</code>	Value to format and insert.

**Returns**

Iterator after writing.

**do\_put()** [3/8]

```
template<typename _CharT, typename _OutIter>
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long long __v) const [inline], [protected], [virtual]
```

**Numeric formatting.**

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

<a href="#"></a> <code>__s</code>	Stream to write to.
---	---------------------

**Parameters**

<a href="#"></a> <code>__io</code>	Source of locale and flags.
<a href="#"></a> <code>__fill</code>	Char_type to use for filling.
<a href="#"></a> <code>__v</code>	Value to format and insert.

**Returns**

Iterator after writing.

**do\_put()** [4/8]

```
template<typename _CharT, typename _OutIter>
virtual iter\_type std::num_put< _CharT, _OutIter >::do_put (
    iter\_type __s,
    ios\_base & __io,
    char\_type __fill,
    unsigned long __v) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

<a href="#"></a> <code>__s</code>	Stream to write to.
<a href="#"></a> <code>__io</code>	Source of locale and flags.
<a href="#"></a> <code>__fill</code>	Char_type to use for filling.
<a href="#"></a> <code>__v</code>	Value to format and insert.

**Returns**

Iterator after writing.

**do\_put()** [5/8]

```
template<typename _CharT, typename _OutIter>
virtual iter\_type std::num_put< _CharT, _OutIter >::do_put (
    iter\_type __s,
    ios\_base & __io,
    char\_type __fill,
    unsigned long long __v) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

## Parameters

<a href="#"></a> <a href="#"><u>_s</u></a>	Stream to write to.
<a href="#"></a> <a href="#"><u>_io</u></a>	Source of locale and flags.
<a href="#"></a> <a href="#"><u>_fill</u></a>	Char_type to use for filling.
<a href="#"></a> <a href="#"><u>_v</u></a>	Value to format and insert.

## Returns

Iterator after writing.

**do\_put()** [6/8]

```
template<typename _CharT, typename _OutIter>
_OutIter std::num_put<_CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const void * __v) const    [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

## Parameters

<a href="#"></a> <a href="#"><u>_s</u></a>	Stream to write to.
<a href="#"></a> <a href="#"><u>_io</u></a>	Source of locale and flags.
<a href="#"></a> <a href="#"><u>_fill</u></a>	Char_type to use for filling.
<a href="#"></a> <a href="#"><u>_v</u></a>	Value to format and insert.

## Returns

Iterator after writing.

References [std::ios\\_base::basefield](#), [std::ios\\_base::flags\(\)](#), [std::ios\\_base::fmtflags](#), [std::ios\\_base::hex](#), [std::ios\\_base::showbase](#), and [std::ios\\_base::uppercase](#).

**do\_put()** [7/8]

```
template<typename _CharT, typename _OutIter>
_OutIter std::num_put<_CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    double __v) const    [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

#### Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

#### Returns

Iterator after writing.

#### **do\_put()** [8/8]

```
template<typename _CharT, typename _OutIter>
_OutIter std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long double __v) const [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

#### Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

#### Returns

Iterator after writing.

#### **put()** [1/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
```

```

    char_type __fill,
    bool __v) const [inline]

```

Numeric formatting.

Formats the boolean *v* and inserts it into a stream. It does so by calling num\_put::do\_put().

If ios\_base::boolalpha is set, writes ctype<CharT>::truenam() or ctype<CharT>::falsename(). Otherwise formats *v* as an int.

#### Parameters

<a href="#"></a> <code>__s</code>	Stream to write to.
<a href="#"></a> <code>__io</code>	Source of locale and flags.
<a href="#"></a> <code>__fill</code>	Char_type to use for filling.
<a href="#"></a> <code>__v</code>	Value to format and insert.

#### Returns

Iterator after writing.

Referenced by [std::basic\\_ostream<\\_CharT, \\_Traits >::operator<<\(\)](#).

#### put() [2/8]

```

template<typename _CharT, typename _OutIter>
iter_type std::num_put<_CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const void * __v) const [inline]

```

Numeric formatting.

Formats the pointer value *v* and inserts it into a stream. It does so by calling num\_put::do\_put().

This function formats *v* as an unsigned long with ios\_base::hex and ios\_base::showbase set.

#### Parameters

<a href="#"></a> <code>__s</code>	Stream to write to.
<a href="#"></a> <code>__io</code>	Source of locale and flags.
<a href="#"></a> <code>__fill</code>	Char_type to use for filling.
<a href="#"></a> <code>__v</code>	Value to format and insert.

#### Returns

Iterator after writing.

**put()** [3/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    double __v) const [inline]
```

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::floatfield`. If equal to `ios_base::fixed`, formats like the `printf f` specifier. Else if equal to `ios_base::scientific`, formats like `e` or `E` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `g` or `G` depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like `g` or `G`.

The output precision is given by `io.precision()`. This precision is capped at `numeric_limits::digits10 + 2` (different for double and long double). The default precision is 6.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showpoint` is set, a decimal point will always be output.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

**Parameters**

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after writing.

**put()** [4/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long __v) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively.

Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.

If ios\_base::showpos is set, '+' is output before positive values. If ios\_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is numpunct::decimal\_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands\_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios\_base::adjustfield) == ios\_base::left, result is padded at the end. If ios\_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

#### Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

#### Returns

Iterator after writing.

#### put() [5/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put<_CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long double __v) const [inline]
```

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling num\_put::do\_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios\_base::floatfield. If equal to ios\_base::fixed, formats like the printf f specifier. Else if equal to ios\_base::scientific, formats like e or E with ios\_base::uppercase unset or set respectively. Otherwise, formats like g or G depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like g or G.

The output precision is given by io.precision(). This precision is capped at numeric\_limits::digits10 + 2 (different for double and long double). The default precision is 6.

If ios\_base::showpos is set, '+' is output before positive values. If ios\_base::showpoint is set, a decimal point will always be output.

The decimal point character used is numpunct::decimal\_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands\_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios\_base::adjustfield) == ios\_base::left, result is padded at the end. If ios\_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

#### Parameters

<code>__s</code>	Stream to write to.
------------------	---------------------

**Parameters**

$\leftarrow$ _io	Source of locale and flags.
$\leftarrow$ _fill	Char_type to use for filling.
$\leftarrow$ _v	Value to format and insert.

**Returns**

Iterator after writing.

**put()** [6/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long long __v) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling num\_put::do\_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios\_base::basefield. If equal to ios\_base::oct, formats like the printf o specifier. Else if equal to ios\_base::hex, formats like x or X with ios\_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.

If ios\_base::showpos is set, '+' is output before positive values. If ios\_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is numpunct::decimal\_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands\_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios\_base::adjustfield) == ios\_base::left, result is padded at the end. If ios\_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

**Parameters**

$\leftarrow$ _s	Stream to write to.
$\leftarrow$ _io	Source of locale and flags.
$\leftarrow$ _fill	Char_type to use for filling.
$\leftarrow$ _v	Value to format and insert.

**Returns**

Iterator after writing.

**put()** [7/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    unsigned long __v) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling num\_put::do\_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios\_base::basefield. If equal to ios\_base::oct, formats like the printf o specifier. Else if equal to ios\_base::hex, formats like x or X with ios\_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.

If ios\_base::showpos is set, '+' is output before positive values. If ios\_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is numpunct::decimal\_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands\_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios\_base::adjustfield) == ios\_base::left, result is padded at the end. If ios\_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

**Parameters**

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after writing.

**put()** [8/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    unsigned long long __v) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling num\_put::do\_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios\_base::basefield. If equal to ios\_base::oct, formats like the printf o specifier. Else if equal to ios\_base::hex, formats like x or X with ios\_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showbase` is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is `numput::decimal_point()`. Thousands separators are inserted according to `numput::grouping()` and `numput::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

#### Parameters

<code>_↔ _s</code>	Stream to write to.
<code>_↔ _io</code>	Source of locale and flags.
<code>_↔ _fill</code>	Char_type to use for filling.
<code>_↔ _v</code>	Value to format and insert.

#### Returns

Iterator after writing.

#### 6.712.1 Detailed Description

**template<typename \_Tp>**  
**struct std::numeric\_limits<\_Tp>**

Properties of fundamental types.

This class allows a program to obtain information about the representation of a fundamental type on a given platform. For non-fundamental types, the functions will return 0 and the data members will all be `false`.

#### 6.712.2 Member Function Documentation

##### **denorm\_min()**

```
template<typename _Tp>
constexpr _Tp std::numeric_limits<_Tp>::denorm_min () [inline], [static], [constexpr], [noexcept]
```

The minimum positive denormalized value. For types where `has_denorm` is false, this is the minimum positive normalized value.

**epsilon()**

```
template<typename _Tp>
```

```
constexpr _Tp std::numeric_limits<_Tp>::epsilon () [inline], [static], [constexpr], [noexcept]
```

The *machine epsilon*: the difference between 1 and the least value greater than 1 that is representable.

Referenced by [std::binomial\\_distribution<\\_IntType>::operator\(\)\(\)](#), [std::poisson\\_distribution<\\_IntType>::operator\(\)\(\)](#), and [std::operator<<\(\)](#).

**infinity()**

```
template<typename _Tp>
```

```
constexpr _Tp std::numeric_limits<_Tp>::infinity () [inline], [static], [constexpr], [noexcept]
```

The representation of positive infinity, if `has_infinity`.

**lowest()**

```
template<typename _Tp>
```

```
constexpr _Tp std::numeric_limits<_Tp>::lowest () [inline], [static], [constexpr], [noexcept]
```

A finite value `x` such that there is no other finite value `y` where `y < x`.

Referenced by [std::cauchy\\_distribution<\\_RealType>::min\(\)](#), [std::extreme\\_value\\_distribution<\\_RealType>::min\(\)](#), [std::normal\\_distribution<\\_RealType>::min\(\)](#), and [std::student\\_t\\_distribution<\\_RealType>::min\(\)](#).

**max()**

```
template<typename _Tp>
```

```
constexpr _Tp std::numeric_limits<_Tp>::max () [inline], [static], [constexpr], [noexcept]
```

The maximum finite value.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_parallel\\_random\\_shuffle\\_drs\(\)](#), [std::bernoulli\\_distribution::max\(\)](#), [std::cauchy\\_distribution<\\_RealType>::max\(\)](#), [std::chi\\_squared\\_distribution<\\_RealType>::max\(\)](#), [std::exponential\\_distribution<\\_RealType>::max\(\)](#), [std::extreme\\_value\\_distribution<\\_RealType>::max\(\)](#), [std::fisher\\_f\\_distribution<\\_RealType>::max\(\)](#), [std::gamma\\_distribution<\\_RealType>::max\(\)](#), [std::geometric\\_distribution<\\_IntType>::max\(\)](#), [std::lognormal\\_distribution<\\_RealType>::max\(\)](#), [std::negative\\_binomial\\_distribution<\\_IntType>::max\(\)](#), [std::normal\\_distribution<\\_RealType>::max\(\)](#), [std::poisson\\_distribution<\\_IntType>::max\(\)](#), [std::student\\_t\\_distribution<\\_RealType>::max\(\)](#), [std::weibull\\_distribution<\\_RealType>::max\(\)](#), [std::tr2::dynamic\\_bitset<\\_WordT, \\_Alloc>::max\\_size\(\)](#), [std::binomial\\_distribution<\\_IntType>::operator\(\)\(\)](#), [std::independent\\_bits\\_engine<\\_IntType>::operator\(\)\(\)](#), and [std::operator<<\(\)](#).

**min()**

```
template<typename _Tp>
```

```
constexpr _Tp std::numeric_limits<_Tp>::min () [inline], [static], [constexpr], [noexcept]
```

The minimum finite value, or for floating types with denormalization, the minimum positive normalized value.

Referenced by [std::bernoulli\\_distribution::min\(\)](#).

**quiet\_NaN()**

```
template<typename _Tp>
```

```
constexpr _Tp std::numeric_limits<_Tp>::quiet_NaN () [inline], [static], [constexpr], [noexcept]
```

The representation of a quiet Not a Number, if `has_quiet_NaN`.

