6.263.2 Constructor & Destructor Documentation . . . . .	1776
6.263.3 Member Function Documentation . . . . .	1777
6.264 __gnu_pbds::detail::branch_policy< Node_Cltr, Node_Itr, _Alloc > Struct Template Reference . . . . .	1777

6.264.1 Detailed Description	1778
6.265 <code>__gnu_pbds::detail::branch_policy&lt; Node_Cltr, Node_Cltr, _Alloc &gt;</code> Struct Template Reference	1778
6.265.1 Detailed Description	1779
6.266 <code>std::cauchy_distribution&lt; _RealType &gt;</code> Class Template Reference	1779
6.266.1 Detailed Description	1780
6.266.2 Member Typedef Documentation	1780
6.266.3 Member Function Documentation	1780
6.266.4 Friends And Related Symbol Documentation	1781
6.267 <code>__gnu_pbds::cc_hash_max_collision_check_resize_trigger&lt; External_Load_Access, Size_Type &gt;</code> Class Template Reference	1781
6.267.1 Detailed Description	1782
6.267.2 Member Enumeration Documentation	1782
6.267.3 Constructor & Destructor Documentation	1782
6.267.4 Member Function Documentation	1782
6.268 <code>__gnu_pbds::cc_hash_table&lt; Key, Mapped, Hash_Fn, Eq_Fn, Comb_Hash_Fn, Resize_Policy, Store_Hash, _Alloc &gt;</code> Class Template Reference	1785
6.268.1 Detailed Description	1786
6.268.2 Constructor & Destructor Documentation	1786
6.269 <code>__gnu_pbds::cc_hash_tag</code> Struct Reference	1789
6.269.1 Detailed Description	1790
6.270 <code>__gnu_pbds::detail::cc_ht_map&lt; Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Hash_Fn, Resize_Policy &gt;</code> Class Template Reference	1790
6.270.1 Detailed Description	1793
6.270.2 Member Enumeration Documentation	1793
6.270.3 Member Function Documentation	1793
6.271 <code>__gnu_cxx::char_traits&lt; _CharT &gt;</code> Struct Template Reference	1795
6.271.1 Detailed Description	1796
6.272 <code>std::char_traits&lt; _CharT &gt;</code> Struct Template Reference	1796
6.272.1 Detailed Description	1797
6.273 <code>std::char_traits&lt; __gnu_cxx::character&lt; _Value, _Int, _St &gt; &gt;</code> Struct Template Reference	1797
6.273.1 Detailed Description	1799
6.274 <code>std::char_traits&lt; wchar_t &gt;</code> Struct Reference	1799
6.274.1 Detailed Description	1801
6.275 <code>__gnu_cxx::character&lt; _Value, _Int, _St &gt;</code> Struct Template Reference	1801
6.275.1 Detailed Description	1802
6.276 <code>std::chi_squared_distribution&lt; _RealType &gt;</code> Class Template Reference	1802
6.276.1 Detailed Description	1803
6.276.2 Member Typedef Documentation	1803
6.276.3 Member Function Documentation	1803
6.276.4 Friends And Related Symbol Documentation	1804

## 1 Deprecated List

### Module [negators](#)

Deprecated in C++17, no longer in the standard since C++20. Use `not_fn` instead.

### Module [pointer\\_adaptors](#)

Deprecated in C++11, no longer in the standard since C++17.

### Module [ptrmem\\_adaptors](#)

Deprecated in C++11, no longer in the standard since C++17. Use `mem_fn` instead.

### Struct [std::aligned\\_storage<\\_Len, \\_Align>](#)

Deprecated in C++23. Uses can be replaced by an array `std::byte[_Len]` declared with `alignas(↔_Align)`.

### Struct [std::aligned\\_union<\\_Len, \\_Types>](#)

Deprecated in C++23.

### Class [std::auto\\_ptr<\\_Tp>](#)

Deprecated in C++11, no longer in the standard since C++17. Use `unique_ptr` instead.

### Struct [std::binary\\_function<\\_Arg1, \\_Arg2, \\_Result>](#)

Deprecated in C++11, no longer in the standard since C++17.

### Member [std::get\\_unexpected\(\)](#) `noexcept`

Removed from the C++ standard in C++17

### Struct [std::is\\_literal\\_type<\\_Tp>](#)

Deprecated in C++17, removed in C++20. The idea of a literal type isn't useful.

### Struct [std::is\\_pod<\\_Tp>](#)

Deprecated in C++20. Use `is_standard_layout` && `is_trivial` instead.

**Struct `std::is_trivial<_Tp>`**

Deprecated in C++26. Use a combination of one or more more specialized type traits instead, such as `is_trivially_default_constructible`, `is_trivially_copy_constructible`, `is_trivially_copy_assignable`, etc., depending on the exact check(s) needed.

**Member `std::random_shuffle` (`_RandomAccessIterator __first, _RandomAccessIterator __last`)**

Since C++17, `std::random_shuffle` is not part of the C++ standard. Use `std::shuffle` instead, which was introduced in C++11.

**Member `std::random_shuffle` (`_RandomAccessIterator __first, _RandomAccessIterator __last, _RandomNumberGenerator &&__rand`)**

Since C++17, `std::random_shuffle` is not part of the C++ standard. Use `std::shuffle` instead, which was introduced in C++11.

**Member `std::set_unexpected` (`unexpected_handler`) `noexcept`**

Removed from the C++ standard in C++17

**Struct `std::unary_function<_Arg, _Result>`**

Deprecated in C++11, no longer in the standard since C++17.

**Member `std::unexpected` ()**

Removed from the C++ standard in C++17

## 2 Todo List

**Member `__gnu_cxx::distance` (`_InputIterator __first, _InputIterator __last, _Distance &__n`)**

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation\\_\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation__style.html)

**Class `__gnu_cxx::hash_map<_Key, _Tp, _HashFn, _EqualKey, _Alloc>`**

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation\\_\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation__style.html)

**Class `__gnu_cxx::hash_multimap<_Key, _Tp, _HashFn, _EqualKey, _Alloc>`**

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation\\_\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation__style.html)

**Class `__gnu_cxx::hash_multiset<_Value, _HashFcn, _EqualKey, _Alloc>`**

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation\\_\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation__style.html)

**Class `__gnu_cxx::hash_set<_Value, _HashFcn, _EqualKey, _Alloc>`**

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation\\_\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation__style.html)

Member [\\_\\_gnu\\_cxx::power](#) ([\\_Tp \\_\\_x](#), [\\_Integer \\_\\_n](#), [\\_MonoidOperation \\_\\_monoid\\_op](#))

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

Member [\\_\\_gnu\\_cxx::power](#) ([\\_Tp \\_\\_x](#), [\\_Integer \\_\\_n](#))

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

Member [\\_\\_gnu\\_cxx::random\\_sample](#) ([\\_InputIterator \\_\\_first](#), [\\_InputIterator \\_\\_last](#), [\\_RandomAccessIterator \\_\\_out\\_first](#), [\\_RandomAccessIterator \\_\\_out\\_last](#))

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

Member [\\_\\_gnu\\_cxx::random\\_sample](#) ([\\_InputIterator \\_\\_first](#), [\\_InputIterator \\_\\_last](#), [\\_RandomAccessIterator \\_\\_out\\_first](#), [\\_RandomAccessIterator \\_\\_out\\_last](#), [\\_RandomNumberGenerator &\\_\\_rand](#))

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

Member [\\_\\_gnu\\_cxx::random\\_sample\\_n](#) ([\\_ForwardIterator \\_\\_first](#), [\\_ForwardIterator \\_\\_last](#), [\\_OutputIterator \\_\\_out](#), [const \\_Distance \\_\\_n](#))

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

Member [\\_\\_gnu\\_cxx::random\\_sample\\_n](#) ([\\_ForwardIterator \\_\\_first](#), [\\_ForwardIterator \\_\\_last](#), [\\_OutputIterator \\_\\_out](#), [const \\_Distance \\_\\_n](#), [\\_RandomNumberGenerator &\\_\\_rand](#))

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

Struct [\\_\\_gnu\\_cxx::rb\\_tree](#)<[\\_Key](#), [\\_Value](#), [\\_KeyOfValue](#), [\\_Compare](#), [\\_Alloc](#)>

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

Class [\\_\\_gnu\\_cxx::rope](#)<[\\_CharT](#), [\\_Alloc](#)>

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

Class [\\_\\_gnu\\_cxx::slist](#)<[\\_Tp](#), [\\_Alloc](#)>

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

Module [mathsf](#)

Provide accuracy comparisons on a per-function basis for a small number of targets.

Class [std::basic\\_string](#)<[\\_CharT](#), [\\_Traits](#), [\\_Alloc](#)>

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

Member [std::regex\\_traits](#)<[\\_Ch\\_type](#)>::[transform\\_primary](#) ([\\_Fwd\\_iter \\_\\_first](#), [\\_Fwd\\_iter \\_\\_last](#)) const

Implement this function correctly.

## 3 Topic Documentation

### 3.1 Algorithms

Collaboration diagram for Algorithms:

#### Topics

- [Generalized Numeric operations](#)
- [Mutating](#)
- [Non-Mutating](#)
- [Sorting](#)

#### 3.1.1 Detailed Description

Components for performing algorithmic operations. Includes non-modifying sequence, modifying (mutating) sequence, sorting, searching, merge, partition, heap, set, minima, maxima, and permutation operations.

### 3.1.2 Generalized Numeric operations

Collaboration diagram for Generalized Numeric operations:

#### Functions

- `template<typename _InputIterator, typename _Tp>`

### 3.1.2.1 Detailed Description

### 3.1.2.2 Function Documentation

#### **accumulate()** [1/2]

```
template<typename _InputIterator, typename _Tp>
_Tp std::accumulate (
    _InputIterator __first,
    _InputIterator __last,
    _Tp __init) [inline], [constexpr]
```

Accumulate values in a range.

Accumulates the values in the range `[first,last)` using `operator+()`. The initial value is *init*. The values are processed in order.

**Parameters**

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__init</code>	Starting value to add other values to.

**Returns**

The final sum.

**accumulate()** [2/2]

```
template<typename _InputIterator, typename _Tp, typename _BinaryOperation>
_Tp std::accumulate (
    _InputIterator __first,
    _InputIterator __last,
    _Tp __init,
    _BinaryOperation __binary_op) [inline], [constexpr]
```

Accumulate values in a range with operation.

Accumulates the values in the range `[first,last)` using the function object `__binary_op`. The initial value is `__init`. The values are processed in order.

**Parameters**

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__init</code>	Starting value to add other values to.
<code>__binary_op</code>	Function object to accumulate with.

**Returns**

The final sum.

**adjacent\_difference()** [1/2]

```
template<typename _InputIterator, typename _OutputIterator>
_OutputIterator std::adjacent_difference (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result) [constexpr]
```

Return differences between adjacent values.

Computes the difference between adjacent values in the range `[first,last)` using `operator-()` and writes the result to `__result`.

**Parameters**

<code>__first</code>	Start of input range.
<code>__last</code>	End of input range.
<code>__result</code>	Output sums.

**Returns**

Iterator pointing just beyond the values written to result.

**adjacent\_difference()** [2/2]

```
template<typename _InputIterator, typename _OutputIterator, typename _BinaryOperation>
_OutputIterator std::adjacent_difference (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _BinaryOperation __binary_op)  [constexpr]
```

Return differences between adjacent values.

Computes the difference between adjacent values in the range [`__first`,`__last`) using the function object `__binary_op` and writes the result to `__result`.

**Parameters**

<code>__first</code>	Start of input range.
<code>__last</code>	End of input range.
<code>__result</code>	Output sum.
<code>__binary_op</code>	Function object.

**Returns**

Iterator pointing just beyond the values written to result.

**exclusive\_scan()** [1/2]

```
template<typename _InputIterator, typename _OutputIterator, typename _Tp>
_OutputIterator std::exclusive_scan (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _Tp __init)  [inline], [constexpr]
```

Output the cumulative sum of one range to a second range.

**Parameters**

<code>__first</code>	Start of input range.
<code>__last</code>	End of input range.
<code>__result</code>	Start of output range.
<code>__init</code>	Initial value.

**Returns**

The end of the output range.

Write the cumulative sum (aka prefix sum, aka scan) of the input range to the output range. Each element of the output range contains the running total of all earlier elements (and the initial value), using `std::plus<>` for summation.

This function generates an "exclusive" scan, meaning the Nth element of the output range is the sum of the first N-1 input elements, so the Nth input element is not included.

References [exclusive\\_scan\(\)](#), and [move\(\)](#).

**exclusive\_scan()** [2/2]

```
template<typename _InputIterator, typename _OutputIterator, typename _Tp, typename _Binary↵
Operation>
_OutputIterator std::exclusive_scan (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _Tp __init,
    _BinaryOperation __binary_op) [constexpr]
```

Output the cumulative sum of one range to a second range.

**Parameters**

<code>__first</code>	Start of input range.
<code>__last</code>	End of input range.
<code>__result</code>	Start of output range.
<code>__init</code>	Initial value.
<code>__binary_op</code>	Function to perform summation.

**Returns**

The end of the output range.

Write the cumulative sum (aka prefix sum, aka scan) of the input range to the output range. Each element of the output range contains the running total of all earlier elements (and the initial value), using `binary_op` for summation.

This function generates an "exclusive" scan, meaning the Nth element of the output range is the sum of the first N-1 input elements, so the Nth input element is not included.

References [move\(\)](#).

Referenced by [exclusive\\_scan\(\)](#).

**inclusive\_scan()** [1/3]

```
template<typename _InputIterator, typename _OutputIterator>
_OutputIterator std::inclusive_scan (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result) [inline], [constexpr]
```

Output the cumulative sum of one range to a second range.

**Parameters**

<code>__first</code>	Start of input range.
<code>__last</code>	End of input range.
<code>__result</code>	Start of output range.

**Returns**

The end of the output range.

Write the cumulative sum (aka prefix sum, aka scan) of the input range to the output range. Each element of the output range contains the running total of all earlier elements, using `std::plus<>` for summation.

This function generates an "inclusive" scan, meaning the Nth element of the output range is the sum of the first N input elements, so the Nth input element is included.

References [inclusive\\_scan\(\)](#).

**inclusive\_scan()** [2/3]

```
template<typename _InputIterator, typename _OutputIterator, typename _BinaryOperation>
_OutputIterator std::inclusive_scan (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _BinaryOperation __binary_op) [constexpr]
```

Output the cumulative sum of one range to a second range.

**Parameters**

<code>__first</code>	Start of input range.
<code>__last</code>	End of input range.
<code>__result</code>	Start of output range.
<code>__binary_op</code>	Function to perform summation.

**Returns**

The end of the output range.

Write the cumulative sum (aka prefix sum, aka scan) of the input range to the output range. Each element of the output range contains the running total of all earlier elements, using `binary_op` for summation.

This function generates an "inclusive" scan, meaning the Nth element of the output range is the sum of the first N input elements, so the Nth input element is included.

References [inclusive\\_scan\(\)](#), and [move\(\)](#).

**inclusive\_scan()** [3/3]

```
template<typename _InputIterator, typename _OutputIterator, typename _BinaryOperation, typename _Tp>
_OutputIterator std::inclusive_scan (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _BinaryOperation __binary_op,
    _Tp __init) [constexpr]
```

Output the cumulative sum of one range to a second range.

**Parameters**

<code>__first</code>	Start of input range.
<code>__last</code>	End of input range.
<code>__result</code>	Start of output range.
<code>__binary_op</code>	Function to perform summation.
<code>__init</code>	Initial value.

**Returns**

The end of the output range.

Write the cumulative sum (aka prefix sum, aka scan) of the input range to the output range. Each element of the output range contains the running total of all earlier elements (and the initial value), using `binary_op` for summation.

This function generates an "inclusive" scan, meaning the Nth element of the output range is the sum of the first N input elements, so the Nth input element is included.

Referenced by [inclusive\\_scan\(\)](#), and [inclusive\\_scan\(\)](#).

**inner\_product()** [1/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _Tp>
_Tp std::inner_product (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _Tp __init) [inline], [constexpr]
```

Compute inner product of two ranges.

Starting with an initial value of `__init`, multiplies successive elements from the two ranges and adds each product into the accumulated value using `operator+()`. The values in the ranges are processed in order.

**Parameters**

<code>__first1</code>	Start of range 1.
<code>__last1</code>	End of range 1.
<code>__first2</code>	Start of range 2.
<code>__init</code>	Starting value to add other values to.

**Returns**

The final inner product.

**inner\_product()** [2/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _Tp, typename _BinaryOp1,
typename _BinaryOperation2>
_Tp std::inner_product (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _Tp __init,
    _BinaryOperation1 __binary_op1,
    _BinaryOperation2 __binary_op2) [inline], [constexpr]
```

Compute inner product of two ranges.

Starting with an initial value of `__init`, applies `__binary_op2` to successive elements from the two ranges and accumulates each result into the accumulated value using `__binary_op1`. The values in the ranges are processed in order.

**Parameters**

<code>__first1</code>	Start of range 1.
<code>__last1</code>	End of range 1.
<code>__first2</code>	Start of range 2.
<code>__init</code>	Starting value to add other values to.
<code>__binary_op1</code>	Function object to accumulate with.
<code>__binary_op2</code>	Function object to apply to pairs of input values.

**Returns**

The final inner product.

**iota()**

```
template<typename _ForwardIterator, typename _Tp>
void std::iota (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Tp __value) [constexpr]
```

Create a range of sequentially increasing values.

For each element in the range `[first,last)` assigns `value` and increments `value` as if by `++value`.

**Parameters**

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__value</code>	Starting value.

**Returns**

Nothing.

**partial\_sum()** [1/2]

```
template<typename _InputIterator, typename _OutputIterator>
_OutputIterator std::partial_sum (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result) [constexpr]
```

Return list of partial sums.

Accumulates the values in the range `[first,last)` using the `+` operator. As each successive input value is added into the total, that partial sum is written to `__result`. Therefore, the first value in `__result` is the first value of the input, the second value in `__result` is the sum of the first and second input values, and so on.

**Parameters**

<code>__first</code>	Start of input range.
<code>__last</code>	End of input range.
<code>__result</code>	Output sum.

**Returns**

Iterator pointing just beyond the values written to `__result`.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_parallel\\_random\\_shuffle\\_drs\\_pu\(\)](#), and [\\_\\_gnu\\_parallel::\\_\\_sequential\\_random\\_shuffle\(\)](#).

**partial\_sum()** [2/2]

```
template<typename _InputIterator, typename _OutputIterator, typename _BinaryOperation>
_OutputIterator std::partial_sum (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _BinaryOperation __binary_op) [constexpr]
```

Return list of partial sums.

Accumulates the values in the range `[first,last)` using `__binary_op`. As each successive input value is added into the total, that partial sum is written to `__result`. Therefore, the first value in `__result` is the first value of the input, the second value in `__result` is the sum of the first and second input values, and so on.

**Parameters**

<code>__first</code>	Start of input range.
<code>__last</code>	End of input range.
<code>__result</code>	Output sum.
<code>__binary_op</code>	Function object.

**Returns**

Iterator pointing just beyond the values written to `__result`.

**reduce()** [1/3]

```
template<typename _InputIterator>
iterator_traits< _InputIterator >::value_type std::reduce (
    _InputIterator __first,
    _InputIterator __last) [inline], [constexpr]
```

Calculate reduction of values in a range.

**Parameters**

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

**Returns**

The final sum.

Reduce the values in the range `[first, last)` using addition, with an initial value of `T{}`, where `T` is the iterator's value type. Equivalent to calling `std::reduce(first, last, T{}, std::plus<>())`.

References [reduce\(\)](#).

**reduce()** [2/3]

```
template<typename _InputIterator, typename _Tp>
_Tp std::reduce (
    _InputIterator __first,
    _InputIterator __last,
    _Tp __init) [inline], [constexpr]
```

Calculate reduction of values in a range.

## Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__init</code>	Starting value to add other values to.

## Returns

The final sum.

Reduce the values in the range `[first, last)` using addition. Equivalent to calling `std::reduce(first, last, init, std::plus<>())`.

References [move\(\)](#), and [reduce\(\)](#).

**reduce()** [3/3]

```
template<typename _InputIterator, typename _Tp, typename _BinaryOperation>
_Tp std::reduce (
    _InputIterator __first,
    _InputIterator __last,
    _Tp __init,
    _BinaryOperation __binary_op) [constexpr]
```

Calculate reduction of values in a range.

## Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__init</code>	Starting value to add other values to.
<code>__binary_op</code>	A binary function object.

## Returns

The final sum.

Reduce the values in the range `[first, last)` using a binary operation. The initial value is `init`. The values are not necessarily processed in order.

This algorithm is similar to `std::accumulate` but is not required to perform the operations in order from first to last. For operations that are commutative and associative the result will be the same as for `std::accumulate`, but for other operations (such as floating point arithmetic) the result can be different.

Referenced by [reduce\(\)](#), and [reduce\(\)](#).

**transform\_exclusive\_scan()**

```
template<typename _InputIterator, typename _OutputIterator, typename _Tp, typename _BinaryOperation,
typename _UnaryOperation>
_OutputIterator std::transform_exclusive_scan (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _Tp __init,
    _BinaryOperation __binary_op,
    _UnaryOperation __unary_op) [constexpr]
```

Output the cumulative sum of one range to a second range.

**Parameters**

<code>__first</code>	Start of input range.
<code>__last</code>	End of input range.
<code>__result</code>	Start of output range.
<code>__init</code>	Initial value.
<code>__binary_op</code>	Function to perform summation.
<code>__unary_op</code>	Function to transform elements of the input range.

**Returns**

The end of the output range.

Write the cumulative sum (aka prefix sum, aka scan) of the input range to the output range. Each element of the output range contains the running total of all earlier elements (and the initial value), using `__unary_op` to transform the input elements and using `__binary_op` for summation.

This function generates an "exclusive" scan, meaning the Nth element of the output range is the sum of the first N-1 input elements, so the Nth input element is not included.

References [move\(\)](#).

**transform\_inclusive\_scan()** [1/2]

```
template<typename _InputIterator, typename _OutputIterator, typename _BinaryOperation, typename _UnaryOperation>
_OutputIterator std::transform_inclusive_scan (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _BinaryOperation __binary_op,
    _UnaryOperation __unary_op) [constexpr]
```

Output the cumulative sum of one range to a second range.

## Parameters

<code>__first</code>	Start of input range.
<code>__last</code>	End of input range.
<code>__result</code>	Start of output range.
<code>__binary_op</code>	Function to perform summation.
<code>__unary_op</code>	Function to transform elements of the input range.

## Returns

The end of the output range.

Write the cumulative sum (aka prefix sum, aka scan) of the input range to the output range. Each element of the output range contains the running total of all earlier elements, using `__unary_op` to transform the input elements and using `__binary_op` for summation.

This function generates an "inclusive" scan, meaning the Nth element of the output range is the sum of the first N input elements, so the Nth input element is included.

References [move\(\)](#), and [transform\\_inclusive\\_scan\(\)](#).

**transform\_inclusive\_scan()** [2/2]

```
template<typename _InputIterator, typename _OutputIterator, typename _BinaryOperation, typename ↵
    _UnaryOperation, typename _Tp>
_OutputIterator std::transform_inclusive_scan (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _BinaryOperation __binary_op,
    _UnaryOperation __unary_op,
    _Tp __init) [constexpr]
```

Output the cumulative sum of one range to a second range.

## Parameters

<code>__first</code>	Start of input range.
<code>__last</code>	End of input range.
<code>__result</code>	Start of output range.
<code>__binary_op</code>	Function to perform summation.
<code>__unary_op</code>	Function to transform elements of the input range.
<code>__init</code>	Initial value.

## Returns

The end of the output range.

Write the cumulative sum (aka prefix sum, aka scan) of the input range to the output range. Each element of the output range contains the running total of all earlier elements (and the initial value), using `__unary_op` to transform the input elements and using `__binary_op` for summation.

This function generates an "inclusive" scan, meaning the Nth element of the output range is the sum of the first N input elements, so the Nth input element is included.

Referenced by [transform\\_inclusive\\_scan\(\)](#).

**transform\_reduce()** [1/3]

```
template<typename _InputIterator, typename _Tp, typename _BinaryOperation, typename _Unary↵
Operation>
_Tp std::transform_reduce (
    _InputIterator __first,
    _InputIterator __last,
    _Tp __init,
    _BinaryOperation __binary_op,
    _UnaryOperation __unary_op) [constexpr]
```

Transform the elements of a range and reduce.

**Parameters**

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__init</code>	Starting value to add other values to.
<code>__binary_op</code>	The function used to perform reduction.
<code>__unary_op</code>	The function used to transform values from the range.

**Returns**

The final sum.

Call `unary_op(first[n])` for each `n` in `[0, last-first)` and then use `binary_op` to reduce the values returned by `unary_op` to a single value of type `T`.

**transform\_reduce()** [2/3]

```
template<typename _InputIterator1, typename _InputIterator2, typename _Tp>
_Tp std::transform_reduce (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _Tp __init) [inline], [constexpr]
```

Combine elements from two ranges and reduce.

**Parameters**

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__init</code>	Starting value to add other values to.

**Returns**

The final sum.

Call `first1[n]*first2[n]` for each `n` in `[0, last1-first1)` and then use addition to sum those products to a single value of type `T`.

The range beginning at `first2` must contain at least `last1-first1` elements.

References [move\(\)](#), and [transform\\_reduce\(\)](#).

**transform\_reduce()** [3/3]

```
template<typename _InputIterator1, typename _InputIterator2, typename _Tp, typename _Binary↵
Operation1, typename _BinaryOperation2>
_Tp std::transform_reduce (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _Tp __init,
    _BinaryOperation1 __binary_op1,
    _BinaryOperation2 __binary_op2) [constexpr]
```

Combine elements from two ranges and reduce.

**Parameters**

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__init</code>	Starting value to add other values to.
<code>__binary_op1</code>	The function used to perform reduction.
<code>__binary_op2</code>	The function used to combine values from the ranges.

**Returns**

The final sum.

Call `binary_op2(first1[n], first2[n])` for each `n` in `[0, last1-first1)` and then use `binary_op1` to reduce the values returned by `binary_op2` to a single value of type `T`.

The range beginning at `first2` must contain at least `last1-first1` elements.

Referenced by [transform\\_reduce\(\)](#).

### 3.1.3.1 Detailed Description

### 3.1.3.2 Function Documentation

#### `copy()`

```
template<typename _II, typename _OI>
_OOI std::copy (
```

```
__II __first,  
__II __last,  
__OI __result) [inline], [constexpr]
```

Copies the range [first,last) into result.

#### Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.

#### Returns

`result + (last - first)`

This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling). Result may not be contained within [first,last); the `copy_backward` function should be used instead.

Note that the end of the output range is permitted to be contained within [first,last).

### **copy\_backward()**

```
template<typename _BI1, typename _BI2>  
_BI2 std::copy_backward (  
    _BI1 __first,  
    _BI1 __last,  
    _BI2 __result) [inline], [constexpr]
```

Copies the range [first,last) into result.

#### Parameters

<code>__first</code>	A bidirectional iterator.
<code>__last</code>	A bidirectional iterator.
<code>__result</code>	A bidirectional iterator.

#### Returns

`result - (last - first)`

The function has the same effect as `copy`, but starts at the end of the range and works its way to the start, returning the start of the result. This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling).

Result may not be in the range (first,last]. Use `copy` instead. Note that the start of the output range may overlap [first,last).

**copy\_if()**

```
template<typename _InputIterator, typename _OutputIterator, typename _Predicate>
_OutputIterator std::copy_if (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _Predicate __pred) [constexpr]
```

Copy the elements of a sequence for which a predicate is true.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__pred</code>	A predicate.

**Returns**

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first,__last)` for which `__pred` returns true to the range beginning at `__result`.

`copy_if()` is stable, so the relative order of elements that are copied is unchanged.

**copy\_n()**

```
template<typename _InputIterator, typename _Size, typename _OutputIterator>
_OutputIterator std::copy_n (
    _InputIterator __first,
    _Size __n,
    _OutputIterator __result) [inline], [constexpr]
```

Copies the range `[first,first+n)` into `[result,result+n)`.

**Parameters**

<code>__first</code>	An input iterator.
<code>__n</code>	The number of elements to copy.
<code>__result</code>	An output iterator.

**Returns**

`result+n`.

This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling).

References [move\(\)](#).

**fill()**

```
template<typename _ForwardIterator, typename _Tp>
void std::fill (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __value) [inline], [constexpr]
```

Fills the range [first,last) with copies of value.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__value</code>	A reference-to-const of arbitrary type.

**Returns**

Nothing.

This function fills a range with copies of the same value. For char types filling contiguous areas of memory, this becomes an inline call to `memset` or `wmemset`.

**fill\_n()**

```
template<typename _OI, typename _Size, typename _Tp>
_OI std::fill_n (
    _OI __first,
    _Size __n,
    const _Tp & __value) [inline], [constexpr]
```

Fills the range [first,first+n) with copies of value.

**Parameters**

<code>__first</code>	An output iterator.
<code>__n</code>	The count of copies to perform.
<code>__value</code>	A reference-to-const of arbitrary type.

**Returns**

The iterator at first+n.

This function fills a range with copies of the same value. For char types filling contiguous areas of memory, this becomes an inline call to `memset` or `wmemset`.

If `__n` is negative, the function does nothing.

References [\\_\\_iterator\\_category\(\)](#).

**generate()**

```
template<typename _ForwardIterator, typename _Generator>
void std::generate (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Generator __gen) [constexpr]
```

Assign the result of a function object to each value in a sequence.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__gen</code>	A function object callable with no arguments.

**Returns**

`generate()` returns no value.

Performs the assignment `*i = __gen()` for each `i` in the range `[__first, __last)`.

**generate\_n()**

```
template<typename _OutputIterator, typename _Size, typename _Generator>
_OutputIterator std::generate_n (
    _OutputIterator __first,
    _Size __n,
    _Generator __gen) [constexpr]
```

Assign the result of a function object to each value in a sequence.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__n</code>	The length of the sequence.
<code>__gen</code>	A function object callable with no arguments.

**Returns**

The end of the sequence, i.e., `__first + __n`

Performs the assignment `*i = __gen()` for each `i` in the range `[__first, __first + __n)`.

If `__n` is negative, the function does nothing and returns `__first`.

**is\_partitioned()**

```
template<typename _InputIterator, typename _Predicate>
bool std::is_partitioned (
    _InputIterator __first,
    _InputIterator __last,
    _Predicate __pred) [inline], [nodiscard], [constexpr]
```

Checks whether the sequence is partitioned.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

**Returns**

True if the range `[__first,__last)` is partitioned by `__pred`, i.e. if all elements that satisfy `__pred` appear before those that do not.

**iter\_swap()**

```
template<typename _ForwardIterator1, typename _ForwardIterator2>
void std::iter_swap (
    _ForwardIterator1 __a,
    _ForwardIterator2 __b) [inline], [constexpr]
```

Swaps the contents of two iterators.

**Parameters**

<code>↔ __a</code>	An iterator.
<code>↔ __b</code>	Another iterator.

**Returns**

Nothing.

This function swaps the values pointed to by two iterators, not the iterators themselves.

**move()**

```
template<typename _II, typename _OI>
_OI std::move (
    _II __first,
    _II __last,
    _OI __result) [inline], [constexpr]
```

Moves the range `[first,last)` into result.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.

**Returns**

result + (last - first)

This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling). Result may not be contained within `[first,last)`; the `move_backward` function should be used instead.

Note that the end of the output range is permitted to be contained within `[first,last)`.

**move\_backward()**

```
template<typename _BI1, typename _BI2>
_BI2 std::move_backward (
    _BI1 __first,
    _BI1 __last,
    _BI2 __result) [inline], [constexpr]
```

Moves the range `[first,last)` into `result`.

**Parameters**

<code>__first</code>	A bidirectional iterator.
<code>__last</code>	A bidirectional iterator.
<code>__result</code>	A bidirectional iterator.

**Returns**

result - (last - first)

The function has the same effect as `move`, but starts at the end of the range and works its way to the start, returning the start of the result. This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling).

Result may not be in the range `(first,last]`. Use `move` instead. Note that the start of the output range may overlap `[first,last)`.

**partition()**

```
template<typename _ForwardIterator, typename _Predicate>
_FowardIterator std::partition (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Predicate __pred) [inline], [constexpr]
```

Move elements for which a predicate is true to the beginning of a sequence.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__pred</code>	A predicate functor.

**Returns**

An iterator `middle` such that `__pred(i)` is true for each iterator `i` in the range `[__first, middle)` and false for each `i` in the range `[middle, __last)`.

`__pred` must not modify its operand. `partition()` does not preserve the relative ordering of elements in each group, use `stable_partition()` if this is needed.

References [\\_\\_iterator\\_category\(\)](#), and [\\_\\_partition\(\)](#).

**partition\_copy()**

```
template<typename _InputIterator, typename _OutputIterator1, typename _OutputIterator2, typename
_Predicate>
pair< _OutputIterator1, _OutputIterator2 > std::partition_copy (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator1 __out_true,
    _OutputIterator2 __out_false,
    _Predicate __pred) [constexpr]
```

Copy the elements of a sequence to separate output sequences depending on the truth value of a predicate.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__out_true</code>	An output iterator.
<code>__out_false</code>	An output iterator.
<code>__pred</code>	A predicate.

**Returns**

A pair designating the ends of the resulting sequences.

Copies each element in the range `[__first,__last)` for which `__pred` returns true to the range beginning at `out_true` and each element for which `__pred` returns false to `__out_false`.

**partition\_point()**

```
template<typename _ForwardIterator, typename _Predicate>
_FowardIterator std::partition_point (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Predicate __pred) [nodiscard], [constexpr]
```

Find the partition point of a partitioned range.

## Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__pred</code>	A predicate.

## Returns

An iterator `mid` such that `all_of(__first, mid, __pred)` and `none_of(mid, __last, __pred)` are both true.

References [advance\(\)](#), and [distance\(\)](#).

**random\_shuffle()** [1/2]

```
template<typename _RandomAccessIterator>
void std::random_shuffle (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last) [inline]
```

Randomly shuffle the elements of a sequence.

## Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.

## Returns

Nothing.

Reorder the elements in the range `[__first, __last)` using a random distribution, so that every possible ordering of the sequence is equally likely.

**Deprecated** Since C++17, `std::random_shuffle` is not part of the C++ standard. Use `std::shuffle` instead, which was introduced in C++11.

**random\_shuffle()** [2/2]

```
template<typename _RandomAccessIterator, typename _RandomNumberGenerator>
void std::random_shuffle (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _RandomNumberGenerator && __rand)
```

Shuffle the elements of a sequence using a random number generator.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__rand</code>	The RNG functor or function.

**Returns**

Nothing.

Reorders the elements in the range `[__first, __last)` using `__rand` to provide a random distribution. Calling `__rand(N)` for a positive integer `N` should return a randomly chosen integer from the range `[0, N)`.

**Deprecated** Since C++17, `std::random_shuffle` is not part of the C++ standard. Use `std::shuffle` instead, which was introduced in C++11.

**remove()**

```
template<typename _ForwardIterator, typename _Tp>
_FowardIterator std::remove (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __value) [inline], [nodiscard], [constexpr]
```

Remove elements from a sequence.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__value</code>	The value to be removed.

**Returns**

An iterator designating the end of the resulting sequence.

All elements equal to `__value` are removed from the range `[__first, __last)`.

`remove()` is stable, so the relative order of elements that are not removed is unchanged.

Elements between the end of the resulting sequence and `__last` are still present, but their value is unspecified.

**remove\_copy()**

```
template<typename _InputIterator, typename _OutputIterator, typename _Tp>
_OutputIterator std::remove_copy (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    const _Tp & __value) [inline], [constexpr]
```

Copy a sequence, removing elements of a given value.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__value</code>	The value to be removed.

## Returns

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first,__last)` not equal to `__value` to the range beginning at `__result`. `remove_copy()` is stable, so the relative order of elements that are copied is unchanged.

**remove\_copy\_if()**

```
template<typename _InputIterator, typename _OutputIterator, typename _Predicate>
_OutputIterator std::remove_copy_if (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _Predicate __pred) [inline], [constexpr]
```

Copy a sequence, removing elements for which a predicate is true.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__pred</code>	A predicate.

## Returns

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first,__last)` for which `__pred` returns false to the range beginning at `__result`. `remove_copy_if()` is stable, so the relative order of elements that are copied is unchanged.

**remove\_if()**

```
template<typename _ForwardIterator, typename _Predicate>
_FowardIterator std::remove_if (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Predicate __pred) [inline], [nodiscard], [constexpr]
```

Remove elements from a sequence using a predicate.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__pred</code>	A predicate.

**Returns**

An iterator designating the end of the resulting sequence.

All elements for which `__pred` returns true are removed from the range `[__first,__last)`.

`remove_if()` is stable, so the relative order of elements that are not removed is unchanged.

Elements between the end of the resulting sequence and `__last` are still present, but their value is unspecified.

**replace()**

```
template<typename _ForwardIterator, typename _Tp>
void std::replace (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __old_value,
    const _Tp & __new_value) [constexpr]
```

Replace each occurrence of one value in a sequence with another value.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__old_value</code>	The value to be replaced.
<code>__new_value</code>	The replacement value.

**Returns**

`replace()` returns no value.

For each iterator `i` in the range `[__first,__last)` if `*i == __old_value` then the assignment `*i = __new_value` is performed.

**replace\_copy\_if()**

```
template<typename _InputIterator, typename _OutputIterator, typename _Predicate, typename _Tp>
_OutputIterator std::replace_copy_if (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _Predicate __pred,
    const _Tp & __new_value) [inline], [constexpr]
```

Copy a sequence, replacing each value for which a predicate returns true with another value.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__pred</code>	A predicate.
<code>__new_value</code>	The replacement value.

**Returns**

The end of the output sequence, `__result+(__last-__first)`.

Copies each element in the range `[__first,__last)` to the range `[__result,__result+(__last-__first))` replacing elements for which `__pred` returns true with `__new_value`.

**replace\_if()**

```
template<typename _ForwardIterator, typename _Predicate, typename _Tp>
void std::replace_if (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Predicate __pred,
    const _Tp & __new_value) [constexpr]
```

Replace each value in a sequence for which a predicate returns true with another value.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__pred</code>	A predicate.
<code>__new_value</code>	The replacement value.

**Returns**

`replace_if()` returns no value.

For each iterator `i` in the range `[__first,__last)` if `__pred(*i)` is true then the assignment `*i = __new_value` is performed.

**reverse()**

```
template<typename _BidirectionalIterator>
void std::reverse (
    _BidirectionalIterator __first,
    _BidirectionalIterator __last) [inline], [constexpr]
```

Reverse a sequence.

**Parameters**

<code>__first</code>	A bidirectional iterator.
<code>__last</code>	A bidirectional iterator.

**Returns**

`reverse()` returns no value.

Reverses the order of the elements in the range `[__first, __last)`, so that the first element becomes the last etc. For every `i` such that  $0 \leq i < (\text{__last} - \text{__first})/2$ , `reverse()` swaps `*(__first+i)` and `*(__last-(i+1))`

References [\\_\\_iterator\\_category\(\)](#), and [\\_\\_reverse\(\)](#).

**reverse\_copy()**

```
template<typename _BidirectionalIterator, typename _OutputIterator>
_OutputIterator std::reverse_copy (
    _BidirectionalIterator __first,
    _BidirectionalIterator __last,
    _OutputIterator __result) [constexpr]
```

Copy a sequence, reversing its elements.

**Parameters**

<code>__first</code>	A bidirectional iterator.
<code>__last</code>	A bidirectional iterator.
<code>__result</code>	An output iterator.

**Returns**

An iterator designating the end of the resulting sequence.

Copies the elements in the range `[__first, __last)` to the range `[__result, __result+(__last-__first))` such that the order of the elements is reversed. For every `i` such that  $0 \leq i < (\text{__last} - \text{__first})$ , `reverse_copy()` performs the assignment `*(__result+(__last-__first)-1-i) = *(__first+i)`. The ranges `[__first, __last)` and `[__result, __result+(__last-__first))` must not overlap.

**rotate()**

```
template<typename _ForwardIterator>
_FowardIterator std::rotate (
    _ForwardIterator __first,
    _ForwardIterator __middle,
    _ForwardIterator __last) [inline], [constexpr]
```

Rotate the elements of a sequence.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__middle</code>	A forward iterator.
<code>__last</code>	A forward iterator.

**Returns**

`first + (last - middle).`

Rotates the elements of the range `[__first, __last)` by `(__middle - __first)` positions so that the element at `__middle` is moved to `__first`, the element at `__middle+1` is moved to `__first+1` and so on for each element in the range `[__first, __last)`.

This effectively swaps the ranges `[__first, __middle)` and `[__middle, __last)`.

Performs `*(__first+(n+(__last-__middle))%(__last-__first))=*(__first+n)` for each `n` in the range `[0, __last-__first)`.

References [\\_\\_iterator\\_category\(\)](#), and [\\_\\_rotate\(\)](#).

**rotate\_copy()**

```
template<typename _ForwardIterator, typename _OutputIterator>
_OutputIterator std::rotate_copy (
    _ForwardIterator __first,
    _ForwardIterator __middle,
    _ForwardIterator __last,
    _OutputIterator __result) [inline], [constexpr]
```

Copy a sequence, rotating its elements.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__middle</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__result</code>	An output iterator.

**Returns**

An iterator designating the end of the resulting sequence.

Copies the elements of the range `[__first, __last)` to the range beginning at

**Returns**

, rotating the copied elements by `(__middle-__first)` positions so that the element at `__middle` is moved to `↔ __result`, the element at `__middle+1` is moved to `__result+1` and so on for each element in the range `[__first, __last)`.

Performs `*(__result+(n+(__last-__middle))%(__last-__first))=*(__first+n)` for each `n` in the range `[0, __last-__first)`.

**shuffle()**

```
template<typename _RandomAccessIterator, typename _UniformRandomNumberGenerator>
void std::shuffle (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _UniformRandomNumberGenerator && __g)
```

Shuffle the elements of a sequence using a uniform random number generator.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__g</code>	A <code>UniformRandomNumberGenerator</code> (26.5.1.3).

**Returns**

Nothing.

Reorders the elements in the range `[__first,__last)` using `__g` to provide random numbers.

References [\\_\\_gen\\_two\\_uniform\\_ints\(\)](#), [std::pair<\\_T1,\\_T2>::first](#), and [std::pair<\\_T1,\\_T2>::second](#).

**stable\_partition()**

```
template<typename _ForwardIterator, typename _Predicate>
_FowardIterator std::stable_partition (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Predicate __pred) [inline]
```

Move elements for which a predicate is true to the beginning of a sequence, preserving relative ordering.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__pred</code>	A predicate functor.

**Returns**

An iterator `middle` such that `__pred(i)` is true for each iterator `i` in the range `[first,middle)` and false for each `i` in the range `[middle,last)`.

Performs the same function as `partition()` with the additional guarantee that the relative ordering of elements in each group is preserved, so any two elements `x` and `y` in the range `[__first,__last)` such that `__pred(x) == __pred(y)` will have the same relative ordering after calling `stable_partition()`.

**swap\_ranges()**

```
template<typename _ForwardIterator1, typename _ForwardIterator2>
_FForwardIterator2 std::swap_ranges (
    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2) [constexpr]
```

Swap the elements of two sequences.

**Parameters**

<code>__first1</code>	A forward iterator.
<code>__last1</code>	A forward iterator.
<code>__first2</code>	A forward iterator.

**Returns**

An iterator equal to `first2+(last1-first1)`.

Swaps each element in the range `[first1,last1)` with the corresponding element in the range `[first2,(last1-first1))`. The ranges must not overlap.

**transform()** [1/2]

```
template<typename _InputIterator, typename _OutputIterator, typename _UnaryOperation>
_OutputIterator std::transform (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _UnaryOperation __unary_op) [constexpr]
```

Perform an operation on a sequence.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__unary_op</code>	A unary operator.

**Returns**

An output iterator equal to `__result+(__last-__first)`.

Applies the operator to each element in the input range and assigns the results to successive elements of the output sequence. Evaluates `*(__result+N)=unary_op(*(__first+N))` for each `N` in the range `[0,__last-__first)`.

`unary_op` must not alter its argument.

**transform()** [2/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename _BinaryOperation>
_OutputIterator std::transform (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _OutputIterator __result,
    _BinaryOperation __binary_op) [constexpr]
```

Perform an operation on corresponding elements of two sequences.

**Parameters**

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__binary_op</code>	A binary operator.

**Returns**

An output iterator equal to `result+(last-first)`.

Applies the operator to the corresponding elements in the two input ranges and assigns the results to successive elements of the output sequence. Evaluates `(__result+N)=__binary_op(*(__first1+N), (__first2+N))` for each `N` in the range `[0, __last1-__first1)`.

`binary_op` must not alter either of its arguments.

**unique()** [1/2]

```
template<typename _ForwardIterator>
_FowardIterator std::unique (
    _ForwardIterator __first,
    _ForwardIterator __last) [inline], [nodiscard], [constexpr]
```

Remove consecutive duplicate values from a sequence.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.

**Returns**

An iterator designating the end of the resulting sequence.

Removes all but the first element from each group of consecutive values that compare equal. `unique()` is stable, so the relative order of elements that are not removed is unchanged. Elements between the end of the resulting sequence and `__last` are still present, but their value is unspecified.

**unique()** [2/2]

```
template<typename _ForwardIterator, typename _BinaryPredicate>
_FForwardIterator std::unique (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _BinaryPredicate __binary_pred) [inline], [nodiscard], [constexpr]
```

Remove consecutive values from a sequence using a predicate.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__binary_pred</code>	A binary predicate.

**Returns**

An iterator designating the end of the resulting sequence.

Removes all but the first element from each group of consecutive values for which `__binary_pred` returns true. `unique()` is stable, so the relative order of elements that are not removed is unchanged. Elements between the end of the resulting sequence and `__last` are still present, but their value is unspecified.

**unique\_copy()** [1/2]

```
template<typename _InputIterator, typename _OutputIterator>
_OutputIterator std::unique_copy (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result) [inline], [constexpr]
```

Copy a sequence, removing consecutive duplicate values.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.

**Returns**

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first, __last)` to the range beginning at `__result`, except that only the first element is copied from groups of consecutive elements that compare equal. `unique_copy()` is stable, so the relative order of elements that are copied is unchanged.

**unique\_copy()** [2/2]

```
template<typename _InputIterator, typename _OutputIterator, typename _BinaryPredicate>
_OutputIterator std::unique_copy (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    _BinaryPredicate __binary_pred) [inline], [constexpr]
```

Copy a sequence, removing consecutive values using a predicate.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__binary_pred</code>	A binary predicate.

**Returns**

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first, __last)` to the range beginning at `__result`, except that only the first element is copied from groups of consecutive elements for which `__binary_pred` returns true. `unique_copy()` is stable, so the relative order of elements that are copied is unchanged.

### 3.1.4.1 Detailed Description

### 3.1.4.2 Function Documentation

#### `adjacent_find()` [1/2]

```
template<typename _ForwardIterator>
_FowardIterator std::adjacent_find (
    _ForwardIterator __first,
    _ForwardIterator __last) [inline], [nodiscard], [constexpr]
```

Find two adjacent values in a sequence that are equal.

#### Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.

#### Returns

The first iterator `i` such that `i` and `i+1` are both valid iterators in `[__first, __last)` and such that `*i == *(i+1)`, or `__last` if no such iterator exists.

**adjacent\_find()** [2/2]

```
template<typename _ForwardIterator, typename _BinaryPredicate>
_FForwardIterator std::adjacent_find (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _BinaryPredicate __binary_pred) [inline], [nodiscard], [constexpr]
```

Find two adjacent values in a sequence using a predicate.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__binary_pred</code>	A binary predicate.

**Returns**

The first iterator `i` such that `i` and `i+1` are both valid iterators in `[__first,__last)` and such that `__binary_pred(*i,*i+1)` is true, or `__last` if no such iterator exists.

**all\_of()**

```
template<typename _InputIterator, typename _Predicate>
bool std::all_of (
    _InputIterator __first,
    _InputIterator __last,
    _Predicate __pred) [inline], [nodiscard], [constexpr]
```

Checks that a predicate is true for all the elements of a sequence.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

**Returns**

True if the check is true, false otherwise.

Returns true if `__pred` is true for each element in the range `[__first,__last)`, and false otherwise.

**any\_of()**

```
template<typename _InputIterator, typename _Predicate>
bool std::any_of (
    _InputIterator __first,
    _InputIterator __last,
    _Predicate __pred) [inline], [nodiscard], [constexpr]
```

Checks that a predicate is true for at least one element of a sequence.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

**Returns**

True if the check is true, false otherwise.

Returns true if an element exists in the range `[__first,__last)` such that `__pred` is true, and false otherwise.

**count()**

```
template<typename _InputIterator, typename _Tp>
iterator_traits< _InputIterator >::difference_type std::count (
    _InputIterator __first,
    _InputIterator __last,
    const _Tp & __value) [inline], [nodiscard], [constexpr]
```

Count the number of copies of a value in a sequence.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__value</code>	The value to be counted.

**Returns**

The number of iterators `i` in the range `[__first,__last)` for which `*i == __value`

**count\_if()**

```
template<typename _InputIterator, typename _Predicate>
iterator_traits< _InputIterator >::difference_type std::count_if (
    _InputIterator __first,
    _InputIterator __last,
    _Predicate __pred) [inline], [nodiscard], [constexpr]
```

Count the elements of a sequence for which a predicate is true.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

**Returns**

The number of iterators `i` in the range `[__first,__last)` for which `__pred(*i)` is true.

**equal()** [1/4]

```
template<typename _II1, typename _II2>
bool std::equal (
    _II1 __first1,
    _II1 __last1,
    _II2 __first2) [inline], [nodiscard], [constexpr]
```

Tests a range for element-wise equality.

**Parameters**

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.

**Returns**

A boolean true or false.

This compares the elements of two ranges using `==` and returns true or false depending on whether all of the corresponding elements of the ranges are equal.

**equal()** [2/4]

```
template<typename _II1, typename _II2>
bool std::equal (
    _II1 __first1,
    _II1 __last1,
    _II2 __first2,
    _II2 __last2) [inline], [nodiscard], [constexpr]
```

Tests a range for element-wise equality.

**Parameters**

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.

**Returns**

A boolean true or false.

This compares the elements of two ranges using `==` and returns true or false depending on whether all of the corresponding elements of the ranges are equal.

**equal()** [3/4]

```
template<typename _IIter1, typename _IIter2, typename _BinaryPredicate>
bool std::equal (
    _IIter1 __first1,
    _IIter1 __last1,
    _IIter2 __first2,
    _BinaryPredicate __binary_pred) [inline], [nodiscard], [constexpr]
```

Tests a range for element-wise equality.

**Parameters**

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__binary_pred</code>	A binary predicate <a href="#">functor</a> .

**Returns**

A boolean true or false.

This compares the elements of two ranges using the `binary_pred` parameter, and returns true or false depending on whether all of the corresponding elements of the ranges are equal.

**equal()** [4/4]

```
template<typename _IIter1, typename _IIter2, typename _BinaryPredicate>
bool std::equal (
    _IIter1 __first1,
    _IIter1 __last1,
    _IIter2 __first2,
    _IIter2 __last2,
    _BinaryPredicate __binary_pred) [inline], [nodiscard], [constexpr]
```

Tests a range for element-wise equality.

**Parameters**

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.
<code>__binary_pred</code>	A binary predicate <a href="#">functor</a> .

**Returns**

A boolean true or false.

This compares the elements of two ranges using the `binary_pred` parameter, and returns true or false depending on whether all of the corresponding elements of the ranges are equal.

**find()**

```
template<typename _InputIterator, typename _Tp>
_InputIterator std::find (
    _InputIterator __first,
    _InputIterator __last,
    const _Tp & __val) [inline], [nodiscard], [constexpr]
```

Find the first occurrence of a value in a sequence.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__val</code>	The value to find.

**Returns**

The first iterator `i` in the range `[__first,__last)` such that `*i == __val`, or `__last` if no such iterator exists.

References to [\\_address\(\)](#).

**find\_end()** [1/2]

```
template<typename _ForwardIterator1, typename _ForwardIterator2>
_FowardIterator1 std::find_end (
    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2,
    _ForwardIterator2 __last2) [inline], [nodiscard], [constexpr]
```

Find last matching subsequence in a sequence.

**Parameters**

<code>__first1</code>	Start of range to search.
<code>__last1</code>	End of range to search.
<code>__first2</code>	Start of sequence to match.
<code>__last2</code>	End of sequence to match.

**Returns**

The last iterator `i` in the range `[__first1,__last1-(__last2-__first2))` such that `*(i+N) == *(__first2+N)` for each `N` in the range `[0,__last2-__first2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1,__last1)` for a sub-sequence that compares equal value-by-value with the sequence given by `[__first2,__last2)` and returns an iterator to the `__first` element of the sub-sequence, or `__last1` if the sub-sequence is not found. The sub-sequence will be the last such subsequence contained in `[__first1,__last1)`.

Because the sub-sequence must lie completely within the range `[__first1,__last1)` it must start at a position less than `__last1-(__last2-__first2)` where `__last2-__first2` is the length of the sub-sequence. This means that the returned iterator `i` will be in the range `[__first1,__last1-(__last2-__first2))`

**find\_end()** [2/2]

```
template<typename _ForwardIterator1, typename _ForwardIterator2, typename _BinaryPredicate>
_FForwardIterator1 std::find_end (
    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2,
    _ForwardIterator2 __last2,
    _BinaryPredicate __comp) [inline], [nodiscard], [constexpr]
```

Find last matching subsequence in a sequence using a predicate.

**Parameters**

<code>__first1</code>	Start of range to search.
<code>__last1</code>	End of range to search.
<code>__first2</code>	Start of sequence to match.
<code>__last2</code>	End of sequence to match.
<code>__comp</code>	The predicate to use.

**Returns**

The last iterator `i` in the range `[__first1, __last1-(__last2-__first2))` such that `predicate(*(i+N), (__first2+N))` is true for each `N` in the range `[0, __last2-__first2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for a sub-sequence that compares equal value-by-value with the sequence given by `[__first2, __last2)` using `comp` as a predicate and returns an iterator to the first element of the sub-sequence, or `__last1` if the sub-sequence is not found. The sub-sequence will be the last such subsequence contained in `[__first, __last1)`.

Because the sub-sequence must lie completely within the range `[__first1, __last1)` it must start at a position less than `__last1-(__last2-__first2)` where `__last2-__first2` is the length of the sub-sequence. This means that the returned iterator `i` will be in the range `[__first1, __last1-(__last2-__first2))`.

**find\_first\_of()** [1/2]

```
template<typename _InputIterator, typename _ForwardIterator>
_InputIterator std::find_first_of (
    _InputIterator __first1,
    _InputIterator __last1,
    _ForwardIterator __first2,
    _ForwardIterator __last2) [nodiscard], [constexpr]
```

Find element from a set in a sequence.

**Parameters**

<code>__first1</code>	Start of range to search.
<code>__last1</code>	End of range to search.
<code>__first2</code>	Start of match candidates.
<code>__last2</code>	End of match candidates.

**Returns**

The first iterator `i` in the range `[__first1, __last1)` such that `*i == *(i2)` such that `i2` is an iterator in `[__first2, __last2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for an element that is equal to some element in the range `[__first2, __last2)`. If found, returns an iterator in the range `[__first1, __last1)`, otherwise returns `__last1`.

**find\_first\_of()** [2/2]

```
template<typename _InputIterator, typename _ForwardIterator, typename _BinaryPredicate>
_InputIterator std::find_first_of (
    _InputIterator __first1,
    _InputIterator __last1,
    _ForwardIterator __first2,
    _ForwardIterator __last2,
    _BinaryPredicate __comp) [nodiscard], [constexpr]
```

Find element from a set in a sequence using a predicate.

**Parameters**

<code>__first1</code>	Start of range to search.
<code>__last1</code>	End of range to search.
<code>__first2</code>	Start of match candidates.
<code>__last2</code>	End of match candidates.
<code>__comp</code>	Predicate to use.

**Returns**

The first iterator `i` in the range `[__first1, __last1)` such that `comp(*i, *(i2))` is true and `i2` is an iterator in `[__first2, __last2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for an element that is equal to some element in the range `[__first2, __last2)`. If found, returns an iterator in the range `[__first1, __last1)`, otherwise returns `__last1`.

**find\_if()**

```
template<typename _InputIterator, typename _Predicate>
_InputIterator std::find_if (
    _InputIterator __first,
    _InputIterator __last,
    _Predicate __pred) [inline], [nodiscard], [constexpr]
```

Find the first element in a sequence for which a predicate is true.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

**Returns**

The first iterator `i` in the range `[__first,__last)` such that `__pred(*i)` is true, or `__last` if no such iterator exists.

**find\_if\_not()**

```
template<typename _InputIterator, typename _Predicate>
_InputIterator std::find_if_not (
    _InputIterator __first,
    _InputIterator __last,
    _Predicate __pred)  [inline], [nodiscard], [constexpr]
```

Find the first element in a sequence for which a predicate is false.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

**Returns**

The first iterator `i` in the range `[__first,__last)` such that `__pred(*i)` is false, or `__last` if no such iterator exists.

References [\\_\\_find\\_if\\_not\(\)](#).

**for\_each()**

```
template<typename _InputIterator, typename _Function>
_Function std::for_each (
    _InputIterator __first,
    _InputIterator __last,
    _Function __f)  [constexpr]
```

Apply a function to every element of a sequence.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__f</code>	A unary function object.

## Returns

`__f`

Applies the function object `__f` to each element in the range `[first,last)`. `__f` must not modify the order of the sequence. If `__f` has a return value it is ignored.

**for\_each\_n()**

```
template<typename _InputIterator, typename _Size, typename _Function>
_InputIterator std::for_each_n (
    _InputIterator __first,
    _Size __n,
    _Function __f) [constexpr]
```

Apply a function to every element of a sequence.

## Parameters

<code>__first</code>	An input iterator.
<code>__n</code>	A value convertible to an integer.
<code>__f</code>	A unary function object.

## Returns

`__first+__n`

Applies the function object `__f` to each element in the range `[first, first+n)`. `__f` must not modify the order of the sequence. If `__f` has a return value it is ignored.

References [move\(\)](#).

**is\_permutation()** [1/4]

```
template<typename _ForwardIterator1, typename _ForwardIterator2>
bool std::is_permutation (
    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2) [inline], [constexpr]
```

Checks whether a permutation of the second sequence is equal to the first sequence.

**Parameters**

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.

**Returns**

true if there exists a permutation of the elements in the range `[__first2, __first2 + (__last1 - __first1))`, beginning with `ForwardIterator2` begin, such that `equal(__first1, __last1, begin)` returns true; otherwise, returns false.

**is\_permutation() [2/4]**

```
template<typename _ForwardIterator1, typename _ForwardIterator2, typename _BinaryPredicate>
bool std::is_permutation (
    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2,
    _BinaryPredicate __pred) [inline], [nodiscard], [constexpr]
```

Checks whether a permutation of the second sequence is equal to the first sequence.

**Parameters**

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__pred</code>	A binary predicate.

**Returns**

true if there exists a permutation of the elements in the range `[__first2, __first2 + (__last1 - __first1))`, beginning with `ForwardIterator2` begin, such that `equal(__first1, __last1, __begin, __pred)` returns true; otherwise, returns false.

**is\_permutation() [3/4]**

```
template<typename _ForwardIterator1, typename _ForwardIterator2>
bool std::is_permutation (
    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2,
    _ForwardIterator2 __last2) [inline], [nodiscard], [constexpr]
```

Checks whether a permutaion of the second sequence is equal to the first sequence.

## Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of first range.

## Returns

true if there exists a permutation of the elements in the range `[__first2, __last2)`, beginning with `ForwardIterator2` begin, such that `equal(__first1, __last1, begin)` returns true; otherwise, returns false.

**is\_permutation()** [4/4]

```
template<typename _ForwardIterator1, typename _ForwardIterator2, typename _BinaryPredicate>
bool std::is_permutation (
    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2,
    _ForwardIterator2 __last2,
    _BinaryPredicate __pred) [inline], [nodiscard], [constexpr]
```

Checks whether a permutation of the second sequence is equal to the first sequence.

## Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of first range.
<code>__pred</code>	A binary predicate.

## Returns

true if there exists a permutation of the elements in the range `[__first2, __last2)`, beginning with `ForwardIterator2` begin, such that `equal(__first1, __last1, __begin, __pred)` returns true; otherwise, returns false.

**mismatch()** [1/4]

```
template<typename _InputIterator1, typename _InputIterator2>
pair< _InputIterator1, _InputIterator2 > std::mismatch (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2) [inline], [nodiscard], [constexpr]
```

Finds the places in ranges which don't match.

**Parameters**

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.

**Returns**

A pair of iterators pointing to the first mismatch.

This compares the elements of two ranges using `==` and returns a pair of iterators. The first iterator points into the first range, the second iterator points into the second range, and the elements pointed to by the iterators are not equal.

**mismatch()** [2/4]

```
template<typename _InputIterator1, typename _InputIterator2, typename _BinaryPredicate>
pair< _InputIterator1, _InputIterator2 > std::mismatch (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _BinaryPredicate __binary_pred) [inline], [nodiscard], [constexpr]
```

Finds the places in ranges which don't match.

**Parameters**

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__binary_pred</code>	A binary predicate <a href="#">functor</a> .

**Returns**

A pair of iterators pointing to the first mismatch.

This compares the elements of two ranges using the `binary_pred` parameter, and returns a pair of iterators. The first iterator points into the first range, the second iterator points into the second range, and the elements pointed to by the iterators are not equal.

**mismatch()** [3/4]

```
template<typename _InputIterator1, typename _InputIterator2>
pair< _InputIterator1, _InputIterator2 > std::mismatch (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2) [inline], [nodiscard], [constexpr]
```

Finds the places in ranges which don't match.

## Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.

## Returns

A pair of iterators pointing to the first mismatch.

This compares the elements of two ranges using `==` and returns a pair of iterators. The first iterator points into the first range, the second iterator points into the second range, and the elements pointed to by the iterators are not equal.

**mismatch()** [4/4]

```
template<typename _InputIterator1, typename _InputIterator2, typename _BinaryPredicate>
pair< _InputIterator1, _InputIterator2 > std::mismatch (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _BinaryPredicate __binary_pred) [inline], [nodiscard], [constexpr]
```

Finds the places in ranges which don't match.

## Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.
<code>__binary_pred</code>	A binary predicate <a href="#">functor</a> .

## Returns

A pair of iterators pointing to the first mismatch.

This compares the elements of two ranges using the `binary_pred` parameter, and returns a pair of iterators. The first iterator points into the first range, the second iterator points into the second range, and the elements pointed to by the iterators are not equal.

**none\_of()**

```
template<typename _InputIterator, typename _Predicate>
bool std::none_of (
    _InputIterator __first,
    _InputIterator __last,
    _Predicate __pred) [inline], [nodiscard], [constexpr]
```

Checks that a predicate is false for all the elements of a sequence.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__pred</code>	A predicate.

**Returns**

True if the check is true, false otherwise.

Returns true if `__pred` is false for each element in the range `[__first, __last)`, and false otherwise.

**search()** [1/2]

```
template<typename _ForwardIterator1, typename _ForwardIterator2>
_FForwardIterator1 std::search (
    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2,
    _ForwardIterator2 __last2) [inline], [nodiscard], [constexpr]
```

Search a sequence for a matching sub-sequence.

**Parameters**

<code>__first1</code>	A forward iterator.
<code>__last1</code>	A forward iterator.
<code>__first2</code>	A forward iterator.
<code>__last2</code>	A forward iterator.

**Returns**

The first iterator `i` in the range `[__first1, __last1-(__last2-__first2))` such that `*(i+N) == *(__first2+N)` for each `N` in the range `[0, __last2-__first2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for a sub-sequence that compares equal value-by-value with the sequence given by `[__first2, __last2)` and returns an iterator to the first element of the sub-sequence, or `__last1` if the sub-sequence is not found.

Because the sub-sequence must lie completely within the range `[__first1, __last1)` it must start at a position less than `__last1-(__last2-__first2)` where `__last2-__first2` is the length of the sub-sequence.

This means that the returned iterator `i` will be in the range `[__first1, __last1-(__last2-__first2))`

**search()** [2/2]

```
template<typename _ForwardIterator1, typename _ForwardIterator2, typename _BinaryPredicate>
_FForwardIterator1 std::search (
    _ForwardIterator1 __first1,
    _ForwardIterator1 __last1,
    _ForwardIterator2 __first2,
    _ForwardIterator2 __last2,
    _BinaryPredicate __predicate) [inline], [constexpr]
```

Search a sequence for a matching sub-sequence using a predicate.

## Parameters

<code>__first1</code>	A forward iterator.
<code>__last1</code>	A forward iterator.
<code>__first2</code>	A forward iterator.
<code>__last2</code>	A forward iterator.
<code>__predicate</code>	A binary predicate.

## Returns

The first iterator `i` in the range `[__first1, __last1 - (__last2 - __first2))` such that `__predicate(*(i+N), *(__first2+N))` is true for each `N` in the range `[0, __last2 - __first2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for a sub-sequence that compares equal value-by-value with the sequence given by `[__first2, __last2)`, using `__predicate` to determine equality, and returns an iterator to the first element of the sub-sequence, or `__last1` if no such iterator exists.

## See also

`search(_ForwardIter1, _ForwardIter1, _ForwardIter2, _ForwardIter2)`

**search\_n()** [1/2]

```
template<typename _ForwardIterator, typename _Integer, typename _Tp>
_FowardIterator std::search_n (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Integer __count,
    const _Tp & __val) [inline], [nodiscard], [constexpr]
```

Search a sequence for a number of consecutive values.

## Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__count</code>	The number of consecutive values.
<code>__val</code>	The value to find.

## Returns

The first iterator `i` in the range `[__first, __last - __count)` such that `*(i+N) == __val` for each `N` in the range `[0, __count)`, or `__last` if no such iterator exists.

Searches the range `[__first, __last)` for `count` consecutive elements equal to `__val`.

**search\_n()** [2/2]

```
template<typename _ForwardIterator, typename _Integer, typename _Tp, typename _BinaryPredicate>
_FForwardIterator std::search_n (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Integer __count,
    const _Tp & __val,
    _BinaryPredicate __binary_pred) [inline], [nodiscard], [constexpr]
```

Search a sequence for a number of consecutive values using a predicate.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__count</code>	The number of consecutive values.
<code>__val</code>	The value to find.
<code>__binary_pred</code>	A binary predicate.

**Returns**

The first iterator `i` in the range `[__first, __last - __count)` such that `__binary_pred(*(i+N), __val)` is true for each `N` in the range `[0, __count)`, or `__last` if no such iterator exists.

Searches the range `[__first, __last)` for `__count` consecutive elements for which the predicate returns true.

### 3.1.5.1 Detailed Description

#### 3.1.5.2 Function Documentation

##### clamp() [1/2]

```
template<typename _Tp>
const _Tp & std::clamp (
    const _Tp & __val,
    const _Tp & __lo,
    const _Tp & __hi) [nodiscard], [constexpr]
```

Returns the value clamped between lo and hi.

##### Parameters

<code>__val</code>	A value of arbitrary type.
<code>__lo</code>	A lower limit of arbitrary type.
<code>__hi</code>	An upper limit of arbitrary type.

##### Return values

<code>`__lo`</code>	if <code>__val &lt; __lo</code>
<code>`__hi`</code>	if <code>__hi &lt; __val</code>
<code>`__val`</code>	otherwise.

##### Precondition

`_Tp` is `LessThanComparable` and `(__hi < __lo)` is false.

References [max\(\)](#), and [min\(\)](#).

##### clamp() [2/2]

```
template<typename _Tp, typename _Compare>
const _Tp & std::clamp (
    const _Tp & __val,
    const _Tp & __lo,
    const _Tp & __hi,
    _Compare __comp) [nodiscard], [constexpr]
```

Returns the value clamped between lo and hi.

##### Parameters

<code>__val</code>	A value of arbitrary type.
<code>__lo</code>	A lower limit of arbitrary type.
<code>__hi</code>	An upper limit of arbitrary type.
<code>__comp</code>	A comparison functor.

**Return values**

<code>__lo</code>	if <code>__comp(__val, __lo)</code>
<code>__hi</code>	if <code>__comp(__hi, __val)</code>
<code>__val</code>	otherwise.

**Precondition**

`__comp(__hi, __lo)` is false.

References [max\(\)](#), and [min\(\)](#).

**inplace\_merge()** [1/2]

```
template<typename _BidirectionalIterator>
void std::inplace_merge (
    _BidirectionalIterator __first,
    _BidirectionalIterator __middle,
    _BidirectionalIterator __last) [inline]
```

Merges two sorted ranges in place.

**Parameters**

<code>__first</code>	An iterator.
<code>__middle</code>	Another iterator.
<code>__last</code>	Another iterator.

**Returns**

Nothing.

Merges two sorted and consecutive ranges, `[__first, __middle)` and `[__middle, __last)`, and puts the result in `[__first, __last)`. The output will be sorted. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

If enough additional memory is available, this takes  $(\text{__last} - \text{__first}) - 1$  comparisons. Otherwise an  $N \log N$  algorithm is used, where  $N$  is `distance(__first, __last)`.

**inplace\_merge()** [2/2]

```
template<typename _BidirectionalIterator, typename _Compare>
void std::inplace_merge (
    _BidirectionalIterator __first,
    _BidirectionalIterator __middle,
    _BidirectionalIterator __last,
    _Compare __comp) [inline]
```

Merges two sorted ranges in place.

## Parameters

<code>__first</code>	An iterator.
<code>__middle</code>	Another iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A functor to use for comparisons.

## Returns

Nothing.

Merges two sorted and consecutive ranges, `[__first,__middle)` and `[middle,last)`, and puts the result in `[__first,__last)`. The output will be sorted. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

If enough additional memory is available, this takes  $(\text{__last} - \text{__first}) - 1$  comparisons. Otherwise an  $N \log N$  algorithm is used, where  $N$  is `distance(__first,__last)`.

The comparison function should have the same effects on ordering as the function used for the initial sort.

**is\_sorted()** [1/2]

```
template<typename _ForwardIterator>
bool std::is_sorted (
    _ForwardIterator __first,
    _ForwardIterator __last) [inline], [nodiscard], [constexpr]
```

Determines whether the elements of a sequence are sorted.

## Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.

## Returns

True if the elements are sorted, false otherwise.

**is\_sorted()** [2/2]

```
template<typename _ForwardIterator, typename _Compare>
bool std::is_sorted (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Compare __comp) [inline], [nodiscard], [constexpr]
```

Determines whether the elements of a sequence are sorted according to a comparison functor.

**Parameters**

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

**Returns**

True if the elements are sorted, false otherwise.

**is\_sorted\_until()** [1/2]

```
template<typename _ForwardIterator>
_FowardIterator std::is_sorted_until (
    _ForwardIterator __first,
    _ForwardIterator __last) [inline], [nodiscard], [constexpr]
```

Determines the end of a sorted sequence.

**Parameters**

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.

**Returns**

An iterator pointing to the last iterator `i` in `[__first, __last)` for which the range `[__first, i)` is sorted.

**is\_sorted\_until()** [2/2]

```
template<typename _ForwardIterator, typename _Compare>
_FowardIterator std::is_sorted_until (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Compare __comp) [inline], [nodiscard], [constexpr]
```

Determines the end of a sorted sequence using comparison functor.

**Parameters**

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

**Returns**

An iterator pointing to the last iterator `i` in `[__first, __last)` for which the range `[__first, i)` is sorted.

**lexicographical\_compare()** [1/2]

```
template<typename _II1, typename _II2>
bool std::lexicographical_compare (
    _II1 __first1,
    _II1 __last1,
    _II2 __first2,
    _II2 __last2) [inline], [nodiscard], [constexpr]
```

Performs **dictionary** comparison on ranges.

**Parameters**

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.

**Returns**

A boolean true or false.

*Returns true if the sequence of elements defined by the range `[first1,last1)` is lexicographically less than the sequence of elements defined by the range `[first2,last2)`. Returns false otherwise.* (Quoted from [25.3.8]/1.) If the iterators are all character pointers, then this is an inline call to `memcmp`.

**lexicographical\_compare()** [2/2]

```
template<typename _II1, typename _II2, typename _Compare>
bool std::lexicographical_compare (
    _II1 __first1,
    _II1 __last1,
    _II2 __first2,
    _II2 __last2,
    _Compare __comp) [inline], [nodiscard], [constexpr]
```

Performs **dictionary** comparison on ranges.

**Parameters**

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.
<code>__comp</code>	A <a href="#">comparison functor</a> .

**Returns**

A boolean true or false.

The same as the four-parameter `lexicographical_compare`, but uses the `comp` parameter instead of `<`.

## lexicographical\_compare\_three\_way()

```
template<typename _InputIter1, typename _InputIter2, typename _Comp>
auto std::lexicographical_compare_three_way (
    _InputIter1 __first1,
    _InputIter1 __last1,
    _InputIter2 __first2,
    _InputIter2 __last2,
    _Comp __comp) -> decltype(__comp(*__first1, *__first2))    [nodiscard], [constexpr]
```

Performs dictionary comparison on ranges.

### Parameters

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.
<code>__comp</code>	A <a href="#">comparison functor</a> .

### Returns

The comparison category that `__comp(*__first1, *__first2)` returns.

Referenced by [operator<=>\(\)](#).

## max() [1/2]

```
template<typename _Tp>
const _Tp & std::max (
    const _Tp & __a,
    const _Tp & __b)    [inline], [nodiscard], [constexpr]
```

This does what you think it does.

### Parameters

<code>__a</code>	A thing of arbitrary type.
<code>__b</code>	Another thing of arbitrary type.

### Returns

The greater of the parameters.

This is the simple classic generic implementation. It will work on temporary expressions, since they are only evaluated once, unlike a preprocessor macro.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_find\\_template\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_nth\\_element\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_partial\\_sum\\_linear\\_partition\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_random\\_shuffle\\_drs\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_qsb\\_conquer\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_search\\_template\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_sequential\\_random\\_shuffle\(\)](#), [std::\\_\\_Deque\\_base<\\_Tp, \\_Alloc>::\\_\\_M\\_initialize\\_buckets\(\)](#), [std::deque<\\_Tp, \\_Alloc>::\\_\\_M\\_reallocate\\_map\(\)](#), [clamp\(\)](#), [clamp\(\)](#), [\\_\\_gnu\\_parallel::multiseq\\_partition\(\)](#), [\\_\\_gnu\\_parallel::multiseq\\_select\(\)](#), [std::shuffle\\_order\\_engine<\\_RandomNumberEngine, \\_\\_k>::operator\(\)\(\)](#), and [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::overflow\(\)](#).

**max()** [2/2]

```
template<typename _Tp, typename _Compare>
const _Tp & std::max (
    const _Tp & __a,
    const _Tp & __b,
    _Compare __comp) [inline], [nodiscard], [constexpr]
```

This does what you think it does.

**Parameters**

<code>__a</code>	A thing of arbitrary type.
<code>__b</code>	Another thing of arbitrary type.
<code>__comp</code>	A <a href="#">comparison functor</a> .

**Returns**

The greater of the parameters.

This will work on temporary expressions, since they are only evaluated once, unlike a preprocessor macro.

**max\_element()** [1/2]

```
template<typename _ForwardIterator>
_FowardIterator std::max_element (
    _ForwardIterator __first,
    _ForwardIterator __last) [inline], [nodiscard], [constexpr]
```

Return the maximum element in a range.

**Parameters**

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

**Returns**

Iterator referencing the first instance of the largest value.

**max\_element()** [2/2]

```
template<typename _ForwardIterator, typename _Compare>
_FowardIterator std::max_element (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Compare __comp) [inline], [nodiscard], [constexpr]
```

Return the maximum element in a range using comparison functor.

**Parameters**

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	Comparison functor.

**Returns**

Iterator referencing the first instance of the largest value according to `__comp`.

**merge()** [1/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator>
_OutputIterator std::merge (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result) [inline], [constexpr]
```

Merges two sorted ranges.

**Parameters**

<code>__first1</code>	An iterator.
<code>__first2</code>	Another iterator.
<code>__last1</code>	Another iterator.
<code>__last2</code>	Another iterator.
<code>__result</code>	An iterator pointing to the end of the merged range.

**Returns**

An output iterator equal to `__result + (__last1 - __first1)`

- `(__last2 - __first2)`.

Merges the ranges `[__first1, __last1)` and `[__first2, __last2)` into the sorted range `[__result, __result + (__last1 - __first1) + (__last2 - __first2))`. Both input ranges must be sorted, and the output range must not overlap with either of the input ranges. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

**merge()** [2/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename ↔  
_Compare>  
_OutputIterator std::merge (  
    _InputIterator1 __first1,  
    _InputIterator1 __last1,  
    _InputIterator2 __first2,  
    _InputIterator2 __last2,  
    _OutputIterator __result,  
    _Compare __comp) [inline], [constexpr]
```

Merges two sorted ranges.

**Parameters**

<code>__first1</code>	An iterator.
<code>__first2</code>	Another iterator.
<code>__last1</code>	Another iterator.
<code>__last2</code>	Another iterator.
<code>__result</code>	An iterator pointing to the end of the merged range.
<code>__comp</code>	A functor to use for comparisons.

**Returns**

An output iterator equal to `__result + (__last1 - __first1)`

- `(__last2 - __first2)`.

Merges the ranges `[__first1, __last1)` and `[__first2, __last2)` into the sorted range `[__result, __result + (__last1 - __first1) + (__last2 - __first2))`. Both input ranges must be sorted, and the output range must not overlap with either of the input ranges. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

The comparison function should have the same effects on ordering as the function used for the initial sort.

**min()** [1/2]

```
template<typename _Tp>
const _Tp & std::min (
    const _Tp & __a,
    const _Tp & __b) [inline], [nodiscard], [constexpr]
```

This does what you think it does.

**Parameters**

<code>__a</code>	A thing of arbitrary type.
<code>__b</code>	Another thing of arbitrary type.

**Returns**

The lesser of the parameters.

This is the simple classic generic implementation. It will work on temporary expressions, since they are only evaluated once, unlike a preprocessor macro.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_find\\_template\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_find\\_template\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_for\\_each\\_template\\_random\\_acc](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_partial\\_sum\\_linear\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_random\\_shuffle\\_drs\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\\_qs\\_div](#), [\\_\\_gnu\\_parallel::\\_\\_qsb\\_conquer\(\)](#), [\\_\\_sample\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_search\\_template\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_sequential\\_multiway\\_merge\(\)](#),

**min\_element()** [2/2]

```
template<typename _ForwardIterator, typename _Compare>
_FForwardIterator std::min_element (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Compare __comp) [inline], [nodiscard], [constexpr]
```

Return the minimum element in a range using comparison functor.

**Parameters**

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	Comparison functor.

**Returns**

Iterator referencing the first instance of the smallest value according to `__comp`.

**minmax()** [1/2]

```
template<typename _Tp>
pair< const _Tp &, const _Tp & > std::minmax (
    const _Tp & __a,
    const _Tp & __b) [inline], [nodiscard], [constexpr]
```

Determines min and max at once as an ordered pair.

**Parameters**

<code>__a</code>	A thing of arbitrary type.
<code>__b</code>	Another thing of arbitrary type.

**Returns**

A pair(`__b`, `__a`) if `__b` is smaller than `__a`, pair(`__a`, `__b`) otherwise.

**minmax()** [2/2]

```
template<typename _Tp, typename _Compare>
pair< const _Tp &, const _Tp & > std::minmax (
    const _Tp & __a,
    const _Tp & __b,
    _Compare __comp) [inline], [nodiscard], [constexpr]
```

Determines min and max at once as an ordered pair.

## Parameters

<code>__a</code>	A thing of arbitrary type.
<code>__b</code>	Another thing of arbitrary type.
<code>__comp</code>	A <a href="#">comparison functor</a> .

## Returns

A pair(`__b`, `__a`) if `__b` is smaller than `__a`, pair(`__a`, `__b`) otherwise.

**minmax\_element()** [1/2]

```
template<typename _ForwardIterator>
pair< _ForwardIterator, _ForwardIterator > std::minmax_element (
    _ForwardIterator __first,
    _ForwardIterator __last) [inline], [nodiscard], [constexpr]
```

Return a pair of iterators pointing to the minimum and maximum elements in a range.

## Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

## Returns

make\_pair(`m`, `M`), where `m` is the first iterator `i` in [`__first`, `__last`) such that no other element in the range is smaller, and where `M` is the last iterator `i` in [`__first`, `__last`) such that no other element in the range is larger.

**minmax\_element()** [2/2]

```
template<typename _ForwardIterator, typename _Compare>
pair< _ForwardIterator, _ForwardIterator > std::minmax_element (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Compare __comp) [inline], [nodiscard], [constexpr]
```

Return a pair of iterators pointing to the minimum and maximum elements in a range.

## Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	Comparison functor.

## Returns

make\_pair(`m`, `M`), where `m` is the first iterator `i` in [`__first`, `__last`) such that no other element in the range is smaller, and where `M` is the last iterator `i` in [`__first`, `__last`) such that no other element in the range is larger.

**next\_permutation()** [1/2]

```
template<typename _BidirectionalIterator>
bool std::next_permutation (
    _BidirectionalIterator __first,
    _BidirectionalIterator __last) [inline], [constexpr]
```

Permute range into the next *dictionary* ordering.

**Parameters**

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

**Returns**

False if wrapped to first permutation, true otherwise.

Treats all permutations of the range as a set of *dictionary* sorted sequences. Permutes the current sequence into the next one of this set. Returns true if there are more sequences to generate. If the sequence is the largest of the set, the smallest is generated and false returned.

**next\_permutation()** [2/2]

```
template<typename _BidirectionalIterator, typename _Compare>
bool std::next_permutation (
    _BidirectionalIterator __first,
    _BidirectionalIterator __last,
    _Compare __comp) [inline], [constexpr]
```

Permute range into the next *dictionary* ordering using comparison functor.

**Parameters**

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	A comparison functor.

**Returns**

False if wrapped to first permutation, true otherwise.

Treats all permutations of the range [`__first`,`__last`) as a set of *dictionary* sorted sequences ordered by `__comp`. Permutes the current sequence into the next one of this set. Returns true if there are more sequences to generate. If the sequence is the largest of the set, the smallest is generated and false returned.

**nth\_element()** [1/2]

```
template<typename _RandomAccessIterator>
void std::nth_element (
    _RandomAccessIterator __first,
    _RandomAccessIterator __nth,
    _RandomAccessIterator __last) [inline], [constexpr]
```

Sort a sequence just enough to find a particular position.

## Parameters

<code>__first</code>	An iterator.
<code>__nth</code>	Another iterator.
<code>__last</code>	Another iterator.

## Returns

Nothing.

Rearranges the elements in the range `[__first, __last)` so that `*__nth` is the same element that would have been in that position had the whole sequence been sorted. The elements either side of `*__nth` are not completely sorted, but for any iterator `i` in the range `[__first, __nth)` and any iterator `j` in the range `[__nth, __last)` it holds that `*j < *i` is false.

References [\\_\\_lg\(\)](#).

**nth\_element()** [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
void std::nth_element (
    _RandomAccessIterator __first,
    _RandomAccessIterator __nth,
    _RandomAccessIterator __last,
    _Compare __comp) [inline], [constexpr]
```

Sort a sequence just enough to find a particular position using a predicate for comparison.

## Parameters

<code>__first</code>	An iterator.
<code>__nth</code>	Another iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

## Returns

Nothing.

Rearranges the elements in the range `[__first, __last)` so that `*__nth` is the same element that would have been in that position had the whole sequence been sorted. The elements either side of `*__nth` are not completely sorted, but for any iterator `i` in the range `[__first, __nth)` and any iterator `j` in the range `[__nth, __last)` it holds that `__comp(*j, *i)` is false.

References [\\_\\_lg\(\)](#).

**partial\_sort()** [1/2]

```
template<typename _RandomAccessIterator>
void std::partial_sort (
    _RandomAccessIterator __first,
    _RandomAccessIterator __middle,
    _RandomAccessIterator __last) [inline], [constexpr]
```

Sort the smallest elements of a sequence.

**Parameters**

<code>__first</code>	An iterator.
<code>__middle</code>	Another iterator.
<code>__last</code>	Another iterator.

**Returns**

Nothing.

Sorts the smallest (`__middle - __first`) elements in the range `[first, last)` and moves them to the range `[__first, __middle)`. The order of the remaining elements in the range `[__middle, __last)` is unspecified. After the sort if `i` and `j` are iterators in the range `[__first, __middle)` such that `i` precedes `j` and `k` is an iterator in the range `[__middle, __last)` then `*j < *i` and `*k < *i` are both false.

