Meets many of the requirements of a `container`, but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-first-out queue behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `front`, `back`, `push_back`, and `pop_front`, such as `std::list` or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second `Sequence` parameter, and `push` and `pop`, which are standard queue/FIFO operations.

### 6.807.2 Constructor & Destructor Documentation

#### `queue()`

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<is_default_constructible<↔
_Seq>::value>::type>
std::queue< _Tp, _Sequence >::queue () [inline]
```

Default constructor creates no elements.

References `c`.

### 6.807.3 Member Function Documentation

#### back() [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::queue< _Tp, _Sequence >::back () [inline], [nodiscard]
```

Returns a read/write reference to the data at the last element of the queue.

References [c](#).

#### back() [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::queue< _Tp, _Sequence >::back () const [inline], [nodiscard]
```

Returns a read-only (constant) reference to the data at the last element of the queue.

References [c](#).

#### empty()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
bool std::queue< _Tp, _Sequence >::empty () const [inline], [nodiscard]
```

Returns true if the queue is empty.

References [c](#).

#### front() [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::queue< _Tp, _Sequence >::front () [inline], [nodiscard]
```

Returns a read/write reference to the data at the first element of the queue.

References [c](#).

#### front() [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::queue< _Tp, _Sequence >::front () const [inline], [nodiscard]
```

Returns a read-only (constant) reference to the data at the first element of the queue.

References [c](#).

#### pop()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::queue< _Tp, _Sequence >::pop () [inline]
```

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.

References [c](#).

#### push()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::queue< _Tp, _Sequence >::push (
    const value_type & __x) [inline]
```

Add data to the end of the queue.

## Parameters

|                 |                   |
|-----------------|-------------------|
| <code>_↔</code> | Data to be added. |
| <code>_X</code> |                   |

This is a typical queue operation. The function creates an element at the end of the queue and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

References [c](#).

**size()**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
size_type std::queue< _Tp, _Sequence >::size () const [inline], [nodiscard]
```

Returns the number of elements in the queue.

References [c](#).

**6.807.4 Member Data Documentation****c**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
_Sequence std::queue< _Tp, _Sequence >::c [protected]
```

c is the underlying container.

**6.808 \_\_gnu\_parallel::quicksort\_tag Struct Reference**

```
#include <tags.h>
```

Inheritance diagram for `__gnu_parallel::quicksort_tag`:

**Public Member Functions**

- `quicksort_tag` ([\\_ThreadIndex](#) \_\_num\_threads)
- [\\_ThreadIndex](#) `__get_num_threads` ()
- void `set_num_threads` ([\\_ThreadIndex](#) \_\_num\_threads)

### 6.808.1 Detailed Description

Forces parallel sorting using unbalanced quicksort at compile time.

### 6.808.2 Member Function Documentation

#### \_\_get\_num\_threads()

```
__ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline], [inherited]
```

Find out desired number of threads.

#### Returns

Desired number of threads.

Referenced by `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, and `__gnu_parallel::__parallel_sort()`.

#### set\_num\_threads()

```
void __gnu_parallel::parallel_tag::set_num_threads (
    __ThreadIndex __num_threads) [inline], [inherited]
```

Set the desired number of threads.

#### Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

## 6.809 std::random\_access\_iterator\_tag Struct Reference

```
#include <stl_iterator_base_types.h>
```

Inheritance diagram for `std::random_access_iterator_tag`:

### 6.809.1 Detailed Description

Random-access iterators support a superset of bidirectional iterator operations. The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

### 6.810 \_\_gnu\_cxx::random\_condition Struct Reference

```
#include <throw_allocator.h>
```

Inheritance diagram for `__gnu_cxx::random_condition`:

## Classes

- struct [always\\_adjustor](#)
- struct [group\\_adjustor](#)
- struct [never\\_adjustor](#)

## Public Member Functions

- void **seed** (unsigned long \_\_s)

## Static Public Member Functions

- static void **set\_probability** (double \_\_p)
- static void **throw\_conditionally** ()

### 6.810.1 Detailed Description

Base class for random probability control and throw.

The documentation for this struct was generated from the following file:

- [throw\\_allocator.h](#)

## 6.811 `std::random_device` Class Reference

```
#include <random>
```

## Public Types

- typedef unsigned int [result\\_type](#)

## Public Member Functions

- **random\_device** (const [random\\_device](#) &)=delete
- **random\_device** (const [std::string](#) &\_\_token)
- double **entropy** () const noexcept
- [result\\_type](#) **operator()** ()
- void **operator=** (const [random\\_device](#) &)=delete

## Static Public Member Functions

- static constexpr [result\\_type](#) **max** ()
- static constexpr [result\\_type](#) **min** ()

### 6.811.1 Detailed Description

A standard interface to a platform-specific non-deterministic random number generator (if any are available).

Since

C++11

### 6.811.2 Member Typedef Documentation

#### result\_type

```
typedef unsigned int std::random_device::result_type
```

The type of the generated random value.

The documentation for this class was generated from the following file:

- [random.h](#)

### 6.812 std::range\_error Class Reference

```
#include <stdexcept>
```

Inheritance diagram for std::range\_error:

#### Public Member Functions

- **range\_error** (const char \*)
- **range\_error** (const [range\\_error](#) &)=default
- **range\_error** (const [string](#) &\_\_arg)
- **range\_error** ([range\\_error](#) &&)=default
- [range\\_error](#) & **operator=** (const [range\\_error](#) &)=default
- [range\\_error](#) & **operator=** ([range\\_error](#) &&)=default
- virtual const char \* **what** () const noexcept

#### 6.812.1 Detailed Description

Thrown to indicate range errors in internal computations.

#### 6.812.2 Member Function Documentation

##### what()

```
virtual const char * std::runtime_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in `std::experimental::filesystem::v1::filesystem_error`, and `std::filesystem::filesystem_error`.

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

## 6.813 `__gnu_pbds::range_invalidation_guarantee` Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for `__gnu_pbds::range_invalidation_guarantee`:

### 6.813.1 Detailed Description

Signifies an invalidation guarantee that includes all those of its base, and additionally, that any range-type iterator (including the returns of `begin()` and `end()`) is in the correct relative positions to other range-type iterators as long as its corresponding entry has not be erased, regardless of modifications to the container object.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

### 6.814 `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >` Class Template Reference

Inheritance diagram for `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >`:

#### 6.814.1 Detailed Description

**template<typename Key, typename Hash\_Fn, typename \_Alloc, typename Comb\_Hash\_Fn, bool Store\_Hash>**  
**class** `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >`

Primary template.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

### 6.815 `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, false >` Class Template Reference

```
#include <ranged_hash_fn.hpp>
```

#### Protected Types

- typedef Comb\_Hash\_Fn **comb\_hash\_fn\_base**
- typedef Hash\_Fn **hash\_fn\_base**
- typedef [rebind\\_traits](#)< \_Alloc, Key >::const\_reference **key\_const\_reference**
- typedef \_Alloc::size\_type **size\_type**

#### Protected Member Functions

- **ranged\_hash\_fn** (size\_type)
- **ranged\_hash\_fn** (size\_type, const Hash\_Fn &)
- **ranged\_hash\_fn** (size\_type, const Hash\_Fn &, const Comb\_Hash\_Fn &)
- void **notify\_resized** (size\_type)
- size\_type **operator()** (key\_const\_reference) const
- void **swap** ([ranged\\_hash\\_fn](#)< Key, Hash\_Fn, \_Alloc, Comb\_Hash\_Fn, false > &)

#### 6.815.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Hash_Fn>
class __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, false >
```

Specialization 1 The client supplies a hash function and a ranged hash function, and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

#### 6.816 `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, true >` Class Template Reference

```
#include <ranged_hash_fn.hpp>
```

##### Protected Types

- typedef Comb\_Hash\_Fn **comb\_hash\_fn\_base**
- typedef [std::pair](#)< size\_type, size\_type > **comp\_hash**
- typedef Hash\_Fn **hash\_fn\_base**
- typedef [rebind\\_traits](#)< \_Alloc, Key >::const\_reference **key\_const\_reference**
- typedef \_Alloc::size\_type **size\_type**

##### Protected Member Functions

- **ranged\_hash\_fn** (size\_type)
- **ranged\_hash\_fn** (size\_type, const Hash\_Fn &)
- **ranged\_hash\_fn** (size\_type, const Hash\_Fn &, const Comb\_Hash\_Fn &)
- void **notify\_resized** (size\_type)
- **comp\_hash operator()** (key\_const\_reference) const
- **comp\_hash operator()** (key\_const\_reference, size\_type) const
- void **swap** ([ranged\\_hash\\_fn](#)< Key, Hash\_Fn, \_Alloc, Comb\_Hash\_Fn, true > &)

#### 6.816.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Hash_Fn>
class __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, true >
```

Specialization 2 The client supplies a hash function and a ranged hash function, and requests that hash values be stored.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

#### 6.817 `__gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, false >` Class Template Reference

```
#include <ranged_hash_fn.hpp>
```

##### Protected Types

- typedef Comb\_Hash\_Fn **comb\_hash\_fn\_base**
- typedef \_Alloc::size\_type **size\_type**

### Protected Member Functions

- **ranged\_hash\_fn** (size\_type)
- **ranged\_hash\_fn** (size\_type, const Comb\_Hash\_Fn &)
- **ranged\_hash\_fn** (size\_type, const [null\\_type](#) &, const Comb\_Hash\_Fn &)
- void **swap** ([ranged\\_hash\\_fn](#)< Key, [null\\_type](#), \_Alloc, Comb\_Hash\_Fn, false > &)

#### 6.817.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Comb_Hash_Fn>
class __gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, false >
```

Specialization 3 The client does not supply a hash function (by specifying `null_type` as the `Hash_Fn` parameter), and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

#### 6.818 `__gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, true >` Class Template Reference

```
#include <ranged_hash_fn.hpp>
```

### Protected Types

- typedef Comb\_Hash\_Fn **comb\_hash\_fn\_base**
- typedef \_Alloc::size\_type **size\_type**

### Protected Member Functions

- **ranged\_hash\_fn** (size\_type)
- **ranged\_hash\_fn** (size\_type, const Comb\_Hash\_Fn &)
- **ranged\_hash\_fn** (size\_type, const [null\\_type](#) &, const Comb\_Hash\_Fn &)
- void **swap** ([ranged\\_hash\\_fn](#)< Key, [null\\_type](#), \_Alloc, Comb\_Hash\_Fn, true > &)

#### 6.818.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Comb_Hash_Fn>
class __gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, true >
```

Specialization 4 The client does not supply a hash function (by specifying `null_type` as the `Hash_Fn` parameter), and requests that hash values be stored.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

## 6.819 `__gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, Store_Hash >` Class Template Reference

Inheritance diagram for `__gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, Store_Hash >`:

### 6.819.1 Detailed Description

`template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Probe_Fn, typename Probe_Fn, bool Store_Hash>`

`class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, Store_Hash >`

Primary template.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

## 6.820 `__gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, false >` Class Template Reference

```
#include <ranged_probe_fn.hpp>
```

### Protected Types

- typedef `Comb_Probe_Fn` **comb\_probe\_fn\_base**
- typedef `Hash_Fn` **hash\_fn\_base**
- typedef `rebind_traits< _Alloc, Key >::const_reference` **key\_const\_reference**
- typedef `Probe_Fn` **probe\_fn\_base**
- typedef `_Alloc::size_type` **size\_type**

### Protected Member Functions

- **ranged\_probe\_fn** (`size_type`)
- **ranged\_probe\_fn** (`size_type, const Hash_Fn &`)
- **ranged\_probe\_fn** (`size_type, const Hash_Fn &, const Comb_Probe_Fn &`)
- **ranged\_probe\_fn** (`size_type, const Hash_Fn &, const Comb_Probe_Fn &, const Probe_Fn &`)

- void **notify\_resized** (size\_type)
- size\_type **operator()** (key\_const\_reference) const
- size\_type **operator()** (key\_const\_reference, size\_type, size\_type) const
- void **swap** (ranged\_probe\_fn< Key, Hash\_Fn, \_Alloc, Comb\_Probe\_Fn, Probe\_Fn, false > &)

#### 6.820.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Probe_Fn, typename Probe_Fn>
class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, false >
```

Specialization 1

The client supplies a probe function and a ranged probe function, and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

#### 6.821 \_\_gnu\_pbds::detail::ranged\_probe\_fn< Key, Hash\_Fn, \_Alloc, Comb\_Probe\_Fn, Probe\_Fn, true > Class Template Reference

```
#include <ranged_probe_fn.hpp>
```

##### Protected Types

- typedef Comb\_Probe\_Fn **comb\_probe\_fn\_base**
- typedef [std::pair](#)< size\_type, size\_type > **comp\_hash**
- typedef Hash\_Fn **hash\_fn\_base**
- typedef [rebind\\_traits](#)< \_Alloc, Key >::const\_reference **key\_const\_reference**
- typedef Probe\_Fn **probe\_fn\_base**
- typedef \_Alloc::size\_type **size\_type**

##### Protected Member Functions

- **ranged\_probe\_fn** (size\_type)
- **ranged\_probe\_fn** (size\_type, const Hash\_Fn &)
- **ranged\_probe\_fn** (size\_type, const Hash\_Fn &, const Comb\_Probe\_Fn &)
- **ranged\_probe\_fn** (size\_type, const Hash\_Fn &, const Comb\_Probe\_Fn &, const Probe\_Fn &)
- void **notify\_resized** (size\_type)
- [comp\\_hash](#) **operator()** (key\_const\_reference) const

- size\_type **operator()** (key\_const\_reference, size\_type, size\_type) const
- void **swap** (ranged\_probe\_fn< Key, Hash\_Fn, \_Alloc, Comb\_Probe\_Fn, Probe\_Fn, true > &)

#### 6.821.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Probe_Fn, typename Probe_Fn>
class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, true >
```

Specialization 2- The client supplies a probe function and a ranged probe function, and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

## 6.822 `__gnu_pbds::detail::ranged_probe_fn< Key, null_type, _Alloc, Comb_Probe_Fn, null_type, false >` Class Template Reference

```
#include <ranged_probe_fn.hpp>
```

### Protected Types

- typedef `Comb_Probe_Fn` **comb\_probe\_fn\_base**
- typedef `rebind_traits< _Alloc, Key >::const_reference` **key\_const\_reference**
- typedef `_Alloc::size_type` **size\_type**

### Protected Member Functions

- **ranged\_probe\_fn** (`size_type` size)
- **ranged\_probe\_fn** (`size_type`, const `Comb_Probe_Fn` &r\_comb\_probe\_fn)
- **ranged\_probe\_fn** (`size_type`, const `null_type` &, const `Comb_Probe_Fn` &r\_comb\_probe\_fn, const `null_type` &)
- void **swap** (`ranged_probe_fn` &other)

#### 6.822.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Comb_Probe_Fn>
class __gnu_pbds::detail::ranged_probe_fn< Key, null_type, _Alloc, Comb_Probe_Fn, null_type, false >
```

Specialization 3 and 4 The client does not supply a hash function or probe function, and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

## 6.823 `std::rank< _Tp >` Struct Template Reference

```
#include <type_traits>
```

Inheritance diagram for `std::rank< _Tp >`:

### Public Types

- using **type**
- using **value\_type**

### Public Member Functions

- constexpr **operator value\_type** () const noexcept

### Static Public Attributes

- static constexpr std::size\_t **value**

#### 6.823.1 Detailed Description

```
template<typename _Tp>
struct std::rank<_Tp>
```

rank

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

### 6.824 std::ratio<\_Num, \_Den > Struct Template Reference

```
#include <ratio>
```

#### Public Types

- typedef [ratio](#)< num, den > **type**

#### Static Public Attributes

- static constexpr intmax\_t **den**
- static constexpr intmax\_t **num**

#### 6.824.1 Detailed Description

```
template<intmax_t _Num, intmax_t _Den = 1>
struct std::ratio<_Num, _Den>
```

Provides compile-time rational arithmetic.

This class template represents any finite rational number with a numerator and denominator representable by compile-time constants of type intmax\_t. The ratio is simplified when instantiated.

For example:

```
std::ratio<7,-21>::num == -1;
std::ratio<7,-21>::den == 3;
```

The documentation for this struct was generated from the following file:

- [ratio](#)

### 6.825 std::ratio\_equal<\_R1, \_R2 > Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_equal<_R1, _R2>`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 6.825.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_equal<_R1, _R2>
```

ratio\_equal

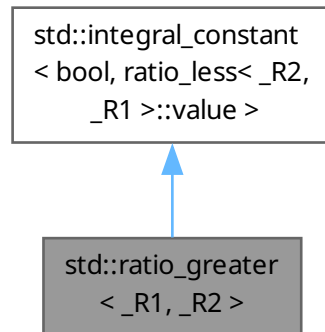

The documentation for this struct was generated from the following file:

- [ratio](#)

#### 6.826 `std::ratio_greater<_R1, _R2>` Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_greater< _R1, _R2 >`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 6.826.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_greater< _R1, _R2 >
```

ratio\_greater

The documentation for this struct was generated from the following file:

- [ratio](#)

#### 6.827 std::ratio\_greater\_equal< \_R1, \_R2 > Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_greater_equal<_R1, _R2>`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 6.827.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_greater_equal<_R1, _R2>
```

`ratio_greater_equal`

The documentation for this struct was generated from the following file:

- [ratio](#)

## 6.828 `std::ratio_less<_R1, _R2>` Struct Template Reference

```
#include <ratio>
```

#### 6.828.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_less<_R1, _R2>
```

`ratio_less`

The documentation for this struct was generated from the following file:

- [ratio](#)

## 6.829 `std::ratio_less_equal<_R1, _R2>` Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_less_equal<_R1, _R2>`:

### Public Types

- using **type**
- using **value\_type**

### Public Member Functions

- constexpr **operator value\_type** () const noexcept

### Static Public Attributes

- static constexpr bool **value**

#### 6.829.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_less_equal<_R1, _R2>
```

`ratio_less_equal`

The documentation for this struct was generated from the following file:

- [ratio](#)

## 6.830 `std::ratio_not_equal<_R1, _R2>` Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_not_equal<_R1, _R2>`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 6.830.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_not_equal<_R1, _R2>
```

`ratio_not_equal`

The documentation for this struct was generated from the following file:

- [ratio](#)

## 6.831 `std::raw_storage_iterator<_OutputIterator, _Tp>` Class Template Reference

```
#include <stl_raw_storage_iter.h>
```

Inheritance diagram for `std::raw_storage_iterator<_OutputIterator, _Tp>`:

### Public Types

- typedef void [difference\\_type](#)
- typedef [output\\_iterator\\_tag](#) [iterator\\_category](#)
- typedef void [pointer](#)
- typedef void [reference](#)
- typedef void [value\\_type](#)

### Public Member Functions

- **raw\_storage\_iterator** ([\\_OutputIterator](#) \_\_x)
- [\\_OutputIterator](#) **base** () const

#### 6.831.1 Detailed Description

```
template<class _OutputIterator, class _Tp>
class std::raw_storage_iterator<_OutputIterator, _Tp>
```

This iterator class lets algorithms store their results into uninitialized memory.

#### 6.831.2 Member Typedef Documentation

##### difference\_type

typedef void `std::iterator< output\_iterator\_tag, void, void, void, void >::difference_type` [inherited]  
 Distance between iterators is represented as this type.

**iterator\_category**

```
typedef output\_iterator\_tag std::iterator< output\_iterator\_tag, void, void, void, void >::iterator←  
_category [inherited]
```

One of the [tag types](#).

**pointer**

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::pointer [inherited]
```

This type represents a pointer-to-value\_type.

**reference**

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::reference [inherited]
```

This type represents a reference-to-value\_type.

**value\_type**

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::value_type [inherited]
```

The type "pointed to" by the iterator.

The documentation for this class was generated from the following file:

#### 6.833.1 Detailed Description

`template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>`

`class __gnu_pbds::detail::rb_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >`

Red-Black tree.

This implementation uses an idea from the SGI STL (using a *header* node which is needed for efficient iteration).

#### 6.833.2 Member Function Documentation

##### **node\_begin()** [1/2]

`template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>`

`bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin () [inline], [inherited]`

Returns a `node_iterator` corresponding to the node at the root of the tree.

##### **node\_begin()** [2/2]

`template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>`

`bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin () const [inline], [inherited]`

Returns a `const node_iterator` corresponding to the node at the root of the tree.

**node\_end()** [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵  
Alloc>  
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu↵  
pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end ()  
[inline], [inherited]
```

Returns a `node_iterator` corresponding to a node just after a leaf of the tree.

**node\_end()** [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵  
Alloc>  
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __↵  
gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node↵  
end () const [inline], [inherited]
```

Returns a const `node_iterator` corresponding to a node just after a leaf of the tree.

The documentation for this class was generated from the following file:

- [rb\\_tree\\_.hpp](#)

## 6.834 `__gnu_pbds::detail::rb_tree_node_< Value_Type, Metadata, _Alloc >` Struct Template Reference

- `uintmax_t filesystem::remove_all` (const [path](#) &, [error\\_code](#) &)
- `bool operator==` (const [recursive\\_directory\\_iterator](#) &\_\_lhs, const [recursive\\_directory\\_iterator](#) &\_\_rhs) noexcept

### 6.840.1 Detailed Description

Iterator type for recursively traversing a directory hierarchy.

Since

C++17

The documentation for this class was generated from the following file:

- [bits/fs\\_dir.h](#)

### 6.841 \_\_gnu\_cxx::recursive\_init\_error Class Reference

```
#include <cxxabi.h>
```

Inheritance diagram for `__gnu_cxx::recursive_init_error`:

## Public Member Functions

- virtual const char \* [what](#) () const noexcept

### 6.841.1 Detailed Description

Exception thrown by `__cxa_guard_acquire`.

C++ 2011 6.7 [stmt.dcl]/4: If control re-enters the declaration recursively while the variable is being initialized, the behavior is undefined.

Since we already have a library function to handle locking, we might as well check for this situation and throw an exception. We use the second byte of the guard variable to remember that we're in the middle of an initialization.

### 6.841.2 Member Function Documentation

#### `what()`

```
virtual const char * std::exception::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error.

Reimplemented in [std::bad\\_alloc](#), [std::bad\\_cast](#), [std::bad\\_exception](#), [std::bad\\_function\\_call](#), [std::bad\\_typeid](#), [std::bad\\_weak\\_ptr](#), [std::experimental::filesystem::v1::filesystem\\_error](#), [std::experimental::fundamentals\\_v1::bad\\_any\\_cast](#), [std::filesystem::filesystem\\_error](#), [std::future\\_error](#), [std::logic\\_error](#), and [std::runtime\\_error](#).

The documentation for this class was generated from the following file:

- [cxxabi.h](#)

## 6.842 std::recursive\_mutex Class Reference

```
#include <mutex>
```

### Public Types

- typedef \_\_native\_type \* **native\_handle\_type**

### Public Member Functions

- **recursive\_mutex** (const [recursive\\_mutex](#) &)=delete
- void **lock** ()
- native\_handle\_type **native\_handle** () noexcept
- [recursive\\_mutex](#) & **operator=** (const [recursive\\_mutex](#) &)=delete
- bool **try\_lock** () noexcept
- void **unlock** ()

#### 6.842.1 Detailed Description

The standard recursive mutex type.

A recursive mutex can be locked more than once by the same thread. Other threads cannot lock the mutex until the owning thread unlocks it as many times as it was locked.

Since

C++11

The documentation for this class was generated from the following file:

- [mutex](#)

## 6.843 std::recursive\_timed\_mutex Class Reference

```
#include <mutex>
```

### Public Types

- typedef \_\_native\_type \* **native\_handle\_type**

### Public Member Functions

- **recursive\_timed\_mutex** (const [recursive\\_timed\\_mutex](#) &)=delete
- void **lock** ()
- native\_handle\_type **native\_handle** () noexcept
- [recursive\\_timed\\_mutex](#) & **operator=** (const [recursive\\_timed\\_mutex](#) &)=delete
- bool **try\_lock** () noexcept
- template<class \_Rep, class \_Period>  
bool **try\_lock\_for** (const [chrono::duration](#)< \_Rep, \_Period > &\_\_rtime)

- `template<class _Clock, class _Duration>`  
`bool try_lock_until (const chrono::time_point< _Clock, _Duration > &__atime)`
- `void unlock ()`

#### Friends

- `class __timed_mutex_impl< recursive_timed_mutex >`

#### 6.843.1 Detailed Description

The standard recursive timed mutex type.

A recursive mutex that supports a timeout when trying to acquire the lock. A recursive mutex can be locked more than once by the same thread. Other threads cannot lock the mutex until the owning thread unlocks it as many times as it was locked.

Since

C++11

The documentation for this class was generated from the following file:

- [mutex](#)

### 6.844 `std::bitset<_Nb>::reference` Class Reference

```
#include <bitset>
```

#### Public Member Functions

- **reference** (const [reference](#) &)=default
- constexpr [reference](#) & **flip** () noexcept
- constexpr **operator bool** () const noexcept
- constexpr [reference](#) & **operator=** (bool \_\_x) noexcept
- constexpr [reference](#) & **operator=** (const [reference](#) &\_\_j) noexcept
- constexpr bool **operator~** () const noexcept

#### Friends

- class **bitset**

#### 6.844.1 Detailed Description

```
template<size_t _Nb>
```

```
class std::bitset<_Nb>::reference
```

This encapsulates the concept of a single bit. An instance of this class is a proxy for an actual bit; this way the individual bit operations are done as faster word-size bitwise instructions.

Most users will never need to use this class directly; conversions to and from bool are automatic and should be transparent. Overloaded operators help to preserve the illusion.

(On a typical system, this *bit reference* is 64 times the size of an actual bit. Ha.)

The documentation for this class was generated from the following file:

- [bitset](#)

### 6.845 `std::tr2::dynamic_bitset<_WordT, _Alloc>::reference` Class Reference

```
#include <dynamic_bitset>
```

## Public Member Functions

- **reference** ([dynamic\\_bitset](#) &\_\_b, size\_type \_\_pos) noexcept
- **reference** & **flip** () noexcept
- **operator bool** () const noexcept
- **reference** & **operator=** (bool \_\_x) noexcept
- **reference** & **operator=** (const [reference](#) &\_\_j) noexcept
- bool **operator~** () const noexcept

## Friends

- class [dynamic\\_bitset](#)

### 6.845.1 Detailed Description

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
class std::tr2::dynamic_bitset<_WordT, _Alloc >::reference
```

This encapsulates the concept of a single bit. An instance of this class is a proxy for an actual bit; this way the individual bit operations are done as faster word-size bitwise instructions.

Most users will never need to use this class directly; conversions to and from bool are automatic and should be transparent. Overloaded operators help to preserve the illusion.

(On a typical system, this "bit %reference" is 64 times the size of an actual bit. Ha.)

The documentation for this class was generated from the following file:

- [dynamic\\_bitset](#)

## 6.846 std::reference\_wrapper<\_Tp> Class Template Reference

```
#include <refwrap.h>
```

## Public Types

- typedef \_Tp **type**

## Public Member Functions

- template<typename \_Up, typename = \_\_not\_same<\_Up>, typename = decltype(reference\_wrapper::\_S\_fun(std::declval<\_Up>()))> constexpr **reference\_wrapper** (\_Up &&\_\_uref) noexcept(noexcept(reference\_wrapper::\_S\_fun(std::declval<\_Up>())))
- **reference\_wrapper** (const [reference\\_wrapper](#) &)=default
- constexpr \_Tp & **get** () const noexcept
- constexpr **operator \_Tp &** () const noexcept
- template<typename... \_Args> constexpr \_\_invoke\_result<\_Tp &, \_Args... >::type **operator()** (\_Args &&... \_\_args) const noexcept(\_\_is\_nothrow\_invocable<\_Tp &, \_Args... >::value)
- **reference\_wrapper** & **operator=** (const [reference\\_wrapper](#) &)=default

## Related Symbols

(Note that these are not member symbols.)

- template<typename \_Tp> constexpr [reference\\_wrapper](#)<\_Tp> **ref** (\_Tp &\_\_t) noexcept
- template<typename \_Tp> constexpr [reference\\_wrapper](#)<const \_Tp> **cref** (const \_Tp &\_\_t) noexcept

- `template<typename _Tp>`  
`constexpr reference\_wrapper< _Tp > ref (reference\_wrapper< _Tp > __t) noexcept`
- `template<typename _Tp>`  
`constexpr reference\_wrapper< const _Tp > cref (reference\_wrapper< _Tp > __t) noexcept`

### 6.846.1 Detailed Description

`template<typename _Tp>`  
`class std::reference\_wrapper< _Tp >`

Primary class template for `reference_wrapper`.

### 6.846.2 Friends And Related Symbol Documentation

#### `cref()` [1/2]

```
template<typename _Tp>
reference\_wrapper< const _Tp > cref (
    const _Tp & __t) [related]
```

Denotes a const reference should be taken to a variable.

#### `cref()` [2/2]

```
template<typename _Tp>
reference\_wrapper< const _Tp > cref (
    reference\_wrapper< _Tp > __t) [related]
```

`std::cref` overload to prevent wrapping a `reference_wrapper`

#### `ref()` [1/2]

```
template<typename _Tp>
reference\_wrapper< _Tp > ref (
    _Tp & __t) [related]
```

Denotes a reference should be taken to a variable.

#### `ref()` [2/2]

```
template<typename _Tp>
reference\_wrapper< _Tp > ref (
    reference\_wrapper< _Tp > __t) [related]
```

`std::ref` overload to prevent wrapping a `reference_wrapper`

The documentation for this class was generated from the following files:

- [type\\_traits](#)
- [refwrap.h](#)

## 6.847 `std::regex_error` Class Reference

```
#include <regex>
```

Inheritance diagram for std::regex\_error:

### Public Member Functions

- [regex\\_error](#) ([error\\_type](#) \_\_ecode)
- [regex\\_constants::error\\_type code](#) () const noexcept
- virtual const char \* [what](#) () const noexcept

#### 6.847.1 Detailed Description

A regular expression exception class.

The regular expression library throws objects of this class on error.

Since

C++11

#### 6.847.2 Constructor & Destructor Documentation

##### regex\_error()

```
std::regex_error::regex_error (  
    error\_type __ecode) [explicit]
```

Constructs a regex\_error object.

##### Parameters

|                      |                       |
|----------------------|-----------------------|
| <code>__ecode</code> | the regex error code. |
|----------------------|-----------------------|

References [regex\\_error\(\)](#).

Referenced by [regex\\_error\(\)](#).

### 6.847.3 Member Function Documentation

#### code()

```
regex_constants::error_type std::regex_error::code () const [inline], [noexcept]
```

Gets the regex error code.

#### Returns

the regex error code.

References [code\(\)](#).

Referenced by [code\(\)](#).

#### what()

```
virtual const char * std::runtime_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#), and [std::filesystem::filesystem\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this class was generated from the following file:

- [regex\\_error.h](#)

### 6.848 std::regex\_iterator< \_Bi\_iter, \_Ch\_type, \_Rx\_traits > Class Template Reference

```
#include <regex>
```

#### Public Types

- typedef std::ptrdiff\_t **difference\_type**
- typedef [std::forward\\_iterator\\_tag](#) **iterator\_category**
- typedef [std::input\\_iterator\\_tag](#) **iterator\_concept**
- typedef const value\_type \* **pointer**
- typedef const value\_type & **reference**
- typedef [basic\\_regex](#)< \_Ch\_type, \_Rx\_traits > **regex\_type**
- typedef [match\\_results](#)< \_Bi\_iter > **value\_type**

#### Public Member Functions

- [regex\\_iterator](#) ()=default
- [regex\\_iterator](#) (\_Bi\_iter \_\_a, \_Bi\_iter \_\_b, const [regex\\_type](#) &\_\_re, [regex\\_constants::match\\_flag\\_type](#) \_\_m= [regex\\_constants::match\\_default](#))
- [regex\\_iterator](#) (\_Bi\_iter, \_Bi\_iter, const [regex\\_type](#) &&, [regex\\_constants::match\\_flag\\_type](#)=[regex\\_constants::match\\_default](#))=default
- [regex\\_iterator](#) (const [regex\\_iterator](#) &)=default
- const value\_type & [operator\\*](#) () const noexcept
- [regex\\_iterator](#) & [operator++](#) ()
- [regex\\_iterator](#) [operator++](#) (int)
- const value\_type \* [operator->](#) () const noexcept
- [regex\\_iterator](#) & [operator=](#) (const [regex\\_iterator](#) &)=default
- bool [operator==](#) (const [regex\\_iterator](#) &) const noexcept
- bool [operator==](#) ([default\\_sentinel\\_t](#)) const noexcept

### 6.848.1 Detailed Description

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>>
class std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >
```

An iterator adaptor that will provide repeated calls of `regex_search` over a range until no more matches remain.

Since

C++11

### 6.848.2 Constructor & Destructor Documentation

#### regex\_iterator() [1/3]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator () [default]
```

Provides a singular iterator, useful for indicating one-past-the-end of a range.

Referenced by `std::regex_iterator< const char * >::regex_iterator()`, and `operator==(())`.

#### regex\_iterator() [2/3]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a `regex_iterator`...

#### Parameters

|                   |                                                    |
|-------------------|----------------------------------------------------|
| <code>__a</code>  | [IN] The start of a text range to search.          |
| <code>__b</code>  | [IN] One-past-the-end of the text range to search. |
| <code>__re</code> | [IN] The regular expression to match.              |
| <code>__m</code>  | [IN] Policy flags for match rules.                 |

#### regex\_iterator() [3/3]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator (
    const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & ) [default]
```

Copy constructs a `regex_iterator`.

### 6.848.3 Member Function Documentation

#### **operator\*()**

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type & std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator* () const
[inline], [noexcept]
```

Dereferences a `regex_iterator`.

#### **operator++()** [1/2]

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ ()
```

Increments a `regex_iterator`.

References `std::regex_constants::match_continuous`, `std::regex_constants::match_not_null`, `std::regex_constants::match_prev_avail`, and `std::regex_search()`.

#### **operator++()** [2/2]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ (
    int ) [inline]
```

Postincrements a `regex_iterator`.

#### **operator->()**

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type * std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator-> () const
[inline], [noexcept]
```

Selects a `regex_iterator` member.

#### **operator=()**

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator & std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator= (
    const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & ) [default]
```

Copy assigns one `regex_iterator` to another.

#### **operator==()**

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
bool std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator== (
    const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs) const [noexcept]
```

Tests the equivalence of two `regex` iterators.

References `regex_iterator()`.

The documentation for this class was generated from the following files:

- [regex.h](#)
- [regex.tcc](#)

## 6.849 std::regex\_token\_iterator< \_Bi\_iter, \_Ch\_type, \_Rx\_traits > Class Template Reference

```
#include <regex>
```

### Public Types

### 6.849.1 Detailed Description

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>>
```

```
class std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >
```

Iterates over submatches in a range (or *splits* a text string).

The purpose of this iterator is to enumerate all, or all specified, matches of a regular expression within a text range. The dereferenced value of an iterator of this class is a std::sub\_match object.

Since

C++11

## 6.849.2 Constructor & Destructor Documentation

### regex\_token\_iterator() [1/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator () [inline]
```

Default constructs a `regex_token_iterator`.

A default-constructed `regex_token_iterator` is a singular iterator that will compare equal to the one-past-the-end value for any iterator of the same type.

Referenced by `operator++()`, `operator=()`, and `operator==()`.

### regex\_token\_iterator() [2/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    int __submatch = 0,
    regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a `regex_token_iterator`...

#### Parameters

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__a</code>        | [IN] The start of the text to search.                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>__b</code>        | [IN] One-past-the-end of the text to search.                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>__re</code>       | [IN] The regular expression to search for.                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>__submatch</code> | [IN] Which submatch to return. There are some special values for this parameter: <ul style="list-style-type: none"> <li>• -1 each enumerated subexpression does NOT match the regular expression (aka field splitting)</li> <li>• 0 the entire string matching the subexpression is returned for each match within the text.</li> <li>• &gt;0 enumerates only the indicated subexpression from a match within the text.</li> </ul> |
| <code>__m</code>        | [IN] Policy flags for match rules.                                                                                                                                                                                                                                                                                                                                                                                                 |

### regex\_token\_iterator() [3/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    const std::vector< int > & __submatches,
    regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a `regex_token_iterator`...

#### Parameters

|                  |                                              |
|------------------|----------------------------------------------|
| <code>__a</code> | [IN] The start of the text to search.        |
| <code>__b</code> | [IN] One-past-the-end of the text to search. |

## Parameters

|                           |                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------|
| <code>__re</code>         | [IN] The regular expression to search for.                                                 |
| <code>__submatches</code> | [IN] A list of subexpressions to return for each regular expression match within the text. |
| <code>__m</code>          | [IN] Policy flags for match rules.                                                         |

**regex\_token\_iterator()** [4/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    initializer_list< int > __submatches,
    regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a regex\_token\_iterator...

## Parameters

|                           |                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------|
| <code>__a</code>          | [IN] The start of the text to search.                                                      |
| <code>__b</code>          | [IN] One-past-the-end of the text to search.                                               |
| <code>__re</code>         | [IN] The regular expression to search for.                                                 |
| <code>__submatches</code> | [IN] A list of subexpressions to return for each regular expression match within the text. |
| <code>__m</code>          | [IN] Policy flags for match rules.                                                         |

**regex\_token\_iterator()** [5/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
template<std::size_t _Nm>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    const int (&) __submatches[_Nm],
    regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a regex\_token\_iterator...

## Parameters

|                           |                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------|
| <code>__a</code>          | [IN] The start of the text to search.                                                      |
| <code>__b</code>          | [IN] One-past-the-end of the text to search.                                               |
| <code>__re</code>         | [IN] The regular expression to search for.                                                 |
| <code>__submatches</code> | [IN] A list of subexpressions to return for each regular expression match within the text. |
| <code>__m</code>          | [IN] Policy flags for match rules.                                                         |

**regex\_token\_iterator()** [6/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs) [inline]
```

Copy constructs a `regex_token_iterator`.

**Parameters**

|                    |                                                   |
|--------------------|---------------------------------------------------|
| <code>__rhs</code> | [IN] A <code>regex_token_iterator</code> to copy. |
|--------------------|---------------------------------------------------|

**6.849.3 Member Function Documentation****operator\*()**

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type & std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator* ()
const [inline]
```

Dereferences a `regex_token_iterator`.

**operator++()** [1/2]

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ ()
Ch_type, _Rx_traits >::operator++ ()
```

Increments a `regex_token_iterator`.

References `regex_token_iterator()`.

**operator++()** [2/2]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_token_iterator std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ (
    int ) [inline]
```

Postincrements a `regex_token_iterator`.

**operator->()**

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type * std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator-> ()
const [inline]
```

Selects a `regex_token_iterator` member.

**operator=()**

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator= (
    const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs)
```

Assigns a `regex_token_iterator` to another.

## Parameters

|                    |                                                   |
|--------------------|---------------------------------------------------|
| <code>__rhs</code> | [IN] A <code>regex_token_iterator</code> to copy. |
|--------------------|---------------------------------------------------|

References [regex\\_token\\_iterator\(\)](#).

**operator==( )**

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
bool std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits >::operator==(
    const regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits > & __rhs) const
```

Compares a `regex_token_iterator` to another for equality.

References [regex\\_token\\_iterator\(\)](#).

### 6.850.1 Detailed Description

```
template<typename _Ch_type>
class std::regex_traits< _Ch_type >
```

Describes aspects of a regular expression.

A regular expression traits class that satisfies the requirements of section [28.7].

The class `regex` is parameterized around a set of related types and functions used to complete the definition of its semantics. This class satisfies the requirements of such a traits class.

Since

C++11

### 6.850.2 Constructor & Destructor Documentation

#### `regex_traits()`

```
template<typename _Ch_type>
std::regex_traits< _Ch_type >::regex_traits () [inline]
```

Constructs a default traits object.

Referenced by [value\(\)](#).

### 6.850.3 Member Function Documentation

#### `getloc()`

```
template<typename _Ch_type>
locale_type std::regex_traits< _Ch_type >::getloc () const [inline]
```

Gets a copy of the current locale in use by the `regex_traits` object.

#### `imbue()`

```
template<typename _Ch_type>
locale_type std::regex_traits< _Ch_type >::imbue (
    locale_type __loc) [inline]
```

Imbues the `regex_traits` object with a copy of a new locale.

#### Parameters

|                    |           |
|--------------------|-----------|
| <code>__loc</code> | A locale. |
|--------------------|-----------|

#### Returns

a copy of the previous locale in use by the `regex_traits` object.

#### Note

Calling `imbue` with a different locale than the one currently in use invalidates all cached data held by `*this`.

#### `istype()`

```
template<typename _Ch_type>
bool std::regex_traits< _Ch_type >::istype (
    _Ch_type __c,
    char_class_type __f) const
```

Determines if `c` is a member of an identified class.

## Parameters

|                  |                                                                 |
|------------------|-----------------------------------------------------------------|
| <code>__c</code> | a character.                                                    |
| <code>__f</code> | a class type (as returned from <code>lookup_classname</code> ). |

## Returns

true if the character `__c` is a member of the classification represented by `__f`, false otherwise.

## Exceptions

|                            |                                                    |
|----------------------------|----------------------------------------------------|
| <code>std::bad_cast</code> | if the current locale does not have a ctype facet. |
|----------------------------|----------------------------------------------------|

References [std::use\\_facet\(\)](#).

**length()**

```
template<typename _Ch_type>
std::size_t std::regex_traits<_Ch_type>::length (
    const char_type * __p) [inline], [static]
```

Gives the length of a C-style string starting at `__p`.