**round\_error()**

```
template<typename _Tp>
```

```
constexpr _Tp std::numeric_limits<_Tp>::round_error () [inline], [static], [constexpr], [noexcept]
```

The maximum rounding error measurement (see LIA-1).

**signaling\_NaN()**

```
template<typename _Tp>
constexpr _Tp std::numeric_limits<_Tp>::signaling_NaN () [inline], [static], [constexpr],
[noexcept]
```

The representation of a signaling Not a Number, if has\_signaling\_NaN.

**6.712.3 Member Data Documentation****digits**

```
int std::__numeric_limits_base::digits [static], [constexpr], [inherited]
```

The number of radix digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of radix digits in the mantissa.

Referenced by [std::generate\\_canonical\(\)](#), [std::independent\\_bits\\_engine<\\_RandomNumberEngine, \\_\\_w, \\_UIntType>::operator\(\)](#), and [std::linear\\_congruential\\_engine< uint\\_fast32\\_t, 16807UL, 0UL, 2147483647UL>::seed\(\)](#).

**digits10**

```
int std::__numeric_limits_base::digits10 [static], [constexpr], [inherited]
```

The number of base 10 digits that can be represented without change.

**has\_denorm**

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr], [inherited]
```

See std::float\_denorm\_style for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr], [inherited]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr], [inherited]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr], [inherited]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr], [inherited]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr], [inherited]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr], [inherited]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr], [inherited]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr], [inherited]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr], [inherited]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr], [inherited]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr], [inherited]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr], [inherited]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr], [inherited]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr], [inherited]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr], [inherited]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr], [inherited]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr], [inherited]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

Referenced by [std::generate\\_canonical\(\)](#).

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr], [inherited]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr], [inherited]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr], [inherited]
```

True if trapping is implemented for this type.

### 6.713.1 Detailed Description

`numeric_limits<bool>` specialization.

### 6.713.2 Member Data Documentation

#### `digits`

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### `digits10`

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### `has_denorm`

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

#### `has_denorm_loss`

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.714.1 Detailed Description

`numeric_limits<char>` specialization.

### 6.714.2 Member Data Documentation

#### **digits**

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### **digits10**

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### **has\_denorm**

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

`bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]`  
True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

`bool std::__numeric_limits_base::has_infinity [static], [constexpr]`  
True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

`bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]`  
True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

`bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]`  
True if the type has a representation for a signaling Not a Number.

**is\_bounded**

`bool std::__numeric_limits_base::is_bounded [static], [constexpr]`  
True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

`bool std::__numeric_limits_base::is_exact [static], [constexpr]`  
True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

`bool std::__numeric_limits_base::is_iec559 [static], [constexpr]`  
True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.715.1 Detailed Description

numeric\_limits<char16\_t> specialization.

### 6.715.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

**has\_denorm\_loss**

`bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]`  
True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

`bool std::__numeric_limits_base::has_infinity [static], [constexpr]`  
True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

`bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]`  
True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

`bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]`  
True if the type has a representation for a signaling Not a Number.

**is\_bounded**

`bool std::__numeric_limits_base::is_bounded [static], [constexpr]`  
True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

`bool std::__numeric_limits_base::is_exact [static], [constexpr]`  
True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

`bool std::__numeric_limits_base::is_iec559 [static], [constexpr]`  
True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.717.1 Detailed Description

`numeric_limits<double>` specialization.

### 6.717.2 Member Data Documentation

#### **digits**

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### **digits10**

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### **has\_denorm**

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.718.1 Detailed Description

numeric\_limits<float> specialization.

### 6.718.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of [radix](#) digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of [radix](#) digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See [std::float\\_denorm\\_style](#) for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.719.1 Detailed Description

numeric\_limits<int> specialization.

### 6.719.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of [radix](#) digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of [radix](#) digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See [std::float\\_denorm\\_style](#) for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.720.1 Detailed Description

`numeric_limits<long>` specialization.

### 6.720.2 Member Data Documentation

#### **digits**

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### **digits10**

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### **has\_denorm**

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.721.1 Detailed Description

`numeric_limits<long double>` specialization.

### 6.721.2 Member Data Documentation

#### **digits**

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### **digits10**

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### **has\_denorm**

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.722.1 Detailed Description

numeric\_limits<long long> specialization.

### 6.722.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of [radix](#) digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of [radix](#) digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See [std::float\\_denorm\\_style](#) for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.723.1 Detailed Description

numeric\_limits<short> specialization.

### 6.723.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of [radix](#) digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of [radix](#) digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See [std::float\\_denorm\\_style](#) for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.724.1 Detailed Description

numeric\_limits<signed char> specialization.

### 6.724.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of [radix](#) digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of [radix](#) digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See [std::float\\_denorm\\_style](#) for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.725.1 Detailed Description

numeric\_limits<unsigned char> specialization.

### 6.725.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of [radix](#) digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of [radix](#) digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See [std::float\\_denorm\\_style](#) for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.726.1 Detailed Description

`numeric_limits<unsigned int>` specialization.

### 6.726.2 Member Data Documentation

#### **digits**

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### **digits10**

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### **has\_denorm**

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.727.1 Detailed Description

numeric\_limits<unsigned long> specialization.

### 6.727.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of [radix](#) digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of [radix](#) digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See [std::float\\_denorm\\_style](#) for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.728.1 Detailed Description

`numeric_limits<unsigned long long>` specialization.

### 6.728.2 Member Data Documentation

#### **digits**

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### **digits10**

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### **has\_denorm**

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.729.1 Detailed Description

`numeric_limits<unsigned short>` specialization.

### 6.729.2 Member Data Documentation

#### **digits**

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### **digits10**

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### **has\_denorm**

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.730.1 Detailed Description

`numeric_limits<wchar_t>` specialization.

### 6.730.2 Member Data Documentation

#### **digits**

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### **digits10**

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### **has\_denorm**

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

#### 6.731.1 Detailed Description

**template<typename \_CharT>**  
**class std::numpunct<\_CharT>**

Primary class template numpunct.

This facet stores several pieces of information related to printing and scanning numbers, such as the decimal point character. It takes a template parameter specifying the char type. The numpunct facet is used by streams for many I/O operations involving numbers.

The numpunct template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from a numpunct facet.

#### 6.731.2 Member Typedef Documentation

##### char\_type

```
template<typename _CharT>
typedef _CharT std::numpunct<_CharT>::char_type
```

Public typedefs.

##### string\_type

```
template<typename _CharT>
typedef basic\_string<_CharT> std::numpunct<_CharT>::string_type
```

Public typedefs.

#### 6.731.3 Constructor & Destructor Documentation

##### numpunct() [1/3]

```
template<typename _CharT>
std::numpunct<_CharT>::numpunct (
    size_t __refs = 0) [inline], [explicit]
```

Numpunct constructor.

## Parameters

<code>__refs</code>	RefCount to pass to the base class.
---------------------	-------------------------------------

References [std::locale::facet::facet\(\)](#).

**numpunct()** [2/3]

```
template<typename _CharT>
std::numpunct< _CharT >::numpunct (
    __cache_type * __cache,
    size_t __refs = 0) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up the predefined locale facets.

## Parameters

<code>__cache</code>	<code>__numpunct_cache</code> object.
<code>__refs</code>	RefCount to pass to the base class.

References [std::locale::facet::facet\(\)](#).

**numpunct()** [3/3]

```
template<typename _CharT>
std::numpunct< _CharT >::numpunct (
    __c_locale __cloc,
    size_t __refs = 0) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

## Parameters

<code>__cloc</code>	The C locale.
<code>__refs</code>	RefCount to pass to the base class.

References [std::locale::facet::facet\(\)](#).

**~numpunct()**

```
template<typename _CharT>
virtual std::numpunct< _CharT >::~~numpunct () [protected], [virtual]
```

Destructor.

**6.731.4 Member Function Documentation****decimal\_point()**

```
template<typename _CharT>
char_type std::numpunct< _CharT >::decimal_point () const [inline]
```

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `returning numpunct<char_type>::do_decimal_point()`.

**Returns**

*char\_type* representing a decimal point.

References [do\\_decimal\\_point\(\)](#).

**do\_decimal\_point()**

```
template<typename _CharT>
virtual char_type std::num_punct<_CharT>::do_decimal_point () const [inline], [protected],
[virtual]
```

Return decimal point character.

Returns a *char\_type* to use as a decimal point. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a decimal point.

Referenced by [decimal\\_point\(\)](#).

**do\_falsename()**

```
template<typename _CharT>
virtual string_type std::num_punct<_CharT>::do_falsename () const [inline], [protected], [virtual]
```

Return string representation of bool false.

Returns a *string\_type* containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

**Returns**

*string\_type* representing printed form of false.

Referenced by [falsename\(\)](#).

**do\_grouping()**

```
template<typename _CharT>
virtual string std::num_punct<_CharT>::do_grouping () const [inline], [protected], [virtual]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

**See also**

[grouping\(\)](#) for details.

**Returns**

String representing grouping specification.

Referenced by [grouping\(\)](#).

**do\_thousands\_sep()**

```
template<typename _CharT>
virtual char_type std::num_punct<_CharT>::do_thousands_sep () const [inline], [protected],
[virtual]
```

Return thousands separator character.

Returns a *char\_type* to use as a thousands separator. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a thousands separator.

Referenced by [thousands\\_sep\(\)](#).

**do\_truename()**

```
template<typename _CharT>
```

```
virtual string\_type std::num\_punct< _CharT >::do_truename () const [inline], [protected], [virtual]
```

Return string representation of bool true.

Returns a *string\_type* containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

**Returns**

*string\_type* representing printed form of true.

Referenced by [truename\(\)](#).

**falsename()**

```
template<typename _CharT>
```

```
string\_type std::num\_punct< _CharT >::false_name () const [inline]
```

Return string representation of bool false.

This function returns a *string\_type* containing the text representation for false bool variables. It does so by calling `num_punct<char_type>::do_false_name()`.

**Returns**

*string\_type* representing printed form of false.

References [do\\_false\\_name\(\)](#).

**grouping()**

```
template<typename _CharT>
```

```
string std::num\_punct< _CharT >::grouping () const [inline]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the `grouping()` returns `"\003\002"` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `"32"`, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `num_punct<char_type>::do_grouping()`.

**Returns**

string representing grouping specification.

References [do\\_grouping\(\)](#).

**thousands\_sep()**

```
template<typename _CharT>
char_type std::numpunct<_CharT>::thousands_sep () const [inline]
```

Return thousands separator character.

This function returns a char\_type to use as a thousands separator. It does so by returning returning numpunct<char↵\_type>::do\_thousands\_sep().

**Returns**

char\_type representing a thousands separator.

References [do\\_thousands\\_sep\(\)](#).

**truename()**

```
template<typename _CharT>
string_type std::numpunct<_CharT>::true_name () const [inline]
```

Return string representation of bool true.

This function returns a string\_type containing the text representation for true bool variables. It does so by calling numpunct<char\_type>::do\_true\_name().

**Returns**

string\_type representing printed form of true.

References [do\\_true\\_name\(\)](#).

**6.731.5 Member Data Documentation****id**

```
template<typename _CharT>
locale::id std::numpunct<_CharT>::id [static]
```

Numpunct facet id.

template<typename _CharT>
class std::numpunct_byname<_CharT>
```

class numpunct\_byname [22.2.3.2].

#### 6.732.2 Member Function Documentation

##### decimal\_point()

```
template<typename _CharT>
char_type std::numpunct<_CharT>::decimal_point () const [inline], [inherited]
```

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `returning numpunct<char_type>::do_decimal_point()`.

##### Returns

*char\_type* representing a decimal point.

References [do\\_decimal\\_point\(\)](#).

##### do\_decimal\_point()

```
template<typename _CharT>
virtual char_type std::numpunct<_CharT>::do_decimal_point () const [inline], [protected],
[virtual], [inherited]
```

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

##### Returns

*char\_type* representing a decimal point.

Referenced by [decimal\\_point\(\)](#).

##### do\_falsename()

```
template<typename _CharT>
virtual string_type std::numpunct<_CharT>::do_falsename () const [inline], [protected], [virtual],
[inherited]
```

Return string representation of bool false.

Returns a `string_type` containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

**Returns**

string\_type representing printed form of false.

Referenced by [falsename\(\)](#).

**do\_grouping()**

```
template<typename _CharT>
virtual string std::num_punct< _CharT >::do_grouping () const [inline], [protected], [virtual],
[inherited]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

**See also**

grouping() for details.