**partial\_sort()** [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
void std::partial_sort (
    _RandomAccessIterator __first,
    _RandomAccessIterator __middle,
    _RandomAccessIterator __last,
    _Compare __comp) [inline], [constexpr]
```

Sort the smallest elements of a sequence using a predicate for comparison.

**Parameters**

<code>__first</code>	An iterator.
<code>__middle</code>	Another iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

**Returns**

Nothing.

Sorts the smallest (`__middle - __first`) elements in the range `[__first, __last)` and moves them to the range `[__first, __middle)`. The order of the remaining elements in the range `[__middle, __last)` is unspecified. After the sort if `i` and `j` are iterators in the range `[__first, __middle)` such that `i` precedes `j` and `k` is an iterator in the range `[__middle, __last)` then `*__comp(j, *i)` and `__comp(*k, *i)` are both false.

**partial\_sort\_copy()** [1/2]

```
template<typename _InputIterator, typename _RandomAccessIterator>
_RandomAccessIterator std::partial_sort_copy (
    _InputIterator __first,
    _InputIterator __last,
    _RandomAccessIterator __result_first,
    _RandomAccessIterator __result_last) [inline], [constexpr]
```

Copy the smallest elements of a sequence.

## Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__result_first</code>	A random-access iterator.
<code>__result_last</code>	Another random-access iterator.

## Returns

An iterator indicating the end of the resulting sequence.

Copies and sorts the smallest  $N$  values from the range  $[\text{__first}, \text{__last})$  to the range beginning at `__result_first`, where the number of elements to be copied,  $N$ , is the smaller of  $(\text{__last} - \text{__first})$  and  $(\text{__result\_last} - \text{__result\_first})$ . After the sort if  $i$  and  $j$  are iterators in the range  $[\text{__result\_first}, \text{__result\_first} + N)$  such that  $i$  precedes  $j$  then  $*j < *i$  is false. The value returned is `__result_first + N`.

**partial\_sort\_copy()** [2/2]

```
template<typename _InputIterator, typename _RandomAccessIterator, typename _Compare>
_RandomAccessIterator std::partial_sort_copy (
    _InputIterator __first,
    _InputIterator __last,
    _RandomAccessIterator __result_first,
    _RandomAccessIterator __result_last,
    _Compare __comp) [inline], [constexpr]
```

Copy the smallest elements of a sequence using a predicate for comparison.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	Another input iterator.
<code>__result_first</code>	A random-access iterator.
<code>__result_last</code>	Another random-access iterator.
<code>__comp</code>	A comparison functor.

## Returns

An iterator indicating the end of the resulting sequence.

Copies and sorts the smallest  $N$  values from the range  $[\text{__first}, \text{__last})$  to the range beginning at `result_`  
`__first`, where the number of elements to be copied,  $N$ , is the smaller of  $(\text{__last} - \text{__first})$  and  $(\text{__}  
`result\_last} - \text{__result\_first})`$ . After the sort if  $i$  and  $j$  are iterators in the range  $[\text{__result\_first},$   
 $\text{__result\_first} + N)$  such that  $i$  precedes  $j$  then `__comp(*j, *i)` is false. The value returned is `__`  
`result\_first} + N`.

**prev\_permutation()** [1/2]

```
template<typename _BidirectionalIterator>
bool std::prev_permutation (
    _BidirectionalIterator __first,
    _BidirectionalIterator __last) [inline], [constexpr]
```

Permute range into the previous *dictionary* ordering.

**Parameters**

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

**Returns**

False if wrapped to last permutation, true otherwise.

Treats all permutations of the range as a set of *dictionary* sorted sequences. Permutes the current sequence into the previous one of this set. Returns true if there are more sequences to generate. If the sequence is the smallest of the set, the largest is generated and false returned.

**prev\_permutation()** [2/2]

```
template<typename _BidirectionalIterator, typename _Compare>
bool std::prev_permutation (
    _BidirectionalIterator __first,
    _BidirectionalIterator __last,
    _Compare __comp) [inline], [constexpr]
```

Permute range into the previous *dictionary* ordering using comparison functor.

**Parameters**

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	A comparison functor.

**Returns**

False if wrapped to last permutation, true otherwise.

Treats all permutations of the range [`__first`,`__last`) as a set of *dictionary* sorted sequences ordered by `__comp`. Permutes the current sequence into the previous one of this set. Returns true if there are more sequences to generate. If the sequence is the smallest of the set, the largest is generated and false returned.

**sort()** [1/2]

```
template<typename _RandomAccessIterator>
void std::sort (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last) [inline], [constexpr]
```

Sort the elements of a sequence.

## Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.

## Returns

Nothing.

Sorts the elements in the range `[__first, __last)` in ascending order, such that for each iterator `i` in the range `[__first, __last - 1)`, `*(i+1) < *i` is false.

The relative ordering of equivalent elements is not preserved, use `stable_sort()` if this is needed.

**sort()** [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
void std::sort (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp) [inline], [constexpr]
```

Sort the elements of a sequence using a predicate for comparison.

## Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

## Returns

Nothing.

Sorts the elements in the range `[__first, __last)` in ascending order, such that `__comp(*(i+1), *i)` is false for every iterator `i` in the range `[__first, __last - 1)`.

The relative ordering of equivalent elements is not preserved, use `stable_sort()` if this is needed.

**stable\_sort()** [1/2]

```
template<typename _RandomAccessIterator>
void std::stable_sort (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last) [inline]
```

Sort the elements of a sequence, preserving the relative order of equivalent elements.

**Parameters**

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.

**Returns**

Nothing.

Sorts the elements in the range `[__first,__last)` in ascending order, such that for each iterator `i` in the range `[__first,__last-1)`, `*(i+1)< *i` is false.

The relative ordering of equivalent elements is preserved, so any two elements `x` and `y` in the range `[__first,__last)` such that `x<y` is false and `y<x` is false will have the same relative ordering after calling `stable_sort()`.

**stable\_sort() [2/2]**

```
template<typename _RandomAccessIterator, typename _Compare>
void std::stable_sort (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp) [inline]
```

Sort the elements of a sequence using a predicate for comparison, preserving the relative order of equivalent elements.

**Parameters**

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__comp</code>	A comparison functor.

**Returns**

Nothing.

Sorts the elements in the range `[__first,__last)` in ascending order, such that for each iterator `i` in the range `[__first,__last-1)`, `__comp(*(i+1),*i)` is false.

The relative ordering of equivalent elements is preserved, so any two elements `x` and `y` in the range `[__first,__last)` such that `__comp(x,y)` is false and `__comp(y,x)` is false will have the same relative ordering after calling `stable_sort()`.

### 3.1.5.3 Binary Search

Collaboration diagram for Binary Search:

## Functions

- `template<typename _ForwardIterator, typename _Tp>`  
`constexpr bool std::binary\_search (_ForwardIterator __first, _ForwardIterator __last, const _Tp &__val)`
- `template<typename _ForwardIterator, typename _Tp, typename _Compare>`  
`constexpr bool std::binary\_search (_ForwardIterator __first, _ForwardIterator __last, const _Tp &__val, _Compare __comp)`
- `template<typename _ForwardIterator, typename _Tp>`  
`constexpr pair< _ForwardIterator, _ForwardIterator > std::equal\_range (_ForwardIterator __first, _ForwardIterator __last, const _Tp &__val)`
- `template<typename _ForwardIterator, typename _Tp, typename _Compare>`  
`constexpr pair< _ForwardIterator, _ForwardIterator > std::equal\_range (_ForwardIterator __first, _ForwardIterator __last, const _Tp &__val, _Compare __comp)`

`constexpr _ForwardIterator std::lower\_bound (_ForwardIterator __first, _ForwardIterator __last, const _Tp &__val, _Compare __comp)`
- `template<typename _ForwardIterator, typename _Tp>`  
`constexpr _ForwardIterator std::upper\_bound (_ForwardIterator __first, _ForwardIterator __last, const _Tp &__val)`
- `template<typename _ForwardIterator, typename _Tp, typename _Compare>`  
`constexpr _ForwardIterator std::upper\_bound (_ForwardIterator __first, _ForwardIterator __last, const _Tp &__val, _Compare __comp)`

#### 3.1.5.3.1 Detailed Description

These algorithms are variations of a classic binary search, and all assume that the sequence being searched is already sorted.

The number of comparisons will be logarithmic (and as few as possible). The number of steps through the sequence will be logarithmic for random-access iterators (e.g., pointers), and linear otherwise.

The LWG has passed Defect Report 270, which notes: *The proposed resolution reinterprets binary search. Instead of thinking about searching for a value in a sorted range, we view that as an important special case of a more general algorithm: searching for the partition point in a partitioned range. We also add a guarantee that the old wording did not: we ensure that the upper bound is no earlier than the lower bound, that the pair returned by `equal_range` is a valid range, and that the first part of that pair is the lower bound.*

The actual effect of the first sentence is that a comparison functor passed by the user doesn't necessarily need to induce a strict weak ordering relation. Rather, it partitions the range.

### 3.1.5.3.2 Function Documentation

#### binary\_search() [1/2]

```
template<typename _ForwardIterator, typename _Tp>
bool std::binary_search (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __val) [nodiscard], [constexpr]
```

Determines whether an element exists in a range.

##### Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.

##### Returns

True if `__val` (or its equivalent) is in `[__first,__last]`.

Note that this does not actually return an iterator to `__val`. For that, use `std::find` or a container's specialized find member functions.

#### binary\_search() [2/2]

```
template<typename _ForwardIterator, typename _Tp, typename _Compare>
bool std::binary_search (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __val,
    _Compare __comp) [nodiscard], [constexpr]
```

Determines whether an element exists in a range.

##### Parameters

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.
<code>__comp</code>	A functor to use for comparisons.

##### Returns

True if `__val` (or its equivalent) is in `[__first,__last]`.

Note that this does not actually return an iterator to `__val`. For that, use `std::find` or a container's specialized find member functions.

The comparison function should have the same effects on ordering as the function used for the initial sort.

**equal\_range()** [1/2]

```
template<typename _ForwardIterator, typename _Tp>
pair< _ForwardIterator, _ForwardIterator > std::equal_range (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __val) [inline], [nodiscard], [constexpr]
```

Finds the largest subrange in which `__val` could be inserted at any place in it without changing the ordering.

**Parameters**

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.

**Returns**

An pair of iterators defining the subrange.

This is equivalent to

```
std::make_pair(lower_bound(__first, __last, __val),
               upper_bound(__first, __last, __val))
```

but does not actually call those functions.

**equal\_range()** [2/2]

```
template<typename _ForwardIterator, typename _Tp, typename _Compare>
pair< _ForwardIterator, _ForwardIterator > std::equal_range (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __val,
    _Compare __comp) [inline], [nodiscard], [constexpr]
```

Finds the largest subrange in which `__val` could be inserted at any place in it without changing the ordering.

**Parameters**

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.
<code>__comp</code>	A functor to use for comparisons.

**Returns**

An pair of iterators defining the subrange.

This is equivalent to

```
std::make_pair(lower_bound(__first, __last, __val, __comp),
               upper_bound(__first, __last, __val, __comp))
```

but does not actually call those functions.

**lower\_bound()** [1/2]

```
template<typename _ForwardIterator, typename _Tp>
_FForwardIterator std::lower_bound (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __val) [inline], [nodiscard], [constexpr]
```

Finds the first position in which *val* could be inserted without changing the ordering.

**Parameters**

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.

**Returns**

An iterator pointing to the first element *not less than val*, or `end()` if every element is less than *val*.

**lower\_bound()** [2/2]

```
template<typename _ForwardIterator, typename _Tp, typename _Compare>
_FForwardIterator std::lower_bound (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __val,
    _Compare __comp) [inline], [nodiscard], [constexpr]
```

Finds the first position in which `__val` could be inserted without changing the ordering.

**Parameters**

<code>__first</code>	An iterator to the start of a sorted range.
<code>__last</code>	A past-the-end iterator for the sorted range.
<code>__val</code>	The search term.
<code>__comp</code>	A functor to use for comparisons.

**Returns**

An iterator pointing to the first element *not less than* `__val`, or `end()` if every element is less than `__val`.

The comparison function should have the same effects on ordering as the function used for the initial sort.

**upper\_bound()** [1/2]

```
template<typename _ForwardIterator, typename _Tp>
_FForwardIterator std::upper_bound (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __val) [inline], [nodiscard], [constexpr]
```

Finds the last position in which `__val` could be inserted without changing the ordering.

**Parameters**

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.

**Returns**

An iterator pointing to the first element greater than `__val`, or `end()` if no elements are greater than `__val`.

**upper\_bound() [2/2]**

```
template<typename _ForwardIterator, typename _Tp, typename _Compare>
_FowardIterator std::upper_bound (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __val,
    _Compare __comp) [inline], [nodiscard], [constexpr]
```

Finds the last position in which `__val` could be inserted without changing the ordering.

**Parameters**

<code>__first</code>	An iterator.
<code>__last</code>	Another iterator.
<code>__val</code>	The search term.
<code>__comp</code>	A functor to use for comparisons.

**Returns**

An iterator pointing to the first element greater than `__val`, or `end()` if no elements are greater than `__val`.

The comparison function should have the same effects on ordering as the function used for the initial sort.

`constexpr void std::sort\_heap (_RandomAccessIterator __first, _RandomAccessIterator __last, _Compare __comp)`

### 3.1.5.4.1 Detailed Description

### 3.1.5.4.2 Function Documentation

#### `is_heap()` [1/2]

```
template<typename _RandomAccessIterator>
bool std::is_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last) [inline], [nodiscard], [constexpr]
```

Determines whether a range is a heap.

#### Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

#### Returns

True if range is a heap, false otherwise.

**is\_heap()** [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
bool std::is_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp) [inline], [nodiscard], [constexpr]
```

Determines whether a range is a heap using comparison functor.

**Parameters**

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	Comparison functor to use.

**Returns**

True if range is a heap, false otherwise.

References [distance\(\)](#).

**is\_heap\_until()** [1/2]

```
template<typename _RandomAccessIterator>
_RandomAccessIterator std::is_heap_until (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last) [inline], [nodiscard], [constexpr]
```

Search the end of a heap.

**Parameters**

<code>__first</code>	Start of range.
<code>__last</code>	End of range.

**Returns**

An iterator pointing to the first element not in the heap.

This operation returns the last iterator *i* in [`__first`, `__last`) for which the range [`__first`, *i*) is a heap.

References [distance\(\)](#).

**is\_heap\_until()** [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
_RandomAccessIterator std::is_heap_until (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp) [inline], [nodiscard], [constexpr]
```

Search the end of a heap using comparison functor.

**Parameters**

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__comp</code>	Comparison functor to use.

**Returns**

An iterator pointing to the first element not in the heap.

This operation returns the last iterator `i` in `[__first, __last)` for which the range `[__first, i)` is a heap. Comparisons are made using `__comp`.

References [distance\(\)](#).

**make\_heap() [1/2]**

```
template<typename _RandomAccessIterator>
void std::make_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last) [inline], [constexpr]
```

Construct a heap over a range.

**Parameters**

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.

This operation makes the elements in `[__first, __last)` into a heap.

**make\_heap() [2/2]**

```
template<typename _RandomAccessIterator, typename _Compare>
void std::make_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp) [inline], [constexpr]
```

Construct a heap over a range using comparison functor.

**Parameters**

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.
<code>__comp</code>	Comparison functor to use.

This operation makes the elements in `[__first, __last)` into a heap. Comparisons are made using `__comp`.

**pop\_heap()** [1/2]

```
template<typename _RandomAccessIterator>
void std::pop_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last) [inline], [constexpr]
```

Pop an element off a heap.

**Parameters**

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.

**Precondition**

`[__first, __last)` is a valid, non-empty range.

This operation pops the top of the heap. The elements `__first` and `__last-1` are swapped and `[__first, __last-1)` is made into a heap.

**pop\_heap()** [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
void std::pop_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp) [inline], [constexpr]
```

Pop an element off a heap using comparison functor.

**Parameters**

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.
<code>__comp</code>	Comparison functor to use.

This operation pops the top of the heap. The elements `__first` and `__last-1` are swapped and `[__first, __last-1)` is made into a heap. Comparisons are made using `comp`.

**push\_heap()** [1/2]

```
template<typename _RandomAccessIterator>
void std::push_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last) [inline], [constexpr]
```

Push an element onto a heap.

**Parameters**

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap + element.

This operation pushes the element at `last-1` onto the valid heap over the range `[__first,__last-1)`. After completion, `[__first,__last)` is a valid heap.

**push\_heap() [2/2]**

```
template<typename _RandomAccessIterator, typename _Compare>
void std::push_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp) [inline], [constexpr]
```

Push an element onto a heap using comparison functor.

**Parameters**

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap + element.
<code>__comp</code>	Comparison functor.

This operation pushes the element at `__last-1` onto the valid heap over the range `[__first,__last-1)`. After completion, `[__first,__last)` is a valid heap. Compare operations are performed using `comp`.

**sort\_heap() [1/2]**

```
template<typename _RandomAccessIterator>
void std::sort_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last) [inline], [constexpr]
```

Sort a heap.

**Parameters**

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.

This operation sorts the valid heap in the range `[__first,__last)`.

**sort\_heap() [2/2]**

```
template<typename _RandomAccessIterator, typename _Compare>
void std::sort_heap (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp) [inline], [constexpr]
```

Sort a heap using comparison functor.

## Parameters

<code>__first</code>	Start of heap.
<code>__last</code>	End of heap.
<code>__comp</code>	Comparison functor to use.

This operation sorts the valid heap in the range `[__first,__last)`. Comparisons are made using `__comp`.

## 3.1.5.5 Set Operations

Collaboration diagram for Set Operations:

- `template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename _Compare>`  
`constexpr _OutputIterator std::set\_symmetric\_difference (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2, _OutputIterator __result, _Compare __comp)`

- `template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator>`  
`constexpr _OutputIterator std::set\_union (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2,`  
`_InputIterator2 __last2, _OutputIterator __result)`
- `template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename _Compare>`  
`constexpr _OutputIterator std::set\_union (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2,`  
`_InputIterator2 __last2, _OutputIterator __result, _Compare __comp)`

### 3.1.5.5.1 Detailed Description

These algorithms are common set operations performed on sequences that are already sorted. The number of comparisons will be linear.

### 3.1.5.5.2 Function Documentation

#### **includes()** [1/2]

```
template<typename _InputIterator1, typename _InputIterator2>
bool std::includes (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2) [inline], [nodiscard], [constexpr]
```

Determines whether all elements of a sequence exists in a range.

#### Parameters

<code>__first1</code>	Start of search range.
<code>__last1</code>	End of search range.
<code>__first2</code>	Start of sequence
<code>__last2</code>	End of sequence.

#### Returns

True if each element in `[__first2,__last2)` is contained in order within `[__first1,__last1)`. False otherwise.

This operation expects both `[__first1,__last1)` and `[__first2,__last2)` to be sorted. Searches for the presence of each element in `[__first2,__last2)` within `[__first1,__last1)`. The iterators over each range only move forward, so this is a linear algorithm. If an element in `[__first2,__last2)` is not found before the search iterator reaches `__last2`, false is returned.

#### **includes()** [2/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _Compare>
bool std::includes (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _Compare __comp) [inline], [nodiscard], [constexpr]
```

Determines whether all elements of a sequence exists in a range using comparison.

## Parameters

<code>__first1</code>	Start of search range.
<code>__last1</code>	End of search range.
<code>__first2</code>	Start of sequence
<code>__last2</code>	End of sequence.
<code>__comp</code>	Comparison function to use.

## Returns

True if each element in `[__first2,__last2)` is contained in order within `[__first1,__last1)` according to `comp`. False otherwise.

This operation expects both `[__first1,__last1)` and `[__first2,__last2)` to be sorted. Searches for the presence of each element in `[__first2,__last2)` within `[__first1,__last1)`, using `comp` to decide. The iterators over each range only move forward, so this is a linear algorithm. If an element in `[__first2,__last2)` is not found before the search iterator reaches `__last2`, false is returned.

**set\_difference()** [1/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator>
_OutputIterator std::set_difference (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result) [inline], [constexpr]
```

Return the difference of two sorted ranges.

## Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__result</code>	Start of output range.

## Returns

End of the output range.

This operation iterates over both ranges, copying elements present in the first range but not the second in order to the output range. Iterators increment for each range. When the current element of the first range is less than the second, that element is copied and the iterator advances. If the current element of the second range is less, the iterator advances, but no element is copied. If an element is contained in both ranges, no elements are copied and both ranges advance. The output range may not overlap either input range.

**set\_difference()** [2/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename _Compare>
_OutputIterator std::set_difference (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result,
    _Compare __comp) [inline], [constexpr]
```

Return the difference of two sorted ranges using comparison functor.

**Parameters**

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__result</code>	Start of output range.
<code>__comp</code>	The comparison functor.

**Returns**

End of the output range.

This operation iterates over both ranges, copying elements present in the first range but not the second in order to the output range. Iterators increment for each range. When the current element of the first range is less than the second according to `__comp`, that element is copied and the iterator advances. If the current element of the second range is less, no element is copied and the iterator advances. If an element is contained in both ranges according to `__comp`, no elements are copied and both ranges advance. The output range may not overlap either input range.

**set\_intersection()** [1/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator>
_OutputIterator std::set_intersection (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result) [inline], [constexpr]
```

Return the intersection of two sorted ranges.

**Parameters**

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.

<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__result</code>	Start of output range.

**Returns**

End of the output range.

This operation iterates over both ranges, copying elements present in both ranges in order to the output range. Iterators increment for each range. When the current element of one range is less than the other, that iterator advances. If an element is contained in both ranges, the element from the first range is copied and both ranges advance. The output range may not overlap either input range.

**set\_intersection()** [2/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename _Compare>
_OutputIterator std::set_intersection (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result,
    _Compare __comp) [inline], [constexpr]
```

Return the intersection of two sorted ranges using comparison functor.

**Parameters**

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__result</code>	Start of output range.
<code>__comp</code>	The comparison functor.

**Returns**

End of the output range.

This operation iterates over both ranges, copying elements present in both ranges in order to the output range. Iterators increment for each range. When the current element of one range is less than the other according to `__comp`, that iterator advances. If an element is contained in both ranges according to `__comp`, the element from the first range is copied and both ranges advance. The output range may not overlap either input range.

**set\_symmetric\_difference()** [1/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator>
_OutputIterator std::set_symmetric_difference (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result) [inline], [constexpr]
```

Return the symmetric difference of two sorted ranges.

**Parameters**

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__result</code>	Start of output range.

**Returns**

End of the output range.

This operation iterates over both ranges, copying elements present in one range but not the other in order to the output range. Iterators increment for each range. When the current element of one range is less than the other, that element is copied and the iterator advances. If an element is contained in both ranges, no elements are copied and both ranges advance. The output range may not overlap either input range.

**set\_symmetric\_difference()** [2/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename ↵
_Compare>
_OutputIterator std::set_symmetric_difference (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result,
    _Compare __comp) [inline], [constexpr]
```

Return the symmetric difference of two sorted ranges using comparison functor.

**Parameters**

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__result</code>	Start of output range.
<code>__comp</code>	The comparison functor.

**Returns**

End of the output range.

This operation iterates over both ranges, copying elements present in one range but not the other in order to the output range. Iterators increment for each range. When the current element of one range is less than the other according to `comp`, that element is copied and the iterator advances. If an element is contained in both ranges according to `__comp`, no elements are copied and both ranges advance. The output range may not overlap either input range.

**set\_union()** [1/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator>
_OutputIterator std::set_union (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result) [inline], [constexpr]
```

Return the union of two sorted ranges.

**Parameters**

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__result</code>	Start of output range.

**Returns**

End of the output range.

This operation iterates over both ranges, copying elements present in each range in order to the output range. Iterators increment for each range. When the current element of one range is less than the other, that element is copied and the iterator advanced. If an element is contained in both ranges, the element from the first range is copied and both ranges advance. The output range may not overlap either input range.

**set\_union()** [2/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename <←
_Compare>
_OutputIterator std::set_union (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result,
    _Compare __comp) [inline], [constexpr]
```

Return the union of two sorted ranges using a comparison functor.

#### Parameters

<code>__first1</code>	Start of first range.
<code>__last1</code>	End of first range.
<code>__first2</code>	Start of second range.
<code>__last2</code>	End of second range.
<code>__result</code>	Start of output range.
<code>__comp</code>	The comparison functor.

#### Returns

End of the output range.

This operation iterates over both ranges, copying elements present in each range in order to the output range. Iterators increment for each range. When the current element of one range is less than the other according to `__comp`, that element is copied and the iterator advanced. If an equivalent element according to `__comp` is contained in both ranges, the element from the first range is copied and both ranges advance. The output range may not overlap either input range.

### 3.2.1 Detailed Description

Components for performing atomic operations.

### 3.2.2 Macro Definition Documentation

#### ATOMIC\_BOOL\_LOCK\_FREE

```
#define ATOMIC_BOOL_LOCK_FREE
```

Lock-free property.

0 indicates that the types are never lock-free. 1 indicates that the types are sometimes lock-free. 2 indicates that the types are always lock-free.

### 3.2.3 Typedef Documentation

#### **atomic\_bool**

```
typedef atomic<bool> std::atomic_bool
```

`atomic_bool`

#### **atomic\_char**

```
typedef atomic<char> std::atomic_char
```

`atomic_char`

#### **atomic\_char16\_t**

```
typedef atomic<char16_t> std::atomic_char16_t
```

`atomic_char16_t`

#### **atomic\_char32\_t**

```
typedef atomic<char32_t> std::atomic_char32_t
```

`atomic_char32_t`

#### **atomic\_int**

```
typedef atomic<int> std::atomic_int
```

`atomic_int`

#### **atomic\_int16\_t**

```
typedef atomic<int16_t> std::atomic_int16_t
```

`atomic_int16_t`

#### **atomic\_int32\_t**

```
typedef atomic<int32_t> std::atomic_int32_t
```

`atomic_int32_t`

**atomic\_int64\_t**

```
typedef atomic<int64_t> std::atomic_int64_t
```

atomic\_int64\_t

**atomic\_int8\_t**

```
typedef atomic<int8_t> std::atomic_int8_t

### 3.3 Concurrency

Collaboration diagram for Concurrency:

#### Topics

- [Condition Variables](#)
- [Futures](#)
- [Mutexes](#)
- [Threads](#)

#### 3.3.1 Detailed Description

Components for concurrent operations, including threads, mutexes, and condition variables.

#### 3.3.2 Condition Variables

Collaboration diagram for Condition Variables:

## Classes

- class `std::condition_variable`
- class `std::condition_variable_any`

## Enumerations

- enum class `std::cv_status` { `no_timeout` , `timeout` }

## Functions

- void `std::notify_all_at_thread_exit` (`condition_variable` &, `unique_lock`< `mutex` >)

### 3.3.2.1 Detailed Description

Classes for `condition_variable` support.

### 3.3.2.2 Enumeration Type Documentation

#### `cv_status`

```
enum class std::cv_status [strong]
```

`cv_status`

### 3.3.3 Futures

Collaboration diagram for Futures:

## Classes

- class `std::__basic_future<_Res>`
- class `std::future<_Res>`
- class `std::future<_Res &>`
- class `std::future<void>`
- class `std::future_error`
- struct `std::is_error_code_enum<future_errc>`
- class `std::packaged_task<_Res(_ArgTypes...)>`
- class `std::promise<_Res>`
- class `std::promise<_Res &>`
- class `std::promise<void>`
- class `std::shared_future<_Res>`
- class `std::shared_future<_Res &>`
- class `std::shared_future<void>`

## Enumerations

- enum class `std::future_errc` { `future_already_retrieved` , `promise_already_satisfied` , `no_state` , `broken_←  
promise` }
- enum class `std::future_status` { `ready` , `timeout` , `deferred` }
- enum class `std::launch` { `async` , `deferred` }

## Functions

- `std::__basic_future<_Res>::__basic_future` (const `shared_future<_Res>` &) noexcept
- `std::__basic_future<_Res>::__basic_future` (`future<_Res>` &&) noexcept
- `std::__basic_future<_Res>::__basic_future` (`shared_future<_Res>` &&) noexcept
- template<typename \_Fn, typename... \_Args>  
`future<__async_result_of<_Fn, _Args...>> std::async` (\_Fn &&\_\_fn, \_Args &&... \_\_args)
- template<typename \_Fn, typename... \_Args>  
`future<__async_result_of<_Fn, _Args...>> std::async` (`launch` \_\_policy, \_Fn &&\_\_fn, \_Args &&... \_\_args)
- const `error_category` & `std::future_category` () noexcept
- `error_code` `std::make_error_code` (`future_errc` \_\_errc) noexcept
- `error_condition` `std::make_error_condition` (`future_errc` \_\_errc) noexcept
- constexpr `launch` `std::operator&` (`launch` \_\_x, `launch` \_\_y) noexcept
- constexpr `launch` & `std::operator&=` (`launch` &\_\_x, `launch` \_\_y) noexcept
- constexpr `launch` `std::operator^` (`launch` \_\_x, `launch` \_\_y) noexcept
- constexpr `launch` & `std::operator^=` (`launch` &\_\_x, `launch` \_\_y) noexcept
- constexpr `launch` `std::operator|` (`launch` \_\_x, `launch` \_\_y) noexcept
- constexpr `launch` & `std::operator|=` (`launch` &\_\_x, `launch` \_\_y) noexcept
- constexpr `launch` `std::operator~` (`launch` \_\_x) noexcept
- template<typename \_Fun, typename \_Signature = \_\_function\_guide\_t<\_Fun, decltype(&\_Fun::operator())>>  
`std::packaged_task` (\_Fun) -> `packaged_task<_Signature>`
- template<typename \_Res, typename... \_ArgTypes>  
`std::packaged_task` (\_Res\*)(\_ArgTypes...) -> `packaged_task<_Res(_ArgTypes...)>`
- `shared_future<_Res>` `std::future<_Res>::share` () noexcept
- `shared_future<_Res &>` `std::future<_Res &>::share` () noexcept
- `shared_future<void>` `std::future<void>::share` () noexcept
- template<typename \_Res, typename... \_ArgTypes>  
void `std::swap` (`packaged_task<_Res(_ArgTypes...)>` &\_\_x, `packaged_task<_Res(_ArgTypes...)>` &\_\_y) noexcept
- template<typename \_Res>  
void `std::swap` (`promise<_Res>` &\_\_x, `promise<_Res>` &\_\_y) noexcept

### 3.3.3.1 Detailed Description

Futures and promises provide support for retrieving the result from an asynchronous function, e.g. one that is running in another thread. A `std::future` represents an asynchronous result that will become ready at some later time. A consumer can wait on a future until the result is ready to be accessed.

Since

C++11

### 3.3.3.2 Enumeration Type Documentation

#### **future\_errc**

```
enum class std::future_errc [strong]
```

Error code for futures.

#### **future\_status**

```
enum class std::future_status [strong]
```

Status code for futures.

#### **launch**

```
enum class std::launch [strong]
```

Launch code for futures.

### 3.3.3.3 Function Documentation

#### **async()** [1/2]

```
template<typename _Fn, typename... _Args>
future< __async_result_of< _Fn, _Args... > > std::async (
    _Fn && __fn,
    _Args &&... __args) [inline], [nodiscard]
```

async, potential overload

References [async\(\)](#), and [forward\(\)](#).

**async() [2/2]**

```
template<typename _Fn, typename... _Args>
future< __async_result_of< _Fn, _Args... > > std::async (
    launch __policy,
    _Fn && __fn,
    _Args &&... __args) [nodiscard]
```

async

References [async\(\)](#), [forward\(\)](#), and [move\(\)](#).

Referenced by [async\(\)](#), and [async\(\)](#).

**future\_category()**

```
const error_category & std::future_category () [noexcept]
```

Points to a statically-allocated object derived from error\_category.

Referenced by [make\\_error\\_code\(\)](#), and [make\\_error\\_condition\(\)](#).

**make\_error\_code()**

```
error_code std::make_error_code (
    future_errc __errc) [inline], [noexcept]
```

Overload of make\_error\_code for future\_errc.

References [future\\_category\(\)](#), and [make\\_error\\_code\(\)](#).

Referenced by [make\\_error\\_code\(\)](#), [system\\_category\(\)](#), and [std::filesystem::filesystem\\_error::what\(\)](#).

**make\_error\_condition()**

```
error_condition std::make_error_condition (
    future_errc __errc) [inline], [noexcept]
```

Overload of make\_error\_condition for future\_errc.

References [future\\_category\(\)](#).

Referenced by [system\\_category\(\)](#).

**swap()**

```
template<typename _Res, typename... _ArgTypes>
void std::swap (
    packaged_task< _Res(_ArgTypes...) > & __x,
    packaged_task< _Res(_ArgTypes...) > & __y) [inline], [noexcept]
```

swap

**3.3.4 Mutexes**

Collaboration diagram for Mutexes:

**Classes**

- struct [std::adopt\\_lock\\_t](#)
- struct [std::defer\\_lock\\_t](#)
- class [std::lock\\_guard< \\_Mutex >](#)
- class [std::mutex](#)
- struct [std::once\\_flag](#)
- class [std::recursive\\_mutex](#)
- class [std::recursive\\_timed\\_mutex](#)
- class [std::shared\\_lock< \\_Mutex >](#)
- class [std::shared\\_timed\\_mutex](#)
- class [std::timed\\_mutex](#)
- struct [std::try\\_to\\_lock\\_t](#)
- class [std::unique\\_lock< \\_Mutex >](#)

**Functions**

- void [std::\\_\\_once\\_proxy](#) (void)
- template<typename \_Callable, typename... \_Args>  
void [std::call\\_once](#) ([once\\_flag](#) &\_\_once, \_Callable &&\_\_f, \_Args &&... \_\_args)
- template<typename \_L1, typename \_L2, typename... \_L3>  
void [std::lock](#) (\_L1 &\_\_l1, \_L2 &\_\_l2, \_L3 &... \_\_l3)
- template<typename \_L1, typename \_L2, typename... \_L3>  
int [std::try\\_lock](#) (\_L1 &\_\_l1, \_L2 &\_\_l2, \_L3 &... \_\_l3)

## Variables

- constexpr [adopt\\_lock\\_t](#) std::adopt\_lock
- constexpr [defer\\_lock\\_t](#) std::defer\_lock
- constexpr [try\\_to\\_lock\\_t](#) std::try\_to\_lock

### 3.3.4.1 Detailed Description

Classes for mutex support.

### 3.3.4.2 Function Documentation

#### call\_once()

```
template<typename _Callable, typename... _Args>
void std::call_once (
    once_flag & __once,
    _Callable && __f,
    _Args &&... __args)
```

Invoke a callable and synchronize with other calls using the same flag.

#### lock()

```
template<typename _L1, typename _L2, typename... _L3>
void std::lock (
    _L1 & __l1,
    _L2 & __l2,
    _L3 &... __l3)
```

Generic lock.

#### Parameters

<a href="#"></a> <a href="#">_l1</a>	Meets Lockable requirements (try_lock() may throw).
<a href="#"></a> <a href="#">_l2</a>	Meets Lockable requirements (try_lock() may throw).
<a href="#"></a> <a href="#">_l3</a>	Meets Lockable requirements (try_lock() may throw).

#### Exceptions

<i>An</i>	exception thrown by an argument's lock() or try_lock() member.
-----------	--

#### Postcondition

All arguments are locked.

All arguments are locked via a sequence of calls to lock(), try\_lock() and unlock(). If this function exits via an exception any locks that were obtained will be released.

References [defer\\_lock](#), and [try\\_lock\(\)](#).

**try\_lock()**

```
template<typename _L1, typename _L2, typename... _L3>
int std::try_lock (
    _L1 & __l1,
    _L2 & __l2,
    _L3 &... __l3) [inline], [nodiscard]
```

Generic try\_lock.

**Parameters**

<a href="#"></a> _l1	Meets Lockable requirements (try_lock() may throw).
<a href="#"></a> _l2	Meets Lockable requirements (try_lock() may throw).
<a href="#"></a> _l3	Meets Lockable requirements (try_lock() may throw).

**Returns**

Returns -1 if all try\_lock() calls return true. Otherwise returns a 0-based index corresponding to the argument that returned false.

**Postcondition**

Either all arguments are locked, or none will be.

Sequentially calls try\_lock() on each argument.

Referenced by [lock\(\)](#).

**3.3.4.3 Variable Documentation****adopt\_lock**

```
adopt_lock_t std::adopt_lock [inline], [constexpr]
```

Tag used to make a scoped lock take ownership of a locked mutex.

**defer\_lock**

```
defer_lock_t std::defer_lock [inline], [constexpr]
```

Tag used to prevent a scoped lock from acquiring ownership of a mutex.

Referenced by [lock\(\)](#).

## try\_to\_lock

```
try_to_lock_t std::try_to_lock [inline], [constexpr]
```

Tag used to prevent a scoped lock from blocking if a mutex is locked.

### 3.3.5 Threads

Collaboration diagram for Threads:

#### Namespaces

- namespace [std::this\\_thread](#)

#### Classes

- struct [std::hash< thread::id >](#)
- class [std::thread](#)

#### Functions

- bool **operator==** ([thread::id](#) \_\_x, [thread::id](#) \_\_y) noexcept
- void **swap** ([thread](#) &\_\_x, [thread](#) &\_\_y) noexcept
- strong\_ordering **operator<=>** ([thread::id](#) \_\_x, [thread::id](#) \_\_y) noexcept
- template<class \_CharT, class \_Traits>  
[basic\\_ostream](#)< \_CharT, \_Traits > & **operator<<** ([basic\\_ostream](#)< \_CharT, \_Traits > &\_\_out, [thread::id](#) \_\_id)

#### 3.3.5.1 Detailed Description

Since

C++11

Classes for thread support.

## 3.4 Containers

Collaboration diagram for Containers:

### Topics

- [Associative](#)
- [Sequences](#)
- [Unordered Associative](#)

### 3.4.1 Detailed Description

Containers are collections of objects.

A container may hold any type which meets certain requirements, but the type of contained object is chosen at compile time, and all objects in a given container must be of the same type. (Polymorphism is possible by declaring a container of pointers to a base class and then populating it with pointers to instances of derived classes. Variant value types such as the `any` class from `Boost` can also be used.

All contained types must be `Assignable` and `CopyConstructible`. Specific containers may place additional requirements on the types of their contained objects.

Containers manage memory allocation and deallocation themselves when storing your objects. The objects are destroyed when the container is itself destroyed. Note that if you are storing pointers in a container, `delete` is *not* automatically called on the pointers before destroying them.

All containers must meet certain requirements, summarized in `tables`.

The standard containers are further refined into [Sequences](#) and [Associative Containers](#). [Unordered Associative Containers](#).

### 3.4.2 Associative

Collaboration diagram for Associative:

#### Classes

- class `std::map< _Key, _Tp, _Compare, _Alloc >`
- class `std::multimap< _Key, _Tp, _Compare, _Alloc >`
- class `std::multiset< _Key, _Compare, _Alloc >`
- class `std::set< _Key, _Compare, _Alloc >`

#### 3.4.2.1 Detailed Description

Associative containers allow fast retrieval of data based on keys.

Each container type is parameterized on a `Key` type, and an ordering relation used to sort the elements of the container.

All associative containers must meet certain requirements, summarized in [tables](#).

### 3.4.3 Sequences

Collaboration diagram for Sequences:

## Files

- file `inplace_vector`

## Classes

- struct `std::array<_Tp, _Nm>`
- class `std::basic_string<_CharT, _Traits, _Alloc>`
- class `std::basic_string_view<_CharT, _Traits>`
- class `std::experimental::fundamentals_v1::basic_string_view<_CharT, _Traits>`
- class `std::deque<_Tp, _Alloc>`
- class `std::forward_list<_Tp, _Alloc>`
- class `std::list<_Tp, _Alloc>`
- class `std::priority_queue<_Tp, _Sequence, _Compare>`
- class `std::queue<_Tp, _Sequence>`
- class `std::stack<_Tp, _Sequence>`
- class `std::vector<_Tp, _Alloc>`
- class `std::vector<bool, _Alloc>`

### 3.4.3.1 Detailed Description

Sequences arrange a collection of objects into a strictly linear order.

The differences between sequences are usually due to one or both of the following:

- memory management
- algorithmic complexity

As an example of the first case, `vector` is required to use a contiguous memory layout, while other sequences such as `deque` are not.

The prime reason for choosing one sequence over another should be based on the second category of differences, algorithmic complexity. For example, if you need to perform many inserts and removals from the middle of a sequence, `list` would be ideal. But if you need to perform constant-time access to random elements of the sequence, then `list` should not be used.

All sequences must meet certain requirements, summarized in `tables`.

### 3.4.4 Unordered Associative

Collaboration diagram for Unordered Associative:

## Classes

- class [std::unordered\\_map<\\_Key, \\_Tp, \\_Hash, \\_Pred, \\_Alloc>](#)
- class [std::unordered\\_multimap<\\_Key, \\_Tp, \\_Hash, \\_Pred, \\_Alloc>](#)
- class [std::unordered\\_multiset<\\_Value, \\_Hash, \\_Pred, \\_Alloc>](#)
- class [std::unordered\\_set<\\_Value, \\_Hash, \\_Pred, \\_Alloc>](#)

### 3.4.4.1 Detailed Description

Unordered associative containers allow fast retrieval of data based on keys.

Each container type is parameterized on a `Key` type, a `Hash` type providing a hashing functor, and an ordering relation used to sort the elements of the container.

All unordered associative containers must meet certain requirements, summarized in [tables](#).

## 3.5 Diagnostics

Collaboration diagram for Diagnostics:

## Topics

- [Exceptions](#)

## Classes

- class [std::error\\_category](#)
- class [std::error\\_code](#)
- class [std::error\\_condition](#)
- struct [std::is\\_error\\_code\\_enum<\\_Tp>](#)
- struct [std::is\\_error\\_condition\\_enum<\\_Tp>](#)

## Functions

- `const error_category & std::generic_category ()` noexcept
- `error_code make_error_code (errc __e)` noexcept
- `error_condition make_error_condition (errc __e)` noexcept
- `template<typename _CharT, typename _Traits>  
basic_ostream< _CharT, _Traits > & operator<< (basic_ostream< _CharT, _Traits > & __os, const error_code & __e)`
- `strong_ordering operator<=> (const error_code & __lhs, const error_code & __rhs)` noexcept
- `strong_ordering operator<=> (const error_condition & __lhs, const error_condition & __rhs)` noexcept
- `bool operator== (const error_code & __lhs, const error_code & __rhs)` noexcept
- `bool operator== (const error_code & __lhs, const error_condition & __rhs)` noexcept
- `bool operator== (const error_condition & __lhs, const error_condition & __rhs)` noexcept
- `const error_category & std::system_category ()` noexcept

## Variables

- `template<typename _Tp>  
constexpr bool std::is_error_code_enum_v`
- `template<typename _Tp>  
constexpr bool std::is_error_condition_enum_v`

### 3.5.1 Detailed Description

Components for error handling, reporting, and diagnostic operations.

### 3.5.2 Function Documentation

#### `generic_category()`

```
const error_category & std::generic_category () [noexcept]
```

Error category for `errno` error codes.

Referenced by `std::error_condition::error_condition()`, `std::error_condition::clear()`, `std::error_code::make_error_code()`, and `std::error_condition::make_error_condition()`.

#### `make_error_code()`

```
error_code make_error_code (
    errc __e) [related]
```

Create an `error_code` representing a standard `errc` condition.

The `std::errc` constants correspond to `errno` macros and so use the generic category.

Since

C++11

References `std::generic_category()`.

Referenced by `error_code()`.

**make\_error\_condition()**

```
error_condition make_error_condition (
    errc __e) [related]
```

Create an `error_condition` representing a standard `errc` condition.

The `std::errc` constants correspond to `errno` macros and so use the generic category.

Since

C++11

References [error\\_condition\(\)](#), and [std::generic\\_category\(\)](#).

Referenced by [error\\_condition\(\)](#).

**operator<<()**

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & operator<< (
    basic_ostream< _CharT, _Traits > & __os,
    const error_code & __e) [related]
```

Write a `std::error_code` to an ostream.

Since

C++11

References [operator<=>\(\)](#).

**operator<=>() [1/2]**

```
strong_ordering operator<=> (
    const error_code & __lhs,
    const error_code & __rhs) [related]
```

Ordered comparison for `std::error_code`.

This defines a total order by comparing the categories, and then if they are equal comparing the values.

Since

C++11

Referenced by [operator<<\(\)](#).

**operator<=>()** [2/2]

```
strong_ordering operator<=> (
    const error_condition & __lhs,
    const error_condition & __rhs) [related]
```

Ordered comparison for `std::error_condition`.

This defines a total order by comparing the categories, and then if they are equal comparing the values.

Since

C++11

References [error\\_condition\(\)](#), and [operator<=>\(\)](#).

Referenced by [operator<=>\(\)](#).

**operator==( )** [1/3]

```
bool operator== (
    const error_code & __lhs,
    const error_code & __rhs) [related]
```

Equality comparison for `std::error_code`.

Returns true only if they have the same category and the same value.

Since

C++11

**operator==( )** [2/3]

```
bool operator== (
    const error_code & __lhs,
    const error_condition & __rhs) [related]
```

Equality comparison for `std::error_code` and `std::error_condition`.

Uses each category's `equivalent` member function to check whether the values correspond to an equivalent error in that category.

Since

C++11

References [error\\_condition\(\)](#).

**operator==()** [3/3]

```
bool operator== (
    const error\_condition & __lhs,
    const error\_condition & __rhs) [related]
```

Equality comparison for `std::error_condition`.

Returns true only if they have the same category and the same value.

Since

C++11

References [error\\_condition\(\)](#).

**system\_category()**

```
const error\_category & std::system_category () [noexcept]
```

Error category for other error codes defined by the OS.

- `template<typename _Tp>`  
`void std::throw_with_nested (_Tp &&__t)`
- bool `std::uncaught_exception () noexcept`
- void `std::unexpected ()`

## Variables

- class \_\_attribute\_\_((\_\_abi\_tag\_\_("cxx11"))) failure typedef \_ios\_Fmtflags [std::ios\\_base::fmtflags](#)

### 3.5.3.1 Detailed Description

Since

C++98

Classes and functions for reporting errors via exceptions.

### 3.5.3.2 Typedef Documentation

#### terminate\_handler

```
typedef void(* std::terminate_handler) ()
```

If you write a replacement terminate handler, it must be of this type.

#### unexpected\_handler

```
typedef void(* std::unexpected_handler) ()
```

If you write a replacement unexpected handler, it must be of this type.

### 3.5.3.3 Function Documentation

#### \_\_verbose\_terminate\_handler()

```
void __gnu_cxx::__verbose_terminate_handler ()
```

A replacement for the standard terminate\_handler which prints more information about the terminating exception (if any) on stderr.

Call

```
std::set_terminate(__gnu_cxx::__verbose_terminate_handler)
```

to use. For more info, see <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt02ch06s02.html>.

In 3.4 and later, this is on by default.

**current\_exception()**

```
exception_ptr std::current_exception () [noexcept]
```

Obtain an `exception_ptr` to the currently handled exception.

If there is none, or the currently handled exception is foreign, return the null value.

Since

C++11

References [make\\_exception\\_ptr\(\)](#).

Referenced by [std::nested\\_exception::nested\\_exception\(\)](#), and [make\\_exception\\_ptr\(\)](#).

**get\_terminate()**

```
terminate_handler std::get_terminate () [noexcept]
```

Return the current terminate handler.

**get\_unexpected()**

```
unexpected_handler std::get_unexpected () [noexcept]
```

Return the current unexpected handler.

Since

C++11

**Deprecated** Removed from the C++ standard in C++17

**make\_exception\_ptr()**

```
template<typename _Ex>  
exception_ptr std::make_exception_ptr (  
    _Ex __ex) [noexcept]
```

Obtain an `exception_ptr` pointing to a copy of the supplied object.

References [current\\_exception\(\)](#).

Referenced by [current\\_exception\(\)](#).

**rethrow\_exception()**

```
void std::rethrow_exception (
    exception_ptr )
```

Throw the object pointed to by the `exception_ptr`.

References [rethrow\\_exception\(\)](#).

Referenced by [std::\\_\\_basic\\_future<\\_Res & >::\\_M\\_get\\_result\(\)](#), [rethrow\\_exception\(\)](#), and [std::nested\\_exception::rethrow\\_nested\(\)](#).

**rethrow\_if\_nested()**

```
template<typename _Ex>
void std::rethrow_if_nested (
    const _Ex & __ex) [inline]
```

Rethrow a nested exception

If `__ex` contains a `std::nested_exception` object, call its `rethrow_nested()` member to rethrow the stored exception.

After catching an exception thrown by a call to `std::throw_with_nested` this function can be used to rethrow the exception that was active when `std::throw_with_nested` was called.

Since

C++11

**set\_terminate()**

```
terminate_handler std::set_terminate (
    terminate_handler ) [noexcept]
```

Takes a new handler function as an argument, returns the old function.

**set\_unexpected()**

```
unexpected_handler std::set_unexpected (
    unexpected_handler ) [noexcept]
```

Takes a new handler function as an argument, returns the old function.

**Deprecated** Removed from the C++ standard in C++17

**terminate()**

```
void std::terminate () [noexcept]
```

The runtime will call this function if exception handling must be abandoned for any reason. It can also be called by the user.

Referenced by [std::nested\\_exception::rethrow\\_nested\(\)](#).

**throw\_with\_nested()**

```
template<typename _Tp>
void std::throw_with_nested (
    _Tp && __t) [inline]
```

Throw an exception that also stores the currently active exception.

If `_Tp` is derived from `std::nested_exception` or is not usable as a base-class, throws a copy of `__t`. Otherwise, throws an object of an implementation-defined type derived from both `_Tp` and `std::nested_exception`, containing a copy of `__t` and the result of `std::current_exception()`.

In other words, throws the argument as a new exception that contains the currently active exception nested within it. This is intended for use in a catch handler to replace the caught exception with a different type, while still preserving the original exception. When the new exception is caught, the nested exception can be rethrown by using `std::rethrow_if_nested`.

This can be used at API boundaries, for example to catch a library's internal exception type and rethrow it nested with a `std::runtime_error`, or vice versa.

Since

C++11

References [forward\(\)](#).

**uncaught\_exception()**

```
bool std::uncaught_exception () [noexcept]
```

[18.6.4]/1: 'Returns true after completing evaluation of a throw-expression until either completing initialization of the exception-declaration in the matching handler or entering `unexpected()` due to the throw; or after entering `terminate()` for any reason other than an explicit call to `terminate()`. [Note: This includes stack unwinding [15.2]. end note]'

2: 'When `uncaught_exception()` is true, throwing an exception can result in a call of `terminate()`' (15.5.1).'

References [uncaught\\_exception\(\)](#).

Referenced by [std::basic\\_ostream<\\_CharT, \\_Traits>::sentry::~~sentry\(\)](#), and [uncaught\\_exception\(\)](#).

## unexpected()

```
void std::unexpected ()
```

The runtime will call this function if an exception is thrown which violates the function's exception specification.

**Deprecated** Removed from the C++ standard in C++17

### 3.5.3.4 Variable Documentation

#### fmtflags

```
class __attribute__((__abi_tag__ ("cxx11"))) failure typedef _Ios_Fmtflags std::ios_base::fmtflags
```

These are thrown to indicate problems with io.

##### 27.4.2.1.1 Class ios\_base::failure

This is a bitmask type.

*\_Ios\_Fmtflags* is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type *fmtflags* are:

- boolalpha
- dec
- fixed
- hex
- internal
- left
- oct
- right
- scientific
- showbase
- showpoint
- showpos
- skipws
- unitbuf
- uppercase
- adjustfield
- basefield
- floatfield

Referenced by `std::num_get<_CharT, _InIter>::do_get()`, `std::num_put<_CharT, _OutIter>::do_put()`, `std::num_put<_CharT, _OutIter>::do_put()`, `std::num_put<_CharT, _OutIter>::do_put()`, `std::__detail::operator>>()`, `register_callback()`, `std::resetiosflags()`, `setf()`, `setf()`, `std::setiosflags()`, and `unsetf()`.

## 3.6 Extensions

Collaboration diagram for Extensions:

### Topics

- [Dynamic Bitset.](#)
- [Policy-Based Data Structures](#)
- [SGI](#)

### Namespaces

- namespace [\\_\\_gnu\\_cxx](#)
- namespace [std::tr2](#)

### Classes

- class [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base >](#)

#### 3.6.1 Detailed Description

Components generally useful that are not part of any standard.

### 3.6.2 Dynamic Bitset.

Collaboration diagram for Dynamic Bitset.:

#### Classes

- struct `std::tr2::__dynamic_bitset_base<_WordT, _Alloc>`
- class `std::tr2::dynamic_bitset<_WordT, _Alloc>`

#### Functions

- `template<typename _CharT, typename _Traits, typename _Alloc1>`  
`void std::tr2::dynamic_bitset<_WordT, _Alloc>::M_copy_to_string (std::basic_string<_CharT, _Traits, ↵`  
`_Alloc1> &__str, _CharT __zero=_CharT('0'), _CharT __one=_CharT('1')) const`
- `template<typename _CharT, typename _Traits, typename _WordT, typename _Alloc>`  
`std::basic_ostream<_CharT, _Traits> & std::tr2::operator<< (std::basic_ostream<_CharT, _Traits> &__os,`  
`const dynamic_bitset<_WordT, _Alloc> &__x)`
- `template<typename _CharT, typename _Traits, typename _WordT, typename _Alloc>`  
`std::basic_istream<_CharT, _Traits> & std::tr2::operator>> (std::basic_istream<_CharT, _Traits> &__is,`  
`dynamic_bitset<_WordT, _Alloc> &__x)`
- `template<typename _WordT, typename _Alloc>`  
`bool std::tr2::operator!= (const dynamic_bitset<_WordT, _Alloc> &__lhs, const dynamic_bitset<_WordT, _Alloc`  
`> &__rhs)`
- `template<typename _WordT, typename _Alloc>`  
`bool std::tr2::operator<= (const dynamic_bitset<_WordT, _Alloc> &__lhs, const dynamic_bitset<_WordT, ↵`  
`_Alloc> &__rhs)`
- `template<typename _WordT, typename _Alloc>`  
`bool std::tr2::operator> (const dynamic_bitset<_WordT, _Alloc> &__lhs, const dynamic_bitset<_WordT, _Alloc`  
`> &__rhs)`
- `template<typename _WordT, typename _Alloc>`  
`bool std::tr2::operator>= (const dynamic_bitset<_WordT, _Alloc> &__lhs, const dynamic_bitset<_WordT, ↵`  
`_Alloc> &__rhs)`
- `template<typename _WordT, typename _Alloc>`  
`dynamic_bitset<_WordT, _Alloc> std::tr2::operator& (const dynamic_bitset<_WordT, _Alloc> &__x, const`  
`dynamic_bitset<_WordT, _Alloc> &__y)`

- `template<typename _WordT, typename _Alloc>`  
`dynamic_bitset< _WordT, _Alloc > std::tr2::operator| (const dynamic_bitset< _WordT, _Alloc > &__x, const dynamic_bitset< _WordT, _Alloc > &__y)`
- `template<typename _WordT, typename _Alloc>`  
`dynamic_bitset< _WordT, _Alloc > std::tr2::operator^ (const dynamic_bitset< _WordT, _Alloc > &__x, const dynamic_bitset< _WordT, _Alloc > &__y)`
- `template<typename _WordT, typename _Alloc>`  
`dynamic_bitset< _WordT, _Alloc > std::tr2::operator- (const dynamic_bitset< _WordT, _Alloc > &__x, const dynamic_bitset< _WordT, _Alloc > &__y)`

### 3.6.2.1 Detailed Description

### 3.6.2.2 Function Documentation

#### **operator"!="()**

```
template<typename _WordT, typename _Alloc>
bool std::tr2::operator!= (
    const dynamic_bitset< _WordT, _Alloc > & __lhs,
    const dynamic_bitset< _WordT, _Alloc > & __rhs) [inline]
```

These comparisons for equality/inequality are, well, *bitwise*.

#### **operator&()**

```
template<typename _WordT, typename _Alloc>
dynamic_bitset< _WordT, _Alloc > std::tr2::operator& (
    const dynamic_bitset< _WordT, _Alloc > & __x,
    const dynamic_bitset< _WordT, _Alloc > & __y) [inline]
```

Global bitwise operations on bitsets.

#### Parameters

<code>__x</code>	A bitset.
<code>__y</code>	A bitset of the same size as <code>__x</code> .

#### Returns

A new bitset.

These should be self-explanatory.

#### **operator-()**

```
template<typename _WordT, typename _Alloc>
dynamic_bitset< _WordT, _Alloc > std::tr2::operator- (
    const dynamic_bitset< _WordT, _Alloc > & __x,
    const dynamic_bitset< _WordT, _Alloc > & __y) [inline]
```

Global bitwise operations on bitsets.

**Parameters**

$\_x$	A bitset.
$\_y$	A bitset of the same size as $\_x$ .

**Returns**

A new bitset.

These should be self-explanatory.

**operator<<()**

```
template<typename _CharT, typename _Traits, typename _WordT, typename _Alloc>
std::basic_ostream< _CharT, _Traits > & std::tr2::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const dynamic_bitset< _WordT, _Alloc > & __x) [inline]
```

Stream output operator for `dynamic_bitset`.

**operator<=()**

```
template<typename _WordT, typename _Alloc>
bool std::tr2::operator<= (
    const dynamic_bitset< _WordT, _Alloc > & __lhs,
    const dynamic_bitset< _WordT, _Alloc > & __rhs) [inline]
```

These comparisons for equality/inequality are, well, *bitwise*.

**operator>()**

```
template<typename _WordT, typename _Alloc>
bool std::tr2::operator> (
    const dynamic_bitset< _WordT, _Alloc > & __lhs,
    const dynamic_bitset< _WordT, _Alloc > & __rhs) [inline]
```

These comparisons for equality/inequality are, well, *bitwise*.

**operator>=()**

```
template<typename _WordT, typename _Alloc>
bool std::tr2::operator>= (
    const dynamic_bitset< _WordT, _Alloc > & __lhs,
    const dynamic_bitset< _WordT, _Alloc > & __rhs) [inline]
```

These comparisons for equality/inequality are, well, *bitwise*.

**operator>>()**

```
template<typename _CharT, typename _Traits, typename _WordT, typename _Alloc>
std::basic_istream< _CharT, _Traits > & std::tr2::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    dynamic_bitset< _WordT, _Alloc > & __x)
```

Stream input operator for dynamic\_bitset.

Input will skip whitespace and only accept '0' and '1' characters. The dynamic\_bitset will grow as necessary to hold the string of bits.

References `std::basic_string< _CharT, _Traits, _Alloc >::empty()`, `std::basic_string< _CharT, _Traits, _Alloc >::push_back()`, `std::basic_ios< _CharT, _Traits >::rdbuf()`, `std::basic_string< _CharT, _Traits, _Alloc >::reserve()`, `std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset()`, `std::basic_ios< _CharT, _Traits >::setstate()`, `std::basic_string< _CharT, _Traits, _Alloc >::size()`, `std::tr2::dynamic_bitset< _WordT, _Alloc >::size()`, and `std::basic_ios< _CharT, _Traits >::widen()`.

**operator^()**

```
template<typename _WordT, typename _Alloc>
dynamic_bitset< _WordT, _Alloc > std::tr2::operator^ (
    const dynamic_bitset< _WordT, _Alloc > & __x,
    const dynamic_bitset< _WordT, _Alloc > & __y) [inline]
```

Global bitwise operations on bitsets.

**Parameters**

$\_x$	A bitset.
$\_y$	A bitset of the same size as $\_x$ .

**Returns**

A new bitset.

These should be self-explanatory.

**operator" | ()**

```
template<typename _WordT, typename _Alloc>
dynamic_bitset< _WordT, _Alloc > std::tr2::operator| (
    const dynamic_bitset< _WordT, _Alloc > & __x,
    const dynamic_bitset< _WordT, _Alloc > & __y) [inline]
```

Global bitwise operations on bitsets.

**Parameters**

$\_x$	A bitset.
$\_y$	A bitset of the same size as $\_x$ .

**Returns**

A new bitset.

These should be self-explanatory.

**3.6.3 Policy-Based Data Structures**

Collaboration diagram for Policy-Based Data Structures:

**Topics**

- [Tags](#)
- [Traits](#)

**Classes**

- `struct \_\_gnu\_pbds::detail::container\_base\_dispatch<_VTp, Cmp_Fn, _Alloc, pairing_heap_tag, null_type >`

### 3.6.3.1 Detailed Description

This is a library of policy-based elementary data structures: associative containers and priority queues. It is designed for high-performance, flexibility, semantic safety, and conformance to the corresponding containers in std (except for some points where it differs by design).

For details, see: [http://gcc.gnu.org/onlinedocs/libstdc++/ext/pb\\_ds/index.html](http://gcc.gnu.org/onlinedocs/libstdc++/ext/pb_ds/index.html)

### 3.6.4.1 Detailed Description

Because libstdc++ based its implementation of the STL subsections of the library on the SGI 3.3 implementation, we inherited their extensions as well.

They are additionally documented in the [online documentation](#), a copy of which is also shipped with the library source code (in `.../docs/html/documentation.html`). You can also read the documentation [on SGI's site](#), which is still running even though the code is not maintained.

**NB** that the following notes are pulled from various comments all over the place, so they may seem stilted.

The `identity_element` functions are not part of the C++ standard; SGI provided them as an extension. Its argument is an operation, and its return value is the identity element for that operation. It is overloaded for addition and multiplication, and you can overload it for your own nefarious operations.

As an extension to the binders, SGI provided composition functors and wrapper functions to aid in their creation. The `unary_compose` functor is constructed from two functions/functors, `f` and `g`. Calling `operator()` with a single argument `x` returns `f(g(x))`. The function `compose1` takes the two functions and constructs a `unary_compose` variable for you.

`binary_compose` is constructed from three functors, `f`, `g1`, and `g2`. Its `operator()` returns `f(g1(x),g2(x))`. The function `compose2` takes `f`, `g1`, and `g2`, and constructs the `binary_compose` instance for you. For example, if `f` returns an `int`, then

```
int answer = (compose2(f,g1,g2))(x);
```

is equivalent to

```
int temp1 = g1(x);
int temp2 = g2(x);
int answer = f(temp1,temp2);
```

But the first form is more compact, and can be passed around as a functor to other algorithms.

As an extension, SGI provided a functor called `identity`. When a functor is required but no operations are desired, this can be used as a pass-through. Its `operator()` returns its argument unchanged.

`select1st` and `select2nd` are extensions provided by SGI. Their `operator()`s take a `std::pair` as an argument, and return either the first member or the second member, respectively. They can be used (especially with the composition functors) to *strip* data from a sequence before performing the remainder of an algorithm.

The `operator()` of the `project1st` functor takes two arbitrary arguments and returns the first one, while `project2nd` returns the second one. They are extensions provided by SGI.

These three functors are each constructed from a single arbitrary variable/value. Later, their `operator()`s completely ignore any arguments passed, and return the stored value.

- `constant_void_fun`'s `operator()` takes no arguments
- `constant_unary_fun`'s `operator()` takes one argument (ignored)
- `constant_binary_fun`'s `operator()` takes two arguments (ignored)

The helper creator functions `constant0`, `constant1`, and `constant2` each take a *result* argument and construct variables of the appropriate functor type.

### 3.6.4.2 Function Documentation

#### `__median()` [1/2]

```
template<typename _Tp>
const _Tp & __gnu_cxx::__median (
    const _Tp & __a,
    const _Tp & __b,
    const _Tp & __c)
```

Find the median of three values.

#### Parameters

<code>__a</code>	A value.
<code>__b</code>	A value.
<code>__c</code>	A value.

#### Returns

One of `a`, `b` or `c`.

If  $\{1,m,n\}$  is some convolution of  $\{a,b,c\}$  such that  $1 \leq m \leq n$  then the value returned will be  $m$ . This is an SGI extension.

#### `__median()` [2/2]

```
template<typename _Tp, typename _Compare>
const _Tp & __gnu_cxx::__median (
    const _Tp & __a,
    const _Tp & __b,
    const _Tp & __c,
    _Compare __comp)
```

Find the median of three values using a predicate for comparison.

**Parameters**

<code>__a</code>	A value.
<code>__b</code>	A value.
<code>__c</code>	A value.
<code>__comp</code>	A binary predicate.

**Returns**

One of `a`, `b` or `c`.

If  $\{l,m,n\}$  is some convolution of  $\{a,b,c\}$  such that `comp` (`l`, `m`) and `comp` (`m`, `n`) are both true then the value returned will be `m`. This is an SGI extension.

**`_Find_first()`**

```
template<size_t _Nb>
size_t std::bitset< _Nb >::_Find_first () const [inline], [constexpr], [noexcept]
Finds the index of the first "on" bit.
```

**Returns**

The index of the first bit set, or `size()` if not found.

**See also**

[`\_Find\_next`](#)

**`_Find_next()`**

```
template<size_t _Nb>
size_t std::bitset< _Nb >::_Find_next (
    size_t __prev) const [inline], [constexpr], [noexcept]
```

Finds the index of the next "on" bit after `prev`.

**Returns**

The index of the next bit set, or `size()` if not found.

**Parameters**

<code>__prev</code>	Where to start searching.
---------------------	---------------------------

**See also**

[`\_Find\_first`](#)

**`_Unchecked_flip()`**

```
template<size_t _Nb>
bitset< _Nb > & std::bitset< _Nb >::_Unchecked_flip (
    size_t __pos) [inline], [constexpr], [noexcept]
```

These versions of single-bit set, reset, flip, and test are extensions from the SGI version. They do no range checking. Referenced by [`flip\(\)`](#).

**\_\_Unchecked\_reset()**

```
template<size_t _Nb>
bitset< _Nb > & std::bitset< _Nb >::__Unchecked_reset (
    size_t __pos) [inline], [constexpr], [noexcept]
```

These versions of single-bit set, reset, flip, and test are extensions from the SGI version. They do no range checking. Referenced by [reset\(\)](#).

**\_\_Unchecked\_set() [1/2]**

```
template<size_t _Nb>
bitset< _Nb > & std::bitset< _Nb >::__Unchecked_set (
    size_t __pos) [inline], [constexpr], [noexcept]
```

These versions of single-bit set, reset, flip, and test are extensions from the SGI version. They do no range checking. Referenced by [set\(\)](#).

**\_\_Unchecked\_set() [2/2]**

```
template<size_t _Nb>
bitset< _Nb > & std::bitset< _Nb >::__Unchecked_set (
    size_t __pos,
    int __val) [inline], [constexpr], [noexcept]
```

These versions of single-bit set, reset, flip, and test are extensions from the SGI version. They do no range checking.

**\_\_Unchecked\_test()**

```
template<size_t _Nb>
bool std::bitset< _Nb >::__Unchecked_test (
    size_t __pos) const [inline], [constexpr], [noexcept]
```

These versions of single-bit set, reset, flip, and test are extensions from the SGI version. They do no range checking. Referenced by [operator\[\]\(\)](#), and [test\(\)](#).

**compose1()**

```
template<class _Operation1, class _Operation2>
unary_compose< _Operation1, _Operation2 > __gnu_cxx::compose1 (
    const _Operation1 & __fn1,
    const _Operation2 & __fn2) [inline]
```

An [SGI extension](#) .

**compose2()**

```
template<class _Operation1, class _Operation2, class _Operation3>
binary_compose< _Operation1, _Operation2, _Operation3 > __gnu_cxx::compose2 (
    const _Operation1 & __fn1,
    const _Operation2 & __fn2,
    const _Operation3 & __fn3) [inline]
```

An [SGI extension](#) .

**constant0()**

```
template<class _Result>
constant_void_fun< _Result > __gnu_cxx::constant0 (
    const _Result & __val) [inline]
```

An [SGI extension](#) .

**constant1()**

```
template<class _Result>
constant_unary_fun< _Result, _Result > __gnu_cxx::constant1 (
    const _Result & __val) [inline]
```

An [SGI extension](#) .

**constant2()**

```
template<class _Result>
constant_binary_fun< _Result, _Result, _Result > __gnu_cxx::constant2 (
    const _Result & __val) [inline]
```

An [SGI extension](#) .

**copy\_n()**

```
template<typename _InputIterator, typename _Size, typename _OutputIterator>
std::pair< _InputIterator, _OutputIterator > __gnu_cxx::copy_n (
    _InputIterator __first,
    _Size __count,
    _OutputIterator __result) [inline]
```

Copies the range [first,first+count) into [result,result+count).

**Parameters**

<code>__first</code>	An input iterator.
<code>__count</code>	The number of elements to copy.
<code>__result</code>	An output iterator.

**Returns**

A `std::pair` composed of `first+count` and `result+count`.

This is an SGI extension. This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling).

References [std::\\_\\_iterator\\_category\(\)](#).

**distance()**

```
template<typename _InputIterator, typename _Distance>
void __gnu_cxx::distance (
    _InputIterator __first,
    _InputIterator __last,
    _Distance & __n) [inline]
```

This is an SGI extension.

**Todo** Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

References [std::\\_\\_iterator\\_category\(\)](#), and [distance\(\)](#).

Referenced by [\\_\\_gnu\\_cxx::temporary\\_buffer<\\_ForwardIterator, \\_Tp >::temporary\\_buffer\(\)](#), and [distance\(\)](#).

**identity\_element()** [1/2]

```
template<class _Tp>
_Tp __gnu_cxx::identity_element (
    std::multiplies< _Tp > ) [inline]
```

An SGI extension .

**identity\_element()** [2/2]

```
template<class _Tp>
_Tp __gnu_cxx::identity_element (
    std::plus< _Tp > ) [inline]
```

An SGI extension .

**lexicographical\_compare\_3way()**

```
template<typename _InputIterator1, typename _InputIterator2>
int __gnu_cxx::lexicographical_compare_3way (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2)
```

memcmp on steroids.

**Parameters**

<code>__first1</code>	An input iterator.
<code>__last1</code>	An input iterator.
<code>__first2</code>	An input iterator.
<code>__last2</code>	An input iterator.

**Returns**

An int, as with memcmp.

The return value will be less than zero if the first range is *lexigraphically less than* the second, greater than zero if the second range is *lexigraphically less than* the first, and zero otherwise. This is an SGI extension.

**power()** [1/2]

```
template<typename _Tp, typename _Integer>
_Tp __gnu_cxx::power (
    _Tp __x,
    _Integer __n) [inline]
```

This is an SGI extension.

**Todo** Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation\\_5\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_5_style.html)

**power()** [2/2]

```
template<typename _Tp, typename _Integer, typename _MonoidOperation>
_Tp __gnu_cxx::power (
    _Tp __x,
```

```
    _Integer __n,  
    _MonoidOperation __monoid_op) [inline]
```

This is an SGI extension.

**Todo** Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

#### **random\_sample()** [1/2]

```
template<typename _InputIterator, typename _RandomAccessIterator>  
_RandomAccessIterator __gnu_cxx::random_sample (  
    _InputIterator __first,  
    _InputIterator __last,  
    _RandomAccessIterator __out_first,  
    _RandomAccessIterator __out_last) [inline]
```

This is an SGI extension.

**Todo** Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

#### **random\_sample()** [2/2]

```
template<typename _InputIterator, typename _RandomAccessIterator, typename _RandomNumberGenerator>  
_RandomAccessIterator __gnu_cxx::random_sample (  
    _InputIterator __first,  
    _InputIterator __last,  
    _RandomAccessIterator __out_first,  
    _RandomAccessIterator __out_last,  
    _RandomNumberGenerator & __rand) [inline]
```

This is an SGI extension.

**Todo** Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

#### **random\_sample\_n()** [1/2]

```
template<typename _ForwardIterator, typename _OutputIterator, typename _Distance>  
_OutputIterator __gnu_cxx::random_sample_n (  
    _ForwardIterator __first,  
    _ForwardIterator __last,  
    _OutputIterator __out,  
    const _Distance __n)
```

This is an SGI extension.

**Todo** Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

References [std::distance\(\)](#), [std::min\(\)](#), and [random\\_sample\\_n\(\)](#).

Referenced by [random\\_sample\\_n\(\)](#).

**random\_sample\_n()** [2/2]

```
template<typename _ForwardIterator, typename _OutputIterator, typename _Distance, typename _RandomNumberGenerator>
_OutputIterator __gnu_cxx::random_sample_n (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _OutputIterator __out,
    const _Distance __n,
    _RandomNumberGenerator & __rand)
```

This is an SGI extension.

**Todo** Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html)

References [std::distance\(\)](#), and [std::min\(\)](#).

**uninitialized\_copy\_n()**

```
template<typename _InputIter, typename _Size, typename _ForwardIter>
std::pair< _InputIter, _ForwardIter > __gnu_cxx::uninitialized_copy_n (
    _InputIter __first,
    _Size __count,
    _ForwardIter __result) [inline]
```

Copies the range [first,last) into result.

**Parameters**

<code>__first</code>	An input iterator.
<code>__count</code>	Length
<code>__result</code>	An output iterator.

**Returns**

`__result + (__first + __count)`

Like `copy()`, but does not require an initialized output range.

References [std::\\_\\_iterator\\_category\(\)](#).

### 3.7.1 Detailed Description

### 3.7.2 Typedef Documentation

#### file\_time\_type

using `std::filesystem::file_time_type`

The type used for file timestamps.

### 3.7.3 Enumeration Type Documentation

#### copy\_options

enum class `std::filesystem::copy_options` : unsigned short [strong]

Bitmask type controlling effects of `filesystem::copy`

#### directory\_options

enum class `std::filesystem::directory_options` : unsigned char [strong]

Bitmask type controlling directory iteration.

#### file\_type

enum class `std::filesystem::file_type` : signed char [strong]

Enumerated type representing the type of a file.

#### perm\_options

enum class `std::filesystem::perm_options` : unsigned [strong]

Bitmask type controlling changes to permissions.

#### perms

enum class `std::filesystem::perms` : unsigned [strong]

Bitmask type representing file access permissions.

### 3.7.4 Function Documentation

#### begin() [1/2]

```
directory_iterator begin (  
    directory_iterator __iter) [related]
```

Enable range-based `for` using `directory_iterator`.

Since

C++17

e.g. `for (auto& entry : std::filesystem::directory_iterator(".")) ...`

#### begin() [2/2]

```
recursive_directory_iterator begin (  
    recursive_directory_iterator __iter) [related]
```

Enable range-based `for` using `recursive_directory_iterator`.

Since

C++17

e.g. `for (auto& entry : recursive_directory_iterator(".")) ...`

**end()** [1/2]

```
directory_iterator end (
    directory_iterator ) [related]
```

Return a past-the-end `directory_iterator`.

**end()** [2/2]

```
recursive_directory_iterator end (
    recursive_directory_iterator ) [related]
```

Return a past-the-end `recursive_directory_iterator`.

**u8path()** [1/2]

```
template<typename _InputIterator, typename _Require = __detail::_Path2<_InputIterator>, typename
_CharT = __detail::_value_type_is_char_or_char8_t<_InputIterator>>
```

```
path u8path (
    _InputIterator __first,
    _InputIterator __last) [related]
```

Create a path from a UTF-8-encoded sequence of char

Since

C++17

References [u8path\(\)](#).

Referenced by [u8path\(\)](#), and [u8path\(\)](#).

**u8path()** [2/2]

```
template<typename _Source, typename _Require = __detail::_Path<_Source>, typename _CharT = __↵
detail::_value_type_is_char_or_char8_t<_Source>>
```

```
path u8path (
    const _Source & __source) [related]
```

Create a path from a UTF-8-encoded sequence of char

Since

C++17

References [u8path\(\)](#).

- typedef `basic_stringstream< wchar_t > std::wstringstream`

### 3.8.1 Detailed Description

Nearly all of the I/O classes are parameterized on the type of characters they read and write. (The major exception is `ios_base` at the top of the hierarchy.) This is a change from pre-Standard streams, which were not templates.

For ease of use and compatibility, all of the `basic_*` I/O-related classes are given typedef names for both of the builtin character widths (wide and narrow). The typedefs are the same as the pre-Standard names, for example:

```
typedef basic_ifstream<char> ifstream;
```

Because properly forward-declaring these classes can be difficult, you should not do it yourself. Instead, include the `<iosfwd>` header, which contains only declarations of all the I/O classes as well as the typedefs. Trying to forward-declare the typedefs themselves (e.g., `class ostream;`) is not valid ISO C++.

For more specific declarations, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/io.html#std.io.objects>

### 3.8.2 Typedef Documentation

#### **filebuf**

```
typedef basic_filebuf<char> std::filebuf
```

Class for `char` file buffers.

#### **fstream**

```
typedef basic_fstream<char> std::fstream
```

Class for `char` mixed input and output file streams.

#### **ifstream**

```
typedef basic_ifstream<char> std::ifstream
```

Class for `char` input file streams.

#### **ios**

```
typedef basic_ios<char> std::ios
```

Base class for `char` streams.

#### **iostream**

```
typedef basic_iostream<char> std::iostream
```

Base class for `char` mixed input and output streams.

#### **istream**

```
typedef basic_istream<char> std::istream
```

Base class for `char` input streams.

#### **istreamstream**

```
typedef basic_istreamstream<char> std::istreamstream
```

Class for `char` input memory streams.

#### **ofstream**

```
typedef basic_ofstream<char> std::ofstream
```

Class for `char` output file streams.

**ostream**

```
typedef basic_ostream<char> std::ostream
```

Base class for `char` output streams.

**ostringstream**

```
typedef basic_ostringstream<char> std::ostringstream
```

Class for `char` output memory streams.

**streambuf**

```
typedef basic_streambuf<char> std::streambuf
```

Base class for `char` buffers.

**stringbuf**

```
typedef basic_stringbuf<char> std::stringbuf
```

Class for `char` memory buffers.

**stringstream**

```
typedef basic_stringstream<char> std::stringstream
```

Class for `char` mixed input and output memory streams.

**wfilebuf**

```
typedef basic_filebuf<wchar_t> std::wfilebuf
```

Class for `wchar_t` file buffers.

**wfstream**

```
typedef basic_wfstream<wchar_t> std::wfstream
```

Class for `wchar_t` mixed input and output file streams.

**wifstream**

```
typedef basic_ifstream<wchar_t> std::wifstream
```

Class for `wchar_t` input file streams.

**wios**

```
typedef basic_ios<wchar_t> std::wios
```

Base class for `wchar_t` streams.

**wiostream**

```
typedef basic_iostream<wchar_t> std::wiostream
```

Base class for `wchar_t` mixed input and output streams.

**wistream**

```
typedef basic_istream<wchar_t> std::wistream
```

Base class for `wchar_t` input streams.

**wistringstream**

typedef `basic_istream<wchar_t>` `std::wistream`  
 Class for `wchar_t` input memory streams.

**wofstream**

typedef `basic_ofstream<wchar_t>` `std::wofstream`  
 Class for `wchar_t` output file streams.

**wostream**

typedef `basic_ostream<wchar_t>` `std::wostream`  
 Base class for `wchar_t` output streams.

**wostringstream**

typedef `basic_ostream<wchar_t>` `std::wostringstream`  
 Class for `wchar_t` output memory streams.

**wstreambuf**

typedef `basic_streambuf<wchar_t>` `std::wstreambuf`  
 Base class for `wchar_t` buffers.

**wstringbuf**

typedef `basic_stringbuf<wchar_t>` `std::wstringbuf`  
 Class for `wchar_t` memory buffers.

**wstringstream**

typedef `basic_stringstream<wchar_t>` `std::wstringstream`  
 Class for `wchar_t` mixed input and output memory streams.

### 3.9.1 Detailed Description

Abstractions for uniform iterating through various underlying types.

### 3.9.2 Function Documentation

#### `__iterator_category()`

```
template<typename _Iter>
iterator_traits< _Iter >::iterator_category std::__iterator_category (
    const _Iter & ) [inline], [constexpr]
```

This function is not a part of the C++ standard but is syntactic sugar for internal library use only.

Referenced by `std::basic_string< _CharT >::basic_string()`, `std::deque< _Tp, polymorphic_allocator< _Tp > >::deque()`, `std::vector< _Tp, polymorphic_allocator< _Tp > >::vector()`, `__gnu_debug::__valid_range_aux()`, `advance()`, `std::deque< _Tp, polymorphic_allocator< _Tp > >::assign()`, `__gnu_cxx::copy_n()`, `__gnu_cxx::distance()`, `distance()`, `fill_n()`, `std::deque< _Tp, polymorphic_allocator< _Tp > >::insert()`, `std::vector< _Tp, polymorphic_allocator< _Tp > >::insert()`, `partition()`, `reverse()`, `rotate()`, and `__gnu_cxx::uninitialized_copy_n()`.

#### `back_inserter()`

```
template<typename _Container>
back_insert_iterator< _Container > std::back_inserter (
    _Container & __x) [inline], [nodiscard], [constexpr]
```

##### Parameters

<code>__x</code>	A container of arbitrary type.
------------------	--------------------------------

##### Returns

An instance of `back_insert_iterator` working on `__x`.

This wrapper function helps in creating `back_insert_iterator` instances. Typing the name of the iterator requires knowing the precise full type of the container, which can be tedious and impedes generic programming. Using this function lets you take advantage of automatic template parameter deduction, making the compiler match the correct types for you.

Referenced by `std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >::format()`, `std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >::format()`, `regex_replace()`, `regex_replace()`, `regex_replace()`, and `regex_replace()`.

#### `front_inserter()`

```
template<typename _Container>
front_insert_iterator< _Container > std::front_inserter (
    _Container & __x) [inline], [nodiscard], [constexpr]
```

##### Parameters

<code>__x</code>	A container of arbitrary type.
------------------	--------------------------------

##### Returns

An instance of `front_insert_iterator` working on `x`.

This wrapper function helps in creating `front_insert_iterator` instances. Typing the name of the iterator requires knowing the precise full type of the container, which can be tedious and impedes generic programming. Using this function lets you take advantage of automatic template parameter deduction, making the compiler match the correct types for you.

**inserter()**

```
template<typename _Container>
insert_iterator< _Container > std::inserter (
    _Container & __x,
    std::__detail::__range_iter_t< _Container > __i) [nodiscard], [constexpr]
```

**Parameters**

$\leftrightarrow$ __x	A container of arbitrary type.
$\leftrightarrow$ __i	An iterator into the container.

**Returns**

An instance of insert\_iterator working on \_\_x.

This wrapper function helps in creating insert\_iterator instances. Typing the name of the iterator requires knowing the precise full type of the container, which can be tedious and impedes generic programming. Using this function lets you take advantage of automatic template parameter deduction, making the compiler match the correct types for you.

**make\_reverse\_iterator()**

```
template<typename _Iterator>
reverse_iterator< _Iterator > std::make_reverse_iterator (
    _Iterator __i) [inline], [constexpr]
```

Generator function for reverse\_iterator.

**operator==()**

```
template<typename _IteratorL, typename _IteratorR>
requires requires { { __x.base() == __y.base() } -> convertible_to<bool>; }
bool std::operator== (
    const reverse_iterator< _IteratorL > & __x,
    const reverse_iterator< _IteratorR > & __y) [nodiscard], [constexpr]
```

**Parameters**

$\leftrightarrow$ __x	A reverse_iterator.
$\leftrightarrow$ __y	A reverse_iterator.

**Returns**

A simple bool.

Reverse iterators forward comparisons to their underlying base() iterators.

References [std::reverse\\_iterator< \\_Iterator >::base\(\)](#).

### 3.9.3 Iterator Tags

Collaboration diagram for Iterator Tags:

#### Classes

- struct [std::bidirectional\\_iterator\\_tag](#)
- struct [std::contiguous\\_iterator\\_tag](#)

- struct [std::input\\_iterator\\_tag](#)
- struct [std::output\\_iterator\\_tag](#)
- struct [std::random\\_access\\_iterator\\_tag](#)

#### 3.9.3.1 Detailed Description

These are empty types, used to distinguish different iterators. The distinction is not made by what they contain, but simply by what they are. Different underlying algorithms can then be used based on the different operations supported by different iterator types.

`bool std::has_facet (const locale &__loc)`
- `template<typename _Facet>`  
`const _Facet &std::use_facet (const locale &__loc)`

### 3.10.1 Detailed Description

Classes and functions for internationalization and localization.

### 3.10.2 Function Documentation

#### `has_facet()`

```
template<typename _Facet>
bool std::has_facet (
    const locale & __loc) [inline], [nodiscard], [noexcept]
```

Test for the presence of a facet.

`has_facet` tests the `locale` argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

#### Template Parameters

<code>_Facet</code>	The facet type to test the presence of.
---------------------	---

## Parameters

<code>__loc</code>	The locale to test.
--------------------	---------------------

## Returns

true if `__loc` contains a facet of type `_Facet`, else false.

**use\_facet()**

```
template<typename _Facet>
const _Facet & std::use_facet (
    const locale & __loc) [inline], [nodiscard]
```

Return a facet.

`use_facet` looks for and returns a reference to a facet of type `Facet` where `Facet` is the template parameter. If `has_facet(locale)` is true, there is a suitable facet to return. It throws `std::bad_cast` if the locale doesn't contain a facet of type `Facet`.

## Template Parameters

<code>_Facet</code>	The facet type to access.
---------------------	---------------------------

## Parameters

<code>__loc</code>	The locale to use.
--------------------	--------------------

## Returns

Reference to facet of type `Facet`.

## Exceptions

<code>std::bad_cast</code>	if <code>__loc</code> doesn't contain a facet of type <code>_Facet</code> .
----------------------------	---

Referenced by `std::money_get<_CharT, _InIter>::do_get()`, `std::time_get<_CharT, _InIter>::do_get()`, `std::time_get<_CharT, _InIter>::do_get_monthname()`, `std::time_get<_CharT, _InIter>::do_get_time()`, `std::time_get<_CharT, _InIter>::do_get_year()`, `std::money_put<_CharT, _OutIter>::do_put()`, `std::time_put<_CharT, _OutIter>::do_put()`, `std::time_get<_CharT, _InIter>::get()`, `isalnum()`, `isalpha()`, `isblank()`, `iscntrl()`, `std::regex_traits<_Ch_type>::isctype()`, `isdigit()`, `isgraph()`, `islower()`, `isprint()`, `ispunct()`, `isspace()`, `isupper()`, `isxdigit()`, `std::regex_traits<_Ch_type>::lookup_classname()`, `std::regex_traits<_Ch_type>::lookup_collatename()`, `std::basic_ostream<_CharT, _Traits>::operator<<()`, `std::basic_istream<_CharT, _Traits>::operator>>()`, `std::time_put<_CharT, _OutIter>::put()`, `tolower()`, `toupper()`, `std::regex_traits<_CharT>::transform()`, `std::regex_traits<_CharT>::transform_primary()`, `std::regex_traits<_CharT>::translate_nocase()`, `std::regex_traits<_Ch_type>::value()` and `ws()`.

### 3.11.3.1 Detailed Description

Classes and functions for complex numbers.

### 3.11.3.2 Function Documentation

#### abs()

```
template<typename _Tp>
_Tp std::abs (
    const complex< _Tp > & __z) [inline]
```

Return magnitude of z.

Referenced by [fabs\(\)](#), [std::tr1::fabs\(\)](#), [frexp\(\)](#), [std::binomial\\_distribution< \\_IntType >::operator\(\)\(\)](#), and [std::poisson\\_distribution< \\_IntType](#)

#### arg()

```
template<typename _Tp>
_Tp std::arg (
    const complex< _Tp > & __z) [inline]
```

Return phase angle of z.

#### conj()

```
template<typename _Tp>
complex< _Tp > std::conj (
    const complex< _Tp > & __z) [inline], [constexpr]
```

Return complex conjugate of z.

#### cos()

```
template<typename _Tp>
complex< _Tp > std::cos (
    const complex< _Tp > & __z) [inline]
```

Return complex cosine of z.

Referenced by [polar\(\)](#).

#### cosh()

```
template<typename _Tp>
complex< _Tp > std::cosh (
    const complex< _Tp > & __z) [inline]
```

Return complex hyperbolic cosine of z.

#### exp()

```
template<typename _Tp>
complex< _Tp > std::exp (
    const complex< _Tp > & __z) [inline]
```

Return complex base e exponential of z.

Referenced by [pow\(\)](#).

#### fabs()

```
template<typename _Tp>
std::complex< _Tp > std::tr1::fabs (
    const std::complex< _Tp > & __z) [inline]
```

[fabs\(\\_\\_z\)](#) [8.1.8].

References [std::abs\(\)](#).

**log()**

```
template<typename _Tp>
complex< _Tp > std::log (
    const complex< _Tp > & __z) [inline]
```

Return complex natural logarithm of z.

Referenced by [log10\(\)](#), [std::binomial\\_distribution< \\_IntType >::operator\(\)\(\)](#), [std::gamma\\_distribution< \\_RealType >::operator\(\)\(\)](#), [std::normal\\_distribution< \\_RealType >::operator\(\)\(\)](#), [std::poisson\\_distribution< \\_IntType >::operator\(\)\(\)](#), [operator<<\(\)](#), [operator<<\(\)](#), [operator<<\(\)](#), [pow\(\)](#), and [pow\(\)](#).

**log10()**

```
template<typename _Tp>
complex< _Tp > std::log10 (
    const complex< _Tp > & __z) [inline]
```

Return complex base 10 logarithm of z.