## Parameters

|                  |                                                 |
|------------------|-------------------------------------------------|
| <code>__p</code> | a pointer to the start of a character sequence. |
|------------------|-------------------------------------------------|

## Returns

the number of characters between `*__p` and the first default-initialized value of type `char_type`. In other words, uses the C-string algorithm for determining the length of a sequence of characters.

**lookup\_classname()**

```
template<typename _Ch_type>
template<typename _Fwd_iter>
regex_traits<_Ch_type>::char_class_type std::regex_traits<_Ch_type>::lookup_classname (
    _Fwd_iter __first,
    _Fwd_iter __last,
    bool __icase = false) const
```

Maps one or more characters to a named character classification.

## Parameters

|                      |                                              |
|----------------------|----------------------------------------------|
| <code>__first</code> | beginning of the character sequence.         |
| <code>__last</code>  | one-past-the-end of the character sequence.  |
| <code>__icase</code> | ignores the case of the classification name. |

### Returns

an unspecified value that represents the character classification named by the character sequence designated by the iterator range `[__first, __last)`. If `icase` is true, the returned mask identifies the classification regardless of the case of the characters to be matched (for example, `[:lower:]` is the same as `[:alpha:]`), otherwise a case-dependent classification is returned. The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns a value that compares equal to 0.

At least the following names (or their wide-character equivalent) are supported.

- d
- w
- s
- alnum
- alpha
- blank
- cntrl
- digit
- graph
- lower
- print
- punct
- space
- upper
- xdigit

References [std::use\\_facet\(\)](#).

### lookup\_collatename()

```
template<typename _Ch_type>
template<typename _Fwd_iter>
regex_traits<_Ch_type >::string_type std::regex_traits<_Ch_type >::lookup_collatename (
    _Fwd_iter __first,
    _Fwd_iter __last) const
```

Gets a collation element by name.

### Parameters

|                      |                                                 |
|----------------------|-------------------------------------------------|
| <code>__first</code> | beginning of the collation element name.        |
| <code>__last</code>  | one-past-the-end of the collation element name. |

### Returns

a sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range `[__first, __last)`. Returns an empty string if the character sequence is not a valid collating element.

References [std::use\\_facet\(\)](#).

**transform()**

```
template<typename _Ch_type>
template<typename _Fwd_iter>
string_type std::regex_traits<_Ch_type>::transform (
    _Fwd_iter __first,
    _Fwd_iter __last) const [inline]
```

Gets a sort key for a character sequence.

**Parameters**

|                      |                                             |
|----------------------|---------------------------------------------|
| <code>__first</code> | beginning of the character sequence.        |
| <code>__last</code>  | one-past-the-end of the character sequence. |

Returns a sort key for the character sequence designated by the iterator range [F1, F2) such that if the character sequence [G1, G2) sorts before the character sequence [H1, H2) then `v.transform(G1, G2) < v.transform(H1, H2)`. What this really does is provide a more efficient way to compare a string to multiple other strings in locales with fancy collation rules and equivalence classes.

**Returns**

a locale-specific sort key equivalent to the input range.

**Exceptions**

|                            |                                                      |
|----------------------------|------------------------------------------------------|
| <code>std::bad_cast</code> | if the current locale does not have a collate facet. |
|----------------------------|------------------------------------------------------|

**transform\_primary()**

```
template<typename _Ch_type>
template<typename _Fwd_iter>
string_type std::regex_traits<_Ch_type>::transform_primary (
    _Fwd_iter __first,
    _Fwd_iter __last) const [inline]
```

Gets a sort key for a character sequence, independent of case.

**Parameters**

|                      |                                             |
|----------------------|---------------------------------------------|
| <code>__first</code> | beginning of the character sequence.        |
| <code>__last</code>  | one-past-the-end of the character sequence. |

**Effects:** if `typeid(use_facet<collate<_Ch_type>>(getloc())) == typeid(collate_byname<_Ch_type>)` and the form of the sort key returned by `collate_byname<_Ch_type>::transform(__first, __last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

**Todo** Implement this function correctly.

**translate()**

```
template<typename _Ch_type>
char_type std::regex_traits<_Ch_type>::translate (
    char_type __c) const [inline]
```

Performs the identity translation.

**Parameters**

|                  |                                                   |
|------------------|---------------------------------------------------|
| <code>__c</code> | A character to the locale-specific character set. |
|------------------|---------------------------------------------------|

**Returns**

`__c`.

**translate\_nocase()**

```
template<typename _Ch_type>
char_type std::regex_traits< _Ch_type >::translate_nocase (
    char_type __c) const [inline]
```

Translates a character into a case-insensitive equivalent.

**Parameters**

|                  |                                                   |
|------------------|---------------------------------------------------|
| <code>__c</code> | A character to the locale-specific character set. |
|------------------|---------------------------------------------------|

**Returns**

the locale-specific lower-case equivalent of `__c`.

**Exceptions**

|                            |                                                        |
|----------------------------|--------------------------------------------------------|
| <code>std::bad_cast</code> | if the imbued locale does not support the ctype facet. |
|----------------------------|--------------------------------------------------------|

**value()**

```
template<typename _Ch_type>
int std::regex_traits< _Ch_type >::value (
    _Ch_type __ch,
    int __radix) const
```

Converts a digit to an int.

**Parameters**

|                      |                                                                |
|----------------------|----------------------------------------------------------------|
| <code>__ch</code>    | a character representing a digit.                              |
| <code>__radix</code> | the radix if the numeric conversion (limited to 8, 10, or 16). |

**Returns**

the value represented by the digit `__ch` in base `radix` if the character `__ch` is a valid digit in base `radix`; otherwise returns -1.

### 6.861.1 Detailed Description

template<typename [\\_Iterator](#)>

class std::reverse\_iterator< [\\_Iterator](#) >

Bidirectional and random access iterators have corresponding reverse iterator adaptors that iterate through the data structure in the opposite direction. They have the same signatures as the corresponding iterators. The fundamental relation between a reverse iterator and its corresponding iterator *i* is established by the identity:

```
&*(reverse_iterator(i)) == &(i - 1)
```

*This mapping is dictated by the fact that while there is always a pointer past the end of an array, there might not be a valid pointer before the beginning of an array.* [24.4.1]/1,2

Reverse iterators can be tricky and surprising at first. Their semantics make sense, however, and the trickiness is a side effect of the requirement that the iterators must be safe.

### 6.861.2 Constructor & Destructor Documentation

[reverse\\_iterator\(\)](#) [1/4]

```
template<typename \_Iterator>
```

```
std::reverse\_iterator< \_Iterator >::reverse_iterator () [inline], [constexpr], [noexcept]
```

The default constructor value-initializes member **current**. If it is a pointer, that means it is zero-initialized.

Referenced by [std::reverse\\_iterator< iterator >::operator+\(\)](#), and [std::reverse\\_iterator< iterator >::operator-\(\)](#).

[reverse\\_iterator\(\)](#) [2/4]

```
template<typename \_Iterator>
```

```
std::reverse\_iterator< \_Iterator >::reverse_iterator (  
    iterator_type __x) [inline], [explicit], [constexpr], [noexcept]
```

This iterator will move in the opposite direction that *x* does.

[reverse\\_iterator\(\)](#) [3/4]

```
template<typename \_Iterator>
```

```
std::reverse\_iterator< \_Iterator >::reverse_iterator (  
    const reverse\_iterator< \_Iterator > & __x) [inline], [constexpr], [noexcept]
```

The copy constructor is normal.

**reverse\_iterator()** [4/4]

```
template<typename _Iterator>
template<typename _Iter>
requires __convertible<_Iter>
std::reverse_iterator<_Iterator>::reverse_iterator (
    const reverse_iterator<_Iter> & __x) [inline], [constexpr], [noexcept]
```

A reverse\_iterator across other types can be copied if the underlying iterator can be converted to the type of current.

**6.861.3 Member Function Documentation****base()**

```
template<typename _Iterator>
iterator_type std::reverse_iterator<_Iterator>::base () const [inline], [nodiscard], [constexpr],
[noexcept]
```

**Returns**

current, the iterator used for underlying work.

Referenced by [std::operator==\(\)](#).

**operator\*()**

```
template<typename _Iterator>
reference std::reverse_iterator<_Iterator>::operator* () const [inline], [nodiscard], [constexpr]
```

**Returns**

A reference to the value at --current

This requires that --current is dereferenceable.

**Warning**

This implementation requires that for an iterator of the underlying iterator type, x, a reference obtained by \*x remains valid after x has been modified or destroyed. This is a bug: <http://gcc.gnu.org/PR51823>

**operator+()**

```
template<typename _Iterator>
reverse_iterator std::reverse_iterator<_Iterator>::operator+ (
    difference_type __n) const [inline], [nodiscard], [constexpr]
```

**Returns**

A reverse\_iterator that refers to current - \_\_n

The underlying iterator must be a Random Access Iterator.

**operator++()** [1/2]

```
template<typename _Iterator>
reverse_iterator & std::reverse_iterator<_Iterator>::operator++ () [inline], [constexpr]
```

**Returns**

\*this

Decrements the underlying iterator.

**operator++()** [2/2]

```
template<typename _Iterator>
reverse_iterator std::reverse_iterator< _Iterator >::operator++ (
    int ) [inline], [constexpr]
```

**Returns**

The original value of `*this`

Decrements the underlying iterator.

**operator+=()**

```
template<typename _Iterator>
reverse_iterator & std::reverse_iterator< _Iterator >::operator+= (
    difference_type __n) [inline], [constexpr]
```

**Returns**

`*this`

Moves the underlying iterator backwards `__n` steps. The underlying iterator must be a Random Access Iterator.

**operator-()**

```
template<typename _Iterator>
reverse_iterator std::reverse_iterator< _Iterator >::operator- (
    difference_type __n) const [inline], [nodiscard], [constexpr]
```

**Returns**

A `reverse_iterator` that refers to `current - __n`

The underlying iterator must be a Random Access Iterator.

**operator--()** [1/2]

```
template<typename _Iterator>
reverse_iterator & std::reverse_iterator< _Iterator >::operator-- () [inline], [constexpr]
```

**Returns**

`*this`

Increments the underlying iterator.

**operator--()** [2/2]

```
template<typename _Iterator>
reverse_iterator std::reverse_iterator< _Iterator >::operator-- (
    int ) [inline], [constexpr]
```

**Returns**

A `reverse_iterator` with the previous value of `*this`

Increments the underlying iterator.

**operator-=( )**

```
template<typename _Iterator>
reverse_iterator & std::reverse_iterator< _Iterator >::operator-= (
    difference_type __n) [inline], [constexpr]
```

**Returns**

\*this

Moves the underlying iterator forwards `__n` steps. The underlying iterator must be a Random Access Iterator.

**operator->()**

```
template<typename _Iterator>
pointer std::reverse_iterator< _Iterator >::operator-> () const [inline], [nodiscard], [constexpr]
```

**Returns**

A pointer to the value at `--current`

This requires that `--current` is dereferenceable.

**operator[]()**

```
template<typename _Iterator>
reference std::reverse_iterator< _Iterator >::operator[] (
    difference_type __n) const [inline], [nodiscard], [constexpr]
```

**Returns**

The value at `current - __n - 1`

The underlying iterator must be a Random Access Iterator.

### 6.862.1 Detailed Description

```
template<class _CharT, class _Alloc>
class __gnu_cxx::rope<_CharT, _Alloc>
```

This is an SGI extension.

**Todo** Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html)

The documentation for this class was generated from the following files:

- `rope`
- `ropeimpl.h`

### 6.863 std::runtime\_error Class Reference

```
#include <stdexcept_except.h>
```

Inheritance diagram for `std::runtime_error`:

## Public Member Functions

- `runtime_error (const char *)`
- `runtime_error (const runtime_error &) noexcept`

- `runtime_error` (const `string` & \_\_arg)
- `runtime_error` (`runtime_error` &&) noexcept
- `runtime_error` & `operator=` (const `runtime_error` &) noexcept
- `runtime_error` & `operator=` (`runtime_error` &&) noexcept
- virtual const char \* `what` () const noexcept

### 6.863.1 Detailed Description

One of two subclasses of exception.

Runtime errors represent problems outside the scope of a program; they cannot be easily predicted and can generally only be caught as the program executes.

### 6.863.2 Constructor & Destructor Documentation

#### `runtime_error()`

```
std::runtime_error::runtime_error (
    const string & __arg) [explicit]
```

Takes a character string describing the error.

References `runtime_error()`.

Referenced by `runtime_error()`.

### 6.863.3 Member Function Documentation

#### `what()`

```
virtual const char * std::runtime_error::what () const [virtual], [noexcept]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from `std::exception`.

Reimplemented in `std::experimental::filesystem::v1::filesystem_error`, and `std::filesystem::filesystem_error`.

References `what()`.

Referenced by `what()`.

The documentation for this class was generated from the following file:

- `stdexcept_except.h`

## 6.864 `__gnu_pbds::sample_probe_fn` Class Reference

```
#include <sample_probe_fn.hpp>
```

### Public Types

- typedef std::size\_t `size_type`

### Public Member Functions

- `sample_probe_fn` ()
- `sample_probe_fn` (const `sample_probe_fn` &)
- void `swap` (`sample_probe_fn` &)

### Protected Member Functions

- `size_type` `operator()` (key\_const\_reference r\_key, `size_type` i) const

### 6.864.1 Detailed Description

A sample probe policy.

### 6.864.2 Constructor & Destructor Documentation

#### **sample\_probe\_fn()** [1/2]

```
__gnu_pbds::sample_probe_fn::sample_probe_fn ()
```

Default constructor.

Referenced by [sample\\_probe\\_fn\(\)](#), and [swap\(\)](#).

#### **sample\_probe\_fn()** [2/2]

```
__gnu_pbds::sample_probe_fn::sample_probe_fn (  
    const sample\_probe\_fn & )
```

Copy constructor.

References [sample\\_probe\\_fn\(\)](#).

### 6.864.3 Member Function Documentation

#### **operator>()()**

```
size_type __gnu_pbds::sample_probe_fn::operator() (  
    key_const_reference r_key,  
    size_type i) const [inline], [protected]
```

Returns the i-th offset from the hash value of some key r\_key.

#### **swap()**

```
void __gnu_pbds::sample_probe_fn::swap (  
    sample\_probe\_fn & ) [inline]
```

Swaps content.

References [sample\\_probe\\_fn\(\)](#).

The documentation for this class was generated from the following file:

- [sample\\_probe\\_fn.hpp](#)

## 6.865 \_\_gnu\_pbds::sample\_range\_hashing Class Reference

```
#include <sample_range_hashing.hpp>
```

### Public Types

- typedef std::size\_t [size\\_type](#)

### Public Member Functions

- [sample\\_range\\_hashing](#) ()
- [sample\\_range\\_hashing](#) (const [sample\\_range\\_hashing](#) &other)
- void [swap](#) ([sample\\_range\\_hashing](#) &other)

### Protected Member Functions

- void [notify\\_resized](#) ([size\\_type](#))
- [size\\_type](#) [operator\(\)](#) ([size\\_type](#)) const

### 6.865.1 Detailed Description

A sample range-hashing functor.

### 6.865.2 Member Typedef Documentation

#### `size_type`

`typedef std::size_t __gnu_pbds::sample_range_hashing::size_type`  
 Size type.

### 6.865.3 Constructor & Destructor Documentation

#### `sample_range_hashing()` [1/2]

`__gnu_pbds::sample_range_hashing::sample_range_hashing ()`  
 Default constructor.  
 Referenced by [sample\\_range\\_hashing\(\)](#), and [swap\(\)](#).

#### `sample_range_hashing()` [2/2]

`__gnu_pbds::sample_range_hashing::sample_range_hashing (`  
     `const sample\_range\_hashing & other)`  
 Copy constructor.  
 References [sample\\_range\\_hashing\(\)](#).

### 6.865.4 Member Function Documentation

#### `notify_resized()`

`void __gnu_pbds::sample_range_hashing::notify_resized (`  
     `size\_type ) [protected]`  
 Notifies the policy object that the container's size has changed to argument's size.

#### `operator>()()`

`size\_type __gnu_pbds::sample_range_hashing::operator() (`  
     `size\_type ) const [inline], [protected]`  
 Transforms the `__hash` value hash into a ranged-hash value.

#### `swap()`

`void __gnu_pbds::sample_range_hashing::swap (`  
     `sample\_range\_hashing & other) [inline]`  
 Swaps content.  
 References [sample\\_range\\_hashing\(\)](#).  
 The documentation for this class was generated from the following file:

- [sample\\_range\\_hashing.hpp](#)

## 6.866 `__gnu_pbds::sample_ranged_hash_fn` Class Reference

`#include <sample_ranged_hash_fn.hpp>`

### Public Types

- `typedef std::size_t size\_type`

## Public Member Functions

- [sample\\_ranged\\_hash\\_fn](#) ()
- [sample\\_ranged\\_hash\\_fn](#) (const [sample\\_ranged\\_hash\\_fn](#) &)
- void [swap](#) ([sample\\_ranged\\_hash\\_fn](#) &)

## Protected Member Functions

- void [notify\\_resized](#) (size\_type)
- size\_type [operator\(\)](#) (key\_const\_reference) const

### 6.866.1 Detailed Description

A sample ranged-hash functor.

### 6.866.2 Constructor & Destructor Documentation

#### [sample\\_ranged\\_hash\\_fn](#)() [1/2]

```
__gnu_pbds::sample_ranged_hash_fn::sample_ranged_hash_fn ()
```

Default constructor.

Referenced by [sample\\_ranged\\_hash\\_fn](#)(), and [swap](#)().

#### [sample\\_ranged\\_hash\\_fn](#)() [2/2]

```
__gnu_pbds::sample_ranged_hash_fn::sample_ranged_hash_fn (  
    const sample\_ranged\_hash\_fn & )
```

Copy constructor.

References [sample\\_ranged\\_hash\\_fn](#)().

### 6.866.3 Member Function Documentation

#### [notify\\_resized](#)()

```
void __gnu_pbds::sample_ranged_hash_fn::notify_resized (  
    size_type ) [protected]
```

Notifies the policy object that the container's `__size` has changed to `size`.

#### [operator](#)()()

```
size_type __gnu_pbds::sample_ranged_hash_fn::operator() (  
    key_const_reference ) const [inline], [protected]
```

Transforms `key_const_reference` into a position within the table.

#### [swap](#)()

```
void __gnu_pbds::sample_ranged_hash_fn::swap (  
    sample\_ranged\_hash\_fn & ) [inline]
```

Swaps content.

References [sample\\_ranged\\_hash\\_fn](#)().

The documentation for this class was generated from the following file:

- [sample\\_ranged\\_hash\\_fn.hpp](#)

### 6.867 `__gnu_pbds::sample_ranged_probe_fn` Class Reference

```
#include <sample_ranged_probe_fn.hpp>
```

## Public Types

- typedef std::size\_t **size\_type**

## Public Member Functions

- **sample\_ranged\_probe\_fn** (const [sample\\_ranged\\_probe\\_fn](#) &)
- void **swap** ([sample\\_ranged\\_probe\\_fn](#) &)

## Protected Member Functions

- void **notify\_resized** (size\_type)
- size\_type **operator()** (key\_const\_reference, std::size\_t, size\_type) const

### 6.867.1 Detailed Description

A sample ranged-probe functor.

The documentation for this class was generated from the following file:

- [sample\\_ranged\\_probe\\_fn.hpp](#)

## 6.868 `__gnu_pbds::sample_resize_policy` Class Reference

```
#include <sample_resize_policy.hpp>
```

## Public Types

- typedef std::size\_t [size\\_type](#)

## Public Member Functions

- [sample\\_resize\\_policy](#) ()
- [sample\\_range\\_hashing](#) (const [sample\\_resize\\_policy](#) &other)
- void **swap** ([sample\\_resize\\_policy](#) &other)

## Protected Member Functions

- [size\\_type](#) **get\_new\_size** ([size\\_type](#) size, [size\\_type](#) num\_used\_e) const
- bool **is\_resize\_needed** () const
- void **notify\_cleared** ()
- void **notify\_erase\_search\_collision** ()
- void **notify\_erase\_search\_end** ()
- void **notify\_erase\_search\_start** ()
- void **notify\_erased** ([size\\_type](#) num\_e)
- void **notify\_find\_search\_collision** ()
- void **notify\_find\_search\_end** ()
- void **notify\_find\_search\_start** ()
- void **notify\_insert\_search\_collision** ()
- void **notify\_insert\_search\_end** ()
- void **notify\_insert\_search\_start** ()
- void **notify\_inserted** ([size\\_type](#) num\_e)
- void **notify\_resized** ([size\\_type](#) new\_size)

### 6.868.1 Detailed Description

A sample resize policy.

### 6.868.2 Member Typedef Documentation

#### **size\_type**

```
typedef std::size_t __gnu_pbds::sample_resize_policy::size_type
```

Size type.

### 6.868.3 Constructor & Destructor Documentation

#### **sample\_resize\_policy()**

```
__gnu_pbds::sample_resize_policy::sample_resize_policy ()
```

Default constructor.  
Referenced by [sample\\_range\\_hashing\(\)](#), and [swap\(\)](#).

### 6.868.4 Member Function Documentation

#### **get\_new\_size()**

```
size_type __gnu_pbds::sample_resize_policy::get_new_size (  
    size_type size,  
    size_type num_used_e) const [protected]
```

Queries what the new size should be.

#### **is\_resize\_needed()**

```
bool __gnu_pbds::sample_resize_policy::is_resize_needed () const [inline], [protected]
```

Queries whether a resize is needed.

#### **notify\_cleared()**

```
void __gnu_pbds::sample_resize_policy::notify_cleared () [protected]
```

Notifies the table was cleared.

#### **notify\_erase\_search\_collision()**

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

#### **notify\_erase\_search\_end()**

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_end () [inline], [protected]
```

Notifies a search ended.

#### **notify\_erase\_search\_start()**

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_start () [inline], [protected]
```

Notifies a search started.

#### **notify\_erased()**

```
void __gnu_pbds::sample_resize_policy::notify_erased (  
    size_type num_e) [inline], [protected]
```

Notifies an element was erased.

**notify\_find\_search\_collision()**

```
void __gnu_pbds::sample_resize_policy::notify_find_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

**notify\_find\_search\_end()**

```
void __gnu_pbds::sample_resize_policy::notify_find_search_end () [inline], [protected]
```

Notifies a search ended.

**notify\_find\_search\_start()**

```
void __gnu_pbds::sample_resize_policy::notify_find_search_start () [inline], [protected]
```

Notifies a search started.

**notify\_insert\_search\_collision()**

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

**notify\_insert\_search\_end()**

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_end () [inline], [protected]
```

Notifies a search ended.

**notify\_insert\_search\_start()**

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_start () [inline], [protected]
```

Notifies a search started.

**notify\_inserted()**

```
void __gnu_pbds::sample_resize_policy::notify_inserted (  
    size_type num_e) [inline], [protected]
```

Notifies an element was inserted.

**notify\_resized()**

```
void __gnu_pbds::sample_resize_policy::notify_resized (  
    size_type new_size) [protected]
```

Notifies the table was resized to new\_size.

**sample\_range\_hashing()**

```
__gnu_pbds::sample_resize_policy::sample_range_hashing (  
    const sample_resize_policy & other)
```

Copy constructor.

References [sample\\_resize\\_policy\(\)](#).

**swap()**

```
void __gnu_pbds::sample_resize_policy::swap (  
    sample_resize_policy & other) [inline]
```

Swaps content.

References [sample\\_resize\\_policy\(\)](#).

The documentation for this class was generated from the following file:

- [sample\\_resize\\_policy.hpp](#)

## 6.869 \_\_gnu\_pbds::sample\_resize\_trigger Class Reference

```
#include <sample_resize_trigger.hpp>
```

### Public Types

#### 6.869.1 Detailed Description

A sample resize trigger policy.

#### 6.869.2 Member Typedef Documentation

##### **size\_type**

```
typedef std::size_t __gnu_pbds::sample_resize_trigger::size_type
```

Size type.

#### 6.869.3 Constructor & Destructor Documentation

##### **sample\_resize\_trigger()**

```
__gnu_pbds::sample_resize_trigger::sample_resize_trigger ()
```

Default constructor.

Referenced by [sample\\_range\\_hashing\(\)](#), and [swap\(\)](#).

#### 6.869.4 Member Function Documentation

##### is\_grow\_needed()

```
bool __gnu_pbds::sample_resize_trigger::is_grow_needed (
    size_type size,
    size_type num_entries) const [inline], [protected]
```

Queries whether a grow is needed.

##### is\_resize\_needed()

```
bool __gnu_pbds::sample_resize_trigger::is_resize_needed () const [inline], [protected]
```

Queries whether a resize is needed.

##### notify\_cleared()

```
void __gnu_pbds::sample_resize_trigger::notify_cleared () [protected]
```

Notifies the table was cleared.

##### notify\_erase\_search\_collision()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

##### notify\_erase\_search\_end()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_end () [inline], [protected]
```

Notifies a search ended.

##### notify\_erase\_search\_start()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_start () [inline], [protected]
```

Notifies a search started.

##### notify\_erased()

```
void __gnu_pbds::sample_resize_trigger::notify_erased (
    size_type num_entries) [inline], [protected]
```

Notifies an element was erased.

##### notify\_externally\_resized()

```
void __gnu_pbds::sample_resize_trigger::notify_externally_resized (
    size_type new_size) [protected]
```

Notifies the table was resized externally.

##### notify\_find\_search\_collision()

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

##### notify\_find\_search\_end()

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_end () [inline], [protected]
```

Notifies a search ended.

**notify\_find\_search\_start()**

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_start () [inline], [protected]
```

Notifies a search started.

**notify\_insert\_search\_collision()**

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

**notify\_insert\_search\_end()**

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_end () [inline], [protected]
```

Notifies a search ended.

**notify\_insert\_search\_start()**

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_start () [inline], [protected]
```

Notifies a search started.

**notify\_inserted()**

```
void __gnu_pbds::sample_resize_trigger::notify_inserted (
    size_type num_entries) [inline], [protected]
```

Notifies an element was inserted. the total number of entries in the table is num\_entries.

**notify\_resized()**

```
void __gnu_pbds::sample_resize_trigger::notify_resized (
    size_type new_size) [protected]
```

Notifies the table was resized as a result of this object's signifying that a resize is needed.

**sample\_range\_hashing()**

```
__gnu_pbds::sample_resize_trigger::sample_range_hashing (
    const sample_resize_trigger & )
```

Copy constructor.  
References [sample\\_resize\\_trigger\(\)](#).

**swap()**

```
void __gnu_pbds::sample_resize_trigger::swap (
    sample_resize_trigger & ) [inline]
```

Swaps content.  
References [sample\\_resize\\_trigger\(\)](#).  
The documentation for this class was generated from the following file:

- [sample\\_resize\\_trigger.hpp](#)

**6.870 \_\_gnu\_pbds::sample\_size\_policy Class Reference**

```
#include <sample_size_policy.hpp>
```

**Public Types**

- typedef std::size\_t [size\\_type](#)

**Public Member Functions**

- [sample\\_size\\_policy](#) ()
- [sample\\_range\\_hashing](#) (const [sample\\_size\\_policy](#) &)
- void [swap](#) ([sample\\_size\\_policy](#) &other)

- [size\\_type](#) [get\\_nearest\\_smaller\\_size](#) ([size\\_type](#) size) const

**6.870.1 Detailed Description**

A sample size policy.

**6.870.2 Member Typedef Documentation****size\_type**

typedef std::size\_t `__gnu_pbds::sample_size_policy::size_type`  
Size type.

**6.870.3 Constructor & Destructor Documentation****sample\_size\_policy()**

`__gnu_pbds::sample_size_policy::sample_size_policy` ()  
Default constructor.  
Referenced by [sample\\_range\\_hashing\(\)](#), and [swap\(\)](#).

**6.870.4 Member Function Documentation****get\_nearest\_larger\_size()**

[size\\_type](#) `__gnu_pbds::sample_size_policy::get_nearest_larger_size` (  
    [size\\_type](#) size) const [inline], [protected]

Given a `__size` size, returns a `__size` that is larger.

**get\_nearest\_smaller\_size()**

[size\\_type](#) `__gnu_pbds::sample_size_policy::get_nearest_smaller_size` (  
    [size\\_type](#) size) const [inline], [protected]

Given a `__size` size, returns a `__size` that is smaller.

**sample\_range\_hashing()**

`__gnu_pbds::sample_size_policy::sample_range_hashing` (  
    const [sample\\_size\\_policy](#) & )

Copy constructor.  
References [sample\\_size\\_policy\(\)](#).

**swap()**

void `__gnu_pbds::sample_size_policy::swap` (  
    [sample\\_size\\_policy](#) & other) [inline]

Swaps content.  
References [sample\\_size\\_policy\(\)](#).

The documentation for this class was generated from the following file:

## 6.871 `__gnu_pbds::sample_tree_node_update`< `Const_Node_Iter`, `Node_Iter`, `Cmp_Fn`, `_Alloc` > Class Template Reference

```
#include <sample_tree_node_update.hpp>
```

### 6.871.1 Detailed Description

```
template<typename Const_Node_Iter, typename Node_Iter, typename Cmp_Fn, typename _Alloc>
class __gnu_pbds::sample_tree_node_update< Const_Node_Iter, Node_Iter, Cmp_Fn, _Alloc >
```

A sample node updatator.

The documentation for this class was generated from the following file:

- [sample\\_tree\\_node\\_update.hpp](#)

## 6.872 `__gnu_pbds::sample_trie_access_traits` Struct Reference

```
#include <sample_trie_access_traits.hpp>
```

### Public Types

- enum { `max_size` }
- typedef `std::string::const_iterator` `const_iterator`
- typedef char `e_type`
- typedef `rebind_traits< _Alloc, key\_type >::const_reference` `key_const_reference`
- typedef `std::string` `key_type`
- typedef `std::size_t` `size_type`

### Static Public Member Functions

- static `const_iterator` `begin` (`key_const_reference`)
- static `size_type` `e_pos` (`e_type`)
- static `const_iterator` `end` (`key_const_reference`)

### 6.872.1 Detailed Description

A sample trie element access traits.

### 6.872.2 Member Typedef Documentation

#### `e_type`

```
typedef char __gnu_pbds::sample_trie_access_traits::e_type
Element type.
```

### 6.872.3 Member Function Documentation

#### `begin()`

```
const_iterator __gnu_pbds::sample_trie_access_traits::begin (
    key_const_reference ) [inline], [static]
```

Returns a `const_iterator` to the first element of `r_key`.

**e\_pos()**

```
size_type __gnu_pbds::sample_trie_access_traits::e_pos (
    e_type ) [inline], [static]
```

Maps an element to a position.

**end()**

```
const_iterator __gnu_pbds::sample_trie_access_traits::end (
    key_const_reference ) [inline], [static]
```

Returns a const\_iterator to the after-last element of r\_key.

The documentation for this struct was generated from the following file:

- [sample\\_trie\\_access\\_traits.hpp](#)

## 6.873 `__gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >` Class Template Reference

```
#include <sample_trie_node_update.hpp>
```

**Public Types**

- typedef std::size\_t **metadata\_type**

**Protected Member Functions**

- [sample\\_trie\\_node\\_update](#) ()
- void [operator](#)() (node\_iterator, node\_const\_iterator) const

**6.873.1 Detailed Description**

```
template<typename Node_Cltr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >
```

A sample node updator.

**6.873.2 Constructor & Destructor Documentation****sample\_trie\_node\_update()**

```
template<typename Node_Cltr, typename Node_Itr, typename _ATraits, typename _Alloc>
__gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >::sample_trie_node_↵
update () [protected]
```

Default constructor.

**6.873.3 Member Function Documentation****operator>()()**

```
template<typename Node_Cltr, typename Node_Itr, typename _ATraits, typename _Alloc>
void __gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >::operator() (
    node_iterator ,
    node_const_iterator ) const [inline], [protected]
```

Updates the rank of a node through a node\_iterator node\_it; end\_nd\_it is the end node iterator.

The documentation for this class was generated from the following file:

- [sample\\_trie\\_node\\_update.hpp](#)

## 6.874 `__gnu_pbds::sample_update_policy` Struct Reference

```
#include <sample_update_policy.hpp>
```

### Public Member Functions

- [sample\\_update\\_policy](#) ()
- [sample\\_update\\_policy](#) (const [sample\\_update\\_policy](#) &)
- void [swap](#) ([sample\\_update\\_policy](#) &other)

### Protected Types

- typedef some\_metadata\_type [metadata\\_type](#)

### Protected Member Functions

- [metadata\\_type operator\(\)](#) () const
- bool [operator\(\)](#) (metadata\_reference) const

#### 6.874.1 Detailed Description

A sample list-update policy.

#### 6.874.2 Member Typedef Documentation

##### `metadata_type`

```
typedef some_metadata_type __gnu_pbds::sample_update_policy::metadata_type [protected]
```

Metadata on which this functor operates.

#### 6.874.3 Constructor & Destructor Documentation

##### `sample_update_policy()` [1/2]

```
__gnu_pbds::sample_update_policy::sample_update_policy ()
```

Default constructor.

Referenced by [sample\\_update\\_policy\(\)](#), and [swap\(\)](#).

##### `sample_update_policy()` [2/2]

```
__gnu_pbds::sample_update_policy::sample_update_policy (  
    const sample\_update\_policy & )
```

Copy constructor.

References [sample\\_update\\_policy\(\)](#).

#### 6.874.4 Member Function Documentation

##### `operator>()()` [1/2]

```
metadata\_type __gnu_pbds::sample_update_policy::operator() () const [protected]
```

Creates a metadata object.

**operator>()** [2/2]

```
bool __gnu_pbds::sample_update_policy::operator() (
    metadata_reference ) const [protected]
```

Decides whether a metadata object should be moved to the front of the list. A list-update based containers object will call this method to decide whether to move a node to the front of the list. The method should return true if the node should be moved to the front of the list.

**swap()**

```
void __gnu_pbds::sample_update_policy::swap (
    sample_update_policy & other) [inline]
```

Swaps content.

References [sample\\_update\\_policy\(\)](#).

The documentation for this struct was generated from the following file:

- [sample\\_update\\_policy.hpp](#)

**6.875 \_\_gnu\_parallel::sampling\_tag Struct Reference**

```
#include <tags.h>
```

Inheritance diagram for \_\_gnu\_parallel::sampling\_tag:

**Public Member Functions**

- [sampling\\_tag](#) ([\\_ThreadIndex](#) \_\_num\_threads)
- [\\_ThreadIndex](#) [\\_\\_get\\_num\\_threads](#) ()
- void [set\\_num\\_threads](#) ([\\_ThreadIndex](#) \_\_num\_threads)

**6.875.1 Detailed Description**

Forces parallel merging with exact splitting, at compile time.

**6.875.2 Member Function Documentation****\_\_get\_num\_threads()**

```
\_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline], [inherited]
```

Find out desired number of threads.

### Returns

Desired number of threads.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), and [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#).

### set\_num\_threads()

```
void __gnu_parallel::parallel_tag::set_num_threads (
    __ThreadIndex __num_threads) [inline], [inherited]
```

Set the desired number of threads.

### Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

The documentation for this struct was generated from the following file:

- [tags.h](#)

## 6.876 std::scoped\_allocator\_adaptor<\_OuterAlloc, \_InnerAllocs > Class Template Reference

- template<typename \_OutputIterator>  
  void **param** (\_OutputIterator \_\_dest) const
- size\_t **size** () const noexcept

### 6.877.1 Detailed Description

The `seed_seq` class generates sequences of seeds for random number generators.

Since

C++11

### 6.877.2 Member Typedef Documentation

#### **result\_type**

```
typedef uint_least32_t std::seed\_seq::result\_type
```

The type of the seed vales.

### 6.877.3 Constructor & Destructor Documentation

#### **seed\_seq()**

```
std::seed_seq::seed_seq () [inline], [noexcept]
```

Default constructor.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

## 6.878 \_\_gnu\_cxx::select1st< \_Pair > Struct Template Reference

```
#include <functional>
```

## Public Types

### 6.880 `__gnu_pbds::detail::select_value_type< Key, Mapped >` Struct Template Reference

```
#include <types_traits.hpp>
```

#### Public Types

- typedef `std::pair< const Key, Mapped >` `type`

#### 6.880.1 Detailed Description

```
template<typename Key, typename Mapped>
struct __gnu_pbds::detail::select_value_type< Key, Mapped >
```

Choose `value_type` to be a key/value pair or just a key.

The documentation for this struct was generated from the following file:

- [types\\_traits.hpp](#)

### 6.881 `__gnu_pbds::detail::select_value_type< Key, null_type >` Struct Template Reference

```
#include <types_traits.hpp>
```

#### Public Types

- typedef `Key` `type`

#### 6.881.1 Detailed Description

```
template<typename Key>
struct __gnu_pbds::detail::select_value_type< Key, null_type >
```

Specialization for sets where the key is the `value_type`.

The documentation for this struct was generated from the following file:

- [types\\_traits.hpp](#)

### 6.882 `std::basic_istream< _CharT, _Traits >::sentry` Class Reference

```
#include <istream>
```

#### Public Types

- typedef `__istream_type::__ctype_type` `__ctype_type`
- typedef `_Traits::int_type` `__int_type`
- typedef `basic_istream< _CharT, _Traits >` `__istream_type`
- typedef `basic_streambuf< _CharT, _Traits >` `__streambuf_type`
- typedef `_Traits traits_type`

#### Public Member Functions

- `sentry` (`basic_istream< _CharT, _Traits > &__is`, `bool __noskipws=false`)
- `operator bool` () `const`

### 6.882.1 Detailed Description

```
template<typename _CharT, typename _Traits>
class std::basic_istream<_CharT, _Traits>::sentry
```

Performs setup work for input streams.

Objects of this class are created before all of the standard extractors are run. It is responsible for *exception-safe prefix and suffix operations*, although only prefix actions are currently required by the standard.

### 6.882.2 Member Typedef Documentation

#### traits\_type

```
template<typename _CharT, typename _Traits>
typedef _Traits std::basic_istream<_CharT, _Traits>::sentry::traits_type
```

Easy access to dependent types.

### 6.882.3 Constructor & Destructor Documentation

#### sentry()

```
template<typename _CharT, typename _Traits>
std::basic_istream<_CharT, _Traits>::sentry::sentry (
    basic_istream<_CharT, _Traits> & __is,
    bool __noskipws = false) [explicit]
```

The constructor performs all the work.

#### Parameters

|                         |                                       |
|-------------------------|---------------------------------------|
| <code>__is</code>       | The input stream to guard.            |
| <code>__noskipws</code> | Whether to consume whitespace or not. |

If the stream state is good (`__is.good()` is true), then the following actions are performed, otherwise the sentry state is false (*not okay*) and failbit is set in the stream state.

The sentry's preparatory actions are:

1. if the stream is tied to an output stream, `is.tie()->flush()` is called to synchronize the output sequence
2. if `__noskipws` is false, and `ios_base::skipws` is set in `is.flags()`, the sentry extracts and discards whitespace characters from the stream. The currently imbued locale is used to determine whether each character is whitespace.

If the stream state is still good, then the sentry state becomes true (*okay*).

References `std::basic_istream<_CharT, _Traits>::basic_istream()`, `std::ios_base::badbit`, `std::basic_ios<_CharT, _Traits>::good()`, and `std::ios_base::goodbit`.

### 6.882.4 Member Function Documentation

#### operator bool()

```
template<typename _CharT, typename _Traits>
std::basic_istream<_CharT, _Traits>::sentry::operator bool () const [inline], [explicit]
```

Quick status checking.

## Returns

The sentry state.

For ease of use, sentries may be converted to booleans. The return value is that of the sentry state (`true == okay`). The documentation for this class was generated from the following files:

- [istream](#)
- [istream.tcc](#)

## 6.883 `std::basic_ostream<_CharT, _Traits>::sentry` Class Reference

```
#include <ostream.h>
```

### Public Member Functions

- [sentry](#) ([basic\\_ostream](#)<\_CharT, \_Traits> &\_\_os)
- [~sentry](#) ()
- [operator bool](#) () const

#### 6.883.1 Detailed Description

```
template<typename _CharT, typename _Traits>
class std::basic_ostream<_CharT, _Traits>::sentry
```

Performs setup work for output streams.

Objects of this class are created before all of the standard inserters are run. It is responsible for *exception-safe prefix and suffix operations*.

#### 6.883.2 Constructor & Destructor Documentation

##### `sentry()`

```
template<typename _CharT, typename _Traits>
std::basic_ostream<_CharT, _Traits>::sentry::sentry (
    basic_ostream<_CharT, _Traits> &__os) [explicit]
```

The constructor performs preparatory work.

##### Parameters

|                   |                             |
|-------------------|-----------------------------|
| <code>__os</code> | The output stream to guard. |
|-------------------|-----------------------------|

If the stream state is good (`__os.good()` is true), then if the stream is tied to another output stream, `is.<-tie()->flush()` is called to synchronize the output sequences.

If the stream state is still good, then the sentry state becomes true (*okay*).

References [std::basic\\_ostream<\\_CharT, \\_Traits>::basic\\_ostream\(\)](#), [std::basic\\_ios<\\_CharT, \\_Traits>::bad\(\)](#), [std::ios\\_base::failbit](#), [std::basic\\_ios<\\_CharT, \\_Traits>::good\(\)](#), [std::basic\\_ios<\\_CharT, \\_Traits>::setstate\(\)](#), and [std::basic\\_ios<\\_CharT, \\_Traits>::tie\(\)](#).

##### `~sentry()`

```
template<typename _CharT, typename _Traits>
std::basic_ostream<_CharT, _Traits>::sentry::~sentry () [inline]
Possibly flushes the stream.
```

If `ios_base::unitbuf` is set in `os.flags()`, and `std::uncaught_exception()` is true, the sentry destructor flushes the output stream.