**Returns**

String representing grouping specification.

Referenced by [grouping\(\)](#).

**do\_thousands\_sep()**

```
template<typename _CharT>
virtual char_type std::num_punct< _CharT >::do_thousands_sep () const [inline], [protected],
[virtual], [inherited]
```

Return thousands separator character.

Returns a char\_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

**Returns**

char\_type representing a thousands separator.

Referenced by [thousands\\_sep\(\)](#).

**do\_truename()**

```
template<typename _CharT>
virtual string_type std::num_punct< _CharT >::do_truename () const [inline], [protected], [virtual],
[inherited]
```

Return string representation of bool true.

Returns a string\_type containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

**Returns**

string\_type representing printed form of true.

Referenced by [truename\(\)](#).

**falsename()**

```
template<typename _CharT>
string_type std::num_punct< _CharT >::falsename () const [inline], [inherited]
```

Return string representation of bool false.

This function returns a string\_type containing the text representation for false bool variables. It does so by calling num\_punct<char\_type>::do\_falsename().

**Returns**

string\_type representing printed form of false.

References [do\\_falsename\(\)](#).

**grouping()**

```
template<typename _CharT>
string std::num_punct<_CharT>::grouping () const [inline], [inherited]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns "\003\002" and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was "32", this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling num\_punct<char\_type>::do\_grouping().

**Returns**

string representing grouping specification.

References [do\\_grouping\(\)](#).

**thousands\_sep()**

```
template<typename _CharT>
char_type std::num_punct<_CharT>::thousands_sep () const [inline], [inherited]
```

Return thousands separator character.

This function returns a char\_type to use as a thousands separator. It does so by returning num\_punct<char\_type>::do\_thousands\_sep().

**Returns**

char\_type representing a thousands separator.

References [do\\_thousands\\_sep\(\)](#).

**true\_name()**

```
template<typename _CharT>
string_type std::num_punct<_CharT>::true_name () const [inline], [inherited]
```

Return string representation of bool true.

This function returns a string\_type containing the text representation for true bool variables. It does so by calling num\_punct<char\_type>::do\_true\_name().

**Returns**

string\_type representing printed form of true.

References [do\\_true\\_name\(\)](#).

#### 6.737.1 Detailed Description

template<typename \_Tp, typename \_CharT = char, typename \_Traits = char\_traits<\_CharT>>  
class std::ostream\_iterator< \_Tp, \_CharT, \_Traits >

Provides output iterator semantics for streams.

This class provides an iterator to write to an ostream. The type Tp is the only type written by this iterator and there must be an operator<<(Tp) defined.

#### Template Parameters

<a href="#">_Tp</a>	The type to write to the ostream.
<a href="#">_CharT</a>	The ostream char_type.
<a href="#">_Traits</a>	The ostream char_traits.

#### 6.737.2 Member Typedef Documentation

##### char\_type

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef _CharT std::ostream\_iterator< _Tp, _CharT, _Traits >::char_type
```

Public typedef.

##### difference\_type

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
using std::ostream\_iterator< _Tp, _CharT, _Traits >::difference_type
```

Public typedef.

##### iterator\_category

```
typedef output\_iterator\_tag std::iterator< output\_iterator\_tag, void, void, void, void >::iterator←_category [inherited]
```

One of the [tag types](#).

**ostream\_type**

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef basic_ostream<_CharT, _Traits> std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_↵
type
Public typedef.
```

**pointer**

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::pointer [inherited]
This type represents a pointer-to-value_type.
```

**reference**

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::reference [inherited]
This type represents a reference-to-value_type.
```

**traits\_type**

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef _Traits std::ostream_iterator< _Tp, _CharT, _Traits >::traits_type
Public typedef.
```

**value\_type**

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type [inherited]
The type "pointed to" by the iterator.
```

**6.737.3 Constructor & Destructor Documentation****ostream\_iterator() [1/3]**

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
    ostream_type & __s) [inline], [noexcept]
```

Construct from an ostream.

References [std::\\_\\_addressof\(\)](#).

Referenced by [ostream\\_iterator\(\)](#).

**ostream\_iterator() [2/3]**

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
    ostream_type & __s,
    const _CharT * __c) [inline], [noexcept]
```

Construct from an ostream.

The delimiter string *c* is written to the stream after every *Tp* written to the stream. The delimiter is not copied, and thus must not be destroyed while this iterator is in use.

**Parameters**

<a href="#">_↵ _s</a>	Underlying ostream to write to.
<a href="#">_↵ _c</a>	CharT delimiter string to insert.

References [std::\\_\\_addressof\(\)](#).

### ostream\_iterator() [3/3]

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
    const ostream_iterator< _Tp, _CharT, _Traits > & __obj) [inline], [noexcept]
```

Copy constructor.

References [ostream\\_iterator\(\)](#).

## 6.737.4 Member Function Documentation

### operator=()

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
ostream_iterator & std::ostream_iterator< _Tp, _CharT, _Traits >::operator= (
    const _Tp & __value) [inline]
```

Writes *value* to underlying ostream using operator<<. If constructed with delimiter string, writes delimiter to ostream. The documentation for this class was generated from the following file:

- [stream\\_iterator.h](#)

## 6.738 std::experimental::fundamentals\_v2::ostream\_joiner<\_DelimT, \_CharT, \_Traits > Class Template Reference

```
#include <iterator>
```

### Public Types

## 6.739.1 Detailed Description

**template<typename \_CharT, typename \_Traits>**  
**class std::ostreambuf\_iterator< \_CharT, \_Traits >**

Provides output iterator semantics for streambufs.

## 6.739.2 Member Typedef Documentation

### char\_type

```
template<typename _CharT, typename _Traits>
typedef _CharT std::ostreambuf\_iterator< _CharT, _Traits >::char_type
```

Public typedefs.

### difference\_type

```
template<typename _CharT, typename _Traits>
using std::ostreambuf\_iterator< _CharT, _Traits >::difference_type
```

Public typedefs.

### iterator\_category

```
typedef output\_iterator\_tag std::iterator< output\_iterator\_tag, void, void, void, void >::iterator↔  
_category [inherited]
```

One of the [tag types](#).

### ostream\_type

```
template<typename _CharT, typename _Traits>
typedef basic\_ostream<_CharT, _Traits> std::ostreambuf\_iterator< _CharT, _Traits >::ostream_type
```

Public typedefs.

### pointer

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::pointer [inherited]
```

This type represents a pointer-to-value\_type.

### reference

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::reference [inherited]
```

This type represents a reference-to-value\_type.

### streambuf\_type

```
template<typename _CharT, typename _Traits>
typedef basic_streambuf<_CharT, _Traits> std::ostreambuf_iterator< _CharT, _Traits >::streambuf←
_type
Public typedefs.
```

### traits\_type

```
template<typename _CharT, typename _Traits>
typedef _Traits std::ostreambuf_iterator< _CharT, _Traits >::traits_type
Public typedefs.
```

### value\_type

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type [inherited]
The type "pointed to" by the iterator.
```

## 6.739.3 Constructor & Destructor Documentation

### ostreambuf\_iterator() [1/2]

```
template<typename _CharT, typename _Traits>
std::ostreambuf_iterator< _CharT, _Traits >::ostreambuf_iterator (
    ostream_type & __s) [inline], [noexcept]
```

Construct output iterator from ostream.

### ostreambuf\_iterator() [2/2]

```
template<typename _CharT, typename _Traits>
std::ostreambuf_iterator< _CharT, _Traits >::ostreambuf_iterator (
    streambuf_type * __s) [inline], [noexcept]
```

Construct output iterator from streambuf.

## 6.739.4 Member Function Documentation

### failed()

```
template<typename _CharT, typename _Traits>
bool std::ostreambuf_iterator< _CharT, _Traits >::failed () const [inline], [nodiscard], [noexcept]
```

Return true if previous operator=() failed.

Referenced by [std::basic\\_ostream< \\_CharT, \\_Traits >::operator<<\(\)](#).

### operator\*()

```
template<typename _CharT, typename _Traits>
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator* () [inline], [nodiscard]
Return *this.
```

### operator++() [1/2]

```
template<typename _CharT, typename _Traits>
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator++ () [inline]
```

Return \*this.

**operator++()** [2/2]

```
template<typename _CharT, typename _Traits>
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator++ (
    int ) [inline]
```

Return \*this.

**operator=()**

```
template<typename _CharT, typename _Traits>
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator= (
    _CharT __c) [inline]
```

Write character to streambuf. Calls streambuf.sputc().

The documentation for this class was generated from the following files:

- [iosfwd](#)
- [streambuf\\_iterator.h](#)

**6.740 std::out\_of\_range Class Reference**

```
#include <stdexcept_except.h>
```

Inheritance diagram for std::out\_of\_range:

**Public Member Functions**

- **out\_of\_range** (const char \*)
- **out\_of\_range** (const [out\\_of\\_range](#) &)=default

- **out\_of\_range** & **operator=** ([out\\_of\\_range](#) &&)=default
- virtual const char \* **what** () const noexcept

### 6.740.1 Detailed Description

This represents an argument whose value is not within the expected range (e.g., boundary checks in `basic_string`).

### 6.740.2 Member Function Documentation

#### `what()`

```
virtual const char * std::logic_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this class was generated from the following file:

### 6.742.1 Detailed Description

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>
class __gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >
```

Ordered-vector tree associative-container.

### 6.742.2 Member Function Documentation

#### `node_begin()` [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::ov_tree_map<
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin () [inline]
```

Returns a `node_iterator` corresponding to the node at the root of the tree.

#### `node_begin()` [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::ov_tree_r
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin () const [inline]
```

Returns a const `node_iterator` corresponding to the node at the root of the tree.

#### `node_end()` [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::ov_tree_map<
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end () [inline]
```

Returns a `node_iterator` corresponding to a node just after a leaf of the tree.