References [log\(\)](#).

**norm()**

```
template<typename _Tp>
_Tp constexpr std::norm (
    const complex< _Tp > & __z) [inline], [constexpr]
```

Return z magnitude squared.

Referenced by [std::complex< \\_Tp >::operator/\(\)](#).

**operator\*() [1/3]**

```
template<typename _Tp>
complex< _Tp > std::operator* (
    const _Tp & __x,
    const complex< _Tp > & __y) [inline], [constexpr]
```

Return new complex value x times y.

**operator\*() [2/3]**

```
template<typename _Tp>
complex< _Tp > std::operator* (
    const complex< _Tp > & __x,
    const _Tp & __y) [inline], [constexpr]
```

Return new complex value x times y.

**operator\*() [3/3]**

```
template<typename _Tp>
complex< _Tp > std::operator* (
    const complex< _Tp > & __x,
    const complex< _Tp > & __y) [inline], [constexpr]
```

Return new complex value x times y.

**operator\*=() [1/2]**

```
template<typename _Tp>
complex< _Tp > & std::complex< _Tp >::operator*= (
    const _Tp & __t) [constexpr]
```

Multiply this complex number by a scalar.

**operator\*=() [2/2]**

```
template<typename _Tp>
template<typename _Up>
complex< _Tp > & std::complex< _Tp >::operator*= (
    const complex< _Up > & __z) [constexpr]
```

Multiply this complex number by another.

References [complex\(\)](#).

**operator+() [1/4]**

```
template<typename _Tp>
complex< _Tp > std::operator+ (
    const _Tp & __x,
    const complex< _Tp > & __y) [inline], [constexpr]
```

Return new complex value x plus y.

**operator+() [2/4]**

```
template<typename _Tp>
complex< _Tp > std::operator+ (
    const complex< _Tp > & __x) [inline], [constexpr]
```

Return x.

**operator+() [3/4]**

```
template<typename _Tp>
complex< _Tp > std::operator+ (
    const complex< _Tp > & __x,
    const _Tp & __y) [inline], [constexpr]
```

Return new complex value x plus y.

**operator+() [4/4]**

```
template<typename _Tp>
complex< _Tp > std::operator+ (
    const complex< _Tp > & __x,
    const complex< _Tp > & __y) [inline], [constexpr]
```

Return new complex value x plus y.

**operator+=()**

```
template<typename _Tp>
template<typename _Up>
complex< _Tp > & std::complex< _Tp >::operator+= (
    const complex< _Up > & __z) [constexpr]
```

Add another complex number to this one.

References [complex\(\)](#).

**operator-() [1/4]**

```
template<typename _Tp>
complex< _Tp > std::operator- (
    const _Tp & __x,
    const complex< _Tp > & __y) [inline], [constexpr]
```

Return new complex value x minus y.

**operator-() [2/4]**

```
template<typename _Tp>
complex< _Tp > std::operator- (
    const complex< _Tp > & __x) [inline], [constexpr]
```

Return complex negation of x.

**operator-() [3/4]**

```
template<typename _Tp>
complex< _Tp > std::operator- (
    const complex< _Tp > & __x,
    const _Tp & __y) [inline], [constexpr]
```

Return new complex value x minus y.

**operator-() [4/4]**

```
template<typename _Tp>
complex< _Tp > std::operator- (
    const complex< _Tp > & __x,
    const complex< _Tp > & __y) [inline], [constexpr]
```

Return new complex value x minus y.

**operator-=( )**

```
template<typename _Tp>
template<typename _Up>
complex< _Tp > & std::complex< _Tp >::operator-= (
    const complex< _Up > & __z) [constexpr]
```

Subtract another complex number from this one.

References [complex\(\)](#).

**operator/( ) [1/3]**

```
template<typename _Tp>
complex< _Tp > std::operator/ (
    const _Tp & __x,
    const complex< _Tp > & __y) [inline], [constexpr]
```

Return new complex value x divided by y.

**operator/( ) [2/3]**

```
template<typename _Tp>
complex< _Tp > std::operator/ (
    const complex< _Tp > & __x,
    const _Tp & __y) [inline], [constexpr]
```

Return new complex value x divided by y.

**operator/( ) [3/3]**

```
template<typename _Tp>
complex< _Tp > std::operator/ (
    const complex< _Tp > & __x,
    const complex< _Tp > & __y) [inline], [constexpr]
```

Return new complex value x divided by y.

**operator/=(** [1/2]

```
template<typename _Tp>
complex< _Tp > & std::complex< _Tp >::operator/= (
    const _Tp & __t) [constexpr]
```

Divide this complex number by a scalar.

**operator/=(** [2/2]

```
template<typename _Tp>
template<typename _Up>
complex< _Tp > & std::complex< _Tp >::operator/= (
    const complex< _Up > & __z) [constexpr]
```

Divide this complex number by another.

References [complex\(\)](#), and [std::norm\(\)](#).

**operator<<()**

```
template<typename _Tp, typename _CharT, class _Traits>
basic_ostream< _CharT, _Traits > & std::operator<< (
    basic_ostream< _CharT, _Traits > & __os,
    const complex< _Tp > & __x)
```

Insertion operator for complex values.

References [std::ios\\_base::failbit](#), [std::basic\\_istream< \\_CharT, \\_Traits >::putback\(\)](#), [std::basic\\_ios< \\_CharT, \\_Traits >::setstate\(\)](#), and [std::basic\\_ios< \\_CharT, \\_Traits >::widen\(\)](#).

**operator=()** [1/2]

```
template<typename _Tp>
complex< _Tp > & std::complex< _Tp >::operator= (
    const _Tp & __t) [constexpr]
```

Assign a scalar to this complex number.

**operator=()** [2/2]

```
template<typename _Tp>
template<typename _Up>
complex< _Tp > & std::complex< _Tp >::operator= (
    const complex< _Up > & __z) [constexpr]
```

Assign another complex number to this one.

References [complex\(\)](#).

**operator==(** [1/2]

```
template<typename _Tp>
bool std::operator== (
    const complex< _Tp > & __x,
    const _Tp & __y) [inline], [constexpr]
```

Return true if *x* is equal to *y*.

**operator==(** [2/2]

```
template<typename _Tp>
bool std::operator== (
    const complex< _Tp > & __x,
    const complex< _Tp > & __y) [inline], [constexpr]
```

Return true if  $x$  is equal to  $y$ .

### **operator>>()**

```
template<typename _Tp, typename _CharT, class _Traits>
basic_istream< _CharT, _Traits > & std::operator>> (
    basic_istream< _CharT, _Traits > & __is,
    complex< _Tp > & __x)
```

Extraction operator for complex values.

### **polar()**

```
template<typename _Tp>
complex< _Tp > std::polar (
    const _Tp & __rho,
    const _Tp & __theta = _Tp(0)) [inline]
```

Return complex with magnitude  $\rho$  and angle  $\theta$ .

References [cos\(\)](#), and [sin\(\)](#).

Referenced by [pow\(\)](#), and [pow\(\)](#).

### **pow()** [1/5]

```
template<typename _Tp>
complex< _Tp > std::pow (
    const _Tp & __x,
    const complex< _Tp > & __y) [inline]
```

Return  $x$  to the  $y$ 'th power.

References [log\(\)](#), [polar\(\)](#), and [pow\(\)](#).

### **pow()** [2/5]

```
template<typename _Tp>
complex< _Tp > std::pow (
    const complex< _Tp > & __x,
    const _Tp & __y)
```

Return  $x$  to the  $y$ 'th power.

References [exp\(\)](#), [log\(\)](#), [polar\(\)](#), and [pow\(\)](#).

### **pow()** [3/5]

```
template<typename _Tp>
complex< _Tp > std::pow (
    const complex< _Tp > & __x,
    const complex< _Tp > & __y) [inline]
```

Return  $x$  to the  $y$ 'th power.

### **pow()** [4/5]

```
template<typename _Tp>
complex< _Tp > std::pow (
    const complex< _Tp > & __z,
    int __n) [inline]
```

Return  $x$  to the  $y$ 'th power.

Referenced by [std::gamma\\_distribution< \\_RealType >::operator\(\)\(\)](#), [operator<<\(\)](#), [pow\(\)](#), [pow\(\)](#), and [std::tr1::pow\(\)](#).

**pow()** [5/5]

```
template<typename _Tp, typename _Up>
std::complex< typename __gnu_cxx::__promote_2< _Tp, _Up >::__type > std::tr1::pow (
    const std::complex< _Tp > & __x,
    const _Up & __y) [inline]
```

Additional overloads [8.1.9].

References [std::pow\(\)](#).

**sin()**

```
template<typename _Tp>
complex< _Tp > std::sin (
    const complex< _Tp > & __z) [inline]
```

Return complex sine of z.

Referenced by [polar\(\)](#).

**sinh()**

```
template<typename _Tp>
complex< _Tp > std::sinh (
    const complex< _Tp > & __z) [inline]
```

Return complex hyperbolic sine of z.

**sqrt()**

```
template<typename _Tp>
complex< _Tp > std::sqrt (
    const complex< _Tp > & __z) [inline]
```

Return complex square root of z.

Referenced by [std::normal\\_distribution< \\_RealType >::operator\(\)\(\)](#), and [std::student\\_t\\_distribution< \\_RealType >::operator\(\)\(\)](#).

**tan()**

```
template<typename _Tp>
complex< _Tp > std::tan (
    const complex< _Tp > & __z) [inline]
```

Return complex tangent of z.

Referenced by [operator<<\(\)](#).

**tanh()**

```
template<typename _Tp>
complex< _Tp > std::tanh (
    const complex< _Tp > & __z) [inline]
```

Return complex hyperbolic tangent of z.

### 3.11.4 Decimal Floating-Point Arithmetic

Collaboration diagram for Decimal Floating-Point Arithmetic:

#### Namespaces

- namespace [std::decimal](#)

#### 3.11.4.1 Detailed Description

Classes and functions for decimal floating-point arithmetic.

### 3.11.5 Mathematical Special Functions

### 3.11.5.1 Detailed Description

### 3.11.5.2 Mathematical Special Functions

A collection of advanced mathematical special functions, defined by ISO/IEC IS 29124 and then added to ISO C++ 2017.

#### 3.11.5.2.1 Introduction and History

The first significant library upgrade on the road to C++2011, [TR1](#), included a set of 23 mathematical functions that significantly extended the standard transcendental functions inherited from C and declared in `<cmath>`.

Although most components from TR1 were eventually adopted for C++11 these math functions were left behind out of concern for implementability. The math functions were published as a separate international standard [IS 29124 – Extensions to the C++ Library to Support Mathematical Special Functions](#).

For C++17 these functions were incorporated into the main standard.

### 3.11.5.2.2 Contents

The following functions are implemented in namespace `std`:

- `assoc_laguerre` - Associated Laguerre functions
- `assoc_legendre` - Associated Legendre functions
- `beta` - Beta functions
- `comp_ellint_1` - Complete elliptic functions of the first kind
- `comp_ellint_2` - Complete elliptic functions of the second kind
- `comp_ellint_3` - Complete elliptic functions of the third kind
- `cyl_bessel_i` - Regular modified cylindrical Bessel functions
- `cyl_bessel_j` - Cylindrical Bessel functions of the first kind
- `cyl_bessel_k` - Irregular modified cylindrical Bessel functions
- `cyl_neumann` - Cylindrical Neumann functions or Cylindrical Bessel functions of the second kind
- `ellint_1` - Incomplete elliptic functions of the first kind
- `ellint_2` - Incomplete elliptic functions of the second kind
- `ellint_3` - Incomplete elliptic functions of the third kind
- `expint` - The exponential integral
- `hermite` - Hermite polynomials
- `laguerre` - Laguerre functions
- `legendre` - Legendre polynomials
- `riemann_zeta` - The Riemann zeta function
- `sph_bessel` - Spherical Bessel functions
- `sph_legendre` - Spherical Legendre functions
- `sph_neumann` - Spherical Neumann functions

The hypergeometric functions were stricken from the TR29124 and C++17 versions of this math library because of implementation concerns. However, since they were in the TR1 version and since they are popular we kept them as an extension in namespace `__gnu_cxx`:

- [conf\\_hyperg](#) - Confluent hypergeometric functions
- [hyperg](#) - Hypergeometric functions

### 3.11.5.2.3 Argument Promotion

The arguments supplied to the non-suffixed functions will be promoted according to the following rules:

1. If any argument intended to be floating point is given an integral value That integral value is promoted to double.
2. All floating point arguments are promoted up to the largest floating point precision among them.

### 3.11.5.2.4 NaN Arguments

If any of the floating point arguments supplied to these functions is invalid or NaN (`std::numeric_limits<Tp>::quiet_NaN`), the value NaN is returned.

### 3.11.5.2.5 Implementation

We strive to implement the underlying math with type generic algorithms to the greatest extent possible. In practice, the functions are thin wrappers that dispatch to function templates. Type dependence is controlled with `std::numeric_limits` and functions thereof.

We don't promote `float` to `double` or `double` to `long double` reflexively. The goal is for `float` functions to operate more quickly, at the cost of `float` accuracy and possibly a smaller domain of validity. Similarly, `long double` should give you more dynamic range and slightly more precision than `double` on many systems.

### 3.11.5.2.6 Testing

These functions have been tested against equivalent implementations from the [Gnu Scientific Library, GSL](#) and [Boost](#) and the ratio

$$\frac{|f - f_{test}|}{|f_{test}|}$$

is generally found to be within  $10^{-15}$  for 64-bit double on linux-x86\_64 systems over most of the ranges of validity.

**Todo** Provide accuracy comparisons on a per-function basis for a small number of targets.

### 3.11.5.2.7 General Bibliography

### 3.11.5.3 Function Documentation

#### `airy_ai()`

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type __gnu_cxx::airy_ai (
    _Tp __x) [inline]
```

Return the Airy function  $Ai(x)$  of real argument x.

**airy\_aif()**

```
float __gnu_cxx::airy_aif (
    float __x) [inline]
```

Return the Airy function  $Ai(x)$  of float argument x.

**airy\_ail()**

```
long double __gnu_cxx::airy_ail (
    long double __x) [inline]
```

Return the Airy function  $Ai(x)$  of long double argument x.

**airy\_bi()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type __gnu_cxx::airy_bi (
    _Tp __x) [inline]
```

Return the Airy function  $Bi(x)$  of real argument x.

**airy\_bif()**

```
float __gnu_cxx::airy_bif (
    float __x) [inline]
```

Return the Airy function  $Bi(x)$  of float argument x.

**airy\_bil()**

```
long double __gnu_cxx::airy_bil (
    long double __x) [inline]
```

Return the Airy function  $Bi(x)$  of long double argument x.

**assoc\_laguerre()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::assoc_laguerre (
    unsigned int __n,
    unsigned int __m,
    _Tp __x) [inline]
```

Return the associated Laguerre polynomial of nonnegative order n, nonnegative degree m and real argument x ↦  $L_n^m(x)$ .

The associated Laguerre function of real degree  $\alpha$ ,  $L_n^\alpha(x)$ , is defined by

$$L_n^\alpha(x) = \frac{(\alpha+1)_n}{n!} {}_1F_1(-n; \alpha+1; x)$$

where  $(\alpha)_n$  is the Pochhammer symbol and  ${}_1F_1(a; c; x)$  is the confluent hypergeometric function.

The associated Laguerre polynomial is defined for integral degree  $\alpha = m$  by:

$$L_n^m(x) = (-1)^m \frac{d^m}{dx^m} L_{n+m}(x)$$

where the Laguerre polynomial is defined by:

$$L_n(x) = \frac{e^x}{n!} \frac{d^n}{dx^n} (x^n e^{-x})$$

and  $x \geq 0$ .

See also

`laguerre` for details of the Laguerre function of degree `n`

#### Template Parameters

<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .
------------------	--

#### Parameters

<code>__n</code>	The order of the Laguerre function, <code>__n &gt;= 0</code> .
<code>__m</code>	The degree of the Laguerre function, <code>__m &gt;= 0</code> .
<code>__x</code>	The argument of the Laguerre function, <code>__x &gt;= 0</code> .

#### Exceptions

<code>std::domain_error</code>	if <code>__x &lt; 0</code> .
--------------------------------	------------------------------

### `assoc_laguerref()`

```
float std::assoc_laguerref (  
    unsigned int __n,  
    unsigned int __m,  
    float __x) [inline]
```

Return the associated Laguerre polynomial of order `n`, degree `m`:  $L_n^m(x)$  for `float` argument.

See also

`assoc_laguerre` for more details.

### `assoc_laguerrel()`

```
long double std::assoc_laguerrel (  
    unsigned int __n,  
    unsigned int __m,  
    long double __x) [inline]
```

Return the associated Laguerre polynomial of order `n`, degree `m`:  $L_n^m(x)$ .

See also

`assoc_laguerre` for more details.

### `assoc_legendre()`

```
template<typename _Tp>  
__gnu_cxx::__promote< _Tp >::__type std::assoc_legendre (  
    unsigned int __l,
```

```
    unsigned int __m,
    _Tp __x) [inline]
```

Return the associated Legendre function of degree `l` and order `m`.

The associated Legendre function is derived from the Legendre function  $P_l(x)$  by the Rodrigues formula:

$$P_l^m(x) = (1 - x^2)^{m/2} \frac{d^m}{dx^m} P_l(x)$$

See also

`legendre` for details of the Legendre function of degree `l`

#### Template Parameters

<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .
------------------	--

#### Parameters

<code>__l</code>	The degree <code>__l</code> $\geq 0$ .
<code>__m</code>	The order <code>__m</code> $\leq l$ .
<code>__x</code>	The argument, <code>abs (__x)</code> $\leq 1$ .

#### Exceptions

<code>std::domain_error</code>	if <code>abs (__x) &gt; 1</code> .
--------------------------------	------------------------------------

#### `assoc_legendref()`

```
float std::assoc_legendref (
    unsigned int __l,
    unsigned int __m,
    float __x) [inline]
```

Return the associated Legendre function of degree `l` and order `m` for `float` argument.

See also

`assoc_legendre` for more details.

#### `assoc_legendrel()`

```
long double std::assoc_legendrel (
    unsigned int __l,
    unsigned int __m,
    long double __x) [inline]
```

Return the associated Legendre function of degree `l` and order `m`.

See also

`assoc_legendre` for more details.

**beta()**

```
template<typename _Tpa, typename _Tpb>
__gnu_cxx::__promote_2< _Tpa, _Tpb >::__type std::beta (
    _Tpa __a,
    _Tpb __b) [inline]
```

Return the beta function,  $B(a, b)$ , for real parameters  $a, b$ .

The beta function is defined by

$$B(a, b) = \int_0^1 t^{a-1} (1-t)^{b-1} dt = \frac{\Gamma(a)\Gamma(b)}{\Gamma(a+b)}$$

where  $a > 0$  and  $b > 0$

**Template Parameters**

<code>_Tpa</code>	The floating-point type of the parameter <code>__a</code> .
<code>_Tpb</code>	The floating-point type of the parameter <code>__b</code> .

**Parameters**

<code>__a</code>	The first argument of the beta function, <code>__a &gt; 0</code> .
<code>__b</code>	The second argument of the beta function, <code>__b &gt; 0</code> .

**Exceptions**

<code>std::domain_error</code>	if <code>__a &lt; 0</code> or <code>__b &lt; 0</code> .
--------------------------------	---

**betaf()**

```
float std::betaf (
    float __a,
    float __b) [inline]
```

Return the beta function,  $B(a, b)$ , for `float` parameters  $a, b$ .

**See also**

`beta` for more details.

**betal()**

```
long double std::betal (
    long double __a,
    long double __b) [inline]
```

Return the beta function,  $B(a, b)$ , for long double parameters  $a, b$ .

**See also**

`beta` for more details.

**comp\_ellint\_1()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::comp_ellint_1 (
    _Tp __k) [inline]
```

Return the complete elliptic integral of the first kind  $K(k)$  for real modulus  $k$ .

The complete elliptic integral of the first kind is defined as

$$K(k) = F(k, \pi/2) = \int_0^{\pi/2} \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}}$$

where  $F(k, \phi)$  is the incomplete elliptic integral of the first kind and the modulus  $|k| \leq 1$ .

See also

`ellint_1` for details of the incomplete elliptic function of the first kind.

**Template Parameters**

<code>_Tp</code>	The floating-point type of the modulus <code>__k</code> .
------------------	---

**Parameters**

<code>__k</code>	The modulus, <code>abs (__k) &lt;= 1</code>
------------------	---

**Exceptions**

<code>std::domain_error</code>	if <code>abs (__k) &gt; 1</code> .
--------------------------------	------------------------------------

**comp\_ellint\_1f()**

```
float std::comp_ellint_1f (
    float __k) [inline]
```

Return the complete elliptic integral of the first kind  $E(k)$  for `float` modulus  $k$ .

See also

`comp_ellint_1` for details.

**comp\_ellint\_1l()**

```
long double std::comp_ellint_1l (
    long double __k) [inline]
```

Return the complete elliptic integral of the first kind  $E(k)$  for long double modulus  $k$ .

See also

`comp_ellint_1` for details.

**comp\_ellint\_2()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::comp_ellint_2 (
    _Tp __k) [inline]
```

Return the complete elliptic integral of the second kind  $E(k)$  for real modulus  $k$ .

The complete elliptic integral of the second kind is defined as

$$E(k) = E(k, \pi/2) = \int_0^{\pi/2} \sqrt{1 - k^2 \sin^2 \theta} d\theta$$

where  $E(k, \phi)$  is the incomplete elliptic integral of the second kind and the modulus  $|k| \leq 1$ .

See also

`ellint_2` for details of the incomplete elliptic function of the second kind.

**Template Parameters**

<code>_Tp</code>	The floating-point type of the modulus <code>__k</code> .
------------------	---

**Parameters**

<code>__k</code>	The modulus, <code>abs (__k) &lt;= 1</code>
------------------	---

**Exceptions**

<code>std::domain_error</code>	if <code>abs (__k) &gt; 1</code> .
--------------------------------	------------------------------------

**comp\_ellint\_2f()**

```
float std::comp_ellint_2f (
    float __k) [inline]
```

Return the complete elliptic integral of the second kind  $E(k)$  for `float` modulus  $k$ .

See also

`comp_ellint_2` for details.

**comp\_ellint\_2l()**

```
long double std::comp_ellint_2l (
    long double __k) [inline]
```

Return the complete elliptic integral of the second kind  $E(k)$  for long double modulus  $k$ .

See also

`comp_ellint_2` for details.

**comp\_ellint\_3()**

```
template<typename _Tp, typename _Tpn>
__gnu_cxx::__promote_2< _Tp, _Tpn >::__type std::comp_ellint_3 (
    _Tp __k,
    _Tpn __nu) [inline]
```

Return the complete elliptic integral of the third kind  $\Pi(k, \nu) = \Pi(k, \nu, \pi/2)$  for real modulus  $k$ .  
The complete elliptic integral of the third kind is defined as

$$\Pi(k, \nu) = \Pi(k, \nu, \pi/2) = \int_0^{\pi/2} \frac{d\theta}{(1 - \nu \sin^2 \theta) \sqrt{1 - k^2 \sin^2 \theta}}$$

where  $\Pi(k, \nu, \phi)$  is the incomplete elliptic integral of the second kind and the modulus  $|k| \leq 1$ .

See also

ellint\_3 for details of the incomplete elliptic function of the third kind.

**Template Parameters**

<code>_Tp</code>	The floating-point type of the modulus <code>__k</code> .
<code>_Tpn</code>	The floating-point type of the argument <code>__nu</code> .

**Parameters**

<code>__k</code>	The modulus, <code>abs (__k) &lt;= 1</code>
<code>__nu</code>	The argument

**Exceptions**

<code>std::domain_error</code>	if <code>abs (__k) &gt; 1</code> .
--------------------------------	------------------------------------

**comp\_ellint\_3f()**

```
float std::comp_ellint_3f (
    float __k,
    float __nu) [inline]
```

Return the complete elliptic integral of the third kind  $\Pi(k, \nu)$  for `float` modulus  $k$ .

See also

comp\_ellint\_3 for details.

**comp\_ellint\_3l()**

```
long double std::comp_ellint_3l (
    long double __k,
    long double __nu) [inline]
```

Return the complete elliptic integral of the third kind  $\Pi(k, \nu)$  for `long double` modulus  $k$ .

See also

comp\_ellint\_3 for details.

**conf\_hyperg()**

```
template<typename _Tpa, typename _Tpc, typename _Tp>
__gnu_cxx::__promote_3< _Tpa, _Tpc, _Tp >::__type __gnu_cxx::conf_hyperg (
    _Tpa __a,
    _Tpc __c,
    _Tp __x) [inline]
```

Return the confluent hypergeometric function  ${}_1F_1(a; c; x)$  of real numeratorial parameter  $a$ , denominatorial parameter  $c$ , and argument  $x$ .

The confluent hypergeometric function is defined by

$${}_1F_1(a; c; x) = \sum_{n=0}^{\infty} \frac{(a)_n x^n}{(c)_n n!}$$

where the Pochhammer symbol is  $(x)_k = (x)(x+1)\dots(x+k-1)$ ,  $(x)_0 = 1$

**Parameters**

$\leftrightarrow$ _a	The numeratorial parameter
$\leftrightarrow$ _c	The denominatorial parameter
$\leftrightarrow$ _x	The argument

**conf\_hypergf()**

```
float __gnu_cxx::conf_hypergf (
    float __a,
    float __c,
    float __x) [inline]
```

Return the confluent hypergeometric function  ${}_1F_1(a; c; x)$  of `float` numeratorial parameter  $a$ , denominatorial parameter  $c$ , and argument  $x$ .

**See also**

`conf_hyperg` for details.

**conf\_hypergl()**

```
long double __gnu_cxx::conf_hypergl (
    long double __a,
    long double __c,
    long double __x) [inline]
```

Return the confluent hypergeometric function  ${}_1F_1(a; c; x)$  of `long double` numeratorial parameter  $a$ , denominatorial parameter  $c$ , and argument  $x$ .

**See also**

`conf_hyperg` for details.

**cyl\_bessel\_i()**

```
template<typename _Tpnu, typename _Tp>
__gnu_cxx::__promote_2< _Tpnu, _Tp >::__type std::cyl_bessel_i (
    _Tpnu __nu,
    _Tp __x) [inline]
```

Return the regular modified Bessel function  $I_\nu(x)$  for real order  $\nu$  and argument  $x \geq 0$ .  
 The regular modified cylindrical Bessel function is:

$$I_\nu(x) = i^{-\nu} J_\nu(ix) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}$$

**Template Parameters**

<code>_Tpnu</code>	The floating-point type of the order <code>__nu</code> .
<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .

**Parameters**

<code>__nu</code>	The order
<code>__x</code>	The argument, <code>__x</code> $\geq 0$

**Exceptions**

<code>std::domain_error</code>	if <code>__x</code> $< 0$ .
--------------------------------	-----------------------------

**cyl\_bessel\_if()**

```
float std::cyl_bessel_if (
    float __nu,
    float __x) [inline]
```

Return the regular modified Bessel function  $I_\nu(x)$  for `float` order  $\nu$  and argument  $x \geq 0$ .

**See also**

`cyl_bessel_i` for setails.

**cyl\_bessel\_il()**

```
long double std::cyl_bessel_il (
    long double __nu,
    long double __x) [inline]
```

Return the regular modified Bessel function  $I_\nu(x)$  for `long double` order  $\nu$  and argument  $x \geq 0$ .

**See also**

`cyl_bessel_i` for setails.

**cyl\_bessel\_j()**

```
template<typename _Tpnu, typename _Tp>
__gnu_cxx::__promote_2< _Tpnu, _Tp >::__type std::cyl_bessel_j (
    _Tpnu __nu,
    _Tp __x) [inline]
```

Return the Bessel function  $J_\nu(x)$  of real order  $\nu$  and argument  $x \geq 0$ .

The cylindrical Bessel function is:

$$J_\nu(x) = \sum_{k=0}^{\infty} \frac{(-1)^k (x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}$$

**Template Parameters**

<code>_Tpnu</code>	The floating-point type of the order <code>__nu</code> .
<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .

**Parameters**

<code>__nu</code>	The order
<code>__x</code>	The argument, <code>__x</code> $\geq 0$

**Exceptions**

<code>std::domain_error</code>	if <code>__x</code> $< 0$ .
--------------------------------	-----------------------------

**cyl\_bessel\_jf()**

```
float std::cyl_bessel_jf (
    float __nu,
    float __x) [inline]
```

Return the Bessel function of the first kind  $J_\nu(x)$  for `float` order  $\nu$  and argument  $x \geq 0$ .

**See also**

`cyl_bessel_j` for setails.

**cyl\_bessel\_jl()**

```
long double std::cyl_bessel_jl (
    long double __nu,
    long double __x) [inline]
```

Return the Bessel function of the first kind  $J_\nu(x)$  for `long double` order  $\nu$  and argument  $x \geq 0$ .

**See also**

`cyl_bessel_j` for setails.

**cyl\_bessel\_k()**

```
template<typename _Tpnu, typename _Tp>
__gnu_cxx::__promote_2< _Tpnu, _Tp >::__type std::cyl_bessel_k (
    _Tpnu __nu,
    _Tp __x) [inline]
```

Return the irregular modified Bessel function  $K_\nu(x)$  of real order  $\nu$  and argument  $x$ .

The irregular modified Bessel function is defined by:

$$K_\nu(x) = \frac{\pi}{2} \frac{I_{-\nu}(x) - I_\nu(x)}{\sin \nu\pi}$$

where for integral  $\nu = n$  a limit is taken:  $\lim_{\nu \rightarrow n}$ . For negative argument we have simply:

$$K_{-\nu}(x) = K_\nu(x)$$

**Template Parameters**

<code>_Tpnu</code>	The floating-point type of the order <code>__nu</code> .
<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .

**Parameters**

<code>__nu</code>	The order
<code>__x</code>	The argument, <code>__x &gt;= 0</code>

**Exceptions**

<code>std::domain_error</code>	if <code>__x &lt; 0</code> .
--------------------------------	------------------------------

**cyl\_bessel\_kf()**

```
float std::cyl_bessel_kf (
    float __nu,
    float __x) [inline]
```

Return the irregular modified Bessel function  $K_\nu(x)$  for `float` order  $\nu$  and argument  $x \geq 0$ .

**See also**

`cyl_bessel_k` for setails.

**cyl\_bessel\_kl()**

```
long double std::cyl_bessel_kl (
    long double __nu,
    long double __x) [inline]
```

Return the irregular modified Bessel function  $K_\nu(x)$  for `long double` order  $\nu$  and argument  $x \geq 0$ .

**See also**

`cyl_bessel_k` for setails.

**cyl\_neumann()**

```
template<typename _Tpnu, typename _Tp>
__gnu_cxx::__promote_2< _Tpnu, _Tp >::__type std::cyl_neumann (
    _Tpnu __nu,
    _Tp __x) [inline]
```

Return the Neumann function  $N_\nu(x)$  of real order  $\nu$  and argument  $x \geq 0$ .

The Neumann function is defined by:

$$N_\nu(x) = \frac{J_\nu(x) \cos \nu\pi - J_{-\nu}(x)}{\sin \nu\pi}$$

where  $x \geq 0$  and for integral order  $\nu = n$  a limit is taken:  $\lim_{\nu \rightarrow n}$ .

**Template Parameters**

<code>_Tpnu</code>	The floating-point type of the order <code>__nu</code> .
<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .

**Parameters**

<code>__nu</code>	The order
<code>__x</code>	The argument, <code>__x</code> $\geq 0$

**Exceptions**

<code>std::domain_error</code>	if <code>__x</code> $< 0$ .
--------------------------------	-----------------------------

**cyl\_neumannf()**

```
float std::cyl_neumannf (
    float __nu,
    float __x) [inline]
```

Return the Neumann function  $N_\nu(x)$  of float order  $\nu$  and argument  $x$ .

**See also**

`cyl_neumann` for setails.

**cyl\_neumannl()**

```
long double std::cyl_neumannl (
    long double __nu,
    long double __x) [inline]
```

Return the Neumann function  $N_\nu(x)$  of long double order  $\nu$  and argument  $x$ .

**See also**

`cyl_neumann` for setails.

**ellint\_1()**

```
template<typename _Tp, typename _Tpp>
__gnu_cxx::__promote_2< _Tp, _Tpp >::__type std::ellint_1 (
    _Tp __k,
    _Tpp __phi) [inline]
```

Return the incomplete elliptic integral of the first kind  $F(k, \phi)$  for `real` modulus  $k$  and angle  $\phi$ .  
The incomplete elliptic integral of the first kind is defined as

$$F(k, \phi) = \int_0^\phi \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}}$$

For  $\phi = \pi/2$  this becomes the complete elliptic integral of the first kind,  $K(k)$ .

See also

`comp_ellint_1`.

**Template Parameters**

<code>_Tp</code>	The floating-point type of the modulus <code>__k</code> .
<code>_Tpp</code>	The floating-point type of the angle <code>__phi</code> .

**Parameters**

<code>__k</code>	The modulus, <code>abs (__k) &lt;= 1</code>
<code>__phi</code>	The integral limit argument in radians

**Exceptions**

<code>std::domain_error</code>	if <code>abs (__k) &gt; 1</code> .
--------------------------------	------------------------------------

**ellint\_1f()**

```
float std::ellint_1f (
    float __k,
    float __phi) [inline]
```

Return the incomplete elliptic integral of the first kind  $E(k, \phi)$  for `float` modulus  $k$  and angle  $\phi$ .

See also

`ellint_1` for details.

**ellint\_1l()**

```
long double std::ellint_1l (
    long double __k,
    long double __phi) [inline]
```

Return the incomplete elliptic integral of the first kind  $E(k, \phi)$  for `long double` modulus  $k$  and angle  $\phi$ .

See also

`ellint_1` for details.

**ellint\_2()**

```
template<typename _Tp, typename _Tpp>
__gnu_cxx::__promote_2< _Tp, _Tpp >::__type std::ellint_2 (
    _Tp __k,
    _Tpp __phi) [inline]
```

Return the incomplete elliptic integral of the second kind  $E(k, \phi)$ .

The incomplete elliptic integral of the second kind is defined as

$$E(k, \phi) = \int_0^\phi \sqrt{1 - k^2 \sin^2 \theta}$$

For  $\phi = \pi/2$  this becomes the complete elliptic integral of the second kind,  $E(k)$ .

See also

`comp_ellint_2`.

**Template Parameters**

<code>_Tp</code>	The floating-point type of the modulus <code>__k</code> .
<code>_Tpp</code>	The floating-point type of the angle <code>__phi</code> .

**Parameters**

<code>__k</code>	The modulus, <code>abs (__k) &lt;= 1</code>
<code>__phi</code>	The integral limit argument in radians

**Returns**

The elliptic function of the second kind.

**Exceptions**

<code>std::domain_error</code>	if <code>abs (__k) &gt; 1</code> .
--------------------------------	------------------------------------

**ellint\_2f()**

```
float std::ellint_2f (
    float __k,
    float __phi) [inline]
```

Return the incomplete elliptic integral of the second kind  $E(k, \phi)$  for `float` argument.

See also

`ellint_2` for details.

**ellint\_2l()**

```
long double std::ellint_2l (
    long double __k,
    long double __phi) [inline]
```

Return the incomplete elliptic integral of the second kind  $E(k, \phi)$ .

See also

`ellint_2` for details.

**ellint\_3()**

```
template<typename _Tp, typename _Tpn, typename _Tpp>
__gnu_cxx::__promote_3< _Tp, _Tpn, _Tpp >::__type std::ellint_3 (
    _Tp __k,
    _Tpn __nu,
    _Tpp __phi) [inline]
```

Return the incomplete elliptic integral of the third kind  $\Pi(k, \nu, \phi)$ .

The incomplete elliptic integral of the third kind is defined by:

$$\Pi(k, \nu, \phi) = \int_0^\phi \frac{d\theta}{(1 - \nu \sin^2 \theta) \sqrt{1 - k^2 \sin^2 \theta}}$$

For  $\phi = \pi/2$  this becomes the complete elliptic integral of the third kind,  $\Pi(k, \nu)$ .

See also

`comp_ellint_3`.

**Template Parameters**

<code>_Tp</code>	The floating-point type of the modulus <code>__k</code> .
<code>_Tpn</code>	The floating-point type of the argument <code>__nu</code> .
<code>_Tpp</code>	The floating-point type of the angle <code>__phi</code> .

**Parameters**

<code>__k</code>	The modulus, <code>abs (__k) &lt;= 1</code>
<code>__nu</code>	The second argument
<code>__phi</code>	The integral limit argument in radians

**Returns**

The elliptic function of the third kind.

**Exceptions**

<code>std::domain_error</code>	if <code>abs (__k) &gt; 1</code> .
--------------------------------	------------------------------------

**ellint\_3f()**

```
float std::ellint_3f (
    float __k,
    float __nu,
    float __phi) [inline]
```

Return the incomplete elliptic integral of the third kind  $\Pi(k, \nu, \phi)$  for `float` argument.

**See also**

`ellint_3` for details.

**ellint\_3l()**

```
long double std::ellint_3l (
    long double __k,
    long double __nu,
    long double __phi) [inline]
```

Return the incomplete elliptic integral of the third kind  $\Pi(k, \nu, \phi)$ .

**See also**

`ellint_3` for details.

**expint()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::expint (
    _Tp __x) [inline]
```

Return the exponential integral  $Ei(x)$  for `real` argument `x`.

The exponential integral is given by

$$Ei(x) = - \int_{-x}^{\infty} \frac{e^t}{t} dt$$

**Template Parameters**

<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .
------------------	--

**Parameters**

<code>__x</code>	The argument of the exponential integral function.
------------------	--

**expintf()**

```
float std::expintf (
    float __x) [inline]
```

Return the exponential integral  $Ei(x)$  for `float` argument `x`.

**See also**

`expint` for details.

**expintl()**

```
long double std::expintl (
    long double __x) [inline]
```

Return the exponential integral  $Ei(x)$  for long double argument `x`.

**See also**

`expint` for details.

**hermite()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::hermite (
    unsigned int __n,
    _Tp __x) [inline]
```

Return the Hermite polynomial  $H_n(x)$  of order `n` and real argument `x`.

The Hermite polynomial is defined by:

$$H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2}$$

The Hermite polynomial obeys a reflection formula:

$$H_n(-x) = (-1)^n H_n(x)$$

**Template Parameters**

<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .
------------------	--

**Parameters**

<code>__n</code>	The order
<code>__x</code>	The argument

**hermitef()**

```
float std::hermitef (
    unsigned int __n,
    float __x) [inline]
```

Return the Hermite polynomial  $H_n(x)$  of nonnegative order `n` and float argument `x`.

**See also**

`hermite` for details.

**hermitel()**

```
long double std::hermitel (
    unsigned int __n,
    long double __x) [inline]
```

Return the Hermite polynomial  $H_n(x)$  of nonnegative order `n` and long double argument `x`.

See also

hermite for details.

### hyperg()

```
template<typename _Tpa, typename _Tpb, typename _Tpc, typename _Tp>
__gnu_cxx::__promote_4< _Tpa, _Tpb, _Tpc, _Tp >::__type __gnu_cxx::hyperg (
    _Tpa __a,
    _Tpb __b,
    _Tpc __c,
    _Tp __x) [inline]
```

Return the hypergeometric function  ${}_2F_1(a, b; c; x)$  of real numeratorial parameters  $a$  and  $b$ , denominatorial parameter  $c$ , and argument  $x$ .

The hypergeometric function is defined by

$${}_2F_1(a; c; x) = \sum_{n=0}^{\infty} \frac{(a)_n (b)_n x^n}{(c)_n n!}$$

where the Pochhammer symbol is  $(x)_k = (x)(x+1)\dots(x+k-1)$ ,  $(x)_0 = 1$

#### Parameters

$\longleftrightarrow$ _a	The first numeratorial parameter
$\longleftrightarrow$ _b	The second numeratorial parameter
$\longleftrightarrow$ _c	The denominatorial parameter
$\longleftrightarrow$ _x	The argument

### hypergf()

```
float __gnu_cxx::hypergf (
    float __a,
    float __b,
    float __c,
    float __x) [inline]
```

Return the hypergeometric function  ${}_2F_1(a, b; c; x)$  of @ float numeratorial parameters  $a$  and  $b$ , denominatorial parameter  $c$ , and argument  $x$ .

See also

hyperg for details.

### hypergl()

```
long double __gnu_cxx::hypergl (
    long double __a,
    long double __b,
    long double __c,
    long double __x) [inline]
```

Return the hypergeometric function  ${}_2F_1(a, b; c; x)$  of long double numeratorial parameters  $a$  and  $b$ , denominatorial parameter  $c$ , and argument  $x$ .

See also

[hyperg](#) for details.

### laguerre()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::laguerre (
    unsigned int __n,
    _Tp __x) [inline]
```

Returns the Laguerre polynomial  $L_n(x)$  of nonnegative degree  $n$  and real argument  $x \geq 0$ .

The Laguerre polynomial is defined by:

$$L_n(x) = \frac{e^x}{n!} \frac{d^n}{dx^n} (x^n e^{-x})$$

#### Template Parameters

<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .
------------------	--

#### Parameters

<code>__n</code>	The nonnegative order
<code>__x</code>	The argument <code>__x</code> $\geq 0$

#### Exceptions

<code>std::domain_error</code>	if <code>__x &lt; 0</code> .
--------------------------------	------------------------------

### laguerref()

```
float std::laguerref (
    unsigned int __n,
    float __x) [inline]
```

Returns the Laguerre polynomial  $L_n(x)$  of nonnegative degree  $n$  and `float` argument  $x \geq 0$ .

See also

[laguerre](#) for more details.

### laguerrel()

```
long double std::laguerrel (
    unsigned int __n,
    long double __x) [inline]
```

Returns the Laguerre polynomial  $L_n(x)$  of nonnegative degree  $n$  and `long double` argument  $x \geq 0$ .

See also

[laguerre](#) for more details.

**legendre()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::legendre (
    unsigned int __l,
    _Tp __x) [inline]
```

Return the Legendre polynomial  $P_l(x)$  of nonnegative degree  $l$  and real argument  $|x| \leq 0$ .  
 The Legendre function of order  $l$  and argument  $x$ ,  $P_l(x)$ , is defined by:

$$P_l(x) = \frac{1}{2^l l!} \frac{d^l}{dx^l} (x^2 - 1)^l$$

**Template Parameters**

<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .
------------------	--

**Parameters**

<code>__l</code>	The degree $l \geq 0$
<code>__x</code>	The argument $\text{abs}(\text{__x}) \leq 1$

**Exceptions**

<code>std::domain_error</code>	if $\text{abs}(\text{__x}) > 1$
--------------------------------	---------------------------------

**legendref()**

```
float std::legendref (
    unsigned int __l,
    float __x) [inline]
```

Return the Legendre polynomial  $P_l(x)$  of nonnegative degree  $l$  and `float` argument  $|x| \leq 0$ .

**See also**

`legendre` for more details.

**legendrel()**

```
long double std::legendrel (
    unsigned int __l,
    long double __x) [inline]
```

Return the Legendre polynomial  $P_l(x)$  of nonnegative degree  $l$  and `long double` argument  $|x| \leq 0$ .

**See also**

`legendre` for more details.

**riemann\_zeta()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::riemann_zeta (
    _Tp __s) [inline]
```

Return the Riemann zeta function  $\zeta(s)$  for real argument  $s$ .

The Riemann zeta function is defined by:

$$\zeta(s) = \sum_{k=1}^{\infty} k^{-s} \text{ for } s > 1$$

and

$$\zeta(s) = \frac{1}{1 - 2^{1-s}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-s} \text{ for } 0 <= s <= 1$$

For  $s < 1$  use the reflection formula:

$$\zeta(s) = 2^s \pi^{s-1} \sin\left(\frac{\pi s}{2}\right) \Gamma(1-s) \zeta(1-s)$$

**Template Parameters**

<code>_Tp</code>	The floating-point type of the argument <code>__s</code> .
------------------	--

**Parameters**

<code>__s</code>	The argument $s \neq 1$
------------------	-------------------------

**riemann\_zetaf()**

```
float std::riemann_zetaf (
    float __s) [inline]
```

Return the Riemann zeta function  $\zeta(s)$  for `float` argument  $s$ .

**See also**

`riemann_zeta` for more details.

**riemann\_zetal()**

```
long double std::riemann_zetal (
    long double __s) [inline]
```

Return the Riemann zeta function  $\zeta(s)$  for `long double` argument  $s$ .

**See also**

`riemann_zeta` for more details.

**sph\_bessel()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::sph_bessel (
    unsigned int __n,
    _Tp __x) [inline]
```

Return the spherical Bessel function  $j_n(x)$  of nonnegative order  $n$  and real argument  $x \geq 0$ .  
The spherical Bessel function is defined by:

$$j_n(x) = \left(\frac{\pi}{2x}\right)^{1/2} J_{n+1/2}(x)$$

**Template Parameters**

<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .
------------------	--

**Parameters**

<code>__n</code>	The integral order $n \geq 0$
<code>__x</code>	The real argument $x \geq 0$

**Exceptions**

<code>std::domain_error</code>	if <code>__x &lt; 0</code> .
--------------------------------	------------------------------

**sph\_besself()**

```
float std::sph_besself (
    unsigned int __n,
    float __x) [inline]
```

Return the spherical Bessel function  $j_n(x)$  of nonnegative order  $n$  and `float` argument  $x \geq 0$ .

**See also**

`sph_bessel` for more details.

**sph\_bessell()**

```
long double std::sph_bessell (
    unsigned int __n,
    long double __x) [inline]
```

Return the spherical Bessel function  $j_n(x)$  of nonnegative order  $n$  and `long double` argument  $x \geq 0$ .

**See also**

`sph_bessel` for more details.

**sph\_legendre()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::sph_legendre (
    unsigned int __l,
    unsigned int __m,
    _Tp __theta) [inline]
```

Return the spherical Legendre function of nonnegative integral degree  $l$  and order  $m$  and real angle  $\theta$  in radians. The spherical Legendre function is defined by

$$Y_l^m(\theta, \phi) = (-1)^m \left[ \frac{(2l+1)}{4\pi} \frac{(l-m)!}{(l+m)!} \right] P_l^m(\cos \theta) \exp^{im\phi}$$

**Template Parameters**

<code>_Tp</code>	The floating-point type of the angle <code>__theta</code> .
------------------	---

**Parameters**

<code>__l</code>	The order <code>__l</code> $\geq 0$
<code>__m</code>	The degree <code>__m</code> $\geq 0$ and <code>__m</code> $\leq$ <code>__l</code>
<code>__theta</code>	The radian polar angle argument

**sph\_legendref()**

```
float std::sph_legendref (
    unsigned int __l,
    unsigned int __m,
    float __theta) [inline]
```

Return the spherical Legendre function of nonnegative integral degree  $l$  and order  $m$  and float angle  $\theta$  in radians.

**See also**

`sph_legendre` for details.

**sph\_legendrel()**

```
long double std::sph_legendrel (
    unsigned int __l,
    unsigned int __m,
    long double __theta) [inline]
```

Return the spherical Legendre function of nonnegative integral degree  $l$  and order  $m$  and long double angle  $\theta$  in radians.

**See also**

`sph_legendre` for details.

**sph\_neumann()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::sph_neumann (
    unsigned int __n,
    _Tp __x) [inline]
```

Return the spherical Neumann function of integral order  $n \geq 0$  and real argument  $x \geq 0$ .  
The spherical Neumann function is defined by

$$n_n(x) = \left(\frac{\pi}{2x}\right)^{1/2} N_{n+1/2}(x)$$

**Template Parameters**

<code>_Tp</code>	The floating-point type of the argument <code>__x</code> .
------------------	--

**Parameters**

<code>__n</code>	The integral order $n \geq 0$
<code>__x</code>	The real argument $__x \geq 0$

**Exceptions**

<code>std::domain_error</code>	if <code>__x &lt; 0</code> .
--------------------------------	------------------------------

**sph\_neumannf()**

```
float std::sph_neumannf (
    unsigned int __n,
    float __x) [inline]
```

Return the spherical Neumann function of integral order  $n \geq 0$  and float argument  $x \geq 0$ .

**See also**

`sph_neumann` for details.

**sph\_neumannl()**

```
long double std::sph_neumannl (
    unsigned int __n,
    long double __x) [inline]
```

Return the spherical Neumann function of integral order  $n \geq 0$  and long double  $x \geq 0$ .

**See also**

`sph_neumann` for details.

### 3.11.6 Numeric Arrays

Collaboration diagram for Numeric Arrays:

#### Classes

- class `std::gslice`
- class `std::gslice_array<_Tp>`
- class `std::indirect_array<_Tp>`
- class `std::mask_array<_Tp>`
- class `std::slice`
- class `std::slice_array<_Tp>`
- class `std::valarray<_Tp>`

#### Functions

- `std::gslice::gslice()`
- `std::gslice::gslice(const gslice &)`

### 3.11.6.1 Detailed Description

Classes and functions for representing and manipulating arrays of elements.

### 3.11.6.2 Function Documentation

#### gslice() [1/3]

```
std::gslice::gslice () [inline]
```

Construct an empty slice.

References [gslice\(\)](#).

Referenced by [gslice\(\)](#), [gslice\(\)](#), [gslice\(\)](#), and [operator=\(\)](#).

#### gslice() [2/3]

```
std::gslice::gslice (
    const gslice & __g) [inline]
```

Copy constructor.

References [gslice\(\)](#).

#### gslice() [3/3]

```
std::gslice::gslice (
    size_t __o,
    const valarray<size_t> & __l,
    const valarray<size_t> & __s) [inline]
```

Construct a slice.

Constructs a slice with as many dimensions as the length of the *l* and *s* arrays.

#### Parameters

<code>__o</code>	Offset in array of first element.
<code>__l</code>	Array of dimension lengths.
<code>__s</code>	Array of dimension strides between array elements.

References [gslice\(\)](#).

**gslice\_array()**

```
template<typename _Tp>
std::gslice_array< _Tp >::gslice_array (
    const gslice_array< _Tp > & __a) [inline]
```

Copy constructor. Both slices refer to the same underlying array.

References [gslice\\_array\(\)](#).

Referenced by [gslice\\_array\(\)](#), and [operator=\(\)](#).

**indirect\_array()**

```
template<typename _Tp>
std::indirect_array< _Tp >::indirect_array (
    const indirect_array< _Tp > & __a) [inline]
```

Copy constructor. Both slices refer to the same underlying array.

References [indirect\\_array\(\)](#).

Referenced by [indirect\\_array\(\)](#), and [operator=\(\)](#).

**mask\_array()**

```
template<typename _Tp>
std::mask_array< _Tp >::mask_array (
    const mask_array< _Tp > & __a) [inline]
```

Copy constructor. Both slices refer to the same underlying array.

References [mask\\_array\(\)](#).

Referenced by [mask\\_array\(\)](#), and [operator=\(\)](#).

**slice()** [1/2]

```
std::slice::slice () [inline]
```

Construct an empty slice.

Referenced by [operator==](#).

**slice()** [2/2]

```
std::slice::slice (
    size_t __o,
    size_t __d,
    size_t __s) [inline]
```

Construct a slice.

**Parameters**

<a href="#"></a> <code>__o</code>	Offset in array of first element.
<a href="#"></a> <code>__d</code>	Number of elements in slice.
<a href="#"></a> <code>__s</code>	Stride between array elements.

**slice\_array()**

```
template<typename _Tp>
std::slice_array< _Tp >::slice_array (
    const slice_array< _Tp > & __a) [inline]
```

Copy constructor. Both slices refer to the same underlying array.

References [slice\\_array\(\)](#).

Referenced by [slice\\_array\(\)](#), and [operator=\(\)](#).

#### **valarray()** [1/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray () [inline], [noexcept]
```

Construct an empty array.

Referenced by [valarray\(\)](#), [valarray\(\)](#), [valarray\(\)](#), [cshift\(\)](#), [operator%=\(\(\)\)](#), [operator%=\(\(\)\)](#), [operator&=\(\(\)\)](#), [operator&=\(\(\)\)](#), [operator\\*=\(\(\)\)](#), [operator\\*=\(\(\)\)](#), [operator+=\(\(\)\)](#), [operator+=\(\(\)\)](#), [operator-=\(\(\)\)](#), [operator-=\(\(\)\)](#), [operator/=\(\(\)\)](#), [operator/=\(\(\)\)](#), [operator<<=\(\(\)\)](#), [operator=\(\(\)\)](#), [operator=\(\(\)\)](#), [operator>>=\(\(\)\)](#), [operator>>=\(\(\)\)](#), [operator\[\]\(\)](#), [operator\[\]\(\)](#), [operator\[\]\(\)](#), [operator\[\]\(\)](#), [operator^=\(\(\)\)](#), [operator^=\(\(\)\)](#), [operator|=\(\(\)\)](#), [shift\(\)](#), and [swap\(\)](#).

#### **valarray()** [2/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    const _Tp & __t,
    size_t __n) [inline]
```

Construct an array with *n* elements initialized to *t*.

#### **valarray()** [3/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    const gslice_array< _Tp > & __ga) [inline]
```

Construct an array with the same size and values in *ga*.

References [size\(\)](#).

#### **valarray()** [4/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    const indirect_array< _Tp > & __ia) [inline]
```

Construct an array with the same size and values in *ia*.

#### **valarray()** [5/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    const mask_array< _Tp > & __ma) [inline]
```

Construct an array with the same size and values in *ma*.

#### **valarray()** [6/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    const slice_array< _Tp > & __sa) [inline]
```

Construct an array with the same size and values in *sa*.

#### **valarray()** [7/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    const valarray< _Tp > & __v) [inline]
```

Copy constructor.  
References [valarray\(\)](#).

#### **valarray()** [8/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    initializer_list< _Tp > __l) [inline]
```

Construct an array with an `initializer_list` of values.  
References [size\(\)](#).

#### **valarray()** [9/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    size_t __n) [inline], [explicit]
```

Construct an array with  $n$  elements.

#### **valarray()** [10/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
    valarray< _Tp > && __v) [inline], [noexcept]
```

Move constructor.  
References [valarray\(\)](#).

#### **~gslice()**

```
std::gslice::~gslice () [inline]
```

Destructor.

#### **apply()** [1/2]

```
template<class _Tp>
_Expr< _ValFuncClos< _ValArray, _Tp >, _Tp > std::valarray< _Tp >::apply (
    _Tp __func_Tp) const [inline]
```

Apply a function to the array.  
Returns a new `valarray` with elements assigned to the result of applying `__func` to the corresponding element of this array. The new array has the same size as this one.

##### Parameters

<code>__func</code>	Function of <code>Tp</code> returning <code>Tp</code> to apply.
---------------------	---

##### Returns

New `valarray` with transformed elements.

#### **apply()** [2/2]

```
template<class _Tp>
_Expr< _RefFuncClos< _ValArray, _Tp >, _Tp > std::valarray< _Tp >::apply (
    _Tp __funcconst _Tp &) const [inline]
```

Apply a function to the array.

Returns a new valarray with elements assigned to the result of applying `__func` to the corresponding element of this array. The new array has the same size as this one.

**Parameters**

<code>__func</code>	Function of const Tp& returning Tp to apply.
---------------------	--

**Returns**

New valarray with transformed elements.

**begin()** [1/2]

```
template<class _Tp>
const _Tp * std::begin (
    const valarray< _Tp > & __va) [inline], [noexcept]
```

Return an iterator pointing to the first element of the const valarray.

**Parameters**

<code>__va</code>	valarray.
-------------------	-----------

References [\\_\\_addressof\(\)](#).

**begin()** [2/2]

```
template<class _Tp>
_Tp * std::begin (
    valarray< _Tp > & __va) [inline], [noexcept]
```

Return an iterator pointing to the first element of the valarray.

**Parameters**

<code>__va</code>	valarray.
-------------------	-----------

References [\\_\\_addressof\(\)](#).

Referenced by [cbegin\(\)](#), [std::vector< \\_Tp, \\_Alloc >::insert\(\)](#), [std::list< \\_Tp, \\_Alloc >::merge\(\)](#), [std::list< \\_Tp, \\_Alloc >::merge\(\)](#), [std::list< \\_Tp, \\_Alloc >::remove\(\)](#), [std::list< \\_Tp, \\_Alloc >::remove\\_if\(\)](#), [std::vector< \\_State< \\_TraitsT::char\\_type > >::reserve\(\)](#), [std::list< \\_Tp, \\_Alloc >::sort\(\)](#), [std::list< \\_Tp, \\_Alloc >::sort\(\)](#), [std::list< \\_Tp, \\_Alloc >::unique\(\)](#), and [std::list< \\_Tp, \\_Alloc >::unique\(\)](#).

**cshift()**

```
template<class _Tp>
valarray< _Tp > std::valarray< _Tp >::cshift (
    int __n) const [inline]
```

Return a rotated array.

A new valarray is constructed as a copy of this array with elements in shifted positions. For an element with index *i*, the new position is  $(i - n) \% \text{size}()$ . The new valarray has the same size as the current one. Elements that are shifted beyond the array bounds are shifted into the other end of the array. No elements are lost.

Positive arguments shift toward index 0, wrapping around the top. Negative arguments shift towards the top, wrapping around to 0.

**Parameters**

<code>__↵</code> <code>__n</code>	Number of element positions to rotate.
--------------------------------------	--

**Returns**

New valarray with elements in shifted positions.

References [valarray\(\)](#).

**end()** [1/2]

```
template<class _Tp>
const _Tp * std::end (
    const valarray< _Tp > & __va) [inline], [noexcept]
```

Return an iterator pointing to one past the last element of the const valarray.

**Parameters**

<code>__va</code>	<code>valarray.</code>
-------------------	------------------------

References [\\_\\_addressof\(\)](#).

**end()** [2/2]

```
template<class _Tp>
_Tp * std::end (
    valarray< _Tp > & __va) [inline], [noexcept]
```

Return an iterator pointing to one past the last element of the valarray.

**Parameters**

<code>__va</code>	<code>valarray.</code>
-------------------	------------------------

References [\\_\\_addressof\(\)](#).

Referenced by [cend\(\)](#), [std::vector< \\_Tp, \\_Alloc >::insert\(\)](#), [std::list< \\_Tp, \\_Alloc >::merge\(\)](#), [std::list< \\_Tp, \\_Alloc >::merge\(\)](#), [std::vector< \\_Tp, \\_Alloc >::operator=\(\)](#), [std::list< \\_Tp, \\_Alloc >::remove\(\)](#), [std::list< \\_Tp, \\_Alloc >::remove\\_if\(\)](#), [std::vector< \\_State< \\_TraitsT::char\\_type > >::reserve\(\)](#), [std::list< \\_Tp, \\_Alloc >::resize\(\)](#), [std::list< \\_Tp, \\_Alloc >::resize\(\)](#), [std::list< \\_Tp, \\_Alloc >::sort\(\)](#), [std::list< \\_Tp, \\_Alloc >::sort\(\)](#), [std::list< \\_Tp, \\_Alloc >::unique\(\)](#), and [std::list< \\_Tp, \\_Alloc >::unique\(\)](#).

**max()**

```
template<typename _Tp>
_Tp std::valarray< _Tp >::max () const [inline]
```

Return the maximum element using operator<().

**min()**

```
template<typename _Tp>
_Tp std::valarray< _Tp >::min () const [inline]
```

Return the minimum element using operator<().

**operator=()** [1/20]

```
gslice & std::gslice::operator= (
    const gslice & __g) [inline]
```

Assignment operator.

References [gslice\(\)](#).

**operator=()** [2/20]

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator= (
    const _Tp & __t) const [inline]
```

Assign all slice elements to *t*.

**operator=()** [3/20]

```
template<typename _Tp>
gslice_array< _Tp > & std::gslice_array< _Tp >::operator= (
    const gslice_array< _Tp > & __a) [inline]
```

Assignment operator. Assigns slice elements to corresponding elements of *a*.  
References [gslice\\_array\(\)](#).

**operator=()** [4/20]

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator= (
    const valarray< _Tp > & __v) const [inline]
```

Assign slice elements to corresponding elements of *v*.  
References [std::valarray< \\_Tp >::size\(\)](#).

**operator=()** [5/20]

```
template<typename _Tp>
void std::indirect_array< _Tp >::operator= (
    const _Tp & __t) const [inline]
```

Assign all slice elements to *t*.

**operator=()** [6/20]

```
template<typename _Tp>
indirect_array< _Tp > & std::indirect_array< _Tp >::operator= (
    const indirect_array< _Tp > & __a) [inline]
```

Assignment operator. Assigns elements to corresponding elements of *a*.  
References [indirect\\_array\(\)](#).

**operator=()** [7/20]

```
template<typename _Tp>
void std::indirect_array< _Tp >::operator= (
    const valarray< _Tp > & __v) const [inline]
```

Assign slice elements to corresponding elements of *v*.

**operator=()** [8/20]

```
template<typename _Tp>
void std::mask_array< _Tp >::operator= (
    const _Tp & __t) const [inline]
```

Assign all slice elements to *t*.

**operator=()** [9/20]

```
template<typename _Tp>
mask_array< _Tp > & std::mask_array< _Tp >::operator= (
    const mask_array< _Tp > & __a) [inline]
```

Assignment operator. Assigns elements to corresponding elements of *a*.

References [mask\\_array\(\)](#).

**operator=()** [10/20]

```
template<typename _Tp>
void std::slice_array< _Tp >::operator= (
    const _Tp & __t) const [inline]
```

Assign all slice elements to *t*.

**operator=()** [11/20]

```
template<typename _Tp>
slice_array< _Tp > & std::slice_array< _Tp >::operator= (
    const slice_array< _Tp > & __a) [inline]
```

Assignment operator. Assigns slice elements to corresponding elements of *a*.

References [slice\\_array\(\)](#).

**operator=()** [12/20]

```
template<typename _Tp>
void std::slice_array< _Tp >::operator= (
    const valarray< _Tp > & __v) const [inline]
```

Assign slice elements to corresponding elements of *v*.

**operator=()** [13/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
    const _Tp & __t) [inline]
```

Assign elements to a value.

Assign all elements of array to *t*.

**Parameters**

↵	Value for elements.
↵	
↵	
↵	
<i>t</i>	

**operator=()** [14/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
    const gslice_array< _Tp > & __ga) [inline]
```

Assign elements to an array subset.

Assign elements of array to values in *ga*. Results are undefined if *ga* does not have the same size as this array.

**Parameters**

<code>__ga</code>	Array slice to get values from.
-------------------	---------------------------------

References [size\(\)](#).

**operator=()** [15/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
    const indirect_array< _Tp > & __ia) [inline]
```

Assign elements to an array subset.

Assign elements of array to values in *ia*. Results are undefined if *ia* does not have the same size as this array.

**Parameters**

<code>__↔ _ia</code>	Array slice to get values from.
--------------------------	---------------------------------

**operator=()** [16/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
    const mask_array< _Tp > & __ma) [inline]
```

Assign elements to an array subset.

Assign elements of array to values in *ma*. Results are undefined if *ma* does not have the same size as this array.

**Parameters**

<code>__ma</code>	Array slice to get values from.
-------------------	---------------------------------

**operator=()** [17/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
    const slice_array< _Tp > & __sa) [inline]
```

Assign elements to an array subset.

Assign elements of array to values in *sa*. Results are undefined if *sa* does not have the same size as this array.

**Parameters**

<code>__sa</code>	Array slice to get values from.
-------------------	---------------------------------

**operator=()** [18/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
    const valarray< _Tp > & __v) [inline]
```

Assign elements to an array.

Assign elements of array to values in *v*.

**Parameters**

<a href="#"><code>_↔</code></a>	Valarray to get values from.
<a href="#"><code>_v</code></a>	

References [valarray\(\)](#).

**operator=()** [19/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
    initializer_list< _Tp > __l) [inline]
```

Assign elements to an initializer\_list.

Assign elements of array to values in `__l`. Results are undefined if `__l` does not have the same size as this array.

**Parameters**

<a href="#"><code>↔</code></a>	initializer_list to get values from.
<a href="#"><code>_↔</code></a>	
<a href="#"><code>↔</code></a>	
<a href="#"><code>_↔</code></a>	
<a href="#"><code>/</code></a>	

**operator=()** [20/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
    valarray< _Tp > && __v) [inline], [noexcept]
```

Move assign elements to an array.

Move assign elements of array to values in `v`.

**Parameters**

<a href="#"><code>_↔</code></a>	Valarray to get values from.
<a href="#"><code>_v</code></a>	

References [valarray\(\)](#).

**operator[]()** [1/9]

```
template<typename _Tp>
gslice_array< _Tp > std::valarray< _Tp >::operator[] (
    const gslice & __s) [inline]
```

Return a reference to an array subset.

Returns a new valarray containing the elements of the array indicated by the `gslice` argument. The new valarray has the same size as the input `gslice`.

**See also**

[gslice](#).

**Parameters**

$\_ \leftrightarrow$	The source gslice.
$\_s$	

**Returns**

New valarray containing elements in  $\_s$ .

**operator[]() [2/9]**

```
template<typename _Tp>
_Expr< _GClos< _ValArray, _Tp >, _Tp > std::valarray< _Tp >::operator[] (
    const gslice & __s) const [inline]
```

Return an array subset.

Returns a slice\_array referencing the elements of the array indicated by the slice argument.

**See also**

gslice.

**Parameters**

$\_ \leftrightarrow$	The source slice.
$\_s$	

**Returns**

Slice\_array referencing elements indicated by  $\_s$ .

**operator[]() [3/9]**

```
template<typename _Tp>
mask_array< _Tp > std::valarray< _Tp >::operator[] (
    const valarray< bool > & __m) [inline]
```

Return a reference to an array subset.

Returns a new mask\_array referencing the elements of the array indicated by the argument. The input is a valarray of bool which represents a bitmask indicating which elements are part of the subset. Elements of the array are part of the subset if the corresponding element of the argument is true.

**Parameters**

$\_ \leftrightarrow$	The valarray bitmask.
$\_m$	

**Returns**

New valarray containing elements indicated by  $\_m$ .

References [valarray\(\)](#), and [size\(\)](#).

**operator[]()** [4/9]

```
template<typename _Tp>
valarray< _Tp > std::valarray< _Tp >::operator[] (
    const valarray< bool > & __m) const [inline]
```

Return an array subset.

Returns a new valarray containing the elements of the array indicated by the argument. The input is a valarray of bool which represents a bitmask indicating which elements should be copied into the new valarray. Each element of the array is added to the return valarray if the corresponding element of the argument is true.

**Parameters**

$\leftarrow$	The valarray bitmask.
$\_m$	

**Returns**

New valarray containing elements indicated by  $\_m$ .

References [valarray\(\)](#), and [size\(\)](#).

**operator[]()** [5/9]

```
template<typename _Tp>
indirect_array< _Tp > std::valarray< _Tp >::operator[] (
    const valarray< size_t > & __i) [inline]
```

Return a reference to an array subset.

Returns an indirect\_array referencing the elements of the array indicated by the argument. The elements in the argument are interpreted as the indices of elements of this valarray to include in the subset. The returned indirect\_array refers to these elements.

**Parameters**

$\leftarrow$	The valarray element index list.
$\_ \leftarrow$	
$\leftarrow$	
$\_ \leftarrow$	
$i$	

**Returns**

Indirect\_array referencing elements in  $\_i$ .

References [valarray\(\)](#), and [size\(\)](#).

**operator[]()** [6/9]

```
template<typename _Tp>
_Expr< _IClos< _ValArray, _Tp >, _Tp > std::valarray< _Tp >::operator[] (
    const valarray< size_t > & __i) const [inline]
```

Return an array subset.

Returns a new valarray containing the elements of the array indicated by the argument. The elements in the argument are interpreted as the indices of elements of this valarray to copy to the return valarray.

**Parameters**

$\leftarrow$	The valarray element index list.
$\_ \leftarrow$	
$\leftarrow$	
$\_ \leftarrow$	
$i$	

**Returns**

New valarray containing elements in `__s`.

References [valarray\(\)](#).

**operator[]()** [7/9]

```
template<typename _Tp>
_Tp & std::valarray< _Tp >::operator[] (
    size_t __i) [inline], [noexcept]
```

Return a reference to the *i*'th array element.

**Parameters**

$\leftarrow$	Index of element to return.
$\_ \leftarrow$	
$\leftarrow$	
$\_ \leftarrow$	
$i$	

**Returns**

Reference to the *i*'th element.

**operator[]()** [8/9]

```
template<typename _Tp>
slice_array< _Tp > std::valarray< _Tp >::operator[] (
    slice __s) [inline]
```

Return a reference to an array subset.

Returns a new valarray containing the elements of the array indicated by the slice argument. The new valarray has the same size as the input slice.

**See also**

[slice](#).

**Parameters**

$\_ \leftarrow$	The source slice.
$\_s$	

**Returns**

New valarray containing elements in `__s`.

**operator[]()** [9/9]

```
template<typename _Tp>
_Expr< _SClos< _ValArray, _Tp >, _Tp > std::valarray< _Tp >::operator[] (
    slice __s) const [inline]
```

Return an array subset.

Returns a new valarray containing the elements of the array indicated by the slice argument. The new valarray has the same size as the input slice.

**See also**

slice.

**Parameters**

<code>__s</code>	The source slice.
------------------	-------------------

**Returns**

New valarray containing elements in `__s`.

**resize()**

```
template<class _Tp>
void std::valarray< _Tp >::resize (
    size_t __size,
    _Tp __c = _Tp()) [inline]
```

Resize array.

Resize this array to *size* and set all elements to *c*. All references and iterators are invalidated.

**Parameters**

<code>__size</code>	New array size.
<code>__c</code>	New value for all elements.

**shift()**

```
template<class _Tp>
valarray< _Tp > std::valarray< _Tp >::shift (
    int __n) const [inline]
```

Return a shifted array.

A new valarray is constructed as a copy of this array with elements in shifted positions. For an element with index *i*, the new position is *i* - *n*. The new valarray has the same size as the current one. New elements without a value are set to 0. Elements whose new position is outside the bounds of the array are discarded.

Positive arguments shift toward index 0, discarding elements [0, *n*). Negative arguments discard elements from the top of the array.

**Parameters**

<code>__n</code>	Number of element positions to shift.
------------------	---------------------------------------

**Returns**

New valarray with elements in shifted positions.

References [valarray\(\)](#).

**size()** [1/3]

```
valarray< size_t > std::gslice::size () const [inline]
```

Return array of sizes of slice dimensions.

**size()** [2/3]

```
size_t std::slice::size () const [inline]
```

Return size of slice.

**size()** [3/3]

```
template<class _Tp>  
size_t std::valarray< _Tp >::size () const [inline]
```

Return the number of elements in array.

Referenced by [valarray\(\)](#), [valarray\(\)](#), [std::gslice\\_array< \\_Tp >::operator=\(\)](#), [operator=\(\)](#), [operator\[\]\(\)](#), [operator\[\]\(\)](#), and [operator\[\]\(\)](#).

**start()** [1/2]

```
size_t std::gslice::start () const [inline]
```

Return array offset of first slice element.

**start()** [2/2]

```
size_t std::slice::start () const [inline]
```

Return array offset of first slice element.

**stride()** [1/2]

```
valarray< size_t > std::gslice::stride () const [inline]
```

Return array of array strides for each dimension.

**stride()** [2/2]

```
size_t std::slice::stride () const [inline]
```

Return array stride of slice.

**sum()**

```
template<class _Tp>  
_Tp std::valarray< _Tp >::sum () const [inline]
```

Return the sum of all elements in the array.

Accumulates the sum of all elements into a `Tp` using `+=`. The order of adding the elements is unspecified.

**swap()**

```
template<class _Tp>  
void std::valarray< _Tp >::swap (  
    valarray< _Tp > & __v) [inline], [noexcept]
```

Swap.

References [valarray\(\)](#).

#### Functions

- `template<typename _RealType, size_t __bits, typename _UniformRandomNumberGenerator>  
_RealType std::generate\_canonical (_UniformRandomNumberGenerator &__g)`

#### 3.11.7.1 Detailed Description

A facility for generating random numbers on selected distributions.

#### 3.11.7.2 Function Documentation

##### **`generate_canonical()`**

```
template<typename _RealType, size_t __bits, typename _UniformRandomNumberGenerator>  
_RealType std::generate_canonical (  
    _UniformRandomNumberGenerator & __g)
```

A function template for converting the output of a (integral) uniform random number generator to a floating point result in the range [0-1).

Referenced by [generate\\_canonical\(\)](#).

- `template<typename _IntType, typename _CharT, typename _Traits>`  
`std::basic_istream< _CharT, _Traits > & std::operator>> (std::basic_istream< _CharT, _Traits > &__is,`  
`std::geometric_distribution< _IntType > &__x)`

## Detailed Description

### Function Documentation

#### `operator<<()` [1/2]

```
template<typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::bernoulli_distribution & __x)
```

Inserts a `bernoulli_distribution` random number distribution `__x` into the output stream `__os`.

#### Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>bernoulli_distribution</code> random number distribution.

#### Returns

The output stream with the state of `__x` inserted or in an error state.

#### `operator<<()` [2/2]

```
template<typename _IntType, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::geometric_distribution< _IntType > & __x)
```

Inserts a `geometric_distribution` random number distribution `__x` into the output stream `__os`.

#### Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>geometric_distribution</code> random number distribution.

#### Returns

The output stream with the state of `__x` inserted or in an error state.

References `std::numeric_limits< _Tp >::epsilon()`, `log()`, and `std::numeric_limits< _Tp >::max()`.

**operator>>()** [1/2]

```
template<typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & std::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::bernoulli_distribution & __x) [inline]
```

Extracts a `bernoulli_distribution` random number distribution `__x` from the input stream `__is`.

## Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>bernoulli_distribution</code> random number generator engine.

## Returns

The input stream with `__x` extracted or in an error state.

References [std::bernoulli\\_distribution::param\(\)](#).

**operator>>()** [2/2]

```
template<typename _IntType, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & std::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::geometric_distribution< _IntType > & __x)
Extracts a geometric_distribution random number distribution __x from the input stream __is.
```

## Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>geometric_distribution</code> random number generator engine.

## Returns

The input stream with `__x` extracted or in an error state.

References [std::ios\\_base::flags\(\)](#), and [std::geometric\\_distribution< \\_IntType >::param\(\)](#).

**3.11.7.3.3 Normal Distributions**

Collaboration diagram for Normal Distributions:

## Classes

- class [std::cauchy\\_distribution< \\_RealType >](#)
- class [std::chi\\_squared\\_distribution< \\_RealType >](#)

## Functions

- `template<typename _RealType, typename _CharT, typename _Traits>`  
`std::basic_ostream< _CharT, _Traits > & std::operator<< (std::basic_ostream< _CharT, _Traits > &__os, const`  
`std::cauchy_distribution< _RealType > &__x)`
- `template<typename _RealType, typename _CharT, typename _Traits>`  
`std::basic_istream< _CharT, _Traits > & std::operator>> (std::basic_istream< _CharT, _Traits > &__is,`  
`std::cauchy_distribution< _RealType > &__x)`

## Detailed Description

### Function Documentation

#### `operator<<()`

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::cauchy_distribution< _RealType > & __x)
```

Inserts a `cauchy_distribution` random number distribution `__x` into the output stream `__os`.

#### Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>cauchy_distribution</code> random number distribution.

#### Returns

The output stream with the state of `__x` inserted or in an error state.

References [tan\(\)](#).

#### `operator>>()`

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & std::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::cauchy_distribution< _RealType > & __x)
```

Extracts a `cauchy_distribution` random number distribution `__x` from the input stream `__is`.

#### Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>cauchy_distribution</code> random number generator engine.

#### Returns

The input stream with `__x` extracted or in an error state.

References [std::ios\\_base::flags\(\)](#), and [std::cauchy\\_distribution< \\_RealType >::param\(\)](#).

### 3.11.7.3.4 Poisson Distributions

Collaboration diagram for Poisson Distributions:

#### Classes

`std::basic_istream< _CharT, _Traits > & std::operator>> (std::basic_istream< _CharT, _Traits > &__is,`  
`std::weibull_distribution< _RealType > &__x)`

#### Detailed Description

#### Function Documentation

##### `operator<<()` [1/3]

```

template<typename _RealType, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::exponential_distribution< _RealType > & __x)

```

Inserts a `exponential_distribution` random number distribution `__x` into the output stream `__os`.

## Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>exponential_distribution</code> random number distribution.

## Returns

The output stream with the state of `__x` inserted or in an error state.

References [log\(\)](#).

**operator<<()** [2/3]

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::extreme_value_distribution< _RealType > & __x)
```

Inserts a `extreme_value_distribution` random number distribution `__x` into the output stream `__os`.

## Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>extreme_value_distribution</code> random number distribution.

## Returns

The output stream with the state of `__x` inserted or in an error state.

References [log\(\)](#).

**operator<<()** [3/3]

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::weibull_distribution< _RealType > & __x)
```

Inserts a `weibull_distribution` random number distribution `__x` into the output stream `__os`.

## Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>weibull_distribution</code> random number distribution.

## Returns

The output stream with the state of `__x` inserted or in an error state.

References [log\(\)](#), and [pow\(\)](#).

**operator>>()** [1/3]

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & std::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::exponential_distribution< _RealType > & __x)
```

Extracts a `exponential_distribution` random number distribution `__x` from the input stream `__is`.

## Parameters

$\_is$	An input stream.
$\_x$	A exponential_distribution random number generator engine.

## Returns

The input stream with  $\_x$  extracted or in an error state.

References [std::ios\\_base::flags\(\)](#), and [std::exponential\\_distribution<\\_RealType>::param\(\)](#).

**operator>>()** [2/3]

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & std::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::extreme_value_distribution< _RealType > & __x)
```

Extracts a extreme\_value\_distribution random number distribution  $\_x$  from the input stream  $\_is$ .

## Parameters

$\_is$	An input stream.
$\_x$	A extreme_value_distribution random number generator engine.

## Returns

The input stream with  $\_x$  extracted or in an error state.

References [std::ios\\_base::flags\(\)](#), and [std::extreme\\_value\\_distribution<\\_RealType>::param\(\)](#).

**operator>>()** [3/3]

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & std::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::weibull_distribution< _RealType > & __x)
```

Extracts a weibull\_distribution random number distribution  $\_x$  from the input stream  $\_is$ .

## Parameters

$\_is$	An input stream.
$\_x$	A weibull_distribution random number generator engine.

## Returns

The input stream with  $\_x$  extracted or in an error state.

References [std::ios\\_base::flags\(\)](#), and [std::weibull\\_distribution<\\_RealType>::param\(\)](#).

### 3.11.7.3.5 Sampling Distributions

- class `std::uniform_real_distribution<_RealType>`

#### Functions

- `template<typename _IntType, typename _CharT, typename _Traits>`  
`std::basic_ostream<_CharT, _Traits> & std::operator<< (std::basic_ostream<_CharT, _Traits> &, const std::uniform_int_distribution<_IntType> &)`
- `template<typename _RealType, typename _CharT, typename _Traits>`  
`std::basic_ostream<_CharT, _Traits> & std::operator<< (std::basic_ostream<_CharT, _Traits> &, const std::uniform_real_distribution<_RealType> &)`
- `template<typename _IntType, typename _CharT, typename _Traits>`  
`std::basic_istream<_CharT, _Traits> & std::operator>> (std::basic_istream<_CharT, _Traits> &, std::uniform_int_distribution<_IntType> &)`

- `template<typename _RealType, typename _CharT, typename _Traits>`  
`std::basic_istream< _CharT, _Traits > & std::operator>> (std::basic_istream< _CharT, _Traits > &,`  
`std::uniform_real_distribution< _RealType > &)`

## Detailed Description

## Function Documentation

### `operator<<()` [1/2]

```
template<typename _IntType, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::uniform_int_distribution< _IntType > & __x)
```

Inserts a `uniform_int_distribution` random number distribution `__x` into the output stream `os`.

#### Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>uniform_int_distribution</code> random number distribution.

#### Returns

The output stream with the state of `__x` inserted or in an error state.

References `std::ios_base::flags()`.

### `operator<<()` [2/2]

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::uniform_real_distribution< _RealType > & __x)
```

Inserts a `uniform_real_distribution` random number distribution `__x` into the output stream `__os`.

#### Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>uniform_real_distribution</code> random number distribution.

#### Returns

The output stream with the state of `__x` inserted or in an error state.

### `operator>>()` [1/2]

```
template<typename _IntType, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & std::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::uniform_int_distribution< _IntType > & __x)
```

Extracts a `uniform_int_distribution` random number distribution `__x` from the input stream `__is`.

## Parameters

$\leftrightarrow$ _is	An input stream.
$\leftrightarrow$ _x	A uniform_int_distribution random number generator engine.

## Returns

The input stream with \_\_x extracted or in an error state.

References [std::ios\\_base::flags\(\)](#), and [std::uniform\\_int\\_distribution<\\_IntType>::param\(\)](#).

**operator>>()** [2/2]

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_istream<_CharT, _Traits> & std::operator>> (
    std::basic_istream<_CharT, _Traits> & __is,
    std::uniform_real_distribution<_RealType> & __x)
Extracts a uniform_real_distribution random number distribution __x from the input stream __is.
```

## Parameters

$\leftrightarrow$ _is	An input stream.
$\leftrightarrow$ _x	A uniform_real_distribution random number generator engine.

## Returns

The input stream with \_\_x extracted or in an error state.

References [std::ios\\_base::flags\(\)](#), and [std::uniform\\_real\\_distribution<\\_RealType>::param\(\)](#).

`std::independent_bits_engine` < `_RandomNumberEngine`, `__w`, `_UIntType` > & `__x`)

### 3.11.7.4.1 Detailed Description

These classes define objects which provide random or pseudorandom numbers, either from a discrete or a continuous interval. The random number generator supplied as a part of this library are all uniform random number generators which provide a sequence of random number uniformly distributed over their range.

A number generator is a function object with an operator() that takes zero arguments and returns a number.

A compliant random number generator must satisfy the following requirements.

**Table 291 Random Number Generator Requirements**

To be documented.
-------------------

### 3.11.7.4.2 Typedef Documentation

#### `minstd_rand`

typedef `linear_congruential_engine` < `uint_fast32_t`, 48271UL, 0UL, 2147483647UL > `std::minstd_rand`

An alternative LCR (Lehmer Generator function).

#### `minstd_rand0`

typedef `linear_congruential_engine` < `uint_fast32_t`, 16807UL, 0UL, 2147483647UL > `std::minstd_rand0`

The classic Minimum Standard rand0 of Lewis, Goodman, and Miller.

#### `mt19937`

typedef `mersenne_twister_engine` < `uint_fast32_t`, 32, 624, 397, 31, 0x9908b0dfUL, 11, 0xffffffffUL, 7, 0x9d2c5680UL, 15, 0xefc60000UL, 18, 1812433253UL > `std::mt19937`

The classic Mersenne Twister.

Reference: M. Matsumoto and T. Nishimura, Mersenne Twister: A 623-Dimensionally Equidistributed Uniform Pseudo-Random Number Generator, ACM Transactions on Modeling and Computer Simulation, Vol. 8, No. 1, January 1998, pp 3-30.

**mt19937\_64**

```
typedef mersenne_twister_engine< uint_fast64_t, 64, 312, 156, 31, 0xb5026f5aa96619e9ULL, 29,
0x5555555555555555ULL, 17, 0x71d67ffeda60000ULL, 37, 0xffff7eee00000000ULL, 43, 6364136223846793005ULL>
std::mt19937_64
```

An alternative Mersenne Twister.