References [std::ios\\_base::badbit](#), [std::uncaught\\_exception\(\)](#), and [std::ios\\_base::unitbuf](#).

### 6.883.3 Member Function Documentation

#### operator bool()

```
template<typename _CharT, typename _Traits>  
std::basic_ostream< _CharT, _Traits >::sentry::operator bool () const [inline], [explicit]  
Quick status checking.
```

#### Returns

The sentry state.

For ease of use, sentries may be converted to booleans. The return value is that of the sentry state (true == okay).

### 6.887.1 Detailed Description

`template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>  
class std::set< _Key, _Compare, _Alloc >`

A standard container made up of unique keys, which can be retrieved in logarithmic time.

Since

C++98

#### Template Parameters

|                       |                                                                              |
|-----------------------|------------------------------------------------------------------------------|
| <code>_Key</code>     | Type of key objects.                                                         |
| <code>_Compare</code> | Comparison function object type, defaults to <code>less&lt;_Key&gt;</code> . |
| <code>_Alloc</code>   | Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .             |

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys).

Sets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (\*\_unique versus \*\_equal, same as the standard).

## 6.887.2 Member Typedef Documentation

### allocator\_type

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
typedef _Alloc std::set<_Key, _Compare, _Alloc>::allocator_type
Public typedefs.
```

### const\_iterator

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
typedef _Rep_type::const_iterator std::set<_Key, _Compare, _Alloc>::const_iterator
Iterator-related typedefs.
```

### const\_pointer

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
typedef _Alloc_traits::const_pointer std::set<_Key, _Compare, _Alloc>::const_pointer
Iterator-related typedefs.
```

### const\_reference

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
typedef _Alloc_traits::const_reference std::set<_Key, _Compare, _Alloc>::const_reference
Iterator-related typedefs.
```

### const\_reverse\_iterator

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
typedef _Rep_type::const_reverse_iterator std::set<_Key, _Compare, _Alloc>::const_reverse_iterator
Iterator-related typedefs.
```

### difference\_type

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
typedef _Rep_type::difference_type std::set<_Key, _Compare, _Alloc>::difference_type
Iterator-related typedefs.
```

### iterator

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
typedef _Rep_type::const_iterator std::set<_Key, _Compare, _Alloc>::iterator
Iterator-related typedefs.
```

### key\_compare

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
typedef _Compare std::set< _Key, _Compare, _Alloc >::key_compare  
Public typedefs.
```

### key\_type

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>  
typedef _Key std::set< _Key, _Compare, _Alloc >::key_type  
Public typedefs.
```

### pointer

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>  
typedef _Alloc_traits::pointer std::set< _Key, _Compare, _Alloc >::pointer  
Iterator-related typedefs.
```

### reference

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>  
typedef _Alloc_traits::reference std::set< _Key, _Compare, _Alloc >::reference  
Iterator-related typedefs.
```

### reverse\_iterator

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>  
typedef _Rep_type::const_reverse_iterator std::set< _Key, _Compare, _Alloc >::reverse_iterator  
Iterator-related typedefs.
```

### size\_type

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>  
typedef _Rep_type::size_type std::set< _Key, _Compare, _Alloc >::size_type  
Iterator-related typedefs.
```

### value\_compare

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>  
typedef _Compare std::set< _Key, _Compare, _Alloc >::value_compare  
Public typedefs.
```

### value\_type

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>  
typedef _Key std::set< _Key, _Compare, _Alloc >::value_type  
Public typedefs.
```

### 6.887.3 Constructor & Destructor Documentation

#### set() [1/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
std::set<_Key, _Compare, _Alloc>::set () [default]
```

Default constructor creates no elements.

#### set() [2/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
std::set<_Key, _Compare, _Alloc>::set (
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a set with no elements.

#### Parameters

|                     |                      |
|---------------------|----------------------|
| <code>__comp</code> | Comparator to use.   |
| <code>__a</code>    | An allocator object. |

#### set() [3/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
template<typename _InputIterator>
```

```
std::set<_Key, _Compare, _Alloc>::set (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Builds a set from a range.

#### Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

Create a set consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

#### set() [4/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
template<typename _InputIterator>
```

```
std::set<_Key, _Compare, _Alloc>::set (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a set from a range.

## Parameters

|                      |                       |
|----------------------|-----------------------|
| <code>__first</code> | An input iterator.    |
| <code>__last</code>  | An input iterator.    |
| <code>__comp</code>  | A comparison functor. |
| <code>__a</code>     | An allocator object.  |

Create a set consisting of copies of the elements from `[__first,__last)`. This is linear in  $N$  if the range is already sorted, and  $N\log N$  otherwise (where  $N$  is `distance(__first,__last)`).

**set()** [5/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::set (
    const set<_Key, _Compare, _Alloc> & ) [default]
```

Set copy constructor.

Whether the allocator is copied depends on the allocator traits.

**set()** [6/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::set (
    set<_Key, _Compare, _Alloc> && ) [default]
```

Set move constructor

The newly-created set contains the exact contents of the moved instance. The moved instance is a valid, but unspecified, set.

**set()** [7/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::set (
    initializer_list<value_type> & __l,
    const _Compare & __comp = _Compare(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a set from an `initializer_list`.

## Parameters

|                     |                                    |
|---------------------|------------------------------------|
| <code>__l</code>    | An <code>initializer_list</code> . |
| <code>__comp</code> | A comparison functor.              |
| <code>__a</code>    | An allocator object.               |

Create a set consisting of copies of the elements in the list. This is linear in  $N$  if the list is already sorted, and  $N\log N$  otherwise (where  $N$  is `__l.size()`).

**set()** [8/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::set (
    const allocator_type & __a) [inline], [explicit]
```

Allocator-extended default constructor.

#### set() [9/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc >::set (
    const set<_Key, _Compare, _Alloc > & __x,
    const __type_identity_t< allocator_type > & __a) [inline]
```

Allocator-extended copy constructor.

#### set() [10/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc >::set (
    set<_Key, _Compare, _Alloc > && __x,
    const __type_identity_t< allocator_type > & __a) [inline], [noexcept]
```

Allocator-extended move constructor.

#### set() [11/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc >::set (
    initializer_list< value_type > __l,
    const allocator_type & __a) [inline]
```

Allocator-extended initializer-list constructor.

#### set() [12/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator>
std::set<_Key, _Compare, _Alloc >::set (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a) [inline]
```

Allocator-extended range constructor.

#### ~set()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc >::~~set () [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

### 6.887.4 Member Function Documentation

#### begin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc >::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

### **cbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>
```

```
iterator std::set< _Key, _Compare, _Alloc >::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

### **cend()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>
```

```
iterator std::set< _Key, _Compare, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

### **clear()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>
```

```
void std::set< _Key, _Compare, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in a set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

### **contains()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>
```

```
template<typename _Kt>
```

```
auto std::set< _Key, _Compare, _Alloc >::contains (  
    const _Kt & __x) const -> decltype(_M_t._M_find_tr(__x), void(), true) [inline]
```

Finds whether an element with the given key exists.

#### **Parameters**

|                |                                |
|----------------|--------------------------------|
| <code>↵</code> | Key of elements to be located. |
| <code>X</code> |                                |

#### **Returns**

True if there is an element with the specified key.

### **contains()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>
```

```
bool std::set< _Key, _Compare, _Alloc >::contains (  
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                 |                                |
|-----------------|--------------------------------|
| <code>_↔</code> | Key of elements to be located. |
| <code>_X</code> |                                |

**Returns**

True if there is an element with the specified key.

**count()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
size_type std::set< _Key, _Compare, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

|                 |                     |
|-----------------|---------------------|
| <code>_↔</code> | Element to located. |
| <code>_X</code> |                     |

**Returns**

Number of elements with specified key.

This function only makes sense for multisets; for set the result will either be 0 (not present) or 1 (present).

**crbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
reverse_iterator std::set< _Key, _Compare, _Alloc >::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

**crend()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
reverse_iterator std::set< _Key, _Compare, _Alloc >::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

**emplace()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
template<typename... _Args>
```

```
std::pair< iterator, bool > std::set< _Key, _Compare, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Attempts to build and insert an element into the set.

**Parameters**

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__args</code> | Arguments used to generate an element. |
|---------------------|----------------------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a `bool` that is true if the element was actually inserted.

This function attempts to build and insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

**emplace\_hint()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args>
iterator std::set< _Key, _Compare, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Attempts to insert an element into the set.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__args</code> | Arguments used to generate the element to be inserted.                        |

**Returns**

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

**empty()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
bool std::set< _Key, _Compare, _Alloc >::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the set is empty.

**end()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set< _Key, _Compare, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

**equal\_range()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair< iterator, iterator > std::set< _Key, _Compare, _Alloc >::equal_range (
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

**equal\_range()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair< const_iterator, const_iterator > std::set< _Key, _Compare, _Alloc >::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

**erase()** [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::set< _Key, _Compare, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                    |                              |
|--------------------|------------------------------|
| <code>__key</code> | Key of element to be erased. |
| <code>__x</code>   |                              |

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase() [2/3]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::set< _Key, _Compare, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from a set.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase() [3/3]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::set< _Key, _Compare, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from a set.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc>::find (
    const key_type & __x) [inline]
```

Tries to locate an element in a set.

**Parameters**

|                 |                        |
|-----------------|------------------------|
| <code>_↵</code> | Element to be located. |
| <code>_x</code> |                        |

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

**find()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::set<_Key, _Compare, _Alloc>::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in a set.

**Parameters**

|                 |                        |
|-----------------|------------------------|
| <code>_↵</code> | Element to be located. |
| <code>_x</code> |                        |

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

**get\_allocator()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
allocator_type std::set<_Key, _Compare, _Alloc>::get_allocator () const [inline], [noexcept]
```

Returns the allocator object with which the set was constructed.

**insert()** [1/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator>
void std::set<_Key, _Compare, _Alloc>::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

**Parameters**

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

**insert()** [2/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair< iterator, bool > std::set< _Key, _Compare, _Alloc >::insert (
    const value_type & __x) [inline]
```

Attempts to insert an element into the set.

**Parameters**

|                  |                         |
|------------------|-------------------------|
| <code>__x</code> | Element to be inserted. |
|------------------|-------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

Referenced by `std::set< _Key, _Cmp, polymorphic_allocator< _Key > >::insert()`.

**insert()** [3/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set< _Key, _Compare, _Alloc >::insert (
    const_iterator __position,
    const value_type & __x) [inline]
```

Attempts to insert an element into the set.

**Parameters**

|                         |                                                                               |
|-------------------------|-------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>        | Element to be inserted.                                                       |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

**insert()** [4/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
void std::set<_Key, _Compare, _Alloc>::insert (
    initializer_list<value_type> & __l) [inline]
```

Attempts to insert a list of elements into the set.

**Parameters**

|   |                                                                 |
|---|-----------------------------------------------------------------|
| ↩ | A std::initializer_list<value_type> of elements to be inserted. |
| ↩ |                                                                 |
| ↩ |                                                                 |
| ↩ |                                                                 |
| / |                                                                 |

Complexity similar to that of the range constructor.

**key\_comp()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
key_compare std::set<_Key, _Compare, _Alloc>::key_comp () const [inline]
```

Returns the comparison object with which the set was constructed.

**lower\_bound()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc>::lower_bound (
    const key_type & __x) [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|    |                    |
|----|--------------------|
| ↩  | Key to be located. |
| _X |                    |

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

**lower\_bound()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::set<_Key, _Compare, _Alloc>::lower_bound (
    const key_type & __x) const [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

**max\_size()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
size_type std::set< _Key, _Compare, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the maximum size of the set.

**operator=()** [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
set & std::set< _Key, _Compare, _Alloc >::operator= (
    const set< _Key, _Compare, _Alloc > & ) [default]
```

Set assignment operator.

Whether the allocator is copied depends on the allocator traits.

**operator=()** [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
set & std::set< _Key, _Compare, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Set list assignment operator.

**Parameters**

|                 |                      |
|-----------------|----------------------|
| <code>↵</code>  | An initializer_list. |
| <code>_↵</code> |                      |
| <code>↵</code>  |                      |
| <code>_↵</code> |                      |
| <code>/</code>  |                      |

This function fills a set with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the set and that the resulting set's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
set & std::set< _Key, _Compare, _Alloc >::operator= (
    set< _Key, _Compare, _Alloc > && ) [default]
```

Move assignment operator.

**rbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
reverse_iterator std::set<_Key, _Compare, _Alloc >::rbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

**rend()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
reverse_iterator std::set<_Key, _Compare, _Alloc >::rend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

**size()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
size_type std::set<_Key, _Compare, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the set.

**swap()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
void std::set<_Key, _Compare, _Alloc >::swap (
    set<_Key, _Compare, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another set.

**Parameters**

|                  |                                                |
|------------------|------------------------------------------------|
| <code>__x</code> | A set of the same element and allocator types. |
|------------------|------------------------------------------------|

This exchanges the elements between two sets in constant time. (It is only swapping a pointer, an integer, and an instance of the Compare type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Referenced by [std::swap\(\)](#).

**upper\_bound()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
iterator std::set<_Key, _Compare, _Alloc >::upper_bound (
    const key_type & __x) [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

**Returns**

Iterator pointing to the first element greater than key, or end().

**upper\_bound()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::set< _Key, _Compare, _Alloc >::upper_bound (
    const key_type & __x) const [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

**Returns**

Iterator pointing to the first element greater than key, or end().

**value\_comp()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
value_compare std::set< _Key, _Compare, _Alloc >::value_comp () const [inline]
```

Returns the comparison object with which the set was constructed.

The documentation for this class was generated from the following files:

- [stl\\_multiset.h](#)
- [stl\\_set.h](#)

**6.888 std::shared\_future<\_Res> Class Template Reference**

```
#include <future>
```

Inheritance diagram for std::shared\_future<\_Res>:

## Public Member Functions

- `shared_future` (const `shared_future` &\_\_sf) noexcept

### 6.888.1 Detailed Description

template<typename \_Res>  
class `std::shared_future`<\_Res>

Primary template for `shared_future`.

### 6.888.2 Constructor & Destructor Documentation

#### `shared_future()` [1/3]

```
template<typename _Res>
std::shared_future<_Res>::shared_future (
    const shared_future<_Res> & __sf) [inline], [noexcept]
```

Copy constructor.

#### `shared_future()` [2/3]

```
template<typename _Res>
std::shared_future<_Res>::shared_future (
    future<_Res> && __uf) [inline], [noexcept]
```

Construct from a future rvalue.

References `std::move()`.

#### `shared_future()` [3/3]

```
template<typename _Res>
std::shared_future<_Res>::shared_future (
    shared_future<_Res> && __sf) [inline], [noexcept]
```

Construct from a `shared_future` rvalue.

References `std::move()`.

### 6.888.3 Member Function Documentation

#### `_M_get_result()`

```
template<typename _Res>
```

```
__result_type std::__basic_future< _Res >::_M_get_result () const [inline], [protected], [inherited]
```

Wait for the state to be ready and rethrow any stored exception.

Referenced by [std::future< \\_Res >::get\(\)](#), and [std::shared\\_future< \\_Res >::get\(\)](#).

#### `get()`

```
template<typename _Res>
```

```
const _Res & std::shared_future< _Res >::get () const [inline]
```

Retrieving the value.

References [std::\\_\\_basic\\_future< \\_Res >::\\_M\\_get\\_result\(\)](#).

### 6.892.1 Detailed Description

**template<typename \_Tp>**  
**class std::shared\_ptr< \_Tp >**

A smart pointer with reference-counted copy semantics.

Since

C++11

A `shared_ptr` object is either empty or *owns* a pointer passed to the constructor. Copies of a `shared_ptr` share ownership of the same pointer. When the last `shared_ptr` that owns the pointer is destroyed or reset, the owned pointer is freed (either by `delete` or by invoking a custom deleter that was passed to the constructor).

A `shared_ptr` also stores another pointer, which is usually (but not always) the same pointer as it owns. The stored pointer can be retrieved by calling the `get()` member function.

The equality and relational operators for `shared_ptr` only compare the stored pointer returned by `get()`, not the owned pointer. To test whether two `shared_ptr` objects share ownership of the same pointer see `std::shared_ptr::owner_before` and `std::owner_less`.

### 6.892.2 Member Typedef Documentation

#### element\_type

```
template<typename _Tp>
using std::shared_ptr< _Tp >::element_type
The type pointed to by the stored pointer, remove_extent_t<_Tp>
```

### 6.892.3 Constructor & Destructor Documentation

#### shared\_ptr() [1/14]

```
template<typename _Tp>
std::shared_ptr< _Tp >::shared_ptr () [inline], [constexpr], [noexcept]
Construct an empty shared_ptr.
```

##### Postcondition

```
use_count()==0 && get()==0
```

#### shared\_ptr() [2/14]

```
template<typename _Tp>
std::shared_ptr< _Tp >::shared_ptr (
    const shared_ptr< _Tp > & ) [default], [noexcept]
Copy constructor.
```

#### shared\_ptr() [3/14]

```
template<typename _Tp>
template<typename _Yp, typename = _Constructible<_Yp*>>
std::shared_ptr< _Tp >::shared_ptr (
    _Yp * __p) [inline], [explicit]
Construct a shared_ptr that owns the pointer __p.
```

##### Parameters

|                  |                                                 |
|------------------|-------------------------------------------------|
| <code>__p</code> | A pointer that is convertible to element_type*. |
|------------------|-------------------------------------------------|

##### Postcondition

```
use_count() == 1 && get() == __p
```

##### Exceptions

|                                  |                                               |
|----------------------------------|-----------------------------------------------|
| <code>std::bad_alloc</code> , in | which case <code>delete __p</code> is called. |
|----------------------------------|-----------------------------------------------|

#### shared\_ptr() [4/14]

```
template<typename _Tp>
template<typename _Yp, typename _Deleter, typename = _Constructible<_Yp*, _Deleter>>
std::shared_ptr< _Tp >::shared_ptr (
    _Yp * __p,
    _Deleter __d) [inline]
Construct a shared_ptr that owns the pointer __p and the deleter __d.
```

**Parameters**

|                          |            |
|--------------------------|------------|
| $\leftrightarrow$<br>__p | A pointer. |
| $\leftrightarrow$<br>__d | A deleter. |

**Postcondition**

use\_count() == 1 && get() == \_\_p

**Exceptions**

|                            |                                |
|----------------------------|--------------------------------|
| <i>std::bad_alloc</i> , in | which case __d(__p) is called. |
|----------------------------|--------------------------------|

Requirements: \_Deleter's copy constructor and destructor must not throw  
\_\_shared\_ptr will release \_\_p by calling \_\_d(\_\_p)

**shared\_ptr()** [5/14]

```
template<typename _Tp>
template<typename _Deleter>
std::shared_ptr<_Tp>::shared_ptr (
    nullptr_t __p,
    _Deleter __d) [inline]
```

Construct a shared\_ptr that owns a null pointer and the deleter \_\_d.

**Parameters**

|                          |                          |
|--------------------------|--------------------------|
| $\leftrightarrow$<br>__p | A null pointer constant. |
| $\leftrightarrow$<br>__d | A deleter.               |

**Postcondition**

use\_count() == 1 && get() == \_\_p

**Exceptions**

|                            |                                |
|----------------------------|--------------------------------|
| <i>std::bad_alloc</i> , in | which case __d(__p) is called. |
|----------------------------|--------------------------------|

Requirements: \_Deleter's copy constructor and destructor must not throw  
The last owner will call \_\_d(\_\_p)

**shared\_ptr()** [6/14]

```
template<typename _Tp>
template<typename _Yp, typename _Deleter, typename _Alloc, typename = _Constructible<_Yp*,  $\leftrightarrow$ 
Deleter, _Alloc>>
std::shared_ptr<_Tp>::shared_ptr (
```

```
    _Yp * __p,  
    _Deleter __d,  
    _Alloc __a) [inline]
```

Construct a shared\_ptr that owns the pointer `__p` and the deleter `__d`.

**Parameters**

|                          |               |
|--------------------------|---------------|
| $\leftrightarrow$<br>__p | A pointer.    |
| $\leftrightarrow$<br>__d | A deleter.    |
| $\leftrightarrow$<br>__a | An allocator. |

**Postcondition**

use\_count() == 1 && get() == \_\_p

**Exceptions**

|                            |                                |
|----------------------------|--------------------------------|
| <i>std::bad_alloc</i> , in | which case __d(__p) is called. |
|----------------------------|--------------------------------|

Requirements: \_Deleter's copy constructor and destructor must not throw \_Alloc's copy constructor and destructor must not throw.

\_\_shared\_ptr will release \_\_p by calling \_\_d(\_\_p)

**shared\_ptr() [7/14]**

```
template<typename _Tp>
template<typename _Deleter, typename _Alloc>
std::shared_ptr< _Tp >::shared_ptr (
    nullptr_t __p,
    _Deleter __d,
    _Alloc __a) [inline]
```

Construct a shared\_ptr that owns a null pointer and the deleter \_\_d.

**Parameters**

|                          |                          |
|--------------------------|--------------------------|
| $\leftrightarrow$<br>__p | A null pointer constant. |
| $\leftrightarrow$<br>__d | A deleter.               |
| $\leftrightarrow$<br>__a | An allocator.            |

**Postcondition**

use\_count() == 1 && get() == \_\_p

**Exceptions**

|                            |                                |
|----------------------------|--------------------------------|
| <i>std::bad_alloc</i> , in | which case __d(__p) is called. |
|----------------------------|--------------------------------|

Requirements: \_Deleter's copy constructor and destructor must not throw \_Alloc's copy constructor and destructor must not throw.

The last owner will call \_\_d(\_\_p)

**shared\_ptr()** [8/14]

```
template<typename _Tp>
template<typename _Yp>
std::shared_ptr<_Tp>::shared_ptr (
    const shared_ptr<_Yp> & __r,
    element_type * __p) [inline], [noexcept]
```

Constructs a shared\_ptr instance that stores \_\_p and shares ownership with \_\_r.

**Parameters**

|                                                                                              |                                                       |
|----------------------------------------------------------------------------------------------|-------------------------------------------------------|
|  <b>__r</b> | A shared_ptr.                                         |
|  <b>__p</b> | A pointer that will remain valid while *__r is valid. |

**Postcondition**

```
get() == __p && use_count() == __r.use_count()
```

This can be used to construct a shared\_ptr to a sub-object of an object managed by an existing shared\_ptr. The complete object will remain valid while any shared\_ptr owns it, even if they don't store a pointer to the complete object.

```
shared_ptr<pair<int,int>> pii(new pair<int,int>());
shared_ptr<int> pi(pii, &pii->first);
assert(pii.use_count() == 2);
```

**shared\_ptr()** [9/14]

```
template<typename _Tp>
template<typename _Yp>
std::shared_ptr<_Tp>::shared_ptr (
    shared_ptr<_Yp> && __r,
    element_type * __p) [inline], [noexcept]
```

Constructs a shared\_ptr instance that stores \_\_p and shares ownership with \_\_r.

**Parameters**

|                                                                                                |                                                       |
|------------------------------------------------------------------------------------------------|-------------------------------------------------------|
|  <b>__r</b> | A shared_ptr.                                         |
|  <b>__p</b> | A pointer that will remain valid while *__r is valid. |

**Postcondition**

```
get() == __p && !__r.use_count() && !__r.get()
```

**Since**

C++17

This can be used to construct a shared\_ptr to a sub-object of an object managed by an existing shared\_ptr. The complete object will remain valid while any shared\_ptr owns it, even if they don't store a pointer to the complete object.

```
shared_ptr<pair<int,int>> pii(new pair<int,int>());
shared_ptr<int> pi1(pii, &pii->first);
assert(pii.use_count() == 2);
shared_ptr<int> pi2(std::move(pii), &pii->second);
assert(pii.use_count() == 0);
```

**shared\_ptr()** [10/14]

```
template<typename _Tp>
template<typename _Yp, typename = _Constructible<const shared_ptr<_Yp>&>>
std::shared_ptr< _Tp >::shared_ptr (
    const shared_ptr< _Yp > & __r) [inline], [noexcept]
```

If `__r` is empty, constructs an empty `shared_ptr`; otherwise construct a `shared_ptr` that shares ownership with `__r`.

**Parameters**

|          |               |
|----------|---------------|
| ↵        | A shared_ptr. |
| __↵      |               |
| ↵        |               |
| __↵      |               |
| <i>r</i> |               |

**Postcondition**

`get() == __r.get() && use_count() == __r.use_count()`

**shared\_ptr()** [11/14]

```
template<typename _Tp>
std::shared_ptr< _Tp >::shared_ptr (
    shared_ptr< _Tp > && __r) [inline], [noexcept]
```

Move-constructs a `shared_ptr` instance from `__r`.

**Parameters**

|          |                      |
|----------|----------------------|
| ↵        | A shared_ptr rvalue. |
| __↵      |                      |
| ↵        |                      |
| __↵      |                      |
| <i>r</i> |                      |

**Postcondition**

\*this contains the old value of `__r`, `__r` is empty.

**shared\_ptr()** [12/14]

```
template<typename _Tp>
template<typename _Yp, typename = _Constructible<shared_ptr<_Yp>>>
std::shared_ptr< _Tp >::shared_ptr (
    shared_ptr< _Yp > && __r) [inline], [noexcept]
```

Move-constructs a `shared_ptr` instance from `__r`.

**Parameters**

|          |                      |
|----------|----------------------|
| ↵        | A shared_ptr rvalue. |
| __↵      |                      |
| ↵        |                      |
| __↵      |                      |
| <i>r</i> |                      |

**Postcondition**

\*this contains the old value of `__r`, `__r` is empty.

**shared\_ptr()** [13/14]

```
template<typename _Tp>
template<typename _Yp, typename = _Constructible<const weak_ptr<_Yp>&>>
std::shared_ptr<_Tp>::shared_ptr (
    const weak_ptr<_Yp> & __r) [inline], [explicit]
```

Constructs a `shared_ptr` that shares ownership with `__r` and stores a copy of the pointer stored in `__r`.

**Parameters**

|          |             |
|----------|-------------|
| ↖        | A weak_ptr. |
| __↖      |             |
| ↖        |             |
| __↖      |             |
| <i>r</i> |             |

**Postcondition**

`use_count() == __r.use_count()`

**Exceptions**

|                     |                                                                                |
|---------------------|--------------------------------------------------------------------------------|
| <i>bad_weak_ptr</i> | when <code>__r.expired()</code> , in which case the constructor has no effect. |
|---------------------|--------------------------------------------------------------------------------|

**shared\_ptr()** [14/14]

```
template<typename _Tp>
std::shared_ptr<_Tp>::shared_ptr (
    nullptr_t) [inline], [constexpr], [noexcept]
```

Construct an empty `shared_ptr`.

**Postcondition**

`use_count() == 0 && get() == nullptr`

**6.892.4 Member Function Documentation****get()**

```
template<typename _Tp, _Lock_policy _Lp>
element_type * std::__shared_ptr<_Tp, _Lp>::get () const [inline], [noexcept], [inherited]
```

Return the stored pointer.

**operator bool()**

```
template<typename _Tp, _Lock_policy _Lp>
std::__shared_ptr<_Tp, _Lp>::operator bool () const [inline], [explicit], [noexcept], [inherited]
```

Return true if the stored pointer is not null.

**owner\_before()** [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
template<typename _Tp1>
bool std::__shared_ptr< _Tp, _Lp >::owner_before (
    __shared_ptr< _Tp1, _Lp > const & __rhs) const [inline], [noexcept], [inherited]
```

Define an ordering based on ownership.

This function defines a strict weak ordering between two `shared_ptr` or `weak_ptr` objects, such that one object is less than the other unless they share ownership of the same pointer, or are both empty.

**owner\_before()** [2/2]

```
template<typename _Tp, _Lock_policy _Lp>
template<typename _Tp1>
bool std::__shared_ptr< _Tp, _Lp >::owner_before (
    __weak_ptr< _Tp1, _Lp > const & __rhs) const [inline], [noexcept], [inherited]
```

Define an ordering based on ownership.

This function defines a strict weak ordering between two `shared_ptr` or `weak_ptr` objects, such that one object is less than the other unless they share ownership of the same pointer, or are both empty.

**swap()**

```
template<typename _Tp, _Lock_policy _Lp>
void std::__shared_ptr< _Tp, _Lp >::swap (
    __shared_ptr< _Tp, _Lp > & __other) [inline], [noexcept], [inherited]
```

Exchange both the owned pointer and the stored pointer.

**unique()**

```
template<typename _Tp, _Lock_policy _Lp>
bool std::__shared_ptr< _Tp, _Lp >::unique () const [inline], [noexcept], [inherited]
```

Return true if `use_count() == 1`.

**use\_count()**

```
template<typename _Tp, _Lock_policy _Lp>
long std::__shared_ptr< _Tp, _Lp >::use_count () const [inline], [noexcept], [inherited]
```

If `*this` owns a pointer, return the number of owners, otherwise zero.

### 6.894.1 Detailed Description

```
template<typename _RandomNumberEngine, size_t __k>
class std::shuffle_order_engine< _RandomNumberEngine, __k >
```

Produces random numbers by reordering random numbers from some base engine.

The values from the base engine are stored in a sequence of size `__k` and shuffled by an algorithm that depends on those values.

Since

C++11

### 6.894.2 Member Typedef Documentation

#### result\_type

```
template<typename _RandomNumberEngine, size_t __k>
typedef _RandomNumberEngine::result_type std::shuffle_order_engine< _RandomNumberEngine, __k >↔
::result_type
```

The type of the generated random value.

### 6.894.3 Constructor & Destructor Documentation

#### shuffle\_order\_engine() [1/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine () [inline]
```

Constructs a default `shuffle_order_engine` engine.

The underlying engine is default constructed as well.

#### shuffle\_order\_engine() [2/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
    const _RandomNumberEngine & __rng) [inline], [explicit]
```

Copy constructs a `shuffle_order_engine` engine.

Copies an existing base class random number generator.

#### Parameters

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__rng</code> | An existing (base class) engine object. |
|--------------------|-----------------------------------------|

**shuffle\_order\_engine()** [3/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine<_RandomNumberEngine, __k>::shuffle_order_engine (
    _RandomNumberEngine && __rng) [inline], [explicit]
```

Move constructs a shuffle\_order\_engine engine.

Copies an existing base class random number generator.

**Parameters**

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__rng</code> | An existing (base class) engine object. |
|--------------------|-----------------------------------------|

**shuffle\_order\_engine()** [4/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine<_RandomNumberEngine, __k>::shuffle_order_engine (
    result_type __s) [inline], [explicit]
```

Seed constructs a shuffle\_order\_engine engine.

Constructs the underlying generator engine seeded with \_\_s.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A seed value for the base class engine. |
|------------------|-----------------------------------------|

**shuffle\_order\_engine()** [5/5]

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::shuffle_order_engine<_RandomNumberEngine, __k>::shuffle_order_engine (
    _Sseq & __q) [inline], [explicit]
```

Generator construct a shuffle\_order\_engine engine.

**Parameters**

|                  |                  |
|------------------|------------------|
| <code>__q</code> | A seed sequence. |
|------------------|------------------|

**6.894.4 Member Function Documentation****base()**

```
template<typename _RandomNumberEngine, size_t __k>
const _RandomNumberEngine & std::shuffle_order_engine<_RandomNumberEngine, __k>::base () const
[inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

**discard()**

```
template<typename _RandomNumberEngine, size_t __k>
void std::shuffle_order_engine<_RandomNumberEngine, __k>::discard (
    unsigned long long __z) [inline]
```

Discard a sequence of random numbers.

**max()**

```
template<typename _RandomNumberEngine, size_t __k>
constexpr result\_type std::shuffle\_order\_engine< _RandomNumberEngine, __k >::max () [inline],
[static], [constexpr]
```

Gets the maximum value in the generated random number range.

**min()**

```
template<typename _RandomNumberEngine, size_t __k>
constexpr result\_type std::shuffle\_order\_engine< _RandomNumberEngine, __k >::min () [inline],
[static], [constexpr]
```

Gets the minimum value in the generated random number range.

**operator()()**

```
template<typename _RandomNumberEngine, size_t __k>
shuffle\_order\_engine< _RandomNumberEngine, __k >::result_type std::shuffle\_order\_engine< _↵
RandomNumberEngine, __k >::operator() ()
```

Gets the next value in the generated random number sequence.

References [std::max\(\)](#), and [std::min\(\)](#).

**seed()** [1/3]

```
template<typename _RandomNumberEngine, size_t __k>
void std::shuffle\_order\_engine< _RandomNumberEngine, __k >::seed () [inline]
```

Reseeds the `shuffle_order_engine` object with the default seed for the underlying base class generator engine.

**seed()** [2/3]

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _Sseq>
_If_seed_seq< _Sseq > std::shuffle\_order\_engine< _RandomNumberEngine, __k >::seed (
    _Sseq & __q) [inline]
```

Reseeds the `shuffle_order_engine` object with the given seed sequence.

**Parameters**

|                    |                            |
|--------------------|----------------------------|
| <a href="#">_↵</a> | A seed generator function. |
| <a href="#">_q</a> |                            |

**seed()** [3/3]

```
template<typename _RandomNumberEngine, size_t __k>
void std::shuffle\_order\_engine< _RandomNumberEngine, __k >::seed (
    result\_type __s) [inline]
```

Reseeds the `shuffle_order_engine` object with the default seed for the underlying base class generator engine.

**6.894.5 Friends And Related Symbol Documentation****operator<<**

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _RandomNumberEngine1, size_t __k1, typename _CharT, typename _Traits>
std::basic\_ostream< _CharT, _Traits > & operator<< (
```

```
std::basic_ostream< _CharT, _Traits > & __os,
const std::shuffle_order_engine< _RandomNumberEngine1, __k1 > & __x) [friend]
```

Inserts the current state of a shuffle\_order\_engine random number generator engine \_\_x into the output stream \_\_os.

#### Parameters

|                   |                                                        |
|-------------------|--------------------------------------------------------|
| <code>__os</code> | An output stream.                                      |
| <code>__x</code>  | A shuffle_order_engine random number generator engine. |

#### Returns

The output stream with the state of \_\_x inserted or in an error state.

#### operator==

```
template<typename _RandomNumberEngine, size_t __k>
bool operator== (
    const std::shuffle_order_engine< _RandomNumberEngine, __k > & __lhs,
    const std::shuffle_order_engine< _RandomNumberEngine, __k > & __rhs) [friend]
```

Compares two shuffle\_order\_engine random number generator objects of the same type for equality.

#### Parameters

|                    |                                                              |
|--------------------|--------------------------------------------------------------|
| <code>__lhs</code> | A shuffle_order_engine random number generator object.       |
| <code>__rhs</code> | Another shuffle_order_engine random number generator object. |

#### Returns

true if the infinite sequences of generated values would be equal, false otherwise.

#### operator>>

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _RandomNumberEngine1, size_t __k1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::shuffle_order_engine< _RandomNumberEngine1, __k1 > & __x) [friend]
```

Extracts the current state of a % subtract\_with\_carry\_engine random number generator engine \_\_x from the input stream \_\_is.

#### Parameters

|                   |                                                        |
|-------------------|--------------------------------------------------------|
| <code>__is</code> | An input stream.                                       |
| <code>__x</code>  | A shuffle_order_engine random number generator engine. |

#### Returns

The input stream with the state of \_\_x extracted or in an error state.

#### 6.896.1 Detailed Description

Class defining one-dimensional subset of an array.

The slice class represents a one-dimensional subset of an array, specified by three parameters: start offset, size, and stride. The start offset is the index of the first element of the array that is part of the subset. The size is the total number of elements in the subset. Stride is the distance between each successive array element to include in the subset.

For example, with an array of size 10, and a slice with offset 1, size 3 and stride 2, the subset consists of array elements 1, 3, and 5.

#### 6.896.2 Friends And Related Symbol Documentation

- `class valarray< _Tp >`

### 6.897.1 Detailed Description

`template<typename _Tp>`  
`class std::slice_array< _Tp >`

Reference to one-dimensional subset of an array.

A slice\_array is a reference to the actual elements of an array specified by a slice. The way to get a slice\_array is to call `operator[]`(slice) on a valarray. The returned slice\_array then permits carrying operations out on the referenced subset of elements in the original valarray. For example, `operator+=(valarray)` will add values to the subset of elements in the underlying valarray this slice\_array refers to.

#### Parameters

|           |               |
|-----------|---------------|
| <i>Tp</i> | Element type. |
|-----------|---------------|

### 6.897.2 Member Function Documentation

#### operator%=( )

```
template<typename _Tp>
void std::slice_array<_Tp>::operator%= (
    const valarray<_Tp> & ) const
```

Modulo slice elements by corresponding elements of *v*.

#### operator&=( )

```
template<typename _Tp>
void std::slice_array<_Tp>::operator&= (
    const valarray<_Tp> & ) const
```

Logical and slice elements with corresponding elements of *v*.

#### operator\*=( )

```
template<typename _Tp>
void std::slice_array<_Tp>::operator*= (
    const valarray<_Tp> & ) const
```

Multiply slice elements by corresponding elements of *v*.

#### operator+=( )

```
template<typename _Tp>
void std::slice_array<_Tp>::operator+= (
    const valarray<_Tp> & ) const
```

Add corresponding elements of *v* to slice elements.

#### operator-=( )

```
template<typename _Tp>
void std::slice_array<_Tp>::operator-= (
    const valarray<_Tp> & ) const
```

Subtract corresponding elements of *v* from slice elements.

#### operator/=( )

```
template<typename _Tp>
void std::slice_array<_Tp>::operator/= (
    const valarray<_Tp> & ) const
```

Divide slice elements by corresponding elements of *v*.

#### operator<<=( )

```
template<typename _Tp>
void std::slice_array<_Tp>::operator<<= (
    const valarray<_Tp> & ) const
```

Left shift slice elements by corresponding elements of *v*.

#### operator>>=( )

```
template<typename _Tp>
void std::slice_array<_Tp>::operator>>= (
    const valarray<_Tp> & ) const
```

Right shift slice elements by corresponding elements of *v*.

### **operator^=()**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator^= (
    const valarray< _Tp > & ) const
```

Logical xor slice elements with corresponding elements of *v*.

### **operator" |=()**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator|= (
    const valarray< _Tp > & ) const
```

Logical or slice elements with corresponding elements of *v*.

The documentation for this class was generated from the following files:

#### 6.901.1 Detailed Description

template<typename Key, typename Mapped, typename Cmp\_Fn, typename Node\_And\_It\_Traits, typename \_Alloc>

class `__gnu_pbds::detail::splay_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >`

Splay tree.

## 6.901.2 Member Function Documentation

### node\_begin() [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu↵
pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin
() [inline], [inherited]
```

Returns a `node_iterator` corresponding to the node at the root of the tree.

### node\_begin() [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __↵
gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node↵
begin () const [inline], [inherited]
```

Returns a const `node_iterator` corresponding to the node at the root of the tree.

### node\_end() [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu↵
pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end ()
[inline], [inherited]
```

Returns a `node_iterator` corresponding to a node just after a leaf of the tree.

### node\_end() [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __↵
gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node↵
end () const [inline], [inherited]
```

Returns a const `node_iterator` corresponding to a node just after a leaf of the tree.

### 6.904.1 Detailed Description

template<typename \_Tp, typename \_Sequence = deque<\_Tp>>  
class std::stack<\_Tp, \_Sequence>

A standard container giving FILO behavior.

#### Template Parameters

|                        |                                                      |
|------------------------|------------------------------------------------------|
| <code>_Tp</code>       | Type of element.                                     |
| <code>_Sequence</code> | Type of underlying sequence, defaults to deque<_Tp>. |

Meets many of the requirements of a [container](#), but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-last-out stack behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `back`, `push_back`, and `pop_back`, such as `std::list`, `std::vector`, or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push`, `pop`, and `top`, which are standard stack/FILO operations.

### 6.904.2 Constructor & Destructor Documentation

#### **stack()**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<is_default_constructible<_Seq>::value>::type>
```

```
std::stack< _Tp, _Sequence >::stack () [inline]
```

Default constructor creates no elements.

### 6.904.3 Member Function Documentation

#### **empty()**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
bool std::stack< _Tp, _Sequence >::empty () const [inline], [nodiscard]
```

Returns true if the stack is empty.

#### **pop()**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::stack< _Tp, _Sequence >::pop () [inline]
```

Removes first element.

This is a typical stack operation. It shrinks the stack by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

#### **push()**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::stack< _Tp, _Sequence >::push (
    const value_type & __x) [inline]
```

Add data to the top of the stack.

#### Parameters

|                  |                   |
|------------------|-------------------|
| <code>__x</code> | Data to be added. |
|------------------|-------------------|

This is a typical stack operation. The function creates an element at the top of the stack and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

#### **size()**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
size_type std::stack< _Tp, _Sequence >::size () const [inline], [nodiscard]
```

Returns the number of elements in the stack.

**top()** [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::stack<_Tp, _Sequence>::top () [inline], [nodiscard]
Returns a read/write reference to the data at the first element of the stack.
```

**top()** [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::stack<_Tp, _Sequence>::top () const [inline], [nodiscard]
Returns a read-only (constant) reference to the data at the first element of the stack.
The documentation for this class was generated from the following file:

### 6.905.1 Detailed Description

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
class __gnu_cxx::stdio_filebuf< _CharT, _Traits >
```

Provides a layer of compatibility for C/POSIX.

This GNU extension provides extensions for working with standard C FILE\*'s and POSIX file descriptors. It must be instantiated by the user with the type of character used in the file stream, e.g., `stdio_filebuf<char>`.