#### `node_end()` [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::ov_tree_r
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end () const [inline]
```

Returns a const `node_iterator` corresponding to a node just after a leaf of the tree.

The documentation for this class was generated from the following file:

- [ov\\_tree\\_map.hpp](#)

### 6.743.1 Detailed Description

template<typename `Value_Type`, typename `Metadata_Type`, typename `_Alloc`>  
class `__gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc >`

Const node reference.

### 6.743.2 Member Function Documentation

#### `get_l_child()`

```
template<typename Value_Type, typename Metadata_Type, typename _Alloc>
this_type __gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc >::get_l_↵
l_child () const [inline]
```

Returns the node iterator associated with the left node.

#### `get_r_child()`

```
template<typename Value_Type, typename Metadata_Type, typename _Alloc>
this_type __gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc >::get_↵
r_child () const [inline]
```

Returns the node iterator associated with the right node.

The documentation for this class was generated from the following file:

- [ov\\_tree\\_map\\_/node\\_iterators.hpp](#)

`static Ptr mid_pointer (Ptr p_begin, Ptr p_end)`

### 6.744.1 Detailed Description

```
template<typename Value_Type, typename Metadata_Type, typename _Alloc>
class __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >
```

Node reference.

### 6.744.2 Member Function Documentation

#### `get_l_child()`

```
template<typename Value_Type, typename Metadata_Type, typename _Alloc>
ov_tree_node_it_ __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >::get↵
_l_child () const [inline]
```

Returns the node reference associated with the left node.

#### `get_r_child()`

```
template<typename Value_Type, typename Metadata_Type, typename _Alloc>
ov_tree_node_it_ __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >::get↵
_r_child () const [inline]
```

Returns the node reference associated with the right node.

#### `operator*()`

```
template<typename Value_Type, typename Metadata_Type, typename _Alloc>
reference __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >::operator* ()
const [inline]
```

Access.

## 6.745 \_\_gnu\_pbds::ov\_tree\_tag Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for `__gnu_pbds::ov_tree_tag`:

#### 6.745.1 Detailed Description

Ordered-vector tree.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

#### 6.746 `std::overflow_error` Class Reference

```
#include <stdexcept_except.h>
```

Inheritance diagram for `std::overflow_error`:

### Public Member Functions

- **`overflow_error`** (`const char *`)
- **`overflow_error`** (`const overflow\_error &`)=default
- **`overflow_error`** (`const string &__arg`)
- **`overflow_error`** (`overflow\_error &&`)=default
- **`overflow_error`** & **`operator=`** (`const overflow\_error &`)=default
- **`overflow_error`** & **`operator=`** (`overflow\_error &&`)=default
- virtual `const char * what () const` `noexcept`

#### 6.746.1 Detailed Description

Thrown to indicate arithmetic overflow.

#### 6.746.2 Member Function Documentation

##### `what()`

`virtual const char * std::runtime_error::what () const` `[virtual]`, `[noexcept]`, `[inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#), and [std::filesystem::filesystem\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this class was generated from the following file:

- [stdexcept\\_except.h](#)

## 6.747 `std::owner_less< _Tp >` Struct Template Reference

### 6.747.1 Detailed Description

```
template<typename _Tp = void>
struct std::owner_less< _Tp >
```

Primary template `owner_less`.

The documentation for this struct was generated from the following file:

- [bits/shared\\_ptr.h](#)

## 6.748 `std::experimental::fundamentals_v2::owner_less< shared_ptr< _Tp > >` Struct Template Reference

```
#include <shared_ptr.h>
```

### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)
- typedef `bool` [result\\_type](#)
- typedef `_Tp` [second\\_argument\\_type](#)

### Public Member Functions

- `bool` **operator()** (`const _Tp &__lhs, const _Tp &__rhs`) `const noexcept`
- `bool` **operator()** (`const _Tp &__lhs, const _Tp1 &__rhs`) `const noexcept`
- `bool` **operator()** (`const _Tp1 &__lhs, const _Tp &__rhs`) `const noexcept`

### 6.748.1 Detailed Description

```
template<typename _Tp>
struct std::experimental::fundamentals_v2::owner_less< shared_ptr< _Tp > >
```

Partial specialization of `owner_less` for `shared_ptr`.

### 6.748.2 Member Typedef Documentation

#### `first_argument_type`

```
typedef _Tp std::binary\_function< _Tp, _Tp, bool >::first_argument_type [inherited]
first_argument_type is the type of the first argument
```

#### `result_type`

```
typedef bool std::binary\_function< _Tp, _Tp, bool >::result_type [inherited]
result_type is the return type
```

#### `second_argument_type`

```
typedef _Tp std::binary\_function< _Tp, _Tp, bool >::second_argument_type [inherited]
second_argument_type is the type of the second argument
```

The documentation for this struct was generated from the following file:

- [experimental/bits/shared\\_ptr.h](#)

## 6.749 `std::owner_less< shared_ptr< _Tp > >` Struct Template Reference

```
#include <shared_ptr.h>
```

### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)
- typedef bool [result\\_type](#)
- typedef `_Tp` [second\\_argument\\_type](#)

### Public Member Functions

- bool **operator()** (const `_Tp` &\_\_lhs, const `_Tp` &\_\_rhs) const noexcept
- bool **operator()** (const `_Tp` &\_\_lhs, const `_Tp1` &\_\_rhs) const noexcept
- bool **operator()** (const `_Tp1` &\_\_lhs, const `_Tp` &\_\_rhs) const noexcept

#### 6.749.1 Detailed Description

```
template<typename _Tp>  
struct std::owner_less< shared_ptr< _Tp > >
```

Partial specialization of `owner_less` for `shared_ptr`.

#### 6.749.2 Member Typedef Documentation

##### `first_argument_type`

```
typedef _Tp std::binary_function< _Tp, _Tp, bool >::first_argument_type [inherited]  
first_argument_type is the type of the first argument
```

##### `result_type`

```
typedef bool std::binary_function< _Tp, _Tp, bool >::result_type [inherited]  
result_type is the return type
```

##### `second_argument_type`

```
typedef _Tp std::binary_function< _Tp, _Tp, bool >::second_argument_type [inherited]  
second_argument_type is the type of the second argument  
The documentation for this struct was generated from the following file:
```

- [bits/shared\\_ptr.h](#)

## 6.750 `std::owner_less< void >` Struct Reference

```
#include <shared_ptr.h>
```

### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)
- typedef bool [result\\_type](#)
- typedef `_Tp` [second\\_argument\\_type](#)

### Public Member Functions

- bool **operator()** (const `_Tp` &\_\_lhs, const `_Tp` &\_\_rhs) const noexcept
- bool **operator()** (const `_Tp` &\_\_lhs, const `_Tp1` &\_\_rhs) const noexcept
- bool **operator()** (const `_Tp1` &\_\_lhs, const `_Tp` &\_\_rhs) const noexcept

### 6.750.1 Detailed Description

Void specialization of `owner_less` compares either `shared_ptr` or `weak_ptr`.

### 6.750.2 Member Typedef Documentation

#### `first_argument_type`

```
typedef _Tp std::binary_function< _Tp, _Tp, bool >::first_argument_type [inherited]
first_argument_type is the type of the first argument
```

#### `result_type`

```
typedef bool std::binary_function< _Tp, _Tp, bool >::result_type [inherited]
result_type is the return type
```

#### `second_argument_type`

```
typedef _Tp std::binary_function< _Tp, _Tp, bool >::second_argument_type [inherited]
second_argument_type is the type of the second argument
```

The documentation for this struct was generated from the following file:

- [bits/shared\\_ptr.h](#)

## 6.751 `std::experimental::fundamentals_v2::owner_less< weak_ptr< _Tp > >` Struct Template Reference

```
#include <shared_ptr.h>
```

### Public Types

- typedef `_Tp` `first_argument_type`
- typedef `bool` `result_type`
- typedef `_Tp` `second_argument_type`

### Public Member Functions

- `bool operator()` (`const _Tp &__lhs`, `const _Tp &__rhs`) `const noexcept`
- `bool operator()` (`const _Tp &__lhs`, `const _Tp1 &__rhs`) `const noexcept`
- `bool operator()` (`const _Tp1 &__lhs`, `const _Tp &__rhs`) `const noexcept`

### 6.751.1 Detailed Description

`template<typename _Tp>`

`struct std::experimental::fundamentals_v2::owner_less< weak_ptr< _Tp > >`

Partial specialization of `owner_less` for `weak_ptr`.

### 6.751.2 Member Typedef Documentation

#### `first_argument_type`

```
typedef _Tp std::binary_function< _Tp, _Tp, bool >::first_argument_type [inherited]
first_argument_type is the type of the first argument
```

**result\_type**

typedef bool [std::binary\\_function](#)< \_Tp, \_Tp, bool >::result\_type [inherited]  
 result\_type is the return type

**second\_argument\_type**

typedef \_Tp [std::binary\\_function](#)< \_Tp, \_Tp, bool >::second\_argument\_type [inherited]  
 second\_argument\_type is the type of the second argument  
 The documentation for this struct was generated from the following file:

**6.754.1 Detailed Description**

```
template<typename _T1, typename _T2>  
struct __gnu_cxx::pair<_T1, _T2 >
```

Struct holding two objects of arbitrary type.

## Template Parameters

<code>_T1</code>	Type of first object.
<code>_T2</code>	Type of second object.

<https://gcc.gnu.org/onlinedocs/libstdc++/manual/utilities.html>

## 6.754.2 Member Typedef Documentation

**first\_type**

```
template<typename _T1, typename _T2>
typedef _T1 std::pair< _T1, _T2 >::first_type
```

The type of the first member.

**second\_type**

```
template<typename _T1, typename _T2>
typedef _T2 std::pair< _T1, _T2 >::second_type
```

The type of the second member.

## 6.754.3 Constructor &amp; Destructor Documentation

**pair()** [1/2]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::pair (
    const pair< _T1, _T2 > & ) [constexpr], [default]
```

Copy constructor.

**pair()** [2/2]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::pair (
    pair< _T1, _T2 > && ) [constexpr], [default]
```

Move constructor.

## 6.754.4 Member Function Documentation

**explicit()** [1/5]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_constructible<_U1, _U2>()) && (!_S_dangles<_U1, _U2>())
std::pair< _T1, _T2 >::explicit (
    !_S_convertible< _U1, _U2 > ()) && [constexpr]
```

Constructor accepting two values of arbitrary types.

**explicit()** [2/5]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_constructible<_U1, _U2>()) && (!_S_dangles<_U1, _U2>())
_U2 &constexpr std::pair< _T1, _T2 >::explicit (
    !_S_convertible< _U1, _U2 > ()) [constexpr]
```

Converting constructor from a non-const pair<U1, U2> rvalue.

**explicit()** [3/5]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::explicit (
    !_S_convertible< const _T1 &, const _T2 & > () const & [constexpr]
```

Constructor accepting lvalues of first\_type and second\_type

**explicit()** [4/5]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_constructible<const _U1&, const _U2&>()) && (!_S_dangles<_U1, _U2>())
_U2 &&constexpr std::pair< _T1, _T2 >::explicit (
    !_S_convertible< const _U1 &, const _U2 & > () const [constexpr]
```

Converting constructor from a const pair<U1, U2> lvalue.

**explicit()** [5/5]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::explicit (
    __not_< __and_< __is_implicitly_default_constructible< _T1 >, __is_implicitly_↵
default_constructible< _T2 > > > () [inline], [constexpr], [noexcept]
```

Default constructor.

**operator=()** [1/4]

```
template<typename _T1, typename _T2>
pair & std::pair< _T1, _T2 >::operator= (
    const pair< _T1, _T2 > & __p) [inline], [constexpr], [noexcept]
```

Copy assignment operator.

**operator=()** [2/4]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_assignable<const _U1&, const _U2&>())
pair & std::pair< _T1, _T2 >::operator= (
    const pair< _U1, _U2 > & __p) [inline], [constexpr], [noexcept]
```

Converting assignment from a const pair<U1, U2> lvalue.

**operator=()** [3/4]

```
template<typename _T1, typename _T2>
pair & std::pair< _T1, _T2 >::operator= (
    pair< _T1, _T2 > && __p) [inline], [constexpr], [noexcept]
```

Move assignment operator.

**operator=()** [4/4]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_assignable<_U1, _U2>())
pair & std::pair< _T1, _T2 >::operator= (
    pair< _U1, _U2 > && __p) [inline], [constexpr], [noexcept]
```

Converting assignment from a non-const pair<U1, U2> rvalue.

**swap()**

```
template<typename _T1, typename _T2>
void std::pair<_T1, _T2>::swap (
    pair<_T1, _T2> & __p) [inline], [constexpr], [noexcept]
```

Swap the first members and then the second members.

**6.754.5 Member Data Documentation****first**

```
template<typename _T1, typename _T2>
_T1 std::pair<_T1, _T2>::first
```

The first member.

**second**

```
template<typename _T1, typename _T2>
_T2 std::pair<_T1, _T2>::second
```

The second member.

The documentation for this struct was generated from the following files:

- [bits/stl\\_iterator.h](#)
- [stl\\_pair.h](#)
- [tuple](#)

### 6.755.1 Detailed Description

`template<typename _T1, typename _T2>`  
`struct std::pair< _T1, _T2 >`

Struct holding two objects of arbitrary type.

## Template Parameters

<code>_T1</code>	Type of first object.
<code>_T2</code>	Type of second object.

<https://gcc.gnu.org/onlinedocs/libstdc++/manual/utilities.html>

## 6.755.2 Member Typedef Documentation

**first\_type**

```
template<typename _T1, typename _T2>
typedef _T1 std::pair<_T1, _T2>::first_type
```

The type of the first member.