**3.11.7.4.3 Function Documentation****operator<<()**

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType, typename _CharT, typename
_Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __x)
```

Inserts the current state of a independent\_bits\_engine random number generator engine \_\_x into the output stream \_\_os.

**Parameters**

__os	An output stream.
__x	A independent_bits_engine random number generator engine.

**Returns**

The output stream with the state of \_\_x inserted or in an error state.

### 3.11.8.1 Detailed Description

A collection of advanced mathematical special functions.

### 3.11.8.2 Function Documentation

#### **assoc\_laguerre()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::tr1::assoc_laguerre (
    unsigned int __n,
    unsigned int __m,
    _Tp __x) [inline]
```

5.2.1.1 Associated Laguerre polynomials.

#### **assoc\_legendre()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::tr1::assoc_legendre (
    unsigned int __l,
    unsigned int __m,
    _Tp __x) [inline]
```

5.2.1.2 Associated Legendre functions.

#### **beta()**

```
template<typename _Tpx, typename _Tpy>
__gnu_cxx::__promote_2< _Tpx, _Tpy >::__type std::tr1::beta (
    _Tpx __x,
    _Tpy __y) [inline]
```

5.2.1.3 Beta functions.

#### **comp\_ellint\_1()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::tr1::comp_ellint_1 (
    _Tp __k) [inline]
```

5.2.1.4 Complete elliptic integrals of the first kind.

#### **comp\_ellint\_2()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::tr1::comp_ellint_2 (
    _Tp __k) [inline]
```

5.2.1.5 Complete elliptic integrals of the second kind.

#### **comp\_ellint\_3()**

```
template<typename _Tp, typename _Tpn>
__gnu_cxx::__promote_2< _Tp, _Tpn >::__type std::tr1::comp_ellint_3 (
    _Tp __k,
    _Tpn __nu) [inline]
```

5.2.1.6 Complete elliptic integrals of the third kind.

**cyl\_bessel\_i()**

```
template<typename _Tpnu, typename _Tp>
__gnu_cxx::__promote_2< _Tpnu, _Tp >::__type std::tr1::cyl_bessel_i (
    _Tpnu __nu,
    _Tp __x) [inline]
```

5.2.1.8 Regular modified cylindrical Bessel functions.

**cyl\_bessel\_j()**

```
template<typename _Tpnu, typename _Tp>
__gnu_cxx::__promote_2< _Tpnu, _Tp >::__type std::tr1::cyl_bessel_j (
    _Tpnu __nu,
    _Tp __x) [inline]
```

5.2.1.9 Cylindrical Bessel functions (of the first kind).

**cyl\_bessel\_k()**

```
template<typename _Tpnu, typename _Tp>
__gnu_cxx::__promote_2< _Tpnu, _Tp >::__type std::tr1::cyl_bessel_k (
    _Tpnu __nu,
    _Tp __x) [inline]
```

5.2.1.10 Irregular modified cylindrical Bessel functions.

**cyl\_neumann()**

```
template<typename _Tpnu, typename _Tp>
__gnu_cxx::__promote_2< _Tpnu, _Tp >::__type std::tr1::cyl_neumann (
    _Tpnu __nu,
    _Tp __x) [inline]
```

5.2.1.11 Cylindrical Neumann functions.

**ellint\_1()**

```
template<typename _Tp, typename _Tpp>
__gnu_cxx::__promote_2< _Tp, _Tpp >::__type std::tr1::ellint_1 (
    _Tp __k,
    _Tpp __phi) [inline]
```

5.2.1.12 Incomplete elliptic integrals of the first kind.

**ellint\_2()**

```
template<typename _Tp, typename _Tpp>
__gnu_cxx::__promote_2< _Tp, _Tpp >::__type std::tr1::ellint_2 (
    _Tp __k,
    _Tpp __phi) [inline]
```

5.2.1.13 Incomplete elliptic integrals of the second kind.

**ellint\_3()**

```
template<typename _Tp, typename _Tpn, typename _Tpp>
__gnu_cxx::__promote_3< _Tp, _Tpn, _Tpp >::__type std::tr1::ellint_3 (
    _Tp __k,
    _Tpn __nu,
    _Tpp __phi) [inline]
```

5.2.1.14 Incomplete elliptic integrals of the third kind.

**expint()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::trl::expint (
    _Tp __x) [inline]
```

5.2.1.15 Exponential integrals.

**hermite()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::trl::hermite (
    unsigned int __n,
    _Tp __x) [inline]
```

5.2.1.16 Hermite polynomials.

**laguerre()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::trl::laguerre (
    unsigned int __n,
    _Tp __x) [inline]
```

5.2.1.18 Laguerre polynomials.

**legendre()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::trl::legendre (
    unsigned int __n,
    _Tp __x) [inline]
```

5.2.1.19 Legendre polynomials.

**riemann\_zeta()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::trl::riemann_zeta (
    _Tp __x) [inline]
```

5.2.1.20 Riemann zeta function.

**sph\_bessel()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::trl::sph_bessel (
    unsigned int __n,
    _Tp __x) [inline]
```

5.2.1.21 Spherical Bessel functions.

**sph\_legendre()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::trl::sph_legendre (
    unsigned int __l,
    unsigned int __m,
    _Tp __theta) [inline]
```

5.2.1.22 Spherical associated Legendre functions.

**sph\_neumann()**

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::trl::sph_neumann (
    unsigned int __n,
    _Tp __x) [inline]
```

5.2.1.23 Spherical Neumann functions.

**3.12 Ranges**

Components for dealing with ranges of elements.

**3.13 Regular Expressions**

Collaboration diagram for Regular Expressions:

**Topics**

- [Base and Implementation Classes](#)

**Namespaces**

- namespace [std::regex\\_constants](#)

**Classes**

- class [std::basic\\_regex< \\_Ch\\_type, \\_Rx\\_traits >](#)
- class [std::match\\_results< \\_Bi\\_iter, \\_Alloc >](#)
- class [std::regex\\_error](#)
- class [std::regex\\_iterator< \\_Bi\\_iter, \\_Ch\\_type, \\_Rx\\_traits >](#)
- class [std::regex\\_token\\_iterator< \\_Bi\\_iter, \\_Ch\\_type, \\_Rx\\_traits >](#)
- class [std::regex\\_traits< \\_Ch\\_type >](#)
- class [std::sub\\_match< \\_Biter >](#)

**Typedefs**

- typedef [match\\_results< const char \\* >](#) **std::cmatch**
- typedef [regex\\_iterator< const char \\* >](#) **std::cregex\_iterator**
- typedef [regex\\_token\\_iterator< const char \\* >](#) **std::cregex\_token\_iterator**
- typedef [sub\\_match< const char \\* >](#) **std::csub\_match**
- typedef [basic\\_regex< char >](#) **std::regex**
- typedef [match\\_results< string::const\\_iterator >](#) **std::smatch**

- typedef `regex_iterator` < string::const\_iterator > `std::sregex_iterator`

### 3.13.1 Detailed Description

A facility for performing regular expression pattern matching.

Since

C++11

### 3.13.2 Typedef Documentation

#### cregex\_token\_iterator

```
typedef regex_token_iterator<const char*> std::cregex_token_iterator
```

Token iterator for C-style NULL-terminated strings.

#### csub\_match

```
typedef sub_match<const char*> std::csub_match
```

Standard regex submatch over a C-style null-terminated string.

#### regex

```
typedef basic_regex<char> std::regex
```

Standard regular expressions.

#### sregex\_token\_iterator

```
typedef regex_token_iterator<string::const_iterator> std::sregex_token_iterator
```

Token iterator for standard strings.

#### ssub\_match

```
typedef sub_match<string::const_iterator> std::ssub_match
```

Standard regex submatch over a standard string.

**wcregex\_token\_iterator**

```
typedef regex_token_iterator<const wchar_t*> std::wcregex_token_iterator
```

Token iterator for C-style NULL-terminated wide strings.

**wcsub\_match**

```
typedef sub_match<const wchar_t*> std::wcsub_match
```

Regex submatch over a C-style null-terminated wide string.

**wregex**

```
typedef basic_regex<wchar_t> std::wregex
```

Standard wide-character regular expressions.

**wsregex\_token\_iterator**

```
typedef regex_token_iterator<wstring::const_iterator> std::wsregex_token_iterator
```

Token iterator for standard wide-character strings.

**wssub\_match**

```
typedef sub_match<wstring::const_iterator> std::wssub_match
```

Regex submatch over a standard wide string.

**3.13.3 Function Documentation****operator<<()**

```
template<typename _Ch_type, typename _Ch_traits, typename _Bi_iter>
basic_ostream< _Ch_type, _Ch_traits > & operator<< (
    basic_ostream< _Ch_type, _Ch_traits > & __os,
    const sub_match< _Bi_iter > & __m) [related]
```

Inserts a matched string into an output stream.

**Parameters**

<code>__os</code>	The output stream.
<code>__m</code>	A submatch string.

**Returns**

the output stream with the submatch string inserted.

**operator<=>() [1/4]**

```
template<typename _Bi_iter, typename _Ch_traits, typename _Alloc>
auto operator<=> (
    const sub_match< _Bi_iter > & __lhs,
    const __sub_match_string< _Bi_iter, _Ch_traits, _Alloc > & __rhs) [related]
```

Three-way comparison of a regular expression submatch and a string.

**Parameters**

<code>__lhs</code>	A regular expression submatch.
--------------------	--------------------------------

<code>__rhs</code>	A string.
--------------------	-----------

**Returns**

A value indicating whether `__lhs` is less than, equal to, greater than, or incomparable with `__rhs`.

**operator<=>() [2/4]**

```
template<typename _Bi_iter>
auto operator<=> (
    const sub\_match< _Bi_iter > & __lhs,
    typename iterator\_traits< _Bi_iter >::value_type const & __rhs) [related]
```

Three-way comparison of a regular expression submatch and a character.

**Parameters**

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A character.

**Returns**

A value indicating whether `__lhs` is less than, equal to, greater than, or incomparable with `__rhs`.

**operator<=>() [3/4]**

```
template<typename _Bi_iter>
auto operator<=> (
    const sub\_match< _Bi_iter > & __lhs,
    typename iterator\_traits< _Bi_iter >::value_type const * __rhs) [related]
```

Three-way comparison of a regular expression submatch and a C string.

**Parameters**

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A null-terminated string.

**Returns**

A value indicating whether `__lhs` is less than, equal to, greater than, or incomparable with `__rhs`.

**operator<=>() [4/4]**

```
template<typename _BiIter>
auto operator<=> (
    const sub\_match< _BiIter > & __lhs,
    const sub\_match< _BiIter > & __rhs) [related]
```

Three-way comparison of two regular expression submatches.

**Parameters**

<code>__lhs</code>	First regular expression submatch.
<code>__rhs</code>	Second regular expression submatch.

**Returns**

A value indicating whether `__lhs` is less than, equal to, greater than, or incomparable with `__rhs`.

**operator==( ) [1/5]**

```
template<typename _Bi_iter, typename _Alloc>
bool operator== (
    const match_results< _Bi_iter, _Alloc > & __m1,
    const match_results< _Bi_iter, _Alloc > & __m2) [related]
```

Compares two `match_results` for equality.

**Returns**

true if the two objects refer to the same match, false otherwise.

**operator==( ) [2/5]**

```
template<typename _Bi_iter, typename _Ch_traits, typename _Ch_alloc>
bool operator== (
    const sub_match< _Bi_iter > & __lhs,
    const __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc > & __rhs) [related]
```

Tests the equivalence of a regular expression submatch and a string.

**Parameters**

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A string.

**Returns**

true if `__lhs` is equivalent to `__rhs`, false otherwise.

**operator==( ) [3/5]**

```
template<typename _Bi_iter>
bool operator== (
    const sub_match< _Bi_iter > & __lhs,
    typename iterator_traits< _Bi_iter >::value_type const & __rhs) [related]
```

Tests the equivalence of a regular expression submatch and a character.

**Parameters**

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A character.

**Returns**

true if `__lhs` is equivalent to `__rhs`, false otherwise.

**operator==()** [4/5]

```
template<typename _Bi_iter>
bool operator== (
    const sub_match< _Bi_iter > & __lhs,
    typename iterator_traits< _Bi_iter >::value_type const * __rhs) [related]
```

Tests the equivalence of a regular expression submatch and a C string.

**Parameters**

<code>__lhs</code>	A regular expression submatch.
<code>__rhs</code>	A null-terminated string.

**Returns**

true if `__lhs` is equivalent to `__rhs`, false otherwise.

**operator==()** [5/5]

```
template<typename _BiIter>
bool operator== (
    const sub_match< _BiIter > & __lhs,
    const sub_match< _BiIter > & __rhs) [related]
```

Tests the equivalence of two regular expression submatches.

**Parameters**

<code>__lhs</code>	First regular expression submatch.
<code>__rhs</code>	Second regular expression submatch.

**Returns**

true if `__lhs` is equivalent to `__rhs`, false otherwise.

**regex\_match()** [1/7]

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
bool std::regex_match (
    _Bi_iter __first,
    _Bi_iter __last,
    const basic_regex< _Ch_type, _Rx_traits > & __re,
    regex_constants::match_flag_type __flags = regex_constants::match_default) [inline]
```

Indicates if there is a match between the regular expression `e` and all of the character sequence `[first, last)`.

**Parameters**

<code>__first</code>	Beginning of the character sequence to match.
<code>__last</code>	One-past-the-end of the character sequence to match.
<code>__re</code>	The regular expression.
<code>__flags</code>	Controls how the regular expression is matched.

## Return values

<i>true</i>	A match exists.
<i>false</i>	Otherwise.

## Exceptions

<i>an</i>	exception of type <code>regex_error</code> .
-----------	--

References [std::regex\\_constants::match\\_default](#), and [regex\\_match\(\)](#).

**regex\_match()** [2/7]

```
template<typename _Bi_iter, typename _Alloc, typename _Ch_type, typename _Rx_traits>
bool std::regex_match (
    _Bi_iter __s,
    _Bi_iter __e,
    match_results< _Bi_iter, _Alloc > & __m,
    const basic_regex< _Ch_type, _Rx_traits > & __re,
    regex_constants::match_flag_type __flags = regex_constants::match_default) [inline]
```

Determines if there is a match between the regular expression `e` and all of the character sequence `[first, last)`.

## Parameters

<code>__s</code>	Start of the character sequence to match.
<code>__e</code>	One-past-the-end of the character sequence to match.
<code>__m</code>	The match results.
<code>__re</code>	The regular expression.
<code>__flags</code>	Controls how the regular expression is matched.

## Return values

<i>true</i>	A match exists.
<i>false</i>	Otherwise.

## Exceptions

<i>an</i>	exception of type <code>regex_error</code> .
-----------	--

**regex\_match()** [3/7]

```
template<typename _Ch_type, class _Rx_traits>
bool std::regex_match (
    const _Ch_type * __s,
    const basic_regex< _Ch_type, _Rx_traits > & __re,
    regex_constants::match_flag_type __f = regex_constants::match_default) [inline]
```

Indicates if there is a match between the regular expression `e` and a C-style null-terminated string.

## Parameters

<code>_↔ _s</code>	The C-style null-terminated string to match.
<code>_↔ _re</code>	The regular expression.
<code>_↔ _f</code>	Controls how the regular expression is matched.

## Return values

<code>true</code>	A match exists.
<code>false</code>	Otherwise.

## Exceptions

<code>an</code>	exception of type <code>regex_error</code> .
-----------------	--

**regex\_replace()** [1/6]

```
template<typename _Out_iter, typename _Bi_iter, typename _Rx_traits, typename _Ch_type>
_Out_iter std::regex_replace (
    _Out_iter __out,
    _Bi_iter __first,
    _Bi_iter __last,
    const basic_regex<_Ch_type, _Rx_traits> & __e,
    const _Ch_type * __fmt,
    regex_constants::match_flag_type __flags = regex_constants::match_default)
```

Search for a regular expression within a range for multiple times, and replace the matched parts through filling a format C-string.

## Parameters

<code>__out</code>	[OUT] The output iterator.
<code>__first</code>	[IN] The start of the string to search.
<code>__last</code>	[IN] One-past-the-end of the string to search.
<code>__e</code>	[IN] The regular expression to search for.
<code>__fmt</code>	[IN] The format C-string.
<code>__flags</code>	[IN] Search and replace policy flags.

## Returns

`__out`

## Exceptions

<code>an</code>	exception of type <code>regex_error</code> .
-----------------	--

```

Searches for a regular expression within a string.

## Parameters

<code>__s</code>	[IN] The string to search.
<code>__e</code>	[IN] The regular expression to search for.
<code>__flags</code>	[IN] Search policy flags.

## Return values

<code>true</code>	A match was found within the string.
<code>false</code>	No match was found within the string.

## Exceptions

<code>an</code>	exception of type <code>regex_error</code> .
-----------------	--

References [std::regex\\_constants::match\\_default](#), and [regex\\_search\(\)](#).

**swap()** [1/2]

```
template<typename _Ch_type, typename _Rx_traits>
void swap (
    basic_regex< _Ch_type, _Rx_traits > & __lhs,
    basic_regex< _Ch_type, _Rx_traits > & __rhs) [related]
```

Swaps the contents of two regular expression objects.

**Parameters**

<code>__lhs</code>	First regular expression.
<code>__rhs</code>	Second regular expression.

**swap()** [2/2]

```
template<typename _Bi_iter, typename _Alloc>
void swap (
    match_results< _Bi_iter, _Alloc > & __lhs,
    match_results< _Bi_iter, _Alloc > & __rhs) [related]
```

Swaps two match results.

**Parameters**

<code>__lhs</code>	A match result.
<code>__rhs</code>	A match result.

The contents of the two `match_results` objects are swapped.

**3.13.4 Base and Implementation Classes**

Collaboration diagram for Base and Implementation Classes:

**Classes**

- struct `std::__detail::BracketMatcher< _TraitsT, __icase, __collate >`
- class `std::__detail::Compiler< _TraitsT >`
- class `std::__detail::Executor< _Bilter, _Alloc, _TraitsT, __dfs_mode >`
- class `std::__detail::Scanner< _CharT >`
- class `std::__detail::StateSeq< _TraitsT >`

## Typedefs

- `template<typename _CharT>`  
using `std::__detail::_Matcher`
- `typedef long std::__detail::_StateIdT`

## Enumerations

- `enum std::__detail::_Opcode : int {`  
`_S_opcode_unknown , _S_opcode_alternative , _S_opcode_repeat , _S_opcode_backref ,`  
`_S_opcode_line_begin_assertion , _S_opcode_line_end_assertion , _S_opcode_word_boundary , _S_opcode_subexpr_lookahead ,`  
`_S_opcode_subexpr_begin , _S_opcode_subexpr_end , _S_opcode_dummy , _S_opcode_match ,`  
`_S_opcode_accept }`

## Variables

- `constexpr _StateIdT std::__detail::_S_invalid_state_id`

### 3.13.4.1 Detailed Description

### 3.13.4.2 Enumeration Type Documentation

#### `_Opcode`

```
enum std::__detail::_Opcode : int
```

Operation codes that define the type of transitions within the base NFA that represents the regular expression.

## 3.14 Strings

Collaboration diagram for Strings:

## Classes

- `class std::basic_string< _CharT, _Traits, _Alloc >`
- `class std::basic_string_view< _CharT, _Traits >`
- `class std::experimental::fundamentals_v1::basic_string_view< _CharT, _Traits >`
- `struct std::char_traits< _CharT >`

## Typedefs

- typedef `basic_string< char > std::string`
- typedef `basic_string< char16_t > std::u16string`
- typedef `basic_string< char32_t > std::u32string`
- typedef `basic_string< wchar_t > std::wstring`

### 3.14.1 Detailed Description

### 3.14.2 Typedef Documentation

#### string

```
typedef basic_string<char> std::string
```

A string of `char`.

#### u16string

```
typedef basic_string<char16_t> std::u16string
```

A string of `char16_t`.

#### u32string

```
typedef basic_string<char32_t> std::u32string
```

A string of `char32_t`.

#### wstring

```
typedef basic_string<wchar_t> std::wstring
```

A string of `wchar_t`.

## 3.15 Technical Specifications

Collaboration diagram for Technical Specifications:

## Topics

- [Filesystem TS](#)
- [Library Fundamentals TS](#)
- [Parallelism TS](#)

### 3.15.1 Detailed Description

Components specified by various Technical Specifications.

As indicated by the `std::experimental` namespace and the header paths, the contents of these Technical Specifications are experimental and not part of the C++ standard. As such the interfaces and implementations may change in the future, and there is **no guarantee of compatibility between different GCC releases** for these features.

### 3.15.2 Filesystem TS

Collaboration diagram for Filesystem TS:

#### Files

- file [filesystem](#)

#### Classes

- class [std::experimental::filesystem::v1::filesystem\\_error](#)
- class [std::experimental::filesystem::v1::path::iterator](#)
- class [std::experimental::filesystem::v1::path](#)
- struct [std::experimental::filesystem::v1::space\\_info](#)

#### Typedefs

- using [std::experimental::filesystem::file\\_time\\_type](#)

#### Enumerations

- enum class [std::experimental::filesystem::copy\\_options](#) : unsigned short { **none**, **skip\_existing**, **overwrite\_existing**, **update\_existing**, **recursive**, **copy\_symlinks**, **skip\_symlinks**, **directories\_only**, **create\_symlinks**, **create\_hard\_links** }
- enum class [std::experimental::filesystem::directory\\_options](#) : unsigned char { **none**, **follow\_directory\_symlink**, **skip\_permission\_denied** }
- enum class [std::experimental::filesystem::file\\_type](#) : signed char { **none**, **not\_found**, **regular**, **directory**, **symlink**, **block**, **character**, **fifo**, **socket**, **unknown** }
- enum class [std::experimental::filesystem::perms](#) : unsigned { **none**, **owner\_read**, **owner\_write**, **owner\_exec**, **owner\_all**, **group\_read**, **group\_write**, **group\_exec**, **group\_all**, **others\_read**, **others\_write**, **others\_exec**, **others\_all**, **all**, **set\_uid**, **set\_gid**, **sticky\_bit**, **mask**, **unknown**, **add\_perms**, **remove\_perms**, **symlink\_nofollow** }

## Functions

### 3.15.2.1 Detailed Description

Utilities for performing operations on file systems and their components, such as paths, regular files, and directories.  
ISO/IEC TS 18822:2015 C++ File System Technical Specification

Since

C++11

Remarks

Link using `-lstdc++fs` to use these types and functions.

### 3.15.2.2 Typedef Documentation

#### file\_time\_type

using `std::experimental::filesystem::v1::file_time_type`

The type used for file timestamps.

### 3.15.2.3 Enumeration Type Documentation

#### copy\_options

enum class `std::experimental::filesystem::v1::copy_options` : unsigned short [strong]

Bitmask type controlling effects of `filesystem::copy`

#### directory\_options

enum class `std::experimental::filesystem::v1::directory_options` : unsigned char [strong]

Bitmask type controlling directory iteration.

#### file\_type

enum class `std::experimental::filesystem::v1::file_type` : signed char [strong]

Enumerated type representing the type of a file.

#### perms

enum class `std::experimental::filesystem::v1::perms` : unsigned [strong]

Bitmask type representing file access permissions.

## Classes

- class [std::experimental::fundamentals\\_v1::basic\\_string\\_view<\\_CharT, \\_Traits>](#)

### 3.15.3.1 Detailed Description

Components defined by the *C++ Extensions for Library Fundamentals* Technical Specification, versions 1 and 2.

- ISO/IEC TS 19568:2015 C++ Extensions for Library Fundamentals
- ISO/IEC TS 19568:2017 C++ Extensions for Library Fundamentals, Version 2

### 3.15.3.2 Array creation functions

Collaboration diagram for Array creation functions:

#### Functions

- `template<typename _Tp, size_t _Nm, size_t... _Idx>`  
`constexpr array< remove_cv_t< _Tp >, _Nm > std::experimental::\_\_to\_array (_Tp(&__a)[_Nm],`  
`index\_sequence< _Idx... >)`
- `template<typename _Dest = void, typename... _Types>`  
`constexpr array< typename __make_array_elem< _Dest, _Types... >::type, sizeof...(_Types)> std::experimental::make\_array`  
`(_Types &&... __t)`
- `template<typename _Tp, size_t _Nm>`  
`constexpr array< remove_cv_t< _Tp >, _Nm > std::experimental::to\_array (_Tp(&__a)[_Nm]) noexcept(is_nothrow_constructible<`  
`remove_cv_t< _Tp >, _Tp & >::value)`

#### 3.15.3.2.1 Detailed Description

Array creation functions as described in N4529, Working Draft, C++ Extensions for Library Fundamentals, Version 2

#### 3.15.3.2.2 Function Documentation

##### `make_array()`

```
template<typename _Dest = void, typename... _Types>
array< typename __make_array_elem< _Dest, _Types... >::type, sizeof...(_Types)> std::experimental::fundamentals\_v2::make\_array (
    _Types &&... __t) [constexpr]
```

Create a `std::array` from a variable-length list of arguments.

References [std::forward\(\)](#).

##### `to_array()`

```
template<typename _Tp, size_t _Nm>
array< remove_cv_t< _Tp >, _Nm > std::experimental::fundamentals\_v2::to\_array (
    _Tp(&) __a[_Nm]) [constexpr], [noexcept]
```

Create a `std::array` from an array.

### 3.15.3.3 Const-propagating wrapper

Collaboration diagram for Const-propagating wrapper:

#### Classes

- class `std::experimental::fundamentals_v2::propagate_const<_Tp>`

#### Functions

- `template<typename _Tp>`

### 3.15.3.3.1 Detailed Description

A const-propagating wrapper that propagates const to pointer-like members, as described in n4388 "A Proposal to Add a Const-Propagating Wrapper to the Standard Library".

### 3.15.3.4 Detection idiom

Collaboration diagram for Detection idiom:

- `#define \_\_cpp\_lib\_experimental\_detect`

- `template<typename...>`  
using `std::experimental::void_t`
- `template<typename _Default, template< typename... > class _Op, typename... _Args>`  
using `std::experimental::detected_or`
- `template<typename _Default, template< typename... > class _Op, typename... _Args>`  
using `std::experimental::detected_or_t`
- `template<template< typename... > class _Op, typename... _Args>`  
using `std::experimental::detected_t`
- `template<template< typename... > class _Op, typename... _Args>`  
using `std::experimental::is_detected`
- `template<typename _Expected, template< typename... > class _Op, typename... _Args>`  
using `std::experimental::is_detected_exact`
- `template<typename _To, template< typename... > class _Op, typename... _Args>`  
using `std::experimental::is_detected_convertible`
- `template<template< typename... > class _Op, typename... _Args>`  
constexpr bool `std::experimental::is_detected_v`
- `template<typename _Expected, template< typename... > class _Op, typename... _Args>`  
constexpr bool `std::experimental::is_detected_exact_v`
- `template<typename _To, template< typename... > class _Op, typename... _Args>`  
constexpr bool `std::experimental::is_detected_convertible_v`

#### 3.15.3.4.1 Detailed Description

Since

Library Fundamentals TS v2. C++14.

#### 3.15.3.4.2 Macro Definition Documentation

##### `__cpp_lib_experimental_detect`

```
#define __cpp_lib_experimental_detect
```

A metafunction that always yields void, used for detecting valid types.

#### 3.15.3.4.3 Typedef Documentation

##### `detected_or`

```
template<typename _Default, template< typename... > class _Op, typename... _Args>
using std::experimental::fundamentals_v2::detected_or
```

A metafunction that always yields void, used for detecting valid types.

##### `detected_or_t`

```
template<typename _Default, template< typename... > class _Op, typename... _Args>
using std::experimental::fundamentals_v2::detected_or_t
```

A metafunction that always yields void, used for detecting valid types.

##### `detected_t`

```
template<template< typename... > class _Op, typename... _Args>
using std::experimental::fundamentals_v2::detected_t
```

A metafunction that always yields void, used for detecting valid types.

**is\_detected**

```
template<template< typename... > class _Op, typename... _Args>
using std::experimental::fundamentals_v2::is_detected
```

A metafunction that always yields void, used for detecting valid types.

**is\_detected\_convertible**

```
template<typename _To, template< typename... > class _Op, typename... _Args>
using std::experimental::fundamentals_v2::is_detected_convertible
```

A metafunction that always yields void, used for detecting valid types.

**is\_detected\_exact**

```
template<typename _Expected, template< typename... > class _Op, typename... _Args>
using std::experimental::fundamentals_v2::is_detected_exact
```

A metafunction that always yields void, used for detecting valid types.

**void\_t**

```
template<typename...>
using std::experimental::fundamentals_v2::void_t
```

A metafunction that always yields void, used for detecting valid types.

**3.15.3.4.4 Variable Documentation****is\_detected\_convertible\_v**

```
template<typename _To, template< typename... > class _Op, typename... _Args>
bool std::experimental::fundamentals_v2::is_detected_convertible_v [constexpr]
```

A metafunction that always yields void, used for detecting valid types.

**is\_detected\_exact\_v**

```
template<typename _Expected, template< typename... > class _Op, typename... _Args>
bool std::experimental::fundamentals_v2::is_detected_exact_v [constexpr]
```

A metafunction that always yields void, used for detecting valid types.

**is\_detected\_v**

```
template<template< typename... > class _Op, typename... _Args>
bool std::experimental::fundamentals_v2::is_detected_v [constexpr]
```

A metafunction that always yields void, used for detecting valid types.

### 3.15.3.5 Logical operator traits

Collaboration diagram for Logical operator traits:

- `#define __cpp_lib_experimental_logical_traits`
- `template<typename... _Bn>`  
`constexpr bool std::experimental::conjunction_v`
- `template<typename... _Bn>`  
`constexpr bool std::experimental::disjunction_v`
- `template<typename _Pp>`  
`constexpr bool std::experimental::negation_v`

#### 3.15.3.5.1 Detailed Description

Since

Library Fundamentals TS v2. C++14.

### 3.15.3.6 Optional values

Collaboration diagram for Optional values:

#### Classes

- class `std::experimental::fundamentals_v1::bad_optional_access`
- struct `std::experimental::fundamentals_v1::in_place_t`
- struct `std::experimental::fundamentals_v1::nullopt_t`
- class `std::experimental::fundamentals_v1::optional<_Tp>`

#### Macros

- `#define __cpp_lib_experimental_optional`

#### Variables

- `constexpr in_place_t std::experimental::in_place`
- `constexpr nullopt_t std::experimental::nullopt`

### 3.15.3.6.1 Detailed Description

Class template for optional values and surrounding facilities, as described in n3793 "A proposal to add a utility class to represent optional objects (Revision 5)".

### 3.15.3.6.2 Variable Documentation

#### in\_place

`in_place_t` `std::experimental::fundamentals_v1::in_place` [constexpr]

Tag for in-place construction.

#### nullopt

`nullopt_t` `std::experimental::fundamentals_v1::nullopt` [constexpr]

Tag to disengage optional objects.

### 3.15.3.7 Type-safe container of any type

Collaboration diagram for Type-safe container of any type:

### Classes

- class `std::experimental::fundamentals_v1::any`
- class `std::experimental::fundamentals_v1::bad_any_cast`

### Macros

- `#define __cpp_lib_experimental_any`

### Functions

- static void `std::experimental::fundamentals_v1::any::_Manager_external< _Tp >::_S_manage` (`_Op __op` which, const `any *__anyp`, `_Arg *__arg`)
- static void `std::experimental::fundamentals_v1::any::_Manager_internal< _Tp >::_S_manage` (`_Op __op` which, const `any *__anyp`, `_Arg *__arg`)
- template<typename `_ValueType`>  
`_ValueType std::experimental::any_cast` (const `any &__any`)
- void `std::experimental::swap` (`any &__x`, `any &__y`) noexcept
- template<typename `_ValueType`>  
`_ValueType std::experimental::any_cast` (`any &__any`)
- template<typename `_ValueType`, typename `enable_if<!is_move_constructible< _ValueType >::value||is_lvalue_reference< _ValueType >::value, bool >::type = true>`>  
`_ValueType std::experimental::any_cast` (`any &&__any`)

- `template<typename _ValueType>`  
`const _ValueType * std::experimental::any\_cast (const any *__any) noexcept`
- `template<typename _ValueType>`  
`_ValueType * std::experimental::any\_cast (any *__any) noexcept`

### 3.15.3.7.1 Detailed Description

A type-safe container for single values of value types, as described in n3804 "Any Library Proposal (Revision 3)".

### 3.15.3.7.2 Function Documentation

#### **`any_cast()`** [1/5]

```
template<typename _ValueType, typename enable\_if<!is\_move\_constructible< _ValueType >::value||is\_lvalue\_reference
_ValueType >::value, bool >::type = true>
_ValueType std::experimental::fundamentals\_v1::any\_cast (
    any && __any) [inline]
```

Access the contained object.

#### Template Parameters

<code>_ValueType</code>	A reference or CopyConstructible type.
-------------------------	--

#### Parameters

<code>__any</code>	The object to access.
--------------------	-----------------------

#### Returns

The contained object.

#### Exceptions

<code><i>bad_any_cast</i></code>	If <code>__any.type() != typeid(remove_reference_t&lt;_ValueType&gt;)</code>
----------------------------------	--

References [any\\_cast\(\)](#).

#### **`any_cast()`** [2/5]

```
template<typename _ValueType>
_ValueType std::experimental::fundamentals\_v1::any\_cast (
    any & __any) [inline]
```

Access the contained object.

#### Template Parameters

<code>_ValueType</code>	A reference or CopyConstructible type.
-------------------------	--

#### Parameters

<code>__any</code>	The object to access.
--------------------	-----------------------

**Returns**

The contained object.

**Exceptions**

<i>bad_any_cast</i>	If <code>__any.type() != typeid(remove_reference_t&lt;_ValueType&gt;)</code>
---------------------	--

References [any\\_cast\(\)](#).

**any\_cast() [3/5]**

```
template<typename _ValueType>
_VValueType * std::experimental::fundamentals_v1::any_cast (
    any * __any) [inline], [noexcept]
```

Access the contained object.

**Template Parameters**

<i>_ValueType</i>	The type of the contained object.
-------------------	-----------------------------------

**Parameters**

<i>__any</i>	A pointer to the object to access.
--------------	------------------------------------

**Returns**

The address of the contained object if `__any != nullptr && __any.type() == typeid(_ValueType)` , otherwise a null pointer.

**any\_cast() [4/5]**

```
template<typename _ValueType>
_VValueType std::experimental::fundamentals_v1::any_cast (
    const any & __any) [inline]
```

Access the contained object.

**Template Parameters**

<i>_ValueType</i>	A const-reference or CopyConstructible type.
-------------------	--

**Parameters**

<i>__any</i>	The object to access.
--------------	-----------------------

**Returns**

The contained object.

## Exceptions

<code>bad_any_cast</code>	If <code>__any.type() != typeid(remove_reference_t&lt;_ValueType&gt;)</code>
---------------------------	--

References [any\\_cast\(\)](#).

Referenced by [any\\_cast\(\)](#), [any\\_cast\(\)](#), and [any\\_cast\(\)](#).

**any\_cast()** [5/5]

```
template<typename _ValueType>
const _ValueType * std::experimental::fundamentals_v1::any_cast (
    const any * __any) [inline], [noexcept]
```

Access the contained object.

## Template Parameters

<code>_ValueType</code>	The type of the contained object.
-------------------------	-----------------------------------

## Parameters

<code>__any</code>	A pointer to the object to access.
--------------------	------------------------------------

## Returns

The address of the contained object if `__any != nullptr && __any.type() == typeid(_ValueType)` , otherwise a null pointer.

**swap()**

```
void std::experimental::fundamentals_v1::swap (
    any & __x,
    any & __y) [inline], [noexcept]
```

Exchange the states of two `any` objects.

**3.15.3.8 Variable template for type traits**

Collaboration diagram for Variable template for type traits:

- `#define __cpp_lib_experimental_type_trait_variable_templates`
- `template<typename _Tp>`

### 3.16.1 Detailed Description

Basic function and class templates used with the rest of the library. Includes `pair`, `swap`, forward/move helpers, `declval`, `integer_sequence`.

### 3.16.2 Function Documentation

#### `pair()` [1/2]

```
template<typename _T1, typename _T2>
pair (
    _T1 ,
    _T2 ) -> pair< _T1, _T2 > [related]
```

Two pairs are equal iff their members are equal.

#### `pair()` [2/2]

```
template<class _T1, class _T2>
template<typename... _Args1, typename... _Args2>
std::pair< _T1, _T2 >::pair (
    piecewise_construct_t ,
    tuple< _Args1... > __first,
    tuple< _Args2... > __second) [inline], [constexpr]
```

"piecewise construction" using a tuple of arguments for each member.

#### Parameters

<code>__first</code>	Arguments for the first member of the pair.
----------------------	---

<code>__second</code>	Arguments for the second member of the pair.
-----------------------	--

The elements of each tuple will be used as the constructor arguments for the data members of the pair.  
References [pair\(\)](#).

### `__addressof()`

```
template<typename _Tp>
_Tp * std::__addressof (
    _Tp & __r) [inline], [constexpr], [noexcept]
```

Same as C++11 `std::addressof`.

Referenced by [std::back\\_insert\\_iterator< \\_Container >::back\\_insert\\_iterator\(\)](#), [std::basic\\_istream< char >::basic\\_istream\(\)](#), [std::basic\\_istream< char >::basic\\_istream\(\)](#), [std::basic\\_istream< char >::basic\\_istream\(\)](#), [std::basic\\_ostringstream< char >::basic\\_ostringstream\(\)](#), [std::basic\\_ostringstream< char >::basic\\_ostringstream\(\)](#), [std::basic\\_ostringstream< char >::basic\\_ostringstream\(\)](#), [std::basic\\_stringstream< char >::basic\\_stringstream\(\)](#), [std::basic\\_stringstream< char >::basic\\_stringstream\(\)](#), [std::basic\\_stringstream< char >::basic\\_stringstream\(\)](#), [std::front\\_insert\\_iterator< \\_Container >::front\\_insert\\_iterator\(\)](#), [std::insert\\_iterator< \\_Container >::insert\\_iterator\(\)](#), [std::istream\\_iterator< \\_Tp, \\_CharT, \\_Traits, \\_Dist >::istream\\_iterator\(\)](#), [std::ostream\\_iterator< \\_Tp, \\_CharT, \\_Traits >::ostream\\_iterator\(\)](#), [std::ostream\\_iterator< \\_Tp, \\_CharT, \\_Traits >::ostream\\_iterator\(\)](#), [\\_\\_gnu\\_debug::\\_Safe\\_sequence< \\_Sequence >::M\\_transfer\\_from\\_if](#), [begin\(\)](#), [begin\(\)](#), [std::basic\\_ios< \\_CharT, \\_Traits >::copyfmt\(\)](#), [end\(\)](#), [end\(\)](#), [std::forward\\_list< \\_Tp, \\_Alloc >::merge\(\)](#), [std::list< \\_Tp, \\_Alloc >::merge\(\)](#), [std::list< \\_Tp, \\_Alloc >::merge\(\)](#), [std::sub\\_match< const char \\* >::operator<<\(\)](#), [\\_\\_gnu\\_debug::\\_Safe\\_iterator< \\_Base\\_iterator, map >::operator=\(\)](#), [\\_\\_gnu\\_debug::\\_Safe\\_local\\_iterator< \\_OtherIterator, \\_UContainer >](#), [std::basic\\_string< \\_CharT >::operator=\(\)](#), [std::deque< \\_Tp, \\_Alloc >::operator=\(\)](#), [std::forward\\_list< \\_Tp, \\_Alloc >::operator=\(\)](#), [std::list< \\_Tp, \\_Alloc >::operator=\(\)](#), [std::vector< \\_Tp, \\_Alloc >::operator=\(\)](#), [std::sub\\_match< const char \\* >::operator==\(\)](#), [std::basic\\_istream< char >::rdbuf\(\)](#), [std::basic\\_ostringstream< char >::rdbuf\(\)](#), [std::basic\\_stringstream< char >::rdbuf\(\)](#), [std::vector< \\_State< \\_TraitsT::char\\_type > >::reserve\(\)](#), [std::list< \\_Tp, polymorphic\\_allocator< \\_Tp > >::splice\(\)](#), and [std::list< \\_Tp, polymorphic\\_allocator< \\_Tp > >::splice\(\)](#).

### `__invoke()`

```
template<typename _Callable, typename... _Args>
__invoke_result< _Callable, _Args... >::type std::__invoke (
    _Callable && __fn,
    _Args &&... __args) [constexpr], [noexcept]
```

Invoke a callable object.

References [forward\(\)](#).

Referenced by [std::once\\_flag::call\\_once](#).

### `addressof()`

```
template<typename _Tp>
_Tp * std::addressof (
    _Tp & __r) [inline], [constexpr], [noexcept]
```

Returns the actual address of the object or function referenced by `r`, even in the presence of an overloaded operator`&`.

#### Parameters

<code>←</code>	Reference to an object or function.
<code>__←</code>	
<code>←</code>	
<code>__←</code>	
<code>r</code>	

**Returns**

The actual address.

**Since**

C++11

Referenced by [std::function\\_ref<\\_Res\(\\_ArgTypes...\) \\_GLIBCXX\\_MOF\\_CV noexcept\(\\_Noex\)>::function\\_ref\(\)](#), [std::function\\_ref<\\_Res\(\\_ArgTypes...\) \\_GLIBCXX\\_MOF\\_CV noexcept\(\\_Noex\)>::function\\_ref\(\)](#), [\\_Destroy\(\)](#), [\\_Destroy\\_n\(\)](#), [std::copyable\\_function<\\_Res\(\\_ArgTypes...\) \\_GLIBCXX\\_MOF\\_CV noexcept\(\\_Noex\)>::operator=\(\)](#), and [std::move\\_only\\_function<\\_Res](#)

**declval()**

```
template<typename _Tp>
auto std::declval () -> decltype(__declval< _Tp >(0)) [noexcept]
```

Utility to simplify expressions used in unevaluated operands

**Since**

C++11

Referenced by [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::vector\(\)](#), and [std::unique\\_ptr<\\_State>::operator\\*\(\)](#).

**forward() [1/2]**

```
template<typename _Tp>
_Tp && std::forward (
    typename std::remove_reference< _Tp >::type && __t) [constexpr], [noexcept]
```

Forward an rvalue.

**Returns**

The parameter cast to the specified type.

This function is used to implement "perfect forwarding".

**Since**

C++11

**forward() [2/2]**

```
template<typename _Tp>
_Tp && std::forward (
    typename std::remove_reference< _Tp >::type & __t) [constexpr], [noexcept]
```

Forward an lvalue.

**Returns**

The parameter cast to the specified type.

This function is used to implement "perfect forwarding".

Since

C++11

### forward\_as\_tuple()

```
template<typename... _Elements>
tuple< _Elements &&... > std::forward_as_tuple (
    _Elements &&... __args) [constexpr], [noexcept]
```

Create a tuple of lvalue or rvalue references to the arguments.

References [forward\(\)](#).

Referenced by `std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert_or_assign()`, and `std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert_or_assign()`.

### get() [1/4]

```
template<size_t __i, typename... _Elements>
const __tuple_element_t< __i, tuple< _Elements... > > && std::get (
    const tuple< _Elements... > && __t) [constexpr], [noexcept]
```

Return a const rvalue reference to the *i*th element of a const tuple rvalue.

References [forward\(\)](#).

#### get() [2/4]

```
template<size_t __i, typename... _Elements>
const __tuple_element_t< __i, tuple< _Elements... > > & std::get (
    const tuple< _Elements... > & __t) [constexpr], [noexcept]
```

Return a const reference to the *i*th element of a const tuple.

#### get() [3/4]

```
template<size_t __i, typename... _Elements>
__tuple_element_t< __i, tuple< _Elements... > > && std::get (
    tuple< _Elements... > && __t) [constexpr], [noexcept]
```

Return an rvalue reference to the *i*th element of a tuple rvalue.

References [forward\(\)](#).

#### get() [4/4]

```
template<size_t __i, typename... _Elements>
__tuple_element_t< __i, tuple< _Elements... > > & std::get (
    tuple< _Elements... > & __t) [constexpr], [noexcept]
```

Return a reference to the *i*th element of a tuple.

#### make\_pair()

```
template<typename _T1, typename _T2>
pair< typename __decay_and_strip< _T1 >::__type, typename __decay_and_strip< _T2 >::__type >
std::make_pair (
    _T1 && __x,
    _T2 && __y) [constexpr]
```

A convenience wrapper for creating a pair from two objects.

#### Parameters

<a href="#"></a> <code>__x</code>	The first object.
<a href="#"></a> <code>__y</code>	The second object.

#### Returns

A newly-constructed `pair<>` object of the appropriate type.

The C++98 standard says the objects are passed by reference-to-const, but C++03 says they are passed by value (this was LWG issue #181).

Since C++11 they have been passed by forwarding reference and then forwarded to the new members of the pair. To create a pair with a member of reference type, pass a `reference_wrapper` to this function.

References [forward\(\)](#).

Referenced by [\\_\\_gnu\\_parallel::\\_\\_find\\_template\(\)](#), [\\_\\_gen\\_two\\_uniform\\_ints\(\)](#), [\\_\\_gnu\\_debug::\\_\\_get\\_distance\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_merge\\_advance\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\\_qsb\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_qsb\\_local\\_sort\\_with\\_helping\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_adjacent\\_find\\_selector::\\_\\_M\\_sequential\\_algorithm\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_find\\_first\\_of\\_selector<\\_FIterator>::\\_\\_M\\_sequential\\_algorithm\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_find\\_if\\_selector::\\_\\_M\\_sequential\\_algorithm\(\)](#), [\\_\\_gnu\\_parallel::multiseq\\_partition\(\)](#), [\\_\\_gnu\\_parallel::multiseq\\_selection\(\)](#), [\\_\\_gnu\\_parallel::parallel\\_multiway\\_merge\(\)](#), [\\_\\_gnu\\_parallel::parallel\\_sort\\_mwms\\_pu\(\)](#), and [\\_\\_gnu\\_pbds::detail::pat\\_trie\\_base::\\_\\_Node\\_cite](#)

## make\_tuple()

```
template<typename... _Elements>
tuple< typename __decay_and_strip< _Elements >::__type... > std::make_tuple (
    _Elements &&... __args) [constexpr]
```

Create a tuple containing copies of the arguments.

References `forward()`.

## move()

```
template<typename _Tp>
std::remove_reference<_Tp >::type && std::move (
    _Tp && __t) [constexpr], [noexcept]
```

Convert a value to an rvalue.

## Parameters

$\leftarrow$ $\_ \leftarrow$ $\leftarrow$ $\_ \leftarrow$ $t$	A thing of arbitrary type.
---	----------------------------

## Returns

The parameter cast to an rvalue-reference to allow moving it.

**Since**

C++11

### move\_if\_noexcept()

```

template<typename _Tp>
__conditional_t< __move_if_noexcept_cond< _Tp >::value, const _Tp &, _Tp && > std::move_if_noexcept(
    _Tp & __x) [constexpr], [noexcept]

```

Conditionally convert a value to an rvalue.

#### Parameters

$\leftarrow$	A thing of arbitrary type.
$\_x$	

#### Returns

The parameter, possibly cast to an rvalue-reference.

Same as `std::move` unless the type's move constructor could throw and the type is copyable, in which case an lvalue-reference is returned instead.

#### Since

C++11

References [move\(\)](#).

### operator<=>() [1/2]

```

template<typename _T1, typename _T2, typename _U1, typename _U2>
common_comparison_category_t< __detail::__synth3way_t< _T1, _U1 >, __detail::__synth3way_t< _T2, _U2 > > operator<=>() (
    const pair<_T1, _T2 > & __x,
    const pair<_U1, _U2 > & __y) [related]

```

Defines a lexicographical order for pairs.

For two pairs of comparable types, `P` is ordered before `Q` if `P.first` is less than `Q.first`, or if `P.first` and `Q.first` are equivalent (neither is less than the other) and `P.second` is less than `Q.second`.

**operator<=>()** [2/2]

```
template<typename _T1, typename _T2, typename _U1, typename _U2>
common_comparison_category_t< __detail::__synth3way_t< _T1, _U1 >, __detail::__synth3way_t< _T2,
_U2 > > operator<=> (
    const pair< _T1, _T2 > & __x,
    const pair< _U1, _U2 > & __y) [related]
```

Defines a lexicographical order for pairs.

For two pairs of comparable types, `P` is ordered before `Q` if `P.first` is less than `Q.first`, or if `P.first` and `Q.first` are equivalent (neither is less than the other) and `P.second` is less than `Q.second`.

**operator==(** [1/2]

```
template<typename _T1, typename _T2, typename _U1, typename _U2>
bool operator== (
    const pair< _T1, _T2 > & __x,
    const pair< _U1, _U2 > & __y) [related]
```

Two pairs are equal iff their members are equal.

**operator==(** [2/2]

```
template<typename _T1, typename _T2, typename _U1, typename _U2>
bool operator== (
    const pair< _T1, _T2 > & __x,
    const pair< _U1, _U2 > & __y) [related]
```

Two pairs are equal iff their members are equal.

**swap()** [1/5]

```
template<typename _T1, typename _T2>
enable_if< __and< __is_swappable< _T1 >, __is_swappable< _T2 > >::value >::type swap (
    pair< _T1, _T2 > & __x,
    pair< _T1, _T2 > & __y) [related]
```

Swap overload for pairs. Calls `std::pair::swap()`.

**Note**

This `std::swap` overload is not declared in C++03 mode, which has performance implications, e.g. see <https://gcc.gnu.org/PR38466>

**swap()** [2/5]

```
template<typename _T1, typename _T2>
enable_if< __and< __is_swappable< _T1 >, __is_swappable< _T2 > >::value >::type swap (
    pair< _T1, _T2 > & __x,
    pair< _T1, _T2 > & __y) [related]
```

Swap overload for pairs. Calls `std::pair::swap()`.

**Note**

This `std::swap` overload is not declared in C++03 mode, which has performance implications, e.g. see <https://gcc.gnu.org/PR38466>

**swap()** [3/5]

```
template<typename _Tp>
requires (! __is_tuple_like<_Tp>::value) && is_move_constructible_v<_Tp> && is_move_assignable_v<_Tp>
void std::swap (
    _Tp & __a,
    _Tp & __b) [inline], [constexpr], [noexcept]
```

Swaps two values.

**Parameters**

<code>__a</code>	A thing of arbitrary type.
<code>__b</code>	Another thing of arbitrary type.

**Returns**

Nothing.

**swap()** [4/5]

```
template<typename _Tp, size_t _Nm>
requires is_swappable_v<_Tp>
void std::swap (
    _Tp(&) __a[_Nm],
    _Tp(&) __b[_Nm]) [inline], [constexpr], [noexcept]
```

Swap the contents of two arrays.

**swap()** [5/5]

```
template<typename... _Elements>
enable_if< __and< __is_swappable< _Elements >... >::value >::type std::swap (
    tuple< _Elements... > & __x,
    tuple< _Elements... > & __y) [inline], [constexpr], [delete], [noexcept]
```

Exchange the values of two tuples.

**tie()**

```
template<typename... _Elements>
tuple< _Elements &... > std::tie (
    _Elements &... __args) [constexpr], [noexcept]
```

Return a tuple of lvalue references bound to the arguments.

Referenced by [std::basic\\_ios< \\_CharT, \\_Traits >::copyfmt\(\)](#).

**tuple\_cat()**

```
template<typename... _Tpls, typename = typename enable_if<__and<__is_tuple_like<_Tpls>...>::value>::type>
auto std::tuple_cat (
    _Tpls &&... __tpls) -> typename __tuple_cat_result<_Tpls...>::__type [constexpr]
```

Create a tuple containing all elements from multiple tuple-like objects.

References [forward\(\)](#).

### 3.16.3 Variable Documentation

#### piecewise\_construct

`piecewise_construct_t` `std::piecewise_construct` `[inline]`, `[constexpr]`

Tag for piecewise construction of `std::pair` objects.

### 3.16.5.1 Detailed Description

Function objects, or *functors*, are objects with an `operator()` defined and accessible. They can be passed as arguments to algorithm templates and used in place of a function pointer. Not only is the resulting expressiveness of the library increased, but the generated code can be more efficient than what you might write by hand. When we refer to *functors*, then, generally we include function pointers in the description as well.

Often, functors are only created as temporaries passed to algorithm calls, rather than being created as named variables. Two examples taken from the standard itself follow. To perform a by-element addition of two vectors `a` and `b` containing `double`, and put the result in `a`, use

```
transform (a.begin(), a.end(), b.begin(), a.begin(), plus<double>());
```

To negate every element in `a`, use

```
transform(a.begin(), a.end(), a.begin(), negate<double>());
```

The addition and negation functions will usually be inlined directly.

An *adaptable function object* is one which provides nested typedefs `result_type` and either `argument_type` (for a unary function) or `first_argument_type` and `second_argument_type` (for a binary function). Those typedefs are used by function object adaptors such as `bind2nd`. The standard library provides two class templates, `unary_function` and `binary_function`, which define those typedefs and so can be used as base classes of adaptable function objects.

Since C++11 the use of function object adaptors has been superseded by more powerful tools such as lambda expressions, `function<>`, and more powerful type deduction (using `auto` and `decltype`). The helpers for defining adaptable function objects are deprecated since C++11, and no longer part of the standard library since C++17. However, they are still defined and used by libstdc++ after C++17, as a conforming extension.

### 3.16.5.2 Function Documentation

#### `mem_fn()`

```
template<typename _Tp, typename _Class>
_Mem_fn<_Tp _Class::*> std::mem_fn (
    _Tp _Class::*_pm) [inline], [constexpr], [noexcept]
```

Returns a function object that forwards to the member pointer pointer `pm`.

This allows a pointer-to-member to be transformed into a function object that can be called with an object expression as its first argument.

For a pointer-to-data-member the result must be called with exactly one argument, the object expression that would be used as the first operand in a `obj.*memptr` or `objp->*memptr` expression.

For a pointer-to-member-function the result must be called with an object expression and any additional arguments to pass to the member function, as in an expression like `(obj.*memfun)(args...)` or `(objp->*memfun)(args...)`.

The object expression can be a pointer, reference, `reference_wrapper`, or smart pointer, and the call wrapper will dereference it as needed to apply the pointer-to-member.

Since

C++11

### 3.16.5.3 Adaptors for pointers to functions

Collaboration diagram for Adaptors for pointers to functions:

#### Classes

- class [std::pointer\\_to\\_binary\\_function< \\_Arg1, \\_Arg2, \\_Result >](#)
- class [std::pointer\\_to\\_unary\\_function< \\_Arg, \\_Result >](#)

#### Functions

- `template<typename _Arg, typename _Result>`  
[pointer\\_to\\_unary\\_function< \\_Arg, \\_Result >](#) [std::ptr\\_fun](#) ([\\_Result](#)(\*\_\_x)([\\_Arg](#)))
- `template<typename _Arg1, typename _Arg2, typename _Result>`  
[pointer\\_to\\_binary\\_function< \\_Arg1, \\_Arg2, \\_Result >](#) [std::ptr\\_fun](#) ([\\_Result](#)(\*\_\_x)([\\_Arg1](#), [\\_Arg2](#)))

#### 3.16.5.3.1 Detailed Description

The advantage of function objects over pointers to functions is that the objects in the standard library declare nested typedefs describing their argument and result types with uniform names (e.g., `result_type` from the base classes `unary_function` and `binary_function`). Sometimes those typedefs are required, not just optional.

Adaptors are provided to turn pointers to unary (single-argument) and binary (double-argument) functions into function objects. The long-winded functor `pointer_to_unary_function` is constructed with a function pointer `f`, and its `operator()` called with argument `x` returns `f(x)`. The functor `pointer_to_binary_function` does the same thing, but with a double-argument `f` and `operator()`.

The function `ptr_fun` takes a pointer-to-function `f` and constructs an instance of the appropriate functor.

**Deprecated** Deprecated in C++11, no longer in the standard since C++17.

#### 3.16.5.3.2 Function Documentation

##### `ptr_fun()` [1/2]

```

template<typename _Arg, typename _Result>
pointer_to_unary_function< _Arg, _Result > std::ptr_fun (
    _Result(* __x )(_Arg)) [inline]
  
```

- class [std::mem\\_fun1\\_t< \\_Ret, \\_Tp, \\_Arg >](#)
- class [std::mem\\_fun\\_ref\\_t< \\_Ret, \\_Tp >](#)
- class [std::mem\\_fun\\_t< \\_Ret, \\_Tp >](#)

**Functions**

- template<typename \_Ret, typename \_Tp>  
[mem\\_fun\\_t](#)< \_Ret, \_Tp > **std::mem\_fun** (\_Ret(\_Tp::\*\_\_f)())
- template<typename \_Ret, typename \_Tp, typename \_Arg>  
[mem\\_fun1\\_t](#)< \_Ret, \_Tp, \_Arg > **std::mem\_fun** (\_Ret(\_Tp::\*\_\_f)(\_Arg))
- template<typename \_Ret, typename \_Tp>  
[mem\\_fun\\_ref\\_t](#)< \_Ret, \_Tp > **std::mem\_fun\_ref** (\_Ret(\_Tp::\*\_\_f)())
- template<typename \_Ret, typename \_Tp, typename \_Arg>  
[mem\\_fun1\\_ref\\_t](#)< \_Ret, \_Tp, \_Arg > **std::mem\_fun\_ref** (\_Ret(\_Tp::\*\_\_f)(\_Arg))

**3.16.5.4.1 Detailed Description**

There are a total of  $8 = 2^3$  function objects in this family. (1) Member functions taking no arguments vs member functions taking one argument. (2) Call through pointer vs call through reference. (3) Const vs non-const member function.

All of this complexity is in the function objects themselves. You can ignore it by using the helper function `mem_fun` and `mem_fun_ref`, which create whichever type of adaptor is appropriate.

**Deprecated** Deprecated in C++11, no longer in the standard since C++17. Use `mem_fn` instead.

### 3.16.5.5 Arithmetic Function Object Classes

Collaboration diagram for Arithmetic Function Object Classes:

#### Classes

- struct [std::divides<\\_Tp>](#)

## Functions

- template<typename \_Func, typename... \_BoundArgs>  
constexpr `_Bind_helper<__is_socketlike<_Func>::value, _Func, _BoundArgs...>::type` `std::bind` (`_Func` &&\_\_f, `_BoundArgs` &&... \_\_args)
- template<typename \_Result, typename \_Func, typename... \_BoundArgs>  
constexpr `_Bindres_helper<_Result, _Func, _BoundArgs...>::type` `std::bind` (`_Func` &&\_\_f, `_BoundArgs` &&... \_\_args)
- template<typename \_Operation, typename \_Tp>  
`binder1st<_Operation>` `std::bind1st` (`const _Operation` &\_\_fn, `const _Tp` &\_\_x)
- template<typename \_Operation, typename \_Tp>  
`binder2nd<_Operation>` `std::bind2nd` (`const _Operation` &\_\_fn, `const _Tp` &\_\_x)

### 3.16.5.6.1 Detailed Description

Binders turn functions/functors with two arguments into functors with a single argument, storing an argument to be applied later. For example, a variable `B` of type `binder1st` is constructed from a functor `f` and an argument `x`. Later, `B`'s `operator()` is called with a single argument `y`. The return value is the value of `f(x, y)`. `B` can be *called* with various arguments (`y1, y2, ...`) and will in turn call `f(x, y1), f(x, y2), ...`

The function `bind1st` is provided to save some typing. It takes the function and an argument as parameters, and returns an instance of `binder1st`.

The type `binder2nd` and its creator function `bind2nd` do the same thing, but the stored argument is passed as the second parameter instead of the first, e.g., `bind2nd(std::minus<float>(), 1.3)` will create a functor whose `operator()` accepts a floating-point number, subtracts 1.3 from it, and returns the result. (If `bind1st` had been used, the functor would perform `1.3 - x` instead.

Creator-wrapper functions like `bind1st` are intended to be used in calling algorithms. Their return values will be temporary objects. (The goal is to not require you to type names like `std::binder1st<std::plus<int>>` for declaring a variable to hold the return value from `bind1st(std::plus<int>(), 5)`).

These become more useful when combined with the composition functions.

These functions are deprecated in C++11 and can be replaced by `std::bind` (or `std::tr1::bind`) which is more powerful and flexible, supporting functions with any number of arguments. Uses of `bind1st` can be replaced by `std::bind(f, x, std::placeholders::_1)` and `bind2nd` by `std::bind(f, std::placeholders::_1, x)`.

### 3.16.5.6.2 Function Documentation

#### **bind()** [1/2]

```
template<typename _Func, typename... _BoundArgs>
_Bind_helper< __is_socketlike< _Func >::value, _Func, _BoundArgs... >::type std::bind (
    _Func && __f,
    _BoundArgs &&... __args) [inline], [constexpr]
```

Function template for `std::bind`.

Since

C++11

References [forward\(\)](#).

#### **bind()** [2/2]

```
template<typename _Result, typename _Func, typename... _BoundArgs>
_Bindres_helper< _Result, _Func, _BoundArgs... >::type std::bind (
    _Func && __f,
    _BoundArgs &&... __args) [inline], [constexpr]
```

Function template for `std::bind<R>`.

Since

C++11

References [forward\(\)](#).

#### **bind1st()**

```
template<typename _Operation, typename _Tp>
binder1st< _Operation > std::bind1st (
    const _Operation & __fn,
    const _Tp & __x) [inline]
```

One of the [binder functors](#).

References [bind1st\(\)](#).

Referenced by [bind1st\(\)](#).

#### **bind2nd()**

```
template<typename _Operation, typename _Tp>
binder2nd< _Operation > std::bind2nd (
    const _Operation & __fn,
    const _Tp & __x) [inline]
```

One of the [binder functors](#).

References [bind2nd\(\)](#).

Referenced by [bind2nd\(\)](#).

### 3.16.5.7 Boolean Operations Classes

Collaboration diagram for Boolean Operations Classes:

#### Classes

- struct `std::logical_and< _Tp >`
- struct `std::logical_and< void >`
- struct `std::logical_not< _Tp >`
- struct `std::logical_not< void >`
- struct `std::logical_or< _Tp >`
- struct `std::logical_or< void >`

#### 3.16.5.7.1 Detailed Description

The library provides function objects for the logical operations: `&&`, `||`, and `!`.

### 3.16.5.8 Comparison Classes

Collaboration diagram for Comparison Classes:

#### Classes

- struct `std::equal_to< _Tp >`
- struct `std::greater< _Tp >`
- struct `std::greater< void >`
- struct `std::greater_equal< _Tp >`
- struct `std::greater_equal< void >`
- struct `std::less< _Tp >`
- struct `std::less_equal< _Tp >`
- struct `std::less_equal< void >`
- struct `std::not_equal_to< _Tp >`
- struct `std::not_equal_to< void >`

### 3.16.5.8.1 Detailed Description

The library provides six wrapper functors for all the basic comparisons in C++, like <.

### 3.16.5.9 Hashes

Collaboration diagram for Hashes:

### Classes

- struct `std::hash< _Tp >`
- struct `std::hash< _Tp * >`
- struct `std::hash< bool >`
- struct `std::hash< char >`
- struct `std::hash< char16_t >`
- struct `std::hash< char32_t >`
- struct `std::hash< double >`
- struct `std::hash< float >`
- struct `std::hash< int >`
- struct `std::hash< long >`
- struct `std::hash< long double >`
- struct `std::hash< long long >`
- struct `std::hash< short >`
- struct `std::hash< signed char >`
- struct `std::hash< unsigned char >`
- struct `std::hash< unsigned int >`
- struct `std::hash< unsigned long >`
- struct `std::hash< unsigned long long >`
- struct `std::hash< unsigned short >`
- struct `std::hash< wchar_t >`

### Macros

- `#define _Cxx_hashtable_define_trivial_hash(_Tp)`

### Variables

- `template<typename _Tp, typename = void>`  
`constexpr bool std::__is_hash_enabled_for`
- `template<typename _Tp>`  
`constexpr bool std::__is_hash_enabled_for< _Tp, __void_t< decltype(hash< _Tp >()(declval< _Tp >()))>`  
`>`

### 3.16.5.9.1 Detailed Description

Hashing functors taking a variable type and returning a `std::size_t`.

### 3.16.5.10 Negators

Collaboration diagram for Negators:

#### Classes

- class `std::binary_negate<_Predicate>`
- class `std::unary_negate<_Predicate>`

#### Functions

- template<typename \_Predicate>  
constexpr `unary_negate<_Predicate>` `std::not1` (const \_Predicate &\_\_pred)
- template<typename \_Predicate>  
constexpr `binary_negate<_Predicate>` `std::not2` (const \_Predicate &\_\_pred)

### 3.16.5.10.1 Detailed Description

The function templates `not1` and `not2` are function object adaptors, which each take a predicate functor and wrap it in an instance of `unary_negate` or `binary_negate`, respectively. Those classes are functors whose `operator()` evaluates the wrapped predicate function and then returns the negation of the result.

For example, given a vector of integers and a trivial predicate,

```

struct IntGreaterThanThree
: public std::unary_function<int, bool>
{
    bool operator() (int x) const { return x > 3; }
};

std::find_if (v.begin(), v.end(), not1(IntGreaterThanThree()));
  
```

The call to `find_if` will locate the first index (*i*) of *v* for which ! (*v*[*i*] > 3) is true.

The `not1/unary_negate` combination works on predicates taking a single argument. The `not2/binary_negate` combination works on predicates taking two arguments.

**Deprecated** Deprecated in C++17, no longer in the standard since C++20. Use `not_fn` instead.

### 3.16.5.10.2 Function Documentation

#### `not1()`

```

template<typename _Predicate>
unary_negate<_Predicate> std::not1 (
    const _Predicate & __pred) [inline], [constexpr]
  
```

One of the [negation functors](#).

References [not1\(\)](#).  
 Referenced by [not1\(\)](#).

### not2()

```
template<typename _Predicate>
binary_negate< _Predicate > std::not2 (
    const _Predicate & __pred) [inline], [constexpr]
```

One of the [negation functors](#).

References [not2\(\)](#).  
 Referenced by [not2\(\)](#).

### 3.16.6.1 Detailed Description

Components for memory allocation, deallocation, and management.

### 3.16.6.2 Function Documentation

#### **align()**

```
void * std::align (
    size_t __align,
    size_t __size,
    void *& __ptr,
    size_t & __space) [inline], [noexcept]
```

Fit aligned storage in buffer.

This function tries to fit `__size` bytes of storage with alignment `__align` into the buffer `__ptr` of size `__space` bytes. If such a buffer fits then `__ptr` is changed to point to the first byte of the aligned storage and `__space` is reduced by the bytes used for alignment.

C++11 20.6.5 [ptr.align]

#### Parameters

<code>__align</code>	A fundamental or extended alignment value.
<code>__size</code>	Size of the aligned storage required.
<code>__ptr</code>	Pointer to a buffer of <code>__space</code> bytes.
<code>__space</code>	Size of the buffer pointed to by <code>__ptr</code> .

#### Returns

the updated pointer if the aligned storage fits, otherwise `nullptr`.

**assume\_aligned()**

```
template<size_t _Align, class _Tp>
_Tp * std::assume_aligned (
    _Tp * __ptr) [nodiscard], [constexpr], [noexcept]
```

Inform the compiler that a pointer is aligned.

**Template Parameters**

<code>_Align</code>	An alignment value (i.e. a power of two)
<code>_Tp</code>	An object type

**Parameters**

<code>__ptr</code>	A pointer that is aligned to <code>_Align</code>
--------------------	--

C++20 20.10.6 [ptr.align]

**uninitialized\_copy()**

```
template<typename _InputIterator, typename _ForwardIterator>
_FowardIterator std::uninitialized_copy (
    _InputIterator __first,
    _InputIterator __last,
    _ForwardIterator __result) [inline]
```

Copies the range [first,last) into result.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	A forward iterator.

**Returns**

`__result + (__last - __first)`

Like `std::copy`, but does not require an initialized output range.

References [to\\_address\(\)](#).

Referenced by [\\_\\_gnu\\_parallel::parallel\\_sort\\_mwms\\_pu\(\)](#), and [uninitialized\\_move\(\)](#).

**uninitialized\_copy\_n()**

```
template<typename _InputIterator, typename _Size, typename _ForwardIterator>
_FowardIterator std::uninitialized_copy_n (
    _InputIterator __first,
    _Size __n,
    _ForwardIterator __result) [inline]
```

Copies the range [first,first+n) into result.

**Parameters**

<code>__first</code>	An input iterator.
----------------------	--------------------

<code>__n</code>	The number of elements to copy.
<code>__result</code>	An output iterator.

**Returns**

`__result + __n`

**Since**

C++11

Like `copy_n()`, but does not require an initialized output range.

**`uninitialized_default_construct()`**

```
template<typename _ForwardIterator>
void std::uninitialized_default_construct (
    _ForwardIterator __first,
    _ForwardIterator __last) [inline]
```

Default-initializes objects in the range `[first,last)`.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.

**Since**

C++17

**`uninitialized_default_construct_n()`**

```
template<typename _ForwardIterator, typename _Size>
_FowardIterator std::uninitialized_default_construct_n (
    _ForwardIterator __first,
    _Size __count) [inline]
```

Default-initializes objects in the range `[first,first+count)`.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__count</code>	The number of objects to construct.

**Returns**

`__first + __count`

**Since**

C++17

**uninitialized\_fill()**

```
template<typename _ForwardIterator, typename _Tp>
void std::uninitialized_fill (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Tp & __x) [inline]
```

Copies the value x into the range [first,last).

**Parameters**

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__x</code>	The source value.

**Returns**

Nothing.

Like `std::fill`, but does not require an initialized output range.

References [to\\_address\(\)](#).

**uninitialized\_fill\_n()**

```
template<typename _ForwardIterator, typename _Size, typename _Tp>
_FForwardIterator std::uninitialized_fill_n (
    _ForwardIterator __first,
    _Size __n,
    const _Tp & __x) [inline]
```

Copies the value x into the range [first,first+n).

**Parameters**

<code>__first</code>	A forward iterator.
<code>__n</code>	The number of copies to make.
<code>__x</code>	The source value.

**Returns**

`__first + __n`.

Like `std::fill_n`, but does not require an initialized output range.

References [to\\_address\(\)](#).

**uninitialized\_move()**

```
template<typename _InputIterator, typename _ForwardIterator>
_FForwardIterator std::uninitialized_move (
    _InputIterator __first,
    _InputIterator __last,
    _ForwardIterator __result) [inline]
```

Move-construct from the range [first,last) into result.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.

## Returns

`__result + (__first - __last)`

## Since

C++17

References [uninitialized\\_copy\(\)](#).

**uninitialized\_move\_n()**

```
template<typename _InputIterator, typename _Size, typename _ForwardIterator>
pair< _InputIterator, _ForwardIterator > std::uninitialized_move_n (
    _InputIterator __first,
    _Size __count,
    _ForwardIterator __result) [inline]
```

Move-construct from the range `[first,first+count)` into `result`.

## Parameters

<code>__first</code>	An input iterator.
<code>__count</code>	The number of objects to initialize.
<code>__result</code>	An output iterator.

## Returns

`__result + __count`

## Since

C++17

**uninitialized\_value\_construct()**

```
template<typename _ForwardIterator>
void std::uninitialized_value_construct (
    _ForwardIterator __first,
    _ForwardIterator __last) [inline]
```

Value-initializes objects in the range `[first,last)`.

## Parameters

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.

## Since

C++17

**uninitialized\_value\_construct\_n()**

```
template<typename _ForwardIterator, typename _Size>
_FForwardIterator std::uninitialized_value_construct_n (
    _ForwardIterator __first,
    _Size __count) [inline]
```

Value-initializes objects in the range [first,first+count).

**Parameters**

<code>__first</code>	A forward iterator.
<code>__count</code>	The number of objects to construct.

**Returns**

`__result + __count`

**Since**

C++17

**3.16.6.3 Allocators**

### 3.16.6.3.1 Detailed Description

Classes encapsulating memory operations.

### 3.16.6.3.2 Typedef Documentation

#### `__allocator_base`

```
template<typename _Tp>
using std::__allocator_base
```

An alias to the base class for `std::allocator`.

Used to set the `std::allocator` base class to `std::__new_allocator`.

#### Template Parameters

<code>_Tp</code>	Type of allocated object.
------------------	---------------------------

### 3.16.6.3.3 Function Documentation

#### **operator==( )**

```
template<typename _T1, typename _T2>
bool operator== (
```

```
const allocator< _T1 > & ,
const allocator< _T2 > & ) [related]
```

Equality comparison for `std::allocator` objects

#### Returns

true, for all `std::allocator` objects.

### 3.16.6.4 Pointer Abstractions

Collaboration diagram for Pointer Abstractions:

- `template<typename _Tp, typename... _Args>`  
`shared_ptr< _NonArray< _Tp > > make_shared (_Args &&... __args)`

#### 3.16.6.4.1 Detailed Description

Smart pointers, etc.

#### 3.16.6.4.2 Function Documentation

##### allocate\_shared()

```
template<typename _Tp, typename _Alloc, typename... _Args>
shared_ptr< _NonArray< _Tp > > allocate_shared (
    const _Alloc & __a,
    _Args &&... __args) [related]
```

Create an object that is owned by a `shared_ptr`.

##### Parameters

<code>__a</code>	An allocator.
------------------	---------------

<code>__args</code>	Arguments for the <code>_Tp</code> object's constructor.
---------------------	--

#### Returns

A `shared_ptr` that owns the newly created object.

#### Exceptions

<i>An</i>	exception thrown from <code>_Alloc::allocate</code> or from the constructor of <code>_Tp</code> .
-----------	---

A copy of `__a` will be used to allocate memory for the `shared_ptr` and the new object.

#### **atomic\_compare\_exchange\_strong()** [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
bool std::atomic_compare_exchange_strong (
    __shared_ptr< _Tp, _Lp > * __p,
    __shared_ptr< _Tp, _Lp > * __v,
    __shared_ptr< _Tp, _Lp > __w) [inline]
```

Atomic compare-and-swap for `shared_ptr` objects.

#### Parameters

<code>__p</code>	A non-null pointer to a <code>shared_ptr</code> object.
<code>__v</code>	A non-null pointer to a <code>shared_ptr</code> object.
<code>__w</code>	A non-null pointer to a <code>shared_ptr</code> object.

#### Returns

True if `*__p` was equivalent to `*__v`, false otherwise.

The memory order for failure shall not be `memory_order_release` or `memory_order_acq_rel`.

References [move\(\)](#).

#### **atomic\_compare\_exchange\_strong()** [2/2]

```
template<typename _Tp>
bool std::atomic_compare_exchange_strong (
    shared_ptr< _Tp > * __p,
    shared_ptr< _Tp > * __v,
    shared_ptr< _Tp > __w) [inline]
```

Atomic compare-and-swap for `shared_ptr` objects.

#### Parameters

<code>__p</code>	A non-null pointer to a <code>shared_ptr</code> object.
<code>__v</code>	A non-null pointer to a <code>shared_ptr</code> object.

<a href="#"></a>	A non-null pointer to a shared_ptr object.
<a href="#"></a>	

**Returns**

True if \*\_\_p was equivalent to \*\_\_v, false otherwise.

The memory order for failure shall not be `memory_order_release` or `memory_order_acq_rel`.

References [move\(\)](#).

**atomic\_compare\_exchange\_strong\_explicit() [1/2]**

```
template<typename _Tp, _Lock_policy _Lp>
bool std::atomic_compare_exchange_strong_explicit (
    __shared_ptr< _Tp, _Lp > * __p,
    __shared_ptr< _Tp, _Lp > * __v,
    __shared_ptr< _Tp, _Lp > __w,
    memory_order ,
    memory_order )
```

Atomic compare-and-swap for shared\_ptr objects.

**Parameters**

<a href="#"></a>	A non-null pointer to a shared_ptr object.
<a href="#"></a>	
<a href="#"></a>	A non-null pointer to a shared_ptr object.
<a href="#"></a>	
<a href="#"></a>	A non-null pointer to a shared_ptr object.
<a href="#"></a>	

**Returns**

True if \*\_\_p was equivalent to \*\_\_v, false otherwise.

The memory order for failure shall not be `memory_order_release` or `memory_order_acq_rel`.

References [move\(\)](#).

**atomic\_compare\_exchange\_strong\_explicit() [2/2]**

```
template<typename _Tp>
bool std::atomic_compare_exchange_strong_explicit (
    shared_ptr< _Tp > * __p,
    shared_ptr< _Tp > * __v,
    shared_ptr< _Tp > __w,
    memory_order ,
    memory_order )
```

Atomic compare-and-swap for shared\_ptr objects.

**Parameters**

<a href="#"></a>	A non-null pointer to a shared_ptr object.
<a href="#"></a>	
<a href="#"></a>	A non-null pointer to a shared_ptr object.
<a href="#"></a>	

$\leftarrow$ _w	A non-null pointer to a shared_ptr object.
--------------------	--

**Returns**

True if \*\_\_p was equivalent to \*\_\_v, false otherwise.

The memory order for failure shall not be `memory_order_release` or `memory_order_acq_rel`.  
References [move\(\)](#).

**atomic\_compare\_exchange\_weak() [1/2]**

```
template<typename _Tp, _Lock_policy _Lp>
bool std::atomic_compare_exchange_weak (
    __shared_ptr< _Tp, _Lp > * __p,
    __shared_ptr< _Tp, _Lp > * __v,
    __shared_ptr< _Tp, _Lp > __w) [inline]
```

Atomic compare-and-swap for shared\_ptr objects.

**Parameters**

$\leftarrow$ _p	A non-null pointer to a shared_ptr object.
$\leftarrow$ _v	A non-null pointer to a shared_ptr object.
$\leftarrow$ _w	A non-null pointer to a shared_ptr object.

**Returns**

True if \*\_\_p was equivalent to \*\_\_v, false otherwise.

The memory order for failure shall not be `memory_order_release` or `memory_order_acq_rel`.  
References [move\(\)](#).

**atomic\_compare\_exchange\_weak() [2/2]**

```
template<typename _Tp>
bool std::atomic_compare_exchange_weak (
    shared_ptr< _Tp > * __p,
    shared_ptr< _Tp > * __v,
    shared_ptr< _Tp > __w) [inline]
```

Atomic compare-and-swap for shared\_ptr objects.

**Parameters**

$\leftarrow$ _p	A non-null pointer to a shared_ptr object.
$\leftarrow$ _v	A non-null pointer to a shared_ptr object.
$\leftarrow$ _w	A non-null pointer to a shared_ptr object.

**Returns**

True if `*__p` was equivalent to `*__v`, false otherwise.

The memory order for failure shall not be `memory_order_release` or `memory_order_acq_rel`.  
References [move\(\)](#).

**atomic\_compare\_exchange\_weak\_explicit() [1/2]**

```
template<typename _Tp, _Lock_policy _Lp>
bool std::atomic_compare_exchange_weak_explicit (
    __shared_ptr< _Tp, _Lp > * __p,
    __shared_ptr< _Tp, _Lp > * __v,
    __shared_ptr< _Tp, _Lp > __w,
    memory_order __success,
    memory_order __failure) [inline]
```

Atomic compare-and-swap for `shared_ptr` objects.

**Parameters**

<code>__p</code>	A non-null pointer to a <code>shared_ptr</code> object.
<code>__v</code>	A non-null pointer to a <code>shared_ptr</code> object.
<code>__w</code>	A non-null pointer to a <code>shared_ptr</code> object.

**Returns**

True if `*__p` was equivalent to `*__v`, false otherwise.

The memory order for failure shall not be `memory_order_release` or `memory_order_acq_rel`.  
References [move\(\)](#).

**atomic\_compare\_exchange\_weak\_explicit() [2/2]**

```
template<typename _Tp>
bool std::atomic_compare_exchange_weak_explicit (
    shared_ptr< _Tp > * __p,
    shared_ptr< _Tp > * __v,
    shared_ptr< _Tp > __w,
    memory_order __success,
    memory_order __failure) [inline]
```

Atomic compare-and-swap for `shared_ptr` objects.

**Parameters**

<code>__p</code>	A non-null pointer to a <code>shared_ptr</code> object.
<code>__v</code>	A non-null pointer to a <code>shared_ptr</code> object.
<code>__w</code>	A non-null pointer to a <code>shared_ptr</code> object.

**Returns**

True if \*\_\_p was equivalent to \*\_\_v, false otherwise.

The memory order for failure shall not be `memory_order_release` or `memory_order_acq_rel`.

References [move\(\)](#).

**atomic\_exchange()** [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
__shared_ptr< _Tp, _Lp > std::atomic_exchange (
    __shared_ptr< _Tp, _Lp > * __p,
    __shared_ptr< _Tp, _Lp > __r) [inline]
```

Atomic exchange for `shared_ptr` objects.

**Parameters**

<code>__p</code>	A non-null pointer to a <code>shared_ptr</code> object.
<code>__r</code>	New value to store in *__p.

**Returns**

The original value of \*\_\_p

References [move\(\)](#).

**atomic\_exchange()** [2/2]

```
template<typename _Tp>
shared_ptr< _Tp > std::atomic_exchange (
    shared_ptr< _Tp > * __p,
    shared_ptr< _Tp > __r) [inline]
```

Atomic exchange for `shared_ptr` objects.

**Parameters**

<code>__p</code>	A non-null pointer to a <code>shared_ptr</code> object.
<code>__r</code>	New value to store in *__p.

**Returns**

The original value of \*\_\_p

References [move\(\)](#).

**atomic\_exchange\_explicit()** [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
__shared_ptr< _Tp, _Lp > std::atomic_exchange_explicit (
    __shared_ptr< _Tp, _Lp > * __p,
    __shared_ptr< _Tp, _Lp > __r,
    memory_order ) [inline]
```

Atomic exchange for `shared_ptr` objects.

## Parameters

<code>__p</code>	A non-null pointer to a <code>shared_ptr</code> object.
<code>__r</code>	New value to store in <code>*__p</code> .

## Returns

The original value of `*__p`

**atomic\_exchange\_explicit()** [2/2]

```
template<typename _Tp>
shared_ptr<_Tp> std::atomic_exchange_explicit (
    shared_ptr<_Tp> * __p,
    shared_ptr<_Tp> __r,
    memory_order ) [inline]
```

Atomic exchange for `shared_ptr` objects.

## Parameters

<code>__p</code>	A non-null pointer to a <code>shared_ptr</code> object.
<code>__r</code>	New value to store in <code>*__p</code> .

## Returns

The original value of `*__p`

**atomic\_is\_lock\_free()** [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
bool std::atomic_is_lock_free (
    const __shared_ptr<_Tp, _Lp> * ) [inline]
```

Report whether `shared_ptr` atomic operations are lock-free.

## Parameters

<code>__p</code>	A non-null pointer to a <code>shared_ptr</code> object.
------------------	---

## Returns

True if atomic access to `*__p` is lock-free, false otherwise.

**atomic\_is\_lock\_free()** [2/2]

```
template<typename _Tp>
bool std::atomic_is_lock_free (
    const shared_ptr<_Tp> * __p) [inline]
```

Report whether `shared_ptr` atomic operations are lock-free.

**Parameters**

$\leftarrow$ _p	A non-null pointer to a shared_ptr object.
--------------------	--

**Returns**

True if atomic access to \*\_\_p is lock-free, false otherwise.

**atomic\_load()** [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
__shared_ptr< _Tp, _Lp > std::atomic_load (
    const __shared_ptr< _Tp, _Lp > * __p) [inline]
```

Atomic load for shared\_ptr objects.

**Parameters**

$\leftarrow$ _p	A non-null pointer to a shared_ptr object.
--------------------	--

**Returns**

\*\_\_p

The memory order shall not be memory\_order\_release or memory\_order\_acq\_rel.

**atomic\_load()** [2/2]

```
template<typename _Tp>
shared_ptr< _Tp > std::atomic_load (
    const shared_ptr< _Tp > * __p) [inline]
```

Atomic load for shared\_ptr objects.

**Parameters**

$\leftarrow$ _p	A non-null pointer to a shared_ptr object.
--------------------	--

**Returns**

\*\_\_p

The memory order shall not be memory\_order\_release or memory\_order\_acq\_rel.

**atomic\_load\_explicit()** [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
__shared_ptr< _Tp, _Lp > std::atomic_load_explicit (
    const __shared_ptr< _Tp, _Lp > * __p,
    memory_order ) [inline]
```

Atomic load for shared\_ptr objects.

## Parameters

$\leftarrow$ _p	A non-null pointer to a shared_ptr object.
--------------------	--

## Returns

\*\_\_p

The memory order shall not be `memory_order_release` or `memory_order_acq_rel`.

**atomic\_load\_explicit()** [2/2]

```
template<typename _Tp>
shared_ptr<_Tp> std::atomic_load_explicit (
    const shared_ptr<_Tp> * __p,
    memory_order ) [inline]
```

Atomic load for shared\_ptr objects.

## Parameters

$\leftarrow$ _p	A non-null pointer to a shared_ptr object.
--------------------	--

## Returns

\*\_\_p

The memory order shall not be `memory_order_release` or `memory_order_acq_rel`.

**atomic\_store()** [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
void std::atomic_store (
    __shared_ptr<_Tp, _Lp> * __p,
    __shared_ptr<_Tp, _Lp> __r) [inline]
```

Atomic store for shared\_ptr objects.

## Parameters

$\leftarrow$ _p	A non-null pointer to a shared_ptr object.
$\leftarrow$ _r	The value to store.

The memory order shall not be `memory_order_acquire` or `memory_order_acq_rel`.

References [move\(\)](#).

**atomic\_store()** [2/2]

```
template<typename _Tp>
void std::atomic_store (
    shared_ptr<_Tp> * __p,
    shared_ptr<_Tp> __r) [inline]
```

Atomic store for shared\_ptr objects.

## Parameters

$\leftrightarrow$ _p	A non-null pointer to a shared_ptr object.
$\leftrightarrow$ _r	The value to store.

The memory order shall not be `memory_order_acquire` or `memory_order_acq_rel`.  
References [move\(\)](#).