### 6.905.2 Constructor & Destructor Documentation

#### `stdio_filebuf()` [1/3]

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf () [inline]
deferred initialization
References std::basic\_filebuf< \_CharT, \_Traits >::basic\_filebuf\(\).
```

#### `stdio_filebuf()` [2/3]

```
template<typename _CharT, typename _Traits>
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf (
    int __fd,
    std::ios_base::openmode __mode,
    size_t __size = static_cast<size_t>( BUFSIZ ))
```

#### Parameters

|                     |                                                         |
|---------------------|---------------------------------------------------------|
| <code>__fd</code>   | An open file descriptor.                                |
| <code>__mode</code> | Same meaning as in a standard filebuf.                  |
| <code>__size</code> | Optimal or preferred size of internal buffer, in chars. |

This constructor associates a file stream buffer with an open POSIX file descriptor. The file descriptor will be automatically closed when the `stdio_filebuf` is closed/destroyed.

References [std::basic\\_filebuf< \\_CharT, \\_Traits >::M\\_buf\\_size](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::M\\_mode](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::M\\_reading](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::M\\_set\\_buffer\(\)](#), and [std::basic\\_filebuf< \\_CharT, \\_Traits >::is\\_open\(\)](#).

#### `stdio_filebuf()` [3/3]

```
template<typename _CharT, typename _Traits>
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf (
    std::__c_file * __f,
    std::ios_base::openmode __mode,
    size_t __size = static_cast<size_t>( BUFSIZ ))
```

## Parameters

|                     |                                                                                                    |
|---------------------|----------------------------------------------------------------------------------------------------|
| <code>__f</code>    | An open <code>FILE*</code> .                                                                       |
| <code>__mode</code> | Same meaning as in a standard filebuf.                                                             |
| <code>__size</code> | Optimal or preferred size of internal buffer, in chars. Defaults to system's <code>BUFSIZ</code> . |

This constructor associates a file stream buffer with an open C `FILE*`. The `FILE*` will not be automatically closed when the `stdio_filebuf` is closed/destroyed.

References `std::basic_filebuf<_CharT, _Traits>::_M_buf_size`, `std::basic_filebuf<_CharT, _Traits>::_M_mode`, `std::basic_filebuf<_CharT, _Traits>::_M_reading`, `std::basic_filebuf<_CharT, _Traits>::_M_set_buffer()`, and `std::basic_filebuf<_CharT, _Traits>::is_open()`.

`~stdio_filebuf()`

```
template<typename _CharT, typename _Traits>
__gnu_cxx::stdio_filebuf<_CharT, _Traits>::~~stdio_filebuf () [virtual]
```

Closes the external data stream if the file descriptor constructor was used.

## 6.905.3 Member Function Documentation

`_M_create_pback()`

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf<_CharT, _Traits>::_M_create_pback () [inline], [protected], [inherited]
```

Initializes pback buffers, and moves normal buffers to safety. Assumptions: `_M_in_cur` has already been moved back  
Referenced by `pbackfail()`.

`_M_destroy_pback()`

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf<_CharT, _Traits>::_M_destroy_pback () throw () [inline], [protected], [inherited]
```

Deactivates pback buffer contents, and restores normal buffer. Assumptions: The pback buffer has only moved forward.  
Referenced by `overflow()`, `seekoff()`, `seekpos()`, `underflow()`, and `xsgetn()`.

`_M_set_buffer()`

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf<_CharT, _Traits>::_M_set_buffer (
    streamsize __off) [inline], [protected], [inherited]
```

This function sets the pointers of the internal buffer, both get and put areas. Typically:

`__off == egptr() - eback()` upon underflow/uflow (**read** mode); `__off == 0` upon overflow (**write** mode); `__off == -1` upon open, setbuf, seekoff/pos (**uncommitted** mode).

NB: `egptr() - pbase() == _M_buf_size - 1`, since `_M_buf_size` reflects the actual allocated memory and the last cell is reserved for the overflow char of a full put area.

Referenced by `__gnu_cxx::stdio_filebuf<_CharT, _Traits>::stdio_filebuf()`, `__gnu_cxx::stdio_filebuf<_CharT, _Traits>::stdio_filebuf()`, `close()`, `imbue()`, `open()`, `overflow()`, `pbackfail()`, `underflow()`, `xsgetn()`, and `xspn()`.

`close()`

```
template<typename _CharT, typename _Traits>
basic_filebuf<_CharT, _Traits>::__filebuf_type * std::basic_filebuf<_CharT, _Traits>::close
() [inherited]
```

Closes the currently associated file.

**Returns**

`this` on success, `NULL` on failure

If no file is currently open, this function immediately fails.

If a *put buffer area* exists, `overflow(eof)` is called to flush all the characters. The file is then closed.

If any operations fail, this function also fails.

References [basic\\_filebuf\(\)](#), [\\_M\\_mode](#), [\\_M\\_pback\\_init](#), [\\_M\\_reading](#), [\\_M\\_set\\_buffer\(\)](#), and [is\\_open\(\)](#).

Referenced by [std::basic\\_filebuf< char\\_type, traits\\_type >::~~basic\\_filebuf\(\)](#), and [open\(\)](#).

**eback()**

```
template<typename _CharT, typename _Traits>
```

```
char_type * std::basic\_streambuf< \_CharT, \_Traits >::eback \(\) const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by [std::basic\\_filebuf< char\\_type, traits\\_type >::\\_M\\_destroy\\_pback\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::imbue\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::overflow\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::pbackfail\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::seekoff\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::seekpos\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sputbackc\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sungetc\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::underflow\(\)](#), and [std::basic\\_filebuf< \\_CharT, \\_Traits >::xsgetn\(\)](#).

**egptr()**

```
template<typename _CharT, typename _Traits>
```

```
char_type * std::basic\_streambuf< \_CharT, \_Traits >::egptr \(\) const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by [std::basic\\_filebuf< char\\_type, traits\\_type >::\\_M\\_create\\_pback\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::in\\_avail\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::overflow\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sbumpc\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::seekoff\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::seekpos\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sgetc\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::showmanyc\(\)](#), [std::basic\\_stringbuf< char\\_type, traits\\_type >::underflow\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::underflow\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::underflow\(\)](#), [std::wbuffer\\_convert< \\_Codecvt, \\_Elem, \\_Tr >::underflow\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::xsgetn\(\)](#), and [xsgetn\(\)](#).

**epptr()**

```
template<typename _CharT, typename _Traits>
```

```
char_type * std::basic\_streambuf< \_CharT, \_Traits >::epptr \(\) const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence

- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

Referenced by `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekpos()`, `std::basic_streambuf<char_type, traits_type>::sputc()`, `std::basic_filebuf<_CharT, _Traits>::xsputn()`, and `xsputn()`.

### `fd()`

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
int __gnu_cxx::stdio_filebuf<_CharT, _Traits>::fd () [inline]
```

#### Returns

The underlying file descriptor.

Once associated with an external data stream, this function can be used to access the underlying POSIX file descriptor. Note that there is no way for the library to track what you do with the descriptor, so be careful.

### `file()`

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
std::__c_file * __gnu_cxx::stdio_filebuf<_CharT, _Traits>::file () [inline]
```

#### Returns

The underlying `FILE*`.

This function can be used to access the underlying "C" file pointer. Note that there is no way for the library to track what you do with the file, so be careful.

### `gbump()`

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::gbump (
    int __n) [inline], [protected], [inherited]
```

Moving the read position.

#### Parameters

|                  |                             |
|------------------|-----------------------------|
| <code>__n</code> | The delta by which to move. |
|------------------|-----------------------------|

This just advances the read position without returning any data.

Referenced by `std::basic_filebuf<_CharT, _Traits>::pbackfail()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::pbackfail()`, `std::basic_streambuf<char_type, traits_type>::sbumpc()`, `std::basic_streambuf<char_type, traits_type>::sputbackc()`, `std::basic_streambuf<char_type, traits_type>::sungetc()`, `std::basic_streambuf<char_type, traits_type>::uflow()`, and `std::basic_filebuf<_CharT, _Traits>::xsgetn()`.

### `getloc()`

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf<_CharT, _Traits>::getloc () const [inline], [inherited]
```

Locale access.

## Returns

The current locale in effect.

If `pubimbue(loc)` has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.

Referenced by [std::basic\\_streambuf< char\\_type, traits\\_type >::pubimbue\(\)](#).

## gptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::gptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by [std::basic\\_filebuf< char\\_type, traits\\_type >::\\_M\\_create\\_pback\(\)](#), [std::basic\\_filebuf< char\\_type, traits\\_type >::\\_M\\_destroy](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::imbue\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::in\\_avail\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::pbackfail\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::seekoff\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sgetc\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::showmanyc\(\)](#), [std::basic\\_stringbuf< char >::showmanyc\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sungetc\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::uflow\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::underflow\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::underflow\(\)](#), [std::wbuffer\\_convert< \\_Codecvt, \\_Elem, \\_Tr >::underflow\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::xsgetn\(\)](#), and [xsgetn\(\)](#).

## imbue()

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf< _CharT, _Traits >::imbue (
    const locale & __loc) [protected], [virtual], [inherited]
```

Changes translations.

## Parameters

|                    |               |
|--------------------|---------------|
| <code>__loc</code> | A new locale. |
|--------------------|---------------|

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

## Note

Base class version does nothing.

Reimplemented from [std::basic\\_streambuf< \\_CharT, \\_Traits >](#).

References [\\_M\\_ext\\_buf](#), [\\_M\\_ext\\_next](#), [\\_M\\_mode](#), [\\_M\\_reading](#), [\\_M\\_set\\_buffer\(\)](#), [std::ios\\_base::cur](#), [std::basic\\_streambuf< \\_CharT, \\_Traits >::gptr\(\)](#), [is\\_open\(\)](#), and [seekoff\(\)](#).

## in\_avail()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::in_avail () [inline], [inherited]
```

Looking ahead into the stream.

**Returns**

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

**is\_open()**

```
template<typename _CharT, typename _Traits>
bool std::basic_filebuf<_CharT, _Traits>::is_open () const throw ( )    [inline], [nodiscard],
[inherited]
```

Returns true if the external file is open.

Referenced by `__gnu_cxx::stdio_filebuf<_CharT, _Traits>::stdio_filebuf()`, `__gnu_cxx::stdio_filebuf<_CharT, _Traits>::stdio_filebuf()`, `close()`, `imbue()`, `open()`, `seekoff()`, `seekpos()`, `setbuf()`, and `showmanyc()`.

**open() [1/3]**

```
template<typename _CharT, typename _Traits>
template<typename _Path>
_If_fs_path<_Path, __filebuf_type * > std::basic_filebuf<_CharT, _Traits>::open (
    const _Path & __s,
    ios_base::openmode __mode)    [inline], [inherited]
```

Opens an external file.

**Parameters**

|                     |                                                            |
|---------------------|------------------------------------------------------------|
| <code>__s</code>    | The name of the file, as a <code>filesystem::path</code> . |
| <code>__mode</code> | The open mode flags.                                       |

**Returns**

`this` on success, NULL on failure

**open() [2/3]**

```
template<typename _CharT, typename _Traits>
basic_filebuf<_CharT, _Traits>::__filebuf_type * std::basic_filebuf<_CharT, _Traits>::open (
    const char * __s,
    ios_base::openmode __mode)    [inherited]
```

Opens an external file.

**Parameters**

|                     |                       |
|---------------------|-----------------------|
| <code>__s</code>    | The name of the file. |
| <code>__mode</code> | The open mode flags.  |

**Returns**

`this` on success, NULL on failure

If a file is already open, this function immediately fails. Otherwise it tries to open the file named `__s` using the flags given in `__mode`.

Table 92, adapted here, gives the relation between openmode combinations and the equivalent `fopen()` flags. (NB: lines app, in|out|app, in|app, binary|app, binary|in|out|app, and binary|in|app per DR 596)

| ios_base Flag combination |    |     |       |     | stdio equivalent |
|---------------------------|----|-----|-------|-----|------------------|
| binary                    | in | out | trunc | app |                  |
|                           |    | +   |       |     | w                |
|                           |    | +   |       | +   | a                |
|                           |    |     |       | +   | a                |
|                           |    | +   | +     |     | w                |
|                           | +  |     |       |     | r                |
|                           | +  | +   |       |     | r+               |
|                           | +  | +   | +     |     | w+               |
|                           | +  | +   |       | +   | a+               |
|                           | +  |     |       | +   | a+               |
| +                         |    |     |       |     |                  |
| +                         |    | +   |       |     | wb               |
| +                         |    | +   |       | +   | ab               |
| +                         |    |     |       | +   | ab               |
| +                         |    | +   | +     |     | wb               |
| +                         | +  |     |       |     | rb               |
| +                         | +  | +   |       |     | r+b              |
| +                         | +  | +   | +     |     | w+b              |
| +                         | +  | +   |       | +   | a+b              |
| +                         | +  |     |       | +   | a+b              |

References [\\_M\\_mode](#), [\\_M\\_reading](#), [\\_M\\_set\\_buffer\(\)](#), [std::ios\\_base::ate](#), [close\(\)](#), [std::ios\\_base::end](#), [is\\_open\(\)](#), and [seekoff\(\)](#).

Referenced by [std::basic\\_filebuf< char\\_type, traits\\_type >::open\(\)](#), and [std::basic\\_filebuf< char\\_type, traits\\_type >::open\(\)](#).

### open() [3/3]

```
template<typename _CharT, typename _Traits>
__filebuf_type * std::basic_filebuf< _CharT, _Traits >::open (
    const std::string & __s,
    ios_base::openmode __mode) [inline], [inherited]
```

Opens an external file.

#### Parameters

|                     |                       |
|---------------------|-----------------------|
| <code>__s</code>    | The name of the file. |
| <code>__mode</code> | The open mode flags.  |

#### Returns

`this` on success, NULL on failure

### overflow()

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::int_type std::basic_filebuf< _CharT, _Traits >::overflow (
    int_type __c = _Traits::eof()) [protected], [virtual], [inherited]
```

Consumes data from the buffer; writes to the controlled sequence.

## Parameters

|                  |                                     |
|------------------|-------------------------------------|
| <code>__c</code> | An additional character to consume. |
|------------------|-------------------------------------|

## Returns

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

## Note

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `_M_buf_size`, `_M_destroy_pback()`, `_M_mode`, `_M_reading`, `_M_set_buffer()`, `std::ios_base::app`, `std::ios_base::cur`, `std::ios_base::out`, `std::basic_streambuf<_CharT, _Traits>::pbase()`, `std::basic_streambuf<_CharT, _Traits>::pbackfail()`, and `std::basic_streambuf<_CharT, _Traits>::pptr()`.

Referenced by `pbackfail()`, `sync()`, `underflow()`, and `xsgetn()`.

**pbackfail()**

```
template<typename _CharT, typename _Traits>
basic_filebuf<_CharT, _Traits>::int_type std::basic_filebuf<_CharT, _Traits>::pbackfail (
    int_type __c = _Traits::eof()) [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

## Parameters

|                  |                                                      |
|------------------|------------------------------------------------------|
| <code>__c</code> | The character to be inserted back into the sequence. |
|------------------|------------------------------------------------------|

## Returns

`eof()` on failure, *some other value* on success

## Postcondition

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

## Note

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `_M_create_pback()`, `_M_mode`, `_M_pback_init`, `_M_reading`, `_M_set_buffer()`, `std::ios_base::cur`, `std::basic_streambuf<_CharT, _Traits>::eback()`, `std::basic_streambuf<_CharT, _Traits>::gbump()`, `std::basic_streambuf<_CharT, _Traits>::in`, `std::ios_base::in`, `overflow()`, `seekoff()`, and `underflow()`.

**pbase()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::pbase () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Referenced by [std::basic\\_filebuf< \\_CharT, \\_Traits >::overflow\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::overflow\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::seekoff\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::seekoff\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::str\(\)](#), [std::basic\\_stringbuf< char >::str\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::sync\(\)](#), and [std::basic\\_filebuf< \\_CharT, \\_Traits >::xsputn\(\)](#).

**pbump()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::pbump (
    int __n) [inline], [protected], [inherited]
```

Moving the write position.

**Parameters**

|                  |                             |
|------------------|-----------------------------|
| <code>__n</code> | The delta by which to move. |
|------------------|-----------------------------|

This just advances the write position without returning any data.

Referenced by [std::basic\\_filebuf< \\_CharT, \\_Traits >::overflow\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::overflow\(\)](#), and [std::basic\\_streambuf< char\\_type, traits\\_type >::sputc\(\)](#).

**pptr()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::pptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Referenced by [std::basic\\_filebuf< \\_CharT, \\_Traits >::overflow\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::overflow\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::seekoff\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::seekoff\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sputc\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::sync\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::xsputn\(\)](#), and [xsputn\(\)](#).

**pubimbue()**

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::pubimbue (
    const locale & __loc) [inline], [inherited]
```

Entry point for imbue().

## Parameters

|                    |                 |
|--------------------|-----------------|
| <code>__loc</code> | The new locale. |
|--------------------|-----------------|

## Returns

The previous locale.

Calls the derived `imbue(__loc)`.

**pubseekoff()**

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
    off_type __off,
    ios_base::seekdir __way,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

## Parameters

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__off</code>  | Offset.                                     |
| <code>__way</code>  | Value for <code>ios_base::seekdir</code> .  |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual `seekoff` function.

**pubseekpos()**

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
    pos_type __sp,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

## Parameters

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__sp</code>   | Position                                    |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual `seekpos` function.

**pubsetbuf()**

```
template<typename _CharT, typename _Traits>
basic_streambuf * std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

**pubsync()**

```
template<typename _CharT, typename _Traits>
int std::basic_streambuf< _CharT, _Traits >::pubsync () [inline], [inherited]
```

Calls virtual sync function.

Referenced by [std::basic\\_istream< \\_CharT, \\_Traits >::sync\(\)](#).

**sbumpc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sbumpc () [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.

Referenced by [std::basic\\_istream< \\_CharT, \\_Traits >::ignore\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::snextc\(\)](#), and [std::basic\\_istream< \\_CharT, char\\_traits< \\_CharT > >::unget\(\)](#).

**seekoff()**

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::pos_type std::basic_filebuf< _CharT, _Traits >::seekoff (
    off_type ,
    ios_base::seekdir ,
    ios_base::openmode = ios_base::in | ios_base::out) [protected], [virtual], [inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from [std::basic\\_streambuf< \\_CharT, \\_Traits >](#).

References [\\_M\\_destroy\\_pback\(\)](#), [\\_M\\_reading](#), [std::ios\\_base::cur](#), [is\\_open\(\)](#), [std::basic\\_streambuf< \\_CharT, \\_Traits >::pbase\(\)](#), and [std::basic\\_streambuf< \\_CharT, \\_Traits >::pptr\(\)](#).

Referenced by [imbue\(\)](#), [open\(\)](#), and [pbackfail\(\)](#).

**seekpos()**

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::pos_type std::basic_filebuf< _CharT, _Traits >::seekpos (
    pos_type ,
    ios_base::openmode = ios_base::in | ios_base::out) [protected], [virtual], [inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from [std::basic\\_streambuf< \\_CharT, \\_Traits >](#).

References [\\_M\\_destroy\\_pback\(\)](#), [std::ios\\_base::beg](#), and [is\\_open\(\)](#).

**setbuf()**

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::__streambuf_type * std::basic_filebuf< _CharT, _Traits >↵
::setbuf (
    char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Manipulates the buffer.

**Parameters**

|                          |                            |
|--------------------------|----------------------------|
| <code>__↵<br/>__s</code> | Pointer to a buffer area.  |
| <code>__↵<br/>__n</code> | Size of <code>__s</code> . |

**Returns**

`this`

If no file has been opened, and both `__s` and `__n` are zero, then the stream becomes unbuffered. Otherwise, `__↵  
s` is used as a buffer; see [https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.↵  
html#io.streambuf.buffering](https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.↵<br/>html#io.streambuf.buffering) for more.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `_M_buf`, `_M_buf_size`, and `is_open()`.

**setg()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setg (
    char_type * __gbeg,
    char_type * __gnext,
    char_type * __gend) [inline], [protected], [inherited]
```

Setting the three read area pointers.

**Parameters**

|                      |            |
|----------------------|------------|
| <code>__gbeg</code>  | A pointer. |
| <code>__gnext</code> | A pointer. |
| <code>__gend</code>  | A pointer. |

**Postcondition**

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::wbuffer_convert()`, `std::basic_filebuf<char_type, traits_type>::__M_create()`, `std::basic_filebuf<char_type, traits_type>::__M_destroy_pback()`, `std::basic_filebuf<char_type, traits_type>::__M_set_buffer()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::__overflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::__seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::__seekpos()`, and `std::basic_filebuf<_CharT, _Traits>::__xsgetn()`.

**setp()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setp (
```

```
char_type * __pbeg,  
char_type * __pend) [inline], [protected], [inherited]
```

Setting the three write area pointers.

## Parameters

|                     |            |
|---------------------|------------|
| <code>__pbeg</code> | A pointer. |
| <code>__pend</code> | A pointer. |

## Postcondition

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == epptr()`

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::wbuffer_convert()`, and `std::basic_filebuf<char_type, traits_type>::_M_s`

**sgetc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sgetc () [inline], [inherited]
```

Getting the next character.

## Returns

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

Referenced by `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<_CharT, char_traits<_CharT>>::readsome()`, and `std::basic_streambuf<char_type, traits_type>::snextc()`.

**sgetn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sgetn (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for `xsggetn`.

## Parameters

|                  |                |
|------------------|----------------|
| <code>__s</code> | A buffer area. |
| <code>__n</code> | A count.       |

Returns `xsggetn(__s, __n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

**showmanyc()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_filebuf<_CharT, _Traits>::showmanyc () [protected], [virtual], [inherited]
```

Investigating the data available.

## Returns

An estimate of the number of characters available in the input sequence, or -1.

*If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail.* [27.5.2.4.3]/1

**Note**

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to underflow or uflow] will not return eof() but that they will return immediately.*

The standard adds that *the morphemes of showmanyc are **es-how-many-see**, not **show-manic**.*

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

References [\\_M\\_mode](#), [std::ios\\_base::binary](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::egptr\(\)](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::std::ios\\_base::in](#), and [is\\_open\(\)](#).

**snextc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::snextc () [inline], [inherited]
Getting the next character.
```

**Returns**

The next character, or eof.

Calls [sbumpc\(\)](#), and if that function returns `traits::eof()`, so does this function. Otherwise, [sgetc\(\)](#).

Referenced by [std::basic\\_istream<\\_CharT, char\\_traits<\\_CharT>>::get\(\)](#), [std::basic\\_istream<char\\_type, traits\\_type>::ignore\(\)](#), and [std::basic\\_istream<\\_CharT, char\\_traits<\\_CharT>>::readsome\(\)](#).

**sputbackc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputbackc (
    char_type __c) [inline], [inherited]
```

Pushing characters back into the input stream.

**Parameters**

|                                                                                                      |                             |
|------------------------------------------------------------------------------------------------------|-----------------------------|
|  <code>__c</code> | The character to push back. |
|------------------------------------------------------------------------------------------------------|-----------------------------|

**Returns**

The previous character, if possible.

Similar to [sungetc\(\)](#), but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

Referenced by [std::basic\\_istream<\\_CharT, \\_Traits>::putback\(\)](#).

**sputc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputc (
    char_type __c) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|                                                                                                      |                        |
|------------------------------------------------------------------------------------------------------|------------------------|
|  <code>__c</code> | A character to output. |
|------------------------------------------------------------------------------------------------------|------------------------|

**Returns**

`__c`, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores `__c` in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(↵__c)`.

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::overflow()`.

**sputn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sputn (
    const char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|                   |                     |
|-------------------|---------------------|
| <code>↵__s</code> | A buffer read area. |
| <code>↵__n</code> | A count.            |

One of two public output functions.

Returns `xsgputn(__s, __n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

**sungetc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sungetc () [inline], [inherited]
```

Moving backwards in the input stream.

**Returns**

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbackfail()`. The effect is to *unget* the last character *gotten*.

Referenced by `std::basic_istream<_CharT, _Traits>::ungetc()`.

**sync()**

```
template<typename _CharT, typename _Traits>
int std::basic_filebuf<_CharT, _Traits>::sync () [protected], [virtual], [inherited]
```

Synchronizes the buffer arrays with the controlled sequences.

**Returns**

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

**Note**

Base class version does nothing, returns zero.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `overflow()`, `std::basic_streambuf<_CharT, _Traits>::pbase()`, and `std::basic_streambuf<_CharT, _Traits>::pptr()`.

**uflow()**

```
template<typename _CharT, typename _Traits>
virtual int_type std::basic_streambuf< _CharT, _Traits >::uflow () [inline], [protected], [virtual],
[inherited]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Reimplemented in `__gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >`.

Referenced by `std::basic_streambuf< char_type, traits_type >::sbumpc()`, and `xsgetn()`.

**underflow()**

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::int_type std::basic_filebuf< _CharT, _Traits >::underflow ()
[protected], [virtual], [inherited]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

References `_M_buf_size`, `_M_destroy_pback()`, `_M_mode`, `_M_set_buffer()`, `std::basic_streambuf< _CharT, _Traits >::eback()`, `std::basic_streambuf< _CharT, _Traits >::egptr()`, `std::basic_streambuf< _CharT, _Traits >::gptr()`, `std::ios_base::in`, and `overflow()`.

Referenced by `pbackfail()`.

**xsgetn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_filebuf< _CharT, _Traits >::xsgetn (
    char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character extraction.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A buffer area.                          |
| <code>__n</code> | Maximum number of characters to assign. |

**Returns**

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

References [\\_M\\_buf\\_size](#), [\\_M\\_destroy\\_pback\(\)](#), [\\_M\\_mode](#), [\\_M\\_pback\\_init](#), [\\_M\\_reading](#), [\\_M\\_set\\_buffer\(\)](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::egptr\(\)](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::gbump\(\)](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::in](#), [std::ios\\_base::in](#), [overflow\(\)](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::setg\(\)](#), and [std::basic\\_streambuf<char\\_type, traits\\_type>::xsgetn\(\)](#).

**xspn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_filebuf<_CharT, _Traits>::xspn (
    const char_type * __s,
    streamsize __n)    [protected], [virtual], [inherited]
```

Multiple character insertion.

**Parameters**

|                  |                                        |
|------------------|----------------------------------------|
| <code>__s</code> | A buffer area.                         |
| <code>__n</code> | Maximum number of characters to write. |

**Returns**

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

References [\\_M\\_buf\\_size](#), [\\_M\\_mode](#), [\\_M\\_reading](#), [\\_M\\_set\\_buffer\(\)](#), [std::ios\\_base::app](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::epptr\(\)](#), [std::ios\\_base::out](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::pbase\(\)](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::pptr\(\)](#), and [std::basic\\_streambuf<char\\_type, traits\\_type>::xspn\(\)](#).

**6.905.4 Member Data Documentation****`_M_buf`**

```
template<typename _CharT, typename _Traits>
char_type* std::basic_filebuf<_CharT, _Traits>::_M_buf    [protected], [inherited]
```

Pointer to the beginning of internal buffer.

Referenced by [basic\\_filebuf\(\)](#), and [setbuf\(\)](#).

**`_M_buf_locale`**

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf<_CharT, _Traits>::_M_buf_locale    [protected], [inherited]
```

Current locale setting.

Referenced by [std::basic\\_filebuf<\\_CharT, \\_Traits>::basic\\_filebuf\(\)](#).

### **`_M_buf_size`**

```
template<typename _CharT, typename _Traits>
```

```
size_t std::basic\_filebuf< _CharT, _Traits >::_M_buf_size [protected], [inherited]
```

Actual size of internal buffer. This number is equal to the size of the put area + 1 position, reserved for the overflow char of a full area.

Referenced by [basic\\_filebuf\(\)](#), [\\_\\_gnu\\_cxx::stdio\\_filebuf< \\_CharT, \\_Traits >::stdio\\_filebuf\(\)](#), [\\_\\_gnu\\_cxx::stdio\\_filebuf< \\_CharT, \\_Traits >::overflow\(\)](#), [setbuf\(\)](#), [underflow\(\)](#), [xsgetn\(\)](#), and [xspn\(\)](#).

### **`_M_ext_buf`**

```
template<typename _CharT, typename _Traits>
```

```
char* std::basic\_filebuf< _CharT, _Traits >::_M_ext_buf [protected], [inherited]
```

Buffer for external characters. Used for input when `codecvt::always_noconv() == false`. When valid, this corresponds to `eback()`.

Referenced by [basic\\_filebuf\(\)](#), and [imbue\(\)](#).

### **`_M_ext_buf_size`**

```
template<typename _CharT, typename _Traits>
```

```
streamsize std::basic\_filebuf< _CharT, _Traits >::_M_ext_buf_size [protected], [inherited]
```

Size of buffer held by `_M_ext_buf`.

Referenced by [basic\\_filebuf\(\)](#).

### **`_M_ext_next`**

```
template<typename _CharT, typename _Traits>
```

```
const char* std::basic\_filebuf< _CharT, _Traits >::_M_ext_next [protected], [inherited]
```

Pointers into the buffer held by `_M_ext_buf` that delimit a subsequence of bytes that have been read but not yet converted. When valid, `_M_ext_next` corresponds to `egptr()`.

Referenced by [basic\\_filebuf\(\)](#), and [imbue\(\)](#).

### **`_M_in_beg`**

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic\_streambuf< _CharT, _Traits >::_M_in_beg [protected], [inherited]
```

Start of get area.

### **`_M_in_cur`**

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic\_streambuf< _CharT, _Traits >::_M_in_cur [protected], [inherited]
```

Current read area.

### **`_M_in_end`**

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic\_streambuf< _CharT, _Traits >::_M_in_end [protected], [inherited]
```

End of get area.

### **`_M_mode`**

```
template<typename _CharT, typename _Traits>
```

```
ios_base::openmode std::basic\_filebuf< _CharT, _Traits >::_M_mode [protected], [inherited]
```

Place to stash in || out || in | out settings for current filebuf.

Referenced by [basic\\_filebuf\(\)](#), [\\_\\_gnu\\_cxx::stdio\\_filebuf<\\_CharT, \\_Traits>::stdio\\_filebuf\(\)](#), [\\_\\_gnu\\_cxx::stdio\\_filebuf<\\_CharT, \\_Traits>::close\(\)](#), [imbue\(\)](#), [open\(\)](#), [overflow\(\)](#), [pbackfail\(\)](#), [showmanyc\(\)](#), [underflow\(\)](#), [xsgetn\(\)](#), and [xsputn\(\)](#).

### **`_M_out_beg`**

```
template<typename _CharT, typename _Traits>
char_type* std::basic\_streambuf<\_CharT, \_Traits>::\_M\_out\_beg [protected], [inherited]
Start of put area.
```

### **`_M_out_cur`**

```
template<typename _CharT, typename _Traits>
char_type* std::basic\_streambuf<\_CharT, \_Traits>::\_M\_out\_cur [protected], [inherited]
Current put area.
```

### **`_M_out_end`**

```
template<typename _CharT, typename _Traits>
char_type* std::basic\_streambuf<\_CharT, \_Traits>::\_M\_out\_end [protected], [inherited]
End of put area.
```

### **`_M_pback`**

```
template<typename _CharT, typename _Traits>
char_type std::basic\_filebuf<\_CharT, \_Traits>::\_M\_pback [protected], [inherited]
Necessary bits for putback buffer management.
```

#### **Note**

pbacks of over one character are not currently supported.

Referenced by [basic\\_filebuf\(\)](#).

### **`_M_pback_cur_save`**

```
template<typename _CharT, typename _Traits>
char_type* std::basic\_filebuf<\_CharT, \_Traits>::\_M\_pback\_cur\_save [protected], [inherited]
Necessary bits for putback buffer management.
```

#### **Note**

pbacks of over one character are not currently supported.

Referenced by [basic\\_filebuf\(\)](#).

### **`_M_pback_end_save`**

```
template<typename _CharT, typename _Traits>
char_type* std::basic\_filebuf<\_CharT, \_Traits>::\_M\_pback\_end\_save [protected], [inherited]
Necessary bits for putback buffer management.
```

#### **Note**

pbacks of over one character are not currently supported.

Referenced by [basic\\_filebuf\(\)](#).

## **`_M_pback_init`**

```
template<typename _CharT, typename _Traits>
bool std::basic_filebuf< _CharT, _Traits >::_M_pback_init [protected], [inherited]
```

Necessary bits for putback buffer management.

### Note

pbacks of over one character are not currently supported.

Referenced by [basic\\_filebuf\(\)](#), [close\(\)](#), [pbackfail\(\)](#), and [xsgetn\(\)](#).

## **`_M_reading`**

```
template<typename _CharT, typename _Traits>
bool std::basic_filebuf< _CharT, _Traits >::_M_reading [protected], [inherited]
_M_reading == false && _M_writing == false for uncommitted mode; _M_reading == true for read mode; _M_writing
== true for write mode;
```

NB: `_M_reading == true && _M_writing == true` is unused.

Referenced by [basic\\_filebuf\(\)](#), [\\_\\_gnu\\_cxx::stdio\\_filebuf< \\_CharT, \\_Traits >::stdio\\_filebuf\(\)](#), [\\_\\_gnu\\_cxx::stdio\\_filebuf< \\_CharT, \\_Traits >::close\(\)](#), [imbue\(\)](#), [open\(\)](#), [overflow\(\)](#), [pbackfail\(\)](#), [seekoff\(\)](#), [xsgetn\(\)](#), and [xsputn\(\)](#).

The documentation for this class was generated from the following file:

- [stdio\\_filebuf.h](#)

## **6.906 `__gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >` Class Template Reference**

```
#include <stdio_sync_filebuf.h>
```

Inheritance diagram for `__gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >`:

### Public Types

- `typedef _CharT char_type`
- `typedef traits_type::int_type int_type`
- `typedef traits_type::off_type off_type`
- `typedef traits_type::pos_type pos_type`
- `typedef _Traits traits_type`

**Public Member Functions**

### 6.906.1 Detailed Description

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
class __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >
```

Provides a layer of compatibility for C.

This GNU extension provides extensions for working with standard C FILE\*'s. It must be instantiated by the user with the type of character used in the file stream, e.g., `stdio_filebuf<char>`.

### 6.906.2 Member Function Documentation

#### `eback()`

```
template<typename _CharT, typename _Traits>
```

```
char_type * std::basic_streambuf< _CharT, _Traits >::eback () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence

- `egptr()` returns the end pointer for the input sequence

Referenced by `std::basic_filebuf<char_type, traits_type>::_M_destroy_pback()`, `std::basic_filebuf<_CharT, _Traits>::imbue()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, `std::basic_filebuf<_CharT, _Traits>::pbackfail()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekpos()`, `std::basic_streambuf<char_type, traits_type>::sputbackc()`, `std::basic_streambuf<char_type, traits_type>::sungetc()`, `std::basic_filebuf<_CharT, _Traits>::underflow()`, and `std::basic_filebuf<_CharT, _Traits>::xsgetn()`.

### **egptr()**

```
template<typename _CharT, typename _Traits>
```

```
char_type * std::basic_streambuf<_CharT, _Traits>::egptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::basic_filebuf<char_type, traits_type>::_M_create_pback()`, `std::basic_streambuf<char_type, traits_type>::in_avail()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, `std::basic_streambuf<char_type, traits_type>::sbumpc()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekpos()`, `std::basic_streambuf<char_type, traits_type>::sgetc()`, `std::basic_filebuf<_CharT, _Traits>::showmanyc()`, `std::basic_stringbuf<char_type, traits_type>::underflow()`, `std::basic_filebuf<_CharT, _Traits>::underflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::underflow()`, `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::underflow()`, `std::basic_filebuf<_CharT, _Traits>::xsgetn()`, and `xsgetn()`.

### **epptr()**

```
template<typename _CharT, typename _Traits>
```

```
char_type * std::basic_streambuf<_CharT, _Traits>::epptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

Referenced by `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekpos()`, `std::basic_streambuf<char_type, traits_type>::sputc()`, `std::basic_filebuf<_CharT, _Traits>::xsputn()`, and `xsputn()`.

### **file()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
```

```
std::__c_file * __gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::file () [inline]
```

#### **Returns**

The underlying FILE\*.

This function can be used to access the underlying C file pointer. Note that there is no way for the library to track what you do with the file, so be careful.

## gbump()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::gbump (
    int __n) [inline], [protected], [inherited]
```

Moving the read position.

### Parameters

|                  |                             |
|------------------|-----------------------------|
| <code>__n</code> | The delta by which to move. |
|------------------|-----------------------------|

This just advances the read position without returning any data.

Referenced by `std::basic_filebuf< _CharT, _Traits >::pbackfail()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::pbackfail()`, `std::basic_streambuf< char_type, traits_type >::sbumpc()`, `std::basic_streambuf< char_type, traits_type >::sputbackc()`, `std::basic_streambuf< char_type, traits_type >::sungetc()`, `std::basic_streambuf< char_type, traits_type >::uflow()`, and `std::basic_filebuf< _CharT, _Traits >::xsgetn()`.

## getloc()

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::getloc () const [inline], [inherited]
```

Locale access.

### Returns

The current locale in effect.

If `pubimbue(loc)` has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.

Referenced by `std::basic_streambuf< char_type, traits_type >::pubimbue()`.

## gptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::gptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::basic_filebuf< char_type, traits_type >::_M_create_pback()`, `std::basic_filebuf< char_type, traits_type >::_M_destroy`, `std::basic_filebuf< _CharT, _Traits >::imbue()`, `std::basic_streambuf< char_type, traits_type >::in_avail()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::pbackfail()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_streambuf< char_type, traits_type >::sgetc()`, `std::basic_filebuf< _CharT, _Traits >::showmanyc()`, `std::basic_stringbuf< char >::showmanyc()`, `std::basic_streambuf< char_type, traits_type >::sungetc()`, `std::basic_streambuf< char_type, traits_type >::uflow()`, `std::basic_filebuf< _CharT, _Traits >::underflow()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::underflow()`, `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow()`, `std::basic_filebuf< _CharT, _Traits >::xsgetn()`, and `xsgetn()`.

**imbue()**

```
template<typename _CharT, typename _Traits>
virtual void std::basic_streambuf<_CharT, _Traits>::imbue (
    const locale & __loc) [inline], [protected], [virtual], [inherited]
```

Changes translations.

**Parameters**

|                    |               |
|--------------------|---------------|
| <code>__loc</code> | A new locale. |
|--------------------|---------------|

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

**Note**

Base class version does nothing.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, `std::basic_filebuf<char>`, `std::basic_filebuf<char_type, traits_type>`, and `std::basic_filebuf<wchar_t>`.

Referenced by `std::basic_streambuf<char_type, traits_type>::pubimbue()`.

**in\_avail()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::in_avail () [inline], [inherited]
```

Looking ahead into the stream.

**Returns**

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

**overflow()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::overflow (
    int_type __c = traits_type::eof()) [inline], [protected], [virtual]
```

Consumes data from the buffer; writes to the controlled sequence.

**Parameters**

|                  |                                     |
|------------------|-------------------------------------|
| <code>__c</code> | An additional character to consume. |
|------------------|-------------------------------------|

**Returns**

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

**Note**

Base class version does nothing, returns eof().

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

**pbackfail()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::pbackfail (
    int_type __c = traits_type::eof()) [inline], [protected], [virtual]
```

Tries to back up the input sequence.

**Parameters**

|                 |                                                      |
|-----------------|------------------------------------------------------|
| <code>_↵</code> | The character to be inserted back into the sequence. |
| <code>_C</code> |                                                      |

**Returns**

eof() on failure, *some other value* on success

**Postcondition**

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

**Note**

Base class version does nothing, returns eof().

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

**pbase()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf<_CharT, _Traits>::pbase () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

Referenced by [std::basic\\_filebuf<\\_CharT, \\_Traits>::overflow\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::overflow\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::seekoff\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::seekoff\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::str\(\)](#), [std::basic\\_stringbuf<char>::str\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::sync\(\)](#), and [std::basic\\_filebuf<\\_CharT, \\_Traits>::xsputn\(\)](#).

**pbump()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::pbump (
    int __n) [inline], [protected], [inherited]
```

Moving the write position.

## Parameters

|                 |                             |
|-----------------|-----------------------------|
| <code>_↔</code> | The delta by which to move. |
| <code>_n</code> |                             |

This just advances the write position without returning any data.

Referenced by `std::basic_filebuf<_CharT, _Traits>::overflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, and `std::basic_streambuf<char_type, traits_type>::sputc()`.

**pptr()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf<_CharT, _Traits>::pptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

Referenced by `std::basic_filebuf<_CharT, _Traits>::overflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, `std::basic_filebuf<_CharT, _Traits>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`, `std::basic_streambuf<char_type, traits_type>::seekoff()`, `std::basic_filebuf<_CharT, _Traits>::sync()`, `std::basic_filebuf<_CharT, _Traits>::xsputn()`, and `xsputn()`.

**pubimbue()**

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf<_CharT, _Traits>::pubimbue (
    const locale & __loc) [inline], [inherited]
```

Entry point for imbue().

## Parameters

|                    |                 |
|--------------------|-----------------|
| <code>__loc</code> | The new locale. |
|--------------------|-----------------|

## Returns

The previous locale.

Calls the derived `imbue(__loc)`.

**pubseekoff()**

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf<_CharT, _Traits>::pubseekoff (
    off_type __off,
    ios_base::seekdir __way,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

## Parameters

|                    |                                            |
|--------------------|--------------------------------------------|
| <code>__off</code> | Offset.                                    |
| <code>__way</code> | Value for <code>ios_base::seekdir</code> . |

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |
|---------------------|---------------------------------------------|

Calls virtual seekoff function.

### pubseekpos()

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
    pos_type __sp,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

#### Parameters

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__sp</code>   | Position                                    |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual seekpos function.

### pubsetbuf()

```
template<typename _CharT, typename _Traits>
basic_streambuf * std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

### pubsync()

```
template<typename _CharT, typename _Traits>
int std::basic_streambuf< _CharT, _Traits >::pubsync () [inline], [inherited]
```

Calls virtual sync function.