**second\_type**

```
template<typename _T1, typename _T2>
typedef _T2 std::pair<_T1, _T2>::second_type
```

The type of the second member.

## 6.755.3 Constructor &amp; Destructor Documentation

**pair()** [1/2]

```
template<typename _T1, typename _T2>
std::pair<_T1, _T2>::pair (
    const pair<_T1, _T2> & ) [constexpr], [default]
```

Copy constructor.

Referenced by [pair\(\)](#).

**pair()** [2/2]

```
template<typename _T1, typename _T2>
std::pair<_T1, _T2>::pair (
    pair<_T1, _T2> && ) [constexpr], [default]
```

Move constructor.

## 6.755.4 Member Function Documentation

**explicit()** [1/5]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_constructible<_U1, _U2>()) && (!_S_dangles<_U1, _U2>())
std::pair<_T1, _T2>::explicit (
    !_S_convertible<_U1, _U2> ()) && [constexpr]
```

Constructor accepting two values of arbitrary types.

**explicit()** [2/5]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_constructible<_U1, _U2>()) && (!_S_dangles<_U1, _U2>())
_U2 &constexpr std::pair<_T1, _T2>::explicit (
    !_S_convertible<_U1, _U2> ()) [constexpr]
```

Converting constructor from a non-const pair<U1, U2> rvalue.

#### explicit() [3/5]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::explicit (
    !_S_convertible< const _T1 &, const _T2 & > () const & [constexpr]
```

Constructor accepting lvalues of first\_type and second\_type

#### explicit() [4/5]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_constructible<const _U1&, const _U2&>()) && (!_S_dangles<_U1, _U2>())
_U2 &&constexpr std::pair< _T1, _T2 >::explicit (
    !_S_convertible< const _U1 &, const _U2 & > () const [constexpr]
```

Converting constructor from a const pair<U1, U2> lvalue.

#### explicit() [5/5]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::explicit (
    __not< __and< __is_implicitly_default_constructible< _T1 >, __is_implicitly_↵
default_constructible< _T2 > > > () [inline], [constexpr], [noexcept]
```

Default constructor.

#### operator=() [1/4]

```
template<typename _T1, typename _T2>
pair & std::pair< _T1, _T2 >::operator= (
    const pair< _T1, _T2 > & __p) [inline], [constexpr], [noexcept]
```

Copy assignment operator.

#### operator=() [2/4]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_assignable<const _U1&, const _U2&>())
pair & std::pair< _T1, _T2 >::operator= (
    const pair< _U1, _U2 > & __p) [inline], [constexpr], [noexcept]
```

Converting assignment from a const pair<U1, U2> lvalue.

#### operator=() [3/4]

```
template<typename _T1, typename _T2>
pair & std::pair< _T1, _T2 >::operator= (
    pair< _T1, _T2 > && __p) [inline], [constexpr], [noexcept]
```

Move assignment operator.

#### operator=() [4/4]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_assignable<_U1, _U2>())
```

```
pair & std::pair< _T1, _T2 >::operator= (
    pair< _U1, _U2 > && __p) [inline], [constexpr], [noexcept]
```

Converting assignment from a non-const `pair<U1, U2>` rvalue.

### swap()

```
template<typename _T1, typename _T2>
void std::pair< _T1, _T2 >::swap (
    pair< _T1, _T2 > & __p) [inline], [constexpr], [noexcept]
```

Swap the first members and then the second members.

Referenced by `std::pair< const __iter_key_t< _InputIterator >, __iter_val_t< _InputIterator > >::swap()`, `std::sub_match< const char * >` and `std::swap()`.

### 6.755.5 Member Data Documentation

#### first

```
template<typename _T1, typename _T2>
_T1 std::pair< _T1, _T2 >::first
```

The first member.

Referenced by `__gnu_parallel::__find_template()`, `__gnu_parallel::__find_template()`, `std::__sample()`, `std::set< _Key, _Cmp, polymorphic_allocator< _Key > >::insert()`, `std::pair< const __iter_key_t< _InputIterator >, __iter_val_t< _InputIterator > >::operator<=()`, `std::pair< const __iter_key_t< _InputIterator >, __iter_val_t< _InputIterator > >::operator==()`, and `std::shuffle()`.

#### second

```
template<typename _T1, typename _T2>
_T2 std::pair< _T1, _T2 >::second
```

The second member.

Referenced by `std::__sample()`, `std::set< _Key, _Cmp, polymorphic_allocator< _Key > >::insert()`, `std::pair< const __iter_key_t< _InputIterator >, __iter_val_t< _InputIterator > >::operator<=()`, and `std::shuffle()`.

The documentation for this struct was generated from the following files:

- [bits/stl\\_iterator.h](#)
- [stl\\_pair.h](#)
- [tuple](#)

### 6.756 `__gnu_pbds::detail::pairing_heap< Value_Type, Cmp_Fn, _Alloc >` Class Template Reference

```
#include <pairing_heap.hpp>
```

Inheritance diagram for `__gnu_pbds::detail::pairing_heap< Value_Type, Cmp_Fn, _Alloc >`:

## Public Types

- typedef `_Alloc` **allocator\_type**
- typedef `Cmp_Fn` **cmp\_fn**
- typedef `base_type::const_iterator` **const\_iterator**
- typedef `__rebind_a::const_pointer` **const\_pointer**
- typedef `__rebind_a::const_reference` **const\_reference**
- typedef `_Alloc::difference_type` **difference\_type**
- typedef `base_type::iterator` **iterator**
- typedef `left_child_next_sibling_heap_node_< Value_Type, null_type, _Alloc >` **node**
- typedef `base_type::point_const_iterator` **point\_const\_iterator**
- typedef `base_type::point_iterator` **point\_iterator**
- typedef `__rebind_a::pointer` **pointer**
- typedef `__rebind_a::reference` **reference**
- typedef `_Alloc::size_type` **size\_type**
- typedef `Value_Type` **value\_type**

## Public Member Functions

- **pairing\_heap** (const `Cmp_Fn` &)
- **pairing\_heap** (const `pairing_heap` &)
- **iterator begin** ()
- **const\_iterator begin** () const
- void **clear** ()
- bool **empty** () const
- **iterator end** ()
- **const\_iterator end** () const
- void **erase** (point\_iterator)
- template<typename Pred>  
size\_type **erase\_if** (Pred)
- `Cmp_Fn` & **get\_cmp\_fn** ()
- const `Cmp_Fn` & **get\_cmp\_fn** () const
- void **join** (`pairing_heap` &)
- size\_type **max\_size** () const
- void **modify** (point\_iterator, const\_reference)
- void **pop** ()
- point\_iterator **push** (const\_reference)
- size\_type **size** () const
- template<typename Pred>  
void **split** (Pred, `pairing_heap` &)
- void **swap** (`left_child_next_sibling_heap_< Value_Type, Cmp_Fn, null_type, _Alloc >` &)
- void **swap** (`pairing_heap` &)
- const\_reference **top** () const

## Protected Types

- typedef `alloc_traits::allocator_type` **node\_allocator**
- typedef `alloc_traits::const_pointer` **node\_const\_pointer**
- typedef `null_type` **node\_metadata**
- typedef `std::pair< node_pointer, node_pointer >` **node\_pointer\_pair**

### Protected Member Functions

- void **actual\_erase\_node** (node\_pointer)
- void **bubble\_to\_top** (node\_pointer)
- void **clear\_imp** (node\_pointer)
- template<typename It>  
void **copy\_from\_range** (It, It)

### Static Protected Member Functions

- static void **make\_child\_of** (node\_pointer, node\_pointer)
- static node\_pointer **parent** (node\_pointer)

### Protected Attributes

- node\_pointer **m\_p\_root**
- size\_type **m\_size**

#### 6.756.1 Detailed Description

```
template<typename Value_Type, typename Cmp_Fn, typename _Alloc>  
class __gnu_pbds::detail::pairing_heap< Value_Type, Cmp_Fn, _Alloc >
```

Pairing heap.

The documentation for this class was generated from the following file:

- [pairing\\_heap.hpp](#)

### 6.757 \_\_gnu\_pbds::pairing\_heap\_tag Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for `__gnu_pbds::pairing_heap_tag`:

#### 6.757.1 Detailed Description

Pairing-heap.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

#### 6.758 `__gnu_parallel::parallel_tag` Struct Reference

```
#include <tags.h>
```

Inheritance diagram for \_\_gnu\_parallel::parallel\_tag:

### Public Member Functions

- [parallel\\_tag](#) ()
- [parallel\\_tag](#) ([\\_ThreadIndex](#) \_\_num\_threads)
- [\\_ThreadIndex](#) [\\_\\_get\\_num\\_threads](#) ()

- void [set\\_num\\_threads](#) ([\\_ThreadIndex](#) \_\_num\_threads)

### 6.758.1 Detailed Description

Recommends parallel execution at compile time, optionally using a user-specified number of threads.

### 6.758.2 Constructor & Destructor Documentation

#### **parallel\_tag()** [1/2]

```
__gnu_parallel::parallel_tag::parallel_tag () [inline]
```

Default constructor. Use default number of threads.

#### **parallel\_tag()** [2/2]

```
__gnu_parallel::parallel_tag::parallel_tag (  
    \_ThreadIndex __num_threads) [inline]
```

Default constructor. Recommend number of threads to use.

#### Parameters

<a href="#">__num_threads</a>	Desired number of threads.
-------------------------------	----------------------------

### 6.758.3 Member Function Documentation

#### **\_\_get\_num\_threads()**

```
\_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline]
```

Find out desired number of threads.

#### Returns

Desired number of threads.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), and [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#)

#### **set\_num\_threads()**

```
void __gnu_parallel::parallel_tag::set_num_threads (  
    \_ThreadIndex __num_threads) [inline]
```

Set the desired number of threads.

#### Parameters

<a href="#">__num_threads</a>	Desired number of threads.
-------------------------------	----------------------------

The documentation for this struct was generated from the following file:

- [tags.h](#)

## 6.759 std::bernoulli\_distribution::param\_type Struct Reference

```
#include <random.h>
```

### Public Types

- typedef [bernoulli\\_distribution](#) **distribution\_type**

### Public Member Functions

- **param\_type** (double \_\_p)
- double **p** () const

### Friends

### 6.780.1 Detailed Description

template<typename Key, typename Mapped, typename Node\_And\_It\_Traits, typename \_Alloc>  
class [\\_\\_gnu\\_pbds::detail::pat\\_trie\\_map](#)< Key, Mapped, Node\_And\_It\_Traits, \_Alloc >

PATRICIA trie.

This implementation loosely borrows ideas from: 1) Fast Mergeable Integer Maps, Okasaki, Gill 1998 2) Ptsset: Sets of integers implemented as Patricia trees, Jean-Christophe Filliatr, 2000

### 6.780.2 Member Enumeration Documentation

#### node\_type

enum [\\_\\_gnu\\_pbds::detail::pat\\_trie\\_base::node\\_type](#) [inherited]

Three types of nodes.

i\_node is used by \_Inode, leaf\_node by \_Leaf, and head\_node by \_Head.

### 6.780.3 Member Function Documentation

#### node\_begin() [1/2]

template<typename Key, typename Mapped, typename Node\_And\_It\_Traits, typename \_Alloc>  
[pat\\_trie\\_map](#)< Key, Mapped, Node\_And\_It\_Traits, \_Alloc >::node\_iterator [\\_\\_gnu\\_pbds::detail::pat\\_trie\\_map](#)<  
Key, Mapped, Node\_And\_It\_Traits, \_Alloc >::node\_begin () [inline]

Returns a node\_iterator corresponding to the node at the root of the tree.

**node\_begin()** [2/2]

```
template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_begin () const [inline]
```

Returns a const node\_iterator corresponding to the node at the root of the tree.

**node\_end()** [1/2]

```
template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_end () [inline]
```

Returns a node\_iterator corresponding to a node just after a leaf of the tree.

**node\_end()** [2/2]