**atomic\_store\_explicit()** [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
void std::atomic_store_explicit (
    __shared_ptr< _Tp, _Lp > * __p,
    __shared_ptr< _Tp, _Lp > __r,
    memory_order ) [inline]
```

Atomic store for shared\_ptr objects.

## Parameters

$\leftrightarrow$ _p	A non-null pointer to a shared_ptr object.
$\leftrightarrow$ _r	The value to store.

The memory order shall not be `memory_order_acquire` or `memory_order_acq_rel`.

**atomic\_store\_explicit()** [2/2]

```
template<typename _Tp>
void std::atomic_store_explicit (
    shared_ptr< _Tp > * __p,
    shared_ptr< _Tp > __r,
    memory_order ) [inline]
```

Atomic store for shared\_ptr objects.

## Parameters

$\leftrightarrow$ _p	A non-null pointer to a shared_ptr object.
$\leftrightarrow$ _r	The value to store.

The memory order shall not be `memory_order_acquire` or `memory_order_acq_rel`.

**const\_pointer\_cast()** [1/2]

```
template<typename _Tp, typename _Up>
shared_ptr< _Tp > const_pointer_cast (
    const shared_ptr< _Up > & __r) [related]
```

Convert type of shared\_ptr, via const\_cast

**const\_pointer\_cast()** [2/2]

```
template<typename _Tp, typename _Up>
shared_ptr< _Tp > const_pointer_cast (
    shared_ptr< _Up > && __r) [related]
```

Convert type of `shared_ptr` rvalue, via `const_cast`

Since

C++20

**dynamic\_pointer\_cast()** [1/2]

```
template<typename _Tp, typename _Up>
shared_ptr< _Tp > dynamic_pointer_cast (
    const shared_ptr< _Up > & __r) [related]
```

Convert type of `shared_ptr`, via `dynamic_cast`

**dynamic\_pointer\_cast()** [2/2]

```
template<typename _Tp, typename _Up>
shared_ptr< _Tp > dynamic_pointer_cast (
    shared_ptr< _Up > && __r) [related]
```

Convert type of `shared_ptr` rvalue, via `dynamic_cast`

Since

C++20

**get\_deleter()**

```
template<typename _Del, typename _Tp>
_Del * get_deleter (
    const shared_ptr< _Tp > & __p) [related]
```

20.7.2.2.10 `shared_ptr` `get_deleter`

If `__p` has a deleter of type `_Del`, return a pointer to it.

**make\_shared()**

```
template<typename _Tp, typename... _Args>
shared_ptr< _NonArray< _Tp > > make_shared (
    _Args &&... __args) [related]
```

Create an object that is owned by a `shared_ptr`.

**Parameters**

<code>__args</code>	Arguments for the <code>_Tp</code> object's constructor.
---------------------	--

**Returns**

A `shared_ptr` that owns the newly created object.

**Exceptions**

<code>std::bad_alloc</code> , or	an exception thrown from the constructor of <code>_Tp</code> .
----------------------------------	--

**operator<>() [1/3]**

```
template<typename _Tp, typename _Dp, typename _Up, typename _Ep>
bool std::operator< (
    const unique_ptr< _Tp, _Dp > & __x,
    const unique_ptr< _Up, _Ep > & __y) [inline], [nodiscard], [constexpr]
```

Relational operator for unique\_ptr objects, compares the owned pointers.

References [std::unique\\_ptr< \\_Tp, \\_Dp >::get\(\)](#).

**operator<>() [2/3]**

```
template<typename _Tp, typename _Dp>
bool std::operator< (
    const unique_ptr< _Tp, _Dp > & __x,
    nullptr_t ) [inline], [nodiscard], [constexpr]
```

unique\_ptr comparison with nullptr

References [std::unique\\_ptr< \\_Tp, \\_Dp >::get\(\)](#).

**operator<>() [3/3]**

```
template<typename _Tp, typename _Dp>
bool std::operator< (
    nullptr_t ,
    const unique_ptr< _Tp, _Dp > & __x) [inline], [nodiscard], [constexpr]
```

unique\_ptr comparison with nullptr

References [std::unique\\_ptr< \\_Tp, \\_Dp >::get\(\)](#).

**operator<<>() [1/2]**

```
template<typename _Ch, typename _Tr, typename _Tp, _Lock_policy _Lp>
std::basic_ostream< _Ch, _Tr > & operator<< (
    std::basic_ostream< _Ch, _Tr > & __os,
    const __shared_ptr< _Tp, _Lp > & __p) [related]
```

Write the stored pointer to an ostream.

**operator<<>() [2/2]**

```
template<typename _CharT, typename _Traits, typename _Tp, typename _Dp>
basic_ostream< _CharT, _Traits > & operator<< (
    basic_ostream< _CharT, _Traits > & __os,
    const unique_ptr< _Tp, _Dp > & __p) [related]
```

Stream output operator for unique\_ptr.

Since

C++20

**operator<=>() [1/3]**

```
template<typename _Tp, typename _Dp, typename _Up, typename _Ep>
bool std::operator<= (
    const unique_ptr< _Tp, _Dp > & __x,
    const unique_ptr< _Up, _Ep > & __y) [inline], [nodiscard], [constexpr]
```

Relational operator for unique\_ptr objects, compares the owned pointers.

**operator<=()** [2/3]

```
template<typename _Tp, typename _Dp>
bool std::operator<= (
    const unique\_ptr< _Tp, _Dp > & __x,
    nullptr_t ) [inline], [nodiscard], [constexpr]
```

[unique\\_ptr](#) comparison with [nullptr](#)

**operator<=()** [3/3]

```
template<typename _Tp, typename _Dp>
bool std::operator<= (
    nullptr_t ,
    const unique\_ptr< _Tp, _Dp > & __x) [inline], [nodiscard], [constexpr]
```

[unique\\_ptr](#) comparison with [nullptr](#)

**operator==( )** [1/4]

```
template<typename _Tp, typename _Dp, typename _Up, typename _Ep>
bool std::operator==(
    const unique\_ptr< _Tp, _Dp > & __x,
    const unique\_ptr< _Up, _Ep > & __y) [inline], [nodiscard], [constexpr]
```

Equality operator for [unique\\_ptr](#) objects, compares the owned pointers.

References [std::unique\\_ptr< \\_Tp, \\_Dp >::get\(\)](#).

**operator==( )** [2/4]

```
template<typename _Tp, typename _Dp>
bool std::operator==(
    const unique\_ptr< _Tp, _Dp > & __x,
    nullptr_t ) [inline], [nodiscard], [constexpr], [noexcept]
```

[unique\\_ptr](#) comparison with [nullptr](#)

**operator==( )** [3/4]

```
template<typename _Tp, typename _Up>
bool operator==(
    const shared\_ptr< _Tp > & __a,
    const shared\_ptr< _Up > & __b) [related]
```

Equality operator for [shared\\_ptr](#) objects, compares the stored pointers.

**operator==( )** [4/4]

```
template<typename _Tp>
bool operator==(
    const shared\_ptr< _Tp > & __a,
    nullptr_t ) [related]
```

[shared\\_ptr](#) comparison with [nullptr](#)

**operator>()** [1/3]

```
template<typename _Tp, typename _Dp, typename _Up, typename _Ep>
bool std::operator> (
    const unique\_ptr< _Tp, _Dp > & __x,
    const unique\_ptr< _Up, _Ep > & __y) [inline], [nodiscard], [constexpr]
```

Relational operator for [unique\\_ptr](#) objects, compares the owned pointers.

**operator>()** [2/3]

```
template<typename _Tp, typename _Dp>
bool std::operator> (
    const unique\_ptr< _Tp, _Dp > & __x,
    nullptr_t ) [inline], [nodiscard], [constexpr]
```

[unique\\_ptr](#) comparison with `nullptr`

References [std::unique\\_ptr< \\_Tp, \\_Dp >::get\(\)](#).

**operator>()** [3/3]

```
template<typename _Tp, typename _Dp>
bool std::operator> (
    nullptr_t ,
    const unique\_ptr< _Tp, _Dp > & __x) [inline], [nodiscard], [constexpr]
```

[unique\\_ptr](#) comparison with `nullptr`

References [std::unique\\_ptr< \\_Tp, \\_Dp >::get\(\)](#).

**operator>=()** [1/3]

```
template<typename _Tp, typename _Dp, typename _Up, typename _Ep>
bool std::operator>= (
    const unique\_ptr< _Tp, _Dp > & __x,
    const unique\_ptr< _Up, _Ep > & __y) [inline], [nodiscard], [constexpr]
```

Relational operator for `unique_ptr` objects, compares the owned pointers.

**operator>=()** [2/3]

```
template<typename _Tp, typename _Dp>
bool std::operator>= (
    const unique\_ptr< _Tp, _Dp > & __x,
    nullptr_t ) [inline], [nodiscard], [constexpr]
```

[unique\\_ptr](#) comparison with `nullptr`

**operator>=()** [3/3]

```
template<typename _Tp, typename _Dp>
bool std::operator>= (
    nullptr_t ,
    const unique\_ptr< _Tp, _Dp > & __x) [inline], [nodiscard]
```

[unique\\_ptr](#) comparison with `nullptr`

**reinterpret\_pointer\_cast()** [1/2]

```
template<typename _Tp, typename _Up>
shared\_ptr< _Tp > reinterpret_pointer_cast (
    const shared\_ptr< _Up > & __r) [related]
```

Convert type of `shared_ptr`, via `reinterpret_cast`

Since

C++17

**reinterpret\_pointer\_cast()** [2/2]

```
template<typename _Tp, typename _Up>
shared_ptr< _Tp > reinterpret_pointer_cast (
    shared_ptr< _Up > && __r) [related]
```

Convert type of shared\_ptr rvalue, via reinterpret\_cast

Since

C++20

**static\_pointer\_cast()** [1/2]

```
template<typename _Tp, typename _Up>
shared_ptr< _Tp > static_pointer_cast (
    const shared_ptr< _Up > & __r) [related]
```

Convert type of shared\_ptr, via static\_cast

**static\_pointer\_cast()** [2/2]

```
template<typename _Tp, typename _Up>
shared_ptr< _Tp > static_pointer_cast (
    shared_ptr< _Up > && __r) [related]
```

Convert type of shared\_ptr rvalue, via static\_cast

Since

C++20

**swap()** [1/3]

```
template<typename _Tp>
void swap (
    shared_ptr< _Tp > & __a,
    shared_ptr< _Tp > & __b) [related]
```

Swap overload for shared\_ptr.

**swap()** [2/3]

```
template<typename _Tp, typename _Dp>
enable_if< __is_swappable< _Dp >::value >::type swap (
    unique_ptr< _Tp, _Dp > & __x,
    unique_ptr< _Tp, _Dp > & __y) [related]
```

Swap overload for unique\_ptr.

**swap()** [3/3]

```
template<typename _Tp>
void swap (
    weak_ptr< _Tp > & __a,
    weak_ptr< _Tp > & __b) [related]
```

Swap overload for weak\_ptr.

**to\_address()** [1/2]

```
template<typename _Tp>
_Tp * std::to_address (
    _Tp * __ptr) [constexpr], [noexcept]
```

Obtain address referenced by a pointer to an object.

**Parameters**

<code>__ptr</code>	A pointer to an object
--------------------	------------------------

**Returns**

`__ptr`

Referenced by [std::basic\\_string<\\_CharT>::assign\(\)](#), [find\(\)](#), [to\\_address\(\)](#), [uninitialized\\_copy\(\)](#), [uninitialized\\_fill\(\)](#), and [uninitialized\\_fill\\_n\(\)](#).

**to\_address()** [2/2]

```
template<typename _Ptr>
auto std::to_address (
    const _Ptr & __ptr) [constexpr], [noexcept]
```

Obtain address referenced by a pointer to an object.

**Parameters**

<code>__ptr</code>	A pointer to an object
--------------------	------------------------

**Returns**

`pointer_traits<_Ptr>::to_address(__ptr)` if that expression is well-formed, otherwise `to_address(__ptr.operator->())`.

References [to\\_address\(\)](#).

**3.16.6.5 Pointer Safety and Garbage Collection**

Collaboration diagram for Pointer Safety and Garbage Collection:

**Enumerations**

- enum class [std::pointer\\_safety](#) { **relaxed** , **preferred** , **strict** }

## Functions

- void `std::declare_no_pointers` (char \*, size\_t)
- void `std::declare_reachable` (void \*)
- `pointer_safety` `std::get_pointer_safety` () noexcept
- void `std::undeclare_no_pointers` (char \*, size\_t)
- template<typename \_Tp>  
\_Tp \* `std::undeclare_reachable` (\_Tp \* \_\_p)

### 3.16.6.5.1 Detailed Description

Utilities to assist with garbage collection in an implementation that supports *strict pointer safety*. This implementation only supports *relaxed pointer safety* and so these functions have no effect.

C++11 20.6.4 [util.dynamic.safety], Pointer safety

### 3.16.6.5.2 Enumeration Type Documentation

#### `pointer_safety`

```
enum class std::pointer_safety [strong]
```

Constants representing the different types of pointer safety.

### 3.16.6.5.3 Function Documentation

#### `declare_no_pointers()`

```
void std::declare_no_pointers (
    char * ,
    size_t ) [inline]
```

Inform a garbage collector that a region of memory need not be traced.

#### `declare_reachable()`

```
void std::declare_reachable (
    void * ) [inline]
```

Inform a garbage collector that an object is still in use.

#### `get_pointer_safety()`

```
pointer_safety std::get_pointer_safety () [inline], [noexcept]
```

The type of pointer safety supported by the implementation.

#### `undeclare_no_pointers()`

```
void std::undeclare_no_pointers (
    char * ,
    size_t ) [inline]
```

Unregister a range previously registered with `declare_no_pointers`.

#### `undeclare_reachable()`

```
template<typename _Tp>
_Tp * std::undeclare_reachable (
    _Tp * __p) [inline]
```

Unregister an object previously registered with `declare_reachable`.

### 3.16.6.6 Polymorphic memory resources

Collaboration diagram for Polymorphic memory resources:

#### Files

- file [memory\\_resource](#)

#### Classes

- struct [std::allocator\\_traits< pmr::polymorphic\\_allocator< \\_Tp > >](#)
- class [std::pmr::memory\\_resource](#)
- class [std::pmr::monotonic\\_buffer\\_resource](#)
- class [std::pmr::polymorphic\\_allocator< \\_Tp >](#)
- struct [std::pmr::pool\\_options](#)
- class [std::pmr::unsynchronized\\_pool\\_resource](#)

#### Functions

- [memory\\_resource \\* std::pmr::new\\_delete\\_resource \(\) noexcept](#)

#### 3.16.6.6.1 Detailed Description

Since

C++17

Memory resources are classes that implement the `std::pmr::memory_resource` interface for allocating and deallocating memory. Unlike traditional C++ allocators, memory resources are not value types and are used via pointers to the abstract base class. They are only responsible for allocating and deallocating, not for construction and destruction of objects. As a result, memory resources just allocate raw memory as type `void*` and are not templates that allocate/deallocate and construct/destroy a specific type.

The class template `std::pmr::polymorphic_allocator` is an allocator that uses a memory resource for its allocations.

#### 3.16.6.6.2 Function Documentation

##### `new_delete_resource()`

`memory_resource * std::pmr::new_delete_resource () [nodiscard], [noexcept]`

A `pmr::memory_resource` that uses `new` to allocate memory.

Since

C++17

### 3.16.7 Metaprogramming

Collaboration diagram for Metaprogramming:

### 3.16.7.1 Detailed Description

Template utilities for compile-time introspection and modification, including type classification traits, type property inspection traits and type transformation traits.

Since

C++11

### 3.16.7.2 Typedef Documentation

#### **add\_lvalue\_reference\_t**

```
template<typename _Tp>
using std::add_lvalue_reference_t
Alias template for add_lvalue_reference.
```

#### **add\_pointer\_t**

```
template<typename _Tp>
using std::add_pointer_t
Alias template for add_pointer.
```

#### **add\_rvalue\_reference\_t**

```
template<typename _Tp>
using std::add_rvalue_reference_t
Alias template for add_rvalue_reference.
```

**aligned\_storage\_t**

```
template<size_t _Len, size_t _Align = __aligned_storage_default_alignment(_Len)>
using std::aligned_storage_t
Alias template for aligned_storage.
```

**common\_reference\_t**

```
template<typename... _Tp>
using std::common_reference_t
```

Since

C++20

**common\_type\_t**

```
template<typename... _Tp>
using std::common_type_t
Alias template for common_type.
```

**conditional\_t**

```
template<bool _Cond, typename _Iftrue, typename _Iffalse>
using std::conditional_t
Alias template for conditional.
```

**decay\_t**

```
template<typename _Tp>
using std::decay_t
Alias template for decay.
```

**enable\_if\_t**

```
template<bool _Cond, typename _Tp = void>
using std::enable_if_t
Alias template for enable_if.
```

**false\_type**

```
using std::false_type
The type used as a compile-time boolean with false value.
```

**make\_signed\_t**

```
template<typename _Tp>
using std::make_signed_t
Alias template for make_signed.
```

**make\_unsigned\_t**

```
template<typename _Tp>
using std::make_unsigned_t
Alias template for make_unsigned.
```

**remove\_all\_extents\_t**

```
template<typename _Tp>
using std::remove_all_extents_t
Alias template for remove_all_extents.
```

**remove\_extent\_t**

```
template<typename _Tp>
using std::remove_extent_t
Alias template for remove_extent.
```

**remove\_pointer\_t**

```
template<typename _Tp>
using std::remove_pointer_t
Alias template for remove_pointer.
```

**remove\_reference\_t**

```
template<typename _Tp>
using std::remove_reference_t
Alias template for remove_reference.
```

**result\_of\_t**

```
template<typename _Tp>
using std::result_of_t
Alias template for result_of.
```

**true\_type**

```
using std::true_type
The type used as a compile-time boolean with true value.
```

**type**

```
template<size_t _Len, typename... _Types>
using std::aligned_union< _Len, _Types >::type
The storage.
```

**underlying\_type\_t**

```
template<typename _Tp>
using std::underlying_type_t
Alias template for underlying_type.
```

**3.16.7.3 Function Documentation****is\_corresponding\_member()**

```
template<typename _S1, typename _S2, typename _M1, typename _M2>
bool std::is_corresponding_member (
    _M1 _S1::* __m1,
    _M2 _S2::* __m2) [constexpr], [noexcept]
```

Since

C++20

### is\_pointer\_interconvertible\_with\_class()

```
template<typename _Tp, typename _Mem>
bool std::is_pointer_interconvertible_with_class (
    _Mem __mp) [constexpr], [noexcept]
```

True if `__mp` points to the first member of a standard-layout type.

Returns

true if `s.*__mp` is pointer-interconvertible with `s`

Since

C++20

### swap() [1/2]

```
template<typename _Tp>
_Require< __not< __is_tuple_like< _Tp > >, is_move_constructible< _Tp >, is_move_assignable<
_Tp > > std::swap (
    _Tp & __a,
    _Tp & __b) [inline], [constexpr], [noexcept]
```

Swaps two values.

Parameters

<code>__a</code>	A thing of arbitrary type.
<code>__b</code>	Another thing of arbitrary type.

Returns

Nothing.

### swap() [2/2]

```
template<typename _Tp, size_t _Nm>
__enable_if_t< __is_swappable< _Tp >::value > std::swap (
    _Tp(&) __a[_Nm],
    _Tp(&) __b[_Nm]) [inline], [constexpr], [noexcept]
```

Swap the contents of two arrays.

## 3.16.7.4 Variable Documentation

### alignment\_value

```
template<size_t _Len, typename... _Types>
const size_t std::alignment_union< _Len, _Types >::alignment_value [static]
```

The value of the strictest alignment of `_Types`.

**is\_layout\_compatible\_v**

```
template<typename _Tp, typename _Up>  
bool std::is_layout_compatible_v [constexpr]
```

Since

C++20

**is\_pointer\_interconvertible\_base\_of\_v**

```
template<typename _Base, typename _Derived>  
bool std::is_pointer_interconvertible_base_of_v [constexpr]
```

Since

C++20

### 3.16.9.1 Detailed Description

Classes and functions for time.

Since

C++11

### 3.16.9.2 Typedef Documentation

#### **days**

using `std::chrono::days`  
days

#### **high\_resolution\_clock**

using `std::chrono::high_resolution_clock`

Highest-resolution clock.

This is the clock "with the shortest tick period." Alias to `std::system_clock` until higher-than-nanosecond definitions become feasible.

#### **hours**

using `std::chrono::hours`  
hours

#### **microseconds**

using `std::chrono::microseconds`  
microseconds

#### **milliseconds**

using `std::chrono::milliseconds`  
milliseconds

#### **minutes**

using `std::chrono::minutes`  
minutes

#### **months**

using `std::chrono::months`  
months

#### **nanoseconds**

using `std::chrono::nanoseconds`  
nanoseconds

**seconds**

```
using std::chrono::seconds
seconds
```

**weeks**

```
using std::chrono::weeks
weeks
```

**years**

```
using std::chrono::years
years
```

**3.16.9.3 Function Documentation****abs()**

```
template<typename _Rep, typename _Period>
enable_if_t< numeric_limits< _Rep >::is_signed, duration< _Rep, _Period > > std::chrono::abs (
    duration< _Rep, _Period > __d) [nodiscard], [constexpr]
```

The absolute (non-negative) value of a duration.

**Parameters**

$\leftrightarrow$ _d	A duration with a signed rep type.
-------------------------	------------------------------------

**Returns**

A duration of the same type as the argument, with value  $|d|$ .

**Since**

C++17

**ceil() [1/2]**

```
template<typename _ToDur, typename _Rep, typename _Period>
__enable_if_is_duration< _ToDur > std::chrono::ceil (
    const duration< _Rep, _Period > & __d) [nodiscard], [constexpr]
```

Convert a duration to type `ToDur` and round up.

If the duration cannot be represented exactly in the result type, returns the closest value that is greater than the argument.

**Template Parameters**

<i>_ToDur</i>	The result type must be a duration.
---------------	-------------------------------------

**Parameters**

$\leftrightarrow$ _d	A duration.
-------------------------	-------------

**Returns**

The value of `__d` converted to type `_ToDur`.

**Since**

C++17

References [duration\\_cast\(\)](#).

Referenced by [ceil\(\)](#).

**ceil()** [2/2]

```
template<typename _ToDur, typename _Clock, typename _Dur>
enable_if_t< __is_duration_v< _ToDur >, time_point< _Clock, _ToDur > > std::chrono::ceil (
    const time_point< _Clock, _Dur > & __tp) [nodiscard], [constexpr]
```

Convert a `time_point` to type `ToDur` and round up.

The result is the same time point as measured by the same clock, but using the specified `duration` to represent the time. If the time point cannot be represented exactly in the result type, returns the closest value that is greater than the argument.

**Template Parameters**

<code>_ToDur</code>	The duration type to use for the result.
---------------------	--

**Parameters**

<code>↔</code>	A time point.
<code>↔</code>	
<code>↔</code>	
<code>↔</code>	
<code>t</code>	

**Returns**

The value of `__d` converted to type `_ToDur`.

**Since**

C++17

References [ceil\(\)](#).

**clock\_cast()**

```
template<typename _DestClock, typename _SourceClock, typename _Duration>
requires __detail::__clock_convs<_DestClock, _SourceClock, _Duration> || __detail::__clock_convs↔
_sys<_DestClock, _SourceClock, _Duration> || __detail::__clock_convs_utc<_DestClock, _SourceClock,
_Duration> || __detail::__clock_convs_sys_utc<_DestClock, _SourceClock, _Duration> || __detail::__↔
_clock_convs_utc_sys<_DestClock, _SourceClock, _Duration>
auto std::chrono::clock_cast (
    const time_point< _SourceClock, _Duration > & __t) [inline], [nodiscard]
```

Convert a time point to a different clock.

**duration\_cast()**

```
template<typename _ToDur, typename _Rep, typename _Period>
__enable_if_is_duration< _ToDur > std::chrono::duration_cast (
    const duration< _Rep, _Period > & __d) [nodiscard], [constexpr]
```

Convert a duration to type `ToDur`.

If the duration cannot be represented accurately in the result type, returns the result of integer truncation (i.e., rounded towards zero).

**Template Parameters**

<code>_ToDur</code>	The result type must be a duration.
---------------------	-------------------------------------

**Parameters**

<code>__d</code>	A duration.
------------------	-------------

**Returns**

The value of `__d` converted to type `_ToDur`.

**Since**

C++11

Referenced by [ceil\(\)](#), [floor\(\)](#), and [time\\_point\\_cast\(\)](#).

**floor()** [1/2]

```
template<typename _ToDur, typename _Rep, typename _Period>
__enable_if_is_duration< _ToDur > std::chrono::floor (
    const duration< _Rep, _Period > & __d) [nodiscard], [constexpr]
```

Convert a duration to type `ToDur` and round down.

If the duration cannot be represented exactly in the result type, returns the closest value that is less than the argument.

**Template Parameters**

<code>_ToDur</code>	The result type must be a duration.
---------------------	-------------------------------------

**Parameters**

<code>__d</code>	A duration.
------------------	-------------

**Returns**

The value of `__d` converted to type `_ToDur`.

**Since**

C++17

References [duration\\_cast\(\)](#).

Referenced by [floor\(\)](#), and [round\(\)](#).

**floor()** [2/2]

```
template<typename _ToDur, typename _Clock, typename _Dur>
enable_if_t< __is_duration_v< _ToDur >, time_point< _Clock, _ToDur > > std::chrono::floor (
    const time_point< _Clock, _Dur > & __tp) [nodiscard], [constexpr]
```

Convert a `time_point` to type `ToDur` and round down.

The result is the same time point as measured by the same clock, but using the specified `duration` to represent the time. If the time point cannot be represented exactly in the result type, returns the closest value that is less than the argument.

**Template Parameters**

<code>_ToDur</code>	The <code>duration</code> type to use for the result.
---------------------	---

**Parameters**

<code>↵</code>	A time point.
<code>↵</code>	
<code>↵</code>	
<code>↵</code>	
<code>t</code>	

**Returns**

The value of `__d` converted to type `_ToDur`.

**Since**

C++17

References [floor\(\)](#).

**local\_time\_format()**

```
template<typename _Duration>
__detail::__local_time_fmt< _Duration > std::chrono::local_time_format (
    local_time< _Duration > __time,
    const string * __abbrev = nullptr,
    const seconds * __offset_sec = nullptr) [inline]
```

Return an object that associates timezone info with a local time.

A `chrono::local_time` object has no timezone associated with it. This function creates an object that allows formatting a `local_time` as though it refers to a timezone with the given abbreviated name and offset from UTC.

**Since**

C++20

**operator""d()**

```
chrono::day std::literals::chrono_literals::operator""d (
    unsigned long long __d) [constexpr], [noexcept]
```

Literal suffix for creating `chrono::day` objects.

**Since**

C++20

**operator""h() [1/2]**

```
template<char... _Digits>
chrono::hours std::literals::chrono_literals::operator""h () [constexpr]
Literal suffix for durations of type std::chrono::hours
```

**operator""h() [2/2]**

```
chrono::duration< long double, ratio< 3600, 1 > > std::literals::chrono_literals::operator""h (
    long double __hours) [constexpr]
Literal suffix for durations representing non-integer hours.
```

**operator""min() [1/2]**

```
template<char... _Digits>
chrono::minutes std::literals::chrono_literals::operator""min () [constexpr]
Literal suffix for durations of type std::chrono::minutes
```

**operator""min() [2/2]**

```
chrono::duration< long double, ratio< 60, 1 > > std::literals::chrono_literals::operator""min (
    long double __mins) [constexpr]
Literal suffix for durations representing non-integer minutes.
```

**operator""ms() [1/2]**

```
template<char... _Digits>
chrono::milliseconds std::literals::chrono_literals::operator""ms () [constexpr]
Literal suffix for durations of type std::chrono::milliseconds
```

**operator""ms() [2/2]**

```
chrono::duration< long double, milli > std::literals::chrono_literals::operator""ms (
    long double __msecs) [constexpr]
Literal suffix for durations representing non-integer milliseconds.
```

**operator""ns() [1/2]**

```
template<char... _Digits>
chrono::nanoseconds std::literals::chrono_literals::operator""ns () [constexpr]
Literal suffix for durations of type std::chrono::nanoseconds
```

**operator""ns() [2/2]**

```
chrono::duration< long double, nano > std::literals::chrono_literals::operator""ns (
    long double __nsecs) [constexpr]
Literal suffix for durations representing non-integer nanoseconds.
```

**operator""s() [1/2]**

```
template<char... _Digits>
chrono::seconds std::literals::chrono_literals::operator""s () [constexpr]
Literal suffix for durations of type std::chrono::seconds
```

**operator""s() [2/2]**

```
chrono::duration< long double > std::literals::chrono_literals::operator""s (
    long double __secs) [constexpr]
```

Literal suffix for durations representing non-integer seconds.

**operator""us() [1/2]**

```
template<char... _Digits>
chrono::microseconds std::literals::chrono_literals::operator""us () [constexpr]
Literal suffix for durations of type std::chrono::microseconds
```

**operator""us() [2/2]**

```
chrono::duration< long double, micro > std::literals::chrono_literals::operator""us (
    long double __usecs) [constexpr]
```

Literal suffix for durations representing non-integer microseconds.

**operator""y()**

```
chrono::year std::literals::chrono_literals::operator""y (
    unsigned long long __y) [constexpr], [noexcept]
```

Literal suffix for creating chrono::year objects.

Since

C++20

**operator%() [1/2]**

```
template<typename _Rep1, typename _Period, typename _Rep2>
duration< __common_rep_t< _Rep1, __disable_if_is_duration< _Rep2 > >, _Period > std::chrono↵
::operator% (
    const duration< _Rep1, _Period > & __d,
    const _Rep2 & __s) [constexpr]
```

Arithmetic operators for chrono::duration

**operator%() [2/2]**

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
common_type< duration< _Rep1, _Period1 >, duration< _Rep2, _Period2 > >::type std::chrono↵
::operator% (
    const duration< _Rep1, _Period1 > & __lhs,
    const duration< _Rep2, _Period2 > & __rhs) [constexpr]
```

Arithmetic operators for chrono::duration

**operator\*() [1/2]**

```
template<typename _Rep1, typename _Period, typename _Rep2>
duration< __common_rep_t< _Rep1, _Rep2 >, _Period > operator* (
    const duration< _Rep1, _Period > & __d,
    const _Rep2 & __s) [related]
```

Arithmetic operators for chrono::duration

**operator\*() [2/2]**

```
template<typename _Rep1, typename _Rep2, typename _Period>
duration< __common_rep_t< _Rep2, _Rep1 >, _Period > std::chrono::operator* (
    const _Rep1 & __s,
    const duration< _Rep2, _Period > & __d) [constexpr]
```

Arithmetic operators for chrono::duration

**operator+() [1/3]**

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
common_type< duration< _Rep1, _Period1 >, duration< _Rep2, _Period2 > >::type operator+ (
    const duration< _Rep1, _Period1 > & __lhs,
    const duration< _Rep2, _Period2 > & __rhs) [related]
```

The sum of two durations.

**operator+() [2/3]**

```
template<typename _Rep1, typename _Period1, typename _Clock, typename _Dur2>
time_point< _Clock, typename common_type< duration< _Rep1, _Period1 >, _Dur2 >::type > std::
::chrono::operator+ (
    const duration< _Rep1, _Period1 > & __lhs,
    const time_point< _Clock, _Dur2 > & __rhs) [constexpr]
```

Adjust a time point forwards by the given duration.

**operator+() [3/3]**

```
template<typename _Clock, typename _Dur1, typename _Rep2, typename _Period2>
time_point< _Clock, typename common_type< _Dur1, duration< _Rep2, _Period2 > >::type > operator+
(
    const time_point< _Clock, _Dur1 > & __lhs,
    const duration< _Rep2, _Period2 > & __rhs) [related]
```

Adjust a time point forwards by the given duration.

**operator-() [1/3]**

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
common_type< duration< _Rep1, _Period1 >, duration< _Rep2, _Period2 > >::type std::chrono::
operator- (
    const duration< _Rep1, _Period1 > & __lhs,
    const duration< _Rep2, _Period2 > & __rhs) [constexpr]
```

The difference between two durations.

**operator-() [2/3]**

```
template<typename _Clock, typename _Dur1, typename _Rep2, typename _Period2>
time_point< _Clock, typename common_type< _Dur1, duration< _Rep2, _Period2 > >::type > std::
::chrono::operator- (
    const time_point< _Clock, _Dur1 > & __lhs,
    const duration< _Rep2, _Period2 > & __rhs) [constexpr]
```

Adjust a time point backwards by the given duration.

**operator-() [3/3]**

```
template<typename _Clock, typename _Dur1, typename _Dur2>
common_type< _Dur1, _Dur2 >::type std::chrono::operator- (
```

```
const time_point< _Clock, _Dur1 > & __lhs,
const time_point< _Clock, _Dur2 > & __rhs) [constexpr]
```

The difference between two time points (as a duration)

#### operator/() [1/2]

```
template<typename _Rep1, typename _Period, typename _Rep2>
duration< __common_rep_t< _Rep1, __disable_if_is_duration< _Rep2 > >, _Period > std::chrono::operator/ (
    const duration< _Rep1, _Period > & __d,
    const _Rep2 & __s) [constexpr]
```

Arithmetic operators for chrono::duration

#### operator/() [2/2]

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
common_type< _Rep1, _Rep2 >::type std::chrono::operator/ (
    const duration< _Rep1, _Period1 > & __lhs,
    const duration< _Rep2, _Period2 > & __rhs) [constexpr]
```

Arithmetic operators for chrono::duration

#### operator<()

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
bool std::chrono::operator< (
    const duration< _Rep1, _Period1 > & __lhs,
    const duration< _Rep2, _Period2 > & __rhs) [constexpr]
```

Comparisons for chrono::duration

#### operator<<() [1/3]

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & std::chrono::operator<< (
    basic_ostream< _CharT, _Traits > & __os,
    const local_info & __li)
```

Writes a local\_info object to an ostream in an unspecified format.

#### operator<<() [2/3]

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & std::chrono::operator<< (
    basic_ostream< _CharT, _Traits > & __os,
    const sys_info & __i)
```

Writes a sys\_info object to an ostream in an unspecified format.

#### operator<<() [3/3]

```
template<typename _CharT, typename _Traits, typename _Rep, typename _Period>
basic_ostream< _CharT, _Traits > & std::chrono::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const duration< _Rep, _Period > & __d) [inline]
```

Write a chrono::duration to an ostream.

Since

C++20

References [std::ios\\_base::flags\(\)](#), [std::ios\\_base::getloc\(\)](#), [std::basic\\_ios<\\_CharT, \\_Traits>::imbue\(\)](#), [std::move\(\)](#), [operator<<\(\)](#), and [std::ios\\_base::precision\(\)](#).

Referenced by [operator<<\(\)](#).

### **operator<=()**

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
bool std::chrono::operator<= (
    const duration< _Rep1, _Period1 > & __lhs,
    const duration< _Rep2, _Period2 > & __rhs) [constexpr]
```

Comparisons for chrono::duration

### **operator<=>()**

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
requires three_way_comparable<common_type_t<_Rep1, _Rep2>>
auto std::chrono::operator<=> (
    const duration< _Rep1, _Period1 > & __lhs,
    const duration< _Rep2, _Period2 > & __rhs) [constexpr]
```

Comparisons for chrono::duration

### **operator==()**

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
bool operator== (
    const duration< _Rep1, _Period1 > & __lhs,
    const duration< _Rep2, _Period2 > & __rhs) [related]
```

Comparisons for chrono::duration

### **operator>()**

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
bool std::chrono::operator> (
    const duration< _Rep1, _Period1 > & __lhs,
    const duration< _Rep2, _Period2 > & __rhs) [constexpr]
```

Comparisons for chrono::duration

### **operator>=()**

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
bool std::chrono::operator>= (
    const duration< _Rep1, _Period1 > & __lhs,
    const duration< _Rep2, _Period2 > & __rhs) [constexpr]
```

Comparisons for chrono::duration

### **round()** [1/2]

```
template<typename _ToDur, typename _Rep, typename _Period>
enable_if_t< __and< __is_duration< _ToDur >, __not< treat_as_floating_point< typename _ToDur<
::rep > > >::value, _ToDur > std::chrono::round (
    const duration< _Rep, _Period > & __d) [nodiscard], [constexpr]
```

Convert a duration to type `ToDur` and round to the closest value.

If the duration cannot be represented exactly in the result type, returns the closest value, rounding ties to even.

## Template Parameters

<code>_ToDur</code>	The result type must be a <code>duration</code> with a non-floating-point <code>rep</code> type.
---------------------	--

## Parameters

<code>_↔ _d</code>	A duration.
------------------------	-------------

## Returns

The value of `__d` converted to type `_ToDur`.

## Since

C++17

References [floor\(\)](#).

Referenced by [round\(\)](#).

**round()** [2/2]

```
template<typename _ToDur, typename _Clock, typename _Dur>
enable_if_t< __is_duration_v< _ToDur > &&!treat_as_floating_point_v< typename _ToDur::rep >,
time_point< _Clock, _ToDur > > std::chrono::round (
    const time_point< _Clock, _Dur > & __tp) [nodiscard], [constexpr]
```

Convert a `time_point` to type `ToDur` and round to the closest value.

The result is the same time point as measured by the same clock, but using the specified `duration` to represent the time. If the time point cannot be represented exactly in the result type, returns the closest value, rounding ties to even.

## Template Parameters

<code>_ToDur</code>	The <code>duration</code> type to use for the result, which must have a non-floating-point <code>rep</code> type.
---------------------	---

## Parameters

<code>↔ _↔ ↔ _↔ t</code>	A time point.
--	---------------

## Returns

The value of `__d` converted to type `_ToDur`.

## Since

C++17

References [round\(\)](#).

**time\_point\_cast()**

```
template<typename _ToDur, typename _Clock, typename _Dur>
__enable_if_t< __is_duration< _ToDur >::value, time_point< _Clock, _ToDur > > std::chrono<
::time_point_cast (
    const time_point< _Clock, _Dur > & __t) [nodiscard], [constexpr]
```

Convert a `time_point` to use duration type `ToDur`.

The result is the same time point as measured by the same clock, but using the specified duration to represent the time. If the time point cannot be represented accurately in the result type, returns the result of integer truncation (i.e., rounded towards zero).

**Template Parameters**

<code>_ToDur</code>	The duration type to use for the result.
---------------------	--

**Parameters**

<code>__t</code>	A time point.
------------------	---------------

**Returns**

The value of `__t` converted to use type `_ToDur`.

**Since**

C++11

References [duration\\_cast\(\)](#).

#### 4.1.1 Detailed Description

GNU extensions for public use.

#### 4.1.2 Typedef Documentation

##### `__int_traits`

```
template<typename _Tp>
using __gnu_cxx::__int_traits
Convenience alias for __numeric_traits<integer-type>.
```

#### 4.1.3 Function Documentation

##### `__static_pointer_cast()` [1/2]

```
template<typename _ToType, typename _FromType>
_ToType __gnu_cxx::__static_pointer_cast (
    _FromType * __arg) [inline]
```

Casting operations for cases where `_FromType` is a standard pointer. `_ToType` can be a standard or non-standard pointer.

##### `__static_pointer_cast()` [2/2]

```
template<typename _ToType, typename _FromType>
_ToType __gnu_cxx::__static_pointer_cast (
    const _FromType & __arg) [inline]
```

Casting operations for cases where `_FromType` is not a standard pointer. `_ToType` can be a standard or non-standard pointer. Given that `_FromType` is not a pointer, it must have a `get()` method that returns the standard pointer equivalent of the address it points to, and must have an `element_type` typedef which names the type it points to.

##### `_Bit_scan_forward()`

```
std::size_t __gnu_cxx::_Bit_scan_forward (
    std::size_t __num) [inline]
```

Generic Version of the bsf instruction.

Referenced by `__gnu_cxx::bitmap_allocator< _Tp1 >::_M_allocate_single_object()`.

##### `iota()`

```
template<typename _ForwardIterator, typename _Tp>
void std::iota (
    _ForwardIterator __first,
```

```

    _ForwardIterator __last,
    _Tp __value) [constexpr]

```

Create a range of sequentially increasing values.

For each element in the range [first,last) assigns value and increments value as if by ++value.

#### Parameters

<code>__first</code>	Start of range.
<code>__last</code>	End of range.
<code>__value</code>	Starting value.

#### Returns

Nothing.

#### **operator"!=()** [1/3]

```

template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator!= (
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]

```

Test difference of two strings.

#### Parameters

<code>__lhs</code>	First string.
<code>__rhs</code>	Second string.

#### Returns

True if `__lhs.compare(__rhs) != 0`. False otherwise.

#### **operator"!=()** [2/3]

```

template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator!= (
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
    const _CharT * __rhs) [inline]

```

Test difference of string and C string.

#### Parameters

<code>__lhs</code>	String.
<code>__rhs</code>	C string.

#### Returns

True if `__lhs.compare(__rhs) != 0`. False otherwise.

**operator"!="()** [3/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator!= (
    const _CharT * __lhs,
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test difference of C string and string.

**Parameters**

<code>__lhs</code>	C string.
<code>__rhs</code>	String.

**Returns**

True if `__rhs.compare(__lhs) != 0`. False otherwise.

**operator+()** [1/5]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base > __gnu_cxx::operator+ (
    _CharT __lhs,
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)
```

Concatenate character and string.

**Parameters**

<code>__lhs</code>	First string.
<code>__rhs</code>	Last string.

**Returns**

New string with `__lhs` followed by `__rhs`.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string< \\_CharT, \\_Traits, \\_Alloc, \\_Base >::append\(\)](#), [\\_\\_gnu\\_cxx::\\_\\_versa\\_string< \\_CharT, \\_Traits, \\_Alloc, \\_Base >::reserve\(\)](#), and [\\_\\_gnu\\_cxx::\\_\\_versa\\_string< \\_CharT, \\_Traits, \\_Alloc, \\_Base >::operator+\(\)](#).

**operator+()** [2/5]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base > __gnu_cxx::operator+ (
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
    _CharT __rhs)
```

Concatenate string and character.

**Parameters**

<code>__lhs</code>	First string.
<code>__rhs</code>	Last string.

**Returns**

New string with `__lhs` followed by `__rhs`.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base>::append\(\)](#), [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base>::reserve\(\)](#), and [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base>::size\(\)](#).

**operator+()** [3/5]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base > __gnu_cxx::operator+ (
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)
```

Concatenate two strings.

**Parameters**

<code>__lhs</code>	First string.
<code>__rhs</code>	Last string.

**Returns**

New string with value of `__lhs` followed by `__rhs`.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base>::append\(\)](#), [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base>::size\(\)](#), and [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base>::size\(\)](#).

**operator+()** [4/5]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base > __gnu_cxx::operator+ (
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
    const _CharT * __rhs)
```

Concatenate string and C string.

**Parameters**

<code>__lhs</code>	First string.
<code>__rhs</code>	Last string.

**Returns**

New string with `__lhs` followed by `__rhs`.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base>::size\(\)](#).

**operator+()** [5/5]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base > __gnu_cxx::operator+ (
    const _CharT * __lhs,
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)
```

Concatenate C string and string.

## Parameters

<code>__lhs</code>	First string.
<code>__rhs</code>	Last string.

## Returns

New string with value of `__lhs` followed by `__rhs`.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base>::size\(\)](#).

**operator<()** [1/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator< (
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test if string precedes string.

## Parameters

<code>__lhs</code>	First string.
<code>__rhs</code>	Second string.

## Returns

True if `__lhs` precedes `__rhs`. False otherwise.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base>::compare\(\)](#).

**operator<()** [2/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator< (
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
    const _CharT * __rhs) [inline]
```

Test if string precedes C string.

## Parameters

<code>__lhs</code>	String.
<code>__rhs</code>	C string.

## Returns

True if `__lhs` precedes `__rhs`. False otherwise.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base>::compare\(\)](#).

**operator<()** [3/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator< (
    const _CharT * __lhs,
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test if C string precedes string.

**Parameters**

<code>__lhs</code>	C string.
<code>__rhs</code>	String.

**Returns**

True if `__lhs` precedes `__rhs`. False otherwise.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string< \\_CharT, \\_Traits, \\_Alloc, \\_Base >::compare\(\)](#).

**operator<=()** [1/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator<= (
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test if string doesn't follow string.

**Parameters**

<code>__lhs</code>	First string.
<code>__rhs</code>	Second string.

**Returns**

True if `__lhs` doesn't follow `__rhs`. False otherwise.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string< \\_CharT, \\_Traits, \\_Alloc, \\_Base >::compare\(\)](#).

**operator<=()** [2/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator<= (
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
    const _CharT * __rhs) [inline]
```

Test if string doesn't follow C string.

**Parameters**

<code>__lhs</code>	String.
<code>__rhs</code>	C string.

**Returns**

True if `__lhs` doesn't follow `__rhs`. False otherwise.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base>::compare\(\)](#).

**operator<=()** [3/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator<= (
    const _CharT * __lhs,
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test if C string doesn't follow string.

**Parameters**

<code>__lhs</code>	C string.
<code>__rhs</code>	String.

**Returns**

True if `__lhs` doesn't follow `__rhs`. False otherwise.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base>::compare\(\)](#).

**operator==( )** [1/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator==(
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test equivalence of two strings.

**Parameters**

<code>__lhs</code>	First string.
<code>__rhs</code>	Second string.

**Returns**

True if `__lhs.compare(__rhs) == 0`. False otherwise.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base>::data\(\)](#), and [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_ALL](#)

**operator==( )** [2/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator==(
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
    const _CharT * __rhs) [inline]
```

Test equivalence of string and C string.

**Parameters**

<code>__lhs</code>	String.
<code>__rhs</code>	C string.

**Returns**

True if `__lhs.compare(__rhs) == 0`. False otherwise.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base >::data\(\)](#), and [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base >::compare\(\)](#).

**operator==( ) [3/4]**

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator==(
    const _CharT * __lhs,
    const __versa_string<_CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test equivalence of C string and string.

**Parameters**

<code>__lhs</code>	C string.
<code>__rhs</code>	String.

**Returns**

True if `__rhs.compare(__lhs) == 0`. False otherwise.

**operator==( ) [4/4]**

```
template<typename _Tp>
bool __gnu_cxx::operator==(
    const _Pointer_adapter<_Tp > & __lhs,
    const _Pointer_adapter<_Tp > & __rhs) [inline]
```

Comparison operators for `_Pointer_adapter` defer to the base class' comparison operators, when possible.

**operator>( ) [1/3]**

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator>(
    const __versa_string<_CharT, _Traits, _Alloc, _Base > & __lhs,
    const __versa_string<_CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test if string follows string.

**Parameters**

<code>__lhs</code>	First string.
<code>__rhs</code>	Second string.

**Returns**

True if `__lhs` follows `__rhs`. False otherwise.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base >::compare\(\)](#).

**operator>()** [2/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator> (
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
    const _CharT * __rhs) [inline]
```

Test if string follows C string.

**Parameters**

<code>__lhs</code>	String.
<code>__rhs</code>	C string.

**Returns**

True if `__lhs` follows `__rhs`. False otherwise.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string< \\_CharT, \\_Traits, \\_Alloc, \\_Base >::compare\(\)](#).

**operator>()** [3/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator> (
    const _CharT * __lhs,
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test if C string follows string.

**Parameters**

<code>__lhs</code>	C string.
<code>__rhs</code>	String.

**Returns**

True if `__lhs` follows `__rhs`. False otherwise.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string< \\_CharT, \\_Traits, \\_Alloc, \\_Base >::compare\(\)](#).

**operator>=()** [1/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator>= (
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test if string doesn't precede string.

**Parameters**

<code>__lhs</code>	First string.
<code>__rhs</code>	Second string.

**Returns**

True if `__lhs` doesn't precede `__rhs`. False otherwise.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base >::compare\(\)](#).

**operator>=()** [2/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator>= (
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
    const _CharT * __rhs) [inline]
```

Test if string doesn't precede C string.

**Parameters**

<code>__lhs</code>	String.
<code>__rhs</code>	C string.

**Returns**

True if `__lhs` doesn't precede `__rhs`. False otherwise.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base >::compare\(\)](#).

**operator>=()** [3/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator>= (
    const _CharT * __lhs,
    const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Test if C string doesn't precede string.

**Parameters**

<code>__lhs</code>	C string.
<code>__rhs</code>	String.

**Returns**

True if `__lhs` doesn't precede `__rhs`. False otherwise.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base >::compare\(\)](#).

**swap()**

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
void __gnu_cxx::swap (
    __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
    __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs) [inline]
```

Swap contents of two strings.

## Parameters

<code>__lhs</code>	First string.
<code>__rhs</code>	Second string.

Exchanges the contents of `__lhs` and `__rhs` in constant time.

References [\\_\\_gnu\\_cxx::\\_\\_versa\\_string<\\_CharT, \\_Traits, \\_Alloc, \\_Base>::swap\(\)](#).

## 4.2 `__gnu_cxx::__detail` Namespace Reference

### Classes

- class [\\_\\_mini\\_vector](#)
- class [\\_Bitmap\\_counter](#)
- class [\\_Ffit\\_finder](#)

### Enumerations

- enum { `_S_max_rope_depth` }
- enum { `bits_per_byte` , `bits_per_block` }
- enum `_Tag` { `_S_leaf` , `_S_concat` , `_S_substringfn` , `_S_function` }

### Functions

- void [\\_\\_bit\\_allocate](#) (std::size\_t \* \_\_pmap, std::size\_t \_\_pos) throw ()
- void [\\_\\_bit\\_free](#) (std::size\_t \* \_\_pmap, std::size\_t \_\_pos) throw ()
- template<typename \_ForwardIterator, typename \_Tp, typename \_Compare>  
\_ForwardIterator [\\_\\_lower\\_bound](#) (\_ForwardIterator \_\_first, \_ForwardIterator \_\_last, const \_Tp & \_\_val, \_Compare \_\_comp)

std::size\_t [\\_\\_num\\_bitmaps](#) (\_AddrPair \_\_ap)
- template<typename \_AddrPair>  
std::size\_t [\\_\\_num\\_blocks](#) (\_AddrPair \_\_ap)

#### 4.2.1 Detailed Description

Implementation details not part of the namespace `__gnu_cxx` interface.

#### 4.2.2 Function Documentation

##### `__bit_allocate()`

```
void __gnu_cxx::__detail::__bit_allocate (
    std::size_t * __pmap,
    std::size_t __pos) throw ( )    [inline]
```

Mark a memory address as allocated by re-setting the corresponding bit in the bit-map.

Referenced by [\\_\\_gnu\\_cxx::bitmap\\_allocator<\\_Tp1>::\\_M\\_allocate\\_single\\_object\(\)](#).

##### `__bit_free()`

```
void __gnu_cxx::__detail::__bit_free (
    std::size_t * __pmap,
    std::size_t __pos) throw ( )    [inline]
```

Mark a memory address as free by setting the corresponding bit in the bit-map.

Referenced by [\\_\\_gnu\\_cxx::bitmap\\_allocator<\\_Tp1>::\\_M\\_deallocate\\_single\\_object\(\)](#).

### **\_\_num\_bitmaps()**

```
template<typename _AddrPair>
std::size_t __gnu_cxx::__detail::__num_bitmaps (
    _AddrPair __ap) [inline]
```

The number of Bit-maps pointed to by the address pair passed to the function.

References [\\_\\_num\\_blocks\(\)](#).

Referenced by [\\_\\_gnu\\_cxx::bitmap\\_allocator< \\_Tp1 >::\\_M\\_allocate\\_single\\_object\(\)](#), and [\\_\\_gnu\\_cxx::bitmap\\_allocator< \\_Tp1 >::\\_M\\_deallocate\\_single\\_object\(\)](#).

### **\_\_num\_blocks()**

```
template<typename _AddrPair>
std::size_t __gnu_cxx::__detail::__num_blocks (
    _AddrPair __ap) [inline]
```

The number of Blocks pointed to by the address pair passed to the function.

Referenced by [\\_\\_num\\_bitmaps\(\)](#).

## **4.3 \_\_gnu\_cxx::typelist Namespace Reference**

### **Functions**

- `template<typename Fn, typename Typelist>`  
`void apply (Fn &, Typelist)`
- `template<typename Fn, typename Typelist>`  
`void apply_generator (Fn &fn, Typelist)`
- `template<typename Fn, typename TypelistT, typename TypelistV>`  
`void apply_generator (Fn &fn, TypelistT, TypelistV)`
- `template<typename Gn, typename Typelist>`  
`void apply\_generator (Gn &, Typelist)`
- `template<typename Gn, typename TypelistT, typename TypelistV>`  
`void apply_generator (Gn &, TypelistT, TypelistV)`

#### **4.3.1 Detailed Description**

GNU typelist extensions for public compile-time use.

#### **4.3.2 Function Documentation**

### **apply\_generator()**

```
template<typename Gn, typename Typelist>
void __gnu_cxx::typelist::apply_generator (
    Gn &,
    Typelist )
```

Apply all typelist types to generator functor.

#### 4.4.1 Detailed Description

GNU debug classes for public use.

#### 4.4.2 Typedef Documentation

##### u16string

```
typedef basic_string<char16_t> __gnu_debug::u16string
```

A string of `char16_t`.

**u32string**

typedef `basic_string<char32_t>` `__gnu_debug::u32string`  
 A string of `char32_t`.

**4.4.3 Enumeration Type Documentation****`__Distance_precision`**

enum `__gnu_debug::__Distance_precision`  
 The precision to which we can calculate the distance between two iterators.

**4.4.4 Function Documentation****`__base()`**

```
template<typename _Iterator>
_Iterator __gnu_debug::__base (
    _Iterator __it) [inline], [constexpr]
```

Helper function to extract base iterator of random access safe iterator in order to reduce performance impact of debug mode. Limited to random access iterator because it is the only category for which it is possible to check for correct iterators order in the `__valid_range` function thanks to the `<` operator.  
 Referenced by `__gnu_debug::__Safe_iterator<_Base_iterator, map>::__M_before_dereferenceable()`.

**`__check_singular()`**

```
template<typename _Tp>
bool __gnu_debug::__check_singular (
    _Tp *const & __ptr) [inline], [constexpr]
```

Non-NULL pointers are nonsingular.

**`__check_singular_aux()`**

```
bool __gnu_debug::__check_singular_aux (
    const _Safe_iterator_base * __x) [inline]
```

Iterators that derive from `_Safe_iterator_base` can be determined singular or non-singular.  
 References `__gnu_debug::__Safe_iterator_base::__M_singular()`.

**`__check_string()` [1/2]**

```
template<typename _CharT, typename _Integer>
const _CharT * __gnu_debug::__check_string (
    const _CharT * __s,
    _Integer __n,
    const char * __file,
    unsigned int __line,
    const char * __function) [inline]
```

Checks that `__s` is non-NULL or `__n == 0`, and then returns `__s`.

**`__check_string()` [2/2]**

```
template<typename _CharT>
const _CharT * __gnu_debug::__check_string (
    const _CharT * __s,
    const char * __file,
```

```
    unsigned int __line,
    const char * __function) [inline]
```

Checks that `__s` is non-NULL and then returns `__s`.

### `__foreign_iterator_aux2()` [1/2]

```
template<typename _Iterator, typename _Sequence, typename _Category, typename _OtherIterator,
typename _OtherSequence, typename _OtherCategory>
bool __gnu_debug::__foreign_iterator_aux2 (
    const _Safe_iterator< _Iterator, _Sequence, _Category > & ,
    const _Safe_iterator< _OtherIterator, _OtherSequence, _OtherCategory > & ,
    const _Safe_iterator< _OtherIterator, _OtherSequence, _OtherCategory > & ) [inline]
```

Handle debug iterators from different types of container.

### `__foreign_iterator_aux2()` [2/2]

```
template<typename _Iterator, typename _Sequence, typename _Category, typename _OtherIterator>
bool __gnu_debug::__foreign_iterator_aux2 (
    const _Safe_iterator< _Iterator, _Sequence, _Category > & __it,
    const _Safe_iterator< _OtherIterator, _Sequence, _Category > & __other,
    const _Safe_iterator< _OtherIterator, _Sequence, _Category > & ) [inline]
```

Handle debug iterators from the same type of container.

### `__get_distance()`

```
template<typename _Iterator>
_Distance_traits< _Iterator >::__type __gnu_debug::__get_distance (
    _Iterator __lhs,
    _Iterator __rhs,
    std::random_access_iterator_tag ) [inline], [constexpr]
```

Determine the distance between two iterators with some known precision.

References [std::make\\_pair\(\)](#).

### `__valid_range()` [1/3]

```
template<typename _InputIterator>
bool __gnu_debug::__valid_range (
    _InputIterator __first,
    _InputIterator __last,
    typename _Distance_traits< _InputIterator >::__type & __dist) [inline], [constexpr]
```

Don't know what these iterators are, or if they are even iterators (we may get an integral type for `InputIterator`), so see if they are integral and pass them on to the next phase otherwise.

References [\\_\\_valid\\_range\\_aux\(\)](#).

### `__valid_range()` [2/3]

```
template<typename _Iterator, typename _Sequence, typename _Category>
bool __gnu_debug::__valid_range (
    const _Safe_iterator< _Iterator, _Sequence, _Category > & __first,
    const _Safe_iterator< _Iterator, _Sequence, _Category > & __last,
    typename _Distance_traits< _Iterator >::__type & __dist) [inline], [constexpr]
```

Safe iterators know how to check if they form a valid range.

**`__valid_range()`** [3/3]

```
template<typename _Iterator, typename _UContainer>
bool __gnu_debug::__valid_range (
    const __Safe_local_iterator< _Iterator, _UContainer > & __first,
    const __Safe_local_iterator< _Iterator, _UContainer > & __last,
    typename _Distance_traits< _Iterator >::__type & __dist_info) [inline]
```

Safe local iterators know how to check if they form a valid range.

**`__valid_range_aux()`** [1/2]

```
template<typename _InputIterator>
bool __gnu_debug::__valid_range_aux (
    _InputIterator __first,
    _InputIterator __last,
    std::__false_type ) [inline], [constexpr]
```

We have iterators, so figure out what kind of iterators they are to see if we can check the range ahead of time.

References [std::\\_\\_iterator\\_category\(\)](#), and [\\_\\_valid\\_range\\_aux\(\)](#).

**`__valid_range_aux()`** [2/2]

```
template<typename _Integral>
bool __gnu_debug::__valid_range_aux (
    _Integral ,
    _Integral ,
    std::__true_type ) [inline], [constexpr]
```

We say that integral types for a valid range, and defer to other routines to realize what to do with integral types instead of iterators.

Referenced by [\\_\\_valid\\_range\(\)](#), and [\\_\\_valid\\_range\\_aux\(\)](#).

## 4.5 `__gnu_internal` Namespace Reference

### 4.5.1 Detailed Description

GNU implementation details, not for public use or export. Used only when anonymous namespaces cannot be substituted.

## 4.6 `__gnu_parallel` Namespace Reference

## Variables

- static const int [\\_CASable\\_bits](#)
- static const [\\_CASable](#) [\\_CASable\\_mask](#)

### 4.6.1 Detailed Description

GNU parallel code for public use.

### 4.6.2 Typedef Documentation

#### `_BinIndex`

```
typedef unsigned short \_\_gnu\_parallel::\_BinIndex
```

Type to hold the index of a bin.

Since many variables of this type are allocated, it should be chosen as small as possible.

#### `_CASable`

```
typedef int64_t \_\_gnu\_parallel::\_CASable
```

Longest compare-and-swappable integer type on this platform.

#### `_SequenceIndex`

```
typedef uint64_t \_\_gnu\_parallel::\_SequenceIndex
```

Unsigned integer to index `__elements`. The total number of elements for each algorithm must fit into this type.

#### `_ThreadIndex`

```
typedef uint16_t \_\_gnu\_parallel::\_ThreadIndex
```

Unsigned integer to index a thread number. The maximum thread number (for each processor) must fit into this type.

### 4.6.3 Enumeration Type Documentation

#### **\_AlgorithmStrategy**

enum `__gnu_parallel::_AlgorithmStrategy`

Strategies for run-time algorithm selection:

#### **\_FindAlgorithm**

enum `__gnu_parallel::_FindAlgorithm`

Find algorithms:

#### **\_MultiwayMergeAlgorithm**

enum `__gnu_parallel::_MultiwayMergeAlgorithm`

Merging algorithms:

#### **\_Parallelism**

enum `__gnu_parallel::_Parallelism`

Run-time equivalents for the compile-time tags.

Enumerator

<code>sequential</code>	Not parallel.
<code>parallel_unbalanced</code>	Parallel unbalanced (equal-sized chunks).
<code>parallel_balanced</code>	Parallel balanced (work-stealing).
<code>parallel_omp_loop</code>	Parallel with OpenMP dynamic load-balancing.
<code>parallel_omp_loop_static</code>	Parallel with OpenMP static load-balancing.
<code>parallel_taskqueue</code>	Parallel with OpenMP taskqueue construct.

#### **\_PartialSumAlgorithm**

enum `__gnu_parallel::_PartialSumAlgorithm`

Partial sum algorithms: recursive, linear.

#### **\_SortAlgorithm**

enum `__gnu_parallel::_SortAlgorithm`

Sorting algorithms:

#### **\_SplittingAlgorithm**

enum `__gnu_parallel::_SplittingAlgorithm`

Sorting/merging algorithms: sampling, `__exact`.

### 4.6.4 Function Documentation

#### **\_\_calc\_borders()**

```
template<typename _RAIter, typename _DifferenceTp>
void __gnu_parallel::__calc_borders (
    _RAIter __elements,
```

```

        _DifferenceTp __length,
        _DifferenceTp * __off)

```

Precalculate `__advances` for Knuth-Morris-Pratt algorithm.

#### Parameters

<code>__elements</code>	Begin iterator of sequence to search for.
<code>__length</code>	Length of sequence to search for.
<code>__off</code>	Returned <code>__offsets</code> .

Referenced by [\\_\\_search\\_template\(\)](#).

#### `__compare_and_swap()`

```

template<typename _Tp>
bool __gnu_parallel::__compare_and_swap (
    volatile _Tp * __ptr,
    _Tp __comparand,
    _Tp __replacement) [inline]

```

Compare-and-swap.

Compare `*__ptr` and `__comparand`. If equal, let `*__ptr=__replacement` and return true, return false otherwise.

#### Parameters

<code>__ptr</code>	Pointer to signed integer.
<code>__comparand</code>	Compare value.
<code>__replacement</code>	Replacement value.

Referenced by [\\_\\_parallel\\_partition\(\)](#), [\\_\\_gnu\\_parallel::\\_RestrictedBoundedConcurrentQueue<\\_Tp>::pop\\_back\(\)](#), and [\\_\\_gnu\\_parallel::\\_RestrictedBoundedConcurrentQueue<\\_Tp>::pop\\_front\(\)](#).

#### `__decode2()`

```

void __gnu_parallel::__decode2 (
    _CASable __x,
    int & __a,
    int & __b) [inline]

```

Decode two integers from one `gnu_parallel::_CASable`.

#### Parameters

<code>__x</code>	<code>__gnu_parallel::_CASable</code> to decode integers from.
<code>__a</code>	First integer, to be decoded from the most-significant <code>_CASable_bits/2</code> bits of <code>__x</code> .
<code>__b</code>	Second integer, to be encoded in the least-significant <code>_CASable_bits/2</code> bits of <code>__x</code> .

#### See also

`__encode2`

References `_CASable_bits`, and `_CASable_mask`.

Referenced by [\\_\\_gnu\\_parallel::\\_RestrictedBoundedConcurrentQueue<\\_Tp>::pop\\_back\(\)](#), [\\_\\_gnu\\_parallel::\\_RestrictedBoundedConcurrentQueue<\\_Tp>::pop\\_front\(\)](#), and [\\_\\_gnu\\_parallel::\\_RestrictedBoundedConcurrentQueue<\\_Tp>::push\\_front\(\)](#).

**\_\_determine\_samples()**

```
template<typename _RAIter, typename _DifferenceTp>
void __gnu_parallel::__determine_samples (
    _PMWMSortingData< _RAIter > * __sd,
    _DifferenceTp __num_samples)
Select _M_samples from a sequence.
```

**Parameters**

<code>__sd</code>	Pointer to algorithm data. _Result will be placed in <code>__sd-&gt;_M_samples</code> .
<code>__num_samples</code>	Number of <code>_M_samples</code> to select.

References [\\_\\_equally\\_split\(\)](#), [\\_\\_gnu\\_parallel::PMWMSortingData< \\_RAIter >::\\_M\\_samples](#), [\\_\\_gnu\\_parallel::PMWMSortingData< \\_RAIter >::\\_M\\_starts](#).

**\_\_encode2()**

```
_CASable __gnu_parallel::__encode2 (
    int __a,
    int __b) [inline]
Encode two integers into one gnu_parallel::_CASable.
```

**Parameters**

<code>__a</code>	First integer, to be encoded in the most-significant <code>_CASable_bits/2</code> bits.
<code>__b</code>	Second integer, to be encoded in the least-significant <code>_CASable_bits/2</code> bits.

**Returns**

value encoding `__a` and `__b`.

**See also**

[\\_\\_decode2](#)

References [\\_CASable\\_bits](#).

Referenced by [\\_\\_gnu\\_parallel::RestrictedBoundedConcurrentQueue< \\_Tp >::RestrictedBoundedConcurrentQueue\(\)](#), [\\_\\_gnu\\_parallel::RestrictedBoundedConcurrentQueue< \\_Tp >::pop\\_back\(\)](#), [\\_\\_gnu\\_parallel::RestrictedBoundedConcurrentQueue< \\_Tp >::push\\_front\(\)](#).

**\_\_equally\_split()**

```
template<typename _DifferenceType, typename _OutputIterator>
_OutputIterator __gnu_parallel::__equally_split (
    _DifferenceType __n,
    _ThreadIndex __num_threads,
    _OutputIterator __s)
function to split a sequence into parts of almost equal size.
```

The resulting sequence `__s` of length `__num_threads+1` contains the splitting positions when splitting the range `[0,__n)` into parts of almost equal size (plus minus 1). The first entry is 0, the last one `n`. There may result empty parts.

## Parameters

<code>__n</code>	Number of elements
<code>__num_threads</code>	Number of parts
<code>__s</code>	Splitters

## Returns

End of `__splitter` sequence, i.e. `__s+__num_threads+1`

Referenced by [\\_\\_determine\\_samples\(\)](#), [\\_\\_find\\_template\(\)](#), [\\_\\_parallel\\_partial\\_sum\\_linear\(\)](#), [\\_\\_parallel\\_unique\\_copy\(\)](#), [\\_\\_search\\_template\(\)](#), and [multiway\\_merge\\_exact\\_splitting\(\)](#).

**`__equally_split_point()`**

```
template<typename _DifferenceType>
_DifferenceType __gnu_parallel::__equally_split_point (
    _DifferenceType __n,
    _ThreadIndex __num_threads,
    _ThreadIndex __thread_no)
```

function to split a sequence into parts of almost equal size.

Returns the position of the splitting point between thread number `__thread_no` (included) and thread number `__thread_no+1` (excluded).

## Parameters

<code>__n</code>	Number of elements
<code>__num_threads</code>	Number of parts
<code>__thread_no</code>	Number of threads

## Returns

splitting point

Referenced by [\\_\\_for\\_each\\_template\\_random\\_access\\_ed\(\)](#).

**`__fetch_and_add()`**

```
template<typename _Tp>
_Tp __gnu_parallel::__fetch_and_add (
    volatile _Tp * __ptr,
    _Tp __addend) [inline]
```

Add a value to a variable, atomically.

## Parameters

<code>__ptr</code>	Pointer to a signed integer.
<code>__addend</code>	Value to add.

Referenced by [\\_\\_find\\_template\(\)](#), [\\_\\_for\\_each\\_template\\_random\\_access\\_workstealing\(\)](#), [\\_\\_parallel\\_partition\(\)](#), and [\\_\\_gnu\\_parallel::\\_\\_RestrictedBoundedConcurrentQueue<\\_Tp>::push\\_front\(\)](#).

**\_\_find\_template()** [1/4]

```
template<typename _RAIter1, typename _RAIter2, typename _Pred, typename _Selector>
std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__find_template (
    _RAIter1 __begin1,
    _RAIter1 __end1,
    _RAIter2 __begin2,
    _Pred __pred,
    _Selector __selector) [inline]
```

Parallel std::find, switch for different algorithms.

**Parameters**

<code>__begin1</code>	Begin iterator of first sequence.
<code>__end1</code>	End iterator of first sequence.
<code>__begin2</code>	Begin iterator of second sequence. Must have same length as first sequence.
<code>__pred</code>	Find predicate.
<code>__selector</code>	_Functionality (e. g. std::find_if(), std::equal(),...)

**Returns**

Place of finding in both sequences.

References [\\_\\_find\\_template\(\)](#), [\\_\\_gnu\\_parallel::\\_Settings::get\(\)](#), and [std::make\\_pair\(\)](#).

Referenced by [\\_\\_find\\_template\(\)](#).

**\_\_find\_template()** [2/4]

```
template<typename _RAIter1, typename _RAIter2, typename _Pred, typename _Selector>
std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__find_template (
    _RAIter1 __begin1,
    _RAIter1 __end1,
    _RAIter2 __begin2,
    _Pred __pred,
    _Selector __selector,
    constant_size_blocks_tag )
```

Parallel std::find, constant block size variant.

**Parameters**

<code>__begin1</code>	Begin iterator of first sequence.
<code>__end1</code>	End iterator of first sequence.
<code>__begin2</code>	Begin iterator of second sequence. Second __sequence must have same length as first sequence.
<code>__pred</code>	Find predicate.
<code>__selector</code>	_Functionality (e. g. std::find_if(), std::equal(),...)

**Returns**

Place of finding in both sequences.

`__gnu_parallel::_Settings::find_sequential_search_size`

`__gnu_parallel::_Settings::find_block_size` There are two main differences between the growing blocks and the constant-size blocks variants.

1. For GB, the block size grows; for CSB, the block size is fixed.
2. For GB, the blocks are allocated dynamically; for CSB, the blocks are allocated in a predetermined manner, namely spacial round-robin.

References [\\_GLIBCXX\\_CALL](#), `__gnu_parallel::_Settings::find_initial_block_size`, `__gnu_parallel::_Settings::find_sequential_search_size`, `std::pair<_T1, _T2>::first`, `__gnu_parallel::_Settings::get()`, and `std::min()`.

**`__find_template()`** [3/4]

```
template<typename _RAIter1, typename _RAIter2, typename _Pred, typename _Selector>
std::pair<_RAIter1, _RAIter2> __gnu_parallel::__find_template (
    _RAIter1 __begin1,
    _RAIter1 __end1,
    _RAIter2 __begin2,
    _Pred __pred,
    _Selector __selector,
    equal_split_tag )
```

Parallel `std::find`, equal splitting variant.

## Parameters

<code>__begin1</code>	Begin iterator of first sequence.
<code>__end1</code>	End iterator of first sequence.
<code>__begin2</code>	Begin iterator of second sequence. Second <code>__sequence</code> must have same length as first sequence.
<code>__pred</code>	Find predicate.
<code>__selector</code>	<code>_Functionality</code> (e. g. <code>std::find_if()</code> , <code>std::equal()</code> ,...)

## Returns

Place of finding in both sequences.

References [\\_\\_equally\\_split\(\)](#), and [\\_GLIBCXX\\_CALL](#).

**`__find_template()`** [4/4]

```
template<typename _RAIter1, typename _RAIter2, typename _Pred, typename _Selector>
std::pair<_RAIter1, _RAIter2> __gnu_parallel::__find_template (
    _RAIter1 __begin1,
    _RAIter1 __end1,
    _RAIter2 __begin2,
    _Pred __pred,
    _Selector __selector,
    growing_blocks_tag )
```

Parallel `std::find`, growing block size variant.

## Parameters

<code>__begin1</code>	Begin iterator of first sequence.
-----------------------	-----------------------------------

## Parameters

<code>__end1</code>	End iterator of first sequence.
<code>__begin2</code>	Begin iterator of second sequence. Second <code>__sequence</code> must have same length as first sequence.
<code>__pred</code>	Find predicate.
<code>__selector</code>	<code>_Functionality</code> (e. g. <code>std::find_if()</code> , <code>std::equal()</code> ,...)

## Returns

Place of finding in both sequences.

## See also

`__gnu_parallel::_Settings::find_sequential_search_size`  
`__gnu_parallel::_Settings::find_scale_factor`

There are two main differences between the growing blocks and the constant-size blocks variants.

1. For GB, the block size grows; for CSB, the block size is fixed.
2. For GB, the blocks are allocated dynamically; for CSB, the blocks are allocated in a predetermined manner, namely spacial round-robin.

**`__for_each_template_random_access()`**

```
template<typename _IIter, typename _UserOp, typename _Functionality, typename _Red, typename _↵
Result>
_UserOp __gnu_parallel::__for_each_template_random_access (
    _IIter __begin,
    _IIter __end,
    _UserOp __user_op,
    _Functionality & __functionality,
    _Red __reduction,
    _Result __reduction_start,
    _Result & __output,
    typename std::iterator_traits< _IIter >::difference_type __bound,
    _Parallelism __parallelism_tag)
```

Chose the desired algorithm by evaluating `__parallelism_tag`.

## Parameters

<code>__begin</code>	Begin iterator of input sequence.
<code>__end</code>	End iterator of input sequence.
<code>__user_op</code>	A user-specified functor (comparator, predicate, associative operator,...)
<code>__functionality</code>	functor to <i>process</i> an element with <code>__user_op</code> (depends on desired functionality, e. g. accumulate, <code>for_each</code> ,...)
<code>__reduction</code>	Reduction functor.
<code>__reduction_start</code>	Initial value for reduction.
<code>__output</code>	Output iterator.
<code>__bound</code>	Maximum number of elements processed.

<code>__parallelism_tag</code>	Parallelization method
--------------------------------	------------------------

References [\\_\\_for\\_each\\_template\\_random\\_access\\_ed\(\)](#), [\\_\\_for\\_each\\_template\\_random\\_access\\_omp\\_loop\(\)](#), [\\_\\_for\\_each\\_template\\_random\\_access\\_omp\\_loop\\_static\(\)](#), and [parallel\\_unbalanced\(\)](#).

### `__for_each_template_random_access_ed()`

```
template<typename _RAIter, typename _Op, typename _Fu, typename _Red, typename _Result>
_Op __gnu_parallel::__for_each_template_random_access_ed (
    _RAIter __begin,
    _RAIter __end,
    _Op __o,
    _Fu & __f,
    _Red __r,
    _Result __base,
    _Result & __output,
    typename std::iterator_traits< _RAIter >::difference_type __bound)
```

Embarrassingly parallel algorithm for random access iterators, using hand-crafted parallelization by equal splitting the work.

#### Parameters

<code>__begin</code>	Begin iterator of element sequence.
<code>__end</code>	End iterator of element sequence.
<code>__o</code>	User-supplied functor (comparator, predicate, adding functor, ...)
<code>__f</code>	Functor to "process" an element with <code>__op</code> (depends on desired functionality, e. g. for <code>std::for_each()</code> , ...).
<code>__r</code>	Functor to "add" a single <code>__result</code> to the already processed elements (depends on functionality).
<code>__base</code>	Base value for reduction.
<code>__output</code>	Pointer to position where final result is written to
<code>__bound</code>	Maximum number of elements processed (e. g. for <code>std::count_n()</code> ).

#### Returns

User-supplied functor (that may contain a part of the result).

References [\\_\\_equally\\_split\\_point\(\)](#), and [min\(\)](#).

Referenced by [\\_\\_for\\_each\\_template\\_random\\_access\(\)](#).

### `__for_each_template_random_access_omp_loop()`

```
template<typename _RAIter, typename _Op, typename _Fu, typename _Red, typename _Result>
_Op __gnu_parallel::__for_each_template_random_access_omp_loop (
    _RAIter __begin,
    _RAIter __end,
    _Op __o,
    _Fu & __f,
    _Red __r,
    _Result __base,
    _Result & __output,
    typename std::iterator_traits< _RAIter >::difference_type __bound)
```

Embarrassingly parallel algorithm for random access iterators, using an OpenMP for loop.

## Parameters

<code>__begin</code>	Begin iterator of element sequence.
<code>__end</code>	End iterator of element sequence.
<code>__o</code>	User-supplied functor (comparator, predicate, adding functor, etc.).
<code>__f</code>	Functor to <i>process</i> an element with <code>__op</code> (depends on desired functionality, e. g. for <code>std::for_each()</code> , ...).
<code>__r</code>	Functor to <i>add</i> a single <code>__result</code> to the already processed elements (depends on functionality).
<code>__base</code>	Base value for reduction.
<code>__output</code>	Pointer to position where final result is written to
<code>__bound</code>	Maximum number of elements processed (e. g. for <code>std::count_n()</code> ).

## Returns

User-supplied functor (that may contain a part of the result).

References [min\(\)](#).

Referenced by [\\_\\_for\\_each\\_template\\_random\\_access\(\)](#).

**`__for_each_template_random_access_omp_loop_static()`**

```
template<typename _RAIter, typename _Op, typename _Fu, typename _Red, typename _Result>
_Op __gnu_parallel::__for_each_template_random_access_omp_loop_static (
    _RAIter __begin,
    _RAIter __end,
    _Op __o,
    _Fu & __f,
    _Red __r,
    _Result __base,
    _Result & __output,
    typename std::iterator_traits< _RAIter >::difference_type __bound)

```

Embarrassingly parallel algorithm for random access iterators, using an OpenMP for loop with static scheduling.

## Parameters

<code>__begin</code>	Begin iterator of element sequence.
<code>__end</code>	End iterator of element sequence.
<code>__o</code>	User-supplied functor (comparator, predicate, adding functor, ...).
<code>__f</code>	Functor to <i>process</i> an element with <code>__op</code> (depends on desired functionality, e. g. for <code>std::for_each()</code> , ...).
<code>__r</code>	Functor to <i>add</i> a single <code>__result</code> to the already processed <code>__elements</code> (depends on functionality).
<code>__base</code>	Base value for reduction.
<code>__output</code>	Pointer to position where final result is written to
<code>__bound</code>	Maximum number of elements processed (e. g. for <code>std::count_n()</code> ).

## Returns

User-supplied functor (that may contain a part of the result).

References [std::min\(\)](#).

**`__for_each_template_random_access_workstealing()`**

```
template<typename _RAIter, typename _Op, typename _Fu, typename _Red, typename _Result>
__Op __gnu_parallel::__for_each_template_random_access_workstealing (
    _RAIter __begin,
    _RAIter __end,
    _Op __op,
    _Fu & __f,
    _Red __r,
    _Result __base,
    _Result & __output,
    typename std::iterator_traits< _RAIter >::difference_type __bound)

```

Work stealing algorithm for random access iterators.

Uses O(1) additional memory. Synchronization at job lists is done with atomic operations.

**Parameters**

<code>__begin</code>	Begin iterator of element sequence.
<code>__end</code>	End iterator of element sequence.
<code>__op</code>	User-supplied functor (comparator, predicate, adding functor, ...).
<code>__f</code>	Functor to <i>process</i> an element with <code>__op</code> (depends on desired functionality, e. g. for <code>std::for_each()</code> , ...).
<code>__r</code>	Functor to <i>add</i> a single <code>__result</code> to the already processed elements (depends on functionality).
<code>__base</code>	Base value for reduction.
<code>__output</code>	Pointer to position where final result is written to
<code>__bound</code>	Maximum number of elements processed (e. g. for <code>std::count_n()</code> ).

**Returns**

User-supplied functor (that may contain a part of the result).

References [\\_\\_fetch\\_and\\_add\(\)](#), [\\_\\_yield\(\)](#), [\\_GLIBCXX\\_CALL](#), [\\_\\_gnu\\_parallel::\\_Job<\\_DifferenceTp>::\\_M\\_first](#), [\\_\\_gnu\\_parallel::\\_Job<\\_DifferenceTp>::\\_M\\_last](#), [\\_\\_gnu\\_parallel::\\_Job<\\_DifferenceTp>::\\_M\\_load](#), [\\_\\_gnu\\_parallel::\\_Settings::cache\\_l](#), [\\_\\_gnu\\_parallel::\\_Settings::get\(\)](#), [max\(\)](#), and [min\(\)](#).

Referenced by [\\_\\_for\\_each\\_template\\_random\\_access\(\)](#).

**`__is_sorted()`**

```
template<typename _IIter, typename _Compare>
bool __gnu_parallel::__is_sorted (
    _IIter __begin,
    _IIter __end,
    _Compare __comp)

```

Check whether [`__begin`, `__end`) is sorted according to `__comp`.

**Parameters**

<code>__begin</code>	Begin iterator of sequence.
<code>__end</code>	End iterator of sequence.
<code>__comp</code>	Comparator.

**Returns**

`true` if sorted, `false` otherwise.

Referenced by [\\_\\_sequential\\_multiway\\_merge\(\)](#), [multiway\\_merge\\_loser\\_tree\\_sentinel\(\)](#), and [parallel\\_multiway\\_merge\(\)](#).

**\_\_median\_of\_three\_iterators()**

```
template<typename _RAIter, typename _Compare>
_RAIter __gnu_parallel::__median_of_three_iterators (
    _RAIter __a,
    _RAIter __b,
    _RAIter __c,
    _Compare __comp)
```

Compute the median of three referenced elements, according to `__comp`.

**Parameters**

<code>__a</code>	First iterator.
<code>__b</code>	Second iterator.
<code>__c</code>	Third iterator.
<code>__comp</code>	Comparator.

Referenced by [\\_\\_qsb\\_divide\(\)](#).

**\_\_merge\_advance()**

```
template<typename _RAIter1, typename _RAIter2, typename _OutputIterator, typename _DifferenceTp,
typename _Compare>
_OutputIterator __gnu_parallel::__merge_advance (
    _RAIter1 & __begin1,
    _RAIter1 __end1,
    _RAIter2 & __begin2,
    _RAIter2 __end2,
    _OutputIterator __target,
    _DifferenceTp __max_length,
    _Compare __comp) [inline]
```

Merge routine being able to merge only the `__max_length` smallest elements.

The `__begin` iterators are advanced accordingly, they might not reach `__end`, in contrast to the usual variant. Static switch on whether to use the conditional-move variant.

**Parameters**

<code>__begin1</code>	Begin iterator of first sequence.
<code>__end1</code>	End iterator of first sequence.
<code>__begin2</code>	Begin iterator of second sequence.
<code>__end2</code>	End iterator of second sequence.
<code>__target</code>	Target begin iterator.
<code>__max_length</code>	Maximum number of elements to merge.
<code>__comp</code>	Comparator.

**Returns**

Output end iterator.

References [\\_\\_merge\\_advance\\_movc\(\)](#), and [\\_GLIBCXX\\_CALL](#).

Referenced by [\\_\\_parallel\\_merge\\_advance\(\)](#), and [\\_\\_sequential\\_multiway\\_merge\(\)](#).

**`__merge_advance_movc()`**

```
template<typename _RAIter1, typename _RAIter2, typename _OutputIterator, typename _DifferenceTp,
typename _Compare>
_OutputIterator __gnu_parallel::__merge_advance_movc (
    _RAIter1 & __begin1,
    _RAIter1 __end1,
    _RAIter2 & __begin2,
    _RAIter2 __end2,
    _OutputIterator __target,
    _DifferenceTp __max_length,
    _Compare __comp)
```

Merge routine being able to merge only the `__max_length` smallest elements.

The `__begin` iterators are advanced accordingly, they might not reach `__end`, in contrast to the usual variant. Specially designed code should allow the compiler to generate conditional moves instead of branches.

**Parameters**

<code>__begin1</code>	Begin iterator of first sequence.
<code>__end1</code>	End iterator of first sequence.
<code>__begin2</code>	Begin iterator of second sequence.
<code>__end2</code>	End iterator of second sequence.
<code>__target</code>	Target begin iterator.
<code>__max_length</code>	Maximum number of elements to merge.
<code>__comp</code>	Comparator.

**Returns**

Output end iterator.

Referenced by [\\_\\_merge\\_advance\(\)](#).

**`__merge_advance_usual()`**

```
template<typename _RAIter1, typename _RAIter2, typename _OutputIterator, typename _DifferenceTp,
typename _Compare>
_OutputIterator __gnu_parallel::__merge_advance_usual (
    _RAIter1 & __begin1,
    _RAIter1 __end1,
    _RAIter2 & __begin2,
    _RAIter2 __end2,
    _OutputIterator __target,
    _DifferenceTp __max_length,
    _Compare __comp)
```

Merge routine being able to merge only the `__max_length` smallest elements.

The `__begin` iterators are advanced accordingly, they might not reach `__end`, in contrast to the usual variant.

**Parameters**

<code>__begin1</code>	Begin iterator of first sequence.
<code>__end1</code>	End iterator of first sequence.
<code>__begin2</code>	Begin iterator of second sequence.
<code>__end2</code>	End iterator of second sequence.

## Parameters

<code>__target</code>	Target begin iterator.
<code>__max_length</code>	Maximum number of elements to merge.
<code>__comp</code>	Comparator.

## Returns

Output end iterator.

**`__parallel_merge_advance()`** [1/2]

```
template<typename _RAIter1, typename _RAIter3, typename _Compare>
_RAIter3 __gnu_parallel::__parallel_merge_advance (
    _RAIter1 & __begin1,
    _RAIter1 __end1,
    _RAIter1 & __begin2,
    _RAIter1 __end2,
    _RAIter3 __target,
    typename std::iterator_traits< _RAIter1 >::difference_type __max_length,
    _Compare __comp) [inline]
```

Parallel merge routine being able to merge only the `__max_length` smallest elements.

The `__begin` iterators are advanced accordingly, they might not reach `__end`, in contrast to the usual variant. The functionality is projected onto `parallel_multiway_merge`.

## Parameters

<code>__begin1</code>	Begin iterator of first sequence.
<code>__end1</code>	End iterator of first sequence.
<code>__begin2</code>	Begin iterator of second sequence.
<code>__end2</code>	End iterator of second sequence.
<code>__target</code>	Target begin iterator.
<code>__max_length</code>	Maximum number of elements to merge.
<code>__comp</code>	Comparator.

## Returns

Output end iterator.

References [std::make\\_pair\(\)](#), [multiway\\_merge\\_exact\\_splitting\(\)](#), and [parallel\\_multiway\\_merge\(\)](#).

**`__parallel_merge_advance()`** [2/2]

```
template<typename _RAIter1, typename _RAIter2, typename _RAIter3, typename _Compare>
_RAIter3 __gnu_parallel::__parallel_merge_advance (
    _RAIter1 & __begin1,
    _RAIter1 __end1,
    _RAIter2 & __begin2,
    _RAIter2 __end2,
    _RAIter3 __target,
    typename std::iterator_traits< _RAIter1 >::difference_type __max_length,
    _Compare __comp) [inline]
```

Merge routine fallback to sequential in case the iterators of the two input sequences are of different type.

## Parameters

<code>__begin1</code>	Begin iterator of first sequence.
<code>__end1</code>	End iterator of first sequence.
<code>__begin2</code>	Begin iterator of second sequence.
<code>__end2</code>	End iterator of second sequence.
<code>__target</code>	Target begin iterator.
<code>__max_length</code>	Maximum number of elements to merge.
<code>__comp</code>	Comparator.

## Returns

Output end iterator.

References [\\_\\_merge\\_advance\(\)](#).

**`__parallel_nth_element()`**

```
template<typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_nth_element (
    _RAIter __begin,
    _RAIter __nth,
    _RAIter __end,
    _Compare __comp)
```

Parallel implementation of `std::nth_element()`.

## Parameters

<code>__begin</code>	Begin iterator of input sequence.
<code>__nth</code>	Iterator of element that must be in position afterwards.
<code>__end</code>	End iterator of input sequence.
<code>__comp</code>	Comparator.

References [\\_\\_parallel\\_partition\(\)](#), [\\_GLIBCXX\\_CALL](#), [\\_\\_gnu\\_parallel::\\_Settings::get\(\)](#), [std::max\(\)](#), [\\_\\_gnu\\_parallel::\\_Settings::nth\\_element](#) and [\\_\\_gnu\\_parallel::\\_Settings::partition\\_minimal\\_n](#).

Referenced by [\\_\\_parallel\\_partial\\_sort\(\)](#).

**`__parallel_partial_sort()`**

```
template<typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_partial_sort (
    _RAIter __begin,
    _RAIter __middle,
    _RAIter __end,
    _Compare __comp)
```

Parallel implementation of `std::partial_sort()`.

## Parameters

<code>__begin</code>	Begin iterator of input sequence.
<code>__middle</code>	Sort until this position.
<code>__end</code>	End iterator of input sequence.

<code>__comp</code>	Comparator.
---------------------	-------------

References [\\_\\_parallel\\_nth\\_element\(\)](#).

### **`__parallel_partial_sum()`**

```
template<typename _IIter, typename _OutputIterator, typename _BinaryOperation>
_OutputIterator __gnu_parallel::__parallel_partial_sum (
    _IIter __begin,
    _IIter __end,
    _OutputIterator __result,
    _BinaryOperation __bin_op)
```

Parallel partial sum front-\_\_end.

#### **Parameters**

<code>__begin</code>	Begin iterator of input sequence.
<code>__end</code>	End iterator of input sequence.
<code>__result</code>	Begin iterator of output sequence.
<code>__bin_op</code>	Associative binary function.

#### **Returns**

End iterator of output sequence.

References [\\_\\_parallel\\_partial\\_sum\\_linear\(\)](#), [\\_GLIBCXX\\_CALL](#), and [\\_\\_gnu\\_parallel::\\_Settings::get\(\)](#).

### **`__parallel_partial_sum_basecase()`**

```
template<typename _IIter, typename _OutputIterator, typename _BinaryOperation>
_OutputIterator __gnu_parallel::__parallel_partial_sum_basecase (
    _IIter __begin,
    _IIter __end,
    _OutputIterator __result,
    _BinaryOperation __bin_op,
    typename std::iterator_traits< _IIter >::value_type __value)
```

Base case prefix sum routine.

#### **Parameters**

<code>__begin</code>	Begin iterator of input sequence.
<code>__end</code>	End iterator of input sequence.
<code>__result</code>	Begin iterator of output sequence.
<code>__bin_op</code>	Associative binary function.
<code>__value</code>	Start value. Must be passed since the neutral element is unknown in general.

#### **Returns**

End iterator of output sequence.

Referenced by [\\_\\_parallel\\_partial\\_sum\\_linear\(\)](#).

**`__parallel_partial_sum_linear()`**

```
template<typename _IIter, typename _OutputIterator, typename _BinaryOperation>
_OutputIterator __gnu_parallel::__parallel_partial_sum_linear (
    _IIter __begin,
    _IIter __end,
    _OutputIterator __result,
    _BinaryOperation __bin_op,
    typename std::iterator_traits< _IIter >::difference_type __n)

```

Parallel partial sum implementation, two-phase approach, no recursion.

**Parameters**

<code>__begin</code>	Begin iterator of input sequence.
<code>__end</code>	End iterator of input sequence.
<code>__result</code>	Begin iterator of output sequence.
<code>__bin_op</code>	Associative binary function.
<code>__n</code>	Length of sequence.

**Returns**

End iterator of output sequence.

References [\\_\\_equally\\_split\(\)](#), [\\_\\_parallel\\_partial\\_sum\\_basecase\(\)](#), [\\_\\_gnu\\_parallel::\\_Settings::get\(\)](#), [std::max\(\)](#), [std::min\(\)](#), and [\\_\\_gnu\\_parallel::\\_Settings::partial\\_sum\\_dilation](#).