Referenced by `std::basic_istream< _CharT, _Traits >::sync()`.

### sbumpc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sbumpc () [inline], [inherited]
```

Getting the next character.

#### Returns

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.

Referenced by `std::basic_istream< _CharT, _Traits >::ignore()`, `std::basic_streambuf< char_type, traits_type >::snextc()`, and `std::basic_istream< _CharT, char_traits< _CharT > >::unget()`.

**seekoff()**

```
template<typename _CharT, typename _Traits>
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekoff (
    off_type ,
    ios_base::seekdir ,
    ios_base::openmode = ios_base::in | ios_base::out) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<char>`, `std::basic_filebuf<char_type, traits_type>`, `std::basic_filebuf<wchar_t>`, `std::basic_stringbuf<_CharT, _Traits>`, `std::basic_stringbuf<char>`, and `std::basic_stringbuf<wchar_t>`.

Referenced by `std::basic_streambuf<char_type, traits_type>::pubseekoff()`.

**seekpos()**

```
template<typename _CharT, typename _Traits>
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekpos (
    pos_type ,
    ios_base::openmode = ios_base::in | ios_base::out) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<char>`, `std::basic_filebuf<char_type, traits_type>`, `std::basic_filebuf<wchar_t>`, `std::basic_stringbuf<_CharT, _Traits>`, `std::basic_stringbuf<char>`, and `std::basic_stringbuf<wchar_t>`.

Referenced by `std::basic_streambuf<char_type, traits_type>::pubseekpos()`.

**setbuf()**

```
template<typename _CharT, typename _Traits>
virtual basic_streambuf< char_type, _Traits > * std::basic_streambuf< _CharT, _Traits >::setbuf
(
    char_type * ,
    streamsize ) [inline], [protected], [virtual], [inherited]
```

Manipulates the buffer.

Each derived class provides its own appropriate behavior. See the next-to-last paragraph of <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering> for more on this function.

**Note**

Base class version does nothing, returns `this`.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, `std::basic_filebuf<char>`, `std::basic_filebuf<char_type, traits_type>`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>`, and `std::basic_stringbuf<char>`.

Referenced by `std::basic_streambuf<char_type, traits_type>::pubsetbuf()`.

**setg()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setg (
    char_type * __gbeg,
    char_type * __gnext,
    char_type * __gend) [inline], [protected], [inherited]
```

Setting the three read area pointers.

**Parameters**

|                      |            |
|----------------------|------------|
| <code>__gbeg</code>  | A pointer. |
| <code>__gnext</code> | A pointer. |
| <code>__gend</code>  | A pointer. |

**Postcondition**

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

Referenced by `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert()`, `std::basic_filebuf< char_type, traits_type >::_M_create()`, `std::basic_filebuf< char_type, traits_type >::_M_destroy_pback()`, `std::basic_filebuf< char_type, traits_type >::_M_set_buffer()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos()`, and `std::basic_filebuf< _CharT, _Traits >::xsgetn()`.

**setp()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setp (
    char_type * __pbeg,
    char_type * __pend) [inline], [protected], [inherited]
```

Setting the three write area pointers.

**Parameters**

|                     |            |
|---------------------|------------|
| <code>__pbeg</code> | A pointer. |
| <code>__pend</code> | A pointer. |

**Postcondition**

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == epptr()`

Referenced by `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert()`, and `std::basic_filebuf< char_type, traits_type >::_M_s`

**sgetc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sgetc () [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

Referenced by `std::basic_istream< _CharT, _Traits >::get()`, `std::basic_istream< _CharT, _Traits >::get()`, `std::basic_istream< _CharT, _Traits >::get()`, `std::basic_istream< _CharT, char_traits< _CharT > >::readsome()`, and `std::basic_streambuf< char_type, traits_type >::snextc()`.

**sgetn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sgetn (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for `xsggetn`.

**Parameters**

|                  |                |
|------------------|----------------|
| <code>__s</code> | A buffer area. |
| <code>__n</code> | A count.       |

Returns `xsggetn(__s, __n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

**showmanyc()**

```
template<typename _CharT, typename _Traits>
virtual streamsize std::basic_streambuf<_CharT, _Traits>::showmanyc () [inline], [protected],
[virtual], [inherited]
Investigating the data available.
```

**Returns**

An estimate of the number of characters available in the input sequence, or -1.

*If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail.* [27.5.2.4.3]/1

**Note**

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to `underflow` or `uflow`] will not return `eof()` but that they will return immediately.*

The standard adds that *the morphemes of `showmanyc` are **es-how-many-see**, not **show-manic**.*

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, `std::basic_filebuf<char>`, `std::basic_filebuf<char_type, traits_type>`, `std::basic_filebuf<wchar_t>`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>`, `std::basic_stringbuf<char>`, and `std::basic_stringbuf<wchar_t>`.

Referenced by `std::basic_streambuf<char_type, traits_type>::in_avail()`.

**snextc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::snextc () [inline], [inherited]
Getting the next character.
```

**Returns**

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

Referenced by `std::basic_istream<_CharT, char_traits<_CharT>>::get()`, `std::basic_istream<char_type, traits_type>::ignore()`, and `std::basic_istream<_CharT, char_traits<_CharT>>::readsome()`.

**sputbackc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sputbackc (
    char_type __c) [inline], [inherited]
```

Pushing characters back into the input stream.

**Parameters**

|                  |                             |
|------------------|-----------------------------|
| <code>__c</code> | The character to push back. |
|------------------|-----------------------------|

**Returns**

The previous character, if possible.

Similar to `sungetc()`, but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

Referenced by `std::basic_istream< _CharT, _Traits >::putback()`.

**sputc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sputc (
    char_type __c) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__c</code> | A character to output. |
|------------------|------------------------|

**Returns**

`__c`, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores `__c` in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(__c)`.

Referenced by `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::overflow()`.

**sputn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::sputn (
    const char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|                  |                     |
|------------------|---------------------|
| <code>__s</code> | A buffer read area. |
| <code>__n</code> | A count.            |

---

One of two public output functions.

Returns `xspn(__s, __n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

### **sungetc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sungetc () [inline], [inherited]
```

Moving backwards in the input stream.

#### **Returns**

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbackfail()`. The effect is to *unget* the last character *gotten*.

Referenced by `std::basic_istream<_CharT, _Traits>::unget()`.

### **sync()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int __gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::sync () [inline], [protected],
[virtual]
```

Synchronizes the buffer arrays with the controlled sequences.

#### **Returns**

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

#### **Note**

Base class version does nothing, returns zero.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

### **uflow()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::uflow () [inline], [protected],
[virtual]
```

Fetches more data from the controlled sequence.

#### **Returns**

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

### **underflow()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::underflow () [inline], [protected],
[virtual]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

**xsggetn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::xsggetn (
    char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character extraction.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A buffer area.                          |
| <code>__n</code> | Maximum number of characters to assign. |

**Returns**

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, `std::basic_filebuf<char>`, and `std::basic_filebuf<char_type, traits_type>`.

References `egptr()`, `gptr()`, `std::min()`, and `uflow()`.

Referenced by `std::basic_streambuf<char_type, traits_type>::sgetn()`.

**xsputn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::xsputn (
    const char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character insertion.

**Parameters**

|                  |                                        |
|------------------|----------------------------------------|
| <code>__s</code> | A buffer area.                         |
| <code>__n</code> | Maximum number of characters to write. |

## Returns

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either *n* characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, `std::basic_filebuf<char>`, and `std::basic_filebuf<char_type, traits_type>`.

References `epptr()`, `std::min()`, `overflow()`, and `pptr()`.

Referenced by `std::basic_streambuf<char_type, traits_type>::sputn()`.

### `_M_buf_locale`

```
template<typename _CharT, typename _Traits>
```

```
locale std::basic_streambuf<_CharT, _Traits>::_M_buf_locale [protected], [inherited]
```

Current locale setting.

Referenced by `std::basic_filebuf<_CharT, _Traits>::basic_filebuf()`.

### `_M_in_beg`

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic_streambuf<_CharT, _Traits>::_M_in_beg [protected], [inherited]
```

Start of get area.

### `_M_in_cur`

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic_streambuf<_CharT, _Traits>::_M_in_cur [protected], [inherited]
```

Current read area.

### `_M_in_end`

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic_streambuf<_CharT, _Traits>::_M_in_end [protected], [inherited]
```

End of get area.

### `_M_out_beg`

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic_streambuf<_CharT, _Traits>::_M_out_beg [protected], [inherited]
```

Start of put area.

### `_M_out_cur`

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic_streambuf<_CharT, _Traits>::_M_out_cur [protected], [inherited]
```

Current put area.

### `_M_out_end`

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic_streambuf<_CharT, _Traits>::_M_out_end [protected], [inherited]
```

End of put area.

### 6.913.1 Detailed Description

`template<typename _RealType = double>  
class std::student_t_distribution<_RealType>`

A student\_t\_distribution random number distribution.

The formula for the normal probability mass function is:

$$p(x|n) = \frac{1}{\sqrt{(n\pi)}} \frac{\Gamma((n+1)/2)}{\Gamma(n/2)} \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2}$$

Since

C++11

### 6.913.2 Member Typedef Documentation

#### result\_type

`template<typename _RealType = double>  
typedef _RealType std::student_t_distribution<_RealType>::result_type`  
The type of the range of the distribution.

### 6.913.3 Member Function Documentation

#### max()

`template<typename _RealType = double>  
result_type std::student_t_distribution<_RealType>::max () const [inline]`  
Returns the least upper bound value of the distribution.

#### min()

`template<typename _RealType = double>  
result_type std::student_t_distribution<_RealType>::min () const [inline]`  
Returns the greatest lower bound value of the distribution.

**operator()()**

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::student_t_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

**param() [1/2]**

```
template<typename _RealType = double>
param_type std::student_t_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

**param() [2/2]**

```
template<typename _RealType = double>
void std::student_t_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _RealType = double>
void std::student_t_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

**6.913.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::student_t_distribution< _RealType1 > & __x) [friend]
```

Inserts a student\_t\_distribution random number distribution `__x` into the output stream `__os`.

**Parameters**

|                   |                                                      |
|-------------------|------------------------------------------------------|
| <code>__os</code> | An output stream.                                    |
| <code>__x</code>  | A student_t_distribution random number distribution. |

**Returns**

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _RealType = double>
bool operator== (
    const student_t_distribution< _RealType > & __d1,
    const student_t_distribution< _RealType > & __d2) [friend]
```

Return true if two Student t distributions have the same parameters and the sequences that would be generated are equal.

**operator>>**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::student_t_distribution< _RealType1 > & __x) [friend]
```

Extracts a student\_t\_distribution random number distribution \_\_x from the input stream \_\_is.

**Parameters**

|                   |                                                          |
|-------------------|----------------------------------------------------------|
| <code>__is</code> | An input stream.                                         |
| <code>__x</code>  | A student_t_distribution random number generator engine. |

**Returns**

The input stream with \_\_x extracted or in an error state.

The documentation for this class was generated from the following files:

### 6.914.1 Detailed Description

`template<typename _Bilter>`  
`class std::sub_match< _Bilter >`

A sequence of characters matched by a particular marked sub-expression.

An object of this class is essentially a pair of iterators marking a matched subexpression within a regular expression pattern match. Such objects can be converted to and compared with `std::basic_string` objects of the same character type as the pattern matched by the regular expression.

A `sub_match<Iter>` has a public base class of type `pair<Iter, Iter>`, so inherits `pair`'s data members named `first` and `second`. The iterators that make up the pair are the usual half-open interval referencing the actual original pattern matched.

Since

C++11

### 6.914.2 Member Function Documentation

#### compare() [1/3]

```
template<typename _BiIter>
int std::sub_match<_BiIter >::compare (
    const string_type & __s) const [inline]
```

Compares this sub\_match to a string.

##### Parameters

|                                                                                                    |                                        |
|----------------------------------------------------------------------------------------------------|----------------------------------------|
|  <code>__s</code> | A string to compare to this sub_match. |
|----------------------------------------------------------------------------------------------------|----------------------------------------|

##### Return values

|                 |                                                              |
|-----------------|--------------------------------------------------------------|
| <i>negative</i> | This matched sequence will collate before <code>__s</code> . |
| <i>zero</i>     | This matched sequence is equivalent to <code>__s</code> .    |
| <i>positive</i> | This matched sequence will collate after <code>__s</code> .  |

#### compare() [2/3]

```
template<typename _BiIter>
int std::sub_match<_BiIter >::compare (
    const sub_match<_BiIter > & __s) const [inline]
```

Compares this and another matched sequence.

##### Parameters

|                                                                                                      |                                                  |
|------------------------------------------------------------------------------------------------------|--------------------------------------------------|
|  <code>__s</code> | Another matched sequence to compare to this one. |
|------------------------------------------------------------------------------------------------------|--------------------------------------------------|

##### Return values

|                 |                                                              |
|-----------------|--------------------------------------------------------------|
| <i>negative</i> | This matched sequence will collate before <code>__s</code> . |
| <i>zero</i>     | This matched sequence is equivalent to <code>__s</code> .    |
| <i>positive</i> | This matched sequence will collate after <code>__s</code> .  |

Referenced by `std::sub_match<const char * >::operator==(,)`, and `std::sub_match<const char * >::operator==(,)`.

#### compare() [3/3]

```
template<typename _BiIter>
int std::sub_match<_BiIter >::compare (
    const value_type * __s) const [inline]
```

Compares this sub\_match to a string.

##### Parameters

|                                                                                                      |                                        |
|------------------------------------------------------------------------------------------------------|----------------------------------------|
|  <code>__s</code> | A string to compare to this sub_match. |
|------------------------------------------------------------------------------------------------------|----------------------------------------|

**Return values**

|                 |                                                |
|-----------------|------------------------------------------------|
| <i>negative</i> | This matched sequence will collate before __s. |
| <i>zero</i>     | This matched sequence is equivalent to __s.    |
| <i>positive</i> | This matched sequence will collate after __s.  |

**length()**

```
template<typename _BiIter>
difference_type std::sub_match< _BiIter >::length () const [inline], [noexcept]
Gets the length of the matching sequence.
```

**operator string\_type()**

```
template<typename _BiIter>
string_type std::sub_match< _BiIter >::operator string_type () const [inline]
Gets the matching sequence as a string.
```

**Returns**

the matching sequence as a string.

This is the implicit conversion operator. It is identical to the str() member function except that it will want to pop up in unexpected places and cause a great deal of confusion and cursing from the unwary.

**str()**

```
template<typename _BiIter>
string_type std::sub_match< _BiIter >::str () const [inline]
Gets the matching sequence as a string.
```

**Returns**

the matching sequence as a string.

Referenced by [std::sub\\_match< const char \\* >::operator string\\_type\(\)](#).

**swap()**

```
template<typename _BiIter>
void std::sub_match< _BiIter >::swap (
    sub_match< _BiIter > & __s) [inline], [noexcept]
```

Swap the values of two sub\_match objects.

The documentation for this class was generated from the following file:

- [regex.h](#)

#### 6.916.1 Detailed Description

**template<typename \_UIntType, size\_t \_\_w, size\_t \_\_s, size\_t \_\_r>**  
**class std::subtract\_with\_carry\_engine< \_UIntType, \_\_w, \_\_s, \_\_r >**

The Marsaglia-Zaman generator.

This is a model of a Generalized Fibonacci discrete random number generator, sometimes referred to as the SWC generator.

A discrete random number generator that produces pseudorandom numbers using:

$$x_i \leftarrow (x_{i-s} - x_{i-r} - carry_{i-1}) \bmod m$$

The size of the state is  $r$  and the maximum period of the generator is  $(m^r - m^s - 1)$ .

Since

C++11

#### 6.916.2 Member Typedef Documentation

##### result\_type

template<typename \_UIntType, size\_t \_\_w, size\_t \_\_s, size\_t \_\_r>  
 typedef \_UIntType [std::subtract\\_with\\_carry\\_engine](#)< \_UIntType, \_\_w, \_\_s, \_\_r >::result\_type  
 The type of the generated random value.

#### 6.916.3 Constructor & Destructor Documentation

##### subtract\_with\_carry\_engine() [1/2]

template<typename \_UIntType, size\_t \_\_w, size\_t \_\_s, size\_t \_\_r>  
[std::subtract\\_with\\_carry\\_engine](#)< \_UIntType, \_\_w, \_\_s, \_\_r >::subtract\_with\_carry\_engine (  
     [result\\_type](#) \_\_sd) [inline], [explicit]

Constructs an explicitly seeded subtract\_with\_carry\_engine random number generator.

**subtract\_with\_carry\_engine() [2/2]**

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::subtract_with_carry_engine (
    _Sseq & __q) [inline], [explicit]
```

Constructs a `subtract_with_carry_engine` random number engine seeded from the seed sequence `__q`.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__q</code> | the seed sequence. |
|------------------|--------------------|

**6.916.4 Member Function Documentation****discard()**

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
void std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::discard (
    unsigned long long __z) [inline]
```

Discard a sequence of random numbers.

**max()**

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
constexpr result_type std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::max () [inline],
[static], [constexpr]
```

Gets the inclusive maximum value of the range of random integers returned by this generator.

**min()**

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
constexpr result_type std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::min () [inline],
[static], [constexpr]
```

Gets the inclusive minimum value of the range of random integers returned by this generator.

**operator>()()**

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
subtract_with_carry_engine< _UIntType, __w, __s, __r >::result_type std::subtract_with_carry_engine<
    _UIntType, __w, __s, __r >::operator() ()
```

Gets the next random number in the sequence.

**seed() [1/2]**

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
template<typename _Sseq>
_If_seed_seq< _Sseq > std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::seed (
    _Sseq & __q)
```

Seeds the initial state  $x_0$  of the % `subtract_with_carry_engine` random number generator.

**seed()** [2/2]

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
void std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::seed (
    result_type __sd = 0u)
```

Seeds the initial state  $x_0$  of the random number generator.

N1688[4.19] modifies this as follows. If `__value == 0`, sets value to 19780503. In any case, with a linear congruential generator  $lcg(i)$  having parameters  $m_{lcg} = 2147483563$ ,  $a_{lcg} = 40014$ ,  $c_{lcg} = 0$ , and  $lcg(0) = value$ , sets  $x_{-r} \dots x_{-1}$  to  $lcg(1) \bmod m \dots lcg(r) \bmod m$  respectively. If  $x_{-1} = 0$  set carry to 1, otherwise sets carry to 0.

Referenced by `std::subtract_with_carry_engine< uint_fast32_t, 24, 10, 24 >::subtract_with_carry_engine()`, and `std::subtract_with_carry_engine< uint_fast32_t, 24, 10, 24 >::subtract_with_carry_engine()`.

**6.916.5 Friends And Related Symbol Documentation****operator<<**

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
template<typename _UIntType1, size_t __w1, size_t __s1, size_t __r1, typename _CharT, typename _Traits>
Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::subtract_with_carry_engine< _UIntType1, __w1, __s1, __r1 > & __x) [friend]
```

Inserts the current state of a % `subtract_with_carry_engine` random number generator engine `__x` into the output stream `__os`.

**Parameters**

|                   |                                                                             |
|-------------------|-----------------------------------------------------------------------------|
| <code>__os</code> | An output stream.                                                           |
| <code>__x</code>  | A % <code>subtract_with_carry_engine</code> random number generator engine. |

**Returns**

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
bool operator== (
    const subtract_with_carry_engine< _UIntType, __w, __s, __r > & __lhs,
    const subtract_with_carry_engine< _UIntType, __w, __s, __r > & __rhs) [friend]
```

Compares two % `subtract_with_carry_engine` random number generator objects of the same type for equality.

**Parameters**

|                    |                                                                                   |
|--------------------|-----------------------------------------------------------------------------------|
| <code>__lhs</code> | A % <code>subtract_with_carry_engine</code> random number generator object.       |
| <code>__rhs</code> | Another % <code>subtract_with_carry_engine</code> random number generator object. |

**Returns**

true if the infinite sequences of generated values would be equal, false otherwise.

**operator>>**

```

template<typename _UIntType, size_t __w, size_t __s, size_t __r>
template<typename _UIntType1, size_t __w1, size_t __s1, size_t __r1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::subtract_with_carry_engine< _UIntType1, __w1, __s1, __r1 > & __x) [friend]

```

Extracts the current state of a % subtract\_with\_carry\_engine random number generator engine \_\_x from the input stream \_\_is.

**Parameters**

|                   |                                                                |
|-------------------|----------------------------------------------------------------|
| <code>__is</code> | An input stream.                                               |
| <code>__x</code>  | A % subtract_with_carry_engine random number generator engine. |

**Returns**

The input stream with the state of \_\_x extracted or in an error state.

**6.917 \_\_gnu\_cxx::subtractive\_rng Class Reference**

```
#include <functional>
```

Inheritance diagram for \_\_gnu\_cxx::subtractive\_rng:

**Public Types**

- typedef unsigned int [argument\\_type](#)
- typedef unsigned int [result\\_type](#)

## Public Member Functions

- [subtractive\\_rng](#) ()
- [subtractive\\_rng](#) (unsigned int \_\_seed)
- void **\_M\_initialize** (unsigned int \_\_seed)
- unsigned int [operator\(\)](#) (unsigned int \_\_limit)

### 6.917.1 Detailed Description

The `subtractive_rng` class is documented on [SGI's site](#). Note that this code assumes that `int` is 32 bits.

### 6.917.2 Member Typedef Documentation

#### `argument_type`

typedef unsigned int [std::unary\\_function](#)< unsigned int, unsigned int >::argument\_type [inherited]  
`argument_type` is the type of the argument

#### `result_type`

typedef unsigned int [std::unary\\_function](#)< unsigned int, unsigned int >::result\_type [inherited]  
`result_type` is the return type

### 6.917.3 Constructor & Destructor Documentation

#### `subtractive_rng()` [1/2]

```
__gnu_cxx::subtractive_rng::subtractive_rng (
    unsigned int __seed) [inline]
```

Ctor allowing you to initialize the seed.

#### `subtractive_rng()` [2/2]

```
__gnu_cxx::subtractive_rng::subtractive_rng () [inline]
```

Default ctor; initializes its state with some number you don't see.

### 6.917.4 Member Function Documentation

#### `operator()()`

```
unsigned int __gnu_cxx::subtractive_rng::operator() (
    unsigned int __limit) [inline]
```

Returns a number less than the argument.

The documentation for this class was generated from the following file:

- [ext/functional](#)

- [size\\_type size](#) () const

## Protected Attributes

- struct std::\_Temporary\_buffer::\_Impl **\_M\_impl**
- [size\\_type \\_M\\_original\\_len](#)

### 6.922.1 Detailed Description

**template<class \_ForwardIterator, class \_Tp = typename std::iterator\_traits<\_ForwardIterator>::value\_type>**  
**struct \_\_gnu\_cxx::temporary\_buffer<\_ForwardIterator, \_Tp>**

This class provides similar behavior and semantics of the standard functions `get_temporary_buffer()` and `return_temporary_buffer()`, but encapsulated in a type vaguely resembling a standard container.

By default, a `temporary_buffer<Iter>` stores space for objects of whatever type the `Iter` iterator points to. It is constructed from a typical `[first,last)` range, and provides the `begin()`, `end()`, `size()` functions, as well as `requested_size()`. For non-trivial types, copies of `*first` will be used to initialize the storage.

`malloc` is used to obtain underlying storage.

Like `get_temporary_buffer()`, not all the requested memory may be available. Ideally, the created buffer will be large enough to hold a copy of `[first,last)`, but if `size()` is less than `requested_size()`, then this didn't happen.

### 6.922.2 Constructor & Destructor Documentation

#### `temporary_buffer()`

```
template<class _ForwardIterator, class _Tp = typename std::iterator_traits<_ForwardIterator>::value_type>
```

```
__gnu_cxx::temporary_buffer<_ForwardIterator, _Tp>::temporary_buffer (  

        _ForwardIterator __first,  

        _ForwardIterator __last) [inline]
```

Requests storage large enough to hold a copy of `[first,last)`.

References [std::\\_Temporary\\_buffer<\\_ForwardIterator, \\_Tp>::\\_Temporary\\_buffer\(\)](#), and [\\_\\_gnu\\_cxx::distance\(\)](#).

#### `~temporary_buffer()`

```
template<class _ForwardIterator, class _Tp = typename std::iterator_traits<_ForwardIterator>::value_type>
```

```
__gnu_cxx::temporary_buffer<_ForwardIterator, _Tp>::~~temporary_buffer () [inline]
```

Destroys objects and frees storage.

### 6.922.3 Member Function Documentation

#### `_M_requested_size()`

```
template<typename _ForwardIterator, typename _Tp>
size_type std::\_Temporary\_buffer< _ForwardIterator, _Tp >::_M_requested_size () const [inline],
[inherited]
```

Returns the size requested by the constructor; may be >size().

#### `begin()`

```
template<typename _ForwardIterator, typename _Tp>
iterator std::\_Temporary\_buffer< _ForwardIterator, _Tp >::begin () [inline], [inherited]
```

As per Table mumble.

Referenced by [\\_Temporary\\_buffer\(\)](#).

#### `end()`

```
template<typename _ForwardIterator, typename _Tp>
iterator std::\_Temporary\_buffer< _ForwardIterator, _Tp >::end () [inline], [inherited]
```

As per Table mumble.

Referenced by [\\_Temporary\\_buffer\(\)](#).

#### `size()`

```
template<typename _ForwardIterator, typename _Tp>
size_type std::\_Temporary\_buffer< _ForwardIterator, _Tp >::size () const [inline], [inherited]
```

As per Table mumble.

`thread (_Callable &&__f, _Args &&... __args)`
- `thread (const thread &)=delete`
- `thread (thread &&__t) noexcept`
- `void detach ()`
- `id get_id () const noexcept`
- `void join ()`
- `bool joinable () const noexcept`
- `native_handle_type native\_handle ()`
- `thread & operator= (const thread &)=delete`
- `thread & operator= (thread &&__t) noexcept`
- `void swap (thread &__t) noexcept`

### Static Public Member Functions

- static unsigned int [hardware\\_concurrency](#) () noexcept

### Related Symbols

(Note that these are not member symbols.)

- bool `operator==` ([thread::id](#) \_\_x, [thread::id](#) \_\_y) noexcept
- void `swap` ([thread](#) &\_\_x, [thread](#) &\_\_y) noexcept

#### 6.925.1 Detailed Description

A `std::thread` represents a new thread of execution.

The default constructor creates an object that does not own a thread. The `thread(F&&, Args&&...)` constructor invokes a callable in a new thread, and owns that new thread. A `std::thread` that owns a thread is *joinable*. Joining a thread waits for it to finish executing, which happens when the callable running in that thread returns.

A `std::thread` cannot be copied, but can be moved. Moving a joinable object transfers ownership of its thread to another object.

A joinable `std::thread` must be explicitly joined (or detached) before it is destroyed or assigned to. Attempting to destroy a joinable thread will terminate the whole process.

Since

C++11

## 6.925.2 Member Function Documentation

### native\_handle()

```
native_handle_type std::thread::native_handle () [inline]
```

#### Precondition

thread is joinable

### 6.933.1 Detailed Description

```
template<typename _CharT, typename _InIter>
class std::time_get< _CharT, _InIter >
```

Primary class template `time_get`.

This facet encapsulates the code to parse and return a date or time from a string. It is used by the istream numeric extraction operators.

The `time_get` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `time_get` facet.

### 6.933.2 Member Typedef Documentation

#### `char_type`

```
template<typename _CharT, typename _InIter>
typedef _CharT std::time_get< _CharT, _InIter >::char_type
Public typedefs.
```

#### `iter_type`

```
template<typename _CharT, typename _InIter>
typedef _InIter std::time_get< _CharT, _InIter >::iter_type
Public typedefs.
```

### 6.933.3 Constructor & Destructor Documentation

#### `time_get()`

```
template<typename _CharT, typename _InIter>
std::time_get< _CharT, _InIter >::time_get (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

#### Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

References [std::locale::facet::facet\(\)](#).

#### `~time_get()`

```
template<typename _CharT, typename _InIter>
virtual std::time_get< _CharT, _InIter >::~~time_get () [inline], [protected], [virtual]
Destructor.
```

### 6.933.4 Member Function Documentation

#### `date_order()`

```
template<typename _CharT, typename _InIter>
dateorder std::time_get< _CharT, _InIter >::date_order () const [inline]
Return preferred order of month, day, and year.
```

This function returns an enum from `time_base::dateorder` giving the preferred ordering if the format `x` given to `time_←put::put()` only uses month, day, and year. If the format `x` for the associated locale uses other fields, this function returns `time_base::dateorder::noorder`.

NOTE: The library always returns `noorder` at the moment.

#### Returns

A member of `time_base::dateorder`.

References [do\\_date\\_order\(\)](#).

#### do\_date\_order()

```
template<typename _CharT, typename _InIter>
_GLIBCXX_END_NAMESPACE_LDBL_OR_CXX11 time_base::dateorder std::time_get< _CharT, _InIter >::do_←
date_order () const [protected], [virtual]
```

Return preferred order of month, day, and year.

This function returns an enum from `time_base::dateorder` giving the preferred ordering if the format `x` given to `time_←put::put()` only uses month, day, and year. This function is a hook for derived classes to change the value returned.

#### Returns

A member of `time_base::dateorder`.

Referenced by [date\\_order\(\)](#).

#### do\_get()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get (
    iter_type __s,
    iter_type __end,
    ios_base & __f,
    ios_base::iostate & __err,
    tm * __tm,
    char __format,
    char __modifier) const [inline], [protected]
```

Parse input string according to format.

This function parses the string according to the provided format and optional modifier. This function is a hook for derived classes to change the value returned.

#### See also

[get\(\)](#) for more details.

#### Parameters

|                         |                                               |
|-------------------------|-----------------------------------------------|
| <code>__s</code>        | Start of string to parse.                     |
| <code>__end</code>      | End of string to parse.                       |
| <code>__f</code>        | Source of the locale.                         |
| <code>__err</code>      | Error flags to set.                           |
| <code>__tm</code>       | Pointer to struct <code>tm</code> to fill in. |
| <code>__format</code>   | Format specifier.                             |
| <code>__modifier</code> | Format modifier.                              |

**Returns**

Iterator to first char not parsed.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::goodbit](#), [std::use\\_facet\(\)](#), and [std::\\_\\_ctype\\_abstract\\_base<\\_](#)  
Referenced by [get\(\)](#), and [get\(\)](#).

**do\_get\_date()**

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_date (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [protected], [virtual]
```

Parse input date string.

This function parses a date according to the format *X* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

[get\\_date\(\)](#) for details.

**Parameters**

|                       |                                  |
|-----------------------|----------------------------------|
| <a href="#">__beg</a> | Start of string to parse.        |
| <a href="#">__end</a> | End of string to parse.          |
| <a href="#">__io</a>  | Source of the locale.            |
| <a href="#">__err</a> | Error flags to set.              |
| <a href="#">__tm</a>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond date string.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), and [std::use\\_facet\(\)](#).  
Referenced by [get\\_date\(\)](#).

**do\_get\_monthname()**

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_monthname (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [protected], [virtual]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

[get\\_monthname\(\)](#) for details.

## Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

## Returns

Iterator to first char beyond month name.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), and [std::use\\_facet\(\)](#).

Referenced by [get\\_monthname\(\)](#).

**do\_get\_time()**

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_time (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [protected], [virtual]
```

Parse input time string.

This function parses a time according to the format *x* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

## See also

[get\\_time\(\)](#) for details.

## Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

## Returns

Iterator to first char beyond time string.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), and [std::use\\_facet\(\)](#).

Referenced by [get\\_time\(\)](#).

**do\_get\_weekday()**

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_weekday (
    iter_type __beg,
```

```

iter_type __end,
ios_base & __io,
ios_base::iostate & __err,
tm * __tm) const [protected], [virtual]

```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

`get_weekday()` for details.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

#### Returns

Iterator to first char beyond weekday name.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), and [std::use\\_facet\(\)](#).

Referenced by [get\\_weekday\(\)](#).

#### do\_get\_year()

```

template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_year (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [protected], [virtual]

```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

`get_year()` for details.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond year.

References [std::ios\\_base::M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), [std::\\_\\_ctype\\_abstract\\_base< \\_](#) and [std::use\\_facet\(\)](#).

Referenced by [get\\_year\(\)](#).

**get()** [1/2]

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get (
    iter_type __s,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm,
    char __format,
    char __modifier = 0) const [inline]
```

Parse input string according to format.

This function calls `time_get::do_get` with the provided parameters.

**See also**

`do_get()` and `get()`.

**Parameters**

|                         |                                  |
|-------------------------|----------------------------------|
| <code>__s</code>        | Start of string to parse.        |
| <code>__end</code>      | End of string to parse.          |
| <code>__io</code>       | Source of the locale.            |
| <code>__err</code>      | Error flags to set.              |
| <code>__tm</code>       | Pointer to struct tm to fill in. |
| <code>__format</code>   | Format specifier.                |
| <code>__modifier</code> | Format modifier.                 |

**Returns**

Iterator to first char not parsed.

References [do\\_get\(\)](#).

**get()** [2/2]

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::get (
    iter_type __s,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm,
    const char_type * __fmt,
    const char_type * __fmtend) const [inline]
```

Parse input string according to format.

This function parses the input string according to a provided format string. It does the inverse of `time_put::put`. The format string follows the format specified for `strptime(3)/strptime(3)`. The actual parsing is done by `time_get::do_get`.

**Parameters**

|                       |                                  |
|-----------------------|----------------------------------|
| <code>__s</code>      | Start of string to parse.        |
| <code>__end</code>    | End of string to parse.          |
| <code>__io</code>     | Source of the locale.            |
| <code>__err</code>    | Error flags to set.              |
| <code>__tm</code>     | Pointer to struct tm to fill in. |
| <code>__fmt</code>    | Start of the format string.      |
| <code>__fmtend</code> | End of the format string.        |

**Returns**

Iterator to first char not parsed.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [do\\_get\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>::is\(\)](#), [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>::narrow\(\)](#), [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>::toupper\(\)](#), and [std::use\\_facet\(\)](#).

**get\_date()**

```
template<typename _CharT, typename _InIter>
iter_type std::time_get<_CharT, _InIter>::get_date (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline]
```

Parse input date string.

This function parses a date according to the format *x* and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_date()`.

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

**Parameters**

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond date string.

References [do\\_get\\_date\(\)](#).

**get\_monthname()**

```
template<typename _CharT, typename _InIter>
iter_type std::time_get<_CharT, _InIter>::get_monthname (
```

```

iter_type __beg,
iter_type __end,
ios_base & __io,
ios_base::iostate & __err,
tm * __tm) const [inline]

```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_monthname()`.

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

#### Returns

Iterator to first char beyond month name.

References [do\\_get\\_monthname\(\)](#).

#### get\_time()

```

template<typename _CharT, typename _InIter>
iter_type std::time_get<_CharT, _InIter>::get_time (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline]

```

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_time()`.

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond time string.

References [do\\_get\\_time\(\)](#).

**get\_weekday()**

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_weekday (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_weekday()`.

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

**Parameters**

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond weekday name.

References [do\\_get\\_weekday\(\)](#).

**get\_year()**

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_year (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_year()`.

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

## Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

## Returns

Iterator to first char beyond year.

References [do\\_get\\_year\(\)](#).

## 6.933.5 Member Data Documentation

**id**

```
template<typename _CharT, typename _InIter>
locale::id std::time_get<_CharT, _InIter>::id [static]
Numpunct facet id.

#### 6.934.1 Detailed Description

template<typename \_CharT, typename \_InIter>  
class std::time\_get\_byname< \_CharT, \_InIter >

class time\_get\_byname [22.2.5.2].

#### 6.934.2 Member Function Documentation

##### date\_order()

```
template<typename _CharT, typename _InIter>
date_order std::time_get< _CharT, _InIter >::date_order () const [inline], [inherited]
```

Return preferred order of month, day, and year.

This function returns an enum from time\_base::dateorder giving the preferred ordering if the format x given to time\_↵put::put() only uses month, day, and year. If the format x for the associated locale uses other fields, this function returns time\_base::dateorder::noorder.

NOTE: The library always returns noorder at the moment.

##### Returns

A member of time\_base::dateorder.

References [do\\_date\\_order\(\)](#).

##### do\_date\_order()

```
template<typename _CharT, typename _InIter>
_GLIBCXX_END_NAMESPACE_LDBL_OR_CXX11 time_base::date_order std::time_get< _CharT, _InIter >::do_↵
date_order () const [protected], [virtual], [inherited]
```

Return preferred order of month, day, and year.

This function returns an enum from time\_base::dateorder giving the preferred ordering if the format x given to time\_↵put::put() only uses month, day, and year. This function is a hook for derived classes to change the value returned.

##### Returns

A member of time\_base::dateorder.

Referenced by [date\\_order\(\)](#).

##### do\_get()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get (
    iter_type __s,
    iter_type __end,
    ios_base & __f,
    ios_base::iostate & __err,
    tm * __tm,
```

```
char __format,
char __modifier) const [inline], [protected], [inherited]
```

Parse input string according to format.

This function parses the string according to the provided format and optional modifier. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for more details.

#### Parameters

|                         |                                  |
|-------------------------|----------------------------------|
| <code>__s</code>        | Start of string to parse.        |
| <code>__end</code>      | End of string to parse.          |
| <code>__f</code>        | Source of the locale.            |
| <code>__err</code>      | Error flags to set.              |
| <code>__tm</code>       | Pointer to struct tm to fill in. |
| <code>__format</code>   | Format specifier.                |
| <code>__modifier</code> | Format modifier.                 |

#### Returns

Iterator to first char not parsed.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::goodbit](#), [std::use\\_facet\(\)](#), and [std::\\_\\_ctype\\_abstract\\_base<\\_CharT, \\_InIter>::do\\_get\\_date\(\)](#).  
Referenced by [get\(\)](#), and [get\(\)](#).

#### do\_get\_date()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_date (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [protected], [virtual], [inherited]
```

Parse input date string.

This function parses a date according to the format *X* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

[get\\_date\(\)](#) for details.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond date string.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), and [std::use\\_facet\(\)](#).

Referenced by [get\\_date\(\)](#).

**do\_get\_monthname()**

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_monthname (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [protected], [virtual], [inherited]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

[get\\_monthname\(\)](#) for details.

**Parameters**

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond month name.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), and [std::use\\_facet\(\)](#).

Referenced by [get\\_monthname\(\)](#).

**do\_get\_time()**

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_time (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [protected], [virtual], [inherited]
```

Parse input time string.

This function parses a time according to the format x and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

[get\\_time\(\)](#) for details.

**Parameters**

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond time string.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), and [std::use\\_facet\(\)](#).

Referenced by [get\\_time\(\)](#).

**do\_get\_weekday()**

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_weekday (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [protected], [virtual], [inherited]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

[get\\_weekday\(\)](#) for details.

**Parameters**

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond weekday name.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), and [std::use\\_facet\(\)](#).

Referenced by [get\\_weekday\(\)](#).

**do\_get\_year()**

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_year (
    iter_type __beg,
```

```

iter_type __end,
ios_base & __io,
ios_base::iostate & __err,
tm * __tm) const [protected], [virtual], [inherited]

```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

[get\\_year\(\)](#) for details.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

#### Returns

Iterator to first char beyond year.

References [std::ios\\_base::M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), [std::\\_\\_ctype\\_abstract\\_base<\\_CharT, \\_InIter>::use\\_facet\(\)](#).

Referenced by [get\\_year\(\)](#).

#### get() [1/2]

```

template<typename _CharT, typename _InIter>
iter_type std::time_get<_CharT, _InIter >::get (
    iter_type __s,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm,
    char __format,
    char __modifier = 0) const [inline], [inherited]

```

Parse input string according to format.

This function calls [time\\_get::do\\_get](#) with the provided parameters.

See also

[do\\_get\(\)](#) and [get\(\)](#).

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__s</code>   | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

|                         |                   |
|-------------------------|-------------------|
| <code>__format</code>   | Format specifier. |
| <code>__modifier</code> | Format modifier.  |

#### Returns

Iterator to first char not parsed.

References [do\\_get\(\)](#).

#### get() [2/2]

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::get (
    iter_type __s,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm,
    const char_type * __fmt,
    const char_type * __fmtend) const [inline], [inherited]
```

Parse input string according to format.

This function parses the input string according to a provided format string. It does the inverse of `time_put::put`. The format string follows the format specified for `strptime(3)/strptime(3)`. The actual parsing is done by `time_get::do_get`.

#### Parameters

|                       |                                  |
|-----------------------|----------------------------------|
| <code>__s</code>      | Start of string to parse.        |
| <code>__end</code>    | End of string to parse.          |
| <code>__io</code>     | Source of the locale.            |
| <code>__err</code>    | Error flags to set.              |
| <code>__tm</code>     | Pointer to struct tm to fill in. |
| <code>__fmt</code>    | Start of the format string.      |
| <code>__fmtend</code> | End of the format string.        |

#### Returns

Iterator to first char not parsed.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [do\\_get\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >::is\(\)](#), [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >::narrow\(\)](#), [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >::toupper\(\)](#), and [std::use\\_facet\(\)](#).

#### get\_date()

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_date (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline], [inherited]
```

Parse input date string.

This function parses a date according to the format *x* and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_date()`.