```
template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_end () const [inline]
```

Returns a const node\_iterator corresponding to a node just after a leaf of the tree.

The documentation for this class was generated from the following file:

- [pat\\_trie.hpp](#)

**6.781 \_\_gnu\_pbds::pat\_trie\_tag Struct Reference**

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for `__gnu_pbds::pat_trie_tag`:

### 6.781.1 Detailed Description

PATRICIA trie.

The documentation for this struct was generated from the following file:

**6.784.1 Detailed Description**

**template<typename \_RealType = double>**  
**class std::piecewise\_constant\_distribution< \_RealType >**

A `piecewise_constant_distribution` random number distribution.

This distribution produces random numbers  $x, b_0 \leq x < b_n$ , uniformly distributed over each subinterval  $[b_i, b_{i+1})$  according to the probability mass function

$$p(x|b_0, \dots, b_n, \rho_0, \dots, \rho_{n-1}) = \rho_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}$$

for  $b_i \leq x < b_{i+1}$ .

Since

C++11

### 6.784.2 Member Typedef Documentation

#### result\_type

```
template<typename _RealType = double>
typedef _RealType std::piecewise\_constant\_distribution< _RealType >::result_type
```

The type of the range of the distribution.

### 6.784.3 Member Function Documentation

#### densities()

```
template<typename _RealType = double>
std::vector< double > std::piecewise\_constant\_distribution< _RealType >::densities () const
[inline]
```

Returns a vector of the probability densities.

#### intervals()

```
template<typename _RealType = double>
std::vector< _RealType > std::piecewise\_constant\_distribution< _RealType >::intervals () const
[inline]
```

Returns a vector of the intervals.

#### max()

```
template<typename _RealType = double>
result\_type std::piecewise\_constant\_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### min()

```
template<typename _RealType = double>
result\_type std::piecewise\_constant\_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

#### operator>()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result\_type std::piecewise\_constant\_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

#### param() [1/2]

```
template<typename _RealType = double>
param\_type std::piecewise\_constant\_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

#### param() [2/2]

```
template<typename _RealType = double>
void std::piecewise\_constant\_distribution< _RealType >::param (
    const param\_type & __param) [inline]
```

Sets the parameter set of the distribution.

## Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

**reset()**

```
template<typename _RealType = double>
void std::piecewise_constant_distribution< _RealType >::reset () [inline]
Resets the distribution state.
```

**6.784.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::piecewise_constant_distribution< _RealType1 > & __x) [friend]
Inserts a piecewise_constant_distribution random number distribution __x into the output stream __os.
```

## Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A piecewise_constant_distribution random number distribution.

## Returns

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _RealType = double>
bool operator== (
    const piecewise_constant_distribution< _RealType > & __d1,
    const piecewise_constant_distribution< _RealType > & __d2) [friend]
Return true if two piecewise constant distributions have the same parameters.
```

**operator>>**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::piecewise_constant_distribution< _RealType1 > & __x) [friend]
Extracts a piecewise_constant_distribution random number distribution __x from the input stream __is.
```

## Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A piecewise_constant_distribution random number generator engine.

## Returns

The input stream with `__x` extracted or in an error state.

## 6.786.1 Detailed Description

`template<typename _RealType = double>`  
**class** `std::piecewise_linear_distribution< _RealType >`

A `piecewise_linear_distribution` random number distribution.

This distribution produces random numbers  $x$ ,  $b_0 \leq x < b_n$ , distributed over each subinterval  $[b_i, b_{i+1})$  according to the probability mass function  $p(x|b_0, \dots, b_n, \rho_0, \dots, \rho_n) = \rho_i$ , for  $b_i \leq x < b_{i+1}$ .

Since

C++11

## 6.786.2 Member Typedef Documentation

### result\_type

`template<typename _RealType = double>`  
`typedef _RealType std::piecewise_linear_distribution< _RealType >::result_type`  
 The type of the range of the distribution.

## 6.786.3 Member Function Documentation

### densities()

`template<typename _RealType = double>`  
`std::vector< double > std::piecewise_linear_distribution< _RealType >::densities () const [inline]`  
 Return a vector of the probability densities of the distribution.

### intervals()

`template<typename _RealType = double>`  
`std::vector< _RealType > std::piecewise_linear_distribution< _RealType >::intervals () const [inline]`  
 Return the intervals of the distribution.

### max()

`template<typename _RealType = double>`  
`result_type std::piecewise_linear_distribution< _RealType >::max () const [inline]`  
 Returns the least upper bound value of the distribution.

**min()**

```
template<typename _RealType = double>
result_type std::piecewise_linear_distribution<_RealType>::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

**operator()()**

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::piecewise_linear_distribution<_RealType>::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

**param() [1/2]**

```
template<typename _RealType = double>
param_type std::piecewise_linear_distribution<_RealType>::param () const [inline]
```

Returns the parameter set of the distribution.

**param() [2/2]**

```
template<typename _RealType = double>
void std::piecewise_linear_distribution<_RealType>::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

**reset()**

```
template<typename _RealType = double>
void std::piecewise_linear_distribution<_RealType>::reset () [inline]
```

Resets the distribution state.

**6.786.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream<_CharT, _Traits> & operator<< (
    std::basic_ostream<_CharT, _Traits> & __os,
    const std::piecewise_linear_distribution<_RealType1> & __x) [friend]
```

Inserts a `piecewise_linear_distribution` random number distribution `__x` into the output stream `__os`.

**Parameters**

<code>__os</code>	An output stream.
<code>__x</code>	A <code>piecewise_linear_distribution</code> random number distribution.

**Returns**

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _RealType = double>
bool operator== (
    const piecewise\_linear\_distribution< _RealType > & __d1,
    const piecewise\_linear\_distribution< _RealType > & __d2) [friend]
```

Return true if two piecewise linear distributions have the same parameters.

**operator>>**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic\_istream< _CharT, _Traits > & operator>> (
    std::basic\_istream< _CharT, _Traits > & __is,
    std::piecewise\_linear\_distribution< _RealType1 > & __x) [friend]
```

Extracts a `piecewise_linear_distribution` random number distribution `__x` from the input stream `__is`.

**Parameters**

<code>__is</code>	An input stream.
<code>__x</code>	A <code>piecewise_linear_distribution</code> random number generator engine.

**Returns**

The input stream with `__x` extracted or in an error state.

template<typename _Tp>
template<typename _Up>
using std::pointer\_traits< _Tp * >::rebind
A pointer to a different type.
```

**6.792.3 Member Function Documentation****pointer\_to()** [1/3]

```
template<typename _Ptr, typename _Elt, bool = is_void<_Elt>::value>
pointer std::__ptr_traits_ptr_to< _Ptr, _Elt, bool >::pointer_to (
    element_type & __r) [inline], [static], [inherited]
```

Obtain a pointer to an object.

**Parameters**

	A reference to an object of type <code>element_type</code>
	
	
	
<i>r</i>	

**Returns**

`pointer::pointer_to(__r)`

**Precondition**

`pointer::pointer_to(__r)` is a valid expression.

**pointer\_to()** [2/3]

```
template<typename _Ptr, typename _Elt, bool = is_void<_Elt>::value>
pointer std::__ptr_traits_ptr_to< _Ptr, _Elt, bool >::pointer_to (
    element_type & __r) [inline], [static], [inherited]
```

Obtain a pointer to an object.

**Parameters**

	A reference to an object of type <code>element_type</code>
	
	
	
<i>r</i>	

**Returns**

`pointer::pointer_to(__r)`

**Precondition**

`pointer::pointer_to(__r)` is a valid expression.

**pointer\_to()** [3/3]

```
pointer std::__ptr_traits_ptr_to<_Tp *,_Elt,bool>::pointer_to (
    element_type & __r) [inline], [static]
```

Obtain a pointer to an object.

**Parameters**

↔	A reference to an object of type <code>element_type</code>
↔	
↔	
↔	
<i>r</i>	

**Returns**

```
pointer::pointer_to(__r)
```

**Precondition**

`pointer::pointer_to(__r)` is a valid expression.

## 6.793.1 Detailed Description

`template<typename _IntType = int>`  
**class** `std::poisson_distribution< _IntType >`

A discrete Poisson random number distribution.

The formula for the Poisson probability density function is  $p(i|\mu) = \frac{\mu^i}{i!} e^{-\mu}$  where  $\mu$  is the parameter of the distribution.

Since

C++11

## 6.793.2 Member Typedef Documentation

### result\_type

`template<typename _IntType = int>`  
`typedef _IntType std::poisson_distribution< _IntType >::result_type`  
 The type of the range of the distribution.

## 6.793.3 Member Function Documentation

### max()

`template<typename _IntType = int>`  
`result_type std::poisson_distribution< _IntType >::max () const [inline]`  
 Returns the least upper bound value of the distribution.

### mean()

`template<typename _IntType = int>`  
`double std::poisson_distribution< _IntType >::mean () const [inline]`  
 Returns the distribution parameter mean.

### min()

`template<typename _IntType = int>`  
`result_type std::poisson_distribution< _IntType >::min () const [inline]`  
 Returns the greatest lower bound value of the distribution.

**operator>() [1/2]**

```
template<typename _IntType = int>
template<typename _UniformRandomNumberGenerator>
result_type std::poisson_distribution< _IntType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

**operator()() [2/2]**

```
template<typename _IntType>
template<typename _UniformRandomNumberGenerator>
poisson_distribution< _IntType >::result_type std::poisson_distribution< _IntType >::operator()
(
    _UniformRandomNumberGenerator & __urng,
    const param_type & __param)
```

A rejection algorithm when mean  $\geq 12$  and a simple method based upon the multiplication of uniform random variates otherwise. NB: The former is available only if `_GLIBCXX_USE_C99_MATH_FUNCS` is defined.

Reference: Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. X, Sects. 3.3 & 3.4 (+ Errata!).

References [std::abs\(\)](#), [std::numeric\\_limits< \\_Tp >::epsilon\(\)](#), [std::log\(\)](#), and [std::numeric\\_limits< \\_Tp >::max\(\)](#).

**param() [1/2]**

```
template<typename _IntType = int>
param_type std::poisson_distribution< _IntType >::param () const [inline]
```

Returns the parameter set of the distribution.

**param() [2/2]**

```
template<typename _IntType = int>
void std::poisson_distribution< _IntType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

**reset()**

```
template<typename _IntType = int>
void std::poisson_distribution< _IntType >::reset () [inline]
```

Resets the distribution state.

**6.793.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::poisson_distribution< _IntType1 > & __x) [friend]
```

Inserts a `poisson_distribution` random number distribution `__x` into the output stream `__os`.

#### Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>poisson_distribution</code> random number distribution.

#### Returns

The output stream with the state of `__x` inserted or in an error state.

#### `operator==`

```
template<typename _IntType = int>
bool operator== (
    const poisson_distribution< _IntType > & __d1,
    const poisson_distribution< _IntType > & __d2) [friend]
```

Return true if two Poisson distributions have the same parameters and the sequences that would be generated are equal.