Referenced by [\\_\\_parallel\\_partial\\_sum\(\)](#).

**`__parallel_partition()`**

```
template<typename _RAIter, typename _Predicate>
std::iterator_traits< _RAIter >::difference_type __gnu_parallel::__parallel_partition (
    _RAIter __begin,
    _RAIter __end,
    _Predicate __pred,
    _ThreadIndex __num_threads)

```

Parallel implementation of `std::partition`.

**Parameters**

<code>__begin</code>	Begin iterator of input sequence to split.
<code>__end</code>	End iterator of input sequence to split.
<code>__pred</code>	Partition predicate, possibly including some kind of pivot.
<code>__num_threads</code>	Maximum number of threads to use for this task.

**Returns**

Number of elements not fulfilling the predicate.

References [\\_\\_compare\\_and\\_swap\(\)](#), [\\_\\_fetch\\_and\\_add\(\)](#), [\\_GLIBCXX\\_CALL](#), [\\_GLIBCXX\\_VOLATILE](#), [\\_\\_gnu\\_parallel::\\_Settings::get\(\)](#), [std::max\(\)](#), [\\_\\_gnu\\_parallel::\\_Settings::partition\\_chunk\\_share](#), and [\\_\\_gnu\\_parallel::\\_Settings::partition\\_chunk\\_size](#).

Referenced by [\\_\\_parallel\\_nth\\_element\(\)](#), [\\_\\_parallel\\_sort\\_qs\\_divide\(\)](#), and [\\_\\_qsb\\_divide\(\)](#).

**\_\_parallel\_random\_shuffle()**

```
template<typename _RAIter, typename _RandomNumberGenerator>
void __gnu_parallel::__parallel_random_shuffle (
    _RAIter __begin,
    _RAIter __end,
    _RandomNumberGenerator __rng = _RandomNumber() ) [inline]
```

Parallel random public call.

**Parameters**

<code>__begin</code>	Begin iterator of sequence.
<code>__end</code>	End iterator of sequence.
<code>__rng</code>	Random number generator to use.

References [\\_\\_parallel\\_random\\_shuffle\\_drs\(\)](#).

**\_\_parallel\_random\_shuffle\_drs()**

```
template<typename _RAIter, typename _RandomNumberGenerator>
void __gnu_parallel::__parallel_random_shuffle_drs (
    _RAIter __begin,
    _RAIter __end,
    typename std::iterator_traits< _RAIter >::difference_type __n,
    _ThreadIndex __num_threads,
    _RandomNumberGenerator & __rng)
```

Main parallel random shuffle step.

**Parameters**

<code>__begin</code>	Begin iterator of sequence.
<code>__end</code>	End iterator of sequence.
<code>__n</code>	Length of sequence.
<code>__num_threads</code>	Number of threads to use.
<code>__rng</code>	Random number generator to use.

References [\\_\\_gnu\\_parallel::\\_\\_DRSSorterPU< \\_RAIter, \\_RandomNumberGenerator >::\\_\\_bins\\_end](#), [\\_\\_parallel\\_random\\_shuffle\\_drs\\_pu\(\)](#), [\\_\\_rd\\_log2\(\)](#), [\\_\\_round\\_up\\_to\\_pow2\(\)](#), [\\_\\_sequential\\_random\\_shuffle\(\)](#), [\\_GLIBCXX\\_CALL](#), [\\_\\_gnu\\_parallel::\\_\\_DRandomShufflingGlobalData](#), [\\_\\_gnu\\_parallel::\\_\\_DRSSorterPU< \\_RAIter, \\_RandomNumberGenerator >::\\_\\_M\\_bins\\_begin](#), [\\_\\_gnu\\_parallel::\\_\\_DRandomShufflingGlobalData](#), [\\_\\_gnu\\_parallel::\\_\\_DRandomShufflingGlobalData< \\_RAIter >::\\_\\_M\\_num\\_bins](#), [\\_\\_gnu\\_parallel::\\_\\_DRandomShufflingGlobalData< \\_RAIter >::\\_\\_M\\_num\\_threads](#), [\\_\\_gnu\\_parallel::\\_\\_DRSSorterPU< \\_RAIter, \\_RandomNumberGenerator >::\\_\\_M\\_seed](#), [\\_\\_gnu\\_parallel::\\_\\_DRandomShufflingGlobalData< \\_RAIter >::\\_\\_M\\_temporaries](#), [\\_\\_gnu\\_parallel::\\_\\_Settings::get\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_Settings::L2\\_cache\\_size](#), [std::max\(\)](#), [std::numeric\\_limits< \\_Tp >::max\(\)](#), [std::min\(\)](#), and [\\_\\_gnu\\_parallel::\\_\\_Settings::TLB](#).

Referenced by [\\_\\_parallel\\_random\\_shuffle\(\)](#).

**\_\_parallel\_random\_shuffle\_drs\_pu()**

```
template<typename _RAIter, typename _RandomNumberGenerator>
void __gnu_parallel::__parallel_random_shuffle_drs_pu (
    _DRSSorterPU< _RAIter, _RandomNumberGenerator > * __pus)
```

Random shuffle code executed by each thread.

## Parameters

<code>__pus</code>	Array of thread-local data records.
--------------------	-------------------------------------

References [\\_\\_random\\_number\\_pow2\(\)](#), [\\_\\_sequential\\_random\\_shuffle\(\)](#), [\\_\\_gnu\\_parallel::\\_DRandomShufflingGlobalData<\\_RAIter>::M](#), [\\_\\_gnu\\_parallel::\\_DRSSorterPU<\\_RAIter, \\_RandomNumberGenerator>::M\\_bins\\_begin](#), [\\_\\_gnu\\_parallel::\\_DRandomShufflingGlobalData<\\_RAIter>::M\\_num\\_bins](#), [\\_\\_gnu\\_parallel::\\_DRandomShufflingGlobalData<\\_RAIter>::M\\_num\\_threads](#), [\\_\\_gnu\\_parallel::\\_DRSSorterPU<\\_RAIter, \\_RandomNumberGenerator>::M\\_num\\_threads](#), [\\_\\_gnu\\_parallel::\\_DRSSorterPU<\\_RAIter, \\_RandomNumberGenerator>::M\\_seed](#), [\\_\\_gnu\\_parallel::\\_DRandomShufflingGlobalData<\\_RAIter>::M\\_starts](#), [\\_\\_gnu\\_parallel::\\_DRandomShufflingGlobalData<\\_RAIter>::M](#) and [std::partial\\_sum\(\)](#).

Referenced by [\\_\\_parallel\\_random\\_shuffle\\_drs\(\)](#).

**`__parallel_sort()`** [1/7]

```
template<bool __stable, typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort (
    _RAIter __begin,
    _RAIter __end,
    _Compare __comp,
    balanced_quicksort_tag __parallelism) [inline]
```

Choose balanced quicksort for parallel sorting.

## Parameters

<code>__begin</code>	Begin iterator of input sequence.
<code>__end</code>	End iterator of input sequence.
<code>__comp</code>	Comparator.

## Template Parameters

<code>__stable</code>	Sort stable.
-----------------------	--------------

References [\\_\\_gnu\\_parallel::parallel\\_tag::get\\_num\\_threads\(\)](#), [\\_\\_parallel\\_sort\\_qsb\(\)](#), and [\\_GLIBCXX\\_CALL](#).

Here is the call graph for this function:

**`__parallel_sort()`** [2/7]

```
template<bool __stable, typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort (
```

```

    _RAIter __begin,
    _RAIter __end,
    _Compare __comp,
    default_parallel_tag __parallelism) [inline]

```

Choose multiway mergesort with exact splitting, for parallel sorting.

#### Parameters

<code>__begin</code>	Begin iterator of input sequence.
<code>__end</code>	End iterator of input sequence.
<code>__comp</code>	Comparator.

#### Template Parameters

<code>__stable</code>	Sort stable.
-----------------------	--------------

References [\\_\\_gnu\\_parallel::parallel\\_tag::\\_\\_get\\_num\\_threads\(\)](#), and [\\_GLIBCXX\\_CALL](#).

Here is the call graph for this function:

#### **`__parallel_sort()`** [3/7]

```

template<bool __stable, typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort (
    _RAIter __begin,
    _RAIter __end,
    _Compare __comp,
    multiway_mergesort_exact_tag __parallelism) [inline]

```

Choose multiway mergesort with exact splitting, for parallel sorting.

#### Parameters

<code>__begin</code>	Begin iterator of input sequence.
<code>__end</code>	End iterator of input sequence.
<code>__comp</code>	Comparator.

#### Template Parameters

<code>__stable</code>	Sort stable.
-----------------------	--------------

References [\\_\\_gnu\\_parallel::parallel\\_tag::\\_\\_get\\_num\\_threads\(\)](#), [\\_GLIBCXX\\_CALL](#), and [parallel\\_sort\\_mwms\(\)](#).  
Here is the call graph for this function:

### **\_\_parallel\_sort()** [4/7]

```

template<bool __stable, typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort (
    _RAIter __begin,
    _RAIter __end,
    _Compare __comp,
    multiway_mergesort_sampling_tag __parallelism) [inline]

```

Choose multiway mergesort with splitting by sampling, for parallel sorting.

#### Parameters

<code>__begin</code>	Begin iterator of input sequence.
<code>__end</code>	End iterator of input sequence.
<code>__comp</code>	Comparator.

#### Template Parameters

<code>__stable</code>	Sort stable.
-----------------------	--------------

References [\\_\\_gnu\\_parallel::parallel\\_tag::\\_\\_get\\_num\\_threads\(\)](#), [\\_GLIBCXX\\_CALL](#), and [parallel\\_sort\\_mwms\(\)](#).  
Here is the call graph for this function:

**\_\_parallel\_sort()** [5/7]

```
template<bool __stable, typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort (
    _RAIter __begin,
    _RAIter __end,
    _Compare __comp,
    multiway_mergesort_tag __parallelism) [inline]
```

Choose multiway mergesort, splitting variant at run-time, for parallel sorting.

**Parameters**

<code>__begin</code>	Begin iterator of input sequence.
<code>__end</code>	End iterator of input sequence.
<code>__comp</code>	Comparator.

**Template Parameters**

<code>__stable</code>	Sort stable.
-----------------------	--------------

References [\\_\\_gnu\\_parallel::parallel\\_tag::\\_\\_get\\_num\\_threads\(\)](#), [\\_GLIBCXX\\_CALL](#), [\\_\\_gnu\\_parallel::\\_Settings::get\(\)](#), and [parallel\\_sort\\_mwms\(\)](#).

Here is the call graph for this function:

**\_\_parallel\_sort()** [6/7]

```
template<bool __stable, typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort (
    _RAIter __begin,
    _RAIter __end,
    _Compare __comp,
    parallel_tag __parallelism) [inline]
```

Choose a parallel sorting algorithm.

**Parameters**

<code>__begin</code>	Begin iterator of input sequence.
<code>__end</code>	End iterator of input sequence.
<code>__comp</code>	Comparator.

## Template Parameters

<code>__stable</code>	Sort stable.
-----------------------	--------------

References [\\_\\_gnu\\_parallel::parallel\\_tag::\\_\\_get\\_num\\_threads\(\)](#), [\\_\\_parallel\\_sort\\_qs\(\)](#), [\\_\\_parallel\\_sort\\_qsb\(\)](#), [\\_GLIBCXX\\_CALL](#), [\\_\\_gnu\\_parallel::\\_Settings::get\(\)](#), and [parallel\\_sort\\_mwms\(\)](#).

Here is the call graph for this function:

**`__parallel_sort()`** [7/7]

```

template<bool __stable, typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort (
    _RAIter __begin,
    _RAIter __end,
    _Compare __comp,
    quicksort_tag __parallelism) [inline]

```

Choose quicksort for parallel sorting.

## Parameters

<code>__begin</code>	Begin iterator of input sequence.
<code>__end</code>	End iterator of input sequence.
<code>__comp</code>	Comparator.

## Template Parameters

<code>__stable</code>	Sort stable.
-----------------------	--------------

References [\\_\\_gnu\\_parallel::parallel\\_tag::\\_\\_get\\_num\\_threads\(\)](#), [\\_\\_parallel\\_sort\\_qs\(\)](#), and [\\_GLIBCXX\\_CALL](#).

Here is the call graph for this function:

### **\_\_parallel\_sort\_qs()**

```

template<typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort_qs (
    _RAIter __begin,
    _RAIter __end,
    _Compare __comp,
    _ThreadIndex __num_threads)

```

Unbalanced quicksort main call.

#### Parameters

<code>__begin</code>	Begin iterator of input sequence.
<code>__end</code>	End iterator input sequence, ignored.
<code>__comp</code>	Comparator.
<code>__num_threads</code>	Number of threads that are allowed to work on this part.

References [\\_\\_parallel\\_sort\\_qs\\_conquer\(\)](#), and [\\_GLIBCXX\\_CALL](#).

Referenced by [\\_\\_parallel\\_sort\(\)](#), and [\\_\\_parallel\\_sort\(\)](#).

### **\_\_parallel\_sort\_qs\_conquer()**

```

template<typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort_qs_conquer (
    _RAIter __begin,
    _RAIter __end,
    _Compare __comp,
    _ThreadIndex __num_threads)

```

Unbalanced quicksort conquer step.

#### Parameters

<code>__begin</code>	Begin iterator of subsequence.
<code>__end</code>	End iterator of subsequence.
<code>__comp</code>	Comparator.
<code>__num_threads</code>	Number of threads that are allowed to work on this part.

References [\\_\\_parallel\\_sort\\_qs\\_conquer\(\)](#), [\\_\\_parallel\\_sort\\_qs\\_divide\(\)](#), and [\\_\\_gnu\\_parallel::\\_\\_Settings::get\(\)](#).

Referenced by [\\_\\_parallel\\_sort\\_qs\(\)](#), and [\\_\\_parallel\\_sort\\_qs\\_conquer\(\)](#).

**`__parallel_sort_qs_divide()`**

```
template<typename _RAIter, typename _Compare>
std::iterator_traits< _RAIter >::difference_type __gnu_parallel::__parallel_sort_qs_divide (
    _RAIter __begin,
    _RAIter __end,
    _Compare __comp,
    typename std::iterator_traits< _RAIter >::difference_type __pivot_rank,
    typename std::iterator_traits< _RAIter >::difference_type __num_samples,
    _ThreadIndex __num_threads)
```

Unbalanced quicksort divide step.

**Parameters**

<code>__begin</code>	Begin iterator of subsequence.
<code>__end</code>	End iterator of subsequence.
<code>__comp</code>	Comparator.
<code>__pivot_rank</code>	Desired <code>__rank</code> of the pivot.
<code>__num_samples</code>	Choose pivot from that many samples.
<code>__num_threads</code>	Number of threads that are allowed to work on this part.

References [\\_\\_parallel\\_partition\(\)](#), and [std::min\(\)](#).

Referenced by [\\_\\_parallel\\_sort\\_qs\\_conquer\(\)](#).

**`__parallel_sort_qsb()`**

```
template<typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort_qsb (
    _RAIter __begin,
    _RAIter __end,
    _Compare __comp,
    _ThreadIndex __num_threads)
```

Top-level quicksort routine.

**Parameters**

<code>__begin</code>	Begin iterator of sequence.
<code>__end</code>	End iterator of sequence.
<code>__comp</code>	Comparator.
<code>__num_threads</code>	Number of threads that are allowed to work on this part.

References [\\_\\_qsb\\_conquer\(\)](#), [\\_\\_rd\\_log2\(\)](#), [\\_GLIBCXX\\_CALL](#), and [std::make\\_pair\(\)](#).

Referenced by [\\_\\_parallel\\_sort\(\)](#), and [\\_\\_parallel\\_sort\(\)](#).

**`__parallel_unique_copy()` [1/2]**

```
template<typename _IIter, class _OutputIterator>
_OutputIterator __gnu_parallel::__parallel_unique_copy (
    _IIter __first,
    _IIter __last,
    _OutputIterator __result) [inline]
```

Parallel `std::unique_copy()`, without explicit equality predicate.

## Parameters

<code>__first</code>	Begin iterator of input sequence.
<code>__last</code>	End iterator of input sequence.
<code>__result</code>	Begin iterator of result <code>__sequence</code> .

## Returns

End iterator of result `__sequence`.

References [\\_\\_parallel\\_unique\\_copy\(\)](#).

**`__parallel_unique_copy()`** [2/2]

```
template<typename _IIter, class _OutputIterator, class _BinaryPredicate>
_OutputIterator __gnu_parallel::__parallel_unique_copy (
    _IIter __first,
    _IIter __last,
    _OutputIterator __result,
    _BinaryPredicate __binary_pred)
```

Parallel `std::unique_copy()`, w/ `__o` explicit equality predicate.

## Parameters

<code>__first</code>	Begin iterator of input sequence.
<code>__last</code>	End iterator of input sequence.
<code>__result</code>	Begin iterator of result <code>__sequence</code> .
<code>__binary_pred</code>	Equality predicate.

## Returns

End iterator of result `__sequence`.

References [\\_\\_equally\\_split\(\)](#), and [\\_GLIBCXX\\_CALL](#).

Referenced by [\\_\\_parallel\\_unique\\_copy\(\)](#).

**`__qsb_conquer()`**

```
template<typename _RAIter, typename _Compare>
void __gnu_parallel::__qsb_conquer (
    _QSBThreadLocal< _RAIter > ** __tls,
    _RAIter __begin,
    _RAIter __end,
    _Compare __comp,
    _ThreadIndex __iam,
    _ThreadIndex __num_threads,
    bool __parent_wait)
```

Quicksort conquer step.

## Parameters

<code>__tls</code>	Array of thread-local storages.
<code>__begin</code>	Begin iterator of subsequence.

## Parameters

<code>__end</code>	End iterator of subsequence.
<code>__comp</code>	Comparator.
<code>__iam</code>	Number of the thread processing this function.
<code>__num_threads</code>	Number of threads that are allowed to work on this part.

References [\\_\\_qsb\\_conquer\(\)](#), [\\_\\_qsb\\_divide\(\)](#), [\\_\\_qsb\\_local\\_sort\\_with\\_helping\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_QSBThreadLocal<\\_RAIter>::\\_\\_M\\_elements\\_leftover](#), [\\_\\_gnu\\_parallel::\\_\\_QSBThreadLocal<\\_RAIter>::\\_\\_M\\_initial](#), [std::max\(\)](#), and [std::min\(\)](#).

Referenced by [\\_\\_parallel\\_sort\\_qsb\(\)](#), and [\\_\\_qsb\\_conquer\(\)](#).

**`__qsb_divide()`**

```
template<typename _RAIter, typename _Compare>
std::iterator_traits<_RAIter>::difference_type __gnu_parallel::__qsb_divide (
    _RAIter __begin,
    _RAIter __end,
    _Compare __comp,
    _ThreadIndex __num_threads)
```

Balanced quicksort divide step.

## Parameters

<code>__begin</code>	Begin iterator of subsequence.
<code>__end</code>	End iterator of subsequence.
<code>__comp</code>	Comparator.
<code>__num_threads</code>	Number of threads that are allowed to work on this part.

## Precondition

`(__end-__begin)>=1`

References [\\_\\_median\\_of\\_three\\_iterators\(\)](#), and [\\_\\_parallel\\_partition\(\)](#).

Referenced by [\\_\\_qsb\\_conquer\(\)](#).

**`__qsb_local_sort_with_helping()`**

```
template<typename _RAIter, typename _Compare>
void __gnu_parallel::__qsb_local_sort_with_helping (
    _QSBThreadLocal<_RAIter> ** __tls,
    _Compare & __comp,
    _ThreadIndex __iam,
    bool __wait)
```

Quicksort step doing load-balanced local sort.

## Parameters

<code>__tls</code>	Array of thread-local storages.
<code>__comp</code>	Comparator.
<code>__iam</code>	Number of the thread processing this function.

References [\\_\\_yield\(\)](#), [\\_GLIBCXX\\_PARALLEL\\_ASSERTIONS](#), [\\_\\_gnu\\_parallel::\\_\\_QSBThreadLocal<\\_RAIter>::\\_\\_M\\_elements\\_leftover](#), [\\_\\_gnu\\_parallel::\\_\\_QSBThreadLocal<\\_RAIter>::\\_\\_M\\_initial](#), [\\_\\_gnu\\_parallel::\\_\\_QSBThreadLocal<\\_RAIter>::\\_\\_M\\_leftover\\_parts](#),

[\\_\\_gnu\\_parallel::\\_\\_QSBThreadLocal<\\_RAIter>::\\_\\_M\\_num\\_threads](#), [\\_\\_gnu\\_parallel::\\_Settings::get\(\)](#), [std::make\\_pair\(\)](#), and [\\_\\_gnu\\_parallel::\\_Settings::sort\\_qsb\\_base\\_case\\_maximal\\_n](#).  
Referenced by [\\_\\_qsb\\_conquer\(\)](#).

### **`__random_number_pow2()`**

```
template<typename _RandomNumberGenerator>
int __gnu_parallel::__random_number_pow2 (
    int __logp,
    _RandomNumberGenerator & __rng) [inline]
```

Generate a random number in  $[0, 2^{\text{__logp}})$ .

#### **Parameters**

<code>__logp</code>	Logarithm (basis 2) of the upper range <code>__bound</code> .
<code>__rng</code>	Random number generator to use.

Referenced by [\\_\\_parallel\\_random\\_shuffle\\_drs\\_pu\(\)](#), and [\\_\\_sequential\\_random\\_shuffle\(\)](#).

### **`__rd_log2()`**

```
template<typename _Size>
_Size __gnu_parallel::__rd_log2 (
    _Size __n) [inline]
```

Calculates the rounded-down logarithm of `__n` for base 2.

#### **Parameters**

<code>__n</code>	Argument.
------------------	-----------

#### **Returns**

Returns 0 for any argument  $< 1$ .

Referenced by [\\_\\_gnu\\_parallel::\\_LoserTreeBase<\\_Tp, \\_Compare>::\\_LoserTreeBase\(\)](#), [\\_\\_parallel\\_random\\_shuffle\\_drs\(\)](#), [\\_\\_parallel\\_sort\\_qsb\(\)](#), [\\_\\_round\\_up\\_to\\_pow2\(\)](#), [\\_\\_sequential\\_random\\_shuffle\(\)](#), [multiseq\\_partition\(\)](#), and [multiseq\\_selection\(\)](#).

### **`__round_up_to_pow2()`**

```
template<typename _Tp>
_Tp __gnu_parallel::__round_up_to_pow2 (
    _Tp __x)
```

Round up to the next greater power of 2.

#### **Parameters**

<code>__x</code>	Integer to round up
------------------	---------------------

References [\\_\\_rd\\_log2\(\)](#).

Referenced by [\\_\\_parallel\\_random\\_shuffle\\_drs\(\)](#), [\\_\\_sequential\\_random\\_shuffle\(\)](#), and [multiseq\\_selection\(\)](#).

**`__search_template()`**

```
template<typename __RAIter1, typename __RAIter2, typename _Pred>
__RAIter1 __gnu_parallel::__search_template (
    __RAIter1 __begin1,
    __RAIter1 __end1,
    __RAIter2 __begin2,
    __RAIter2 __end2,
    _Pred __pred)
```

Parallel `std::search`.

**Parameters**

<code>__begin1</code>	Begin iterator of first sequence.
<code>__end1</code>	End iterator of first sequence.
<code>__begin2</code>	Begin iterator of second sequence.
<code>__end2</code>	End iterator of second sequence.
<code>__pred</code>	Find predicate.

**Returns**

Place of finding in first sequences.

References [\\_\\_calc\\_borders\(\)](#), [\\_\\_equally\\_split\(\)](#), [\\_GLIBCXX\\_CALL](#), [std::max\(\)](#), and [std::min\(\)](#).

**`__sequential_multiway_merge()`**

```
template<bool __stable, bool __sentinels, typename _RAIterIterator, typename _RAIter3, typename ↵
_DifferenceTp, typename _Compare>
_RAIter3 __gnu_parallel::__sequential_multiway_merge (
    _RAIterIterator __seqs_begin,
    _RAIterIterator __seqs_end,
    _RAIter3 __target,
    const typename std::iterator_traits< typename std::iterator_traits< _RAIterIterator
>::value_type::first_type >::value_type & __sentinel,
    _DifferenceTp __length,
    _Compare __comp)
```

Sequential multi-way merging switch.

The `_GLIBCXX_PARALLEL_DECISION` is based on the branching factor and runtime settings.

**Parameters**

<code>__seqs_begin</code>	Begin iterator of iterator pair input sequence.
<code>__seqs_end</code>	End iterator of iterator pair input sequence.
<code>__target</code>	Begin iterator of output sequence.
<code>__comp</code>	Comparator.
<code>__length</code>	Maximum length to merge, possibly larger than the number of elements available.
<code>__sentinel</code>	The sequences have <code>__a</code> <code>__sentinel</code> element.

**Returns**

End iterator of output sequence.

References [\\_\\_is\\_sorted\(\)](#), [\\_\\_merge\\_advance\(\)](#), [\\_GLIBCXX\\_CALL](#), [\\_GLIBCXX\\_PARALLEL\\_LENGTH](#), and [std::min\(\)](#).  
Referenced by [multiway\\_merge\(\)](#), [multiway\\_merge\\_sentinels\(\)](#), and [parallel\\_multiway\\_merge\(\)](#).

**\_\_sequential\_random\_shuffle()**

```
template<typename _RAIter, typename _RandomNumberGenerator>
void __gnu_parallel::__sequential_random_shuffle (
    _RAIter __begin,
    _RAIter __end,
    _RandomNumberGenerator & __rng)
```

Sequential cache-efficient random shuffle.

**Parameters**

<code>__begin</code>	Begin iterator of sequence.
<code>__end</code>	End iterator of sequence.
<code>__rng</code>	Random number generator to use.

References [\\_\\_random\\_number\\_pow2\(\)](#), [\\_\\_rd\\_log2\(\)](#), [\\_\\_round\\_up\\_to\\_pow2\(\)](#), [\\_\\_sequential\\_random\\_shuffle\(\)](#), [\\_\\_gnu\\_parallel::\\_Settings::get\(\)](#), [\\_\\_gnu\\_parallel::\\_Settings::L2\\_cache\\_size](#), [std::max\(\)](#), [std::min\(\)](#), [std::partial\\_sum\(\)](#), and [\\_\\_gnu\\_parallel::\\_Settings::TLB\\_size](#).

Referenced by [\\_\\_parallel\\_random\\_shuffle\\_drs\(\)](#), [\\_\\_parallel\\_random\\_shuffle\\_drs\\_pu\(\)](#), and [\\_\\_sequential\\_random\\_shuffle\(\)](#).

**\_\_shrink()**

```
template<typename _IIter>
void __gnu_parallel::__shrink (
    std::vector<_IIter> & __os_starts,
    size_t & __count_to_two,
    size_t & __range_length)
```

Combines two ranges into one and thus halves the number of ranges.

**Parameters**

<code>__os_starts</code>	Start positions worked on (oversampled).
<code>__count_to_two</code>	Counts up to 2.
<code>__range_length</code>	Current length of a chunk.

References [std::vector<\\_Tp, \\_Alloc>::size\(\)](#).

Referenced by [\\_\\_shrink\\_and\\_double\(\)](#).

**\_\_shrink\_and\_double()**

```
template<typename _IIter>
void __gnu_parallel::__shrink_and_double (
    std::vector<_IIter> & __os_starts,
    size_t & __count_to_two,
    size_t & __range_length,
    const bool __make_twice)
```

Shrinks and doubles the ranges.

**Parameters**

<code>__os_starts</code>	Start positions worked on (oversampled).
<code>__count_to_two</code>	Counts up to 2.
<code>__range_length</code>	Current length of a chunk.

<code>__make_twice</code>	Whether the <code>__os_starts</code> is allowed to be grown or not
---------------------------	--

References [\\_\\_shrink\(\)](#), [std::vector<\\_Tp, \\_Alloc >::resize\(\)](#), and [std::vector<\\_Tp, \\_Alloc >::size\(\)](#).  
Referenced by [list\\_partition\(\)](#).

### `__yield()`

```
void __gnu_parallel::__yield () [inline]
```

Yield control to another thread, without waiting for the end of the time slice.

Referenced by [\\_\\_for\\_each\\_template\\_random\\_access\\_workstealing\(\)](#), and [\\_\\_qsb\\_local\\_sort\\_with\\_helping\(\)](#).

### `list_partition()`

```
template<typename _IIter, typename _FunctorType>
size_t __gnu_parallel::list_partition (
    const _IIter __begin,
    const _IIter __end,
    _IIter * __starts,
    size_t * __lengths,
    const int __num_parts,
    _FunctorType & __f,
    int __oversampling = 0)
```

Splits a sequence given by input iterators into parts of almost equal size.

The function needs only one pass over the sequence.

#### Parameters

<code>__begin</code>	Begin iterator of input sequence.
<code>__end</code>	End iterator of input sequence.
<code>__starts</code>	Start iterators for the resulting parts, dimension <code>__num_parts+1</code> . For convenience, <code>__starts[__num_parts]</code> contains the end iterator of the sequence.
<code>__lengths</code>	Length of the resulting parts.
<code>__num_parts</code>	Number of parts to split the sequence into.
<code>__f</code>	Functor to be applied to each element by traversing <code>__it</code>
<code>__oversampling</code>	Oversampling factor. If 0, then the partitions will differ in at most $\sqrt{\text{end} - \text{begin}}$ elements. Otherwise, the ratio between the longest and the shortest part is bounded by $1/(\text{oversampling} \cdot \text{num\_parts})$

#### Returns

Length of the whole sequence.

References [\\_\\_shrink\\_and\\_double\(\)](#), and [std::vector<\\_Tp, \\_Alloc >::size\(\)](#).

### `max()`

```
template<typename _Tp>
const _Tp & __gnu_parallel::max (
    const _Tp & __a,
    const _Tp & __b) [inline]
```

Equivalent to `std::max`.

Referenced by [\\_\\_for\\_each\\_template\\_random\\_access\\_workstealing\(\)](#).

**min()**

```
template<typename _Tp>
const _Tp & __gnu_parallel::min (
    const _Tp & __a,
    const _Tp & __b) [inline]
```

Equivalent to `std::min`.

Referenced by [\\_\\_for\\_each\\_template\\_random\\_access\\_ed\(\)](#), [\\_\\_for\\_each\\_template\\_random\\_access\\_omp\\_loop\(\)](#), and [\\_\\_for\\_each\\_template\\_random\\_access\\_workstealing\(\)](#).

**multiseq\_partition()**

```
template<typename _RanSeqs, typename _RankType, typename _RankIterator, typename _Compare>
void __gnu_parallel::multiseq_partition (
    _RanSeqs __begin_seqs,
    _RanSeqs __end_seqs,
    _RankType __rank,
    _RankIterator __begin_offsets,
    _Compare __comp = std::less< typename std::iterator_traits<typename _RanSeqs>::value_type:: first_type>::value_type>())
```

Splits several sorted sequences at a certain global `__rank`, resulting in a splitting point for each sequence. The sequences are passed via a sequence of random-access iterator pairs, none of the sequences may be empty. If there are several equal elements across the split, the ones on the `__left` side will be chosen from sequences with smaller number.

**Parameters**

<code>__begin_seqs</code>	Begin of the sequence of iterator pairs.
<code>__end_seqs</code>	End of the sequence of iterator pairs.
<code>__rank</code>	The global rank to partition at.
<code>__begin_offsets</code>	A random-access <code>__sequence</code> <code>__begin</code> where the <code>__result</code> will be stored in. Each element of the sequence is an iterator that points to the first element on the greater part of the respective <code>__sequence</code> .
<code>__comp</code>	The ordering functor, defaults to <code>std::less&lt;_Tp&gt;</code> .

References [\\_\\_rd\\_log2\(\)](#), [\\_GLIBCXX\\_CALL](#), [std::distance\(\)](#), [std::priority\\_queue<\\_Tp, \\_Sequence, \\_Compare >::empty\(\)](#), [std::make\\_pair\(\)](#), [std::max\(\)](#), [std::min\(\)](#), [std::priority\\_queue<\\_Tp, \\_Sequence, \\_Compare >::pop\(\)](#), [std::priority\\_queue<\\_Tp, \\_Sequence, \\_Compare >::top\(\)](#).

Referenced by [multiway\\_merge\\_exact\\_splitting\(\)](#).

**multiseq\_selection()**

```
template<typename _Tp, typename _RanSeqs, typename _RankType, typename _Compare>
_Tp __gnu_parallel::multiseq_selection (
    _RanSeqs __begin_seqs,
    _RanSeqs __end_seqs,
    _RankType __rank,
    _RankType & __offset,
    _Compare __comp = std::less<_Tp>())
```

Selects the element at a certain global `__rank` from several sorted sequences.

The sequences are passed via a sequence of random-access iterator pairs, none of the sequences may be empty.

**Parameters**

<code>__begin_seqs</code>	Begin of the sequence of iterator pairs.
---------------------------	--

## Parameters

<code>__end_seqs</code>	End of the sequence of iterator pairs.
<code>__rank</code>	The global rank to partition at.
<code>__offset</code>	The rank of the selected element in the global subsequence of elements equal to the selected element. If the selected element is unique, this number is 0.
<code>__comp</code>	The ordering functor, defaults to <code>std::less</code> .

References [\\_\\_rd\\_log2\(\)](#), [\\_\\_round\\_up\\_to\\_pow2\(\)](#), [\\_GLIBCXX\\_CALL](#), [std::distance\(\)](#), [std::priority\\_queue<\\_Tp, \\_Sequence, \\_Compare>::std::make\\_pair\(\)](#), [std::max\(\)](#), [std::min\(\)](#), [std::priority\\_queue<\\_Tp, \\_Sequence, \\_Compare>::pop\(\)](#), [std::priority\\_queue<\\_Tp, \\_Sequence, \\_Compare>::top\(\)](#).

**multiway\_merge()**

```
template<typename _RAIterPairIterator, typename _RAIterOut, typename _DifferenceTp, typename _Compare>
_RAIterOut __gnu_parallel::multiway_merge (
    _RAIterPairIterator __seqs_begin,
    _RAIterPairIterator __seqs_end,
    _RAIterOut __target,
    _DifferenceTp __length,
    _Compare __comp,
    __gnu_parallel::sequential_tag )
```

## Multiway Merge Frontend.

Merge the sequences specified by `seqs_begin` and `__seqs_end` into `__target`. `__seqs_begin` and `__seqs_end` must point to a sequence of pairs. These pairs must contain an iterator to the beginning of a sequence in their first entry and an iterator the `_M_end` of the same sequence in their second entry.

Ties are broken arbitrarily. See `stable_multiway_merge` for a variant that breaks ties by sequence number but is slower.

The first entries of the pairs (i.e. the begin iterators) will be moved forward.

The output sequence has to provide enough space for all elements that are written to it.

This function will merge the input sequences:

- not stable
- parallel, depending on the input size and Settings
- using sampling for splitting
- not using sentinels

## Example:

```
int sequences[10][10];
for (int __i = 0; __i < 10; ++__i)
    for (int __j = 0; __j < 10; ++__j)
        sequences[__i][__j] = __j;

int __out[33];
std::vector<std::pair<int*> > seqs;
for (int __i = 0; __i < 10; ++__i)
    { seqs.push(std::make_pair<int*>(sequences[__i],
                                    sequences[__i] + 10)) }

multiway_merge(seqs.begin(), seqs.end(), __target, std::less<int>(), 33);
```

See also

`stable_multiway_merge`

#### Precondition

All input sequences must be sorted.

Target must provide enough space to merge out length elements or the number of elements in all sequences, whichever is smaller.

#### Postcondition

`[__target, return __value)` contains merged `__elements` from the input sequences.

`return __value - __target = min(__length, number of elements in all sequences).`

#### Template Parameters

<code>_RAIterPairIterator</code>	iterator over sequence of pairs of iterators
<code>_RAIterOut</code>	iterator over target sequence
<code>_DifferenceTp</code>	difference type for the sequence
<code>_Compare</code>	strict weak ordering type to compare elements in sequences

#### Parameters

<code>__seqs_begin</code>	<code>__begin</code> of sequence <code>__sequence</code>
<code>__seqs_end</code>	<code>_M_end</code> of sequence <code>__sequence</code>
<code>__target</code>	target sequence to merge to.
<code>__comp</code>	strict weak ordering to use for element comparison.
<code>__length</code>	Maximum length to merge, possibly larger than the number of elements available.

#### Returns

`_M_end` iterator of output sequence

References [\\_\\_sequential\\_multiway\\_merge\(\)](#), and [\\_GLIBCXX\\_CALL](#).

#### `multiway_merge_3_variant()`

```
template<template< typename _RAI, typename _Cp > class iterator, typename _RAIterIterator, typename
_RAIter3, typename _DifferenceTp, typename _Compare>
_RAIter3 __gnu_parallel::multiway_merge_3_variant (
    _RAIterIterator __seqs_begin,
    _RAIterIterator __seqs_end,
    _RAIter3 __target,
    _DifferenceTp __length,
    _Compare __comp)
```

Highly efficient 3-way merging procedure.

Merging is done with the algorithm implementation described by Peter Sanders. Basically, the idea is to minimize the number of necessary comparison after merging an element. The implementation trick that makes this fast is that the order of the sequences is stored in the instruction pointer (translated into labels in C++).

This works well for merging up to 4 sequences.

Note that making the merging stable does *not* come at a performance hit.

Whether the merging is done guarded or unguarded is selected by the used iterator class.

## Parameters

<code>__seqs_begin</code>	Begin iterator of iterator pair input sequence.
<code>__seqs_end</code>	End iterator of iterator pair input sequence.
<code>__target</code>	Begin iterator of output sequence.
<code>__comp</code>	Comparator.
<code>__length</code>	Maximum length to merge, less equal than the total number of elements available.

## Returns

End iterator of output sequence.

References [\\_GLIBCXX\\_CALL](#).

**multiway\_merge\_4\_variant()**

```
template<template< typename _RAI, typename _Cp > class iterator, typename _RAIterIterator, typename
_RAIter3, typename _DifferenceTp, typename _Compare>
_RAIter3 __gnu_parallel::multiway_merge_4_variant (
    _RAIterIterator __seqs_begin,
    _RAIterIterator __seqs_end,
    _RAIter3 __target,
    _DifferenceTp __length,
    _Compare __comp)
```

Highly efficient 4-way merging procedure.

Merging is done with the algorithm implementation described by Peter Sanders. Basically, the idea is to minimize the number of necessary comparison after merging an element. The implementation trick that makes this fast is that the order of the sequences is stored in the instruction pointer (translated into goto labels in C++).

This works well for merging up to 4 sequences.

Note that making the merging stable does *not* come at a performance hit.

Whether the merging is done guarded or unguarded is selected by the used iterator class.

## Parameters

<code>__seqs_begin</code>	Begin iterator of iterator pair input sequence.
<code>__seqs_end</code>	End iterator of iterator pair input sequence.
<code>__target</code>	Begin iterator of output sequence.
<code>__comp</code>	Comparator.
<code>__length</code>	Maximum length to merge, less equal than the total number of elements available.

## Returns

End iterator of output sequence.

References [\\_GLIBCXX\\_CALL](#).

**multiway\_merge\_exact\_splitting()**

```
template<bool __stable, typename _RAIterIterator, typename _Compare, typename _DifferenceType>
void __gnu_parallel::multiway_merge_exact_splitting (
    _RAIterIterator __seqs_begin,
    _RAIterIterator __seqs_end,
    _DifferenceType __length,
```

```

        _DifferenceType __total_length,
        _Compare __comp,
        std::vector< std::pair< _DifferenceType, _DifferenceType > > * __pieces)

```

Exact splitting for parallel multiway-merge routine.

None of the passed sequences may be empty.

References [\\_\\_equally\\_split\(\)](#), [\\_GLIBCXX\\_PARALLEL\\_LENGTH](#), [std::vector< \\_Tp, \\_Alloc >::begin\(\)](#), [std::vector< \\_Tp, \\_Alloc >::end\(\)](#), [multiseq\\_partition\(\)](#), and [std::vector< \\_Tp, \\_Alloc >::resize\(\)](#).

Referenced by [\\_\\_parallel\\_merge\\_advance\(\)](#).

### multiway\_merge\_loser\_tree()

```

template<typename _LT, typename _RAIterIterator, typename _RAIter3, typename _DifferenceTp, typename
_Compare>
_RAIter3 __gnu_parallel::multiway_merge_loser_tree (
    _RAIterIterator __seqs_begin,
    _RAIterIterator __seqs_end,
    _RAIter3 __target,
    _DifferenceTp __length,
    _Compare __comp)

```

Multi-way merging procedure for a high branching factor, guarded case.

This merging variant uses a `LoserTree` class as selected by `_LT`.

Stability is selected through the used `LoserTree` class `_LT`.

At least one non-empty sequence is required.

#### Parameters

<code>__seqs_begin</code>	Begin iterator of iterator pair input sequence.
<code>__seqs_end</code>	End iterator of iterator pair input sequence.
<code>__target</code>	Begin iterator of output sequence.
<code>__comp</code>	Comparator.
<code>__length</code>	Maximum length to merge, less equal than the total number of elements available.

#### Returns

End iterator of output sequence.

References [\\_GLIBCXX\\_CALL](#), and [\\_GLIBCXX\\_PARALLEL\\_LENGTH](#).

### multiway\_merge\_loser\_tree\_sentinel()

```

template<typename _UnguardedLoserTree, typename _RAIterIterator, typename _RAIter3, typename ↵
_DifferenceTp, typename _Compare>
_RAIter3 __gnu_parallel::multiway_merge_loser_tree_sentinel (
    _RAIterIterator __seqs_begin,
    _RAIterIterator __seqs_end,
    _RAIter3 __target,
    const typename std::iterator_traits< typename std::iterator_traits< _RAIterIterator
>::value_type::first_type >::value_type & __sentinel,
    _DifferenceTp __length,
    _Compare __comp)

```

Multi-way merging procedure for a high branching factor, requiring sentinels to exist.

## Template Parameters

<code>__UnguardedLoserTree</code>	Loser Tree variant to use for the unguarded merging.
-----------------------------------	--

## Parameters

<code>__seqs_begin</code>	Begin iterator of iterator pair input sequence.
<code>__seqs_end</code>	End iterator of iterator pair input sequence.
<code>__target</code>	Begin iterator of output sequence.
<code>__comp</code>	Comparator.
<code>__length</code>	Maximum length to merge, less equal than the total number of elements available.

## Returns

End iterator of output sequence.

References [\\_\\_is\\_sorted\(\)](#), [\\_GLIBCXX\\_CALL](#), and [multiway\\_merge\\_loser\\_tree\\_unguarded\(\)](#).

**multiway\_merge\_loser\_tree\_unguarded()**

```
template<typename _LT, typename _RAIterIterator, typename _RAIter3, typename _DifferenceTp, typename
_Compare>
_RAIter3 __gnu_parallel::multiway_merge_loser_tree_unguarded (
    _RAIterIterator __seqs_begin,
    _RAIterIterator __seqs_end,
    _RAIter3 __target,
    const typename std::iterator_traits< typename std::iterator_traits< _RAIterIterator
>::value_type::first_type >::value_type & __sentinel,
    _DifferenceTp __length,
    _Compare __comp)
```

Multi-way merging procedure for a high branching factor, unguarded case.

Merging is done using the `LoserTree` class `_LT`.

Stability is selected by the used `LoserTrees`.

## Precondition

No input will run out of elements during the merge.

## Parameters

<code>__seqs_begin</code>	Begin iterator of iterator pair input sequence.
<code>__seqs_end</code>	End iterator of iterator pair input sequence.
<code>__target</code>	Begin iterator of output sequence.
<code>__comp</code>	Comparator.
<code>__length</code>	Maximum length to merge, less equal than the total number of elements available.

## Returns

End iterator of output sequence.

References [\\_GLIBCXX\\_CALL](#).

Referenced by [multiway\\_merge\\_loser\\_tree\\_sentinel\(\)](#).

**multiway\_merge\_sampling\_splitting()**

```
template<bool __stable, typename _RAIterIterator, typename _Compare, typename _DifferenceType>
void __gnu_parallel::multiway_merge_sampling_splitting (
    _RAIterIterator __seqs_begin,
    _RAIterIterator __seqs_end,
    _DifferenceType __length,
    _DifferenceType __total_length,
    _Compare __comp,
    std::vector< std::pair< _DifferenceType, _DifferenceType > > * __pieces)
```

Sampling based splitting for parallel multiway-merge routine.

References [\\_GLIBCXX\\_PARALLEL\\_LENGTH](#), [\\_\\_gnu\\_parallel::\\_Settings::get\(\)](#), and [\\_\\_gnu\\_parallel::\\_Settings::merge\\_oversampling](#).

**multiway\_merge\_sentinels()**

```
template<typename _RAIterPairIterator, typename _RAIterOut, typename _DifferenceTp, typename _↔
Compare>
_RAIterOut __gnu_parallel::multiway_merge_sentinels (
    _RAIterPairIterator __seqs_begin,
    _RAIterPairIterator __seqs_end,
    _RAIterOut __target,
    _DifferenceTp __length,
    _Compare __comp,
    __gnu_parallel::sequential_tag )
```

Multiway Merge Frontend.

Merge the sequences specified by `seqs_begin` and `__seqs_end` into `__target`. `__seqs_begin` and `__seqs_end` must point to a sequence of pairs. These pairs must contain an iterator to the beginning of a sequence in their first entry and an iterator the `_M_end` of the same sequence in their second entry.

Ties are broken arbitrarily. See `stable_multiway_merge` for a variant that breaks ties by sequence number but is slower.

The first entries of the pairs (i.e. the begin iterators) will be moved forward accordingly.

The output sequence has to provide enough space for all elements that are written to it.

This function will merge the input sequences:

- not stable
- parallel, depending on the input size and Settings
- using sampling for splitting
- using sentinels

You have to take care that the element the `_M_end` iterator points to is readable and contains a value that is greater than any other non-sentinel value in all sequences.

Example:

```
int sequences[10][11];
for (int __i = 0; __i < 10; ++__i)
    for (int __j = 0; __j < 11; ++__j)
        sequences[__i][__j] = __j; // __last one is sentinel!

int __out[33];
std::vector<std::pair<int*> > seqs;
for (int __i = 0; __i < 10; ++__i)
    { seqs.push(std::make_pair<int*>(sequences[__i],
                                    sequences[__i] + 10)) }

multiway_merge(seqs.begin(), seqs.end(), __target, std::less<int>(), 33);
```

**Precondition**

All input sequences must be sorted.

Target must provide enough space to merge out length elements or the number of elements in all sequences, whichever is smaller.

For each `__i`, `__seqs_begin[__i].second` must be the end marker of the sequence, but also reference the one more `__sentinel` element.

**Postcondition**

`[__target, return __value)` contains merged `__elements` from the input sequences.

`return __value - __target = min(__length, number of elements in all sequences).`

**See also**

`stable_multiway_merge_sentinels`

**Template Parameters**

<code>_RAIterPairIterator</code>	iterator over sequence of pairs of iterators
<code>_RAIterOut</code>	iterator over target sequence
<code>_DifferenceTp</code>	difference type for the sequence
<code>_Compare</code>	strict weak ordering type to compare elements in sequences

**Parameters**

<code>__seqs_begin</code>	<code>__begin</code> of sequence <code>__sequence</code>
<code>__seqs_end</code>	<code>_M_end</code> of sequence <code>__sequence</code>
<code>__target</code>	target sequence to merge to.
<code>__comp</code>	strict weak ordering to use for element comparison.
<code>__length</code>	Maximum length to merge, possibly larger than the number of elements available.

**Returns**

`_M_end` iterator of output sequence

References [\\_\\_sequential\\_multiway\\_merge\(\)](#), and [\\_GLIBCXX\\_CALL](#).

**`parallel_multiway_merge()`**

```
template<bool __stable, bool __sentinels, typename _RAIterIterator, typename _RAIter3, typename ↵
_DifferenceTp, typename _Splitter, typename _Compare>
_RAIter3 __gnu_parallel::parallel_multiway_merge (
    _RAIterIterator __seqs_begin,
    _RAIterIterator __seqs_end,
    _RAIter3 __target,
    _Splitter __splitter,
    _DifferenceTp __length,
    _Compare __comp,
    _ThreadIndex __num_threads)
```

Parallel multi-way merge routine.

The `_GLIBCXX_PARALLEL_DECISION` is based on the branching factor and runtime settings.

Must not be called if the number of sequences is 1.

### Template Parameters

<code>_Splitter</code>	functor to split input (either <code>__exact</code> or sampling based)
<code>__stable</code>	Stable merging incurs a performance penalty.
<code>__sentinel</code>	Ignored.

### Parameters

<code>__seqs_begin</code>	Begin iterator of iterator pair input sequence.
<code>__seqs_end</code>	End iterator of iterator pair input sequence.
<code>__target</code>	Begin iterator of output sequence.
<code>__comp</code>	Comparator.
<code>__length</code>	Maximum length to merge, possibly larger than the number of elements available.

### Returns

End iterator of output sequence.

References [\\_\\_is\\_sorted\(\)](#), [\\_\\_sequential\\_multiway\\_merge\(\)](#), [\\_GLIBCXX\\_CALL](#), [\\_GLIBCXX\\_PARALLEL\\_LENGTH](#), [\\_\\_gnu\\_parallel::\\_Settings::get\(\)](#), [std::make\\_pair\(\)](#), [\\_\\_gnu\\_parallel::\\_Settings::merge\\_oversampling](#), and [std::min\(\)](#).

Referenced by [\\_\\_parallel\\_merge\\_advance\(\)](#).

### **parallel\_sort\_mwms()**

```
template<bool __stable, bool __exact, typename _RAIter, typename _Compare>
void __gnu_parallel::parallel_sort_mwms (
    _RAIter __begin,
    _RAIter __end,
    _Compare __comp,
    _ThreadIndex __num_threads)
```

PMWMS main call.

### Parameters

<code>__begin</code>	Begin iterator of sequence.
<code>__end</code>	End iterator of sequence.
<code>__comp</code>	Comparator.
<code>__num_threads</code>	Number of threads to use.

References [\\_GLIBCXX\\_CALL](#), [\\_\\_gnu\\_parallel::PMWMSortingData<\\_RAIter>::M\\_num\\_threads](#), [\\_\\_gnu\\_parallel::PMWMSortingData<\\_RAIter>::M\\_pieces](#), [\\_\\_gnu\\_parallel::PMWMSortingData<\\_RAIter>::M\\_samples](#), [\\_\\_gnu\\_parallel::PMWMSortingData<\\_RAIter>::M\\_source](#), [\\_\\_gnu\\_parallel::PMWMSortingData<\\_RAIter>::M\\_starts](#), [\\_\\_gnu\\_parallel::PMWMSortingData<\\_RAIter>::M\\_temporary](#), [\\_\\_gnu\\_parallel::\\_Settings::get\(\)](#), [parallel\\_sort\\_mwms\\_pu\(\)](#), and [\\_\\_gnu\\_parallel::\\_Settings::sort\\_mwms\\_oversampling](#).

Referenced by [\\_\\_parallel\\_sort\(\)](#), [\\_\\_parallel\\_sort\(\)](#), [\\_\\_parallel\\_sort\(\)](#), and [\\_\\_parallel\\_sort\(\)](#).

### **parallel\_sort\_mwms\_pu()**

```
template<bool __stable, bool __exact, typename _RAIter, typename _Compare>
void __gnu_parallel::parallel_sort_mwms_pu (
    _PMWMSortingData<_RAIter> * __sd,
    _Compare & __comp)
```

PMWMS code executed by each thread.

## Parameters

<code>__sd</code>	Pointer to algorithm data.
<code>__comp</code>	Comparator.

References [\\_\\_gnu\\_parallel::PMWMSortingData<\\_RAIter>::M\\_num\\_threads](#), [\\_\\_gnu\\_parallel::PMWMSortingData<\\_RAIter>::M\\_source](#), [\\_\\_gnu\\_parallel::PMWMSortingData<\\_RAIter>::M\\_starts](#), [\\_\\_gnu\\_parallel::PMWMSortingData<\\_RAIter>::M\\_temporary](#), [\\_\\_gnu\\_parallel::Settings::get\(\)](#), [std::make\\_pair\(\)](#), [\\_\\_gnu\\_parallel::Settings::sort\\_mwms\\_oversampling](#), and [std::uninitialized\\_copy\(\)](#).

### Variables

- `template<typename String, typename String::value_type Min_E_Val, typename String::value_type Max_E_Val, bool Reverse, typename ↵_Alloc>`  
`detail::integral_constant< int, Reverse > trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::s_rev_ind`

#### 4.7.1 Detailed Description

GNU extensions for policy-based data structures for public use.

## 4.8 `__gnu_sequential` Namespace Reference

### 4.8.1 Detailed Description

GNU sequential classes for public use.

## 4.9 `abi` Namespace Reference

### 4.9.1 Detailed Description

The cross-vendor C++ Application Binary Interface. A namespace alias to `__cxxabiv1`, but user programs should use the alias `'abi'`.

A brief overview of an ABI is given in the `libstdc++` FAQ, question 5.8 (you may have a copy of the FAQ locally, or you can view the online version at [http://gcc.gnu.org/onlinedocs/libstdc++/faq.html#5\\_8](http://gcc.gnu.org/onlinedocs/libstdc++/faq.html#5_8)).

GCC subscribes to a cross-vendor ABI for C++, sometimes called the IA64 ABI because it happens to be the native ABI for that platform. It is summarized at <http://www.codesourcery.com/cxx-abi/> along with the current specification.

For users of GCC greater than or equal to 3.x, entry points are available in `<cxxabi.h>`, which notes, *'It is not normally necessary for user programs to include this header, or use the entry points directly. However, this header is available should that be needed.'*

## 4.10 `std` Namespace Reference

### Standard Stream Objects

The `<iostream>` header declares the eight standard stream objects. For other declarations, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/io.html> and the [I/O forward declarations](#)

They are required by default to cooperate with the global C library's `FILE` streams, and to be available during program startup and termination. For more information, see the section of the manual linked to above.

- [istream](#) `cin`

### 4.10.1 Detailed Description

ISO C++ entities toplevel namespace is std.

### 4.10.2 Typedef Documentation

#### **\_\_ptr\_rebind**

```
template<typename _Ptr, typename _Tp>
using std::__ptr_rebind
```

Convenience alias for rebinding pointers.

#### **\_\_umap\_traits**

```
template<bool _Cache>
using std::__umap_traits
```

Base types for unordered\_map.

#### **\_\_ummap\_traits**

```
template<bool _Cache>
using std::__ummap_traits
```

Base types for unordered\_multimap.

#### **\_\_umset\_traits**

```
template<bool _Cache>
using std::__umset_traits
```

Base types for unordered\_multiset.

#### **\_\_uset\_traits**

```
template<bool _Cache>
using std::__uset_traits
```

Base types for unordered\_set.

#### **compare\_three\_way\_result\_t**

```
template<typename _Tp, typename _Up = _Tp>
using std::compare_three_way_result_t
```

[cmp.result], result of three-way comparison

#### **index\_sequence**

```
template<size_t... _Idx>
using std::index_sequence
```

Alias template index\_sequence.

#### **index\_sequence\_for**

```
template<typename... _Types>
using std::index_sequence_for
```

Alias template index\_sequence\_for.

**iter\_rvalue\_reference\_t**

```
template<__detail::__dereferenceable _Tp>
using std::iter\_rvalue\_reference\_t
The result type of ranges::iter_move(std::declval<_Tp&>())
```

**make\_index\_sequence**

```
template<size_t _Num>
using std::make\_index\_sequence
Alias template make_index_sequence.
```

**make\_integer\_sequence**

```
template<typename _Tp, _Tp _Num>
using std::make\_integer\_sequence
Alias template make_integer_sequence.
```

**new\_handler**

```
typedef void(* std::new\_handler) ()
If you write your own error handler to be called by new, it must be of this type.
```

**projected**

```
template<indirectly_readable _Iter, indirectly_regular_unary_invocable< _Iter > _Proj>
using std::projected
[projected], projected
```

**streamoff**

```
typedef long long std::streamoff
Type used by fpos, char_traits<char>, and char_traits<wchar_t>.
In clauses 21.1.3.1 and 27.4.1 streamoff is described as an implementation defined type. Note: In versions of GCC up to and including GCC 3.3, streamoff was typedef long.
```

**streampos**

```
typedef fpos<mbstate\_t> std::streampos
File position for char streams.
```

**streamsize**

```
typedef ptrdiff_t std::streamsize
Integral type for I/O operation counts and buffer sizes.
```

**u16streampos**

```
typedef fpos<mbstate\_t> std::u16streampos
File position for char16_t streams.
```

**u32streampos**

```
typedef fpos<mbstate\_t> std::u32streampos
File position for char32_t streams.
```

**wstreampos**

```
typedef fpos<mbstate_t> std::wstreampos
```

File position for wchar\_t streams.

**4.10.3 Enumeration Type Documentation****chars\_format**

```
enum class std::chars_format [strong]
```

floating-point format for primitive numerical conversion

**float\_denorm\_style**

```
enum std::float_denorm_style
```

Describes the denormalization for floating-point types.

These values represent the presence or absence of a variable number of exponent bits. This type is used in the std::numeric\_limits class.

**Enumerator**

denorm_indeterminate	Indeterminate at compile time whether denormalized values are allowed.
denorm_absent	The type does not allow denormalized values.
denorm_present	The type allows denormalized values.

**float\_round\_style**

```
enum std::float_round_style
```

Describes the rounding style for floating-point types.

This is used in the std::numeric\_limits class.

**Enumerator**

round_indeterminate	Intermediate.
round_toward_zero	To zero.
round_to_nearest	To the nearest representable value.
round_toward_infinity	To infinity.
round_toward_neg_infinity	To negative infinity.

**io\_errc**

```
enum class std::io_errc [strong]
```

I/O error code.

**4.10.4 Function Documentation****\_\_find\_if\_not()**

```
template<typename _InputIterator, typename _Predicate>
_InputIterator std::__find_if_not (
    _InputIterator __first,
    _InputIterator __last,
    _Predicate __pred) [inline], [constexpr]
```

Provided for `stable_partition` to use.

Referenced by [find\\_if\\_not\(\)](#).

### `__find_if_not_n()`

```
template<typename _InputIterator, typename _Predicate, typename _Distance>
_InputIterator std::__find_if_not_n (
    _InputIterator __first,
    _Distance & __len,
    _Predicate __pred) [constexpr]
```

Like `find_if_not()`, but uses and updates a count of the remaining range length instead of comparing against an end iterator.

Referenced by [\\_\\_stable\\_partition\\_adaptive\(\)](#).

### `__gcd()`

```
template<typename _EuclideanRingElement>
_EuclideanRingElement std::__gcd (
    _EuclideanRingElement __m,
    _EuclideanRingElement __n) [constexpr]
```

This is a helper function for the rotate algorithm specialized on RAIs. It returns the greatest common divisor of two integer values.

### `__gen_two_uniform_ints()`

```
template<typename _IntType, typename _UniformRandomBitGenerator>
pair< _IntType, _IntType > std::__gen_two_uniform_ints (
    _IntType __b0,
    _IntType __b1,
    _UniformRandomBitGenerator && __g)
```

Generate two uniformly distributed integers using a single distribution invocation.

#### Parameters

<code>__b0</code>	The upper bound for the first integer.
<code>__b1</code>	The upper bound for the second integer.
<code>__g</code>	A <code>UniformRandomBitGenerator</code> .

#### Returns

A pair (i, j) with i and j uniformly distributed over [0, `__b0`) and [0, `__b1`), respectively.

Requires: `__b0 * __b1 <= __g.max() - __g.min()`.

Using `uniform_int_distribution` with a range that is very small relative to the range of the generator ends up wasting potentially expensively generated randomness, since `uniform_int_distribution` does not store leftover randomness between invocations.

If we know we want two integers in ranges that are sufficiently small, we can compose the ranges, use a single distribution invocation, and significantly reduce the waste.

References [make\\_pair\(\)](#).

Referenced by [\\_\\_sample\(\)](#), and [shuffle\(\)](#).

### `__inplace_stable_sort()`

```
template<typename _RandomAccessIterator, typename _Compare>
void std::__inplace_stable_sort (
```

```

    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    _Compare __comp)

```

This is a helper function for the stable sorting routines.

References [\\_\\_inplace\\_stable\\_sort\(\)](#), and [\\_\\_merge\\_without\\_buffer\(\)](#).

Referenced by [\\_\\_inplace\\_stable\\_sort\(\)](#).

### **\_\_lg()**

```

template<typename _Tp>
_Tp std::__lg (
    _Tp __n) [inline], [constexpr]

```

This is a helper function for the sort routines and for random.tcc.

Referenced by [nth\\_element\(\)](#), [nth\\_element\(\)](#), [std::independent\\_bits\\_engine<\\_RandomNumberEngine, \\_\\_w, \\_UIntType >::operator\(\)\(\)](#), and [std::linear\\_congruential\\_engine<uint\\_fast32\\_t, 16807UL, 0UL, 2147483647UL >::seed\(\)](#).

### **\_\_merge\_adaptive()**

```

template<typename _BidirectionalIterator, typename _Distance, typename _Pointer, typename _Compare>
void std::__merge_adaptive (
    _BidirectionalIterator __first,
    _BidirectionalIterator __middle,
    _BidirectionalIterator __last,
    _Distance __len1,
    _Distance __len2,
    _Pointer __buffer,
    _Compare __comp)

```

This is a helper function for the merge routines.

References [\\_\\_move\\_merge\\_adaptive\(\)](#), and [\\_\\_move\\_merge\\_adaptive\\_backward\(\)](#).

### **\_\_merge\_without\_buffer()**

```

template<typename _BidirectionalIterator, typename _Distance, typename _Compare>
void std::__merge_without_buffer (
    _BidirectionalIterator __first,
    _BidirectionalIterator __middle,
    _BidirectionalIterator __last,
    _Distance __len1,
    _Distance __len2,
    _Compare __comp)

```

This is a helper function for the merge routines.

References [\\_\\_merge\\_without\\_buffer\(\)](#), [advance\(\)](#), and [distance\(\)](#).

Referenced by [\\_\\_inplace\\_stable\\_sort\(\)](#), and [\\_\\_merge\\_without\\_buffer\(\)](#).

### **\_\_move\_median\_to\_first()**

```

template<typename _Iterator, typename _Compare>
void std::__move_median_to_first (
    _Iterator __result,
    _Iterator __a,
    _Iterator __b,
    _Iterator __c,
    _Compare __comp) [constexpr]

```

Swaps the median value of `*__a`, `*__b` and `*__c` under `__comp` to `*__result`.

**\_\_move\_merge()**

```
template<typename _InputIterator, typename _OutputIterator, typename _Compare>
_OutputIterator std::__move_merge (
    _InputIterator __first1,
    _InputIterator __last1,
    _InputIterator __first2,
    _InputIterator __last2,
    _OutputIterator __result,
    _Compare __comp)
```

This is a helper function for the `__merge_sort_loop` routines.

**\_\_move\_merge\_adaptive()**

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename _Compare>
void std::__move_merge_adaptive (
    _InputIterator1 __first1,
    _InputIterator1 __last1,
    _InputIterator2 __first2,
    _InputIterator2 __last2,
    _OutputIterator __result,
    _Compare __comp)
```

This is a helper function for the `__merge_adaptive` routines.

Referenced by [\\_\\_merge\\_adaptive\(\)](#).

**\_\_move\_merge\_adaptive\_backward()**

```
template<typename _BidirectionalIterator1, typename _BidirectionalIterator2, typename _BidirectionalIterator3,
typename _Compare>
void std::__move_merge_adaptive_backward (
    _BidirectionalIterator1 __first1,
    _BidirectionalIterator1 __last1,
    _BidirectionalIterator2 __first2,
    _BidirectionalIterator2 __last2,
    _BidirectionalIterator3 __result,
    _Compare __comp)
```

This is a helper function for the `__merge_adaptive` routines.

Referenced by [\\_\\_merge\\_adaptive\(\)](#).

**\_\_partition() [1/2]**

```
template<typename _BidirectionalIterator, typename _Predicate>
_BidirectionalIterator std::__partition (
    _BidirectionalIterator __first,
    _BidirectionalIterator __last,
    _Predicate __pred,
    bidirectional\_iterator\_tag ) [constexpr]
```

This is a helper function...

**\_\_partition() [2/2]**

```
template<typename _ForwardIterator, typename _Predicate>
_FowardIterator std::__partition (
    _ForwardIterator __first,
```

```

    _ForwardIterator __last,
    _Predicate __pred,
    forward_iterator_tag ) [constexpr]

```

This is a helper function...

Referenced by [partition\(\)](#).

#### **\_\_reverse()** [1/2]

```

template<typename _BidirectionalIterator>
void std::__reverse (
    _BidirectionalIterator __first,
    _BidirectionalIterator __last,
    bidirectional_iterator_tag ) [constexpr]

```

This is an uglified reverse(\_BidirectionalIterator, \_BidirectionalIterator) overloaded for bidirectional iterators.

Referenced by [\\_\\_rotate\(\)](#), and [reverse\(\)](#).

#### **\_\_reverse()** [2/2]

```

template<typename _RandomAccessIterator>
void std::__reverse (
    _RandomAccessIterator __first,
    _RandomAccessIterator __last,
    random_access_iterator_tag ) [constexpr]

```

This is an uglified reverse(\_BidirectionalIterator, \_BidirectionalIterator) overloaded for random access iterators.

#### **\_\_rotate()** [1/3]

```

template<typename _BidirectionalIterator>
_BidirectionalIterator std::__rotate (
    _BidirectionalIterator __first,
    _BidirectionalIterator __middle,
    _BidirectionalIterator __last,
    bidirectional_iterator_tag ) [constexpr]

```

This is a helper function for the rotate algorithm.

References [\\_\\_reverse\(\)](#).

#### **\_\_rotate()** [2/3]

```

template<typename _ForwardIterator>
_FwdIterator std::__rotate (
    _ForwardIterator __first,
    _ForwardIterator __middle,
    _ForwardIterator __last,
    forward_iterator_tag ) [constexpr]

```

This is a helper function for the rotate algorithm.

Referenced by [rotate\(\)](#).

#### **\_\_rotate()** [3/3]

```

template<typename _RandomAccessIterator>
_RandomAccessIterator std::__rotate (
    _RandomAccessIterator __first,
    _RandomAccessIterator __middle,
    _RandomAccessIterator __last,
    random_access_iterator_tag ) [constexpr]

```

This is a helper function for the rotate algorithm.

### **\_\_rotate\_adaptive()**

```
template<typename _BidirectionalIterator1, typename _BidirectionalIterator2, typename _Distance>
_BidirectionalIterator1 std::__rotate_adaptive (
    _BidirectionalIterator1 __first,
    _BidirectionalIterator1 __middle,
    _BidirectionalIterator1 __last,
    _Distance __len1,
    _Distance __len2,
    _BidirectionalIterator2 __buffer,
    _Distance __buffer_size)
```

This is a helper function for the merge routines.

### **\_\_sample() [1/2]**

```
template<typename _ForwardIterator, typename _OutputIterator, typename _Cat, typename _Size,
typename _UniformRandomBitGenerator>
_OutputIterator std::__sample (
    _ForwardIterator __first,
    _ForwardIterator __last,
    forward_iterator_tag ,
    _OutputIterator __out,
    _Cat ,
    _Size __n,
    _UniformRandomBitGenerator && __g)
```

Selection sampling algorithm.

References [\\_\\_gen\\_two\\_uniform\\_ints\(\)](#), [distance\(\)](#), [std::pair<\\_T1, \\_T2>::first](#), [min\(\)](#), and [std::pair<\\_T1, \\_T2>::second](#).

### **\_\_sample() [2/2]**

```
template<typename _InputIterator, typename _RandomAccessIterator, typename _Size, typename _↵
UniformRandomBitGenerator>
_RandomAccessIterator std::__sample (
    _InputIterator __first,
    _InputIterator __last,
    input_iterator_tag ,
    _RandomAccessIterator __out,
    random_access_iterator_tag ,
    _Size __n,
    _UniformRandomBitGenerator && __g)
```

Reservoir sampling algorithm.

### **\_\_search\_n\_aux() [1/2]**

```
template<typename _ForwardIterator, typename _Integer, typename _UnaryPredicate>
_FowardIterator std::__search_n_aux (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Integer __count,
    _UnaryPredicate __unary_pred,
    std::forward_iterator_tag ) [constexpr]
```

This is an helper function for `search_n` overloaded for forward iterators.

**\_\_search\_n\_aux()** [2/2]

```
template<typename _RandomAccessIter, typename _Integer, typename _UnaryPredicate>
_RandomAccessIter std::__search_n_aux (
    _RandomAccessIter __first,
    _RandomAccessIter __last,
    _Integer __count,
    _UnaryPredicate __unary_pred,
    std::random_access_iterator_tag ) [constexpr]
```

This is an helper function for `search_n` overloaded for random access iterators.

**\_\_stable\_partition\_adaptive()**

```
template<typename _ForwardIterator, typename _Pointer, typename _Predicate, typename _Distance>
_FowardIterator std::__stable_partition_adaptive (
    _ForwardIterator __first,
    _ForwardIterator __last,
    _Predicate __pred,
    _Distance __len,
    _Pointer __buffer,
    _Distance __buffer_size)
```

This is a helper function... Requires `__first != __last` and `!__pred(*__first)` and `__len == distance(__first, __last)`.

`!__pred(*__first)` allows us to guarantee that we don't move-assign an element onto itself.

References [\\_\\_find\\_if\\_not\\_n\(\)](#), [\\_\\_stable\\_partition\\_adaptive\(\)](#), and [advance\(\)](#).

Referenced by [\\_\\_stable\\_partition\\_adaptive\(\)](#).

**\_Construct()**

```
template<typename _Tp, typename... _Args>
void std::_Construct (
    _Tp * __p,
    _Args &&... __args) [inline], [constexpr]
```

Constructs an object in existing memory by invoking an allocated object's constructor with an initializer.

References [forward\(\)](#).

Referenced by [std::allocator\\_traits< \\_OuterAlloc >::construct\(\)](#), [std::allocator\\_traits< allocator< \\_Tp > >::construct\(\)](#), and [std::allocator\\_traits< allocator< void > >::construct\(\)](#).

**\_Destroy()** [1/2]

```
template<typename _ForwardIterator>
void std::_Destroy (
    _ForwardIterator __first,
    _ForwardIterator __last) [inline], [constexpr]
```

Destroy a range of objects. If the value\_type of the object has a trivial destructor, the compiler should optimize all of this away, otherwise the objects' destructors must be invoked.

References [\\_Destroy\(\)](#), and [addressof\(\)](#).

Referenced by [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::~~vector\(\)](#), [\\_Destroy\(\)](#), [\\_Destroy\\_n\(\)](#), [std::deque< \\_Tp, \\_Alloc >::M\\_range\\_initialize\(\)](#), [std::allocator\\_traits< \\_OuterAlloc >::destroy\(\)](#), [std::allocator\\_traits< allocator< void > >::operator=\(\)](#), and [std::vector< \\_Tp, \\_Alloc >::reserve\(\)](#).

**\_Destroy()** [2/2]

```
template<typename _Tp>
void std::_Destroy (
    _Tp * __pointer) [inline], [constexpr]
```

Destroy the object pointed to by a pointer type.

### **`_Destroy_n()`**

```
template<typename _ForwardIterator, typename _Size>
_FForwardIterator std::_Destroy_n (
    _ForwardIterator __first,
    _Size __count) [inline], [constexpr]
```

Destroy a range of objects. If the value\_type of the object has a trivial destructor, the compiler should optimize all of this away, otherwise the objects' destructors must be invoked.

References [\\_Destroy\(\)](#), [addressof\(\)](#), and [advance\(\)](#).

### **`acosh()`**

```
float std::acosh (
    float __x) [constexpr]
```

Additional overloads.

### **`advance()`**

```
template<typename _InputIterator, typename _Distance>
void std::advance (
    _InputIterator & __i,
    _Distance __n) [inline], [constexpr]
```

A generalization of pointer arithmetic.

#### **Parameters**

$\leftrightarrow$ <code>__i</code>	An input iterator.
$\leftrightarrow$ <code>__n</code>	The <i>delta</i> by which to change <code>__i</code> .

#### **Returns**

Nothing.

This increments `i` by `n`. For bidirectional and random access iterators, `__n` may be negative, in which case `__i` is decremented.

For random access iterators, this uses their `+` and `-` operations and are constant time. For other iterator classes they are linear time.

References [\\_\\_iterator\\_category\(\)](#).

Referenced by [\\_\\_merge\\_without\\_buffer\(\)](#), [\\_\\_stable\\_partition\\_adaptive\(\)](#), [\\_Destroy\\_n\(\)](#), [std::deque<\\_Tp, \\_Alloc>::\\_M\\_range\\_initialize\(\)](#), [\\_\\_gnu\\_pbds::detail::pat\\_trie\\_base::\\_Node\\_citer<node, leaf, head, inode, const\\_iterator, iterator, \\_Alloc>::get\\_child\(\)](#), [\\_\\_gnu\\_pbds::detail::pat\\_trie\\_base::\\_Node\\_iter<node, leaf, head, inode, const\\_iterator, iterator, \\_Alloc>::get\\_child\(\)](#), and [partition\\_point\(\)](#).

### **`begin()` [1/4]**

```
template<typename _Container>
auto std::begin (
    _Container & __cont) -> decltype(__cont.begin()) [inline], [constexpr], [noexcept]
```

Return an iterator pointing to the first element of the container.

## Parameters

<code>__cont</code>	Container.
---------------------	------------

**begin()** [2/4]

```
template<typename _Tp, size_t _Nm>
_Tp * std::begin (
    _Tp(&) __arr[_Nm]) [inline], [constexpr], [noexcept]
```

Return an iterator pointing to the first element of the array.

## Parameters

<code>__arr</code>	Array.
--------------------	--------

**begin()** [3/4]

```
template<typename _Container>
auto std::begin (
    const _Container & __cont) -> decltype(__cont.begin()) [inline], [constexpr], [noexcept]
```

Return an iterator pointing to the first element of the const container.

## Parameters

<code>__cont</code>	Container.
---------------------	------------

**boolalpha()**

```
ios_base & std::boolalpha (
    ios_base & __base) [inline]
```

Calls `base.setf(ios_base::boolalpha)`.

References [std::ios\\_base::boolalpha](#).

**cbegin()**

```
template<typename _Container>
auto std::cbegin (
    const _Container & __cont) -> decltype(std::begin(__cont)) [constexpr], [noexcept]
```

Return an iterator pointing to the first element of the const container.

## Parameters

<code>__cont</code>	Container.
---------------------	------------

References [begin\(\)](#).

Referenced by [std::vector<\\_Tp, \\_Alloc>::insert\(\)](#).

**cend()**

```
template<typename _Container>
auto std::cend (
    const _Container & __cont) -> decltype(std::end(__cont))    [constexpr], [noexcept]
```

Return an iterator pointing to one past the last element of the const container.

**Parameters**

<code>__cont</code>	Container.
---------------------	------------

References [end\(\)](#).

**const\_pointer\_cast()**

```
template<typename _Tp, typename _Tp1, _Lock_policy _Lp>
__shared_ptr< _Tp, _Lp > std::const_pointer_cast (
    const __shared_ptr< _Tp1, _Lp > & __r)    [inline], [noexcept]
const_pointer_cast
```

**crbegin()**

```
template<typename _Container>
auto std::crbegin (
    const _Container & __cont) -> decltype(std::rbegin(__cont))    [inline], [constexpr],
[noexcept]
```

Return a reverse iterator pointing to the last element of the const container.

**Parameters**

<code>__cont</code>	Container.
---------------------	------------

References [rbegin\(\)](#).

**crend()**

```
template<typename _Container>
auto std::crend (
    const _Container & __cont) -> decltype(std::rend(__cont))    [inline], [constexpr],
[noexcept]
```

Return a reverse iterator pointing one past the first element of the const container.

**Parameters**

<code>__cont</code>	Container.
---------------------	------------

References [rend\(\)](#).

**data() [1/4]**

```
template<typename _Container>
auto std::data (
    _Container & __cont) -> decltype(__cont.data())    [nodiscard], [constexpr], [noexcept]
```

Return the data pointer of a container.

**Parameters**

<code>__cont</code>	Container.
---------------------	------------

Referenced by [std::basic\\_stringbuf< char >::basic\\_stringbuf\(\)](#), and [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::find\(\)](#).

**data()** [2/4]

```
template<typename _Tp, size_t _Nm>
_Tp * std::data (
    _Tp(&) __array[_Nm]) [nodiscard], [constexpr], [noexcept]
```

Return the data pointer of an array.

**Parameters**

<code>__array</code>	Array.
----------------------	--------

**data()** [3/4]

```
template<typename _Container>
auto std::data (
    const _Container & __cont) -> decltype(__cont.data()) [nodiscard], [constexpr],
[noexcept]
```

Return the data pointer of a const container.

**Parameters**

<code>__cont</code>	Container.
---------------------	------------

**data()** [4/4]

```
template<typename _Tp>
const _Tp * std::data (
    initializer_list< _Tp > __il) [nodiscard], [constexpr], [noexcept]
```

Return the data pointer of an initializer list.

**Parameters**

<code>__il</code>	Initializer list.
-------------------	-------------------

**dec()**

```
ios_base & std::dec (
    ios_base & __base) [inline]
```

Calls `base.setf(ios_base::dec, ios_base::basefield)`.  
References [std::ios\\_base::basefield](#), and [std::ios\\_base::dec](#).

**defaultfloat()**

```
ios_base & std::defaultfloat (
    ios_base & __base) [inline]
```

Calls `base.unsetf(ios_base::floatfield)`.  
References [std::ios\\_base::floatfield](#).

**distance()**

```
template<typename _InputIterator>
iterator_traits< _InputIterator >::difference_type std::distance (
    _InputIterator __first,
    _InputIterator __last) [inline], [nodiscard], [constexpr]
```

A generalization of pointer arithmetic.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

**Returns**

The distance between them.

Returns `n` such that `__first + n == __last`. This requires that `__last` must be reachable from `__first`. Note that `n` may be negative.

For random access iterators, this uses their `+` and `-` operations and are constant time. For other iterator classes they are linear time.

References [\\_\\_iterator\\_category\(\)](#), and [move\(\)](#).

Referenced by [\\_\\_merge\\_without\\_buffer\(\)](#), [\\_\\_sample\(\)](#), [std::deque< \\_Tp, \\_Alloc >::\\_M\\_range\\_initialize\(\)](#), [is\\_heap\(\)](#), [is\\_heap\\_until\(\)](#), [is\\_heap\\_until\(\)](#), [std::sub\\_match< const char \\* >::length\(\)](#), [\\_\\_gnu\\_parallel::multiseq\\_partition\(\)](#), [\\_\\_gnu\\_parallel::multiseq\\_selection\(\)](#), [\\_\\_gnu\\_pbds::detail::pat\\_trie\\_base::\\_Node\\_citer< node, leaf, head, inode, const\\_iterator, iterator, \\_A partition\\_point\(\), std::match\\_results< \\_BidirectionalIterator, polymorphic\\_allocator< sub\\_match< \\_BidirectionalIterator > > >< const char \\* >::length\(\)](#), [\\_\\_gnu\\_cxx::random\\_sample\\_n\(\)](#), [\\_\\_gnu\\_cxx::random\\_sample\\_n\(\)](#), [std::vector< \\_State< \\_TraitsT::char\\_type > >::reserve\(\)](#), [std::list< \\_Tp, polymorphic\\_allocator< \\_Tp > >::size\(\)](#), and [std::list< \\_Tp, polymorphic\\_allocator< \\_Tp > >::splice\(\)](#).

**dynamic\_pointer\_cast()**

```
template<typename _Tp, typename _Tp1, _Lock_policy _Lp>
__shared_ptr< _Tp, _Lp > std::dynamic_pointer_cast (
    const __shared_ptr< _Tp1, _Lp > & __r) [inline], [noexcept]
```

`dynamic_pointer_cast`

**empty() [1/3]**

```
template<typename _Container>
auto std::empty (
    const _Container & __cont) -> decltype(__cont.empty()) [nodiscard], [constexpr],
[noexcept]
```

Return whether a container is empty.

**Parameters**

<code>__cont</code>	Container.
---------------------	------------

Referenced by [std::list< \\_Tp, \\_Alloc >::sort\(\)](#), and [std::list< \\_Tp, \\_Alloc >::sort\(\)](#).

**empty() [2/3]**

```
template<typename _Tp, size_t _Nm>
bool std::empty (
    const _Tp(&)[_Nm]) [nodiscard], [constexpr], [noexcept]
```

Return whether an array is empty (always false).

**empty()** [3/3]

```
template<typename _Tp>
bool std::empty (
    initializer_list< _Tp > __il) [nodiscard], [constexpr], [noexcept]
```

Return whether an initializer\_list is empty.

**Parameters**

<code>__il</code>	Initializer list.
-------------------	-------------------

**end()** [1/4]

```
template<typename _Container>
auto std::end (
    _Container & __cont) -> decltype(__cont.end()) [inline], [constexpr], [noexcept]
```

Return an iterator pointing to one past the last element of the container.

**Parameters**

<code>__cont</code>	Container.
---------------------	------------

**end()** [2/4]

```
template<typename _Tp, size_t _Nm>
_Tp * std::end (
    _Tp(&) __arr[_Nm]) [inline], [constexpr], [noexcept]
```

Return an iterator pointing to one past the last element of the array.

**Parameters**

<code>__arr</code>	Array.
--------------------	--------

**end()** [3/4]

```
template<typename _Container>
auto std::end (
    const _Container & __cont) -> decltype(__cont.end()) [inline], [constexpr], [noexcept]
```

Return an iterator pointing to one past the last element of the const container.

**Parameters**

<code>__cont</code>	Container.
---------------------	------------

**endl()**

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & std::endl (
    basic_ostream< _CharT, _Traits > & __os) [inline]
```

Write a newline and flush the stream.

This manipulator is often mistakenly used when a simple newline is desired, leading to poor buffering performance. See <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.↵streambuf.buffering> for more on this subject.

References [flush\(\)](#), [std::basic\\_ostream<\\_CharT, \\_Traits>::put\(\)](#), and [std::basic\\_ios<\\_CharT, \\_Traits>::widen\(\)](#).

### ends()

```
template<typename _CharT, typename _Traits>
basic_ostream<_CharT, _Traits> & std::ends (
    basic_ostream<_CharT, _Traits> & __os) [inline]
```

Write a null character into the output sequence.

*Null character* is `CharT()` by definition. For `CharT` of `char`, this correctly writes the ASCII NUL character string terminator.

References [std::basic\\_ostream<\\_CharT, \\_Traits>::put\(\)](#).

### fabs()

```
template<typename _Tp>
_Tp std::fabs (
    const std::complex<_Tp> & __z) [inline]
```

`fabs(__z)` TR1 8.1.8 [tr.c99.cmplx.fabs]

References [abs\(\)](#), and [fabs\(\)](#).

Referenced by [fabs\(\)](#).

### fixed()

```
ios_base & std::fixed (
    ios_base & __base) [inline]
```

Calls `base.setf(ios_base::fixed, ios_base::floatfield)`.

References [std::ios\\_base::fixed](#), and [std::ios\\_base::floatfield](#).

### flush()

```
template<typename _CharT, typename _Traits>
basic_ostream<_CharT, _Traits> & std::flush (
    basic_ostream<_CharT, _Traits> & __os) [inline]
```

Flushes the output stream.

This manipulator simply calls the stream's `flush()` member function.

References [std::basic\\_ostream<\\_CharT, \\_Traits>::flush\(\)](#).

Referenced by [endl\(\)](#).

### frexp()

```
template<typename _Tp, typename _Abi, typename = __detail::__odr_helper>
enable_if_t<is_floating_point_v<_Tp>, simd<_Tp, _Abi>> frexp (
    const simd<_Tp, _Abi> & __x,
    _Samesize<int, simd<_Tp, _Abi>> * __exp)
```

splits `__v` into exponent and mantissa, the sign is kept with the mantissa

The return value will be in the range [0.5, 1.0[ The `__e` value will be an integer defining the power-of-two exponent

References [abs\(\)](#).

### from\_chars()

```
template<typename _Tp, enable_if_t<__or<__is_signed_or_unsigned_integer<_Tp>, is_same<
```

```
char, _Tp > >::value, int > = 0>
from_chars_result std::from_chars (
    const char * __first,
    const char * __last,
    _Tp & __value,
    int __base = 10) [constexpr]
```

std::from\_chars for integer types.

References [std::\\_\\_detail::\\_\\_from\\_chars\\_alnum\(\)](#), and [std::\\_\\_detail::\\_\\_from\\_chars\\_pow2\\_base\(\)](#).

### generate\_canonical()

```
template<typename _RealT, size_t __digits, typename _Urbg>
_RealT std::generate_canonical (
    _Urbg & __urng)
```

Produce a random floating-point value in the range [0..1)

The result of `std::generate_canonical<RealT, digits>(urng)` is a random floating-point value of type `RealT` in the range [0..1), using entropy provided by the uniform random bit generator `urng`. A value for `digits` may be passed to limit the precision of the result to so many bits, but normally `-1u` is passed to get the native precision of `RealT`. As many `urng()` calls are made as needed to obtain the required entropy. On rare occasions, more `urng()` calls are used. It is fastest when the value of `Urbg::max()` is a power of two less one, such as from a `std::philox4x32` (for float) or `philox4x64` (for double).

Since

C++11

**get\_money()**

```
template<typename _MoneyT>
_Get_money< _MoneyT > std::get_money (
    _MoneyT & __mon,
    bool __intl = false) [inline]
```

Extended manipulator for extracting money.

**Parameters**

<code>__mon</code>	Either long double or a specialization of <code>basic_string</code> .
<code>__intl</code>	A bool indicating whether international format is to be used.

Sent to a stream object, this manipulator extracts `__mon`.

**get\_new\_handler()**

```
new_handler std::get_new_handler () [noexcept]
Return the current new handler.
```

**get\_temporary\_buffer()**

```
template<typename _Tp>
pair< _Tp *, ptrdiff_t > std::get_temporary_buffer (
    ptrdiff_t __len) [noexcept]
```

Allocates a temporary buffer.

**Parameters**

<code>__len</code>	The number of objects of type <code>Tp</code> .
--------------------	---

**Returns**

See full description.

Reinventing the wheel, but this time with prettier spokes!

This function tries to obtain storage for `__len` adjacent `Tp` objects. The objects themselves are not constructed, of course. A `pair<>` is returned containing *the buffer's address and capacity (in the units of `sizeof(_Tp)`)*, or a pair of 0 values if no storage can be obtained. Note that the capacity obtained may be less than that requested if the memory is unavailable; you should compare `len` with the `.second` return value.

Provides the nothrow exception guarantee.