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

#### Parameters

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__beg</code> | Start of string to parse.               |
| <code>__end</code> | End of string to parse.                 |
| <code>__io</code>  | Source of the locale.                   |
| <code>__err</code> | Error flags to set.                     |
| <code>__tm</code>  | Pointer to struct <i>tm</i> to fill in. |

#### Returns

Iterator to first char beyond date string.

References [do\\_get\\_date\(\)](#).

#### get\_monthname()

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_monthname (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline], [inherited]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_monthname()`.

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

#### Parameters

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__beg</code> | Start of string to parse.               |
| <code>__end</code> | End of string to parse.                 |
| <code>__io</code>  | Source of the locale.                   |
| <code>__err</code> | Error flags to set.                     |
| <code>__tm</code>  | Pointer to struct <i>tm</i> to fill in. |

#### Returns

Iterator to first char beyond month name.

References [do\\_get\\_monthname\(\)](#).

**get\_time()**

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_time (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline], [inherited]
```

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_time()`.

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

**Parameters**

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__beg</code> | Start of string to parse.               |
| <code>__end</code> | End of string to parse.                 |
| <code>__io</code>  | Source of the locale.                   |
| <code>__err</code> | Error flags to set.                     |
| <code>__tm</code>  | Pointer to struct <i>tm</i> to fill in. |

**Returns**

Iterator to first char beyond time string.

References [do\\_get\\_time\(\)](#).

**get\_weekday()**

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_weekday (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline], [inherited]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_weekday()`.

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

**Parameters**

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__beg</code> | Start of string to parse.               |
| <code>__end</code> | End of string to parse.                 |
| <code>__io</code>  | Source of the locale.                   |
| <code>__err</code> | Error flags to set.                     |
| <code>__tm</code>  | Pointer to struct <i>tm</i> to fill in. |

---

**Returns**

Iterator to first char beyond weekday name.

References [do\\_get\\_weekday\(\)](#).

**get\_year()**

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_year (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline], [inherited]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling time\_get::do\_get\_year().

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, err |= ios\_base::failbit. If parsing reads all the characters, err |= ios\_base::eofbit.

**Parameters**

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond year.

References [do\\_get\\_year\(\)](#).

### 6.936.1 Detailed Description

```
template<typename _CharT, typename _OutIter>
class std::time_put< _CharT, _OutIter >
```

Primary class template time\_put.

This facet encapsulates the code to format and output dates and times according to formats used by strftime().

The time\_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the time\_put facet.

### 6.936.2 Member Typedef Documentation

#### char\_type

```
template<typename _CharT, typename _OutIter>
typedef _CharT std::time_put< _CharT, _OutIter >::char_type
Public typedefs.
```

#### iter\_type

```
template<typename _CharT, typename _OutIter>
typedef _OutIter std::time_put< _CharT, _OutIter >::iter_type
Public typedefs.
```

### 6.936.3 Constructor & Destructor Documentation

#### time\_put()

```
template<typename _CharT, typename _OutIter>
std::time_put< _CharT, _OutIter >::time_put (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

#### Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

References [std::locale::facet::facet\(\)](#).

#### ~time\_put()

```
template<typename _CharT, typename _OutIter>
virtual std::time_put< _CharT, _OutIter >::~~time_put () [inline], [protected], [virtual]
Destructor.
```

### 6.936.4 Member Function Documentation

#### do\_put()

```
template<typename _CharT, typename _OutIter>
_OutIter std::time_put< _CharT, _OutIter >::do_put (
```

```

iter_type __s,
ios_base & __io,
char_type __fill,
const tm * __tm,
char __format,
char __mod) const [protected], [virtual]

```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

See also

[put\(\)](#) for more details.

#### Parameters

|                       |                                              |
|-----------------------|----------------------------------------------|
| <code>__s</code>      | The stream to write to.                      |
| <code>__io</code>     | Source of locale.                            |
| <code>__fill</code>   | <code>char_type</code> to use for padding.   |
| <code>__tm</code>     | Struct tm with date and time info to format. |
| <code>__format</code> | Format char.                                 |
| <code>__mod</code>    | Optional modifier char.                      |

#### Returns

Iterator after writing.

References [std::ios\\_base::M\\_getloc\(\)](#), [std::use\\_facet\(\)](#), and [std::\\_\\_ctype\\_abstract\\_base<\\_CharT >::widen\(\)](#).

Referenced by [put\(\)](#), and [put\(\)](#).

#### put() [1/2]

```

template<typename _CharT, typename _OutIter>
iter_type std::time_put<_CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    char __format,
    char __mod = 0) const [inline]

```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. The format and modifier are interpreted as by [strftime\(\)](#). It does so by returning [time\\_put::do\\_put\(\)](#).

#### Parameters

|                       |                                              |
|-----------------------|----------------------------------------------|
| <code>__s</code>      | The stream to write to.                      |
| <code>__io</code>     | Source of locale.                            |
| <code>__fill</code>   | <code>char_type</code> to use for padding.   |
| <code>__tm</code>     | Struct tm with date and time info to format. |
| <code>__format</code> | Format char.                                 |
| <code>__mod</code>    | Optional modifier char.                      |

**Returns**

Iterator after writing.

References [do\\_put\(\)](#).

**put()** [2/2]

```
template<typename _CharT, typename _OutIter>
_OutIter std::time_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    const _CharT * __beg,
    const _CharT * __end) const
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format string. The format string is interpreted as by strftime().

**Parameters**

|                     |                                              |
|---------------------|----------------------------------------------|
| <code>__s</code>    | The stream to write to.                      |
| <code>__io</code>   | Source of locale.                            |
| <code>__fill</code> | char_type to use for padding.                |
| <code>__tm</code>   | Struct tm with date and time info to format. |
| <code>__beg</code>  | Start of format string.                      |
| <code>__end</code>  | End of format string.                        |

**Returns**

Iterator after writing.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [do\\_put\(\)](#), [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >::narrow\(\)](#), and [std::use\\_facet\(\)](#).

### 6.937.1 Detailed Description

```
template<typename _CharT, typename _OutIter>
class std::time_put_byname< _CharT, _OutIter >
```

class time\_put\_byname [22.2.5.4].

### 6.937.2 Member Function Documentation

#### do\_put()

```
template<typename _CharT, typename _OutIter>
_OutIter std::time_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    char __format,
    char __mod) const [protected], [virtual], [inherited]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

See also

put() for more details.

#### Parameters

|                       |                                              |
|-----------------------|----------------------------------------------|
| <code>__s</code>      | The stream to write to.                      |
| <code>__io</code>     | Source of locale.                            |
| <code>__fill</code>   | char_type to use for padding.                |
| <code>__tm</code>     | Struct tm with date and time info to format. |
| <code>__format</code> | Format char.                                 |
| <code>__mod</code>    | Optional modifier char.                      |

#### Returns

Iterator after writing.

References [std::ios\\_base::M\\_getloc\(\)](#), [std::use\\_facet\(\)](#), and [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>::widen\(\)](#).

Referenced by [put\(\)](#), and [put\(\)](#).

#### put() [1/2]

```
template<typename _CharT, typename _OutIter>
iter_type std::time_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    char __format,
    char __mod = 0) const [inline], [inherited]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. The format and modifier are interpreted as by [strftime\(\)](#). It does so by returning [time\\_put::do\\_put\(\)](#).

## Parameters

|                       |                                                           |
|-----------------------|-----------------------------------------------------------|
| <code>__s</code>      | The stream to write to.                                   |
| <code>__io</code>     | Source of locale.                                         |
| <code>__fill</code>   | <code>char_type</code> to use for padding.                |
| <code>__tm</code>     | Struct <code>tm</code> with date and time info to format. |
| <code>__format</code> | Format char.                                              |
| <code>__mod</code>    | Optional modifier char.                                   |

## Returns

Iterator after writing.

References [do\\_put\(\)](#).

**put()** [2/2]

```
template<typename _CharT, typename _OutIter>
_OutIter std::time_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    const _CharT * __beg,
    const _CharT * __end) const [inherited]
```

Format and output a time or date.

This function formats the data in struct `tm` according to the provided format string. The format string is interpreted as by `strftime()`.

## Parameters

|                     |                                                           |
|---------------------|-----------------------------------------------------------|
| <code>__s</code>    | The stream to write to.                                   |
| <code>__io</code>   | Source of locale.                                         |
| <code>__fill</code> | <code>char_type</code> to use for padding.                |
| <code>__tm</code>   | Struct <code>tm</code> with date and time info to format. |
| <code>__beg</code>  | Start of format string.                                   |
| <code>__end</code>  | End of format string.                                     |

## Returns

Iterator after writing.

References [std::ios\\_base::M\\_getloc\(\)](#), [do\\_put\(\)](#), [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >::narrow\(\)](#), and [std::use\\_facet\(\)](#).

**6.937.3 Member Data Documentation****id**

```
template<typename _CharT, typename _OutIter>
locale::id std::time_put< _CharT, _OutIter >::id [static], [inherited]
```

Numpunct facet id.

The documentation for this class was generated from the following file:

## 6.938 `std::timed_mutex` Class Reference

```
#include <mutex>
```

### Public Types

- typedef `__native_type *` `native_handle_type`

### Public Member Functions

- `timed_mutex` (const `timed_mutex` &)=delete
- void `lock` ()
- `native_handle_type` `native_handle` () noexcept
- `timed_mutex` & `operator=` (const `timed_mutex` &)=delete
- bool `try_lock` () noexcept
- template<class `_Rep`, class `_Period`>  
bool `try_lock_for` (const `chrono::duration`< `_Rep`, `_Period` > &\_\_rtime)
- template<class `_Clock`, class `_Duration`>  
bool `try_lock_until` (const `chrono::time_point`< `_Clock`, `_Duration` > &\_\_atime)
- void `unlock` ()

### Friends

- class `__timed_mutex_impl`< `timed_mutex` >

#### 6.938.1 Detailed Description

The standard timed mutex type.

A non-recursive mutex that supports a timeout when trying to acquire the lock.

Since

C++11

The documentation for this class was generated from the following file:

- [mutex](#)

## 6.939 `std::to_chars_result` Struct Reference

```
#include <charconv>
```

### Public Attributes

- `errc` `ec`
- `char *` `ptr`

### Friends

- bool `operator==` (const `to_chars_result` &, const `to_chars_result` &)=default

#### 6.939.1 Detailed Description

Result type of `std::to_chars`.

The documentation for this struct was generated from the following file:

- [charconv](#)

## 6.940 `std::chrono::treat_as_floating_point<_Rep>` Struct Template Reference

```
#include <chrono.h>
```

Inheritance diagram for `std::chrono::treat_as_floating_point<_Rep>`:

### 6.940.1 Detailed Description

```
template<typename _Rep>  
struct std::chrono::treat_as_floating_point<_Rep>
```

Trait indicating whether to treat a type as a floating-point type.

The chrono library uses this trait to tell whether a `duration` can represent fractional values of the given precision, or only integral values.

You should specialize this trait for your own numeric types that are used with `duration` and can represent non-integral values.

Since

C++11

The documentation for this struct was generated from the following file:

- [chrono.h](#)

## 6.941 `__gnu_pbds::tree<Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc>` Class Template Reference

```
#include <assoc_container.hpp>
```

Inheritance diagram for `__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >`:

## Public Types

- typedef Cmp\_Fn [cmp\\_fn](#)
- typedef Node\_Update **node\_update**

## Public Member Functions

- [tree](#) (const [cmp\\_fn](#) &c)
- **tree** (const [tree](#) &other)
- template<typename It>  
[tree](#) (It first, It last)
- template<typename It>  
[tree](#) (It first, It last, const [cmp\\_fn](#) &c)
- [tree](#) & **operator=** (const [tree](#) &other)
- void **swap** ([tree](#) &other)

### 6.941.1 Detailed Description

```

template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_
tree_tag, template< typename Node_Cltr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class
Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
class __gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >

```

A tree-based container.

## Template Parameters

|                    |                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>Key</i>         | Key type.                                                                                                                             |
| <i>Mapped</i>      | Map type.                                                                                                                             |
| <i>Cmp_Fn</i>      | Comparison functor.                                                                                                                   |
| <i>Tag</i>         | Instantiating data structure type, see <code>container_tag</code> .                                                                   |
| <i>Node_Update</i> | Updates tree internal-nodes, restores invariants when invalidated. XXX See <code>design::tree-based-containersnode</code> invariants. |
| <i>_Alloc</i>      | Allocator type.                                                                                                                       |

Base tag choices are: `ov_tree_tag`, `rb_tree_tag`, `splay_tree_tag`.

Base is `basic_branch`.

## 6.941.2 Member Typedef Documentation

**cmp\_fn**

```
template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_
tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
typedef Cmp_Fn __gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::cmp_fn
Comparison functor type.
```

## 6.941.3 Constructor &amp; Destructor Documentation

**tree()** [1/3]

```
template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_
tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
    const cmp_fn & c) [inline]
```

Constructor taking some policy objects. `r_cmp_fn` will be copied by the `Cmp_Fn` object of the container object.

**tree()** [2/3]

```
template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_
tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
    It first,
    It last) [inline]
```

Constructor taking `__iterators` to a range of `value_types`. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

**tree()** [3/3]

```
template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_
tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
    It first,
```

```
    It last,  
    const cmp_fn & c) [inline]
```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and `last_it` will be inserted into the container object. `r_cmp_fn` will be copied by the `cmp_fn` object of the container object. The documentation for this class was generated from the following file:

- [assoc\\_container.hpp](#)

## 6.942 `__gnu_pbds::detail::tree_metadata_helper< Node_Update, _BTp >` Struct Template Reference

### 6.942.1 Detailed Description

```
template<typename Node_Update, bool _BTp>  
struct __gnu_pbds::detail::tree_metadata_helper< Node_Update, _BTp >
```

Tree metadata helper.

The documentation for this struct was generated from the following file:

- [tree\\_policy/node\\_metadata\\_selector.hpp](#)

## 6.943 `__gnu_pbds::detail::tree_metadata_helper< Node_Update, false >` Struct Template Reference

```
#include <node_metadata_selector.hpp>
```

### Public Types

- typedef `Node_Update::metadata_type` **type**

### 6.943.1 Detailed Description

```
template<typename Node_Update>  
struct __gnu_pbds::detail::tree_metadata_helper< Node_Update, false >
```

Specialization, false.

The documentation for this struct was generated from the following file:

- [tree\\_policy/node\\_metadata\\_selector.hpp](#)

## 6.944 `__gnu_pbds::detail::tree_metadata_helper< Node_Update, true >` Struct Template Reference

```
#include <node_metadata_selector.hpp>
```

### Public Types

- typedef `null_type` **type**

### 6.944.1 Detailed Description

```
template<typename Node_Update>  
struct __gnu_pbds::detail::tree_metadata_helper< Node_Update, true >
```

Specialization, true.

The documentation for this struct was generated from the following file:

- [tree\\_policy/node\\_metadata\\_selector.hpp](#)

## 6.945 `__gnu_pbds::detail::tree_node_metadata_dispatch< Key, Data, Cmp_Fn, Node_Update, _Alloc >` Struct Template Reference

```
#include <node_metadata_selector.hpp>
```

### Public Types

- typedef `tree_metadata_helper< __node_u, null_update >::type` **type**

#### 6.945.1 Detailed Description

```
template<typename Key, typename Data, typename Cmp_Fn, template< typename Node_Cltr, typename  
Const_Iterator, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>  
struct __gnu_pbds::detail::tree_node_metadata_dispatch< Key, Data, Cmp_Fn, Node_Update, _Alloc >
```

Tree node metadata dispatch.

The documentation for this struct was generated from the following file:

- [tree\\_policy/node\\_metadata\\_selector.hpp](#)

## 6.946 `__gnu_pbds::tree_order_statistics_node_update< Node_Cltr, Node_Itr, Cmp_Fn, _Alloc >` Class Template Reference

```
#include <tree_policy.hpp>
```

Inheritance diagram for `__gnu_pbds::tree_order_statistics_node_update< Node_Cltr, Node_Itr, Cmp_Fn, _Alloc >`:

### Public Types

- typedef `_Alloc` **allocator\_type**
- typedef `Cmp_Fn` **cmp\_fn**
- typedef `node_const_iterator::value_type` **const\_iterator**
- typedef `node_iterator::value_type` **iterator**
- typedef `base_type::key_const_reference` **key\_const\_reference**
- typedef `base_type::key_type` **key\_type**

- typedef size\_type **metadata\_type**
- typedef Node\_CItr **node\_const\_iterator**
- typedef Node\_Itr **node\_iterator**
- typedef allocator\_type::size\_type **size\_type**

### Public Member Functions

- iterator [find\\_by\\_order](#) (size\_type)
- const\_iterator [find\\_by\\_order](#) (size\_type) const
- size\_type [order\\_of\\_key](#) (key\_const\_reference) const

### Protected Member Functions

- void [operator\(\)](#) (node\_iterator, node\_const\_iterator) const

## 6.946.1 Detailed Description

template<typename Node\_CItr, typename Node\_Itr, typename Cmp\_Fn, typename \_Alloc>  
class [\\_\\_gnu\\_pbds::tree\\_order\\_statistics\\_node\\_update](#)< Node\_CItr, Node\_Itr, Cmp\_Fn, \_Alloc >

Functor updating ranks of entrees.

## 6.946.2 Member Function Documentation

### [find\\_by\\_order\(\)](#) [1/2]

```
template<typename Node_CItr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>
tree\_order\_statistics\_node\_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::iterator \_\_gnu\_pbds::tree\_order\_statist
Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::find_by_order (
    size_type order) [inline]
```

Finds an entry by `__order`. Returns an iterator to the entry with the `__order` order, or an iterator to the container object's end if order is at least the size of the container object.

### [find\\_by\\_order\(\)](#) [2/2]

```
template<typename Node_CItr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>
tree\_order\_statistics\_node\_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::const_iterator \_\_gnu\_pbds::tree\_order\_s
Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::find_by_order (
    size_type order) const [inline]
```

Finds an entry by `__order`. Returns a const\_iterator to the entry with the `__order` order, or a const\_iterator to the container object's end if order is at least the size of the container object.

### [operator\(\)\(\)](#)

```
template<typename Node_CItr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>
void \_\_gnu\_pbds::tree\_order\_statistics\_node\_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::operator()
(
    node_iterator node_it,
    node_const_iterator end_nd_it) const [inline], [protected]
```

Updates the rank of a node through a node\_iterator `node_it`; `end_nd_it` is the end node iterator.

### [order\\_of\\_key\(\)](#)

```
template<typename Node_CItr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>
tree\_order\_statistics\_node\_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::size_type \_\_gnu\_pbds::tree\_order\_statist
```

```
Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >::order_of_key (
    key_const_reference r_key) const [inline]
```

Returns the order of a key within a sequence. For example, if `r_key` is the smallest key, this method will return 0; if `r_key` is a key between the smallest and next key, this method will return 1; if `r_key` is a key larger than the largest key, this method will return the size of `r_c`.

### 6.955.1 Detailed Description

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_Cltr, typename Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>>
```

```
class __gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >
```

A trie-based container.

## Template Parameters

|                    |                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------|
| <i>Key</i>         | Key type.                                                                                                                |
| <i>Mapped</i>      | Map type.                                                                                                                |
| <i>_ATraits</i>    | Element access traits.                                                                                                   |
| <i>Tag</i>         | Instantiating data structure type, see container_tag.                                                                    |
| <i>Node_Update</i> | Updates trie internal-nodes, restores invariants when invalidated. XXX See design::tree-based-containersnode invariants. |
| <i>_Alloc</i>      | Allocator type.                                                                                                          |

Base tag choice is pat\_trie\_tag.

Base is basic\_branch.

## 6.955.2 Member Typedef Documentation

## access\_traits

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename Node_CItr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
typedef _ATraits __gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::access_traits
```

Element access traits type.

## 6.955.3 Constructor &amp; Destructor Documentation

## trie() [1/3]

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename Node_CItr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
    const access_traits & t) [inline]
```

Constructor taking some policy objects. r\_access\_traits will be copied by the \_ATraits object of the container object.

## trie() [2/3]

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename Node_CItr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
    It first,
    It last) [inline]
```

Constructor taking \_\_iterators to a range of value\_types. The value\_types between first\_it and last\_it will be inserted into the container object.

## trie() [3/3]

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename Node_CItr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc
```

```

= std::allocator<char>>
template<typename It>
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
    It first,
    It last,
    const access_traits & t) [inline]

```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

The documentation for this class was generated from the following file:

- [assoc\\_container.hpp](#)

## 6.956 `__gnu_pbds::detail::trie_metadata_helper< Node_Update, _BTp >` Struct Template Reference

### 6.956.1 Detailed Description

```

template<typename Node_Update, bool _BTp>
struct __gnu_pbds::detail::trie_metadata_helper< Node_Update, _BTp >

```

Trie metadata helper.

### 6.960.1 Detailed Description

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::trie_order_statistics_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >
```

Functor updating ranks of entrees.

### 6.960.2 Member Function Documentation

#### [find\\_by\\_order\(\)](#) [1/2]

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
trie\_order\_statistics\_node\_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::iterator \_\_gnu\_pbds::trie\_order\_stat
Node_CIttr, Node_Itr, _ATraits, _Alloc >::find_by_order (
    size_type order) [inline]
```

Finds an entry by `__order`. Returns an iterator to the entry with the `__order` order, or an iterator to the container object's end if order is at least the size of the container object.

#### [find\\_by\\_order\(\)](#) [2/2]

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
trie\_order\_statistics\_node\_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::const_iterator \_\_gnu\_pbds::trie\_order
Node_CIttr, Node_Itr, _ATraits, _Alloc >::find_by_order (
    size_type order) const [inline]
```

Finds an entry by `__order`. Returns a `const_iterator` to the entry with the `__order` order, or a `const_iterator` to the container object's end if order is at least the size of the container object.

#### [operator>\(\)\(\)](#)

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
void \_\_gnu\_pbds::trie\_order\_statistics\_node\_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >↵
::operator() (
    node_iterator nd_it,
    node_const_iterator ) const [inline], [protected]
```

Updates the rank of a node through a `node_iterator` `nd_it`; `end_nd_it` is the end node iterator.

#### [order\\_of\\_key\(\)](#)

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
trie\_order\_statistics\_node\_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::size_type \_\_gnu\_pbds::trie\_order\_stat
Node_CIttr, Node_Itr, _ATraits, _Alloc >::order_of_key (
    key_const_reference r_key) const [inline]
```

Returns the order of a key within a sequence. For exapmle, if `r_key` is the smallest key, this method will return 0; if `r_key` is a key between the smallest and next key, this method will return 1; if `r_key` is a key larger than the largest key, this method will return the size of `r_c`.

**order\_of\_prefix()**

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::size_type __gnu_pbds::trie_order_statistics_node_update<
Node_CItr, Node_Itr, _ATraits, _Alloc >::order_of_prefix (
    a_const_iterator b,
    a_const_iterator e) const [inline]
```

Returns the order of a prefix within a sequence. For example, if [b, e) is the smallest prefix, this method will return 0; if r\_key is a key between the smallest and next key, this method will return 1; if r\_key is a key larger than the largest key, this method will return the size of r\_c.

The documentation for this class was generated from the following file:

### 6.962.1 Detailed Description

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::trie_prefix_search_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >
```

A node updatator that allows tries to be searched for the range of values that match a certain prefix.

### 6.962.2 Member Typedef Documentation

#### **a\_const\_iterator**

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
typedef access_traits::const_iterator __gnu_pbds::trie_prefix_search_node_update< Node_CIttr,
Node_Itr, _ATraits, _Alloc >::a_const_iterator
Const element iterator.
```

#### **access\_traits**

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
typedef _ATraits __gnu_pbds::trie_prefix_search_node_update< Node_CIttr, Node_Itr, _ATraits, _↵
Alloc >::access_traits
Element access traits.
```

#### **allocator\_type**

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
typedef _Alloc __gnu_pbds::trie_prefix_search_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc
>::allocator_type
_Alloc type.
```

#### **size\_type**

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
typedef allocator_type::size_type __gnu_pbds::trie_prefix_search_node_update< Node_CIttr, Node_↵
Itr, _ATraits, _Alloc >::size_type
Size type.
```

### 6.962.3 Member Function Documentation

#### **operator>()**

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
void __gnu_pbds::trie_prefix_search_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::operator()
(
    node_iterator node_it,
    node_const_iterator end_nd_it) const [inline], [protected]
```

Called to update a node's metadata.

#### **prefix\_range()** [1/4]

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
std::pair< typename trie_prefix_search_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >↵
::iterator, typename trie_prefix_search_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >↵
```

```
::iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc  
>::prefix_range (
    a_const_iterator b,
    a_const_iterator e)
```

Finds the iterator range corresponding to all values whose prefixes match [b, e).

#### **prefix\_range()** [2/4]

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
std::pair< typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >↵
::const_iterator, typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc  
>::const_iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, ↵
_Alloc >::prefix_range (
    a_const_iterator b,
    a_const_iterator e) const
```

Finds the const iterator range corresponding to all values whose prefixes match [b, e).

#### **prefix\_range()** [3/4]

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
std::pair< typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >↵
::iterator, typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >↵
::iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc  
>::prefix_range (
    key_const_reference r_key)
```

Finds the iterator range corresponding to all values whose prefixes match r\_key.

#### **prefix\_range()** [4/4]

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
std::pair< typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >↵
::const_iterator, typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc  
>::const_iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, ↵
_Alloc >::prefix_range (
    key_const_reference r_key) const
```

Finds the const iterator range corresponding to all values whose prefixes match r\_key.

The documentation for this class was generated from the following file:

- [trie\\_policy.hpp](#)

## 6.963 `__gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc > Struct` Template Reference

```
#include <trie_policy.hpp>
```

### Public Types

typedef std::iterator\_traits<const\_iterator>::value_type __gnu_pbds::trie_string_access_traits<
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::e_type
```

Element type.

### 6.963.3 Member Function Documentation

#### [begin\(\)](#)

```
template<typename String, typename String::value_type Min_E_Val, typename String::value_type Max↵
_E_Val, bool Reverse, typename _Alloc>
trie\_string\_access\_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::const_iterator __gnu_pbds::trie_strin
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::begin (
    key_const_reference r_key) [inline], [static]
```

Returns a `const_iterator` to the first element of `key_const_reference` argument.

### e\_pos()

```
template<typename String, typename String::value_type Min_E_Val, typename String::value_type Max←
_E_Val, bool Reverse, typename _Alloc>
trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::size_type __gnu_pbds::trie_string_ac
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::e_pos (
    e_type e) [inline], [static]
```

Maps an element to a position.

### end()

```
template<typename String, typename String::value_type Min_E_Val, typename String::value_type Max←
_E_Val, bool Reverse, typename _Alloc>
trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::const_iterator __gnu_pbds::trie_strin
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::end (
    key_const_reference r_key) [inline], [static]
```

Returns a `const_iterator` to the after-last element of `key_const_reference` argument.

The documentation for this struct was generated from the following file:

- [trie\\_policy.hpp](#)

## 6.964 \_\_gnu\_pbds::trie\_tag Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for `__gnu_pbds::trie_tag`:

#### 6.964.1 Detailed Description

Basic trie structure.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

### 6.965 `__gnu_pbds::detail::trie_traits< Key, Data, _ATraits, Node_Update, Tag, _Alloc >` Struct Template Reference

#### 6.965.1 Detailed Description

```
template<typename Key, typename Data, typename _ATraits, template< typename Node_Cltr, typename
Node_Itr, typename _ATraits_, typename _Alloc > class Node_Update, typename Tag, typename _Alloc>
struct __gnu_pbds::detail::trie_traits< Key, Data, _ATraits, Node_Update, Tag, _Alloc >
```

Trie traits class, primary template.

The documentation for this struct was generated from the following file:

- [branch\\_policy/traits.hpp](#)

## 6.966 `__gnu_pbds::detail::trie_traits< Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc > Struct` Template Reference

```
#include <traits.hpp>
```

### Public Types

- typedef `base_type::Iter< node, leaf, head, inode, false >` **reverse\_iterator**
- typedef `__gnu_pbds::detail::synth_access_traits< type_traits, false, access_traits >` **synth\_access\_traits**

### 6.966.1 Detailed Description

```
template<typename Key, typename Mapped, typename _ATraits, template< typename Node_CItr, typename
Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::trie_traits< Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >
```

Specialization.

### 6.966.2 Member Typedef Documentation

#### **node\_const\_iterator**

```
template<typename Key, typename Mapped, typename _ATraits, template< typename Node_CItr, typename
Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
```

```
typedef base_type::Node_citer<node, leaf, head, inode, const_iterator, iterator, _Alloc> __gnu_pbds::detail::tr
```

```
Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >::node_const_iterator
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

#### **node\_update**

```
template<typename Key, typename Mapped, typename _ATraits, template< typename Node_CItr, typename
Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
```

```
typedef Node_Update<node_const_iterator, node_iterator, _ATraits, _Alloc> __gnu_pbds::detail::trie_traits<
Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >::node_update
```

Type for node update.

## synth\_access\_traits

```
template<typename Key, typename Mapped, typename _ATraits, template< typename Node_CItr, typename
Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
typedef __gnu_pbds::detail::synth_access_traits<type_traits, false, access_traits> __gnu_pbds::detail::trie_traits<
Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >::synth_access_traits
```

Type for synthesized traits.

The documentation for this struct was generated from the following file:

```
#include <traits.hpp>
```

### Public Types

- typedef `_ATraits` **access\_traits**
- typedef `base_type::CItr< node, leaf, head, inode, true >` **const\_iterator**
- typedef `base_type::CItr< node, leaf, head, inode, false >` **const\_reverse\_iterator**
- typedef `base_type::Head< synth_access_traits, metadata >` **head**
- typedef `base_type::Inode< synth_access_traits, metadata >` **inode**
- typedef `const_iterator` **iterator**
- typedef `base_type::Leaf< synth_access_traits, metadata >` **leaf**
- typedef `base_type::Metadata< metadata_type, _Alloc >` **metadata**
- typedef `trie_node_metadata_dispatch< Key, null_type, _ATraits, Node_Update, _Alloc >::type` **metadata\_type**
- typedef `base_type::Node_base< synth_access_traits, metadata >` **node**
- typedef `base_type::Node_citer< node, leaf, head, inode, const_iterator, iterator, _Alloc >` **node\_const\_iterator**
- typedef `node_const_iterator` **node\_iterator**
- typedef `Node_Update< node_const_iterator, node_iterator, _ATraits, _Alloc >` **node\_update**
- typedef `null_node_update< node_const_iterator, node_const_iterator, _ATraits, _Alloc > * null_node_update` **←\_pointer**
- typedef `const_reverse_iterator` **reverse\_iterator**
- typedef `__gnu_pbds::detail::synth_access_traits< type_traits, true, access_traits >` **synth\_access\_traits**

### 6.967.1 Detailed Description

```
template<typename Key, typename _ATraits, template< typename Node_CItr, typename Node_Itr, typename
Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::trie_traits< Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >
```

Specialization.

### 6.967.2 Member Typedef Documentation

#### node\_const\_iterator

```
template<typename Key, typename _ATraits, template< typename Node_CItr, typename Node_Itr, typename
Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
typedef base_type::Node_citer<node, leaf, head, inode, const_iterator, iterator, _Alloc> __gnu_pbds::detail::trie_traits<
Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >::node_const_iterator
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

**node\_update**

```
template<typename Key, typename _ATraits, template< typename Node_CItr, typename Node_Itr, typename
Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
typedef Node_Update<node_const_iterator, node_iterator, _ATraits, _Alloc> __gnu_pbds::detail::trie_traits<
Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >::node_update
Type for node update.
```

**synth\_access\_traits**

```
template<typename Key, typename _ATraits, template< typename Node_CItr, typename Node_Itr, typename
Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
typedef __gnu_pbds::detail::synth_access_traits<type_traits, true, access_traits> __gnu_pbds::detail::trie_traits<
Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >::synth_access_traits
Type for synthesized traits.
```

The documentation for this struct was generated from the following file:

- [pat\\_trie\\_/traits.hpp](#)

**6.968 `__gnu_pbds::trivial_iterator_tag` Struct Reference**

```
#include <tag_and_trait.hpp>
```

**6.968.1 Detailed Description**

A trivial iterator tag. Signifies that the iterators has none of `std::iterators`'s movement abilities.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

**6.969 `std::try_to_lock_t` Struct Reference**

```
#include <std_mutex.h>
```

**6.969.1 Detailed Description**

Try to acquire ownership of the mutex without blocking.

The documentation for this struct was generated from the following file:

- [std\\_mutex.h](#)

**6.970 `std::tuple<_Elements>` Class Template Reference**

```
#include <tuple>
```

### 6.971.1 Detailed Description

```
template<typename _T1, typename _T2>
class std::tuple< _T1, _T2 >
```

Partial specialization, 2-element tuple. Includes construction and assignment from a pair.  
The documentation for this class was generated from the following file:

- [tuple](#)

## 6.972 `std::tuple_element< __i, _Tp >` Struct Template Reference

### 6.972.1 Detailed Description

```
template<size_t __i, typename _Tp>
struct std::tuple_element< __i, _Tp >
```

Gives the type of the ith element of a given tuple type.  
The documentation for this struct was generated from the following file:

- [utility.h](#)

## 6.973 `std::tuple_element< 0, pair< _Tp1, _Tp2 > >` Struct Template Reference

```
#include <stl_pair.h>
```

### Public Types

- `typedef _Tp1 type`

### 6.973.1 Detailed Description

```
template<class _Tp1, class _Tp2>
struct std::tuple_element< 0, pair< _Tp1, _Tp2 > >
```

Partial specialization for `std::pair`.  
The documentation for this struct was generated from the following file:

- [stl\\_pair.h](#)

## 6.974 `std::tuple_element< 1, pair< _Tp1, _Tp2 > >` Struct Template Reference

**6.983.1 Detailed Description**

Part of RTTI.

The `type_info` class describes type information generated by an implementation.

**6.983.2 Constructor & Destructor Documentation****~type\_info()**

```
virtual std::type_info::~~type_info () [virtual]
```

Destructor first. Being the first non-inline virtual function, this controls in which translation unit the vtable is emitted. The compiler makes use of that information to know where to emit the runtime-mandated `type_info` structures in the new-abi.

**6.983.3 Member Function Documentation****before()**

```
bool std::type_info::before (
    const type\_info & __arg) const [noexcept]
```

Returns true if `*this` precedes `__arg` in the implementation's collation order.

**name()**

```
const char * std::type_info::name () const [inline], [noexcept]
```

Returns an *implementation-defined* byte string; this is not portable between compilers!

The documentation for this class was generated from the following file:

- [typeinfo](#)

**6.984 std::type\_info Class Reference**

- class **time\_zone\_link**
- struct **tzdb**

### 6.986.1 Detailed Description

The list of `chrono::tzdb` objects

A single object of this type is constructed by the C++ runtime, and can be accessed by calling `chrono::get_tzdb_list()`.

The front of the list is the current `tzdb` object and can be accessed via `chrono::get_tzdb_list().front()` or `chrono::get_tzdb()` or `*chronoget_tzdb_list().begin()`.

The `chrono::reload_tzdb()` function will check for a newer version and if found, insert it at the front of the list.

Since

C++20

## 6.986.2 Member Function Documentation

### `erase_after()`

```
const_iterator std::chrono::tzdb_list::erase_after (
    const_iterator __p)
```

Remove the tzdb object *after* the one the iterator refers to.

Calling this function concurrently with any of `front()`, `begin()`, or `end()` does not cause a data race, but in general this function is not thread-safe. The behaviour may be undefined if erasing an element from the list while another thread is calling the same function, or incrementing an iterator into the list, or accessing the element being erased (unless it is accessed through an iterator).

#### Parameters

|                  |                             |
|------------------|-----------------------------|
| <code>__p</code> | A dereferenceable iterator. |
|------------------|-----------------------------|

#### Returns

An iterator the element after the one that was erased (or `end()` if there is no such element).

#### Since

C++20

References [erase\\_after\(\)](#).

Referenced by [erase\\_after\(\)](#).

### `front()`

```
const tzdb & std::chrono::tzdb_list::front () const [noexcept]
```

Access the current tzdb at the front of the list.

This returns a reference to the same object as `chrono::get_tzdb()`.

#### Returns

A reference to the current tzdb object.

#### Since

C++20

The documentation for this class was generated from the following file:

- [chrono](#)

## 6.987 `__gnu_cxx::unary_compose<_Operation1, _Operation2 >` Class Template Reference

## Friends

- bool `operator==` (const `uniform_int_distribution` &\_\_d1, const `uniform_int_distribution` &\_\_d2)

### 6.993.1 Detailed Description

```
template<typename _IntType = int>
class std::uniform_int_distribution< _IntType >
```

Uniform discrete distribution for random numbers. A discrete random distribution on the range  $[min, max]$  with equal probability throughout the range.

Since

C++11

### 6.993.2 Member Typedef Documentation

#### result\_type

```
template<typename _IntType = int>
typedef _IntType std::uniform_int_distribution< _IntType >::result_type
The type of the range of the distribution.
```

### 6.993.3 Constructor & Destructor Documentation

#### uniform\_int\_distribution() [1/2]

```
template<typename _IntType = int>
std::uniform_int_distribution< _IntType >::uniform_int_distribution () [inline]
Constructs a uniform distribution object.
```

#### uniform\_int\_distribution() [2/2]

```
template<typename _IntType = int>
std::uniform_int_distribution< _IntType >::uniform_int_distribution (
    _IntType __a,
    _IntType __b = __gnu_cxx::__int_traits<_IntType>::__max) [inline], [explicit]
Constructs a uniform distribution object.
```

### 6.993.4 Member Function Documentation

#### max()

```
template<typename _IntType = int>
result_type std::uniform_int_distribution< _IntType >::max () const [inline]
Returns the inclusive upper bound of the distribution range.
```

#### min()

```
template<typename _IntType = int>
result_type std::uniform_int_distribution< _IntType >::min () const [inline]
Returns the inclusive lower bound of the distribution range.
```

**operator()()**

```
template<typename _IntType = int>
template<typename _UniformRandomBitGenerator>
result_type std::uniform_int_distribution< _IntType >::operator() (
    _UniformRandomBitGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

**param()** [1/2]

```
template<typename _IntType = int>
param_type std::uniform_int_distribution< _IntType >::param () const [inline]
```

Returns the parameter set of the distribution.

Referenced by [std::operator>>\(\)](#).

**param()** [2/2]

```
template<typename _IntType = int>
void std::uniform_int_distribution< _IntType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _IntType = int>
void std::uniform_int_distribution< _IntType >::reset () [inline]
```

Resets the distribution state.

Does nothing for the uniform integer distribution.

**6.993.5 Friends And Related Symbol Documentation****operator==**

```
template<typename _IntType = int>
bool operator== (
    const uniform_int_distribution< _IntType > & __d1,
    const uniform_int_distribution< _IntType > & __d2) [friend]
```

Return true if two uniform integer distributions have the same parameters.

The documentation for this class was generated from the following file:

- [uniform\\_int\\_dist.h](#)

### 6.994.1 Detailed Description

```
template<typename _RealType = double>  
class std::uniform_real_distribution< _RealType >
```

Uniform continuous distribution for random numbers.

A continuous random distribution on the range [min, max) with equal probability throughout the range. The URNG should be real-valued and deliver number in the range [0, 1).

Since

C++11

### 6.994.2 Member Typedef Documentation

#### `result_type`

```
template<typename _RealType = double>  
typedef _RealType std::uniform\_real\_distribution< _RealType >::result_type
```

The type of the range of the distribution.

### 6.994.3 Constructor & Destructor Documentation

#### uniform\_real\_distribution() [1/2]

```
template<typename _RealType = double>
std::uniform_real_distribution< _RealType >::uniform_real_distribution () [inline]
```

Constructs a uniform\_real\_distribution object.

The lower bound is set to 0.0 and the upper bound to 1.0

#### uniform\_real\_distribution() [2/2]

```
template<typename _RealType = double>
std::uniform_real_distribution< _RealType >::uniform_real_distribution (
    _RealType __a,
    _RealType __b = _RealType(1)) [inline], [explicit]
```

Constructs a uniform\_real\_distribution object.

#### Parameters

|                             |                                           |
|-----------------------------|-------------------------------------------|
| $\longleftrightarrow$<br>_a | [IN] The lower bound of the distribution. |
| $\longleftrightarrow$<br>_b | [IN] The upper bound of the distribution. |

### 6.994.4 Member Function Documentation

#### max()

```
template<typename _RealType = double>
result_type std::uniform_real_distribution< _RealType >::max () const [inline]
```

Returns the inclusive upper bound of the distribution range.

#### min()

```
template<typename _RealType = double>
result_type std::uniform_real_distribution< _RealType >::min () const [inline]
```

Returns the inclusive lower bound of the distribution range.

#### operator>()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::uniform_real_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

#### param() [1/2]

```
template<typename _RealType = double>
param_type std::uniform_real_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Referenced by [std::operator>>\(\)](#).

**param()** [2/2]

```
template<typename _RealType = double>
void std::uniform_real_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _RealType = double>
void std::uniform_real_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

Does nothing for the uniform real distribution.

**6.994.5 Friends And Related Symbol Documentation****operator==**

```
template<typename _RealType = double>
bool operator== (
    const uniform_real_distribution< _RealType > & __d1,
    const uniform_real_distribution< _RealType > & __d2) [friend]
```

Return true if two uniform real distributions have the same parameters.

The documentation for this class was generated from the following files:

### 6.995.1 Detailed Description

**template<typename \_Mutex>**  
**class std::unique\_lock< \_Mutex >**

A movable scoped lock type.

A **unique\_lock** controls mutex ownership within a scope. Ownership of the mutex can be delayed until after construction and can be transferred to another **unique\_lock** by move construction or move assignment. If a mutex lock is owned when the destructor runs ownership will be released.