#### `operator>>`

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::poisson_distribution< _IntType1 > & __x) [friend]
```

Extracts a `poisson_distribution` random number distribution `__x` from the input stream `__is`.

#### Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>poisson_distribution</code> random number generator engine.

#### Returns

The input stream with `__x` extracted or in an error state.

### 6.796.1 Detailed Description

```
template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename  
_Alloc = std::allocator<char>>
```

```
class __gnu_pbds::priority_queue<_Tv, Cmp_Fn, Tag, _Alloc >
```

A priority queue composed of one specific heap policy.

## Template Parameters

<code>_Tv</code>	Value type.
<code>Cmp_Fn</code>	Comparison functor.
<code>Tag</code>	Instantiating data structure type, see <code>container_tag</code> .
<code>_Alloc</code>	Allocator type.

Base is dispatched at compile time via `Tag`, from the following choices: `binary_heap_tag`, `binomial_heap_tag`, `pairing_heap_tag`, `rc_binomial_heap_tag`, `thin_heap_tag`

Base choices are: `detail::binary_heap`, `detail::binomial_heap`, `detail::pairing_heap`, `detail::rc_binomial_heap`, `detail::thin_heap`.

## 6.796.2 Constructor &amp; Destructor Documentation

**priority\_queue()** [1/3]

```
template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>
__gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >::priority_queue (
    const cmp_fn & r_cmp_fn) [inline]
```

Constructor taking some policy objects. `r_cmp_fn` will be copied by the `Cmp_Fn` object of the container object.

**priority\_queue()** [2/3]

```
template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >::priority_queue (
    It first_it,
    It last_it) [inline]
```

Constructor taking `__iterators` to a range of `value_types`. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

**priority\_queue()** [3/3]

```
template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >::priority_queue (
    It first_it,
    It last_it,
    const cmp_fn & r_cmp_fn) [inline]
```

Constructor taking `__iterators` to a range of `value_types` and some policy objects The `value_types` between `first_it` and `last_it` will be inserted into the container object. `r_cmp_fn` will be copied by the `cmp_fn` object of the container object.

#### 6.797.1 Detailed Description

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>
class std::priority_queue< _Tp, _Sequence, _Compare >
```

A standard container automatically sorting its contents.

#### Template Parameters

<code>_Tp</code>	Type of element.
<code>_Sequence</code>	Type of underlying sequence, defaults to <code>vector&lt;_Tp&gt;</code> .
<code>_Compare</code>	Comparison function object type, defaults to <code>less&lt;_Sequence::value_type&gt;</code> .

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces priority-based sorting and queue behavior. Very few of the standard container/sequence interface requirements are met (e.g., iterators).

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::vector`, but it can be any type that supports `front()`, `push_back`, `pop_back`, and random-access iterators, such as `std::deque` or an appropriate user-defined type.

The third template parameter supplies the means of making priority comparisons. It defaults to `less<value_type>` but can be anything defining a strict weak ordering.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push`, `pop`, and `top`, which are standard queue operations.

#### Note

No equality/comparison operators are provided for `priority_queue`.

Sorting of the elements takes place as they are added to, and removed from, the `priority_queue` using the `priority_queue`'s member functions. If you access the elements by other means, and change their data such that the sorting order would be different, the `priority_queue` will not re-sort the elements for you. (How could it know to do so?)

#### 6.797.2 Constructor & Destructor Documentation

##### `priority_queue()` [1/2]

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<__and_<is_default_constructible<_Compare>, is_default_constructible<_Seq>>::value>::type>
std::priority_queue< _Tp, _Sequence, _Compare >::priority_queue () [inline]
Default constructor creates no elements.
```

**priority\_queue()** [2/2]

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↵
Sequence::value_type>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>>
std::priority_queue< _Tp, _Sequence, _Compare >::priority_queue (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __x = _Compare()) [inline]
```

Builds a queue from a range.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__x</code>	A comparison functor describing a strict weak ordering.
<code>__s</code>	An initial sequence with which to start.

Begins by copying `__s`, inserting a copy of the elements from `[first,last)` into the copy of `__s`, then ordering the copy according to `__x`.

For more information on function objects, see the documentation on [functor base classes](#).

**6.797.3 Member Function Documentation****empty()**

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↵
Sequence::value_type>>
bool std::priority_queue< _Tp, _Sequence, _Compare >::empty () const [inline], [nodiscard]
```

Returns true if the queue is empty.

Referenced by [\\_\\_gnu\\_parallel::multiseq\\_partition\(\)](#), and [\\_\\_gnu\\_parallel::multiseq\\_selection\(\)](#).

**pop()**

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↵
Sequence::value_type>>
void std::priority_queue< _Tp, _Sequence, _Compare >::pop () [inline]
```

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

Referenced by [\\_\\_gnu\\_parallel::multiseq\\_partition\(\)](#), and [\\_\\_gnu\\_parallel::multiseq\\_selection\(\)](#).

**push()**

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↵
Sequence::value_type>>
void std::priority_queue< _Tp, _Sequence, _Compare >::push (
    const value_type & __x) [inline]
```

Add data to the queue.

**Parameters**

<code>__↵</code>	Data to be added.
<code>__x</code>	

This is a typical queue operation. The time complexity of the operation depends on the underlying sequence. Referenced by [\\_\\_gnu\\_parallel::multiseq\\_partition\(\)](#), and [\\_\\_gnu\\_parallel::multiseq\\_selection\(\)](#).

### size()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↔
Sequence::value_type>>>
size_type std::priority\_queue< _Tp, _Sequence, _Compare >::size () const [inline], [nodiscard]
```

Returns the number of elements in the queue.

### top()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↔
Sequence::value_type>>>
const_reference std::priority\_queue< _Tp, _Sequence, _Compare >::top () const [inline], [nodiscard]
```

Returns a read-only (constant) reference to the data at the first element of the queue. Referenced by [\\_\\_gnu\\_parallel::multiseq\\_partition\(\)](#), and [\\_\\_gnu\\_parallel::multiseq\\_selection\(\)](#). The documentation for this class was generated from the following file:

- template<typename \_Tp1, typename \_Seq1>  
bool `operator`== (const queue< \_Tp1, \_Seq1 > &, const queue< \_Tp1, \_Seq1 > &)

#### 6.807.1 Detailed Description

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
class std::queue< _Tp, _Sequence >
```

A standard container giving FIFO behavior.

#### Template Parameters

<code>_Tp</code>	Type of element.
<code>_Sequence</code>	Type of underlying sequence, defaults to <code>deque&lt;_Tp&gt;</code> .

Meets many of the requirements of a `container`, but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-first-out queue behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `front`, `back`, `push_back`, and `pop_front`, such as `std::list` or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second `Sequence` parameter, and `push` and `pop`, which are standard queue/FIFO operations.

#### 6.807.2 Constructor & Destructor Documentation

##### queue()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<is_default_constructible<↔
_Seq>::value>::type>
std::queue< _Tp, _Sequence >::queue () [inline]
```

Default constructor creates no elements.

References `c`.

### 6.807.3 Member Function Documentation

#### back() [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::queue< _Tp, _Sequence >::back () [inline], [nodiscard]
```

Returns a read/write reference to the data at the last element of the queue.

References [c](#).

#### back() [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::queue< _Tp, _Sequence >::back () const [inline], [nodiscard]
```

Returns a read-only (constant) reference to the data at the last element of the queue.

References [c](#).

#### empty()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
bool std::queue< _Tp, _Sequence >::empty () const [inline], [nodiscard]
```

Returns true if the queue is empty.

References [c](#).

#### front() [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::queue< _Tp, _Sequence >::front () [inline], [nodiscard]
```

Returns a read/write reference to the data at the first element of the queue.

References [c](#).

#### front() [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::queue< _Tp, _Sequence >::front () const [inline], [nodiscard]
```

Returns a read-only (constant) reference to the data at the first element of the queue.

References [c](#).

#### pop()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::queue< _Tp, _Sequence >::pop () [inline]
```

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.

References [c](#).

#### push()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::queue< _Tp, _Sequence >::push (
    const value_type & __x) [inline]
```

Add data to the end of the queue.

## Parameters

<code>_↔</code>	Data to be added.
<code>_X</code>	

This is a typical queue operation. The function creates an element at the end of the queue and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

References [c](#).

**size()**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
size_type std::queue< _Tp, _Sequence >::size () const [inline], [nodiscard]
```

Returns the number of elements in the queue.

References [c](#).

**6.807.4 Member Data Documentation****c**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
_Sequence std::queue< _Tp, _Sequence >::c [protected]
```

c is the underlying container.

### Protected Member Functions

- **ranged\_hash\_fn** (size\_type)
- **ranged\_hash\_fn** (size\_type, const Comb\_Hash\_Fn &)
- **ranged\_hash\_fn** (size\_type, const [null\\_type](#) &, const Comb\_Hash\_Fn &)
- void **swap** ([ranged\\_hash\\_fn](#)< Key, [null\\_type](#), \_Alloc, Comb\_Hash\_Fn, true > &)

#### 6.818.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Comb_Hash_Fn>
class __gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, true >
```

Specialization 4 The client does not supply a hash function (by specifying `null_type` as the `Hash_Fn` parameter), and requests that hash values be stored.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

## 6.819 `__gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, Store_Hash >` Class Template Reference

Inheritance diagram for `__gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, Store_Hash >`:

### 6.819.1 Detailed Description

`template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Probe_Fn, typename Probe_Fn, bool Store_Hash>`

`class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, Store_Hash >`

Primary template.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

## 6.820 `__gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, false >` Class Template Reference

```
#include <ranged_probe_fn.hpp>
```

### Protected Types

- typedef `Comb_Probe_Fn` **comb\_probe\_fn\_base**
- typedef `Hash_Fn` **hash\_fn\_base**
- typedef `rebind_traits< _Alloc, Key >::const_reference` **key\_const\_reference**
- typedef `Probe_Fn` **probe\_fn\_base**
- typedef `_Alloc::size_type` **size\_type**

### Protected Member Functions

- **ranged\_probe\_fn** (`size_type`)
- **ranged\_probe\_fn** (`size_type, const Hash_Fn &`)
- **ranged\_probe\_fn** (`size_type, const Hash_Fn &, const Comb_Probe_Fn &`)
- **ranged\_probe\_fn** (`size_type, const Hash_Fn &, const Comb_Probe_Fn &, const Probe_Fn &`)

- void **notify\_resized** (size\_type)
- size\_type **operator()** (key\_const\_reference) const
- size\_type **operator()** (key\_const\_reference, size\_type, size\_type) const
- void **swap** (ranged\_probe\_fn< Key, Hash\_Fn, \_Alloc, Comb\_Probe\_Fn, Probe\_Fn, false > &)

#### 6.820.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Probe_Fn, typename Probe_Fn>
class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, false >
```

Specialization 1

The client supplies a probe function and a ranged probe function, and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

### 6.821 \_\_gnu\_pbds::detail::ranged\_probe\_fn< Key, Hash\_Fn, \_Alloc, Comb\_Probe\_Fn, Probe\_Fn, true > Class Template Reference

```
#include <ranged_probe_fn.hpp>
```

#### Protected Types

- typedef Comb\_Probe\_Fn **comb\_probe\_fn\_base**

- void **swap** (ranged\_probe\_fn< Key, Hash\_Fn, \_Alloc, Comb\_Probe\_Fn, Probe\_Fn, true > &)

#### 6.821.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Probe_Fn, typename Probe_Fn>
class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, true >
```

Specialization 2- The client supplies a probe function and a ranged probe function, and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

## 6.822 `__gnu_pbds::detail::ranged_probe_fn< Key, null_type, _Alloc, Comb_Probe_Fn, null_type, false >` Class Template Reference

```
#include <ranged_probe_fn.hpp>
```

### Protected Types

- typedef `Comb_Probe_Fn` **comb\_probe\_fn\_base**
- typedef `rebind_traits< _Alloc, Key >::const_reference` **key\_const\_reference**
- typedef `_Alloc::size_type` **size\_type**

### Protected Member Functions

- **ranged\_probe\_fn** (`size_type` size)
- **ranged\_probe\_fn** (`size_type`, const `Comb_Probe_Fn` &r\_comb\_probe\_fn)
- **ranged\_probe\_fn** (`size_type`, const `null_type` &, const `Comb_Probe_Fn` &r\_comb\_probe\_fn, const `null_type` &)
- void **swap** (`ranged_probe_fn` &other)

#### 6.822.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Comb_Probe_Fn>
class __gnu_pbds::detail::ranged_probe_fn< Key, null_type, _Alloc, Comb_Probe_Fn, null_type, false >
```

Specialization 3 and 4 The client does not supply a hash function or probe function, and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

## 6.823 `std::rank< _Tp >` Struct Template Reference

```
#include <type_traits>
```

Inheritance diagram for `std::rank< _Tp >`:

### Public Types

- using **type**
- using **value\_type**

### Public Member Functions

- constexpr **operator value\_type** () const noexcept

### Static Public Attributes

- static constexpr std::size\_t **value**

#### 6.823.1 Detailed Description

```
template<typename _Tp>
struct std::rank<_Tp>
```

rank

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

### 6.824 std::ratio<\_Num, \_Den > Struct Template Reference

```
#include <ratio>
```

#### Public Types

- typedef [ratio](#)< num, den > **type**

#### Static Public Attributes

- static constexpr intmax\_t **den**
- static constexpr intmax\_t **num**

#### 6.824.1 Detailed Description

```
template<intmax_t _Num, intmax_t _Den = 1>
struct std::ratio<_Num, _Den>
```

Provides compile-time rational arithmetic.