**get\_time()**

```
template<typename _CharT>
_Get_time< _CharT > std::get_time (
    std::tm * __tmb,
    const _CharT * __fmt) [inline]
```

Extended manipulator for extracting time.

This manipulator uses `time_get::get` to extract time. [ext.manip]

## Parameters

<code>__tmb</code>	struct to extract the time data to.
<code>__fmt</code>	format string.

**getline()** [1/6]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_istream< _CharT, _Traits > & std::getline (
    basic_istream< _CharT, _Traits > && __is,
    basic_string< _CharT, _Traits, _Alloc > & __str) [inline]
```

Read a line from an rvalue stream into a string.

References [getline\(\)](#).

**getline()** [2/6]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_istream< _CharT, _Traits > & std::getline (
    basic_istream< _CharT, _Traits > && __is,
    basic_string< _CharT, _Traits, _Alloc > & __str,
    _CharT __delim) [inline]
```

Read a line from an rvalue stream into a string.

References [getline\(\)](#).

**getline()** [3/6]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
basic_istream< _CharT, _Traits > & std::getline (
    basic_istream< _CharT, _Traits > & __is,
    __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base > & __str) [inline]
```

Read a line from stream into a string.

## Parameters

<code>__is</code>	Input stream.
<code>__str</code>	Buffer to store into.

## Returns

Reference to the input stream.

Stores characters from `is` into `__str` until ' ' is found, the end of the stream is encountered, or `str.max_size()` is reached. If `is.width()` is non-zero, that is the limit on the number of characters stored into `__str`. Any previous contents of `__str` are erased. If end of line was encountered, it is extracted but not stored into `__str`.

References [getline\(\)](#), and [std::basic\\_ios< \\_CharT, \\_Traits >::widen\(\)](#).

**getline()** [4/6]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
basic_istream< _CharT, _Traits > & std::getline (
```

```
basic_istream< _CharT, _Traits > & __is,
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
_CharT __delim)
```

Read a line from stream into a string.

#### Parameters

<code>__is</code>	Input stream.
<code>__str</code>	Buffer to store into.
<code>__delim</code>	Character marking end of line.

#### Returns

Reference to the input stream.

Stores characters from `__is` into `__str` until `__delim` is found, the end of the stream is encountered, or `str.max_size()` is reached. If `is.width()` is non-zero, that is the limit on the number of characters stored into `__str`. Any previous contents of `__str` are erased. If `delim` was encountered, it is extracted but not stored into `__str`.

#### getline() [5/6]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_istream< _CharT, _Traits > & std::getline (
    basic_istream< _CharT, _Traits > & __is,
    basic_string< _CharT, _Traits, _Alloc > & __str) [inline]
```

Read a line from stream into a string.

#### Parameters

<code>__is</code>	Input stream.
<code>__str</code>	Buffer to store into.

#### Returns

Reference to the input stream.

Stores characters from `is` into `__str` until ' ' is found, the end of the stream is encountered, or `str.max_size()` is reached. Any previous contents of `__str` are erased.

If end of line is encountered, it is extracted but not stored into `__str`.

References `getline()`, and `std::basic_ios< _CharT, _Traits >::widen()`.

#### getline() [6/6]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_istream< _CharT, _Traits > & std::getline (
    basic_istream< _CharT, _Traits > & __is,
    basic_string< _CharT, _Traits, _Alloc > & __str,
    _CharT __delim)
```

Read a line from stream into a string.

**Parameters**

<code>__is</code>	Input stream.
<code>__str</code>	Buffer to store into.
<code>__delim</code>	Character marking end of line.

**Returns**

Reference to the input stream.

Stores characters from `__is` into `__str` until `__delim` is found, the end of the stream is encountered, or `str.max_size()` is reached. Any previous contents of `__str` are erased. If `__delim` is encountered, it is extracted but not stored into `__str`. Convenience interface to `ctype.is(ctype_base::cntrl, __c)`.

References [use\\_facet\(\)](#).

**isdigit()**

```
template<typename _CharT>
bool std::isdigit (
    _CharT __c,
    const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::digit, __c)`.

References [use\\_facet\(\)](#).

**isgraph()**

```
template<typename _CharT>
bool std::isgraph (
    _CharT __c,
    const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::graph, __c)`.

References [use\\_facet\(\)](#).

**islower()**

```
template<typename _CharT>
bool std::islower (
    _CharT __c,
    const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::lower, __c)`.

References [use\\_facet\(\)](#).

**isprint()**

```
template<typename _CharT>
bool std::isprint (
    _CharT __c,
    const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::print, __c)`.

References [use\\_facet\(\)](#).

**ispunct()**

```
template<typename _CharT>
bool std::ispunct (
    _CharT __c,
    const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::punct, __c)`.

References [use\\_facet\(\)](#).

**isspace()**

```
template<typename _CharT>
bool std::isspace (
    _CharT __c,
    const locale & __loc) [inline]
```

Convenience interface to `ctype.is(ctype_base::space, __c)`.

References [use\\_facet\(\)](#).

**isupper()**

```
template<typename _CharT>
bool std::isupper (
    _CharT __c,

**operator"!="() [1/5]**

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
bool std::operator!= (
    const multimap< _Key, _Tp, _Compare, _Alloc > & __x,
    const multimap< _Key, _Tp, _Compare, _Alloc > & __y) [inline]
```

Based on `operator==`.

**operator"!="() [2/5]**

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator!= (
    const multiset< _Key, _Compare, _Alloc > & __x,
    const multiset< _Key, _Compare, _Alloc > & __y) [inline]
```

Returns `!(x == y)`.

### **operator!=()** [3/5]

```
template<typename _Tp, typename _Seq>
bool std::operator!= (
    const queue< _Tp, _Seq > & __x,
    const queue< _Tp, _Seq > & __y) [inline], [nodiscard]
```

Based on `operator==`.

### **operator!=()** [4/5]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator!= (
    const set< _Key, _Compare, _Alloc > & __x,
    const set< _Key, _Compare, _Alloc > & __y) [inline]
```

Returns `!(x == y)`.

### **operator!=()** [5/5]

```
template<typename _Tp, typename _Seq>
bool std::operator!= (
    const stack< _Tp, _Seq > & __x,
    const stack< _Tp, _Seq > & __y) [inline], [nodiscard]
```

Based on `operator==`.

### **operator&()**

```
template<size_t _Nb>
bitset< _Nb > std::operator& (
    const bitset< _Nb > & __x,
    const bitset< _Nb > & __y) [inline], [constexpr], [noexcept]
```

Global bitwise operations on bitsets.

#### Parameters

<code>__x</code>	A bitset.
<code>__y</code>	A bitset of the same size as <code>__x</code> .

#### Returns

A new bitset.

These should be self-explanatory.

### **operator+()** [1/5]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_string< _CharT, _Traits, _Alloc > std::operator+ (
    _CharT __lhs,
    const basic_string< _CharT, _Traits, _Alloc > & __rhs) [inline], [nodiscard], [constexpr]
```

Concatenate character and string.

## Parameters

<code>__lhs</code>	First string.
<code>__rhs</code>	Last string.

## Returns

New string with `__lhs` followed by `__rhs`.

References [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::c\\_str\(\)](#), [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::get\\_allocator\(\)](#), and [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::size\(\)](#).

**operator+()** [2/5]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_string<_CharT, _Traits, _Alloc> std::operator+ (
    const _CharT * __lhs,
    const basic_string<_CharT, _Traits, _Alloc> & __rhs) [inline], [nodiscard], [constexpr]
```

Concatenate C string and string.

## Parameters

<code>__lhs</code>	First string.
<code>__rhs</code>	Last string.

## Returns

New string with value of `__lhs` followed by `__rhs`.

References [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::c\\_str\(\)](#), [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::get\\_allocator\(\)](#), and [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::size\(\)](#).

**operator+()** [3/5]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_string<_CharT, _Traits, _Alloc> std::operator+ (
    const basic_string<_CharT, _Traits, _Alloc> & __lhs,
    _CharT __rhs) [inline], [nodiscard], [constexpr]
```

Concatenate string and character.

## Parameters

<code>__lhs</code>	First string.
<code>__rhs</code>	Last string.

## Returns

New string with `__lhs` followed by `__rhs`.

References [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::c\\_str\(\)](#), [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::get\\_allocator\(\)](#), and [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::size\(\)](#).

**operator+()** [4/5]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_string< _CharT, _Traits, _Alloc > std::operator+ (
    const basic_string< _CharT, _Traits, _Alloc > & __lhs,
    const _CharT * __rhs) [inline], [nodiscard], [constexpr]
```

Concatenate string and C string.

**Parameters**

<code>__lhs</code>	First string.
<code>__rhs</code>	Last string.

**Returns**

New string with `__lhs` followed by `__rhs`.

References `std::basic_string< _CharT, _Traits, _Alloc >::c_str()`, `std::basic_string< _CharT, _Traits, _Alloc >::get_allocator()`, and `std::basic_string< _CharT, _Traits, _Alloc >::size()`.

**operator+()** [5/5]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_string< _CharT, _Traits, _Alloc > std::operator+ (
    const basic_string< _CharT, _Traits, _Alloc > & __lhs,
    const basic_string< _CharT, _Traits, _Alloc > & __rhs) [inline], [nodiscard], [constexpr]
```

Concatenate two strings.

**Parameters**

<code>__lhs</code>	First string.
<code>__rhs</code>	Last string.

**Returns**

New string with value of `__lhs` followed by `__rhs`.

References `std::basic_string< _CharT, _Traits, _Alloc >::c_str()`, `std::basic_string< _CharT, _Traits, _Alloc >::get_allocator()`, and `std::basic_string< _CharT, _Traits, _Alloc >::size()`.

**operator<()** [1/5]

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
bool std::operator< (
    const multimap< _Key, _Tp, _Compare, _Alloc > & __x,
    const multimap< _Key, _Tp, _Compare, _Alloc > & __y) [inline]
```

Multimap ordering relation.

**Parameters**

<code>__x</code>	A multimap.
<code>__y</code>	A multimap of the same type as <code>__x</code> .

**Returns**

True iff  $x$  is lexicographically less than  $y$ .

This is a total ordering relation. It is linear in the size of the multimaps. The elements must be comparable with  $<$ . See `std::lexicographical_compare()` for how the determination is made.

**operator<()** [2/5]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator< (
    const multiset< _Key, _Compare, _Alloc > & __x,
    const multiset< _Key, _Compare, _Alloc > & __y) [inline]
```

Multiset ordering relation.

**Parameters**

$\leftarrow$ __x	A multiset.
$\leftarrow$ __y	A multiset of the same type as __x.

**Returns**

True iff \_\_x is lexicographically less than \_\_y.

This is a total ordering relation. It is linear in the size of the sets. The elements must be comparable with  $<$ . See `std::lexicographical_compare()` for how the determination is made.

**operator<()** [3/5]

```
template<typename _Tp, typename _Seq>
bool std::operator< (
    const queue< _Tp, _Seq > & __x,
    const queue< _Tp, _Seq > & __y) [inline], [nodiscard]
```

Queue ordering relation.

**Parameters**

$\leftarrow$ __x	A queue.
$\leftarrow$ __y	A queue of the same type as x.

**Returns**

True iff \_\_x is lexicographically less than \_\_y.

This is an total ordering relation. Complexity and semantics depend on the underlying sequence type, but the expected rules are: this relation is linear in the size of the sequences, the elements must be comparable with  $<$ , and `std::lexicographical_compare()` is usually used to make the determination.

References `std::queue< _Tp, _Sequence >::c`.

**operator<()** [4/5]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator< (
    const set< _Key, _Compare, _Alloc > & __x,
    const set< _Key, _Compare, _Alloc > & __y) [inline]
```

Set ordering relation.

**Parameters**

$\leftrightarrow$ __x	A set.
$\leftrightarrow$ __y	A set of the same type as x.

**Returns**

True iff \_\_x is lexicographically less than \_\_y.

This is a total ordering relation. It is linear in the size of the sets. The elements must be comparable with <. See std::lexicographical\_compare() for how the determination is made.

**operator<()** [5/5]

```
template<typename _Tp, typename _Seq>
bool std::operator< (
    const stack< _Tp, _Seq > & __x,
    const stack< _Tp, _Seq > & __y) [inline], [nodiscard]
```

Stack ordering relation.

**Parameters**

$\leftrightarrow$ __x	A stack.
$\leftrightarrow$ __y	A stack of the same type as x.

**Returns**

True iff x is lexicographically less than \_\_y.

This is an total ordering relation. Complexity and semantics depend on the underlying sequence type, but the expected rules are: this relation is linear in the size of the sequences, the elements must be comparable with <, and std::lexicographical\_compare() is usually used to make the determination.

**operator<<()** [1/24]

```
template<typename _Ostream, typename _Tp>
__rvalue_stream_insertion_t< _Ostream, _Tp > std::operator<< (
    _Ostream && __os,
    const _Tp & __x) [inline]
```

Generic inserter for rvalue stream.

## Parameters

<code>__os</code>	An input stream.
<code>__x</code>	A reference to the object being inserted.

## Returns

`__os`

This is just a forwarding function to allow insertion to rvalue streams since they won't bind to the inserter functions that take an lvalue reference.

**operator<<()** [2/24]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
basic_ostream< _CharT, _Traits > & std::operator<< (
    basic_ostream< _CharT, _Traits > & __os,
    const __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base > & __str) [inline]
```

Write string to a stream.

## Parameters

<code>__os</code>	Output stream.
<code>__str</code>	String to write out.

## Returns

Reference to the output stream.

Output characters of `__str` into `os` following the same rules as for writing a C string.

**operator<<()** [3/24]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_ostream< _CharT, _Traits > & std::operator<< (
    basic_ostream< _CharT, _Traits > & __os,
    const basic_string< _CharT, _Traits, _Alloc > & __str) [inline]
```

Write string to a stream.

## Parameters

<code>__os</code>	Output stream.
<code>__str</code>	String to write out.

## Returns

Reference to the output stream.

Output characters of `__str` into `os` following the same rules as for writing a C string.

**operator<<()** [4/24]

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & std::operator<< (
    basic_ostream< _CharT, _Traits > & __out,
    _CharT __c) [inline]
```

Character inserters.

## Parameters

<code>__out</code>	An output stream.
<code>__c</code>	A character.

## Returns

`out`

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

**operator<<()** [5/24]

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & std::operator<< (
    basic_ostream< _CharT, _Traits > & __out,
    char __c) [inline]
```

Character inserters.

## Parameters

<code>__out</code>	An output stream.
<code>__c</code>	A character.

## Returns

`out`

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

**operator<<()** [6/24]

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & std::operator<< (
    basic_ostream< _CharT, _Traits > & __out,
    const _CharT * __s) [inline]
```

String inserters.

## Parameters

<code>__out</code>	An output stream.
<code>__s</code>	A character string.

## Returns

`out`

**Precondition**

`__s` must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at `__s`, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

**operator<<() [7/24]**

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & std::operator<< (
    basic_ostream< _CharT, _Traits > & __out,
    const char * __s)
```

String inserters.

**Parameters**

<code>__out</code>	An output stream.
<code>__s</code>	A character string.

**Returns**

`out`

**Precondition**

`__s` must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at `__s`, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

**operator<<() [8/24]**

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
    basic_ostream< char, _Traits > & ,
    char16_t ) [delete]
```

Character inserters.

**Parameters**

<code>__out</code>	An output stream.
<code>__c</code>	A character.

**Returns**

`out`

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

**operator<<()** [9/24]

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
    basic_ostream< char, _Traits > & ,
    char32_t ) [delete]
```

Character inserters.

**Parameters**

<code>__out</code>	An output stream.
<code>__c</code>	A character.

**Returns**

`out`

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

**operator<<()** [10/24]

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
    basic_ostream< char, _Traits > & ,
    const char16_t * ) [delete]
```

String inserters.

**Parameters**

<code>__out</code>	An output stream.
<code>__s</code>	A character string.

**Returns**

`out`

**Precondition**

`__s` must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at `__s`, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

**operator<<()** [11/24]

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
    basic_ostream< char, _Traits > & ,
    const char32_t * ) [delete]
```

String inserters.

**Parameters**

<code>__out</code>	An output stream.
<code>__s</code>	A character string.

**Returns**

`out`

**Precondition**

`__s` must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at `__s`, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

**operator<<() [12/24]**

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
    basic_ostream< char, _Traits > & ,
    const wchar_t * ) [delete]
```

String inserters.

**Parameters**

<code>__out</code>	An output stream.
<code>__s</code>	A character string.

**Returns**

`out`

**Precondition**

`__s` must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at `__s`, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

**operator<<() [13/24]**

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
    basic_ostream< char, _Traits > & ,
    wchar_t ) [delete]
```

Character inserters.

**Parameters**

<code>__out</code>	An output stream.
<code>__c</code>	A character.

**Returns**

out

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

**operator<<()** [14/24]

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
    basic_ostream< char, _Traits > & __out,
    char __c) [inline]
```

Character inserters.

**Parameters**

<code>__out</code>	An output stream.
<code>__c</code>	A character.

**Returns**

out

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

**operator<<()** [15/24]

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
    basic_ostream< char, _Traits > & __out,
    const char * __s) [inline]
```

String inserters.

**Parameters**

<code>__out</code>	An output stream.
<code>__s</code>	A character string.

**Returns**

out

**Precondition**

`__s` must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at `__s`, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

**operator<<()** [16/24]

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
    basic_ostream< char, _Traits > & __out,
    const signed char * __s) [inline]
```

String inserters.

**Parameters**

<code>__out</code>	An output stream.
<code>__s</code>	A character string.

**Returns**

out

**Precondition**

`__s` must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at `__s`, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

**operator<<()** [17/24]

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
    basic_ostream< char, _Traits > & __out,
    const unsigned char * __s) [inline]
```

String inserters.

**Parameters**

<code>__out</code>	An output stream.
<code>__s</code>	A character string.

**Returns**

out

**Precondition**

`__s` must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at `__s`, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

**operator<<()** [18/24]

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
    basic_ostream< char, _Traits > & __out,
    signed char __c) [inline]
```

Character inserters.

## Parameters

<code>__out</code>	An output stream.
<code>__c</code>	A character.

## Returns

out

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

**operator<<()** [19/24]

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
    basic_ostream< char, _Traits > & __out,
    unsigned char __c) [inline]
```

Character inserters.

## Parameters

<code>__out</code>	An output stream.
<code>__c</code>	A character.

## Returns

out

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

**operator<<()** [20/24]

```
template<typename _Traits>
basic_ostream< wchar_t, _Traits > & std::operator<< (
    basic_ostream< wchar_t, _Traits > & ,
    char16_t ) [delete]
```

Character inserters.

## Parameters

<code>__out</code>	An output stream.
<code>__c</code>	A character.

## Returns

out

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

**operator<<()** [21/24]

```
template<typename _Traits>
basic_ostream< wchar_t, _Traits > & std::operator<< (
    basic_ostream< wchar_t, _Traits > & ,
    char32_t ) [delete]
```

Character inserters.

**Parameters**

<code>__out</code>	An output stream.
<code>__c</code>	A character.

**Returns**

`out`

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

**operator<<()** [22/24]

```
template<typename _Traits>
basic_ostream< wchar_t, _Traits > & std::operator<< (
    basic_ostream< wchar_t, _Traits > & ,
    const char16_t * ) [delete]
```

String inserters.

**Parameters**

<code>__out</code>	An output stream.
<code>__s</code>	A character string.

**Returns**

`out`

**Precondition**

`__s` must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at `__s`, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

**operator<<()** [23/24]

```
template<typename _Traits>
basic_ostream< wchar_t, _Traits > & std::operator<< (
    basic_ostream< wchar_t, _Traits > & ,
    const char32_t * ) [delete]
```

String inserters.

## Parameters

<code>__out</code>	An output stream.
<code>__s</code>	A character string.

## Returns

`out`

## Precondition

`__s` must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in `std::basic_ostream`. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at `__s`, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

**operator<<()** [24/24]

```
template<class _CharT, class _Traits, size_t _Nb>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const bitset< _Nb > & __x)
```

Global I/O operators for bitsets.

Direct I/O between streams and bitsets is supported. Output is straightforward. Input will skip whitespace, only accept 0 and 1 characters, and will only extract as many digits as the bitset will hold.

References `std::basic_ios< _CharT, _Traits >::rdbuf()`, `std::basic_ios< _CharT, _Traits >::setstate()`, and `std::basic_ios< _CharT, _Traits >::width()`. Referenced by `std::shared_ptr< _State_base >::operator<<()`.

**operator<=()** [1/5]

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
bool std::operator<= (
    const multimap< _Key, _Tp, _Compare, _Alloc > & __x,
    const multimap< _Key, _Tp, _Compare, _Alloc > & __y) [inline]
```

Based on `operator<`.

**operator<=()** [2/5]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator<= (
    const multiset< _Key, _Compare, _Alloc > & __x,
    const multiset< _Key, _Compare, _Alloc > & __y) [inline]
```

Returns `!(y < x)`

**operator<=()** [3/5]

```
template<typename _Tp, typename _Seq>
bool std::operator<= (
    const queue< _Tp, _Seq > & __x,
    const queue< _Tp, _Seq > & __y) [inline], [nodiscard]
```

Based on `operator<`.

**operator<=()** [4/5]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator<= (
    const set< _Key, _Compare, _Alloc > & __x,
    const set< _Key, _Compare, _Alloc > & __y) [inline]
```

Returns `!(y < x)`

**operator<=()** [5/5]

```
template<typename _Tp, typename _Seq>
bool std::operator<= (
    const stack< _Tp, _Seq > & __x,
    const stack< _Tp, _Seq > & __y) [inline], [nodiscard]
```

Based on `operator<`.

**operator<=>()** [1/7]

```
template<typename _CharT, typename _Traits, typename _Alloc>
auto std::operator<=> (
    const basic_string< _CharT, _Traits, _Alloc > & __lhs,
    const _CharT * __rhs) -> decltype(__detail::__char_traits_cmp_cat<_Traits>(0)) [nodiscard],
[constexpr], [noexcept]
```

Three-way comparison of a string and a C string.

**Parameters**

<code>__lhs</code>	A string.
<code>__rhs</code>	A null-terminated string.

**Returns**

A value indicating whether `__lhs` is less than, equal to, greater than, or incomparable with `__rhs`.

**operator<=>()** [2/7]

```
template<typename _CharT, typename _Traits, typename _Alloc>
auto std::operator<=> (
    const basic_string< _CharT, _Traits, _Alloc > & __lhs,
    const basic_string< _CharT, _Traits, _Alloc > & __rhs) -> decltype(__detail::__↔
char_traits_cmp_cat<_Traits>(0)) [nodiscard], [constexpr], [noexcept]
```

Three-way comparison of a string and a C string.

**Parameters**

<code>__lhs</code>	A string.
<code>__rhs</code>	A null-terminated string.

**Returns**

A value indicating whether `__lhs` is less than, equal to, greater than, or incomparable with `__rhs`.

**operator<=>() [3/7]**

```
template<typename _Tp, typename _Alloc>
__detail::__synth3way_t< _Tp > std::operator<=> (
    const deque< _Tp, _Alloc > & __x,
    const deque< _Tp, _Alloc > & __y) [inline], [nodiscard]
```

Deque ordering relation.

**Parameters**

$\leftrightarrow$ __x	A deque.
$\leftrightarrow$ __y	A deque of the same type as __x.

**Returns**

A value indicating whether \_\_x is less than, equal to, greater than, or incomparable with \_\_y.

See `std::lexicographical_compare_three_way()` for how the determination is made. This operator is used to synthesize relational operators like < and >= etc.

References [std::deque< \\_Tp, \\_Alloc >::begin\(\)](#), [std::deque< \\_Tp, \\_Alloc >::end\(\)](#), and [std::deque< \\_Tp, \\_Alloc >::size\(\)](#).

**operator<=>() [4/7]**

```
template<typename _Tp, typename _Alloc>
__detail::__synth3way_t< _Tp > std::operator<=> (
    const forward_list< _Tp, _Alloc > & __x,
    const forward_list< _Tp, _Alloc > & __y) [inline], [nodiscard]
```

Forward list ordering relation.

**Parameters**

$\leftrightarrow$ __x	A forward_list.
$\leftrightarrow$ __y	A forward_list of the same type as __x.

**Returns**

A value indicating whether \_\_x is less than, equal to, greater than, or incomparable with \_\_y.

See `std::lexicographical_compare_three_way()` for how the determination is made. This operator is used to synthesize relational operators like < and >= etc.

**operator<=>() [5/7]**

```
template<typename _Tp, typename _Alloc>
__detail::__synth3way_t< _Tp > std::operator<=> (
    const list< _Tp, _Alloc > & __x,
    const list< _Tp, _Alloc > & __y) [inline], [nodiscard]
```

List ordering relation.

**Parameters**

$\leftrightarrow$ __x	A list.
$\leftrightarrow$ __y	A list of the same type as __x.

**Returns**

A value indicating whether \_\_x is less than, equal to, greater than, or incomparable with \_\_y.

See `std::lexicographical_compare_three_way()` for how the determination is made. This operator is used to synthesize relational operators like `<` and `>=` etc.

References `std::list<_Tp, _Alloc>::begin()`, `std::list<_Tp, _Alloc>::end()`, and `std::list<_Tp, _Alloc>::size()`.

**operator<=>() [6/7]**

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
__detail::__synth3way_t< pair< const _Key, _Tp > > std::operator<=> (
    const map< _Key, _Tp, _Compare, _Alloc > & __x,
    const map< _Key, _Tp, _Compare, _Alloc > & __y) [inline]
```

Map ordering relation.

**Parameters**

$\leftrightarrow$ __x	A map.
$\leftrightarrow$ __y	A map of the same type as x.

**Returns**

A value indicating whether \_\_x is less than, equal to, greater than, or incomparable with \_\_y.

This is a total ordering relation. It is linear in the size of the maps. The elements must be comparable with `<`.

See `std::lexicographical_compare_three_way()` for how the determination is made. This operator is used to synthesize relational operators like `<` and `>=` etc.

**operator<=>() [7/7]**

```
template<typename _Tp, typename _Alloc>
__detail::__synth3way_t< _Tp > std::operator<=> (
    const vector< _Tp, _Alloc > & __x,
    const vector< _Tp, _Alloc > & __y) [nodiscard], [constexpr]
```

Vector ordering relation.

**Parameters**

$\leftrightarrow$ __x	A vector.
$\leftrightarrow$ __y	A vector of the same type as __x.

**Returns**

A value indicating whether `__x` is less than, equal to, greater than, or incomparable with `__y`.

See `std::lexicographical_compare_three_way()` for how the determination is made. This operator is used to synthesize relational operators like `<` and `>=` etc.

References [std::vector<\\_Tp, \\_Alloc>::begin\(\)](#), [std::vector<\\_Tp, \\_Alloc>::end\(\)](#), and [lexicographical\\_compare\\_three\\_way\(\)](#).

**operator==(** [1/14]

```
template<typename _CharT, typename _Traits, typename _Alloc>
bool std::operator==(
    const basic_string<_CharT, _Traits, _Alloc> & __lhs,
    const _CharT * __rhs) [inline], [nodiscard], [constexpr]
```

Test equivalence of string and C string.

**Parameters**

<code>__lhs</code>	String.
<code>__rhs</code>	C string.

**Returns**

True if `__lhs.compare(__rhs) == 0`. False otherwise.

References [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::data\(\)](#), and [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::size\(\)](#).

**operator==(** [2/14]

```
template<typename _CharT, typename _Traits, typename _Alloc>
bool std::operator==(
    const basic_string<_CharT, _Traits, _Alloc> & __lhs,
    const basic_string<_CharT, _Traits, _Alloc> & __rhs) [inline], [nodiscard], [constexpr],
[noexcept]
```

Test equivalence of two strings.

**Parameters**

<code>__lhs</code>	First string.
<code>__rhs</code>	Second string.

**Returns**

True if `__lhs.compare(__rhs) == 0`. False otherwise.

**operator==(** [3/14]

```
template<typename _Tp, typename _Alloc>
bool std::operator==(
    const deque<_Tp, _Alloc> & __x,
    const deque<_Tp, _Alloc> & __y) [inline], [nodiscard]
```

Deque equality comparison.

**Parameters**

$\_x$	A deque.
$\_y$	A deque of the same type as $\_x$ .

**Returns**

True iff the size and elements of the deques are equal.

This is an equivalence relation. It is linear in the size of the deques. Deques are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

**operator==( ) [4/14]**

```
template<typename _Tp, typename _Alloc>
bool std::operator==(
    const forward_list< _Tp, _Alloc > & __lx,
    const forward_list< _Tp, _Alloc > & __ly)
```

Forward list equality comparison.

**Parameters**

$\_lx$	A forward_list
$\_ly$	A forward_list of the same type as $\_lx$ .

**Returns**

True iff the elements of the forward lists are equal.

This is an equivalence relation. It is linear in the number of elements of the forward lists. Deques are considered equivalent if corresponding elements compare equal.

References `std::forward_list< _Tp, _Alloc >::cbegin()`, and `std::forward_list< _Tp, _Alloc >::cend()`.

**operator==( ) [5/14]**

```
template<typename _StateT>
bool std::operator==(
    const fpos< _StateT > & __lhs,
    const fpos< _StateT > & __rhs) [inline]
```

Test if equivalent to another position.

**operator==( ) [6/14]**

```
template<typename _Res, typename... _Args>
bool std::operator==(
    const function< _Res(_Args...) > & __f,
    nullptr_t ) [inline], [noexcept]
```

Test whether a polymorphic function object wrapper is empty.

**Returns**

true if the wrapper has no target, false otherwise

This function will not throw exceptions.

**operator==()** [7/14]

```
template<typename _Tp, typename _Alloc>
bool std::operator== (
    const list< _Tp, _Alloc > & __x,
    const list< _Tp, _Alloc > & __y) [inline], [nodiscard]
```

List equality comparison.

**Parameters**

$\leftarrow$ __x	A list.
$\leftarrow$ __y	A list of the same type as __x.

**Returns**

True iff the size and elements of the lists are equal.

This is an equivalence relation. It is linear in the size of the lists. Lists are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

**operator==()** [8/14]

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
bool std::operator== (
    const map< _Key, _Tp, _Compare, _Alloc > & __x,
    const map< _Key, _Tp, _Compare, _Alloc > & __y) [inline]
```

Map equality comparison.

**Parameters**

$\leftarrow$ __x	A map.
$\leftarrow$ __y	A map of the same type as x.

**Returns**

True iff the size and elements of the maps are equal.

This is an equivalence relation. It is linear in the size of the maps. Maps are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

**operator==()** [9/14]

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
bool std::operator== (
    const multimap< _Key, _Tp, _Compare, _Alloc > & __x,
    const multimap< _Key, _Tp, _Compare, _Alloc > & __y) [inline]
```

Multimap equality comparison.

**Parameters**

$\_x$	A multimap.
$\_y$	A multimap of the same type as $\_x$ .

**Returns**

True iff the size and elements of the maps are equal.

This is an equivalence relation. It is linear in the size of the multimaps. Multimaps are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

**operator==()** [10/14]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator== (
    const multiset< _Key, _Compare, _Alloc > & __x,
    const multiset< _Key, _Compare, _Alloc > & __y) [inline]
```

Multiset equality comparison.

**Parameters**

$\_x$	A multiset.
$\_y$	A multiset of the same type as $\_x$ .

**Returns**

True iff the size and elements of the multisets are equal.

This is an equivalence relation. It is linear in the size of the multisets. Multisets are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

**operator==()** [11/14]

```
template<typename _Tp, typename _Seq>
bool std::operator== (
    const queue< _Tp, _Seq > & __x,
    const queue< _Tp, _Seq > & __y) [inline], [nodiscard]
```

Queue equality comparison.

**Parameters**

$\_x$	A queue.
$\_y$	A queue of the same type as $\_x$ .

**Returns**

True iff the size and elements of the queues are equal.

This is an equivalence relation. Complexity and semantics depend on the underlying sequence type, but the expected rules are: this relation is linear in the size of the sequences, and queues are considered equivalent if their sequences compare equal.

References [std::queue<\\_Tp, \\_Sequence>::c](#).

**operator==()** [12/14]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator== (
    const set< _Key, _Compare, _Alloc > & __x,
    const set< _Key, _Compare, _Alloc > & __y) [inline]
```

Set equality comparison.

**Parameters**

<a href="#">_X</a>	A set.
<a href="#">_Y</a>	A set of the same type as x.

**Returns**

True iff the size and elements of the sets are equal.

This is an equivalence relation. It is linear in the size of the sets. Sets are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

**operator==()** [13/14]

```
template<typename _Tp, typename _Seq>
bool std::operator== (
    const stack< _Tp, _Seq > & __x,
    const stack< _Tp, _Seq > & __y) [inline], [nodiscard]
```

Stack equality comparison.

**Parameters**

<a href="#">_X</a>	A stack.
<a href="#">_Y</a>	A stack of the same type as __x.

**Returns**

True iff the size and elements of the stacks are equal.

This is an equivalence relation. Complexity and semantics depend on the underlying sequence type, but the expected rules are: this relation is linear in the size of the sequences, and stacks are considered equivalent if their sequences compare equal.

**operator==( )** [14/14]

```
template<typename _Tp, typename _Alloc>
bool std::operator==(
    const vector< _Tp, _Alloc > & __x,
    const vector< _Tp, _Alloc > & __y) [inline], [nodiscard], [constexpr]
```

Vector equality comparison.

**Parameters**

<code>__x</code>	A vector.
<code>__y</code>	A vector of the same type as <code>__x</code> .

**Returns**

True iff the size and elements of the vectors are equal.

This is an equivalence relation. It is linear in the size of the vectors. Vectors are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

References `std::vector< _Tp, _Alloc >::begin()`, `std::vector< _Tp, _Alloc >::end()`, and `std::vector< _Tp, _Alloc >::size()`.

**operator>() [1/5]**

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
bool std::operator> (
    const multimap< _Key, _Tp, _Compare, _Alloc > & __x,
    const multimap< _Key, _Tp, _Compare, _Alloc > & __y) [inline]
```

Based on `operator<`.

**operator>() [2/5]**

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator> (
    const multiset< _Key, _Compare, _Alloc > & __x,
    const multiset< _Key, _Compare, _Alloc > & __y) [inline]
```

Returns `y < x`.

**operator>() [3/5]**

```
template<typename _Tp, typename _Seq>
bool std::operator> (
    const queue< _Tp, _Seq > & __x,
    const queue< _Tp, _Seq > & __y) [inline], [nodiscard]
```

Based on `operator<`.

**operator>() [4/5]**

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator> (
    const set< _Key, _Compare, _Alloc > & __x,
    const set< _Key, _Compare, _Alloc > & __y) [inline]
```

Returns `y < x`.

**operator>()** [5/5]

```
template<typename _Tp, typename _Seq>
bool std::operator> (
    const stack< _Tp, _Seq > & __x,
    const stack< _Tp, _Seq > & __y) [inline], [nodiscard]
```

Based on operator<.

**operator>=()** [1/5]

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
bool std::operator>= (
    const multimap< _Key, _Tp, _Compare, _Alloc > & __x,
    const multimap< _Key, _Tp, _Compare, _Alloc > & __y) [inline]
```

Based on operator<.

**operator>=()** [2/5]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator>= (
    const multiset< _Key, _Compare, _Alloc > & __x,
    const multiset< _Key, _Compare, _Alloc > & __y) [inline]
```

Returns !(x < y)

**operator>=()** [3/5]

```
template<typename _Tp, typename _Seq>
bool std::operator>= (
    const queue< _Tp, _Seq > & __x,
    const queue< _Tp, _Seq > & __y) [inline], [nodiscard]
```

Based on operator<.

**operator>=()** [4/5]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator>= (
    const set< _Key, _Compare, _Alloc > & __x,
    const set< _Key, _Compare, _Alloc > & __y) [inline]
```

Returns !(x < y)

**operator>=()** [5/5]

```
template<typename _Tp, typename _Seq>
bool std::operator>= (
    const stack< _Tp, _Seq > & __x,
    const stack< _Tp, _Seq > & __y) [inline], [nodiscard]
```

Based on operator<.

**operator>>()** [1/10]

```
template<typename _Istream, typename _Tp>
__rvalue_stream_extraction_t< _Istream, _Tp > std::operator>> (
    _Istream && __is,
    _Tp && __x) [inline]
```

Generic extractor for rvalue stream.

**Parameters**

<a href="#"></a> <code>_is</code>	An input stream.
<a href="#"></a> <code>_x</code>	A reference to the extraction target.

**Returns**`__is`

This is just a forwarding function to allow extraction from rvalue streams since they won't bind to the extractor functions that take an lvalue reference.

References [forward\(\)](#), and [move\(\)](#).

**operator>>() [2/10]**

```
template<typename _CharT, typename _Traits>
basic_istream< _CharT, _Traits > & std::operator>> (
    basic_istream< _CharT, _Traits > & __in,
    _CharT & __c)
```

Character extractors.

**Parameters**

<a href="#"></a> <code>_in</code>	An input stream.
<a href="#"></a> <code>_c</code>	A character reference.

**Returns**`in`

Behaves like one of the formatted arithmetic extractors described in `std::basic_istream`. After constructing a sentry object with good status, this function extracts a character (if one is available) and stores it in `__c`. Otherwise, sets failbit in the input stream.

References [std::ios\\_base::badbit](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), [std::basic\\_ios< \\_CharT, \\_Traits >::rdstate\(\)](#), and [std::basic\\_ios< \\_CharT, \\_Traits >::setstate\(\)](#).

**operator>>() [3/10]**

```
template<typename _CharT, typename _Traits, size_t _Num>
basic_istream< _CharT, _Traits > & std::operator>> (
    basic_istream< _CharT, _Traits > & __in,
    _CharT (&) __s[_Num]) [inline]
```

Character string extractors.

**Parameters**

<a href="#"></a> <code>_in</code>	An input stream.
<a href="#"></a> <code>_s</code>	A character array (or a pointer to an array before C++20).

**Returns**`__in`

Behaves like one of the formatted arithmetic extractors described in `std::basic_istream`. After constructing a sentry object with good status, this function extracts up to `n` characters and stores them into the array `__s`. `n` is defined as:

- if `width()` is greater than zero, `n` is `min(width(), n)`
- otherwise `n` is the number of elements of the array
- (before C++20 the pointer is assumed to point to an array of the largest possible size for an array of `char_type`).

Characters are extracted and stored until one of the following happens:

- `n - 1` characters are stored
- EOF is reached
- the next character is whitespace according to the current locale

`width(0)` is then called for the input stream.

If no characters are extracted, sets failbit.

**operator>>() [4/10]**

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
basic_istream< _CharT, _Traits > & std::operator>> (
    basic_istream< _CharT, _Traits > & __is,
    __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base > & __str)
```

Read stream into a string.

**Parameters**

<code>__is</code>	Input stream.
<code>__str</code>	Buffer to store into.

**Returns**

Reference to the input stream.

Stores characters from `__is` into `__str` until whitespace is found, the end of the stream is encountered, or `str.max_size()` is reached. If `is.width()` is non-zero, that is the limit on the number of characters stored into `__str`. Any previous contents of `__str` are erased.

References `std::ios_base::getloc()`, `std::basic_ios< _CharT, _Traits >::rdbuf()`, `std::basic_ios< _CharT, _Traits >::setstate()`, `use_facet()`, and `std::ios_base::width()`.

**operator>>() [5/10]**

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_istream< _CharT, _Traits > & std::operator>> (
    basic_istream< _CharT, _Traits > & __is,
    basic_string< _CharT, _Traits, _Alloc > & __str)
```

Read stream into a string.

**Parameters**

<code>__is</code>	Input stream.
<code>__str</code>	Buffer to store into.

**Returns**

Reference to the input stream.

Stores characters from `__is` into `__str` until whitespace is found, the end of the stream is encountered, or `str.max_size()` is reached. If `is.width()` is non-zero, that is the limit on the number of characters stored into `__str`. Any previous contents of `__str` are erased.

References `std::basic_string<_CharT, _Traits, _Alloc>::append()`, `std::basic_string<_CharT, _Traits, _Alloc>::erase()`, `std::ios_base::getloc()`, `std::basic_string<_CharT, _Traits, _Alloc>::max_size()`, `std::basic_ios<_CharT, _Traits>::rdbuf()`, `std::basic_ios<_CharT, _Traits>::setstate()`, `use_facet()`, and `std::ios_base::width()`.

**operator>>() [6/10]**

```
template<class _Traits>
basic_istream< char, _Traits > & std::operator>> (
    basic_istream< char, _Traits > & __in,
    signed char & __c) [inline]
```

Character extractors.

**Parameters**

<code>__in</code>	An input stream.
<code>__c</code>	A character reference.

**Returns**

`in`

Behaves like one of the formatted arithmetic extractors described in `std::basic_istream`. After constructing a sentry object with good status, this function extracts a character (if one is available) and stores it in `__c`. Otherwise, sets failbit in the input stream.

**operator>>() [7/10]**

```
template<class _Traits, size_t _Num>
basic_istream< char, _Traits > & std::operator>> (
    basic_istream< char, _Traits > & __in,
    signed char(&) __s[_Num]) [inline]
```

Character string extractors.

**Parameters**

<code>__in</code>	An input stream.
<code>__s</code>	A character array (or a pointer to an array before C++20).

**Returns**`__in`

Behaves like one of the formatted arithmetic extractors described in `std::basic_istream`. After constructing a sentry object with good status, this function extracts up to `n` characters and stores them into the array `__s`. `n` is defined as:

- if `width()` is greater than zero, `n` is `min(width(), n)`
- otherwise `n` is the number of elements of the array
- (before C++20 the pointer is assumed to point to an array of the largest possible size for an array of `char_type`).

Characters are extracted and stored until one of the following happens:

- `n - 1` characters are stored
- EOF is reached
- the next character is whitespace according to the current locale

`width(0)` is then called for the input stream.

If no characters are extracted, sets failbit.

**operator>>() [8/10]**

```
template<class _Traits>
basic_istream< char, _Traits > & std::operator>> (
    basic_istream< char, _Traits > & __in,
    unsigned char & __c) [inline]
```

Character extractors.

**Parameters**

<code>__in</code>	An input stream.
<code>__c</code>	A character reference.

**Returns**`in`

Behaves like one of the formatted arithmetic extractors described in `std::basic_istream`. After constructing a sentry object with good status, this function extracts a character (if one is available) and stores it in `__c`. Otherwise, sets failbit in the input stream.

**operator>>() [9/10]**

```
template<class _Traits, size_t _Num>
basic_istream< char, _Traits > & std::operator>> (
    basic_istream< char, _Traits > & __in,
    unsigned char(&) __s[_Num]) [inline]
```

Character string extractors.

**Parameters**

$\leftrightarrow$ _in	An input stream.
$\leftrightarrow$ _s	A character array (or a pointer to an array before C++20).

**Returns**

\_\_in

Behaves like one of the formatted arithmetic extractors described in `std::basic_istream`. After constructing a sentry object with good status, this function extracts up to `n` characters and stores them into the array `__s`. `n` is defined as:

- if `width()` is greater than zero, `n` is `min(width(), n)`
- otherwise `n` is the number of elements of the array
- (before C++20 the pointer is assumed to point to an array of the largest possible size for an array of `char_type`).

Characters are extracted and stored until one of the following happens:

- `n - 1` characters are stored
- EOF is reached
- the next character is whitespace according to the current locale

`width(0)` is then called for the input stream.

If no characters are extracted, sets failbit.

**operator>>() [10/10]**

```
template<class _CharT, class _Traits, size_t _Nb>
std::basic_istream< _CharT, _Traits > & std::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    bitset< _Nb > & __x)
```

Global I/O operators for bitsets.

Direct I/O between streams and bitsets is supported. Output is straightforward. Input will skip whitespace, only accept `0` and `1` characters, and will only extract as many digits as the bitset will hold.

**operator^()**

```
template<size_t _Nb>
bitset< _Nb > std::operator^ (
    const bitset< _Nb > & __x,
    const bitset< _Nb > & __y) [inline], [constexpr], [noexcept]
```

Global bitwise operations on bitsets.

**Parameters**

$\leftrightarrow$ _x	A bitset.
$\leftrightarrow$ _y	A bitset of the same size as <code>__x</code> .

**Returns**

A new bitset.

These should be self-explanatory.

**operator" | ()**

```
template<size_t _Nb>
bitset< _Nb > std::operator| (
    const bitset< _Nb > & __x,
    const bitset< _Nb > & __y) [inline], [constexpr], [noexcept]
```

Global bitwise operations on bitsets.

**Parameters**

<code>__x</code>	A bitset.
<code>__y</code>	A bitset of the same size as <code>__x</code> .

**Returns**

A new bitset.

These should be self-explanatory.

**put\_money()**

```
template<typename _MoneyT>
_Put_money< _MoneyT > std::put_money (
    const _MoneyT & __mon,
    bool __intl = false) [inline]
```

Extended manipulator for inserting money.

**Parameters**

<code>__mon</code>	Either long double or a specialization of <code>basic_string</code> .
<code>__intl</code>	A bool indicating whether international format is to be used.

Sent to a stream object, this manipulator inserts `__mon`.

**put\_time()**

```
template<typename _CharT>
_Put_time< _CharT > std::put_time (
    const std::tm * __tmb,
    const _CharT * __fmt) [inline]
```

Extended manipulator for formatting time.

This manipulator uses `time_put::put` to format time. [ext.manip]

**Parameters**

<code>__tmb</code>	struct tm time data to format.
<code>__fmt</code>	format string.

**rbegin()** [1/4]

```
template<typename _Container>
auto std::rbegin (
    _Container & __cont) -> decltype(__cont.rbegin())    [inline], [constexpr], [noexcept]
```

Return a reverse iterator pointing to the last element of the container.

**Parameters**

<code>__cont</code>	Container.
---------------------	------------

Referenced by [crbegin\(\)](#).

**rbegin()** [2/4]

```
template<typename _Tp, size_t _Nm>
reverse_iterator< _Tp * > std::rbegin (
    _Tp(&) __arr[_Nm])    [inline], [constexpr], [noexcept]
```

Return a reverse iterator pointing to the last element of the array.

**Parameters**

<code>__arr</code>	Array.
--------------------	--------

**rbegin()** [3/4]

```
template<typename _Container>
auto std::rbegin (
    const _Container & __cont) -> decltype(__cont.rbegin())    [inline], [constexpr],
[noexcept]
```

Return a reverse iterator pointing to the last element of the const container.

**Parameters**

<code>__cont</code>	Container.
---------------------	------------

**rbegin()** [4/4]

```
template<typename _Tp>
reverse_iterator< const _Tp * > std::rbegin (
    initializer_list< _Tp > __il)    [inline], [constexpr], [noexcept]
```

Return a reverse iterator pointing to the last element of the `initializer_list`.

**Parameters**

<code>__il</code>	<code>initializer_list</code> .
-------------------	---------------------------------

**rend()** [1/4]

```
template<typename _Container>
auto std::rend (
    _Container & __cont) -> decltype(__cont.rend())    [inline], [constexpr], [noexcept]
```

Return a reverse iterator pointing one past the first element of the container.

## Parameters

<code>__cont</code>	Container.
---------------------	------------

Referenced by [crend\(\)](#).

**rend()** [2/4]

```
template<typename _Tp, size_t _Nm>
reverse_iterator< _Tp * > std::rend (
    _Tp(&) __arr[_Nm]) [inline], [constexpr], [noexcept]
```

Return a reverse iterator pointing one past the first element of the array.

## Parameters

<code>__arr</code>	Array.
--------------------	--------

**rend()** [3/4]

```
template<typename _Container>
auto std::rend (
    const _Container & __cont) -> decltype(__cont.rend()) [inline], [constexpr], [noexcept]
```

Return a reverse iterator pointing one past the first element of the const container.

## Parameters

<code>__cont</code>	Container.
---------------------	------------

**rend()** [4/4]

```
template<typename _Tp>
reverse_iterator< const _Tp * > std::rend (
    initializer_list< _Tp > __il) [inline], [constexpr], [noexcept]
```

Return a reverse iterator pointing one past the first element of the `initializer_list`.

## Parameters

<code>__il</code>	initializer_list.
-------------------	-------------------

**replace\_copy()**

```
template<typename _InputIterator, typename _OutputIterator, typename _Tp>
_OutputIterator std::replace_copy (
    _InputIterator __first,
    _InputIterator __last,
    _OutputIterator __result,
    const _Tp & __old_value,
    const _Tp & __new_value) [inline], [constexpr]
```

Copy a sequence, replacing each element of one value with another value.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__result</code>	An output iterator.
<code>__old_value</code>	The value to be replaced.
<code>__new_value</code>	The replacement value.

## Returns

The end of the output sequence, `result+(last-first)`.

Copies each element in the input range `[__first,__last)` to the output range `[__result,__result+(__last-__first))` replacing elements equal to `__old_value` with `__new_value`.

**resetiosflags()**

```
_Resetiosflags std::resetiosflags (
    ios_base::fmtflags __mask) [inline]
```

Manipulator for `setf`.

## Parameters

<code>__mask</code>	A format flags mask.
---------------------	----------------------

Sent to a stream object, this manipulator resets the specified flags, via `stream.setf(0,__mask)`.

References [std::ios\\_base::fmtflags](#).

**return\_temporary\_buffer()**

```
template<typename _Tp>
void std::return_temporary_buffer (
    _Tp * __p) [inline]
```

The companion to `get_temporary_buffer()`.

## Parameters

<code>__p</code>	A buffer previously allocated by <code>get_temporary_buffer</code> .
------------------	--

## Returns

None.

Frees the memory pointed to by `__p`.

**right()**

```
ios_base & std::right (
    ios_base & __base) [inline]
```

Calls `base.setf(ios_base::right, ios_base::adjustfield)`.

References [std::ios\\_base::adjustfield](#), and [std::ios\\_base::right](#).

**sample()**

```
template<typename _PopulationIterator, typename _SampleIterator, typename _Distance, typename _URBG
UniformRandomBitGenerator>
_SampleIterator std::sample (
    _PopulationIterator __first,
    _PopulationIterator __last,
    _SampleIterator __out,
    _Distance __n,
    _UniformRandomBitGenerator && __g)
```

Take a random sample from a population.

References [forward\(\)](#).

**scientific()**

```
ios_base & std::scientific (
    ios_base & __base) [inline]
```

Calls `base.setf(ios_base::scientific, ios_base::floatfield)`.

References [std::ios\\_base::floatfield](#), and [std::ios\\_base::scientific](#).

**search()**

```
template<typename _ForwardIterator, typename _Searcher>
_FForwardIterator std::search (
    _ForwardIterator __first,
    _ForwardIterator __last,
    const _Searcher & __searcher) [inline], [nodiscard], [constexpr]
```

Search a sequence using a Searcher object.

**Parameters**

<code>__first</code>	A forward iterator.
<code>__last</code>	A forward iterator.
<code>__searcher</code>	A callable object.

**Returns**

```
__searcher(__first, __last).first
```

**set\_new\_handler()**

```
new_handler std::set_new_handler (
    new_handler ) throw ( )
```

Takes a replacement handler as the argument, returns the previous handler.

**setbase()**

```
_Setbase std::setbase (
    int __base) [inline]
```

Manipulator for `setf`.

**Parameters**

<code>__base</code>	A numeric base.
---------------------	-----------------

---

Sent to a stream object, this manipulator changes the `ios_base::basefield` flags to `oct`, `dec`, or `hex` when `base` is 8, 10, or 16, accordingly, and to 0 if `__base` is any other value.

**setfill()**

```
template<typename _CharT>
_Setfill<_CharT> std::setfill (
    _CharT __c) [inline]
```

Manipulator for `fill`.

**Parameters**

<code>__c</code>	The new fill character.
------------------	-------------------------

Sent to a stream object, this manipulator calls `fill(__c)` for that object.

**setiosflags()**

```
_Setiosflags std::setiosflags (
    ios_base::fmtflags __mask) [inline]
```

Manipulator for `setf`.

**Parameters**

<code>__mask</code>	A format flags mask.
---------------------	----------------------

Sent to a stream object, this manipulator sets the format flags to `__mask`.  
References [std::ios\\_base::fmtflags](#).

**setprecision()**

```
_Setprecision std::setprecision (
    int __n) [inline]
```

Manipulator for `precision`.

**Parameters**

<code>__n</code>	The new precision.
------------------	--------------------

Sent to a stream object, this manipulator calls `precision(__n)` for that object.

**setw()**

```
_Setw std::setw (
    int __n) [inline]
```

Manipulator for `width`.

**Parameters**

<code>__n</code>	The new width.
------------------	----------------

Sent to a stream object, this manipulator calls `width(__n)` for that object.

**showbase()**

```
ios_base & std::showbase (
    ios_base & __base) [inline]
```

Calls `base.setf(ios_base::showbase)`.

References [std::ios\\_base::showbase](#).

**showpoint()**

```
ios_base & std::showpoint (
    ios_base & __base) [inline]
```

Calls `base.setf(ios_base::showpoint)`.

References [std::ios\\_base::showpoint](#).

**showpos()**

```
ios_base & std::showpos (
    ios_base & __base) [inline]
```

Calls `base.setf(ios_base::showpos)`.

References [std::ios\\_base::showpos](#).

**size()** [1/2]

```
template<typename _Container>
auto std::size (
    const _Container & __cont) -> decltype(__cont.size()) [nodiscard], [constexpr],
[noexcept]
```

Return the size of a container.

**Parameters**

<code>__cont</code>	Container.
---------------------	------------

Referenced by [std::basic\\_stringbuf< char >::basic\\_stringbuf\(\)](#), [std::deque< \\_Tp, \\_Alloc >::M\\_new\\_elements\\_at\\_back\(\)](#), [std::deque< \\_Tp, \\_Alloc >::M\\_new\\_elements\\_at\\_front\(\)](#), [std::deque< \\_Tp, \\_Alloc >::M\\_push\\_back\\_aux\(\)](#), [std::deque< \\_Tp, \\_Alloc >::find\(\)](#), [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::find\(\)](#), [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::find\\_first\\_not\\_of\(\)](#), [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::find\\_first\\_of\(\)](#), [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::find\\_last\\_not\\_of\(\)](#), [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::find\\_last\\_of\(\)](#), [std::deque< \\_Tp, \\_Alloc >::operator=\(\)](#), [std::vector< \\_Tp, \\_Alloc >::operator=\(\)](#), [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::reserve\(\)](#), [std::vector< \\_Tp, \\_Alloc >::reserve\(\)](#), [std::vector< \\_State< \\_TraitsT::char\\_type >, \\_Alloc >::reserve\(\)](#), [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::rfind\(\)](#), and [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::rfind\(\)](#).

**size()** [2/2]

```
template<typename _Tp, size_t _Nm>
size_t std::size (
    const _Tp(&)[_Nm]) [nodiscard], [constexpr], [noexcept]
```

Return the size of an array.

**skipws()**

```
ios_base & std::skipws (
    ios_base & __base) [inline]
```

Calls base.setf(ios\_base::skipws).

References [std::ios\\_base::skipws](#).

**static\_pointer\_cast()**

```
template<typename _Tp, typename _Tp1, _Lock_policy _Lp>
__shared_ptr< _Tp, _Lp > std::static_pointer_cast (
    const __shared_ptr< _Tp1, _Lp > & __r) [inline], [noexcept]
```

static\_pointer\_cast

**swap()** [1/19]

```
template<class _CharT, class _Traits>
void std::swap (
    basic_filebuf< _CharT, _Traits > & __x,
    basic_filebuf< _CharT, _Traits > & __y) [inline]
```

Swap specialization for filebufs.

**swap()** [2/19]

```
template<class _CharT, class _Traits>
void std::swap (
    basic_fstream< _CharT, _Traits > & __x,
    basic_fstream< _CharT, _Traits > & __y) [inline]
```

Swap specialization for fstreams.

**swap()** [3/19]

```
template<class _CharT, class _Traits>
void std::swap (
    basic_ifstream< _CharT, _Traits > & __x,
    basic_ifstream< _CharT, _Traits > & __y) [inline]
```

Swap specialization for ifstreams.

**swap()** [4/19]

```
template<class _CharT, class _Traits, class _Allocator>
void std::swap (
    basic_istringstream< _CharT, _Traits, _Allocator > & __x,
    basic_istringstream< _CharT, _Traits, _Allocator > & __y) [inline]
```

Swap specialization for istringstreams.

**swap()** [5/19]

```
template<class _CharT, class _Traits>
void std::swap (
    basic_ofstream< _CharT, _Traits > & __x,
    basic_ofstream< _CharT, _Traits > & __y) [inline]
```

Swap specialization for ofstreams.

**swap()** [6/19]

```
template<class _CharT, class _Traits, class _Allocator>
void std::swap (
    basic_ostringstream< _CharT, _Traits, _Allocator > & __x,
    basic_ostringstream< _CharT, _Traits, _Allocator > & __y) [inline]
```

Swap specialization for ostringstreams.

**swap()** [7/19]

```
template<typename _CharT, typename _Traits, typename _Alloc>
void std::swap (
    basic_string< _CharT, _Traits, _Alloc > & __lhs,
    basic_string< _CharT, _Traits, _Alloc > & __rhs) [inline], [constexpr], [noexcept]
```

Swap contents of two strings.

**Parameters**

<code>__lhs</code>	First string.
<code>__rhs</code>	Second string.

Exchanges the contents of `__lhs` and `__rhs` in constant time.

**swap()** [8/19]

```
template<class _CharT, class _Traits, class _Allocator>
void std::swap (
    basic_stringbuf< _CharT, _Traits, _Allocator > & __x,
    basic_stringbuf< _CharT, _Traits, _Allocator > & __y) [inline], [noexcept]
```

Swap specialization for stringbufs.

**swap()** [9/19]

```
template<class _CharT, class _Traits, class _Allocator>
void std::swap (
    basic_stringstream< _CharT, _Traits, _Allocator > & __x,
    basic_stringstream< _CharT, _Traits, _Allocator > & __y) [inline]
```

Swap specialization for stringstreams.

**swap()** [10/19]

```
template<typename _Tp, typename _Alloc>
void std::swap (
    deque< _Tp, _Alloc > & __x,
    deque< _Tp, _Alloc > & __y) [inline], [noexcept]
```

See `std::deque::swap()`.

**swap()** [11/19]

```
template<typename _Tp, typename _Alloc>
void std::swap (
    forward_list< _Tp, _Alloc > & __lx,
    forward_list< _Tp, _Alloc > & __ly) [inline], [noexcept]
```

See `std::forward_list::swap()`.

**swap()** [12/19]

```
template<typename _Res, typename... _Args>
void std::swap (
    function< _Res(_Args...)> & __x,
    function< _Res(_Args...)> & __y) [inline], [noexcept]
```

Swap the targets of two polymorphic function object wrappers.

This function will not throw exceptions.

**swap()** [13/19]

```
template<typename _Tp, typename _Alloc>
void std::swap (
    list< _Tp, _Alloc > & __x,
    list< _Tp, _Alloc > & __y) [inline], [noexcept]
```

See [std::list::swap\(\)](#).

**swap()** [14/19]

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
void std::swap (
    map< _Key, _Tp, _Compare, _Alloc > & __x,
    map< _Key, _Tp, _Compare, _Alloc > & __y) [inline], [noexcept]
```

See [std::map::swap\(\)](#).

References [std::pair<\\_T1, \\_T2>::swap\(\)](#).

**swap()** [15/19]

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
void std::swap (
    multimap< _Key, _Tp, _Compare, _Alloc > & __x,
    multimap< _Key, _Tp, _Compare, _Alloc > & __y) [inline], [noexcept]
```

See [std::multimap::swap\(\)](#).

References [std::multimap<\\_Key, \\_Tp, \\_Compare, \\_Alloc>::swap\(\)](#).

**swap()** [16/19]

```
template<typename _Key, typename _Compare, typename _Alloc>
void std::swap (
    multiset< _Key, _Compare, _Alloc > & __x,
    multiset< _Key, _Compare, _Alloc > & __y) [inline], [noexcept]
```

See [std::multiset::swap\(\)](#).

References [std::multiset<\\_Key, \\_Compare, \\_Alloc>::swap\(\)](#).

**swap()** [17/19]

```
template<typename _Key, typename _Compare, typename _Alloc>
void std::swap (
    set< _Key, _Compare, _Alloc > & __x,
    set< _Key, _Compare, _Alloc > & __y) [inline], [noexcept]
```

See [std::set::swap\(\)](#).

References [std::set<\\_Key, \\_Compare, \\_Alloc>::swap\(\)](#).

**swap()** [18/19]

```
template<typename _Tp, typename _Alloc>
void std::swap (
    vector< _Tp, _Alloc > & __x,
    vector< _Tp, _Alloc > & __y) [inline], [constexpr], [noexcept]
```

See `std::vector::swap()`.

**tolower()**

```
template<typename _CharT>
_CharT std::tolower (
    _CharT __c,
    const locale & __loc) [inline]
```

Convenience interface to `ctype::tolower(__c)`.

References [tolower\(\)](#), and [use\\_facet\(\)](#).

Referenced by [tolower\(\)](#).

**toupper()**

```
template<typename _CharT>
_CharT std::toupper (
    _CharT __c,
    const locale & __loc) [inline]
```

Convenience interface to `ctype::toupper(__c)`.

References [toupper\(\)](#), and [use\\_facet\(\)](#).

Referenced by [toupper\(\)](#).

**unitbuf()**

```
ios_base & std::unitbuf (
    ios_base & __base) [inline]
```

Calls `base.setf(ios_base::unitbuf)`.

References [std::ios\\_base::unitbuf](#).

**uppercase()**

```
ios_base & std::uppercase (
    ios_base & __base) [inline]
```

Calls `base.setf(ios_base::uppercase)`.

References [std::ios\\_base::uppercase](#).

**ws()**

```
template<typename _CharT, typename _Traits>
basic_istream< _CharT, _Traits > & std::ws (
    basic_istream< _CharT, _Traits > & __is)
```

Quick and easy way to eat whitespace.

This manipulator extracts whitespace characters, stopping when the next character is non-whitespace, or when the input sequence is empty. If the sequence is empty, `eofbit` is set in the stream, but not `failbit`.

The current locale is used to distinguish whitespace characters.

Example:

```
MyClass mc;

std::cin >> std::ws >> mc;
```

will skip leading whitespace before calling `operator>>` on `cin` and your object. Note that the same effect can be achieved by creating a `std::basic_istream::sentry` inside your definition of `operator>>`.

References [std::ios\\_base::badbit](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::getloc\(\)](#), [std::ios\\_base::goodbit](#), [std::basic\\_ios<\\_CharT, \\_Traits>::std::basic\\_ios<\\_CharT, \\_Traits>::setstate\(\)](#), and [use\\_facet\(\)](#).

#### 4.10.5 Variable Documentation

##### **cerr**

`ostream` `std::cerr` [extern]

Linked to standard error (unbuffered)

##### **cin**

`istream` `std::cin` [extern]

Linked to standard input.

##### **clog**

`ostream` `std::clog` [extern]

Linked to standard error (buffered)

##### **cout**

`ostream` `std::cout` [extern]

Linked to standard output.

##### **default\_sentinel**

`default_sentinel_t` `std::default_sentinel` [inline], [constexpr]

A default sentinel value.

##### **destroying\_delete**

`destroying_delete_t` `std::destroying_delete` [inline], [constexpr]

Tag variable of type `destroying_delete_t`.

##### **ignore**

`_Swallow_assign` `std::ignore` [inline], [constexpr]

Used with `std::tie` to ignore an element of a tuple

When using `std::tie` to assign the elements of a tuple to variables, unwanted elements can be ignored by using `std::ignore`. For example:

```
int x, y;  
std::tie(x, std::ignore, y) = std::make_tuple(1, 2, 3);
```

This assignment will perform `x=1; std::ignore=2; y=3;` which results in the second element being ignored.

Since

C++11

##### **wcerr**

`wostream` `std::wcerr` [extern]

Linked to standard error (unbuffered)

## wcin

`wistream` `std::wcin` [extern]

Linked to standard input.

## wclog

`wostream` `std::wclog` [extern]

Linked to standard error (buffered)

## wcout

`wostream` `std::wcout` [extern]

Linked to standard output.

## 4.11 std::\_\_debug Namespace Reference

#### 4.11.1 Detailed Description

GNU debug code, replaces standard behavior with debug behavior.

Macros and namespaces used by the implementation outside of debug wrappers to verify certain properties. The `__glibcxx_requires_xxx` macros are merely wrappers around the `__glibcxx_check_xxx` wrappers when we are compiling with debug mode, but disappear when we are in release mode so that there is no checking performed in, e.g., the standard library algorithms.

#### 4.11.2 Function Documentation

##### swap()

```
template<typename _Tp, typename _Alloc>
void std::__debug::swap (
    forward_list< _Tp, _Alloc > & __lx,
    forward_list< _Tp, _Alloc > & __ly) [inline], [noexcept]
```

See `std::forward_list::swap()`.

### 4.12.1 Detailed Description

Implementation details not part of the namespace std interface.

#### 4.12.2 Function Documentation

##### `__from_chars_alnum()`

```
template<bool _DecOnly, typename _Tp>
bool std::__detail::__from_chars_alnum (
    const char *& __first,
    const char * __last,
    _Tp & __val,
    int __base) [constexpr]
```

`std::from_chars` implementation for integers in any base. If `_DecOnly` is true, then we may assume `__base` is at most 10.

Referenced by [std::from\\_chars\(\)](#).

##### `__from_chars_pow2_base()`

```
template<bool _DecOnly, typename _Tp>
bool std::__detail::__from_chars_pow2_base (
    const char *& __first,
    const char * __last,
    _Tp & __val,
    int __base) [constexpr]
```

`std::from_chars` implementation for integers in a power-of-two base. If `_DecOnly` is true, then we may assume `__base` is at most 8.

Referenced by [std::from\\_chars\(\)](#).

##### `operator<<()` [1/2]

```
template<typename _CharT, typename _Traits, typename _String>
std::basic_ostream< _CharT, _Traits > & std::__detail::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const _Quoted_string< _String, _CharT > & __str)
```

Insertter for quoted strings.

##### `operator<<()` [2/2]

```
template<typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::__detail::operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const _Quoted_string< const _CharT *, _CharT > & __str)
```

Insertter for quoted strings.

##### `operator>>()`

```
template<typename _CharT, typename _Traits, typename _Alloc>
std::basic_istream< _CharT, _Traits > & std::__detail::operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    const _Quoted_string< basic_string< _CharT, _Traits, _Alloc > &, _CharT > & __str)
```

Extractor for delimited strings. The left and right delimiters can be different.

#### 4.13.1 Detailed Description

GNU parallel code, replaces standard behavior with parallel behavior.

#### 4.13.2 Function Documentation

##### search()

```
template<typename _ForwardIterator, typename _Searcher>
_FowardIterator std::__parallel::search (
    _ForwardIterator __first,
```

```
    _ForwardIterator __last,  
    const _Searcher & __searcher) [inline]
```

Search a sequence using a Searcher object.

#### Parameters

|                         |                     |
|-------------------------|---------------------|
| <code>__first</code>    | A forward iterator. |
| <code>__last</code>     | A forward iterator. |
| <code>__searcher</code> | A callable object.  |

#### Returns

```
__searcher(__first,__last).first
```

#### 4.15.1 Detailed Description

ISO/IEC TR 24733 Decimal floating-point arithmetic.

#### 4.15.2 Function Documentation

##### `decimal32_to_long_long()`

```
long long std::decimal::decimal32_to_long_long (
    decimal32 __d)
```

Non-conforming extension: Conversion to integral type.

## 4.16 std::experimental Namespace Reference

### Classes

- class [any](#)

#### 4.16.1 Detailed Description

Namespace for features defined in ISO Technical Specifications.

#### 4.16.2 Function Documentation

##### **gcd()**

```
template<typename _Mn, typename _Nn>
common_type_t< _Mn, _Nn > std::experimental::fundamentals_v2::gcd (
    _Mn __m,
    _Nn __n) [constexpr], [noexcept]
```

Greatest common divisor.

##### **get\_deleter()**

```
template<typename _Del, typename _Tp>
_Del * std::experimental::fundamentals_v2::get_deleter (
    const shared_ptr< _Tp > & __p) [inline], [noexcept]
```

C++14 20.8.2.2.10.

##### **lcm()**

```
template<typename _Mn, typename _Nn>
common_type_t< _Mn, _Nn > std::experimental::fundamentals_v2::lcm (
    _Mn __m,
    _Nn __n) [constexpr]
```

Least common multiple.

**make\_boyer\_moore\_horspool\_searcher()**

```
template<typename _RAIter, typename _Hash = std::hash<typename std::iterator_traits<_RAIter>::value_type>, typename _BinaryPredicate = equal_to<>>>
boyer_moore_horspool_searcher< _RAIter, _Hash, _BinaryPredicate > std::experimental::fundamentals_v1::make_boyer_moore_horspool_searcher (
    _RAIter __pat_first,
    _RAIter __pat_last,
    _Hash __hf = _Hash(),
    _BinaryPredicate __pred = _BinaryPredicate()) [inline]
```

Generator function for boyer\_moore\_horspool\_searcher.

References [std::move\(\)](#).

**make\_boyer\_moore\_searcher()**

```
template<typename _RAIter, typename _Hash = std::hash<typename std::iterator_traits<_RAIter>::value_type>, typename _BinaryPredicate = equal_to<>>>
boyer_moore_searcher< _RAIter, _Hash, _BinaryPredicate > std::experimental::fundamentals_v1::make_boyer_moore_searcher (
    _RAIter __pat_first,
    _RAIter __pat_last,
    _Hash __hf = _Hash(),
    _BinaryPredicate __pred = _BinaryPredicate()) [inline]
```

Generator function for boyer\_moore\_searcher.

References [std::move\(\)](#).

**make\_default\_searcher()**

```
template<typename _ForwardIterator, typename _BinaryPredicate = std::equal_to<>>>
default_searcher< _ForwardIterator, _BinaryPredicate > std::experimental::fundamentals_v1::make_default_searcher (
    _ForwardIterator __pat_first,
    _ForwardIterator __pat_last,
    _BinaryPredicate __pred = _BinaryPredicate()) [inline]
```

Generator function for default\_searcher.

**make\_ostream\_joiner()**

```
template<typename _CharT, typename _Traits, typename _DelimT>
ostream_joiner< decay_t< _DelimT >, _CharT, _Traits > std::experimental::fundamentals_v2::make_ostream_joiner (
    basic_ostream< _CharT, _Traits > & __os,
    _DelimT && __delimiter) [inline]
```

Object generator for ostream\_joiner.

References [std::forward\(\)](#).

**not\_fn()**

```
template<typename _Fn>
auto std::experimental::fundamentals_v2::not_fn (
    _Fn && __fn) [inline], [noexcept]
```

[func.not\_fn] Function template not\_fn

References [std::forward\(\)](#).

**sample()**

```
template<typename _PopulationIterator, typename _SampleIterator, typename _Distance, typename _URNG =
UniformRandomNumberGenerator>
_SampleIterator std::experimental::fundamentals_v2::sample (
    _PopulationIterator __first,
    _PopulationIterator __last,
    _SampleIterator __out,
    _Distance __n,
    _UniformRandomNumberGenerator && __g)
```

Take a random sample from a population.

References [std::forward\(\)](#).

**4.16.3 Variable Documentation****is\_bind\_expression\_v**

```
template<typename _Tp>
bool std::experimental::fundamentals_v1::is_bind_expression_v [constexpr]
Variable template for std::is_bind_expression.
```

**is\_placeholder\_v**

```
template<typename _Tp>
int std::experimental::fundamentals_v1::is_placeholder_v [constexpr]
Variable template for std::is_placeholder.
```

- constexpr `basic_string_view`< char16\_t > `operator""sv` (const char16\_t \* \_\_str, size\_t \_\_len) noexcept
- constexpr `basic_string_view`< char32\_t > `operator""sv` (const char32\_t \* \_\_str, size\_t \_\_len) noexcept
- constexpr `basic_string_view`< wchar\_t > `operator""sv` (const wchar\_t \* \_\_str, size\_t \_\_len) noexcept
- template<char... \_Digits>  
constexpr `chrono::microseconds` `operator""us` ()
- constexpr `chrono::duration`< long double, `micro` > `operator""us` (long double \_\_usecs)
- constexpr `chrono::year` `operator""y` (unsigned long long \_\_y) noexcept

### 4.18.1 Detailed Description

ISO C++ inline namespace for literal suffixes.

## 4.19 `std::literals::chrono_literals` Namespace Reference

## Functions

- constexpr `chrono::day` `operator""d` (unsigned long long \_\_d) noexcept
- template<char... \_Digits>  
constexpr `chrono::hours` `operator""h` ()
- constexpr `chrono::duration`< long double, `ratio`< 3600, 1 > > `operator""h` (long double \_\_hours)
- template<char... \_Digits>  
constexpr `chrono::minutes` `operator""min` ()
- constexpr `chrono::duration`< long double, `ratio`< 60, 1 > > `operator""min` (long double \_\_mins)
- template<char... \_Digits>  
constexpr `chrono::milliseconds` `operator""ms` ()
- constexpr `chrono::duration`< long double, `milli` > `operator""ms` (long double \_\_msecs)
- template<char... \_Digits>  
constexpr `chrono::nanoseconds` `operator""ns` ()
- constexpr `chrono::duration`< long double, `nano` > `operator""ns` (long double \_\_nsecs)
- template<char... \_Digits>  
constexpr `chrono::seconds` `operator""s` ()
- constexpr `chrono::duration`< long double > `operator""s` (long double \_\_secs)
- template<char... \_Digits>  
constexpr `chrono::microseconds` `operator""us` ()
- constexpr `chrono::duration`< long double, `micro` > `operator""us` (long double \_\_usecs)
- constexpr `chrono::year` `operator""y` (unsigned long long \_\_y) noexcept

#### 4.19.1 Detailed Description

ISO C++ 2014 namespace for suffixes for duration literals.

These suffixes can be used to create `chrono::duration` values with tick periods of hours, minutes, seconds, milliseconds, microseconds or nanoseconds. For example, `std::chrono::seconds(5)` can be written as `5s` after making the suffix visible in the current scope. The suffixes can be made visible by a `using-directive` or `using-declaration` such as:

```
• using namespace std::chrono_literals;
• using namespace std::literals;
• using namespace std::chrono;
• using namespace std;
• using std::chrono_literals::operator"s;
```

The result of these suffixes on an integer literal is one of the standard typedefs such as `std::chrono::hours`. The result on a floating-point literal is a duration type with the specified tick period and an unspecified floating-point representation, for example `1.5e2ms` might be equivalent to `chrono::duration<long double, chrono::milli>(1.5e2)`.

ISO C++ 2011 namespace for `std::bind` placeholders.

Since

C++11

## 4.21 `std::regex_constants` Namespace Reference

### 5.1 Regular Expression Syntax Options

- enum `syntax_option_type` : unsigned int {  
`_S_icalse` , `_S_nosubs` , `_S_optimize` , `_S_collate` ,  
`_S_ECMAScript` , `_S_basic` , `_S_extended` , `_S_awk` ,  
`_S_grep` , `_S_egrep` , `_S_polynomial` , `_S_multiline` }
- constexpr `syntax_option_type` `icalse`
- constexpr `syntax_option_type` `nosubs`
- constexpr `syntax_option_type` `optimize`
- constexpr `syntax_option_type` `collate`
- constexpr `syntax_option_type` `ECMAScript`
- constexpr `syntax_option_type` `basic`
- constexpr `syntax_option_type` `extended`
- constexpr `syntax_option_type` `awk`
- constexpr `syntax_option_type` `grep`
- constexpr `syntax_option_type` `egrep`
- constexpr `syntax_option_type` `multiline`
- constexpr `syntax_option_type` `__multiline`
- constexpr `syntax_option_type` `__polynomial`
- constexpr `syntax_option_type` `operator&` (`syntax_option_type` \_\_a, `syntax_option_type` \_\_b) noexcept
- constexpr `syntax_option_type` `operator|` (`syntax_option_type` \_\_a, `syntax_option_type` \_\_b) noexcept
- constexpr `syntax_option_type` `operator^` (`syntax_option_type` \_\_a, `syntax_option_type` \_\_b) noexcept
- constexpr `syntax_option_type` `operator~` (`syntax_option_type` \_\_a) noexcept
- constexpr `syntax_option_type` & `operator&=` (`syntax_option_type` & \_\_a, `syntax_option_type` \_\_b) noexcept
- constexpr `syntax_option_type` & `operator|=` (`syntax_option_type` & \_\_a, `syntax_option_type` \_\_b) noexcept
- constexpr `syntax_option_type` & `operator^=` (`syntax_option_type` & \_\_a, `syntax_option_type` \_\_b) noexcept

### 5.2 Matching Rules

Matching a regular expression against a sequence of characters [first, last) proceeds according to the rules of the grammar specified for the regular expression object, modified according to the effects listed below for any bitmask elements set.

- enum `match_flag_type` : unsigned int {  
`_S_default` , `_S_not_bol` , `_S_not_eol` , `_S_not_bow` ,  
`_S_not_eow` , `_S_any` , `_S_not_null` , `_S_continuous` ,  
`_S_prev_avail` , `_S_sed` , `_S_no_copy` , `_S_first_only` ,  
`_S_match_flag_last` }
- constexpr `match_flag_type` `match_default`
- constexpr `match_flag_type` `match_not_bol`
- constexpr `match_flag_type` `match_not_eol`
- constexpr `match_flag_type` `match_not_bow`
- constexpr `match_flag_type` `match_not_eow`
- constexpr `match_flag_type` `match_any`

- constexpr `match_flag_type` `match_not_null`
- constexpr `match_flag_type` `match_continuous`
- constexpr `match_flag_type` `match_prev_avail`
- constexpr `match_flag_type` `format_default`
- constexpr `match_flag_type` `format_sed`
- constexpr `match_flag_type` `format_no_copy`
- constexpr `match_flag_type` `format_first_only`
- constexpr `match_flag_type` `operator&` (`match_flag_type` \_\_a, `match_flag_type` \_\_b) noexcept
- constexpr `match_flag_type` `operator|` (`match_flag_type` \_\_a, `match_flag_type` \_\_b) noexcept
- constexpr `match_flag_type` `operator^` (`match_flag_type` \_\_a, `match_flag_type` \_\_b) noexcept
- constexpr `match_flag_type` `operator~` (`match_flag_type` \_\_a) noexcept
- constexpr `match_flag_type` & `operator&=` (`match_flag_type` &\_\_a, `match_flag_type` \_\_b) noexcept
- constexpr `match_flag_type` & `operator|=` (`match_flag_type` &\_\_a, `match_flag_type` \_\_b) noexcept
- constexpr `match_flag_type` & `operator^=` (`match_flag_type` &\_\_a, `match_flag_type` \_\_b) noexcept

### 5.3 Error Types

- enum `error_type` {  
`_S_error_collate` , `_S_error_ctype` , `_S_error_escape` , `_S_error_backref` ,  
`_S_error_brack` , `_S_error_paren` , `_S_error_brace` , `_S_error_badbrace` ,  
`_S_error_range` , `_S_error_space` , `_S_error_badrepeat` , `_S_error_complexity` ,  
`_S_error_stack` , `_S_null` , `_S_grammar` }
- constexpr `error_type` `error_collate` (`_S_error_collate`)
- constexpr `error_type` `error_ctype` (`_S_error_ctype`)
- constexpr `error_type` `error_escape` (`_S_error_escape`)
- constexpr `error_type` `error_backref` (`_S_error_backref`)
- constexpr `error_type` `error_brack` (`_S_error_brack`)
- constexpr `error_type` `error_paren` (`_S_error_paren`)
- constexpr `error_type` `error_brace` (`_S_error_brace`)
- constexpr `error_type` `error_badbrace` (`_S_error_badbrace`)
- constexpr `error_type` `error_range` (`_S_error_range`)
- constexpr `error_type` `error_space` (`_S_error_space`)
- constexpr `error_type` `error_badrepeat` (`_S_error_badrepeat`)
- constexpr `error_type` `error_complexity` (`_S_error_complexity`)
- constexpr `error_type` `error_stack` (`_S_error_stack`)

#### 4.21.1 Detailed Description

ISO C++ 2011 namespace for options and flags used with `std::regex`.

#### 4.21.2 Enumeration Type Documentation

##### `error_type`

```
enum std::regex_constants::error_type
```

The expression contained an invalid collating element name.

##### `match_flag_type`

```
enum std::regex_constants::match_flag_type : unsigned int
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

### syntax\_option\_type

```
enum std::regex_constants::syntax_option_type : unsigned int
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

#### 4.21.3 Function Documentation

##### error\_backref()

```
error_type std::regex_constants::error_backref (
    _S_error_backref ) [inline], [constexpr]
```

The expression contained an invalid back reference.

##### error\_badbrace()

```
error_type std::regex_constants::error_badbrace (
    _S_error_badbrace ) [inline], [constexpr]
```

The expression contained an invalid range in a `{}` expression.

##### error\_badrepeat()

```
error_type std::regex_constants::error_badrepeat (
    _S_error_badrepeat ) [inline], [constexpr]
```

One of `*?+{` was not preceded by a valid regular expression.

##### error\_brace()

```
error_type std::regex_constants::error_brace (
    _S_error_brace ) [inline], [constexpr]
```

The expression contained mismatched `{` and `}`

##### error\_brack()

```
error_type std::regex_constants::error_brack (
    _S_error_brack ) [inline], [constexpr]
```

The expression contained mismatched `[` and `]`.

##### error\_collate()

```
error_type std::regex_constants::error_collate (
    _S_error_collate ) [inline], [constexpr]
```

The expression contained an invalid collating element name.

##### error\_complexity()

```
error_type std::regex_constants::error_complexity (
    _S_error_complexity ) [inline], [constexpr]
```

The complexity of an attempted match against a regular expression exceeded a pre-set level.

**error\_ctype()**

```
error_type std::regex_constants::error_ctype (
    _S_error_ctype ) [inline], [constexpr]
```

The expression contained an invalid character class name.

**error\_escape()**

```
error_type std::regex_constants::error_escape (
    _S_error_escape ) [inline], [constexpr]
```

The expression contained an invalid escaped character, or a trailing escape.

**error\_paren()**

```
error_type std::regex_constants::error_paren (
    _S_error_paren ) [inline], [constexpr]
```

The expression contained mismatched ( and ).

**error\_range()**

```
error_type std::regex_constants::error_range (
    _S_error_range ) [inline], [constexpr]
```

The expression contained an invalid character range, such as [b-a] in most encodings.

**error\_space()**

```
error_type std::regex_constants::error_space (
    _S_error_space ) [inline], [constexpr]
```

There was insufficient memory to convert the expression into a finite state machine.

**error\_stack()**

```
error_type std::regex_constants::error_stack (
    _S_error_stack ) [inline], [constexpr]
```

There was insufficient memory to determine whether the regular expression could match the specified character sequence.

**operator&() [1/2]**

```
match_flag_type std::regex_constants::operator& (
    match_flag_type __a,
    match_flag_type __b) [constexpr], [noexcept]
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

**operator&() [2/2]**

```
syntax_option_type std::regex_constants::operator& (
    syntax_option_type __a,
    syntax_option_type __b) [constexpr], [noexcept]
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

**operator&=()** [1/2]

```
match_flag_type & std::regex_constants::operator&= (
    match_flag_type & __a,
    match_flag_type __b) [inline], [constexpr], [noexcept]
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

**operator&=()** [2/2]

```
syntax_option_type & std::regex_constants::operator&= (
    syntax_option_type & __a,
    syntax_option_type __b) [inline], [constexpr], [noexcept]
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

**operator^()** [1/2]

```
match_flag_type std::regex_constants::operator^ (
    match_flag_type __a,
    match_flag_type __b) [constexpr], [noexcept]
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

**operator^()** [2/2]

```
syntax_option_type std::regex_constants::operator^ (
    syntax_option_type __a,
    syntax_option_type __b) [constexpr], [noexcept]
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

**operator^=()** [1/2]

```
match_flag_type & std::regex_constants::operator^= (
    match_flag_type & __a,
    match_flag_type __b) [inline], [constexpr], [noexcept]
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

**operator^=()** [2/2]

```
syntax_option_type & std::regex_constants::operator^= (
    syntax_option_type & __a,
    syntax_option_type __b) [inline], [constexpr], [noexcept]
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

#### **operator" |()** [1/2]

```
match_flag_type std::regex_constants::operator| (
    match_flag_type __a,
    match_flag_type __b) [constexpr], [noexcept]
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

#### **operator" |()** [2/2]

```
syntax_option_type std::regex_constants::operator| (
    syntax_option_type __a,
    syntax_option_type __b) [constexpr], [noexcept]
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

#### **operator" |=()** [1/2]

```
match_flag_type & std::regex_constants::operator|= (
    match_flag_type & __a,
    match_flag_type __b) [inline], [constexpr], [noexcept]
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

#### **operator" |=()** [2/2]

```
syntax_option_type & std::regex_constants::operator|= (
    syntax_option_type & __a,
    syntax_option_type __b) [inline], [constexpr], [noexcept]
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

#### **operator~()** [1/2]

```
match_flag_type std::regex_constants::operator~ (
    match_flag_type __a) [constexpr], [noexcept]
```

This is a bitmask type indicating regex matching rules.

The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

**operator~()** [2/2]

```
syntax_option_type std::regex_constants::operator~ (
    syntax_option_type __a) [constexpr], [noexcept]
```

This is a bitmask type indicating how to interpret the regex.

The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type `syntax_option_type` shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

**4.21.4 Variable Documentation****\_\_multiline**

```
syntax_option_type std::regex_constants::__multiline [inline], [constexpr]
```

Extension: Equivalent to `regex_constants::multiline` for C++11 and C++14.

**\_\_polynomial**

```
syntax_option_type std::regex_constants::__polynomial [inline], [constexpr]
```

Extension: Ensure both space complexity of compiled regex and time complexity execution are not exponential. If specified in a regex with back-references, the exception `regex_constants::error_complexity` will be thrown.

**awk**

```
syntax_option_type std::regex_constants::awk [inline], [constexpr]
```

Specifies that the grammar recognized by the regular expression engine is that used by POSIX utility `awk` in IEEE Std 1003.1-2001. This option is identical to `syntax_option_type extended`, except that C-style escape sequences are supported. These sequences are: `\\`, `\a`, `\b`, `\f`, `\n`, `\r`, `\t`, `\v`, `\&apos;`, `\&apos;`, and `\ddd` (where `ddd` is one, two, or three octal digits).

**basic**

```
syntax_option_type std::regex_constants::basic [inline], [constexpr]
```

Specifies that the grammar recognized by the regular expression engine is that used by POSIX basic regular expressions in IEEE Std 1003.1-2001, Portable Operating System Interface (POSIX), Base Definitions and Headers, Section 9, Regular Expressions [IEEE, Information Technology – Portable Operating System Interface (POSIX), IEEE Standard 1003.1-2001].

**collate**

```
syntax_option_type std::regex_constants::collate [inline], [constexpr]
```

Specifies that character ranges of the form `[a-b]` should be locale sensitive.

**ECMAScript**