Since

C++11

### 6.995.2 Friends And Related Symbol Documentation

**swap()**

```
template<typename _Mutex>
void swap (
    unique_lock< _Mutex > & __x,
    unique_lock< _Mutex > & __y) [related]
```

Swap overload for **unique\_lock** objects.

The documentation for this class was generated from the following file:

- [unique\\_lock.h](#)

### 6.996.1 Detailed Description

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
class std::unique_ptr<_Tp, _Dp>
```

A move-only smart pointer that manages unique ownership of a resource.

Since

C++11

### 6.996.2 Constructor & Destructor Documentation

#### unique\_ptr() [1/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr<_Tp, _Dp>::unique_ptr () [inline], [constexpr], [noexcept]
Default constructor, creates a unique_ptr that owns nothing.
```

#### unique\_ptr() [2/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr<_Tp, _Dp>::unique_ptr (
    pointer __p) [inline], [explicit], [constexpr], [noexcept]
Takes ownership of a pointer.
```

#### Parameters

|                    |                                        |
|--------------------|----------------------------------------|
| $\leftarrow$<br>_p | A pointer to an object of element_type |
|--------------------|----------------------------------------|

The deleter will be value-initialized.

#### unique\_ptr() [3/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = deleter_type, typename = _Require<is_copy_constructible<_Del>>>
std::unique_ptr<_Tp, _Dp>::unique_ptr (
    pointer __p,
    const deleter_type & __d) [inline], [constexpr], [noexcept]
Takes ownership of a pointer.
```

#### Parameters

|                    |                                        |
|--------------------|----------------------------------------|
| $\leftarrow$<br>_p | A pointer to an object of element_type |
| $\leftarrow$<br>_d | A reference to a deleter.              |

The deleter will be initialized with \_\_d

**unique\_ptr()** [4/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = deleter_type, typename = _Require<is_move_constructible<_Del>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    pointer __p,
    __enable_if_t<!is_lvalue_reference< _Del >::value, _Del && > __d) [inline], [constexpr],
[noexcept]
```

Takes ownership of a pointer.

**Parameters**

|                    |                                                   |
|--------------------|---------------------------------------------------|
| $\leftarrow$<br>_p | A pointer to an object of element_type            |
| $\leftarrow$<br>_d | An rvalue reference to a (non-reference) deleter. |

The deleter will be initialized with `std::move(__d)`

**unique\_ptr()** [5/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    nullptr_t ) [inline], [constexpr], [noexcept]
```

Creates a unique\_ptr that owns nothing.

**unique\_ptr()** [6/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    unique_ptr< _Tp, _Dp > && ) [default]
```

Move constructor.

**unique\_ptr()** [7/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Up, typename _Ep, typename = _Require< __safe_conversion_up<_Up, _Ep>, __
conditional_t<is_reference<_Dp>::value, is_same<_Ep, _Dp>, is_convertible<_Ep, _Dp>>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    unique_ptr< _Up, _Ep > && __u) [inline], [constexpr], [noexcept]
```

Converting constructor from another type.

Requires that the pointer owned by `__u` is convertible to the type of pointer owned by this object, `__u` does not own an array, and `__u` has a compatible deleter type.

**unique\_ptr()** [8/8]

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    auto_ptr< _Up > && __u) [inline], [noexcept]
```

Converting constructor from auto\_ptr.

**~unique\_ptr()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
std::unique_ptr<_Tp, _Dp>::~~unique_ptr() [inline], [noexcept]
```

Destructor, invokes the deleter if the stored pointer is not null.

**6.996.3 Member Function Documentation****get()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr<_Tp, _Dp>::get() const [inline], [constexpr], [noexcept]
```

Return the stored pointer.

Referenced by `std::unique_ptr<_State>::operator bool()`, `std::unique_ptr<_State>::operator*`, `std::unique_ptr<_State>::operator-`, `std::operator<()`, `std::operator<()`, `std::operator<()`, `std::unique_ptr<_State>::operator<<()`, `std::operator==(())`, `std::operator>()`, and `std::operator>()`.

**get\_deleter() [1/2]**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
const deleter_type & std::unique_ptr<_Tp, _Dp>::get_deleter() const [inline], [constexpr], [noexcept]
```

Return a reference to the stored deleter.

**get\_deleter() [2/2]**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
deleter_type & std::unique_ptr<_Tp, _Dp>::get_deleter() [inline], [constexpr], [noexcept]
```

Return a reference to the stored deleter.

Referenced by `std::unique_ptr<_State>::~~unique_ptr()`, and `std::unique_ptr<_State>::operator=()`.

**operator bool()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
std::unique_ptr<_Tp, _Dp>::operator bool() const [inline], [explicit], [constexpr], [noexcept]
```

Return true if the stored pointer is not null.

**operator\*()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
add_lvalue_reference<element_type>::type std::unique_ptr<_Tp, _Dp>::operator*() const [inline], [constexpr], [noexcept]
```

Dereference the stored pointer.

**operator->()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr<_Tp, _Dp>::operator->() const [inline], [constexpr], [noexcept]
```

Return the stored pointer.

**operator=() [1/3]**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
unique_ptr & std::unique_ptr<_Tp, _Dp>::operator=(
    nullptr_t) [inline], [constexpr], [noexcept]
```

Reset the `unique_ptr` to empty, invoking the deleter if necessary.

**operator=()** [2/3]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
unique_ptr & std::unique_ptr< _Tp, _Dp >::operator= (
    unique_ptr< _Tp, _Dp > && ) [default]
```

Move assignment operator.

Invokes the deleter if this object owns a pointer.

**operator=()** [3/3]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Up, typename _Ep>
enable_if< __and< __safe_conversion_up< _Up, _Ep >, is_assignable< deleter_type &, _Ep && >
>::value, unique_ptr & >::type std::unique_ptr< _Tp, _Dp >::operator= (
    unique_ptr< _Up, _Ep > && __u) [inline], [constexpr], [noexcept]
```

Assignment from another type.

**Parameters**

|                 |                                                                                                |
|-----------------|------------------------------------------------------------------------------------------------|
| <code>_↵</code> | The object to transfer ownership from, which owns a convertible pointer to a non-array object. |
| <code>_U</code> |                                                                                                |

Invokes the deleter if this object owns a pointer.

**release()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr< _Tp, _Dp >::release () [inline], [constexpr], [noexcept]
```

Release ownership of any stored pointer.

**reset()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
void std::unique_ptr< _Tp, _Dp >::reset (
    pointer __p = pointer()) [inline], [constexpr], [noexcept]
```

Replace the stored pointer.

**Parameters**

|                 |                           |
|-----------------|---------------------------|
| <code>_↵</code> | The new pointer to store. |
| <code>_p</code> |                           |

The deleter will be invoked if a pointer is already owned.

Referenced by `std::unique_ptr< _State >::operator=()`, and `std::unique_ptr< _State >::operator=()`.

**swap()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
void std::unique_ptr< _Tp, _Dp >::swap (
    unique_ptr< _Tp, _Dp > & __u) [inline], [constexpr], [noexcept]
```

Exchange the pointer and deleter with another object.

The documentation for this class was generated from the following files:

- [unique\\_ptr.h](#)
- [auto\\_ptr.h](#)

### 6.997.1 Detailed Description

```
template<typename _Tp, typename _Dp>
class std::unique_ptr< _Tp[], _Dp >
```

A move-only smart pointer that manages unique ownership of an array.

Since

C++11

### 6.997.2 Constructor & Destructor Documentation

#### unique\_ptr() [1/6]

```
template<typename _Tp, typename _Dp>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr () [inline], [constexpr], [noexcept]
```

Default constructor, creates a unique\_ptr that owns nothing.

References [unique\\_ptr\(\)](#).

Referenced by [unique\\_ptr\(\)](#), [unique\\_ptr\(\)](#), [unique\\_ptr\(\)](#), [unique\\_ptr\(\)](#), [unique\\_ptr\(\)](#), [unique\\_ptr\(\)](#), [~unique\\_ptr\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), and [swap\(\)](#).

#### unique\_ptr() [2/6]

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename _Vp = _Dp, typename = _DeleterConstraint<_Vp>, typename = typename
enable_if< __safe_conversion_raw<_Up>::value, bool>::type>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    _Up __p) [inline], [explicit], [constexpr], [noexcept]
```

Takes ownership of a pointer.

#### Parameters

|                           |                                                                                |
|---------------------------|--------------------------------------------------------------------------------|
| <a href="#">_↵<br/>_p</a> | A pointer to an array of a type safely convertible to an array of element_type |
|---------------------------|--------------------------------------------------------------------------------|

The deleter will be value-initialized.

References [unique\\_ptr\(\)](#).

**unique\_ptr()** [3/6]

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename _Del = deleter_type, typename = _Require<__safe_conversion_raw<_Up>, is_copy_constructible<_Del>>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    _Up __p,
    const deleter_type & __d) [inline], [constexpr], [noexcept]
```

Takes ownership of a pointer.

**Parameters**

|                                                     |                                                                                             |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------|
| <code><a href="#">_↔</a><br/><code>_p</code></code> | A pointer to an array of a type safely convertible to an array of <code>element_type</code> |

The deleter will be initialized with `std::move(__d)`

References [unique\\_ptr\(\)](#), and [std::move\(\)](#).

**unique\_ptr()** [5/6]

```
template<typename _Tp, typename _Dp>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    unique_ptr< _Tp[], _Dp > && ) [default]
```

Move constructor.

References [unique\\_ptr\(\)](#).

**unique\_ptr()** [6/6]

```
template<typename _Tp, typename _Dp>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    nullptr_t ) [inline], [constexpr], [noexcept]
```

Creates a `unique_ptr` that owns nothing.  
References [unique\\_ptr\(\)](#).

### **~unique\_ptr()**

```
template<typename _Tp, typename _Dp>
std::unique_ptr< _Tp[], _Dp >::~~unique_ptr () [inline]
```

Destructor, invokes the deleter if the stored pointer is not null.  
References [unique\\_ptr\(\)](#), and [get\\_deleter\(\)](#).

## **6.997.3 Member Function Documentation**

### **get()**

```
template<typename _Tp, typename _Dp>
pointer std::unique_ptr< _Tp[], _Dp >::get () const [inline], [constexpr], [noexcept]
```

Return the stored pointer.  
References [get\(\)](#).  
Referenced by [get\(\)](#), [operator bool\(\)](#), and [operator\[\]\(\)](#).

### **get\_deleter() [1/2]**

```
template<typename _Tp, typename _Dp>
const deleter_type & std::unique_ptr< _Tp[], _Dp >::get_deleter () const [inline], [constexpr],
[noexcept]
```

Return a reference to the stored deleter.  
References [get\\_deleter\(\)](#).

### **get\_deleter() [2/2]**

```
template<typename _Tp, typename _Dp>
deleter_type & std::unique_ptr< _Tp[], _Dp >::get_deleter () [inline], [constexpr], [noexcept]
```

Return a reference to the stored deleter.  
References [get\\_deleter\(\)](#).  
Referenced by [~unique\\_ptr\(\)](#), [get\\_deleter\(\)](#), [get\\_deleter\(\)](#), and [operator=\(\)](#).

### **operator bool()**

```
template<typename _Tp, typename _Dp>
std::unique_ptr< _Tp[], _Dp >::operator bool () const [inline], [explicit], [constexpr], [noexcept]
```

Return true if the stored pointer is not null.  
References [get\(\)](#).

### **operator\*()**

```
add_lvalue_reference< element_type >::type std::unique_ptr< _Tp, _Dp >::operator* () const [inline],
[constexpr], [noexcept]
```

Dereference the stored pointer.

### **operator->()**

```
pointer std::unique_ptr< _Tp, _Dp >::operator-> () const [inline], [constexpr], [noexcept]
```

Return the stored pointer.

**operator=()** [1/3]

```
template<typename _Tp, typename _Dp>
unique_ptr & std::unique_ptr< _Tp[], _Dp >::operator= (
    nullptr_t ) [inline], [constexpr], [noexcept]
```

Reset the unique\_ptr to empty, invoking the deleter if necessary.

References [unique\\_ptr\(\)](#), [operator=\(\)](#), and [reset\(\)](#).

**operator=()** [2/3]

```
template<typename _Tp, typename _Dp>
unique_ptr & std::unique_ptr< _Tp[], _Dp >::operator= (
    unique_ptr< _Tp[], _Dp > && ) [default]
```

Move assignment operator.

Invokes the deleter if this object owns a pointer.

References [unique\\_ptr\(\)](#), and [operator=\(\)](#).

Referenced by [operator=\(\)](#), [operator=\(\)](#), and [operator=\(\)](#).

**operator=()** [3/3]

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename _Ep>
enable_if< __and< __safe_conversion_up< _Up, _Ep >, is_assignable< deleter_type &, _Ep && >
>::value, unique_ptr & >::type std::unique_ptr< _Tp[], _Dp >::operator= (
    unique_ptr< _Up, _Ep > && __u) [inline], [constexpr], [noexcept]
```

Assignment from another type.

**Parameters**

|                    |                                                                                             |
|--------------------|---------------------------------------------------------------------------------------------|
| <a href="#">_↔</a> | The object to transfer ownership from, which owns a convertible pointer to an array object. |
| <a href="#">_u</a> |                                                                                             |

Invokes the deleter if this object owns a pointer.

References [unique\\_ptr\(\)](#), [std::forward\(\)](#), [get\\_deleter\(\)](#), [operator=\(\)](#), and [reset\(\)](#).

**operator[]()**

```
template<typename _Tp, typename _Dp>
std::add_lvalue_reference< element_type >::type std::unique_ptr< _Tp[], _Dp >::operator[] (
    size_t __i) const [inline], [constexpr]
```

Access an element of owned array.

References [get\(\)](#), and [operator\[\]\(\)](#).

Referenced by [operator\[\]\(\)](#).

**release()**

```
template<typename _Tp, typename _Dp>
pointer std::unique_ptr< _Tp[], _Dp >::release () [inline], [constexpr], [noexcept]
```

Release ownership of any stored pointer.

References [release\(\)](#).

Referenced by [release\(\)](#).

**reset()**

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename = _Require< __or<is_same<_Up, pointer>, __and<is_same<pointer,
```

```

element_type*>, is_pointer<_Up>, is_convertible< typename remove_pointer<_Up>::type(*)[], element←
_type(*)[] > > > >>
void std::unique_ptr< _Tp[], _Dp >::reset (
    _Up __p) [inline], [constexpr], [noexcept]

```

Replace the stored pointer.

#### Parameters

|                  |                           |
|------------------|---------------------------|
| <code>__p</code> | The new pointer to store. |
|------------------|---------------------------|

The deleter will be invoked if a pointer is already owned.

References [std::move\(\)](#), and [reset\(\)](#).

Referenced by [operator=\(\)](#), [operator=\(\)](#), and [reset\(\)](#).

#### swap()

```

template<typename _Tp, typename _Dp>
void std::unique_ptr< _Tp[], _Dp >::swap (
    unique_ptr< _Tp[], _Dp > & __u) [inline], [constexpr], [noexcept]

```

Exchange the pointer and deleter with another object.

References [unique\\_ptr\(\)](#), and [swap\(\)](#).

Referenced by [swap\(\)](#).

### 6.997.4 Friends And Related Symbol Documentation

#### operator<<()

```

basic_ostream< _CharT, _Traits > & operator<< (
    basic_ostream< _CharT, _Traits > & __os,
    const unique_ptr< _Tp, _Dp > & __p) [related]

```

Stream output operator for `unique_ptr`.

Since

C++20

#### swap()

```

enable_if< __is_swappable< _Dp >::value >::type swap (
    unique_ptr< _Tp, _Dp > & __x,
    unique_ptr< _Tp, _Dp > & __y) [related]

```

Swap overload for `unique_ptr`.

The documentation for this class was generated from the following files:

## Friends

- `template<typename _Key1, typename _Tp1, typename _Hash1, typename _Pred1, typename _Alloc1>`  
`bool operator==` (const `unordered_map< _Key1, _Tp1, _Hash1, _Pred1, _Alloc1 >` &, const `unordered_map< _Key1, _Tp1, _Hash1, _Pred1, _Alloc1 >` &)

## 6.999.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
class std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >
```

A standard container composed of unique keys (containing at most one of each key value) that associates values of another type with the keys.

Since

C++11

## Template Parameters

|                     |                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------|
| <code>_Key</code>   | Type of key objects.                                                                              |
| <code>_Tp</code>    | Type of mapped objects.                                                                           |
| <code>_Hash</code>  | Hashing function object type, defaults to <code>hash&lt;_Key&gt;</code> .                         |
| <code>_Pred</code>  | Predicate function object type, defaults to <code>equal_to&lt;_Key&gt;</code> .                   |
| <code>_Alloc</code> | Allocator type, defaults to <code>std::allocator&lt;std::pair&lt;const _Key, _Tp&gt;&gt;</code> . |

Meets the requirements of a `container`, and `unordered associative container`

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__umap_hashtable`.

## 6.999.2 Member Typedef Documentation

### allocator\_type

```

Iterator-related typedefs.

### difference\_type

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::difference_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::difference_type
```

Iterator-related typedefs.

### hasher

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::hasher std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::hasher
```

Public typedefs.

### iterator

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::iterator
Iterator-related typedefs.
```

### key\_equal

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::key_equal std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::key_equal
Public typedefs.
```

### key\_type

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::key_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::key_type
Public typedefs.
```

### local\_iterator

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::local_iterator
Iterator-related typedefs.
```

### mapped\_type

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::mapped_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::mapped_type
Public typedefs.
```

### pointer

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::pointer std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::pointer
Iterator-related typedefs.
```

### reference

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::reference std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::reference
Iterator-related typedefs.
```

### size\_type

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::size_type
```

Iterator-related typedefs.

### value\_type

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::value_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::value_type
Public typedefs.
```

## 6.999.3 Constructor & Destructor Documentation

### unordered\_map() [1/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map () [default]
Default constructor.
```

### unordered\_map() [2/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    size_type __n,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

#### Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eq1</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

### unordered\_map() [3/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator>
std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_map from a range.

#### Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

## Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eqf</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Create an `unordered_map` consisting of copies of the elements from `[__first,__last)`. This is linear in N (where N is `distance(__first,__last)`).

**unordered\_map()** [4/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    const unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

**unordered\_map()** [5/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

**unordered\_map()** [6/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    const allocator_type & __a ) [inline], [explicit]
```

Creates an `unordered_map` with no elements.

## Parameters

|                  |                      |
|------------------|----------------------|
| <code>__a</code> | An allocator object. |
|------------------|----------------------|

**unordered\_map()** [7/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    initializer_list< value_type > __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eqf = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an `unordered_map` from an `initializer_list`.

## Parameters

|                  |                                    |
|------------------|------------------------------------|
| <code>__l</code> | An <code>initializer_list</code> . |
|------------------|------------------------------------|

## Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eqf</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Create an unordered\_map consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

## 6.999.4 Member Function Documentation

**at()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
mapped_type & std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::at (
    const key_type & __k) [inline]
```

Access to unordered\_map data.

## Parameters

|                  |                                             |
|------------------|---------------------------------------------|
| <code>__k</code> | The key for which data should be retrieved. |
|------------------|---------------------------------------------|

## Returns

A reference to the data whose key is equal to `__k`, if such a data is present in the unordered\_map.

## Exceptions

|                                |                             |
|--------------------------------|-----------------------------|
| <code>std::out_of_range</code> | If no such data is present. |
|--------------------------------|-----------------------------|

**at()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const mapped_type & std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::at (
    const key_type & __k) const [inline]
```

Access to unordered\_map data.

## Parameters

|                  |                                             |
|------------------|---------------------------------------------|
| <code>__k</code> | The key for which data should be retrieved. |
|------------------|---------------------------------------------|

## Returns

A reference to the data whose key is equal to `__k`, if such a data is present in the unordered\_map.

## Exceptions

|                                |                             |
|--------------------------------|-----------------------------|
| <code>std::out_of_range</code> | If no such data is present. |
|--------------------------------|-----------------------------|

**begin()** [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_map`.

**begin()** [2/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the `unordered_map`.

**begin()** [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (
    size_type __n) [inline]
```

Returns a read/write iterator pointing to the first bucket element.

## Parameters

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

## Returns

A read/write local iterator.

**begin()** [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

## Parameters

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

## Returns

A read-only local iterator.

**bucket\_count()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::bucket_count () const [inline],
[noexcept]
```

Returns the number of buckets of the unordered\_map.

**cbegin()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::cbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_map.

**cbegin()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::cbegin (
size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

**Returns**

A read-only local iterator.

**cend()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::cend () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_map.

**cend()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::cend (
size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

**Returns**

A read-only local iterator.

**clear()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in an `unordered_map`. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains() [1/2]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
template<typename _Kt>
```

```
auto std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::contains (
    const _Kt & __x) const -> decltype(M_h.M_find_tr(__x), void(), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                   |                                |
|-------------------|--------------------------------|
| <code>_Key</code> | Key of elements to be located. |
| <code>__x</code>  |                                |

**Returns**

True if there is any element with the specified key.

**contains() [2/2]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
bool std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                   |                                |
|-------------------|--------------------------------|
| <code>_Key</code> | Key of elements to be located. |
| <code>__x</code>  |                                |

**Returns**

True if there is any element with the specified key.

**count()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

|                 |               |
|-----------------|---------------|
| <code>_↵</code> | Key to count. |
| <code>_X</code> |               |

**Returns**

Number of elements with specified key.

This function only makes sense for `unordered_multimap`; for `unordered_map` the result will either be 0 (not present) or 1 (present).

**emplace()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename... _Args>
std::pair< iterator, bool > std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Attempts to build and insert a `std::pair` into the `unordered_map`.

**Parameters**

|                     |                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__args</code> | Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor). |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`. Insertion requires amortized constant time.

**emplace\_hint()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename... _Args>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Attempts to build and insert a `std::pair` into the `unordered_map`.

**Parameters**

|                     |                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the pair should be inserted.                                                                             |
| <code>__args</code> | Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor). |

**Returns**

An iterator that points to the element with key of the `std::pair` built from `__args` (may or may not be that `std::pair`).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

**empty()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
bool std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::empty () const [inline], [nodiscard],
[noexcept]
```

Returns true if the `unordered_map` is empty.

**end() [1/4]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::end () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_map`.

**end() [2/4]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the `unordered_map`.

**end() [3/4]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::end (
    size_type __n) [inline]
```

Returns a read/write iterator pointing to one past the last bucket elements.

**Parameters**

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

**Returns**

A read/write local iterator.

**end() [4/4]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

```
const_local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::end (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

#### Parameters

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

#### Returns

A read-only local iterator.

#### equal\_range() [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::pair< iterator, iterator > std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::equal_
range (
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

#### Parameters

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

#### Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for unordered\_multimap.

#### equal\_range() [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::pair< const_iterator, const_iterator > std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

#### Parameters

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

#### Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for unordered\_multimap.

**erase()** [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <code>__x</code> | Key of element to be erased. |
|------------------|------------------------------|

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_map`. For an `unordered_map` the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [2/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a `[__first,__last)` range of elements from an `unordered_map`.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from an `unordered_map`. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from an `unordered_map`.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_map`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    iterator __position) [inline]
```

Erases an element from an `unordered_map`.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_map`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) [inline]
```

Tries to locate an element in an `unordered_map`.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

**find()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in an `unordered_map`.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↔</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**get\_allocator()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
_allocator_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::get_allocator () const
[inline], [noexcept]
```

Returns the allocator object used by the `unordered_map`.

**hash\_function()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
_hasher std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::hash_function () const [inline]
```

Returns the hash functor object with which the `unordered_map` was constructed.

**insert()** [1/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

**Parameters**

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

**insert()** [2/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair && >::value, pair< iterator, bool > > std::unordered_map<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    _Pair && __x) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

## Parameters

|                 |                                                                      |
|-----------------|----------------------------------------------------------------------|
| <code>_↔</code> | Pair to be inserted (see std::make_pair for easy creation of pairs). |
| <code>_X</code> |                                                                      |

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered\_map. An unordered\_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered\_map. Insertion requires amortized constant time.

**insert()** [3/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair< iterator, bool > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

## Parameters

|                 |                                                                      |
|-----------------|----------------------------------------------------------------------|
| <code>_↔</code> | Pair to be inserted (see std::make_pair for easy creation of pairs). |
| <code>_X</code> |                                                                      |

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered\_map. An unordered\_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered\_map. Insertion requires amortized constant time.

**insert()** [4/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::unordered_map<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    _Pair && __x) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

## Parameters

|                     |                                                                            |
|---------------------|----------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted. |
| <code>__x</code>    | Pair to be inserted (see std::make_pair for easy creation of pairs).       |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

**insert()** [5/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::insert (
    const_iterator __hint,
    const value_type & __x) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

**Parameters**

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>    | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

**insert()** [6/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::insert (
    const_iterator __hint,
    value_type && __x) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

**Parameters**

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>    | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

**insert()** [7/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of elements into the `unordered_map`.

**Parameters**

|                  |                                                                                    |
|------------------|------------------------------------------------------------------------------------|
| <code>__l</code> | A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted. |
| <code>__l</code> |                                                                                    |
| <code>__l</code> |                                                                                    |
| <code>__l</code> |                                                                                    |
| <code>l</code>   |                                                                                    |

Complexity similar to that of the range constructor.

**insert()** [8/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair< iterator, bool > std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    value_type && __x) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

**Parameters**

|                  |                                                                                   |
|------------------|-----------------------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |
| <code>x</code>   |                                                                                   |

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a `bool` that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`.

Insertion requires amortized constant time.

**key\_eq()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
key_equal std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::key_eq () const [inline]
```

Returns the key comparison object with which the `unordered_map` was constructed.

**load\_factor()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
float std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::load_factor () const [inline],
[noexcept]
```

Returns the average number of elements per bucket.

**max\_bucket\_count()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count () const [inline],
[noexcept]
```

Returns the maximum number of buckets of the unordered\_map.

**max\_load\_factor()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
float std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],
[noexcept]
```

Returns a positive number that the unordered\_map tries to keep the load factor less than or equal to.

**max\_load\_factor()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor (
    float __z) [inline]
```

Change the unordered\_map maximum load factor.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <code>__z</code> | The new maximum load factor. |
|------------------|------------------------------|

**max\_size()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_size () const [inline],
[noexcept]
```

Returns the maximum size of the unordered\_map.

**operator=()** [1/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
unordered_map & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    const unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

**operator=()** [2/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_map & std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Unordered\_map list assignment operator.

**Parameters**

|   |                      |
|---|----------------------|
| ↵ | An initializer_list. |
| ↵ |                      |
| ↵ |                      |
| ↵ |                      |
| / |                      |

This function fills an unordered\_map with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the unordered\_map and that the resulting unordered\_map's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_map & std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

**operator[]()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
mapped_type & std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::operator[] (
    const key_type & __k) [inline]
```

Subscript ( [] ) access to unordered\_map data.

**Parameters**

|    |                                             |
|----|---------------------------------------------|
| ↵  | The key for which data should be retrieved. |
| _k |                                             |

**Returns**

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ( [] ) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires constant time.

**operator[]()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
mapped_type & std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::operator[] (
    key_type && __k) [inline]
```

Subscript ( [] ) access to unordered\_map data.

**Parameters**

|                        |                                             |
|------------------------|---------------------------------------------|
| <code>_↵<br/>_k</code> | The key for which data should be retrieved. |
|------------------------|---------------------------------------------|

**Returns**

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ( [] ) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned. Lookup requires constant time.

**rehash()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵  
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::rehash (   
    size_type __n) [inline]
```

May rehash the unordered\_map.

**Parameters**

|                        |                            |
|------------------------|----------------------------|
| <code>_↵<br/>_n</code> | The new number of buckets. |
|------------------------|----------------------------|

Rehash will occur only if the new number of buckets respect the unordered\_map maximum load factor.

**reserve()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵  
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::reserve (   
    size_type __n) [inline]
```

Prepare the unordered\_map for a specified number of elements.

**Parameters**

|                        |                              |
|------------------------|------------------------------|
| <code>_↵<br/>_n</code> | Number of elements required. |
|------------------------|------------------------------|

Same as rehash(ceil(n / max\_load\_factor())).

**size()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵  
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the unordered\_map.

**swap()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵  
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::swap (  
    unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc> & __x) [inline], [noexcept]
```

Swaps data with another `unordered_map`.

## Parameters

|                 |                                                           |
|-----------------|-----------------------------------------------------------|
| <code>_↔</code> | An unordered_map of the same element and allocator types. |
| <code>_X</code> |                                                           |

This exchanges the elements between two unordered\_map in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

The documentation for this class was generated from the following file:

- [unordered\\_map.h](#)

## 6.1000 std::\_\_debug::unordered\_multimap< \_Key, \_Tp, \_Hash, \_Pred, \_Alloc > Class Template Reference

unordered_multimap< _Key1, _Tp1, _Hash1, _Pred1, _Alloc1 > &)`

### 6.1001.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
class std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>
```

A standard container composed of equivalent keys (possibly containing multiple of each key value) that associates values of another type with the keys.

Since

C++11

## Template Parameters

|                     |                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------|
| <code>_Key</code>   | Type of key objects.                                                                              |
| <code>_Tp</code>    | Type of mapped objects.                                                                           |
| <code>_Hash</code>  | Hashing function object type, defaults to <code>hash&lt;_Key&gt;</code> .                         |
| <code>_Pred</code>  | Predicate function object type, defaults to <code>equal_to&lt;_Key&gt;</code> .                   |
| <code>_Alloc</code> | Allocator type, defaults to <code>std::allocator&lt;std::pair&lt;const _Key, _Tp&gt;&gt;</code> . |

Meets the requirements of a [container](#), and [unordered associative container](#)

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__ummap_hashtable`.

Iterator-related typedefs.

**reference**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::reference std::unordered\_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::reference
```

Iterator-related typedefs.

**size\_type**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::size_type std::unordered\_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::size_type
```

Iterator-related typedefs.

**value\_type**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::value_type std::unordered\_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::value_type
```

Public typedefs.

**6.1001.3 Constructor & Destructor Documentation****unordered\_multimap() [1/7]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered\_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap () [default]
```

Default constructor.

**unordered\_multimap() [2/7]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered\_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    size_type __n,
    const hasher & __hf = hasher(),
    const key_equal & __eqf = key_equal(),
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

**Parameters**

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eqf</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

**unordered\_multimap()** [3/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eqf = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_multimap from a range.

**Parameters**

|                      |                                    |
|----------------------|------------------------------------|
| <code>__first</code> | An input iterator.                 |
| <code>__last</code>  | An input iterator.                 |
| <code>__n</code>     | Minimal initial number of buckets. |
| <code>__hf</code>    | A hash functor.                    |
| <code>__eqf</code>   | A key equality functor.            |
| <code>__a</code>     | An allocator object.               |

Create an unordered\_multimap consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is distance(`__first`,`__last`)).

**unordered\_multimap()** [4/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

**unordered\_multimap()** [5/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

**unordered\_multimap()** [6/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    const allocator_type & __a) [inline], [explicit]
```

Creates an unordered\_multimap with no elements.

## Parameters

|                 |                      |
|-----------------|----------------------|
| <code>_↵</code> | An allocator object. |
| <code>_a</code> |                      |

**unordered\_multimap()** [7/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    initializer_list< value_type > __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_multimap from an initializer\_list.

## Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__l</code>   | An initializer_list.               |
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eq1</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Create an unordered\_multimap consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

**6.1001.4 Member Function Documentation****begin()** [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_multimap.

**begin()** [2/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the unordered\_multimap.

**begin()** [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (
    size_type __n) [inline]
```

Returns a read/write iterator pointing to the first bucket element.

**Parameters**

|       |                   |
|-------|-------------------|
| $\_k$ | The bucket index. |
| $\_n$ |                   |

**Returns**

A read/write local iterator.

**begin() [4/4]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::begin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|       |                   |
|-------|-------------------|
| $\_k$ | The bucket index. |
| $\_n$ |                   |

**Returns**

A read-only local iterator.

**bucket\_count()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::bucket_count () const [inline],
[noexcept]
```

Returns the number of buckets of the unordered\_multimap.

**cbegin() [1/2]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::cbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_multimap.

**cbegin() [2/2]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::cbegin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|       |                   |
|-------|-------------------|
| $\_k$ | The bucket index. |
| $\_n$ |                   |

**Returns**

A read-only local iterator.

**cend()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cend () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_multimap.

**cend()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cend (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|                 |                   |
|-----------------|-------------------|
| <code>_↔</code> | The bucket index. |
| <code>_n</code> |                   |

**Returns**

A read-only local iterator.

**clear()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in an unordered\_multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Kt>
auto std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::contains (
    const _Kt & __x) const -> decltype(_M_h._M_find_tr(__x), void()), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                 |                                |
|-----------------|--------------------------------|
| <code>_↔</code> | Key of elements to be located. |
| <code>_x</code> |                                |

**Returns**

True if there is any element with the specified key.

**contains()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
bool std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                  |                                |
|------------------|--------------------------------|
| <code>__x</code> | Key of elements to be located. |
|------------------|--------------------------------|

**Returns**

True if there is any element with the specified key.

**count()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

|                  |               |
|------------------|---------------|
| <code>__x</code> | Key to count. |
|------------------|---------------|

**Returns**

Number of elements with specified key.

**emplace()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename... _Args>
iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the unordered\_multimap.

**Parameters**

|                     |                                                                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__args</code> | Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor). |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------|

**Returns**

An iterator that points to the inserted pair.

This function attempts to build and insert a (key, value) pair into the unordered\_multimap. Insertion requires amortized constant time.

**emplace\_hint()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Attempts to build and insert a `std::pair` into the `unordered_multimap`.

**Parameters**

|                     |                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the pair should be inserted.                                                                             |
| <code>__args</code> | Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor). |

**Returns**

An iterator that points to the element with key of the `std::pair` built from `__args`.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

**empty()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
bool std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::empty () const [inline], [nodiscard],
[noexcept]
```

Returns true if the `unordered_multimap` is empty.

**end() [1/4]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_multimap`.

**end() [2/4]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the `unordered_multimap`.

**end() [3/4]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
    size_type __n) [inline]
```

Returns a read/write iterator pointing to one past the last bucket elements.

## Parameters

|                 |                   |
|-----------------|-------------------|
| <code>_↵</code> | The bucket index. |
| <code>_n</code> |                   |

## Returns

A read/write local iterator.

**end()** [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::end (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

## Parameters

|                 |                   |
|-----------------|-------------------|
| <code>_↵</code> | The bucket index. |
| <code>_n</code> |                   |

## Returns

A read-only local iterator.

**equal\_range()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::pair< iterator, iterator > std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >↵
::equal_range (
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

## Parameters

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_x</code> |                    |

## Returns

Pair of iterators that possibly points to the subsequence matching given key.

**equal\_range()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::pair< const_iterator, const_iterator > std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _↵
Alloc >::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↔</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

**erase() [1/4]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                 |                               |
|-----------------|-------------------------------|
| <code>_↔</code> | Key of elements to be erased. |
| <code>_X</code> |                               |

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase() [2/4]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_multimap`.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from an `unordered_multimap`. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from an unordered\_multimap.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered\_multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    iterator __position) [inline]
```

Erases an element from an unordered\_multimap.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered\_multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) [inline]
```

Tries to locate an element in an unordered\_multimap.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

**find()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in an unordered\_multimap.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

**get\_allocator()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
allocator_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::get_allocator () const
[inline], [noexcept]
```

Returns the allocator object used by the unordered\_multimap.

**hash\_function()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
hasher std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::hash_function () const [inline]
```

Returns the hash functor object with which the unordered\_multimap was constructed.

**insert()** [1/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _InputIterator>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

**Parameters**

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

**insert()** [2/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    _Pair && __x) [inline]
```

Inserts a std::pair into the unordered\_multimap.

**Parameters**

|                  |                                                                      |
|------------------|----------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see std::make_pair for easy creation of pairs). |
|------------------|----------------------------------------------------------------------|

**Returns**

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

**insert()** [3/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x) [inline]
```

Inserts a std::pair into the unordered\_multimap.

**Parameters**

|                  |                                                                      |
|------------------|----------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see std::make_pair for easy creation of pairs). |
|------------------|----------------------------------------------------------------------|

**Returns**

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

**insert()** [4/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    _Pair && __x) [inline]
```

Inserts a std::pair into the unordered\_multimap.

**Parameters**

|                     |                                                                            |
|---------------------|----------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted. |
| <code>__x</code>    | Pair to be inserted (see std::make_pair for easy creation of pairs).       |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

**insert()** [5/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x) [inline]
```

Inserts a `std::pair` into the `unordered_multimap`.

**Parameters**

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>    | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

**insert()** [6/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    value_type && __x) [inline]
```

Inserts a `std::pair` into the `unordered_multimap`.

**Parameters**

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>    | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

**insert()** [7/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::insert (
    initializer_list<value_type> & __l) [inline]
```

Attempts to insert a list of elements into the unordered\_multimap.

**Parameters**

|                  |                                                                 |
|------------------|-----------------------------------------------------------------|
| <code>__l</code> | A std::initializer_list<value_type> of elements to be inserted. |
|------------------|-----------------------------------------------------------------|

Complexity similar to that of the range constructor.

**insert()** [8/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::insert (
    value_type && __x) [inline]
```

Inserts a std::pair into the unordered\_multimap.

**Parameters**

|                  |                                                                      |
|------------------|----------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see std::make_pair for easy creation of pairs). |
|------------------|----------------------------------------------------------------------|

**Returns**

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

**key\_eq()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
key_equal std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::key_eq () const [inline]
```

Returns the key comparison object with which the unordered\_multimap was constructed.

**load\_factor()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
float std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::load_factor () const [inline],
[noexcept]
```

Returns the average number of elements per bucket.

**max\_bucket\_count()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count () const
[inline], [noexcept]
```

Returns the maximum number of buckets of the `unordered_multimap`.

**max\_load\_factor()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],
[noexcept]
```

Returns a positive number that the `unordered_multimap` tries to keep the load factor less than or equal to.

**max\_load\_factor()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor (
    float __z) [inline]
```

Change the `unordered_multimap` maximum load factor.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <code>__z</code> | The new maximum load factor. |
|------------------|------------------------------|

**max\_size()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_size () const [inline],
[noexcept]
```

Returns the maximum size of the `unordered_multimap`.

**operator=()** [1/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

**operator=()** [2/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Unordered\_multimap list assignment operator.

## Parameters

|                |                      |
|----------------|----------------------|
| <code>↔</code> | An initializer_list. |
| <code>↔</code> |                      |
| <code>↔</code> |                      |
| <code>↔</code> |                      |
| <code>/</code> |                      |

This function fills an unordered\_multimap with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered\_multimap and that the resulting unordered\_multimap's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

**rehash()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::rehash (
    size_type __n) [inline]
```

May rehash the unordered\_multimap.

## Parameters

|                |                            |
|----------------|----------------------------|
| <code>↔</code> | The new number of buckets. |
| <code>n</code> |                            |

Rehash will occur only if the new number of buckets respect the unordered\_multimap maximum load factor.

**reserve()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::reserve (
    size_type __n) [inline]
```

Prepare the unordered\_multimap for a specified number of elements.

## Parameters

|                |                              |
|----------------|------------------------------|
| <code>↔</code> | Number of elements required. |
| <code>n</code> |                              |

Same as `rehash(ceil(n / max_load_factor()))`.

**size()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

```
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::size () const [inline],
[noexcept]
```

Returns the size of the unordered\_multimap.

### swap()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::swap (
    unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another unordered\_multimap.

### Parameters

|                  |                                                                |
|------------------|----------------------------------------------------------------|
| <code>__x</code> | An unordered_multimap of the same element and allocator types. |
|------------------|----------------------------------------------------------------|

This exchanges the elements between two unordered\_multimap in constant time. Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.

The documentation for this class was generated from the following file:

### 6.1003.1 Detailed Description

**template<typename \_Value, typename \_Hash = hash<\_Value>, typename \_Pred = equal\_to<\_Value>, typename \_Alloc = allocator<\_Value>>**

**class std::unordered\_multiset<\_Value, \_Hash, \_Pred, \_Alloc>**

A standard container composed of equivalent keys (possibly containing multiple of each key value) in which the elements' keys are the elements themselves.

Since

C++11

#### Template Parameters

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| <code>_Value</code> | Type of key objects.                                                              |
| <code>_Hash</code>  | Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .       |
| <code>_Pred</code>  | Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> . |
| <code>_Alloc</code> | Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .                  |

Meets the requirements of a [container](#), and [unordered associative container](#)

Base is `_Hashtable`, dispatched at compile time via template alias `__umset_hashtable`.

### 6.1003.2 Member Typedef Documentation

#### allocator\_type

```

Iterator-related typedefs.
```

**value\_type**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::value_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::value_↵
type
```

Public typedefs.

### 6.1003.3 Constructor & Destructor Documentation

#### unordered\_multiset() [1/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset () [default]
Default constructor.
```

#### unordered\_multiset() [2/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    size_type __n,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

##### Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eq1</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

#### unordered\_multiset() [3/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_multiset from a range.

##### Parameters

|                      |                                    |
|----------------------|------------------------------------|
| <code>__first</code> | An input iterator.                 |
| <code>__last</code>  | An input iterator.                 |
| <code>__n</code>     | Minimal initial number of buckets. |
| <code>__hf</code>    | A hash functor.                    |
| <code>__eq1</code>   | A key equality functor.            |
| <code>__a</code>     | An allocator object.               |

---

Create an unordered\_multiset consisting of copies of the elements from [\_\_first,\_\_last). This is linear in N (where N is distance(\_\_first,\_\_last)).

**unordered\_multiset()** [4/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    const unordered_multiset< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

**unordered\_multiset()** [5/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    unordered_multiset< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

**unordered\_multiset()** [6/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    initializer_list< value_type > __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_multiset from an initializer\_list.