This class template represents any finite rational number with a numerator and denominator representable by compile-time constants of type intmax\_t. The ratio is simplified when instantiated.

For example:

```
std::ratio<7,-21>::num == -1;
std::ratio<7,-21>::den == 3;
```

The documentation for this struct was generated from the following file:

- [ratio](#)

### 6.825 std::ratio\_equal<\_R1, \_R2 > Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_equal<_R1, _R2>`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 6.825.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_equal<_R1, _R2>
```

`ratio_equal`

The documentation for this struct was generated from the following file:

- [ratio](#)

## 6.826 `std::ratio_greater<_R1, _R2>` Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_greater< _R1, _R2 >`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 6.826.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_greater< _R1, _R2 >
```

ratio\_greater

The documentation for this struct was generated from the following file:

- [ratio](#)

#### 6.827 std::ratio\_greater\_equal< \_R1, \_R2 > Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_greater_equal<_R1, _R2>`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 6.827.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_greater_equal<_R1, _R2>
```

`ratio_greater_equal`

The documentation for this struct was generated from the following file:

- [ratio](#)

## 6.828 `std::ratio_less<_R1, _R2>` Struct Template Reference

```
#include <ratio>
```

#### 6.828.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_less<_R1, _R2>
```

`ratio_less`

The documentation for this struct was generated from the following file:

- [ratio](#)

## 6.829 `std::ratio_less_equal<_R1, _R2>` Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_less_equal<_R1, _R2>`:

### Public Types

- using **type**
- using **value\_type**

### Public Member Functions

- constexpr **operator value\_type** () const noexcept

### Static Public Attributes

- static constexpr bool **value**

#### 6.829.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_less_equal<_R1, _R2>
```

`ratio_less_equal`

The documentation for this struct was generated from the following file:

- [ratio](#)

## 6.830 `std::ratio_not_equal<_R1, _R2>` Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_not_equal<_R1, _R2>`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 6.830.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_not_equal<_R1, _R2>
```

`ratio_not_equal`

The documentation for this struct was generated from the following file:

- [ratio](#)

## 6.831 `std::raw_storage_iterator<_OutputIterator, _Tp>` Class Template Reference

```
#include <stl_raw_storage_iter.h>
```

Inheritance diagram for `std::raw_storage_iterator<_OutputIterator, _Tp>`:

### Public Types

- typedef void [difference\\_type](#)
- typedef [output\\_iterator\\_tag](#) [iterator\\_category](#)
- typedef void [pointer](#)
- typedef void [reference](#)
- typedef void [value\\_type](#)

### Public Member Functions

- **raw\_storage\_iterator** ([\\_OutputIterator](#) \_\_x)
- [\\_OutputIterator](#) **base** () const
- [raw\\_storage\\_iterator](#) & **operator\*** ()
- [raw\\_storage\\_iterator](#) & **operator++** ()
- [raw\\_storage\\_iterator](#) **operator++** (int)
- [raw\\_storage\\_iterator](#) & **operator=** ([\\_Tp](#) &&\_\_element)
- [raw\\_storage\\_iterator](#) & **operator=** (const [\\_Tp](#) &&\_\_element)

### Protected Attributes

- [\\_OutputIterator](#) **\_M\_iter**

#### 6.831.1 Detailed Description

```
template<class _OutputIterator, class _Tp>
class std::raw_storage_iterator<_OutputIterator, _Tp>
```

This iterator class lets algorithms store their results into uninitialized memory.

#### 6.831.2 Member Typedef Documentation

##### **difference\_type**

typedef void `std::iterator< output\_iterator\_tag, void, void, void, void >::difference_type` [inherited]  
 Distance between iterators is represented as this type.

**iterator\_category**

```
typedef output\_iterator\_tag std::iterator< output\_iterator\_tag, void, void, void, void >::iterator↵
_category [inherited]
```

One of the [tag types](#).

**pointer**

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::pointer [inherited]
```

This type represents a pointer-to-value\_type.

**reference**

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::reference [inherited]
```

This type represents a reference-to-value\_type.

**value\_type**

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::value_type [inherited]
```

The type "pointed to" by the iterator.

The documentation for this class was generated from the following file:

- [stl\\_raw\\_storage\\_iter.h](#)

## 6.832 `__gnu_cxx::rb_tree< _Key, _Value, _KeyOfValue, _Compare, _Alloc >` Struct Template Reference

```
#include <rb_tree>
```

**Public Types**

#### 6.833.1 Detailed Description

template<typename Key, typename Mapped, typename Cmp\_Fn, typename Node\_And\_It\_Traits, typename \_Alloc>

class `__gnu_pbds::detail::rb_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >`

Red-Black tree.

This implementation uses an idea from the SGI STL (using a *header* node which is needed for efficient iteration).

#### 6.833.2 Member Function Documentation

##### **node\_begin()** [1/2]

template<typename Key, typename Mapped, typename Cmp\_Fn, typename Node\_And\_It\_Traits, typename \_Alloc>

`bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin () [inline], [inherited]`

Returns a `node_iterator` corresponding to the node at the root of the tree.

##### **node\_begin()** [2/2]

template<typename Key, typename Mapped, typename Cmp\_Fn, typename Node\_And\_It\_Traits, typename \_Alloc>

`bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin () const [inline], [inherited]`

Returns a const `node_iterator` corresponding to the node at the root of the tree.

**node\_end()** [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu↵
pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end ()
[inline], [inherited]
```

Returns a `node_iterator` corresponding to a node just after a leaf of the tree.

**node\_end()** [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __↵
gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node↵
end () const [inline], [inherited]
```

Returns a const `node_iterator` corresponding to a node just after a leaf of the tree.

The documentation for this class was generated from the following file:

- [rb\\_tree\\_.hpp](#)

## 6.834 `__gnu_pbds::detail::rb_tree_node_< Value_Type, Metadata, _Alloc >` Struct Template Reference

```
#include <node.hpp>
```

**Public Types**

- typedef [rebind\\_traits](#)< \_Alloc, metadata\_type >::const\_reference **metadata\_const\_reference**

- `bool operator==` (const [recursive\\_directory\\_iterator](#) &\_\_lhs, const [recursive\\_directory\\_iterator](#) &\_\_rhs) noexcept

### 6.840.1 Detailed Description

Iterator type for recursively traversing a directory hierarchy.

Since

C++17

The documentation for this class was generated from the following file:

- [bits/fs\\_dir.h](#)

### 6.841 \_\_gnu\_cxx::recursive\_init\_error Class Reference

```
#include <cxxabi.h>
```

Inheritance diagram for `__gnu_cxx::recursive_init_error`:

## Public Member Functions

- virtual const char \* [what](#) () const noexcept

### 6.841.1 Detailed Description

Exception thrown by `__cxa_guard_acquire`.

C++ 2011 6.7 [stmt.dcl]/4: If control re-enters the declaration recursively while the variable is being initialized, the behavior is undefined.

Since we already have a library function to handle locking, we might as well check for this situation and throw an exception. We use the second byte of the guard variable to remember that we're in the middle of an initialization.

### 6.841.2 Member Function Documentation

#### `what()`

```
virtual const char * std::exception::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error.

Reimplemented in [std::bad\\_alloc](#), [std::bad\\_cast](#), [std::bad\\_exception](#), [std::bad\\_function\\_call](#), [std::bad\\_typeid](#), [std::bad\\_weak\\_ptr](#), [std::experimental::filesystem::v1::filesystem\\_error](#), [std::experimental::fundamentals\\_v1::bad\\_any\\_cast](#), [std::filesystem::filesystem\\_error](#), [std::future\\_error](#), [std::logic\\_error](#), and [std::runtime\\_error](#).

The documentation for this class was generated from the following file:

- [cxxabi.h](#)

## 6.842 std::recursive\_mutex Class Reference

```
#include <mutex>
```

### Public Types

- typedef \_\_native\_type \* **native\_handle\_type**

### Public Member Functions

- **recursive\_mutex** (const [recursive\\_mutex](#) &)=delete
- void **lock** ()
- native\_handle\_type **native\_handle** () noexcept
- [recursive\\_mutex](#) & **operator=** (const [recursive\\_mutex](#) &)=delete
- bool **try\_lock** () noexcept
- void **unlock** ()

#### 6.842.1 Detailed Description

The standard recursive mutex type.

A recursive mutex can be locked more than once by the same thread. Other threads cannot lock the mutex until the owning thread unlocks it as many times as it was locked.

Since

C++11

The documentation for this class was generated from the following file:

- [mutex](#)

## 6.843 std::recursive\_timed\_mutex Class Reference

```
#include <mutex>
```

### Public Types

- typedef \_\_native\_type \* **native\_handle\_type**

### Public Member Functions

- **recursive\_timed\_mutex** (const [recursive\\_timed\\_mutex](#) &)=delete
- void **lock** ()
- native\_handle\_type **native\_handle** () noexcept
- [recursive\\_timed\\_mutex](#) & **operator=** (const [recursive\\_timed\\_mutex](#) &)=delete
- bool **try\_lock** () noexcept
- template<class \_Rep, class \_Period>  
bool **try\_lock\_for** (const [chrono::duration](#)< \_Rep, \_Period > &\_\_rtime)

- `template<class _Clock, class _Duration>`  
`bool try_lock_until (const chrono::time_point< _Clock, _Duration > &__atime)`
- `void unlock ()`

#### Friends

- `class __timed_mutex_impl< recursive_timed_mutex >`

#### 6.843.1 Detailed Description

The standard recursive timed mutex type.

A recursive mutex that supports a timeout when trying to acquire the lock. A recursive mutex can be locked more than once by the same thread. Other threads cannot lock the mutex until the owning thread unlocks it as many times as it was locked.

Since

C++11

The documentation for this class was generated from the following file:

- [mutex](#)

### 6.844 std::bitset<\_Nb>::reference Class Reference

```
#include <bitset>
```

#### Public Member Functions

- **reference** (const [reference](#) &)=default
- constexpr [reference](#) & **flip** () noexcept
- constexpr **operator bool** () const noexcept
- constexpr [reference](#) & **operator=** (bool \_\_x) noexcept
- constexpr [reference](#) & **operator=** (const [reference](#) &\_\_j) noexcept
- constexpr bool **operator~** () const noexcept

#### Friends

- class **bitset**

#### 6.844.1 Detailed Description

```
template<size_t _Nb>
```

```
class std::bitset<_Nb>::reference
```

This encapsulates the concept of a single bit. An instance of this class is a proxy for an actual bit; this way the individual bit operations are done as faster word-size bitwise instructions.

Most users will never need to use this class directly; conversions to and from bool are automatic and should be transparent. Overloaded operators help to preserve the illusion.

(On a typical system, this *bit reference* is 64 times the size of an actual bit. Ha.)

The documentation for this class was generated from the following file:

- [bitset](#)

### 6.845 std::tr2::dynamic\_bitset<\_WordT, \_Alloc>::reference Class Reference

```
#include <dynamic_bitset>
```

## Public Member Functions

- **reference** ([dynamic\\_bitset](#) &\_\_b, size\_type \_\_pos) noexcept
- **reference** & **flip** () noexcept
- **operator bool** () const noexcept
- **reference** & **operator=** (bool \_\_x) noexcept
- **reference** & **operator=** (const [reference](#) &\_\_j) noexcept
- bool **operator~** () const noexcept

## Friends

- class [dynamic\\_bitset](#)

### 6.845.1 Detailed Description

```