```
syntax_option_type std::regex_constants::ECMAScript [inline], [constexpr]
```

Specifies that the grammar recognized by the regular expression engine is that used by ECMAScript in ECMA-262 [Ecma International, ECMAScript Language Specification, Standard Ecma-262, third edition, 1999], as modified in section [28.13]. This grammar is similar to that defined in the PERL scripting language but extended with elements found in the POSIX regular expression grammar.

**egrep**

```
syntax_option_type std::regex_constants::egrep [inline], [constexpr]
```

Specifies that the grammar recognized by the regular expression engine is that used by POSIX utility `grep` when given the `-E` option in IEEE Std 1003.1-2001. This option is identical to `syntax_option_type` extended, except that newlines are treated as whitespace.

### extended

`syntax_option_type` `std::regex_constants::extended` `[inline]`, `[constexpr]`

Specifies that the grammar recognized by the regular expression engine is that used by POSIX extended regular expressions in IEEE Std 1003.1-2001, Portable Operating System Interface (POSIX), Base Definitions and Headers, Section 9, Regular Expressions.

### format\_default

`match_flag_type` `std::regex_constants::format_default` `[inline]`, `[constexpr]`

When a regular expression match is to be replaced by a new string, the new string is constructed using the rules used by the ECMAScript `replace` function in ECMA- 262 [Ecma International, ECMAScript Language Specification, Standard Ecma-262, third edition, 1999], part 15.5.4.11 `String.prototype.replace`. In addition, during search and replace operations all non-overlapping occurrences of the regular expression are located and replaced, and sections of the input that did not match the expression are copied unchanged to the output string.

Format strings (from ECMA-262 [15.5.4.11]):

- `$$` The dollar-sign itself (`$`)
- `$&` The matched substring.
- `$'` The portion of *string* that precedes the matched substring. This would be `match_results::prefix()`.
- `$'` The portion of *string* that follows the matched substring. This would be `match_results::suffix()`.
- `$n` The *n*th capture, where *n* is in `[1,9]` and `$n` is not followed by a decimal digit. If `n <= match_results::size()` and the *n*th capture is undefined, use the empty string instead. If `n > match_results::size()`, the result is implementation-defined.
- `$nn` The *nn*th capture, where *nn* is a two-digit decimal number on `[01, 99]`. If `nn <= match_results::size()` and the *n*th capture is undefined, use the empty string instead. If `nn > match_results::size()`, the result is implementation-defined.

Referenced by `std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>><const char*>::format()`, `std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>><const char*>::format()`, `std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>><const char*>::format()`, and `std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>><const char*>::format()`.

### format\_first\_only

`match_flag_type` `std::regex_constants::format_first_only` `[inline]`, `[constexpr]`

When specified during a search and replace operation, only the first occurrence of the regular expression shall be replaced.

### format\_no\_copy

`match_flag_type` `std::regex_constants::format_no_copy` `[inline]`, `[constexpr]`

During a search and replace operation, sections of the character container sequence being searched that do not match the regular expression shall not be copied to the output string.

### `format_sed`

`match_flag_type` `std::regex_constants::format_sed` [inline], [constexpr]

When a regular expression match is to be replaced by a new string, the new string is constructed using the rules used by the POSIX sed utility in IEEE Std 1003.1-2001 [IEEE, Information Technology – Portable Operating System Interface (POSIX), IEEE Standard 1003.1-2001].

### `grep`

`syntax_option_type` `std::regex_constants::grep` [inline], [constexpr]

Specifies that the grammar recognized by the regular expression engine is that used by POSIX utility grep in IEEE Std 1003.1-2001. This option is identical to `syntax_option_type basic`, except that newlines are treated as whitespace.

### `icase`

`syntax_option_type` `std::regex_constants::icase` [inline], [constexpr]

Specifies that the matching of regular expressions against a character sequence shall be performed without regard to case.

### `match_any`

`match_flag_type` `std::regex_constants::match_any` [inline], [constexpr]

If more than one match is possible then any match is an acceptable result.

### `match_continuous`

`match_flag_type` `std::regex_constants::match_continuous` [inline], [constexpr]

The expression only matches a sub-sequence that begins at first .

Referenced by `std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++()`.

### `match_default`

`match_flag_type` `std::regex_constants::match_default` [inline], [constexpr]

The default matching rules.

Referenced by `std::regex_iterator< const char * >::regex_iterator()`, `std::regex_token_iterator< const char * >::regex_token_iterator()`, `std::regex_token_iterator< const char * >::regex_token_iterator()`, `std::regex_token_iterator< const char * >::regex_token_iterator()`, `std::regex_token_iterator< const char * >::regex_token_iterator()`, `std::regex_match()`, `std::regex_match()`, `std::regex_match()`, `std::regex_match()`, `std::regex_match()`, `std::regex_replace()`, `std::regex_replace()`, `std::regex_replace()`, `std::regex_replace()`, `std::regex_replace()`, `std::regex_replace()`, `std::regex_search()`, `std::regex_search()`, `std::regex_search()`, `std::regex_search()`, and `std::regex_search()`.

### `match_not_bol`

`match_flag_type` `std::regex_constants::match_not_bol` [inline], [constexpr]

The first character in the sequence [first, last) is treated as though it is not at the beginning of a line, so the character (^) in the regular expression shall not match [first, first).

### `match_not_bow`

`match_flag_type` `std::regex_constants::match_not_bow` [inline], [constexpr]

The expression `\b` is not matched against the sub-sequence [first,first).

### `match_not_eol`

`match_flag_type` `std::regex_constants::match_not_eol` [inline], [constexpr]

The last character in the sequence [first, last) is treated as though it is not at the end of a line, so the character (\$) in the regular expression shall not match [last, last).

### match\_not\_eow

`match_flag_type` `std::regex_constants::match_not_eow` [inline], [constexpr]

The expression \b should not be matched against the sub-sequence [last,last).

### match\_not\_null

`match_flag_type` `std::regex_constants::match_not_null` [inline], [constexpr]

The expression does not match an empty sequence.

Referenced by `std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++()`.

### match\_prev\_avail

`match_flag_type` `std::regex_constants::match_prev_avail` [inline], [constexpr]

--first is a valid iterator position. When this flag is set then the flags `match_not_bol` and `match_not_bow` are ignored by the algorithms `regex_match`, `regex_search`, and `regex_replace`, and by the iterators `regex_iterator` and `regex_token_iterator`.

Referenced by `std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++()`.

### multiline

`syntax_option_type` `std::regex_constants::multiline` [inline], [constexpr]

Specifies that the ^ anchor matches at the beginning of a line, and the \$ anchor matches at the end of a line, not only at the beginning/end of the input. Valid for the ECMAScript syntax, ignored otherwise.

Since

C++17

### nosubs

`syntax_option_type` `std::regex_constants::nosubs` [inline], [constexpr]

Specifies that when a regular expression is matched against a character container sequence, no sub-expression matches are to be stored in the supplied `match_results` structure.

### optimize

`syntax_option_type` `std::regex_constants::optimize` [inline], [constexpr]

Specifies that the regular expression engine should pay more attention to the speed with which regular expressions are matched, and less to the speed with which regular expression objects are constructed. Otherwise it has no detectable effect on the program output.

## 4.22 std::rel\_ops Namespace Reference

### Functions

- `template<class _Tp>`  
`bool operator!= (const _Tp &__x, const _Tp &__y)`
- `template<class _Tp>`  
`bool operator<= (const _Tp &__x, const _Tp &__y)`
- `template<class _Tp>`  
`bool operator> (const _Tp &__x, const _Tp &__y)`
- `template<class _Tp>`  
`bool operator>= (const _Tp &__x, const _Tp &__y)`

### 4.22.1 Detailed Description

The generated relational operators are sequestered here.

Libstdc++ headers must not use the contents of `rel_ops`. User code should also avoid them, because unconstrained function templates are too greedy and can easily cause ambiguities.

C++20 default comparisons are a better solution.

### 4.22.2 Function Documentation

#### **operator!=()**

```
template<class _Tp>
bool std::rel_ops::operator!= (
    const _Tp & __x,
    const _Tp & __y) [inline]
```

Defines != for arbitrary types, in terms of ==.

##### Parameters

|                          |                |
|--------------------------|----------------|
| $\leftrightarrow$<br>__x | A thing.       |
| $\leftrightarrow$<br>__y | Another thing. |

##### Returns

\_\_x != \_\_y

This function uses == to determine its result.

#### **operator<=()**

```
template<class _Tp>
bool std::rel_ops::operator<= (
    const _Tp & __x,
    const _Tp & __y) [inline]
```

Defines <= for arbitrary types, in terms of <.

##### Parameters

|                          |                |
|--------------------------|----------------|
| $\leftrightarrow$<br>__x | A thing.       |
| $\leftrightarrow$<br>__y | Another thing. |

##### Returns

\_\_x <= \_\_y

This function uses < to determine its result.

#### **operator>()**

```
template<class _Tp>
bool std::rel_ops::operator> (
```

```
const _Tp & __x,  
const _Tp & __y) [inline]
```

Defines `>` for arbitrary types, in terms of `<`.

## Parameters

|       |                |
|-------|----------------|
| $\_x$ | A thing.       |
| $\_y$ | Another thing. |

## Returns

$\_x > \_y$

This function uses < to determine its result.

**operator>=()**

```
template<class _Tp>
bool std::rel_ops::operator>= (
    const _Tp & __x,
    const _Tp & __y) [inline]
```

Defines >= for arbitrary types, in terms of <.

## Parameters

|       |                |
|-------|----------------|
| $\_x$ | A thing.       |
| $\_y$ | Another thing. |

## Returns

$\_x >= \_y$

This function uses < to determine its result.

## 4.23 std::this\_thread Namespace Reference

## Functions

- [thread::id get\\_id \(\)](#) noexcept
- template<typename \_Rep, typename \_Period>  
void [sleep\\_for](#) (const [chrono::duration](#)< \_Rep, \_Period > &\_\_rtime)
- template<typename \_Clock, typename \_Duration>  
void [sleep\\_until](#) (const [chrono::time\\_point](#)< \_Clock, \_Duration > &\_\_atime)
- void [yield](#) () noexcept

## 4.23.1 Detailed Description

ISO C++ 2011 namespace for interacting with the current thread.  
C++11 30.3.2 [thread.thread.this] Namespace this\_thread.

## 4.23.2 Function Documentation

**get\_id()**

```
thread::id std::this_thread::get_id () [inline], [noexcept]
```

The unique identifier of the current thread.

### sleep\_for()

```
template<typename _Rep, typename _Period>
void std::this_thread::sleep_for (
    const chrono::duration< _Rep, _Period > & __rtime) [inline]
this_thread::sleep_for
Referenced by sleep\_until\(\).
```

### sleep\_until()

```
template<typename _Clock, typename _Duration>
void std::this_thread::sleep_until (
    const chrono::time_point< _Clock, _Duration > & __atime) [inline]
this_thread::sleep_until
References sleep\_for\(\).
```

### yield()

```
void std::this_thread::yield () [inline], [noexcept]
Allow the implementation to schedule a different thread.
```

#### 4.24.1 Detailed Description

ISO C++ TR1 entities toplevel namespace is `std::tr1`.

#### 4.24.2 Function Documentation

##### `arg()`

```
template<typename _Tp>
_Tp std::arg (
    const complex< _Tp > & __z) [inline]
```

Return phase angle of `z`.

##### `conf_hyperg()`

```
template<typename _Tpa, typename _Tpc, typename _Tp>
__gnu_cxx::__promote_3< _Tpa, _Tpc, _Tp >::__type __gnu_cxx::conf_hyperg (
    _Tpa __a,
    _Tpc __c,
    _Tp __x) [inline]
```

Return the confluent hypergeometric function  ${}_1F_1(a; c; x)$  of real numeratorial parameter `a`, denominatorial parameter `c`, and argument `x`.

The confluent hypergeometric function is defined by

$${}_1F_1(a; c; x) = \sum_{n=0}^{\infty} \frac{(a)_n x^n}{(c)_n n!}$$

where the Pochhammer symbol is  $(x)_k = (x)(x+1)\dots(x+k-1)$ ,  $(x)_0 = 1$

##### Parameters

|                                   |                              |
|-----------------------------------|------------------------------|
| <code>↔</code><br><code>_a</code> | The numeratorial parameter   |
| <code>↔</code><br><code>_c</code> | The denominatorial parameter |

|                                    |              |
|------------------------------------|--------------|
| <code>_↵</code><br><code>_x</code> | The argument |
|------------------------------------|--------------|

### **conf\_hypergf()**

```
float __gnu_cxx::conf_hypergf (
    float __a,
    float __c,
    float __x) [inline]
```

Return the confluent hypergeometric function  ${}_1F_1(a; c; x)$  of `float` numeratorial parameter `a`, denominatorial parameter `c`, and argument `x`.

#### See also

`conf_hyperg` for details.

### **conf\_hypergl()**

```
long double __gnu_cxx::conf_hypergl (
    long double __a,
    long double __c,
    long double __x) [inline]
```

Return the confluent hypergeometric function  ${}_1F_1(a; c; x)$  of `long double` numeratorial parameter `a`, denominatorial parameter `c`, and argument `x`.

#### See also

`conf_hyperg` for details.

### **hyperg()**

```
template<typename _Tpa, typename _Tpb, typename _Tpc, typename _Tp>
__gnu_cxx::__promote_4< _Tpa, _Tpb, _Tpc, _Tp >::__type __gnu_cxx::hyperg (
    _Tpa __a,
    _Tpb __b,
    _Tpc __c,
    _Tp __x) [inline]
```

Return the hypergeometric function  ${}_2F_1(a, b; c; x)$  of real numeratorial parameters `a` and `b`, denominatorial parameter `c`, and argument `x`.

The hypergeometric function is defined by

$${}_2F_1(a; b; c; x) = \sum_{n=0}^{\infty} \frac{(a)_n (b)_n x^n}{(c)_n n!}$$

where the Pochhammer symbol is  $(x)_k = (x)(x+1)\dots(x+k-1)$ ,  $(x)_0 = 1$

#### Parameters

|                                    |                                   |
|------------------------------------|-----------------------------------|
| <code>_↵</code><br><code>_a</code> | The first numeratorial parameter  |
| <code>_↵</code><br><code>_b</code> | The second numeratorial parameter |

## Parameters

|                         |                              |
|-------------------------|------------------------------|
| $\leftrightarrow$<br>_c | The denominatorial parameter |
| $\leftrightarrow$<br>_x | The argument                 |

**hypergf()**

```
float __gnu_cxx::hypergf (
    float __a,
    float __b,
    float __c,
    float __x) [inline]
```

Return the hypergeometric function  ${}_2F_1(a, b; c; x)$  of @ float numeratorial parameters a and b, denominatorial parameter c, and argument x.

## See also

hyperg for details.

**hypergl()**

```
long double __gnu_cxx::hypergl (
    long double __a,
    long double __b,
    long double __c,
    long double __x) [inline]
```

Return the hypergeometric function  ${}_2F_1(a, b; c; x)$  of long double numeratorial parameters a and b, denominatorial parameter c, and argument x.

## See also

hyperg for details.

**norm()**

```
template<typename _Tp>
_Tp constexpr std::norm (
    const complex< _Tp > & ) [constexpr]
```

Return z magnitude squared.

**polar()**

```
template<typename _Tp>
complex< _Tp > std::polar (
    const _Tp & __rho,
    const _Tp & __theta = _Tp(0)) [inline]
```

Return complex with magnitude *rho* and angle *theta*.

**4.25 std::tr1::\_\_detail Namespace Reference****4.25.1 Detailed Description**

Implementation details not part of the namespace std::tr1 interface.

#### 4.26.1 Detailed Description

Namespace for non-standard "TR2" extensions.

### 4.27 std::tr2::\_\_detail Namespace Reference

#### 4.27.1 Detailed Description

Implementation details not part of the namespace std::tr2 interface.

## 5 Concept Documentation

### 5.1 std::assignable\_from Concept Reference

```
#include <concepts>
```

#### 5.1.1 Concept definition

```
template<typename _Lhs, typename _Rhs>
concept std::assignable_from = is_lvalue_reference_v<_Lhs>
    && common_reference_with<__detail::__cref<_Lhs>, __detail::__cref<_Rhs>>
    && requires(_Lhs __lhs, _Rhs&& __rhs) {
        { __lhs = static_cast<_Rhs&&>(__rhs) } -> same_as<_Lhs>;
    }
```

#### 5.1.2 Detailed Description

[concept.assignable], concept assignable\_from

## 5.2 std::common\_reference\_with Concept Reference

```
#include <concepts>
```

### 5.2.1 Concept definition

```
template<typename _Tp, typename _Up>
concept std::common_reference_with = same_as<common_reference_t<_Tp, _Up>, common_reference_t<_Up, _Tp>>
    && convertible_to<_Tp, common_reference_t<_Tp, _Up>>
    && convertible_to<_Up, common_reference_t<_Tp, _Up>>
```

### 5.2.2 Detailed Description

[concept.commonref], concept common\_reference\_with

## 5.3 std::common\_with Concept Reference

```
#include <concepts>
```

### 5.3.1 Concept definition

```
template<typename _Tp, typename _Up>
concept std::common_with = same_as<common_type_t<_Tp, _Up>, common_type_t<_Up, _Tp>>
    && requires {
        static_cast<common_type_t<_Tp, _Up>>(std::declval<_Tp>());
        static_cast<common_type_t<_Tp, _Up>>(std::declval<_Up>());
    }
    && common_reference_with<add_lvalue_reference_t<const _Tp>,
        add_lvalue_reference_t<const _Up>>
    && common_reference_with<add_lvalue_reference_t<common_type_t<_Tp, _Up>>,
        common_reference_t<
            add_lvalue_reference_t<const _Tp>,
            add_lvalue_reference_t<const _Up>>>
```

### 5.3.2 Detailed Description

[concept.common], concept common\_with

## 5.4 std::constructible\_from Concept Reference

```
#include <concepts>
```

### 5.4.1 Concept definition

```
template<typename _Tp, typename... _Args>
concept std::constructible_from = destructible<_Tp> && is_constructible_v<_Tp, _Args...>
```

### 5.4.2 Detailed Description

[concept.constructible], concept constructible\_from

## 5.5 std::convertible\_to Concept Reference

```
#include <concepts>
```

### 5.5.1 Concept definition

```
template<typename _From, typename _To>
concept std::convertible_to = is_convertible_v<_From, _To>
    && requires { static_cast<_To>(std::declval<_From>()); }
```

### 5.5.2 Detailed Description

[concept.convertible], concept convertible\_to

## 5.6 std::copy\_constructible Concept Reference

```
#include <concepts>
```

### 5.6.1 Concept definition

```
template<typename _Tp>
concept std::copy_constructible = move_constructible<_Tp>
    && constructible_from<_Tp, _Tp&> && convertible_to<_Tp&, _Tp>
    && constructible_from<_Tp, const _Tp&> && convertible_to<const _Tp&, _Tp>
    && constructible_from<_Tp, const _Tp> && convertible_to<const _Tp, _Tp>
```

### 5.6.2 Detailed Description

[concept.copyconstructible], concept copy\_constructible

## 5.7 std::default\_initializable Concept Reference

```
#include <concepts>
```

### 5.7.1 Concept definition

```
template<typename _Tp>
concept std::default_initializable = constructible_from<_Tp>
    && requires
    {
        _Tp{};
        (void) ::new _Tp;
    }
```

### 5.7.2 Detailed Description

[concept.defaultinitializable], concept default\_initializable

## 5.8 std::derived\_from Concept Reference

```
#include <concepts>
```

### 5.8.1 Concept definition

```
template<typename _Derived, typename _Base>
concept std::derived_from = __is_base_of(_Base, _Derived)
    && is_convertible_v<const volatile _Derived*, const volatile _Base*>
```

### 5.8.2 Detailed Description

[concept.derived], concept derived\_from

## 5.9 std::destructible Concept Reference

```
#include <concepts>
```

### 5.9.1 Concept definition

```
template<typename _Tp>
concept std::destructible = __detail::__destructible<_Tp>
```

### 5.9.2 Detailed Description

[concept.destructible], concept destructible

## 5.10 `std::equivalence_relation` Concept Reference

```
#include <concepts>
```

### 5.10.1 Concept definition

```
template<typename _Rel, typename _Tp, typename _Up>
concept std::equivalence_relation = relation<_Rel, _Tp, _Up>
```

### 5.10.2 Detailed Description

[concept.equiv], concept equivalence\_relation

## 5.11 `std::indirectly_comparable` Concept Reference

```
#include <iterator_concepts.h>
```

### 5.11.1 Concept definition

```
template<typename _I1, typename _I2, typename _Rel, typename _P1 identity, typename _P2 identity>
concept std::indirectly_comparable = indirect_binary_predicate<_Rel, projected<_I1, _P1>,
    projected<_I2, _P2>>
```

### 5.11.2 Detailed Description

[alg.req.ind.cmp], concept indirectly\_comparable

## 5.12 `std::indirectly_copyable` Concept Reference

```
#include <iterator_concepts.h>
```

### 5.12.1 Concept definition

```
template<typename _In, typename _Out>
concept std::indirectly_copyable = indirectly_readable<_In>
    && indirectly_writable<_Out, iter_reference_t<_In>>
```

### 5.12.2 Detailed Description

[alg.req.ind.copy], concept indirectly\_copyable

## 5.13 `std::indirectly_movable` Concept Reference

```
#include <iterator_concepts.h>
```

### 5.13.1 Concept definition

```
template<typename _In, typename _Out>
concept std::indirectly_movable = indirectly_readable<_In>
    && indirectly_writable<_Out, iter_rvalue_reference_t<_In>>
```

### 5.13.2 Detailed Description

[alg.req.ind.move], concept indirectly\_movable

## 5.14 std::indirectly\_readable Concept Reference

```
#include <iterator_concepts.h>
```

### 5.14.1 Concept definition

```
template<typename _In>
concept std::indirectly_readable = __detail::__indirectly_readable_impl<remove_cvref_t<_In>>
```

### 5.14.2 Detailed Description

Requirements for types that are readable by applying operator\*.

## 5.15 std::indirectly\_swappable Concept Reference

```
#include <iterator_concepts.h>
```

### 5.15.1 Concept definition

```
template<typename _I1, typename _I2 _I1>
concept std::indirectly_swappable = indirectly_readable<_I1> && indirectly_readable<_I2>
    && requires(const _I1 __i1, const _I2 __i2)
{
    ranges::iter_swap(__i1, __i1);
    ranges::iter_swap(__i2, __i2);
    ranges::iter_swap(__i1, __i2);
    ranges::iter_swap(__i2, __i1);
}
```

### 5.15.2 Detailed Description

[alg.req.ind.swap], concept indirectly\_swappable

## 5.16 std::indirectly\_writable Concept Reference

```
#include <iterator_concepts.h>
```

### 5.16.1 Concept definition

```
template<typename _Out, typename _Tp>
concept std::indirectly_writable = requires(_Out&& __o, _Tp&& __t)
{
    *__o = std::forward<_Tp>(__t);
    std::forward<_Out>(__o) = std::forward<_Tp>(__t);
    const_cast<const iter_reference_t<_Out>&&(>(*__o)
        = std::forward<_Tp>(__t);
    const_cast<const iter_reference_t<_Out>&&(>(*std::forward<_Out>(__o))
        = std::forward<_Tp>(__t);
}
```

### 5.16.2 Detailed Description

Requirements for writing a value into an iterator's referenced object.

## 5.17 std::invocable Concept Reference

```
#include <concepts>
```

### 5.17.1 Concept definition

```
template<typename _Fn, typename... _Args>
concept std::invocable = is_invocable_v<_Fn, _Args...>
```

### 5.17.2 Detailed Description

[concept.invocable], concept invocable

## 5.18 std::mergeable Concept Reference

```
#include <iterator_concepts.h>
```

### 5.18.1 Concept definition

```
template<typename _I1, typename _I2, typename _Out, typename _Rel ranges::less, typename _P1 identity, typename
_P2 identity>
concept std::mergeable = input_iterator<_I1> && input_iterator<_I2>
    && weakly_incrementable<_Out> && indirectly_copyable<_I1, _Out>
    && indirectly_copyable<_I2, _Out>
    && indirect_strict_weak_order<_Rel, projected<_I1, _P1>,
        projected<_I2, _P2>>
```

### 5.18.2 Detailed Description

[alg.req.mergeable], concept mergeable

## 5.19 std::move\_constructible Concept Reference

```
#include <concepts>
```

### 5.19.1 Concept definition

```
template<typename _Tp>
concept std::move_constructible = constructible_from<_Tp, _Tp> && convertible_to<_Tp, _Tp>
```

### 5.19.2 Detailed Description

[concept.moveconstructible], concept move\_constructible

## 5.20 std::permutable Concept Reference

```
#include <iterator_concepts.h>
```

### 5.20.1 Concept definition

```
template<typename _Iter>
concept std::permutable = forward_iterator<_Iter>
    && indirectly_movable_storable<_Iter, _Iter>
    && indirectly_swappable<_Iter, _Iter>
```

### 5.20.2 Detailed Description

[alg.req.permutable], concept permutable

## 5.21 std::predicate Concept Reference

```
#include <concepts>
```

### 5.21.1 Concept definition

```
template<typename _Fn, typename... _Args>
concept std::predicate = regular_invocable<_Fn, _Args...>
    && __detail::__boolean_testable<invoke_result_t<_Fn, _Args...>
```

### 5.21.2 Detailed Description

[concept.predicate], concept predicate

## 5.22 std::ranges::bidirectional\_range Concept Reference

```
#include <ranges_base.h>
```

### 5.22.1 Concept definition

```
template<typename _Tp>
concept std::ranges::bidirectional_range = forward_range<_Tp> && bidirectional_iterator<iterator_t<_Tp>>
```

### 5.22.2 Detailed Description

A range for which ranges::begin returns a bidirectional iterator.

## 5.23 std::ranges::borrowed\_range Concept Reference

```
#include <ranges_base.h>
```

### 5.23.1 Concept definition

```
template<typename _Tp>
concept std::ranges::borrowed_range = range<_Tp> && __detail::__maybe_borrowed_range<_Tp>
```

### 5.23.2 Detailed Description

[range.range] The borrowed\_range concept.

## 5.24 std::ranges::common\_range Concept Reference

```
#include <ranges_base.h>
```

### 5.24.1 Concept definition

```
template<typename _Tp>
concept std::ranges::common_range = range<_Tp> && same_as<iterator_t<_Tp>, sentinel_t<_Tp>>
```

### 5.24.2 Detailed Description

A range for which ranges::begin and ranges::end return the same type.

## 5.25 std::ranges::contiguous\_range Concept Reference

```
#include <ranges_base.h>
```

### 5.25.1 Concept definition

```
template<typename _Tp>
concept std::ranges::contiguous_range = random_access_range<_Tp> && contiguous_iterator<iterator_t<_Tp>>
    && requires(_Tp& __t)
    {
        { ranges::data(__t) } -> same_as<add_pointer_t<range_reference_t<_Tp>>>;
    }
```

### 5.25.2 Detailed Description

A range for which ranges::begin returns a contiguous iterator.

## 5.26 `std::ranges::forward_range` Concept Reference

```
#include <ranges_base.h>
```

### 5.26.1 Concept definition

```
template<typename _Tp>
concept std::ranges::forward_range = input_range<_Tp> && forward_iterator<iterator_t<_Tp>>
```

### 5.26.2 Detailed Description

A range for which `ranges::begin` returns a forward iterator.

## 5.27 `std::ranges::input_range` Concept Reference

```
#include <ranges_base.h>
```

### 5.27.1 Concept definition

```
template<typename _Tp>
concept std::ranges::input_range = range<_Tp> && input_iterator<iterator_t<_Tp>>
```

### 5.27.2 Detailed Description

A range for which `ranges::begin` returns an input iterator.

## 5.28 `std::ranges::output_range` Concept Reference

```
#include <ranges_base.h>
```

### 5.28.1 Concept definition

```
template<typename _Range, typename _Tp>
concept std::ranges::output_range = range<_Range> && output_iterator<iterator_t<_Range>, _Tp>
```

### 5.28.2 Detailed Description

A range for which `ranges::begin` returns an output iterator.

## 5.29 `std::ranges::random_access_range` Concept Reference

```
#include <ranges_base.h>
```

### 5.29.1 Concept definition

```
template<typename _Tp>
concept std::ranges::random_access_range = bidirectional_range<_Tp> && random_access_iterator<iterator_t<_Tp>>
```

### 5.29.2 Detailed Description

A range for which `ranges::begin` returns a random access iterator.

## 5.30 `std::ranges::range` Concept Reference

```
#include <ranges_base.h>
```

### 5.30.1 Concept definition

```
template<typename _Tp>
concept std::ranges::range = requires(_Tp& __t)
{
    ranges::begin(__t);
    ranges::end(__t);
}
```

### 5.30.2 Detailed Description

[range.range] The range concept.

## 5.31 std::ranges::sized\_range Concept Reference

```
#include <ranges_base.h>
```

### 5.31.1 Concept definition

```
template<typename _Tp>
concept std::ranges::sized_range = range<_Tp>
    && requires(_Tp& __t) { ranges::size(__t); }
```

### 5.31.2 Detailed Description

[range.sized] The sized\_range concept.

## 5.32 std::ranges::view Concept Reference

```
#include <ranges_base.h>
```

### 5.32.1 Concept definition

```
template<typename _Tp>
concept std::ranges::view = range<_Tp> && movable<_Tp> && enable_view<_Tp>
```

### 5.32.2 Detailed Description

[range.view] The ranges::view concept.

## 5.33 std::ranges::viewable\_range Concept Reference

```
#include <ranges_base.h>
```

### 5.33.1 Concept definition

```
template<typename _Tp>
concept std::ranges::viewable_range = range<_Tp>
    && ((view<remove_cvref_t<_Tp>> && constructible_from<remove_cvref_t<_Tp>, _Tp>)
        || (!view<remove_cvref_t<_Tp>>
            && (is_lvalue_reference_v<_Tp>
                || (movable<remove_reference_t<_Tp>>
                    && !__detail::__is_initializer_list<remove_cvref_t<_Tp>>))))
```

### 5.33.2 Detailed Description

A range which can be safely converted to a view.

## 5.34 std::regular\_invocable Concept Reference

```
#include <concepts>
```

### 5.34.1 Concept definition

```
template<typename _Fn, typename... _Args>
concept std::regular_invocable = invocable<_Fn, _Args...>
```

### 5.34.2 Detailed Description

[concept.regular\_invocable], concept regular\_invocable

## 5.35 std::relation Concept Reference

```
#include <concepts>
```

### 5.35.1 Concept definition

```
template<typename _Rel, typename _Tp, typename _Up>
concept std::relation = predicate<_Rel, _Tp, _Tp> && predicate<_Rel, _Up, _Up>
    && predicate<_Rel, _Tp, _Up> && predicate<_Rel, _Up, _Tp>
```

### 5.35.2 Detailed Description

[concept.relation], concept relation

## 5.36 std::same\_as Concept Reference

```
#include <concepts>
```

### 5.36.1 Concept definition

```
template<typename _Tp, typename _Up>
concept std::same_as = __detail::__same_as<_Tp, _Up> && __detail::__same_as<_Up, _Tp>
```

### 5.36.2 Detailed Description

[concept.same], concept same\_as

## 5.37 std::sortable Concept Reference

```
#include <iterator_concepts.h>
```

### 5.37.1 Concept definition

```
template<typename _Iter, typename _Rel ranges::less, typename _Proj identity>
concept std::sortable = permutable<_Iter>
    && indirect_strict_weak_order<_Rel, projected<_Iter, _Proj>
```

### 5.37.2 Detailed Description

[alg.req.sortable], concept sortable

## 5.38 std::strict\_weak\_order Concept Reference

```
#include <concepts>
```

### 5.38.1 Concept definition

```
template<typename _Rel, typename _Tp, typename _Up>
concept std::strict_weak_order = relation<_Rel, _Tp, _Up>
```

### 5.38.2 Detailed Description

[concept.strictweakorder], concept strict\_weak\_order

## 5.39 std::uniform\_random\_bit\_generator Concept Reference

```
#include <random>
```

### 5.39.1 Concept definition

```
template<typename _Gen>
concept std::uniform_random_bit_generator = invocable<_Gen&> && unsigned_integral<invoke_result_t<_Gen&>>
    && requires
    {
        { _Gen::min() } -> same_as<invoke_result_t<_Gen&>>;
        { _Gen::max() } -> same_as<invoke_result_t<_Gen&>>;
        requires bool_constant<(_Gen::min() < _Gen::max())>::value;
    }
```

### 5.39.2 Detailed Description

Requirements for a uniform random bit generator.

Since

C++20

## 5.40 std::weakly\_incrementable Concept Reference

```
#include <iterator_concepts.h>
```

### 5.40.1 Concept definition

```
template<typename _Iter>
concept std::weakly_incrementable = movable<_Iter>
    && requires(_Iter __i)
    {
        typename iter_difference_t<_Iter>;
        requires __detail::__is_signed_integer_like<iter_difference_t<_Iter>;
        { ++__i } -> same_as<_Iter&>;
        __i++;
    }
```

### 5.40.2 Detailed Description

Requirements on types that can be incremented with ++.

## 6 Class Documentation

### 6.1 \_\_gnu\_parallel::\_\_accumulate\_binop\_reduct<\_BinOp> Struct Template Reference

```
#include <for_each_selectors.h>
```

#### Public Member Functions

- **\_\_accumulate\_binop\_reduct** (\_BinOp &\_\_b)
- template<typename \_Result, typename \_Addend>  
\_Result **operator()** (const \_Result &\_\_x, const \_Addend &\_\_y)

## Public Attributes

- `_BinOp` & `__binop`

### 6.1.1 Detailed Description

```
template<typename _BinOp>
struct __gnu_parallel::__accumulate_binop_reduct< _BinOp >
```

General reduction, using a binary operator.

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

## 6.2 `__gnu_parallel::__accumulate_selector< _It >` Struct Template Reference

```
#include <for_each_selectors.h>
```

Inheritance diagram for `__gnu_parallel::__accumulate_selector< _It >`:

## Public Member Functions

- `template<typename _Op>`  
`std::iterator_traits< _It >::value_type operator() (_Op __o, _It __i)`

## Public Attributes

- `_It` `_M_finish_iterator`

### 6.2.1 Detailed Description

```
template<typename _It>
struct __gnu_parallel::__accumulate_selector< _It >
```

`std::accumulate()` selector.

### 6.2.2 Member Function Documentation

#### `operator>()`

```
template<typename _It>
template<typename _Op>
std::iterator_traits<_It>::value_type __gnu_parallel::__accumulate_selector<_It>::operator()
(
    _Op __o,
    _It __i) [inline]
```

Functor execution.

#### Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__o</code> | Operator (unused).           |
| <code>__i</code> | iterator referencing object. |

#### Returns

The current value.

### 6.2.3 Member Data Documentation

#### `_M_finish_iterator`

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector<_It>::_M_finish_iterator [inherited]
_iterator on last element processed; needed for some algorithms (e. g. std::transform()).
```

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

## 6.3 `__gnu_parallel::__adjacent_difference_selector<_It>` Struct Template Reference

```
#include <for_each_selectors.h>
```

Inheritance diagram for `__gnu_parallel::__adjacent_difference_selector<_It>`:

## Public Member Functions

- `template<typename _Op>`  
`bool operator() (_Op &__o, _It __i)`

## Public Attributes

- `_It _M_finish_iterator`

### 6.3.1 Detailed Description

`template<typename _It>`  
`struct __gnu_parallel::__adjacent_difference_selector< _It >`

Selector that returns the difference between two adjacent \_\_elements.

### 6.3.2 Member Data Documentation

#### `_M_finish_iterator`

`template<typename _It>`  
`_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator` [inherited]  
\_Iterator on last element processed; needed for some algorithms (e. g. `std::transform()`).

The documentation for this struct was generated from the following file:

- `for_each_selectors.h`

## 6.4 `__gnu_parallel::__adjacent_find_selector` Struct Reference

`#include <find_selectors.h>`

Inheritance diagram for `__gnu_parallel::__adjacent_find_selector`:

## Public Member Functions

- `template<typename _RAIter1, typename _RAIter2, typename _Pred>`  
`std::pair< _RAIter1, _RAIter2 > _M_sequential_algorithm (_RAIter1 __begin1, _RAIter1 __end1, _RAIter2 __begin2, _Pred __pred)`
- `template<typename _RAIter1, typename _RAIter2, typename _Pred>`  
`bool operator() (_RAIter1 __i1, _RAIter2 __i2, _Pred __pred)`

### 6.4.1 Detailed Description

Test predicate on two adjacent elements.

### 6.4.2 Member Function Documentation

#### `_M_sequential_algorithm()`

```
template<typename _RAIter1, typename _RAIter2, typename _Pred>
std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__adjacent_find_selector::_M_sequential_algorithm
(
    _RAIter1 __begin1,
    _RAIter1 __end1,
    _RAIter2 __begin2,
    _Pred __pred) [inline]
```

Corresponding sequential algorithm on a sequence.

#### Parameters

|                       |                                    |
|-----------------------|------------------------------------|
| <code>__begin1</code> | Begin iterator of first sequence.  |
| <code>__end1</code>   | End iterator of first sequence.    |
| <code>__begin2</code> | Begin iterator of second sequence. |
| <code>__pred</code>   | Find predicate.                    |

References `std::make_pair()`.

#### `operator()()`

```
template<typename _RAIter1, typename _RAIter2, typename _Pred>
bool __gnu_parallel::__adjacent_find_selector::operator() (
    _RAIter1 __i1,
    _RAIter2 __i2,
    _Pred __pred) [inline]
```

Test on one position.

#### Parameters

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__i1</code>   | _Iterator on first sequence.           |
| <code>__i2</code>   | _Iterator on second sequence (unused). |
| <code>__pred</code> | Find predicate.                        |

### 6.5.1 Detailed Description

```
template<typename _Alloc, typename = typename _Alloc::value_type>
struct __gnu_cxx::__alloc_traits<_Alloc, typename >
```

Uniform interface to C++98 and C++11 allocators.

### 6.5.2 Member Typedef Documentation

#### `const_void_pointer`

```
template<typename _Alloc>
using std::allocator\_traits<_Alloc>::const_void_pointer [inherited]
```

The allocator's const void pointer type.

`Alloc::const_void_pointer` if that type exists, otherwise `pointer_traits<pointer>::rebind<const void>`

#### `is_always_equal`

```
template<typename _Alloc>
using std::allocator\_traits<_Alloc>::is_always_equal [inherited]
```

Whether all instances of the allocator type compare equal.

`Alloc::is_always_equal` if that type exists, otherwise `is_empty<Alloc>::type`

#### `propagate_on_container_copy_assignment`

```
template<typename _Alloc>
using std::allocator\_traits<_Alloc>::propagate_on_container_copy_assignment [inherited]
```

How the allocator is propagated on copy assignment.

`Alloc::propagate_on_container_copy_assignment` if that type exists, otherwise `false_type`

#### `propagate_on_container_move_assignment`

```
template<typename _Alloc>
using std::allocator\_traits<_Alloc>::propagate_on_container_move_assignment [inherited]
```

How the allocator is propagated on move assignment.

`Alloc::propagate_on_container_move_assignment` if that type exists, otherwise `false_type`

### **propagate\_on\_container\_swap**

```
template<typename _Alloc>
```

```
using std::allocator_traits< _Alloc >::propagate_on_container_swap [inherited]
```

How the allocator is propagated on swap.

`Alloc::propagate_on_container_swap` if that type exists, otherwise `false_type`

### **void\_pointer**

```
template<typename _Alloc>
```

```
using std::allocator_traits< _Alloc >::void_pointer [inherited]
```

The allocator's void pointer type.

`Alloc::void_pointer` if that type exists, otherwise `pointer_traits<pointer>::rebind<void>`

## **6.5.3 Member Function Documentation**

### **allocate() [1/4]**

```
template<typename _Alloc, typename = typename _Alloc::value_type>
```

```
constexpr pointer std::allocator_traits< _Alloc >::allocate (
    _Alloc & __a,
    size_type __n) [inline], [static], [nodiscard], [constexpr]
```

Allocate memory.

#### **Parameters**

|                  |                                              |
|------------------|----------------------------------------------|
| <code>__a</code> | An allocator.                                |
| <code>__n</code> | The number of objects to allocate space for. |

Calls `a.allocate(n)`

### **allocate() [2/4]**

```
template<typename _Alloc, typename = typename _Alloc::value_type>
```

```
constexpr pointer std::allocator_traits< _Alloc >::allocate (
    _Alloc & __a,
    size_type __n,
    const_void_pointer __hint) [inline], [static], [nodiscard], [constexpr]
```

Allocate memory.

#### **Parameters**

|                     |                                              |
|---------------------|----------------------------------------------|
| <code>__a</code>    | An allocator.                                |
| <code>__n</code>    | The number of objects to allocate space for. |
| <code>__hint</code> | Aid to locality.                             |

#### **Returns**

Memory of suitable size and alignment for *n* objects of type `value_type`

Returns `a.allocate(n, hint)` if that expression is well-formed, otherwise returns `a.allocate(n)`

**allocate()** [3/4]

```
template<typename _Alloc>
constexpr pointer std::allocator_traits<_Alloc >::allocate (
    _Alloc & __a,
    size_type __n) [inline], [static], [nodiscard], [constexpr], [inherited]
```

Allocate memory.

**Parameters**

|                  |                                              |
|------------------|----------------------------------------------|
| <code>__a</code> | An allocator.                                |
| <code>__n</code> | The number of objects to allocate space for. |

Calls `a.allocate(n)`

**allocate()** [4/4]

```
template<typename _Alloc>
constexpr pointer std::allocator_traits<_Alloc >::allocate (
    _Alloc & __a,
    size_type __n,
    const_void_pointer __hint) [inline], [static], [nodiscard], [constexpr], [inherited]
```

Allocate memory.

**Parameters**

|                     |                                              |
|---------------------|----------------------------------------------|
| <code>__a</code>    | An allocator.                                |
| <code>__n</code>    | The number of objects to allocate space for. |
| <code>__hint</code> | Aid to locality.                             |

**Returns**

Memory of suitable size and alignment for *n* objects of type `value_type`

Returns `a.allocate(n, hint)` if that expression is well-formed, otherwise returns `a.allocate(n)`

**construct()**

```
template<typename _Alloc, typename = typename _Alloc::value_type>
template<typename _Tp, typename... _Args>
requires __can_construct<_Alloc, _Tp, _Args...>
constexpr void std::allocator_traits<_Alloc >::construct (
    _Alloc & __a,
    _Tp * __p,
    _Args &&... __args) [inline], [static], [constexpr], [noexcept]
```

Construct an object of type `_Tp`

**Parameters**

|                     |                                                                      |
|---------------------|----------------------------------------------------------------------|
| <code>__a</code>    | An allocator.                                                        |
| <code>__p</code>    | Pointer to memory of suitable size and alignment for <code>Tp</code> |
| <code>__args</code> | Constructor arguments.                                               |

Calls `__a.construct(__p, std::forward<Args>(__args)...) if that expression is well-formed, otherwise uses placement-new to construct an object of type _Tp at location __p from the arguments __args...`

### deallocate() [1/2]

```
template<typename _Alloc, typename = typename _Alloc::value_type>
constexpr void std::allocator_traits< _Alloc >::deallocate (
    _Alloc & __a,
    pointer __p,
    size_type __n) [inline], [static], [constexpr]
```

Deallocate memory.

#### Parameters

|                  |                                                |
|------------------|------------------------------------------------|
| <code>__a</code> | An allocator.                                  |
| <code>__p</code> | Pointer to the memory to deallocate.           |
| <code>__n</code> | The number of objects space was allocated for. |

Calls `a.deallocate(p, n)`

### deallocate() [2/2]

```
template<typename _Alloc>
constexpr void std::allocator_traits< _Alloc >::deallocate (
    _Alloc & __a,
    pointer __p,
    size_type __n) [inline], [static], [constexpr], [inherited]
```

Deallocate memory.

#### Parameters

|                  |                                                |
|------------------|------------------------------------------------|
| <code>__a</code> | An allocator.                                  |
| <code>__p</code> | Pointer to the memory to deallocate.           |
| <code>__n</code> | The number of objects space was allocated for. |

Calls `a.deallocate(p, n)`

### destroy()

```
template<typename _Alloc, typename = typename _Alloc::value_type>
template<typename _Tp>
constexpr void std::allocator_traits< _Alloc >::destroy (
    _Alloc & __a,
    _Tp * __p) [inline], [static], [constexpr], [noexcept]
```

Destroy an object of type `_Tp`.

## Parameters

|                  |                                  |
|------------------|----------------------------------|
| <code>__a</code> | An allocator.                    |
| <code>__p</code> | Pointer to the object to destroy |

Calls `__a.destroy(__p)` if that expression is well-formed, otherwise calls `__p->~Tp()`

**max\_size()**

```
template<typename _Alloc, typename = typename _Alloc::value_type>
constexpr size_type std::allocator_traits<_Alloc>::max_size (
    const _Alloc & __a) [inline], [static], [constexpr], [noexcept]
```

The maximum supported allocation size.

## Parameters

|                  |               |
|------------------|---------------|
| <code>__a</code> | An allocator. |
|------------------|---------------|

## Returns

`__a.max_size()` or `numeric_limits<size_type>::max()`

Returns `__a.max_size()` if that expression is well-formed, otherwise returns `numeric_limits<size_type>::max()`

**select\_on\_container\_copy\_construction()**

```
template<typename _Alloc>
constexpr _Alloc std::allocator_traits<_Alloc>::select_on_container_copy_construction (
    const _Alloc & __rhs) [inline], [static], [constexpr], [inherited]
```

Obtain an allocator to use when copying a container.

## Parameters

|                    |               |
|--------------------|---------------|
| <code>__rhs</code> | An allocator. |
|--------------------|---------------|

## Returns

`__rhs.select_on_container_copy_construction()` or `__rhs`

Returns `__rhs.select_on_container_copy_construction()` if that expression is well-formed, otherwise returns `__rhs`

The documentation for this struct was generated from the following file:

- [ext/alloc\\_traits.h](#)

**6.6 `std::__basic_future<_Res>` Class Template Reference**

```
#include <future>
```

Inheritance diagram for `std::__basic_future< _Res >`:

### Public Member Functions

- `__basic_future` (const `__basic_future` &)=delete
- `__basic_future` & `operator=` (const `__basic_future` &)=delete
- bool `valid` () const noexcept
- void `wait` () const
- template<typename `_Rep`, typename `_Period`>  
`future_status wait_for` (const `chrono::duration`< `_Rep`, `_Period` > &\_\_rel) const
- template<typename `_Clock`, typename `_Duration`>  
`future_status wait_until` (const `chrono::time_point`< `_Clock`, `_Duration` > &\_\_abs) const

### Protected Types

- typedef `__future_base::Result`< `_Res` > & `__result_type`
- typedef `shared_ptr`< `_State_base` > `__state_type`

### Protected Member Functions

- `__basic_future` (const `__state_type` &\_\_state)
- `__basic_future` (const `shared_future`< `_Res` > &) noexcept
- `__basic_future` (`future`< `_Res` > &&) noexcept
- `__basic_future` (`shared_future`< `_Res` > &&) noexcept
- `__result_type` `_M_get_result` () const
- void `_M_swap` (`__basic_future` &\_\_that) noexcept

#### 6.6.1 Detailed Description

```

template<typename _Res>
class std::__basic_future< _Res >

```

Common implementation for `future` and `shared_future`.

### 6.6.2 Member Function Documentation

#### `_M_get_result()`

```
template<typename _Res>
```

```
__result_type std::__basic_future< _Res >::_M_get_result () const [inline], [protected]
```

Wait for the state to be ready and rethrow any stored exception.

Referenced by `std::future< _Res >::get()`, and `std::shared_future< _Res >::get()`.

The documentation for this class was generated from the following file:

- `future`

### 6.7 `__gnu_parallel::__binder1st< _Operation, _FirstArgumentType, _SecondArgumentType, _ResultType >` Class Template Reference

```
#include <base.h>
```

Inheritance diagram for `__gnu_parallel::__binder1st< _Operation, _FirstArgumentType, _SecondArgumentType, _ResultType >`:

#### Public Types

- typedef `_SecondArgumentType` `argument_type`
- typedef `_ResultType` `result_type`

#### Public Member Functions

- `__binder1st` (`const _Operation &__x`, `const _FirstArgumentType &__y`)
- `_ResultType operator()` (`_SecondArgumentType &__x`) `const`
- `_ResultType operator()` (`const _SecondArgumentType &__x`)

#### Protected Attributes

- `_Operation` `_M_op`
- `_FirstArgumentType` `_M_value`

### 6.7.1 Detailed Description

```
template<typename _Operation, typename _FirstArgumentType, typename _SecondArgumentType, typename
_ResultType>
```

```
class __gnu_parallel::__binder1st< _Operation, _FirstArgumentType, _SecondArgumentType, _ResultType >
```

Similar to `std::binder1st`, but giving the argument types explicitly.

### 6.7.2 Member Typedef Documentation

#### argument\_type

```
typedef _SecondArgumentType std::unary_function< _SecondArgumentType, _ResultType >::argument_type
type [inherited]
```

`argument_type` is the type of the argument

#### result\_type

```
typedef _ResultType std::unary_function< _SecondArgumentType, _ResultType >::result_type [inherited]
```

`result_type` is the return type

The documentation for this class was generated from the following file:

- [base.h](#)

## 6.8 \_\_gnu\_parallel::\_\_binder2nd< \_Operation, \_FirstArgumentType, \_SecondArgumentType, \_ResultType > Class Template Reference

```

```

Inheritance diagram for `__gnu_parallel::__binder2nd< _Operation, _FirstArgumentType, _SecondArgumentType, _ResultType >`:

### Public Types

- typedef `_FirstArgumentType` [argument\\_type](#)
- typedef `_ResultType` [result\\_type](#)

## Public Member Functions

- **\_\_binder2nd** (const \_Operation &\_\_x, const \_SecondArgumentType &\_\_y)
- \_ResultType **operator()** (\_FirstArgumentType &\_\_x)
- \_ResultType **operator()** (const \_FirstArgumentType &\_\_x) const

## Protected Attributes

- \_Operation **\_M\_op**
- \_SecondArgumentType **\_M\_value**

### 6.8.1 Detailed Description

template<typename \_Operation, typename \_FirstArgumentType, typename \_SecondArgumentType, typename \_ResultType>

class \_\_gnu\_parallel::\_\_binder2nd< \_Operation, \_FirstArgumentType, \_SecondArgumentType, \_ResultType >

Similar to std::binder2nd, but giving the argument types explicitly.

### 6.8.2 Member Typedef Documentation

#### argument\_type

```
typedef _FirstArgumentType std::unary_function< _FirstArgumentType, _ResultType >::argument_type
[inherited]
```

argument\_type is the type of the argument

#### result\_type

```
typedef _ResultType std::unary_function< _FirstArgumentType, _ResultType >::result_type [inherited]
```

result\_type is the return type

The documentation for this class was generated from the following file:

- [base.h](#)

### 6.9.1 Detailed Description

```
template<typename _InternT, typename _ExternT, typename _StateT>
class std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >
```

Common base for codecv functions.

This template class provides implementations of the public functions that forward to the protected virtual functions.

This template also provides abstract stubs for the protected virtual functions.

### 6.9.2 Member Function Documentation

#### do\_out()

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::do_out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type * __from_next,
```

```
extern_type * __to,
extern_type * __to_end,
extern_type *& __to_next) const [protected], [pure virtual]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This function is a hook for derived classes to change the value returned.

See also

[out\(\)](#) for more information.

Implemented in `std::codecvt<_InternT, _ExternT, _StateT>`, `std::codecvt<_Elem, char, mbstate_t>`, `std::codecvt<_InternT, _ExternT, std::codecvt<char, char, mbstate_t>`, `std::codecvt<char16_t, char, mbstate_t>`, `std::codecvt<char32_t, char, mbstate_t>`, and `std::codecvt<wchar_t, char, mbstate_t>`.

Referenced by [out\(\)](#).

### `in()`

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base<_InternT, _ExternT, _StateT>::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [inline]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

### Parameters

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

### Returns

`codecvt_base::result`.

**out()**

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

**Parameters**

|                          |                                      |
|--------------------------|--------------------------------------|
| <code>__state</code>     | Persistent conversion state data.    |
| <code>__from</code>      | Start of input.                      |
| <code>__from_end</code>  | End of input.                        |
| <code>__from_next</code> | Returns start of unconverted data.   |
| <code>__to</code>        | Start of output buffer.              |
| <code>__to_end</code>    | End of output buffer.                |
| <code>__to_next</code>   | Returns start of unused output area. |

**Returns**

`codecvt_base::result`.

References [do\\_out\(\)](#).

**unshift()**

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

Reset conversion state.

Writes characters to output that would restore `state` to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types. The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

#### Parameters

|                        |                                      |
|------------------------|--------------------------------------|
| <code>__state</code>   | Persistent conversion state data.    |
| <code>__to</code>      | Start of output buffer.              |
| <code>__to_end</code>  | End of output buffer.                |
| <code>__to_next</code> | Returns start of unused output area. |

#### Returns

`codecvt_base::result`.

### 6.13.1 Detailed Description

```
template<typename _CharT>
class std::__ctype_abstract_base< _CharT >
```

Common base for ctype facet.

This template class provides implementations of the public functions that forward to the protected virtual functions.

This template also provides abstract stubs for the protected virtual functions.

### 6.13.2 Member Typedef Documentation

#### char\_type

```
template<typename _CharT>
typedef _CharT std::__ctype_abstract_base< _CharT >::char_type
```

Typedef for the template parameter.

### 6.13.3 Member Function Documentation

#### do\_is() [1/2]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [protected], [pure virtual]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

#### Parameters

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

#### Returns

`__hi`.

Implemented in `std::ctype< _CharT >`, and `std::mask< _CharT >`.

#### do\_is() [2/2]

```
template<typename _CharT>
virtual bool std::__ctype_abstract_base< _CharT >::do_is (
    mask __m,
    char_type __c) const [protected], [pure virtual]
```

Test char\_type classification.

This function finds a mask M for c and compares it to mask m.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

## Parameters

|                                  |                                    |
|----------------------------------|------------------------------------|
| <a href="#"><code>__c</code></a> | The char_type to find the mask of. |
| <a href="#"><code>__m</code></a> | The mask to compare against.       |

## Returns

(M & \_\_m) != 0.

Implemented in [std::ctype<\\_CharT>](#), [std::ctype<wchar\\_t>](#), and [std::mask<\\_CharT>](#).

Referenced by [std::mask<\\_CharT>::is\(\)](#), and [std::mask<\\_CharT>::is\(\)](#).

**do\_narrow()** [1/2]

```
template<typename _CharT>
virtual char std::\_\_ctype\_abstract\_base<\_CharT>::do\_narrow (
    char\_type __c,
    char __default) const [protected], [pure virtual]
```

Narrow char\_type to char.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, default is returned instead.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

|                                        |                                     |
|----------------------------------------|-------------------------------------|
| <a href="#"><code>__c</code></a>       | The char_type to convert.           |
| <a href="#"><code>__default</code></a> | Char to return if conversion fails. |

## Returns

The converted char.

Implemented in [std::ctype<\\_CharT>](#), [std::ctype<wchar\\_t>](#), and [std::mask<\\_CharT>](#).

Referenced by [std::mask<\\_CharT>::narrow\(\)](#), and [std::mask<\\_CharT>::narrow\(\)](#).

**do\_narrow()** [2/2]

```
template<typename _CharT>
virtual const char\_type * std::\_\_ctype\_abstract\_base<\_CharT>::do\_narrow (
    const char\_type * __lo,
    const char\_type * __hi,
    char __default,
    char * __to) const [protected], [pure virtual]
```

Narrow char\_type array to char.

This virtual function converts each char\_type in the range [`__lo`,`__hi`) to char using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__default` is used instead.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

**Returns**

`__hi`.

Implemented in [std::ctype< \\_CharT >](#), and [std::mask< \\_CharT >](#).

**do\_scan\_is()**

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [pure virtual]
```

Find char\_type matching mask.

This function searches for and returns the first char\_type c in [`__lo`,`__hi`) for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

**Parameters**

|                   |                              |
|-------------------|------------------------------|
| <code>__m</code>  | The mask to compare against. |
| <code>__lo</code> | Pointer to start of range.   |
| <code>__hi</code> | Pointer to end of range.     |

**Returns**

Pointer to a matching char\_type if found, else `__hi`.

Implemented in [std::ctype< \\_CharT >](#), [std::ctype< wchar\\_t >](#), and [std::mask< \\_CharT >](#).

Referenced by [std::mask< \\_CharT >::scan\\_is\(\)](#).

**do\_scan\_not()**

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [pure virtual]
```

Find char\_type not matching mask.

This function searches for and returns a pointer to the first char\_type c of [`lo`,`hi`) for which `is(m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

## Parameters

|                                                                                                                       |                              |
|-----------------------------------------------------------------------------------------------------------------------|------------------------------|
| <a href="#"></a><br><code>_m</code>  | The mask to compare against. |
| <a href="#"></a><br><code>_lo</code> | Pointer to start of range.   |
| <a href="#"></a><br><code>_hi</code> | Pointer to end of range.     |

## Returns

Pointer to a non-matching `char_type` if found, else `__hi`.

Implemented in [std::ctype<\\_CharT>](#), [std::ctype<wchar\\_t>](#), and [std::mask<\\_CharT>](#).

Referenced by [std::mask<\\_CharT>::scan\\_not\(\)](#).

**do\_tolower()** [1/2]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base<_CharT>::do_tolower (
    char_type * __lo,
    const char_type * __hi) const [protected], [pure virtual]
```

Convert array to lowercase.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

## Parameters

|                                                                                                                         |                            |
|-------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><code>_lo</code> | Pointer to start of range. |
| <a href="#"></a><br><code>_hi</code> | Pointer to end of range.   |

## Returns

`__hi`.

Implemented in [std::ctype<\\_CharT>](#), and [std::mask<\\_CharT>](#).

**do\_tolower()** [2/2]

```
template<typename _CharT>
virtual char_type std::__ctype_abstract_base<_CharT>::do_tolower (
    char_type __c) const [protected], [pure virtual]
```

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

## Parameters

|                                  |                           |
|----------------------------------|---------------------------|
| <a href="#"><code>__c</code></a> | The char_type to convert. |
|----------------------------------|---------------------------|

## Returns

The lowercase char\_type if convertible, else `__c`.

Implemented in [std::ctype<\\_CharT>](#), [std::ctype<wchar\\_t>](#), and [std::mask<\\_CharT>](#).

Referenced by [std::mask<\\_CharT>::tolower\(\)](#), and [std::mask<\\_CharT>::tolower\(\)](#).

**do\_toupper()** [1/2]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base<_CharT>::do_toupper (
    char_type * __lo,
    const char_type * __hi) const [protected], [pure virtual]
```

Convert array to uppercase.

This virtual function converts each char\_type in the range [`__lo`,`__hi`) to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

|                                   |                            |
|-----------------------------------|----------------------------|
| <a href="#"><code>__lo</code></a> | Pointer to start of range. |
| <a href="#"><code>__hi</code></a> | Pointer to end of range.   |

## Returns

`__hi`.

Implemented in [std::ctype<\\_CharT>](#), and [std::mask<\\_CharT>](#).

**do\_toupper()** [2/2]

```
template<typename _CharT>
virtual char_type std::__ctype_abstract_base<_CharT>::do_toupper (
    char_type __c) const [protected], [pure virtual]
```

Convert to uppercase.

This virtual function converts the char\_type argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

|                                  |                           |
|----------------------------------|---------------------------|
| <a href="#"><code>__c</code></a> | The char_type to convert. |
|----------------------------------|---------------------------|

**Returns**

The uppercase `char_type` if convertible, else `__c`.

Implemented in [std::ctype<\\_CharT>](#), [std::ctype<wchar\\_t>](#), and [std::mask<\\_CharT>](#).

Referenced by [std::mask<\\_CharT>::toupper\(\)](#), and [std::mask<\\_CharT>::toupper\(\)](#).

**do\_widen()** [1/2]

```
template<typename _CharT>
virtual char_type std::__ctype_abstract_base<_CharT>::do_widen (
    char __c) const [protected], [pure virtual]
```

Widen char.

This virtual function converts the `char` to `char_type` using the simplest reasonable transformation.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                  |                      |
|------------------|----------------------|
| <code>__c</code> | The char to convert. |
|------------------|----------------------|

**Returns**

The converted `char_type`

Implemented in [std::ctype<\\_CharT>](#), [std::ctype<char>](#), [std::ctype<wchar\\_t>](#), and [std::mask<\\_CharT>](#).

Referenced by [std::mask<\\_CharT>::widen\(\)](#), and [std::mask<\\_CharT>::widen\(\)](#).

**do\_widen()** [2/2]

```
template<typename _CharT>
virtual const char * std::__ctype_abstract_base<_CharT>::do_widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [protected], [pure virtual]
```

Widen char array.

This function converts each `char` in the input to `char_type` using the simplest reasonable transformation.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

|                   |                                   |
|-------------------|-----------------------------------|
| <code>__lo</code> | Pointer to start range.           |
| <code>__hi</code> | Pointer to end of range.          |
| <code>__to</code> | Pointer to the destination array. |

**Returns**

`__hi`.

Implemented in [std::ctype<\\_CharT>](#), and [std::mask<\\_CharT>](#).

**is()** [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [inline]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char\_type>::do\_is().

**Parameters**

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__lo</code>  | Pointer to start of range.           |
| <code>__hi</code>  | Pointer to end of range.             |
| <code>__vec</code> | Pointer to an array of mask storage. |

**Returns**

`__hi`.

**is()** [2/2]

```
template<typename _CharT>
bool std::__ctype_abstract_base< _CharT >::is (
    mask __m,
    char_type __c) const [inline]
```

Test char\_type classification.

This function finds a mask M for \_\_c and compares it to mask \_\_m. It does so by returning the value of ctype<char\_↵type>::do\_is().

**Parameters**

|                  |                                       |
|------------------|---------------------------------------|
| <code>↵_c</code> | The char_type to compare the mask of. |
| <code>↵_m</code> | The mask to compare against.          |

**Returns**

$(M \& \_m) \neq 0$ .

Referenced by [std::time\\_get< \\_CharT, \\_InIter >::get\(\)](#).

**narrow()** [1/2]

```
template<typename _CharT>
char std::__ctype_abstract_base< _CharT >::narrow (
    char_type __c,
    char __dfault) const [inline]
```

Narrow char\_type to char.

This function converts the char\_type to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_c).

Note: this is not what you want for codepage conversions. See [codecvt](#) for that.

## Parameters

|                        |                                        |
|------------------------|----------------------------------------|
| <code>__c</code>       | The <code>char_type</code> to convert. |
| <code>__default</code> | Char to return if conversion fails.    |

## Returns

The converted char.

Referenced by `std::time_get<_CharT, _InIter>::do_get_year()`, `std::time_get<_CharT, _InIter>::get()`, and `std::time_put<_CharT, _OutIter>::put()`.

**narrow()** [2/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline]
```

Narrow array to char array.

This function converts each `char_type` in the input to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `char_type` in the input that cannot be converted, `default` is used instead. It does so by returning `ctype<char_type>::do_narrow(__lo, __hi, __default, __to)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

|                        |                                   |
|------------------------|-----------------------------------|
| <code>__lo</code>      | Pointer to start of range.        |
| <code>__hi</code>      | Pointer to end of range.          |
| <code>__default</code> | Char to use if conversion fails.  |
| <code>__to</code>      | Pointer to the destination array. |

## Returns

`__hi`.

**scan\_is()**

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline]
```

Find `char_type` matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is true. It does so by returning `ctype<char_type>::do_scan_is()`.

## Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__m</code> | The mask to compare against. |
|------------------|------------------------------|

**Parameters**

|                                                                                                                        |                            |
|------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><code>__lo</code> | Pointer to start of range. |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.   |

**Returns**

Pointer to matching `char_type` if found, else `__hi`.

**scan\_not()**

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline]
```

Find `char_type` not matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is false. It does so by returning `ctype<char_type>::do_scan_not()`.

**Parameters**

|                                                                                                                          |                                 |
|--------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <a href="#"></a><br><code>__m</code>   | The mask to compare against.    |
| <a href="#"></a><br><code>__lo</code> | Pointer to first char in range. |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.        |

**Returns**

Pointer to non-matching char if found, else `__hi`.

**tolower() [1/2]**

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::tolower (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo, __hi)`.

**Parameters**

|                                                                                                                          |                            |
|--------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <a href="#"></a><br><code>__lo</code> | Pointer to start of range. |
| <a href="#"></a><br><code>__hi</code> | Pointer to end of range.   |

## Returns

`__hi`.**tolower()** [2/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base<_CharT>::tolower (
    char_type __c) const [inline]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_tolower(c)`.

## Parameters

|                  |                           |
|------------------|---------------------------|
| <code>__c</code> | The char_type to convert. |
|------------------|---------------------------|

## Returns

The lowercase char\_type if convertible, else `__c`.Referenced by `std::time_get<_CharT, _InIter>::get()`.**toupper()** [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

## Parameters

|                   |                            |
|-------------------|----------------------------|
| <code>__lo</code> | Pointer to start of range. |
| <code>__hi</code> | Pointer to end of range.   |

## Returns

`__hi`.**toupper()** [2/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base<_CharT>::toupper (
    char_type __c) const [inline]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

## Parameters

|                                                                                                                      |                           |
|----------------------------------------------------------------------------------------------------------------------|---------------------------|
| <a href="#"></a><br><code>_c</code> | The char_type to convert. |
|----------------------------------------------------------------------------------------------------------------------|---------------------------|

## Returns

The uppercase char\_type if convertible, else `__c`.

Referenced by [std::time\\_get<\\_CharT, \\_InIter >::get\(\)](#).

**widen()** [1/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base<_CharT >::widen (
    char __c) const [inline]
```

Widen char to char\_type.

This function converts the char argument to char\_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

|                                                                                                                      |                      |
|----------------------------------------------------------------------------------------------------------------------|----------------------|
| <a href="#"></a><br><code>_c</code> | The char to convert. |
|----------------------------------------------------------------------------------------------------------------------|----------------------|

## Returns

The converted char\_type.

Referenced by [std::money\\_get<\\_CharT, \\_InIter >::do\\_get\(\)](#), [std::time\\_get<\\_CharT, \\_InIter >::do\\_get\(\)](#), [std::money\\_put<\\_CharT, \\_OutIter >::do\\_put\(\)](#) and [std::time\\_put<\\_CharT, \\_OutIter >::do\\_put\(\)](#).

**widen()** [2/2]

```
template<typename _CharT>
const char * std::__ctype_abstract_base<_CharT >::widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline]
```

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

|                                                                                                                         |                                   |
|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------|
| <a href="#"></a><br><code>_lo</code> | Pointer to start of range.        |
| <a href="#"></a><br><code>_hi</code> | Pointer to end of range.          |
| <a href="#"></a><br><code>_to</code> | Pointer to the destination array. |

Returns

`__hi`.

The documentation for this class was generated from the following file:

- [locale\\_facets.h](#)

## 6.14 std::tr2::\_\_dynamic\_bitset\_base< \_WordT, \_Alloc > Struct Template Reference

## 6.14.1 Detailed Description

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
struct std::tr2::__dynamic_bitset_base< _WordT, _Alloc >
```

Base class, general case.

See documentation for `dynamic_bitset`.

### 6.14.2 Member Data Documentation

#### M\_w

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::vector<block_type, allocator_type> std::tr2::__dynamic_bitset_base< _WordT, _Alloc >::_M_w
0 is the least significant word.
```

The documentation for this struct was generated from the following files:

- [dynamic\\_bitset](#)
- [dynamic\\_bitset.tcc](#)

## 6.15 \_\_gnu\_parallel::\_\_fill\_selector<\_It> Struct Template Reference

```
#include <for_each_selectors.h>
```

Inheritance diagram for \_\_gnu\_parallel::\_\_fill\_selector<\_It>:

### Public Member Functions

- `template<typename _ValueType>`  
`bool operator() (_ValueType &__v, _It __i)`

### Public Attributes

- `_It _M_finish_iterator`

### 6.15.1 Detailed Description

```
template<typename _It>
struct __gnu_parallel::__fill_selector<_It>
```

`std::fill()` selector.

### 6.15.2 Member Function Documentation

#### `operator>()()`

```
template<typename _It>
template<typename _ValueType>
```

```
bool __gnu_parallel::__fill_selector< _It >::operator() (
    _ValueType & __v,
    _It __i) [inline]
```

Functor execution.

#### Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__v</code> | Current value.               |
| <code>__i</code> | iterator referencing object. |

### 6.15.3 Member Data Documentation

#### `_M_finish_iterator`

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator [inherited]
_iterator on last element processed; needed for some algorithms (e. g. std::transform()).
```

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

### 6.16 `__gnu_parallel::__find_first_of_selector< _FIterator >` Struct Template Reference

```
#include <find_selectors.h>
```

Inheritance diagram for `__gnu_parallel::__find_first_of_selector< _FIterator >`:

#### Public Member Functions

- `__find_first_of_selector` (`_FIterator __begin`, `_FIterator __end`)
- `template<typename _RAIter1, typename _RAIter2, typename _Pred>`  
`std::pair< _RAIter1, _RAIter2 > \_M\_sequential\_algorithm (_RAIter1 __begin1, _RAIter1 __end1, _RAIter2 __begin2, _Pred __pred)`
- `template<typename _RAIter1, typename _RAIter2, typename _Pred>`  
`bool operator() (_RAIter1 __i1, _RAIter2 __i2, _Pred __pred)`

**Public Attributes**

- `_FIterator _M_begin`
- `_FIterator _M_end`

**6.16.1 Detailed Description**

```
template<typename _FIterator>
struct __gnu_parallel::__find_first_of_selector<_FIterator>
```

Test predicate on several elements.

**6.16.2 Member Function Documentation****`_M_sequential_algorithm()`**

```
template<typename _FIterator>
template<typename _RAIter1, typename _RAIter2, typename _Pred>
std::pair<_RAIter1, _RAIter2> __gnu_parallel::__find_first_of_selector<_FIterator>::_M_↵
sequential_algorithm (
    _RAIter1 __begin1,
    _RAIter1 __end1,
    _RAIter2 __begin2,
    _Pred __pred) [inline]
```

Corresponding sequential algorithm on a sequence.

**Parameters**

|                       |                                    |
|-----------------------|------------------------------------|
| <code>__begin1</code> | Begin iterator of first sequence.  |
| <code>__end1</code>   | End iterator of first sequence.    |
| <code>__begin2</code> | Begin iterator of second sequence. |
| <code>__pred</code>   | Find predicate.                    |

References [std::make\\_pair\(\)](#).

**`operator>()()`**

```
template<typename _FIterator>
template<typename _RAIter1, typename _RAIter2, typename _Pred>
bool __gnu_parallel::__find_first_of_selector<_FIterator>::operator() (
    _RAIter1 __i1,
    _RAIter2 __i2,
    _Pred __pred) [inline]
```

Test on one position.

**Parameters**

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__i1</code>   | _Iterator on first sequence.           |
| <code>__i2</code>   | _Iterator on second sequence (unused). |
| <code>__pred</code> | Find predicate.                        |

## 6.17 \_\_gnu\_parallel::\_\_find\_if\_selector Struct Reference

```
#include <find_selectors.h>
```

Inheritance diagram for \_\_gnu\_parallel::\_\_find\_if\_selector:

### Public Member Functions

- `template<typename _RAIter1, typename _RAIter2, typename _Pred>`  
`std::pair< _RAIter1, _RAIter2 > \_M\_sequential\_algorithm ( _RAIter1 __begin1, _RAIter1 __end1, _RAIter2 __begin2, _Pred __pred)`
- `template<typename _RAIter1, typename _RAIter2, typename _Pred>`  
`bool operator\(\) ( _RAIter1 __i1, _RAIter2 __i2, _Pred __pred)`

#### 6.17.1 Detailed Description

Test predicate on a single element, used for `std::find()` and `std::find_if()`.

#### 6.17.2 Member Function Documentation

##### `_M_sequential_algorithm()`

```
template<typename _RAIter1, typename _RAIter2, typename _Pred>
std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__find_if_selector::_M_sequential_algorithm (
    _RAIter1 __begin1,
    _RAIter1 __end1,
    _RAIter2 __begin2,
    _Pred __pred) [inline]
```

Corresponding sequential algorithm on a sequence.

##### Parameters

|                       |                                    |
|-----------------------|------------------------------------|
| <code>__begin1</code> | Begin iterator of first sequence.  |
| <code>__end1</code>   | End iterator of first sequence.    |
| <code>__begin2</code> | Begin iterator of second sequence. |
| <code>__pred</code>   | Find predicate.                    |

References [std::make\\_pair\(\)](#).

**operator()()**

```
template<typename _RAIter1, typename _RAIter2, typename _Pred>
bool __gnu_parallel::__find_if_selector::operator() (
    _RAIter1 __i1,
    _RAIter2 __i2,
    _Pred __pred) [inline]
```

Test on one position.

**Parameters**

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__i1</code>   | _Iterator on first sequence.           |
| <code>__i2</code>   | _Iterator on second sequence (unused). |
| <code>__pred</code> | Find predicate.                        |

The documentation for this struct was generated from the following file:

- [find\\_selectors.h](#)

**6.18 \_\_gnu\_parallel::\_\_for\_each\_selector<\_It> Struct Template Reference**

```
#include <for_each_selectors.h>
```

Inheritance diagram for \_\_gnu\_parallel::\_\_for\_each\_selector<\_It>:

**Public Member Functions**

- `template<typename _Op>`  
`bool operator() (_Op &__o, _It __i)`

**Public Attributes**

- `_It _M_finish_iterator`

### 6.18.1 Detailed Description

```
template<typename _It>
struct __gnu_parallel::__for_each_selector< _It >
```

std::for\_each() selector.

### 6.18.2 Member Function Documentation

#### operator()()

```
template<typename _It>
template<typename _Op>
bool __gnu_parallel::__for_each_selector< _It >::operator() (
    _Op & __o,
    _It __i) [inline]
```

Functor execution.

#### Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__o</code> | Operator.                    |
| <code>__i</code> | iterator referencing object. |

### 6.18.3 Member Data Documentation

#### `_M_finish_iterator`

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator [inherited]
_iterator on last element processed; needed for some algorithms (e. g. std::transform()).
```

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

## 6.19 `__cxxabiv1::__forced_unwind` Class Reference

```
#include <cxxabi_forced.h>
```

### 6.19.1 Detailed Description

Thrown as part of forced unwinding.

A magic placeholder class that can be caught by reference to recognize forced unwinding.

The documentation for this class was generated from the following file:

- [cxxabi\\_forced.h](#)

## 6.20 `__gnu_parallel::__generate_selector< _It >` Struct Template Reference

```
#include <for_each_selectors.h>
```

Inheritance diagram for `__gnu_parallel::__generate_selector<_It>`:

### Public Member Functions

- `template<typename _Op>`  
`bool operator() (_Op &__o, _It __i)`

### Public Attributes

- `_It _M_finish_iterator`

#### 6.20.1 Detailed Description

`template<typename _It>`  
`struct __gnu_parallel::__generate_selector<_It>`

`std::generate()` selector.

#### 6.20.2 Member Function Documentation

##### `operator>()`

```

template<typename _It>
template<typename _Op>
bool __gnu_parallel::__generate_selector<_It>::operator() (
    _Op & __o,
    _It __i) [inline]
  
```

Functor execution.

##### Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__o</code> | Operator.                    |
| <code>__i</code> | iterator referencing object. |

### 6.20.3 Member Data Documentation

#### `_M_finish_iterator`

```
template<typename _It>
```

```
_It \_\_gnu\_parallel::\_\_generic\_for\_each\_selector< _It >::_M_finish_iterator [inherited]  
_Iterator on last element processed; needed for some algorithms (e. g. std::transform()).
```

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

### 6.21 `__gnu_parallel::__generic_find_selector` Struct Reference

```
#include <find_selectors.h>
```

Inheritance diagram for `__gnu_parallel::__generic_find_selector`:

#### 6.21.1 Detailed Description

Base class of all `__gnu_parallel::__find_template` selectors.

The documentation for this struct was generated from the following file:

- [find\\_selectors.h](#)

### 6.22 `__gnu_parallel::__generic_for_each_selector<_It>` Struct Template Reference

```
#include <for_each_selectors.h>
```

Inheritance diagram for \_\_gnu\_parallel::\_\_generic\_for\_each\_selector<\_It>:

#### Public Attributes

- `_It` [\\_M\\_finish\\_iterator](#)

### 6.22.1 Detailed Description

```
template<typename _It>
struct __gnu_parallel::__generic_for_each_selector< _It >
```

Generic \_\_selector for embarrassingly parallel functions.

### 6.22.2 Member Data Documentation

#### `_M_finish_iterator`

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator
_iterator on last element processed; needed for some algorithms (e. g. std::transform()).
The documentation for this struct was generated from the following file:
```

- [for\\_each\\_selectors.h](#)

### 6.23 `__gnu_parallel::__identity_selector< _It >` Struct Template Reference

```
#include <for_each_selectors.h>
```

Inheritance diagram for `__gnu_parallel::__identity_selector< _It >`:

#### Public Member Functions

- `template<typename _Op>`  
`_It operator() (_Op __o, _It __i)`

#### Public Attributes

- `_It` [\\_M\\_finish\\_iterator](#)

### 6.23.1 Detailed Description

```
template<typename _It>
struct __gnu_parallel::__identity_selector< _It >
```

Selector that just returns the passed iterator.

### 6.23.2 Member Function Documentation

#### operator>()

```
template<typename _It>
template<typename _Op>
_It __gnu_parallel::__identity_selector<_It>::operator() (
    _Op __o,
    _It __i) [inline]
```

Functor execution.

#### Parameters

|                                                                                                    |                              |
|----------------------------------------------------------------------------------------------------|------------------------------|
|  <code>__o</code> | Operator (unused).           |
|  <code>__i</code> | iterator referencing object. |

#### Returns

Passed iterator.

### 6.23.3 Member Data Documentation

#### \_M\_finish\_iterator

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector<_It>::_M_finish_iterator [inherited]
_iterator on last element processed; needed for some algorithms (e. g. std::transform()).
```

The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

## 6.24 \_\_gnu\_parallel::\_\_inner\_product\_selector<\_It, \_It2, \_Tp> Struct Template Reference

```
#include <for_each_selectors.h>
```

Inheritance diagram for \_\_gnu\_parallel::\_\_inner\_product\_selector<\_It, \_It2, \_Tp>:

## Public Member Functions

- [\\_\\_inner\\_product\\_selector](#) (\_It \_\_b1, \_It2 \_\_b2)
- `template<typename _Op>`  
[\\_Tp operator\(\)](#) (\_Op \_\_mult, \_It \_\_current)

## Public Attributes

- [\\_It \\_\\_begin1\\_iterator](#)
- [\\_It2 \\_\\_begin2\\_iterator](#)
- [\\_It \\_\\_M\\_finish\\_iterator](#)

### 6.24.1 Detailed Description

```
template<typename _It, typename _It2, typename _Tp>
struct __gnu_parallel::__inner_product_selector< _It, _It2, _Tp >
```

std::inner\_product() selector.

### 6.24.2 Constructor & Destructor Documentation

#### [\\_\\_inner\\_product\\_selector\(\)](#)

```
template<typename _It, typename _It2, typename _Tp>
__gnu_parallel::__inner_product_selector< _It, _It2, _Tp >::__inner_product_selector (
    _It __b1,
    _It2 __b2) [inline], [explicit]
```

Constructor.

#### Parameters

|                      |                                    |
|----------------------|------------------------------------|
| <a href="#">__b1</a> | Begin iterator of first sequence.  |
| <a href="#">__b2</a> | Begin iterator of second sequence. |

References [\\_\\_begin1\\_iterator](#), and [\\_\\_begin2\\_iterator](#).

### 6.24.3 Member Function Documentation

#### [operator>\(\)\(\)](#)

```
template<typename _It, typename _It2, typename _Tp>
template<typename _Op>
_Tp __gnu_parallel::__inner_product_selector< _It, _It2, _Tp >::operator() (
    _Op __mult,
    _It __current) [inline]
```

Functor execution.

#### Parameters

|                           |                              |
|---------------------------|------------------------------|
| <a href="#">__mult</a>    | Multiplication functor.      |
| <a href="#">__current</a> | iterator referencing object. |

#### Returns

Inner product elemental [\\_\\_result](#).

References [\\_\\_begin1\\_iterator](#), and [\\_\\_begin2\\_iterator](#).

#### 6.24.4 Member Data Documentation

##### **\_\_begin1\_iterator**

```
template<typename _It, typename _It2, typename _Tp>
_It __gnu_parallel::__inner_product_selector< _It, _It2, _Tp >::__begin1_iterator
```

Begin iterator of first sequence.  
Referenced by [\\_\\_inner\\_product\\_selector\(\)](#), and [operator\(\)](#).

##### **\_\_begin2\_iterator**

```
template<typename _It, typename _It2, typename _Tp>
_It2 __gnu_parallel::__inner_product_selector< _It, _It2, _Tp >::__begin2_iterator
```

Begin iterator of second sequence.  
Referenced by [\\_\\_inner\\_product\\_selector\(\)](#), and [operator\(\)](#).

##### **\_M\_finish\_iterator**

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator [inherited]
```

\_Iterator on last element processed; needed for some algorithms (e. g. [std::transform\(\)](#)).  
The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

## 6.25 std::\_\_is\_fast\_hash<\_Hash> Struct Template Reference

```
#include <functional_hash.h>
```

### 6.25.1 Detailed Description

```
template<typename _Hash>
struct std::__is_fast_hash<_Hash>
```

Hint about performance of hash functions.

If a given hash function object is not fast, the hash-based containers will cache the hash code. The default behavior is to consider that hashers are fast unless specified otherwise.

Users can specialize this for their own hash functions in order to force caching of hash codes in unordered containers. Specializing this trait affects the ABI of the unordered containers, so use it carefully.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 6.26 std::\_\_is\_location\_invariant<\_Tp> Struct Template Reference

```
#include <std_function.h>
```

### 6.26.1 Detailed Description

```
template<typename _Tp>
struct std::__is_location_invariant<_Tp>
```

Trait identifying "location-invariant" types, meaning that the address of the object (or any of its members) will not escape. Trivially copyable types are location-invariant and users can specialize this trait for other types.

The documentation for this struct was generated from the following file:

- [std\\_function.h](#)

## 6.27 `__gnu_parallel::__max_element_reduct<_Compare, _It>` Struct Template Reference

```
#include <for_each_selectors.h>
```

### Public Member Functions

- `__max_element_reduct` (`_Compare &__c`)
- `_It operator()` (`_It __x, _It __y`)

### Public Attributes

- `_Compare & __comp`

#### 6.27.1 Detailed Description

```
template<typename _Compare, typename _It>
struct __gnu_parallel::__max_element_reduct<_Compare, _It>
```

Reduction for finding the maximum element, using a comparator.  
The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

## 6.28 `__gnu_parallel::__min_element_reduct<_Compare, _It>` Struct Template Reference

```
#include <for_each_selectors.h>
```

### Public Member Functions

- `__min_element_reduct` (`_Compare &__c`)
- `_It operator()` (`_It __x, _It __y`)

### Public Attributes

- `_Compare & __comp`

#### 6.28.1 Detailed Description

```
template<typename _Compare, typename _It>
struct __gnu_parallel::__min_element_reduct<_Compare, _It>
```

Reduction for finding the maximum element, using a comparator.  
The documentation for this struct was generated from the following file:

- [for\\_each\\_selectors.h](#)

## 6.29 `__gnu_cxx::__detail::__mini_vector<_Tp>` Class Template Reference

```
#include <bitmap_allocator.h>
```

### Public Types

- typedef const `_Tp` & `const_reference`
- typedef std::ptrdiff\_t `difference_type`
- typedef pointer `iterator`
- typedef `_Tp *` `pointer`
- typedef `_Tp &` `reference`

- typedef `std::size_t` **size\_type**
- typedef `_Tp` **value\_type**

### Public Member Functions

- reference **back** () const throw ()
- iterator **begin** () const throw ()
- void **clear** () throw ()
- iterator **end** () const throw ()
- void **erase** (iterator \_\_pos) throw ()
- void **insert** (iterator \_\_pos, const\_reference \_\_x)
- reference **operator[]** (const size\_type \_\_pos) const throw ()
- void **pop\_back** () throw ()
- void **push\_back** (const\_reference \_\_x)
- size\_type **size** () const throw ()

### 6.29.1 Detailed Description

`template<typename _Tp>`  
**class** `__gnu_cxx::__detail::__mini_vector<_Tp>`

`__mini_vector<>` is a stripped down version of the full-fledged `std::vector<>`.  
 It is to be used only for built-in types or PODs. Notable differences are:

1. Not all accessor functions are present.
2. Used ONLY for PODs.
3. No Allocator template argument. Uses `operator new()` to get memory, and `operator delete()` to free it. Caveat: The dtor does NOT free the memory allocated, so this a memory-leaking vector!

The documentation for this class was generated from the following file:

- [bitmap\\_allocator.h](#)

### 6.30 `__gnu_parallel::__mismatch_selector` Struct Reference

`#include <find_selectors.h>`

Inheritance diagram for `__gnu_parallel::__mismatch_selector`:

## Public Member Functions

- `template<typename _RAIter1, typename _RAIter2, typename _Pred>`  
`std::pair< _RAIter1, _RAIter2 > \_M\_sequential\_algorithm ( _RAIter1 __begin1, _RAIter1 __end1, _RAIter2 __begin2, _Pred __pred)`
- `template<typename _RAIter1, typename _RAIter2, typename _Pred>`  
`bool operator() ( _RAIter1 __i1, _RAIter2 __i2, _Pred __pred)`

### 6.30.1 Detailed Description

Test inverted predicate on a single element.

### 6.30.2 Member Function Documentation

#### [\\_M\\_sequential\\_algorithm\(\)](#)

```
template<typename _RAIter1, typename _RAIter2, typename _Pred>
std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__mismatch_selector::_M_sequential_algorithm (
    _RAIter1 __begin1,
    _RAIter1 __end1,
    _RAIter2 __begin2,
    _Pred __pred) [inline]
```

Corresponding sequential algorithm on a sequence.

#### Parameters

|                       |                                    |
|-----------------------|------------------------------------|
| <code>__begin1</code> | Begin iterator of first sequence.  |
| <code>__end1</code>   | End iterator of first sequence.    |
| <code>__begin2</code> | Begin iterator of second sequence. |
| <code>__pred</code>   | Find predicate.                    |

#### [operator\(\)\(\)](#)

```
template<typename _RAIter1, typename _RAIter2, typename _Pred>
bool __gnu_parallel::__mismatch_selector::operator() (
    _RAIter1 __i1,
    _RAIter2 __i2,
    _Pred __pred) [inline]
```

Test on one position.

#### Parameters

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__i1</code>   | _Iterator on first sequence.           |