**Parameters**

|                    |                                    |
|--------------------|------------------------------------|
| <code>__l</code>   | An initializer_list.               |
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eq1</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Create an unordered\_multiset consisting of copies of the elements in the list. This is linear in N (where N is \_\_l.size()).

**unordered\_multiset()** [7/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    const allocator_type & __a) [inline], [explicit]
```

Creates an unordered\_multiset with no elements.

**Parameters**

|                                                                                         |                      |
|-----------------------------------------------------------------------------------------|----------------------|
| <br>_a | An allocator object. |
|-----------------------------------------------------------------------------------------|----------------------|

**6.1003.4 Member Function Documentation****begin() [1/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_multiset`.

**begin() [2/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_multiset`.

**begin() [3/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|                                                                                           |                   |
|-------------------------------------------------------------------------------------------|-------------------|
| <br>_n | The bucket index. |
|-------------------------------------------------------------------------------------------|-------------------|

**Returns**

A read-only local iterator.

**begin() [4/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|                                                                                           |                   |
|-------------------------------------------------------------------------------------------|-------------------|
| <br>_n | The bucket index. |
|-------------------------------------------------------------------------------------------|-------------------|

**Returns**

A read-only local iterator.

**bucket\_count()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::bucket_count () const [inline],
[noexcept]
```

Returns the number of buckets of the unordered\_multiset.

**cbegin() [1/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_multiset.

**cbegin() [2/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin (
size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|       |                   |
|-------|-------------------|
| $\_n$ | The bucket index. |
|-------|-------------------|

**Returns**

A read-only local iterator.

**cend() [1/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_multiset.

**cend() [2/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend (
size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|                        |                   |
|------------------------|-------------------|
| <code>_↔<br/>_n</code> | The bucket index. |
|------------------------|-------------------|

**Returns**

A read-only local iterator.

**clear()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,  
typename _Alloc = allocator<_Value>>  
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in an `unordered_multiset`.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains() [1/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,  
typename _Alloc = allocator<_Value>>  
template<typename _Kt>  
auto std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::contains (   
    const _Kt & __x) const -> decltype(_M_h._M_find_tr(__x), void()), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                        |                                |
|------------------------|--------------------------------|
| <code>_↔<br/>_x</code> | Key of elements to be located. |
|------------------------|--------------------------------|

**Returns**

True if there is any element with the specified key.

**contains() [2/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,  
typename _Alloc = allocator<_Value>>  
bool std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::contains (   
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                        |                                |
|------------------------|--------------------------------|
| <code>_↔<br/>_x</code> | Key of elements to be located. |
|------------------------|--------------------------------|

**Returns**

True if there is any element with the specified key.

**count()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

|                  |                     |
|------------------|---------------------|
| <code>__x</code> | Element to located. |
|------------------|---------------------|

**Returns**

Number of elements with specified key.

**emplace()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Builds and insert an element into the unordered\_multiset.

**Parameters**

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__args</code> | Arguments used to generate an element. |
|---------------------|----------------------------------------|

**Returns**

An iterator that points to the inserted element.

Insertion requires amortized constant time.

**emplace\_hint()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Inserts an element into the unordered\_multiset.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__args</code> | Arguments used to generate the element to be inserted.                        |

**Returns**

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires amortized constant time.

**empty()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::empty () const [inline], [nodiscard],
[noexcept]
```

Returns true if the `unordered_multiset` is empty.

**end() [1/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_multiset`.

**end() [2/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_multiset`.

**end() [3/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

**Returns**

A read-only local iterator.

**end() [4/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
const_local_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::end (  
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|       |                   |
|-------|-------------------|
| $\_↔$ | The bucket index. |
| $\_n$ |                   |

**Returns**

A read-only local iterator.

**equal\_range()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, iterator > std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::equal↔
_range (
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

|       |                    |
|-------|--------------------|
| $\_↔$ | Key to be located. |
| $\_x$ |                    |

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

**equal\_range()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< const_iterator, const_iterator > std::unordered_multiset< _Value, _Hash, _Pred, _Alloc
>::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

|       |                    |
|-------|--------------------|
| $\_↔$ | Key to be located. |
| $\_x$ |                    |

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

**erase()** [1/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                 |                              |
|-----------------|------------------------------|
| <code>_↔</code> | Key of element to be erased. |
| <code>_X</code> |                              |

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase() [2/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_multiset`.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase() [3/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from an `unordered_multiset`.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    iterator __position) [inline]
```

Erases an element from an unordered\_multiset.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered\_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) [inline]
```

Tries to locate an element in an unordered\_multiset.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__x</code> | Element to be located. |
|------------------|------------------------|

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**find()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in an unordered\_multiset.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__x</code> | Element to be located. |
|------------------|------------------------|

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

**get\_allocator()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
allocator_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::get_allocator () const
[inline], [noexcept]
```

Returns the allocator object used by the unordered\_multiset.

**hash\_function()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
hasher std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::hash_function () const [inline]
```

Returns the hash functor object with which the unordered\_multiset was constructed.

**insert()** [1/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that inserts a range of elements.

**Parameters**

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

**insert()** [2/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x) [inline]
```

Inserts an element into the unordered\_multiset.

**Parameters**

|                  |                         |
|------------------|-------------------------|
| <code>__x</code> | Element to be inserted. |
|------------------|-------------------------|

**Returns**

An iterator that points to the inserted element.

Insertion requires amortized constant time.

**insert()** [3/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x) [inline]
```

Inserts an element into the unordered\_multiset.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>    | Element to be inserted.                                                       |

**Returns**

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert_hints)

Insertion requires amortized constant.

**insert()** [4/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    value_type && __x) [inline]
```

Inserts an element into the unordered\_multiset.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>    | Element to be inserted.                                                       |

**Returns**

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert_hints)

Insertion requires amortized constant.

**insert()** [5/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    initializer_list< value_type > __l) [inline]
```

Inserts a list of elements into the unordered\_multiset.

**Parameters**

|   |                                                                 |
|---|-----------------------------------------------------------------|
| ↩ | A std::initializer_list<value_type> of elements to be inserted. |
| ↩ |                                                                 |
| ↩ |                                                                 |
| ↩ |                                                                 |
| / |                                                                 |

Complexity similar to that of the range constructor.

**insert()** [6/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    value_type && __x) [inline]
```

Inserts an element into the unordered\_multiset.

**Parameters**

|     |                         |
|-----|-------------------------|
| ↩   | Element to be inserted. |
| __x |                         |

**Returns**

An iterator that points to the inserted element.

Insertion requires amortized constant time.

**key\_eq()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
key_equal std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::key_eq () const [inline]
```

Returns the key comparison object with which the unordered\_multiset was constructed.

**load\_factor()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::load_factor () const [inline],
[noexcept]
```

Returns the average number of elements per bucket.

**max\_bucket\_count()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_bucket_count () const
[inline], [noexcept]
```

Returns the maximum number of buckets of the unordered\_multiset.

**max\_load\_factor()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],
[noexcept]
```

Returns a positive number that the unordered\_multiset tries to keep the load factor less than or equal to.

**max\_load\_factor()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor (
    float __z) [inline]
```

Change the unordered\_multiset maximum load factor.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <code>__z</code> | The new maximum load factor. |
|------------------|------------------------------|

**max\_size()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_size () const [inline],
[noexcept]
```

Returns the maximum size of the unordered\_multiset.

**operator=()** [1/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
    const unordered_multiset< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

**operator=()** [2/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Unordered\_multiset list assignment operator.

**Parameters**

|                  |                      |
|------------------|----------------------|
| <code>__l</code> | An initializer_list. |
|------------------|----------------------|

This function fills an unordered\_multiset with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered\_multiset and that the resulting unordered\_multiset's size is the same as the number of elements assigned.

### operator=() [3/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::operator= (
    unordered_multiset<_Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

### rehash()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::rehash (
    size_type __n) [inline]
```

May rehash the unordered\_multiset.

#### Parameters

|                  |                            |
|------------------|----------------------------|
| <code>__n</code> | The new number of buckets. |
|------------------|----------------------------|

Rehash will occur only if the new number of buckets respect the unordered\_multiset maximum load factor.

### reserve()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::reserve (
    size_type __n) [inline]
```

Prepare the unordered\_multiset for a specified number of elements.

#### Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__n</code> | Number of elements required. |
|------------------|------------------------------|

Same as rehash(ceil(n / max\_load\_factor())).

### size()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the unordered\_multiset.

### swap()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::swap (
    unordered_multiset<_Value, _Hash, _Pred, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another unordered\_multiset.

## Parameters

|                 |                                                                |
|-----------------|----------------------------------------------------------------|
| <code>_↔</code> | An unordered_multiset of the same element and allocator types. |
| <code>_X</code> |                                                                |

This exchanges the elements between two sets in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

The documentation for this class was generated from the following file:

### 6.1005.1 Detailed Description

`template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>`  
**class** `std::unordered_set< _Value, _Hash, _Pred, _Alloc >`

A standard container composed of unique keys (containing at most one of each key value) in which the elements' keys are the elements themselves.

Since

C++11

### Template Parameters

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| <code>_Value</code> | Type of key objects.                                                              |
| <code>_Hash</code>  | Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .       |
| <code>_Pred</code>  | Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> . |
| <code>_Alloc</code> | Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .                  |

Meets the requirements of a `container`, and `unordered associative container`

Base is `_Hashtable`, dispatched at compile time via template alias `__uset_hashtable`.

### 6.1005.2 Member Typedef Documentation

#### `allocator_type`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,

template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::key_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::key_type
Public typedefs.
```

**local\_iterator**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::local_↵
iterator
Iterator-related typedefs.
```

**pointer**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::pointer std::unordered_set< _Value, _Hash, _Pred, _Alloc >::pointer
Iterator-related typedefs.
```

**reference**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::reference std::unordered_set< _Value, _Hash, _Pred, _Alloc >::reference
Iterator-related typedefs.
```

**size\_type**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::size_type
Iterator-related typedefs.
```

**value\_type**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::value_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::value_type
Public typedefs.
```

**6.1005.3 Constructor & Destructor Documentation****unordered\_set()** [1/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set () [default]
```

Default constructor.

### unordered\_set() [2/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    size_type __n,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

#### Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eq1</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

### unordered\_set() [3/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
template<typename _InputIterator>
```

```
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_set from a range.

#### Parameters

|                      |                                    |
|----------------------|------------------------------------|
| <code>__first</code> | An input iterator.                 |
| <code>__last</code>  | An input iterator.                 |
| <code>__n</code>     | Minimal initial number of buckets. |
| <code>__hf</code>    | A hash functor.                    |
| <code>__eq1</code>   | A key equality functor.            |
| <code>__a</code>     | An allocator object.               |

Create an unordered\_set consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is distance(`__first`,`__last`)).

### unordered\_set() [4/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
std::unordered_set<_Value, _Hash, _Pred, _Alloc >::unordered_set (
    const unordered_set<_Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

#### unordered\_set() [5/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set<_Value, _Hash, _Pred, _Alloc >::unordered_set (
    unordered_set<_Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

#### unordered\_set() [6/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set<_Value, _Hash, _Pred, _Alloc >::unordered_set (
    const allocator_type & __a) [inline], [explicit]
```

Creates an unordered\_set with no elements.

##### Parameters

|                  |                      |
|------------------|----------------------|
| <code>__a</code> | An allocator object. |
|------------------|----------------------|

#### unordered\_set() [7/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set<_Value, _Hash, _Pred, _Alloc >::unordered_set (
    initializer_list<value_type> & __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eqf = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_set from an initializer\_list.

##### Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__l</code>   | An initializer_list.               |
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eqf</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Create an unordered\_set consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

## 6.1005.4 Member Function Documentation

#### begin() [1/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_set`.

#### **begin()** [2/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_set`.

#### **begin()** [3/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

#### **Parameters**

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

#### **Returns**

A read-only local iterator.

#### **begin()** [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

#### **Parameters**

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

#### **Returns**

A read-only local iterator.

#### **bucket\_count()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::bucket_count () const [inline],
[noexcept]
```

Returns the number of buckets of the `unordered_set`.

**cbegin()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_set.

**cbegin()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|       |                   |
|-------|-------------------|
| $\_n$ | The bucket index. |
|-------|-------------------|

**Returns**

A read-only local iterator.

**cend()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_set.

**cend()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cend (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|       |                   |
|-------|-------------------|
| $\_n$ | The bucket index. |
|-------|-------------------|

**Returns**

A read-only local iterator.

**clear()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in an `unordered_set`. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt>
auto std::unordered_set< _Value, _Hash, _Pred, _Alloc >::contains (
    const _Kt & __k) const -> decltype(_M_h._M_find_tr(__k), void()), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                                                                                   |                                |
|-----------------------------------------------------------------------------------|--------------------------------|
|  | Key of elements to be located. |
|  |                                |

**Returns**

True if there is any element with the specified key.

**contains()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_set< _Value, _Hash, _Pred, _Alloc >::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                                                                                     |                                |
|-------------------------------------------------------------------------------------|--------------------------------|
|  | Key of elements to be located. |
|  |                                |

**Returns**

True if there is any element with the specified key.

**count()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

|                 |                     |
|-----------------|---------------------|
| <code>_↔</code> | Element to located. |
| <code>_X</code> |                     |

**Returns**

Number of elements with specified key.

This function only makes sense for unordered\_multisets; for unordered\_set the result will either be 0 (not present) or 1 (present).

**emplace()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Attempts to build and insert an element into the unordered\_set.

**Parameters**

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__args</code> | Arguments used to generate an element. |
|---------------------|----------------------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the unordered\_set. An unordered\_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered\_set.

Insertion requires amortized constant time.

**emplace\_hint()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Attempts to insert an element into the unordered\_set.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__args</code> | Arguments used to generate the element to be inserted.                        |

**Returns**

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires amortized constant time.

**empty()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_set< _Value, _Hash, _Pred, _Alloc >::empty () const [inline], [nodiscard],
[noexcept]
```

Returns true if the `unordered_set` is empty.

**end() [1/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_set`.

**end() [2/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_set`.

**end() [3/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|                     |                   |
|---------------------|-------------------|
| <code>__args</code> | The bucket index. |
| <code>__n</code>    |                   |

**Returns**

A read-only local iterator.

**end() [4/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

#### Parameters

|                     |                   |
|---------------------|-------------------|
| $\leftarrow$<br>__n | The bucket index. |
|---------------------|-------------------|

#### Returns

A read-only local iterator.

#### equal\_range() [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, iterator > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::equal_range
(
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

#### Parameters

|                     |                    |
|---------------------|--------------------|
| $\leftarrow$<br>__x | Key to be located. |
|---------------------|--------------------|

#### Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

#### equal\_range() [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< const_iterator, const_iterator > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::
::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

#### Parameters

|                     |                    |
|---------------------|--------------------|
| $\leftarrow$<br>__x | Key to be located. |
|---------------------|--------------------|

#### Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

**erase()** [1/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <code>__x</code> | Key of element to be erased. |
|------------------|------------------------------|

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_set`. For an `unordered_set` the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [2/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a `[__first, __last)` range of elements from an `unordered_set`.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [3/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from an `unordered_set`.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    iterator __position) [inline]
```

Erases an element from an `unordered_set`.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) [inline]
```

Tries to locate an element in an `unordered_set`.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__x</code> | Element to be located. |
|------------------|------------------------|

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

**find()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in an `unordered_set`.

**Parameters**

|                 |                        |
|-----------------|------------------------|
| <code>_↔</code> | Element to be located. |
| <code>_X</code> |                        |

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**get\_allocator()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
allocator_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::get_allocator () const [inline],
[noexcept]
```

Returns the allocator object used by the `unordered_set`.

**hash\_function()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
hasher std::unordered_set< _Value, _Hash, _Pred, _Alloc >::hash_function () const [inline]
```

Returns the hash functor object with which the `unordered_set` was constructed.

**insert()** [1/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

**Parameters**

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

**insert()** [2/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x) [inline]
```

Attempts to insert an element into the `unordered_set`.

## Parameters

|                  |                         |
|------------------|-------------------------|
| <code>__x</code> | Element to be inserted. |
|------------------|-------------------------|

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the unordered\_set. An unordered\_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered\_set.

Insertion requires amortized constant time.

**insert()** [3/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x) [inline]
```

Attempts to insert an element into the unordered\_set.

## Parameters

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>    | Element to be inserted.                                                       |

## Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires amortized constant.

**insert()** [4/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    value_type && __x) [inline]
```

Attempts to insert an element into the unordered\_set.

## Parameters

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>    | Element to be inserted.                                                       |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires amortized constant.

**insert()** [5/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of elements into the `unordered_set`.

**Parameters**

|   |                                                                                    |
|---|------------------------------------------------------------------------------------|
| ↩ | A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted. |
| ↩ |                                                                                    |
| ↩ |                                                                                    |
| ↩ |                                                                                    |
| / |                                                                                    |

Complexity similar to that of the range constructor.

**insert()** [6/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    value_type && __x) [inline]
```

Attempts to insert an element into the `unordered_set`.

**Parameters**

|     |                         |
|-----|-------------------------|
| ↩   | Element to be inserted. |
| __x |                         |

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a `bool` that is true if the element was actually inserted.

This function attempts to insert an element into the `unordered_set`. An `unordered_set` relies on unique keys and thus an element is only inserted if it is not already present in the `unordered_set`.

Insertion requires amortized constant time.

**key\_eq()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
key_equal std::unordered_set< _Value, _Hash, _Pred, _Alloc >::key_eq () const [inline]
```

Returns the key comparison object with which the `unordered_set` was constructed.

**load\_factor()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_set< _Value, _Hash, _Pred, _Alloc >::load_factor () const [inline], [noexcept]
```

Returns the average number of elements per bucket.

**max\_bucket\_count()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_bucket_count () const [inline],
[noexcept]
```

Returns the maximum number of buckets of the unordered\_set.

**max\_load\_factor()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],
[noexcept]
```

Returns a positive number that the unordered\_set tries to keep the load factor less than or equal to.

**max\_load\_factor()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_load_factor (
    float __z) [inline]
```

Change the unordered\_set maximum load factor.

**Parameters**

|                                                                                     |                              |
|-------------------------------------------------------------------------------------|------------------------------|
|  | The new maximum load factor. |
| <b>_z</b>                                                                           |                              |

**max\_size()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the maximum size of the unordered\_set.

**operator=()** [1/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
    const unordered_set< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

**operator=()** [2/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Unordered\_set list assignment operator.

**Parameters**

|   |                      |
|---|----------------------|
| ↵ | An initializer_list. |
| ↵ |                      |
| ↵ |                      |
| ↵ |                      |
| / |                      |

This function fills an unordered\_set with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the unordered\_set and that the resulting unordered\_set's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
    unordered_set< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

**rehash()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::rehash (
    size_type __n) [inline]
```

May rehash the unordered\_set.

**Parameters**

|   |                            |
|---|----------------------------|
| ↵ | The new number of buckets. |
| n |                            |

Rehash will occur only if the new number of buckets respect the unordered\_set maximum load factor.

**reserve()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::reserve (
    size_type __n) [inline]
```

Prepare the unordered\_set for a specified number of elements.

**Parameters**

|   |                              |
|---|------------------------------|
| ↵ | Number of elements required. |
| n |                              |

---

Same as `rehash(ceil(n / max_load_factor()))`.

**size()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the `unordered_set`.

**swap()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::swap (
    unordered_set< _Value, _Hash, _Pred, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another `unordered_set`.

**Parameters**

|                  |                                                                        |
|------------------|------------------------------------------------------------------------|
| <code>__x</code> | An <code>unordered_set</code> of the same element and allocator types. |
|------------------|------------------------------------------------------------------------|

This exchanges the elements between two sets in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

### 6.1006.1 Detailed Description

A non-thread-safe memory resource that manages pools of fixed-size blocks.

Since

C++17

### 6.1006.2 Member Function Documentation

#### do\_allocate()

```
void * std::pmr::unsynchronized_pool_resource::do_allocate (
    size_t __bytes,
    size_t __alignment) [override], [protected], [virtual]
```

Implements [std::pmr::memory\\_resource](#).

#### do\_deallocate()

```
void std::pmr::unsynchronized_pool_resource::do_deallocate (
    void * __p,
    size_t __bytes,
    size_t __alignment) [override], [protected], [virtual]
```

Implements [std::pmr::memory\\_resource](#).

#### do\_is\_equal()

```
bool std::pmr::unsynchronized_pool_resource::do_is_equal (
    const memory\_resource & __other) const [inline], [override], [protected], [virtual],
[noexcept]
```

Implements [std::pmr::memory\\_resource](#).

The documentation for this class was generated from the following file:

## 6.1007 `std::uses_allocator< typename, typename >` Struct Template Reference

### 6.1007.1 Detailed Description

```
template<typename, typename>
struct std::uses_allocator< typename, typename >
```

Declare `uses_allocator` so it can be specialized in `<queue>` etc.  
 The documentation for this struct was generated from the following file:

- [memoryfwd.h](#)

## 6.1008 `std::uses_allocator< tuple< _Types... >, _Alloc >` Struct Template Reference

```
#include <tuple>
```

### 6.1008.1 Detailed Description

```
template<typename... _Types, typename _Alloc>
struct std::uses_allocator< tuple< _Types... >, _Alloc >
```

Partial specialization for tuples.  
 The documentation for this struct was generated from the following file:

- [tuple](#)

## 6.1009 `std::chrono::utc_clock` Class Reference

```
#include <chrono>
```

### Public Types

- using `duration`
- using `period`
- using `rep`
- using `time_point`

### Static Public Member Functions

- template<typename `_Duration`>  
   static `utc_time< common_type_t< _Duration, seconds > >` `from_sys` (const `sys_time< _Duration >` &\_\_t)
- static `time_point now` ()
- template<typename `_Duration`>  
   static `sys_time< common_type_t< _Duration, seconds > >` `to_sys` (const `utc_time< _Duration >` &\_\_t)

### Static Public Attributes

- static constexpr bool `is_steady`

### 6.1009.1 Detailed Description

A clock that measures Universal Coordinated Time (UTC).  
 The epoch is 1970-01-01 00:00:00.  
 Since

C++20

The documentation for this class was generated from the following file:

## Friends

- `struct _Array<_Tp>`

### 6.1010.1 Detailed Description

```
template<class _Tp>
class std::valarray<_Tp>
```

Smart array designed to support numeric processing.

A valarray is an array that provides constraints intended to allow for effective optimization of numeric array processing by reducing the aliasing that can result from pointer representations. It represents a one-dimensional array from which different multidimensional subsets can be accessed and modified.

#### Template Parameters

|                  |                              |
|------------------|------------------------------|
| <code>_Tp</code> | Type of object in the array. |
|------------------|------------------------------|

### 6.1010.2 Constructor & Destructor Documentation

#### valarray()

```
template<class _Tp>
std::valarray<_Tp>::valarray (
    const _Tp * __restrict__,
    size_t )
```

Construct an array initialized to the first  $n$  elements of  $t$ .

References [valarray\(\)](#).

### 6.1010.3 Member Function Documentation

#### operator"!"()

```
template<class _Tp>
_UnaryOp< __logical_not >::_Rt std::valarray<_Tp>::operator! () const
```

Return a new valarray by applying unary ! to each element.

#### operator%=( ) [1/2]

```
template<class _Tp>
valarray<_Tp> & std::valarray<_Tp>::operator%= (
    const _Tp & )
```

Set each element  $e$  of array to  $e \% t$ .

References [valarray\(\)](#).

#### operator%=( ) [2/2]

```
template<class _Tp>
valarray<_Tp> & std::valarray<_Tp>::operator%= (
    const valarray<_Tp> & )
```

Modulo elements of array by corresponding elements of  $v$ .

References [valarray\(\)](#).

#### operator&=( ) [1/2]

```
template<class _Tp>
valarray<_Tp> & std::valarray<_Tp>::operator&= (
    const _Tp & )
```

Set each element  $e$  of array to  $e \& t$ .

References [valarray\(\)](#).

**operator&=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator&= (
    const valarray< _Tp > & )
```

Logical and corresponding elements of *v* with elements of array.

References [valarray\(\)](#).

**operator\*=()** [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator*= (
    const _Tp & )
```

Multiply each element of array by *t*.

References [valarray\(\)](#).

**operator\*=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator*= (
    const valarray< _Tp > & )
```

Multiply elements of array by corresponding elements of *v*.

References [valarray\(\)](#).

**operator+()**

```
template<class _Tp>
_UnaryOp< __unary_plus >::_Rt std::valarray< _Tp >::operator+ () const
```

Return a new valarray by applying unary + to each element.

**operator+=()** [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator+= (
    const _Tp & )
```

Add *t* to each element of array.

References [valarray\(\)](#).

**operator+=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator+= (
    const valarray< _Tp > & )
```

Add corresponding elements of *v* to elements of array.

References [valarray\(\)](#).

**operator-()**

```
template<class _Tp>
_UnaryOp< __negate >::_Rt std::valarray< _Tp >::operator- () const
```

Return a new valarray by applying unary - to each element.

**operator-=()** [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator-= (
    const _Tp & )
```

Subtract *t* to each element of array.

References [valarray\(\)](#).

**operator-=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator-= (
    const valarray< _Tp > & )
```

Subtract corresponding elements of *v* from elements of array.

References [valarray\(\)](#).

**operator/=()** [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator/= (
    const _Tp & )
```

Divide each element of array by *t*.

References [valarray\(\)](#).

**operator/=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator/= (
    const valarray< _Tp > & )
```

Divide elements of array by corresponding elements of *v*.

References [valarray\(\)](#).

**operator<<=()** [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator<<= (
    const _Tp & )
```

Left shift each element *e* of array by *t* bits.

References [valarray\(\)](#).

**operator<<=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator<<= (
    const valarray< _Tp > & )
```

Left shift elements of array by corresponding elements of *v*.

**operator>>=()** [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator>>= (
    const _Tp & )
```

Right shift each element *e* of array by *t* bits.

References [valarray\(\)](#).

**operator>>=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator>>= (
    const valarray< _Tp > & )
```

Right shift elements of array by corresponding elements of *v*.

References [valarray\(\)](#).

**operator^=()** [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator^= (
    const _Tp & )
```

Set each element *e* of array to  $e \wedge t$ .

References [valarray\(\)](#).

**operator^=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator^= (
    const valarray< _Tp > & )
```

Logical xor corresponding elements of *v* with elements of array.

References [valarray\(\)](#).

**operator" |=()** [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator|= (
    const _Tp & )
```

Set each element *e* of array to  $e \mid t$ .

**operator" |=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator|= (
    const valarray< _Tp > & )
```

Logical or corresponding elements of *v* with elements of array.

References [valarray\(\)](#).

**operator~()**

```
template<class _Tp>
_UnaryOp< __bitwise_not >::_Rt std::valarray< _Tp >::operator~ () const
```

Return a new valarray by applying unary  $\sim$  to each element.

### 6.1012.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::vector< _Tp, _Alloc >
```

A standard container which offers fixed time access to individual elements in any order.

Since

C++98

#### Template Parameters

|                     |                                                                 |
|---------------------|-----------------------------------------------------------------|
| <code>_Tp</code>    | Type of element.                                                |
| <code>_Alloc</code> | Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> . |

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `push_front` and `pop_front`.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ( `[]` ) access is also provided as with C-style arrays.

### 6.1012.2 Constructor & Destructor Documentation

#### **vector()** [1/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
```

```
std::vector< _Tp, _Alloc >::vector () [default]
```

Creates a vector with no elements.

Referenced by [insert\(\)](#), and [operator=\(\)](#).

#### **vector()** [2/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
```

```
std::vector< _Tp, _Alloc >::vector (
    const allocator_type & __a) [inline], [explicit], [constexpr], [noexcept]
```

Creates a vector with no elements.

#### Parameters

|                  |                      |
|------------------|----------------------|
| <code>__a</code> | An allocator object. |
|------------------|----------------------|

#### **vector()** [3/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
```

```
std::vector< _Tp, _Alloc >::vector (
    size_type __n,
    const allocator_type & __a = allocator_type()) [inline], [explicit], [constexpr]
```

Creates a vector with default constructed elements.

#### Parameters

|                  |                                             |
|------------------|---------------------------------------------|
| <code>__n</code> | The number of elements to initially create. |
|------------------|---------------------------------------------|

|                         |               |
|-------------------------|---------------|
| <b><code>__a</code></b> | An allocator. |
|-------------------------|---------------|

This constructor fills the vector with `__n` default constructed elements.

#### **vector()** [4/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc >::vector (
    size_type __n,
    const value_type & __value,
    const allocator_type & __a = allocator_type()) [inline], [constexpr]
```

Creates a vector with copies of an exemplar element.

##### Parameters

|                             |                                             |
|-----------------------------|---------------------------------------------|
| <b><code>__n</code></b>     | The number of elements to initially create. |
| <b><code>__value</code></b> | An element to copy.                         |
| <b><code>__a</code></b>     | An allocator.                               |

This constructor fills the vector with `__n` copies of `__value`.

#### **vector()** [5/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc >::vector (
    const vector<_Tp, _Alloc > & __x) [inline], [constexpr]
```

Vector copy constructor.

##### Parameters

|                         |                                                    |
|-------------------------|----------------------------------------------------|
| <b><code>__x</code></b> | A vector of identical element and allocator types. |
|-------------------------|----------------------------------------------------|

All the elements of `__x` are copied, but any unused capacity in `__x` will not be copied (i.e. `capacity() == size()` in the new vector).

The newly-created vector uses a copy of the allocator object used by `__x` (unless the allocator traits dictate a different object).

#### **vector()** [6/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc >::vector (
    vector<_Tp, _Alloc > && ) [default], [noexcept]
```

Vector move constructor.

The newly-created vector contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified vector.

#### **vector()** [7/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc >::vector (
```

```
const vector< _Tp, _Alloc > & __x,
const __type_identity_t< allocator_type > & __a) [inline], [constexpr]
```

Copy constructor with alternative allocator.

#### vector() [8/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    vector< _Tp, _Alloc > && __rv,
    const __type_identity_t< allocator_type > & __m) [inline], [constexpr], [noexcept]
```

Move constructor with alternative allocator.

#### vector() [9/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    initializer_list< value_type > __l,
    const allocator_type & __a = allocator_type()) [inline], [constexpr]
```

Builds a vector from an initializer list.

##### Parameters

|                          |                      |
|--------------------------|----------------------|
| $\leftrightarrow$<br>__l | An initializer_list. |
| $\leftrightarrow$<br>__a | An allocator.        |

Create a vector consisting of copies of the elements in the initializer\_list \_\_l.

This will call the element type's copy constructor N times (where N is \_\_l.size()) and do no memory reallocation.

#### vector() [10/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
std::vector< _Tp, _Alloc >::vector (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a = allocator_type()) [inline], [constexpr]
```

Builds a vector from a range.

##### Parameters

|         |                    |
|---------|--------------------|
| __first | An input iterator. |
| __last  | An input iterator. |
| __a     | An allocator.      |

Create a vector consisting of copies of the elements from [first,last).

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor N times (where N is distance(first,last)) and do no memory reallocation. But if only input iterators are used, then this will do at most 2N calls to the copy constructor, and logN memory reallocations.

**~vector()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc >::~~vector() [inline], [constexpr], [noexcept]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**6.1012.3 Member Function Documentation****\_M\_allocate\_and\_copy()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _ForwardIterator>
pointer std::vector<_Tp, _Alloc >::_M_allocate_and_copy (
    size_type __n,
    _ForwardIterator __first,
    _ForwardIterator __last) [inline], [constexpr], [protected]
```

Memory expansion handler. Uses the member allocation function to obtain *n* bytes of memory, and then copies [*first*,*last*) into it.

Referenced by [operator=\(\)](#), and [reserve\(\)](#).

**\_M\_range\_check()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc >::_M_range_check (
    size_type __n) const [inline], [constexpr], [protected]
```

Safety check used only from [at\(\)](#).

Referenced by [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp > >::at\(\)](#), and [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp > >::at\(\)](#).

**assign() [1/3]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
void std::vector<_Tp, _Alloc >::assign (
    _InputIterator __first,
    _InputIterator __last) [inline], [constexpr]
```

Assigns a range to a vector.

**Parameters**

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

This function fills a vector with copies of the elements in the range [`__first`,`__last`).

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

**assign() [2/3]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc >::assign (
    initializer_list<value_type > __l) [inline], [constexpr]
```

Assigns an initializer list to a vector.

**Parameters**

|                      |                      |
|----------------------|----------------------|
| $\leftrightarrow$    | An initializer_list. |
| $\_ \leftrightarrow$ |                      |
| $\leftrightarrow$    |                      |
| $\_ \leftrightarrow$ |                      |
| <i>l</i>             |                      |

This function fills a vector with copies of the elements in the initializer list *l*.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

**assign()** [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::assign (
    size_type __n,
    const value_type & __val) [inline], [constexpr]
```

Assigns a given value to a vector.

**Parameters**

|              |                                    |
|--------------|------------------------------------|
| <i>__n</i>   | Number of elements to be assigned. |
| <i>__val</i> | Value to be assigned.              |

This function fills a vector with *\_\_n* copies of the given value. Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

**at()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector<_Tp, _Alloc>::at (
    size_type __n) [inline], [nodiscard], [constexpr]
```

Provides access to the data contained in the vector.

**Parameters**

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| $\_ \leftrightarrow$ | The index of the element for which data should be accessed. |
| <i>__n</i>           |                                                             |

**Returns**

Read/write reference to data.

**Exceptions**

|                          |                                    |
|--------------------------|------------------------------------|
| <i>std::out_of_range</i> | If <i>__n</i> is an invalid index. |
|--------------------------|------------------------------------|

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws *out\_of\_range* if the check fails.

**at()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector<_Tp, _Alloc>::at (
    size_type __n) const [inline], [nodiscard], [constexpr]
```

Provides access to the data contained in the vector.

## Parameters

|                     |                                                             |
|---------------------|-------------------------------------------------------------|
| $\leftarrow$<br>$n$ | The index of the element for which data should be accessed. |
|---------------------|-------------------------------------------------------------|

## Returns

Read-only (constant) reference to data.

## Exceptions

|                                |                                          |
|--------------------------------|------------------------------------------|
| <code>std::out_of_range</code> | If <code>__n</code> is an invalid index. |
|--------------------------------|------------------------------------------|

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

**back()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector<_Tp, _Alloc>::back () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the vector.

## back() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector<_Tp, _Alloc >::back () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write reference to the data at the last element of the vector.

**begin()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector< _Tp, _Alloc >::begin () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

**begin()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::begin () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Referenced by `std::vector<_Tp, polymorphic_allocator<_Tp>>::vector()`, `std::vector<_Tp, polymorphic_allocator<_Tp>>::crend()`, `std::vector<_Tp, polymorphic_allocator<_Tp>>::empty()`, `std::vector<_Tp, polymorphic_allocator<_Tp>>::erase()`, `std::vector<_Tp, polymorphic_allocator<_Tp>>::erase()`, `std::vector<_Tp, polymorphic_allocator<_Tp>>::front()`, `std::vector<_Tp, polymorphic_allocator<_Tp>>::front()`, `std::vector<_Tp, polymorphic_allocator<_Tp>>::insert()`, `std::vector<_Tp, polymorphic_allocator<_Tp>>::insert()`, `std::vector<_Tp, polymorphic_allocator<_Tp>>::insert()`, `__gnu_parallel::multiway_merge_exact_splitting()`, `std::operator<=>()`, `operator=()`, `std::operator==()`, `std::vector<_Tp, polymorphic_allocator<_Tp>>::rend()` and `std::vector<_Tp, polymorphic_allocator<_Tp>>::rend()`.

**capacity()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::vector< _Tp, _Alloc >::capacity () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns the total number of elements that the vector can hold before needing to allocate more memory.

Referenced by [operator=\(\)](#), and [reserve\(\)](#).

**cbegin()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector< _Tp, _Alloc >::cbegin () const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Referenced by [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::erase\(\)](#), [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::erase\(\)](#), [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::insert\(\)](#), [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::insert\(\)](#), and [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::insert\(\)](#).

**cend()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector< _Tp, _Alloc >::cend () const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

**clear()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::clear () [inline], [constexpr], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Referenced by [operator=\(\)](#).

**crbegin()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector< _Tp, _Alloc >::crbegin () const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

**crend()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector< _Tp, _Alloc >::crend () const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

**data()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
_Tp * std::vector< _Tp, _Alloc >::data () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a pointer such that `[data(), data() + size())` is a valid range. For a non-empty vector, `data() == &front()`.

**emplace()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename... _Args>
iterator std::vector< _Tp, _Alloc >::emplace (
    const_iterator __position,
    _Args &&... __args) [inline], [constexpr]
```

Inserts an object in vector before specified iterator.

**Parameters**

|                         |                                   |
|-------------------------|-----------------------------------|
| <code>__position</code> | A const_iterator into the vector. |
| <code>__args</code>     | Arguments.                        |

**Returns**

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.

**empty()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
bool std::vector< _Tp, _Alloc >::empty () const [inline], [nodiscard], [constexpr], [noexcept]
```

Returns true if the vector is empty. (Thus begin() would equal end().)

Referenced by [std::piecewise\\_constant\\_distribution< \\_RealType >::densities\(\)](#), [std::piecewise\\_linear\\_distribution< \\_RealType >::densities\(\)](#) and [std::discrete\\_distribution< \\_IntType >::probabilities\(\)](#).

**end()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector< _Tp, _Alloc >::end () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

**end()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::end () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Referenced by [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::vector\(\)](#), [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::back\(\)](#), [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::back\(\)](#), [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::rbegin\(\)](#), [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::empty\(\)](#), [\\_\\_gnu\\_parallel::multiway\\_merge\\_exact\\_splitting\(\)](#), [std::operator<=>\(\)](#), [operator=\(\)](#), [std::operator==\(\)](#), [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::rbegin\(\)](#), and [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::rbegin\(\)](#).

**erase()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::erase (
```

```
const_iterator __first,
const_iterator __last) [inline], [constexpr]
```

Remove a range of elements.

#### Parameters

|                      |                                                              |
|----------------------|--------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the first element to be erased.         |
| <code>__last</code>  | Iterator pointing to one past the last element to be erased. |

#### Returns

An iterator pointing to the element pointed to by `__last` prior to erasing (or `end()`).

This function will erase the elements in the range `[__first,__last)` and shorten the vector accordingly.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

#### **erase()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::erase (
    const_iterator __position) [inline], [constexpr]
```

Remove element at given position.

#### Parameters

|                         |                                            |
|-------------------------|--------------------------------------------|
| <code>__position</code> | Iterator pointing to element to be erased. |
|-------------------------|--------------------------------------------|

#### Returns

An iterator pointing to the next element (or `end()`).

This function will erase the element at the given position and thus shorten the vector by one.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

#### **front()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::front () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the vector.

#### **front()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::front () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write reference to the data at the first element of the vector.

**get\_allocator()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
allocator_type std::_Vector_base< _Tp, _Alloc >::get_allocator () const [inline], [constexpr],
[noexcept]
```

Get a copy of the memory allocation object.

References [get\\_allocator\(\)](#).

Referenced by [get\\_allocator\(\)](#).

**insert()** [1/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>>
iterator std::vector< _Tp, _Alloc >::insert (
    const_iterator __position,
    _InputIterator __first,
    _InputIterator __last) [inline], [constexpr]
```

Inserts a range into the vector.

**Parameters**

|                         |                                   |
|-------------------------|-----------------------------------|
| <code>__position</code> | A const_iterator into the vector. |
| <code>__first</code>    | An input iterator.                |
| <code>__last</code>     | An input iterator.                |

**Returns**

An iterator that points to the inserted data.

This function will insert copies of the data in the range [`__first`,`__last`) into the vector before the location specified by *pos*. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

**insert()** [2/5]

```
template<typename _Tp, typename _Alloc>
vector< _Tp, _Alloc >::iterator vector::insert (
    const_iterator __position,
    const value_type & __x) [constexpr]
```

Inserts given value into vector before specified iterator.

**Parameters**

|                         |                                   |
|-------------------------|-----------------------------------|
| <code>__position</code> | A const_iterator into the vector. |
| <code>__x</code>        | Data to be inserted.              |

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

References [vector\(\)](#), [std::begin\(\)](#), [std::cbegin\(\)](#), [std::end\(\)](#), [insert\(\)](#), and [std::move\(\)](#).

Referenced by [insert\(\)](#).

**insert()** [3/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::insert (
    const_iterator __position,
    initializer_list< value_type > __l) [inline], [constexpr]
```

Inserts an initializer\_list into the vector.

**Parameters**

|                         |                              |
|-------------------------|------------------------------|
| <code>__position</code> | An iterator into the vector. |
| <code>__l</code>        | An initializer_list.         |

This function will insert copies of the data in the initializer\_list *l* into the vector before the location specified by *position*. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

**insert()** [4/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::insert (
    const_iterator __position,
    size_type __n,
    const value_type & __x) [inline], [constexpr]
```

Inserts a number of copies of given data into the vector.

**Parameters**

|                         |                                    |
|-------------------------|------------------------------------|
| <code>__position</code> | A const_iterator into the vector.  |
| <code>__n</code>        | Number of elements to be inserted. |
| <code>__x</code>        | Data to be inserted.               |

**Returns**

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by *position*. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

**insert()** [5/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::insert (
    const_iterator __position,
    value_type && __x) [inline], [constexpr]
```

Inserts given rvalue into vector before specified iterator.

**Parameters**

|                         |                                   |
|-------------------------|-----------------------------------|
| <code>__position</code> | A const_iterator into the vector. |
| <code>__x</code>        | Data to be inserted.              |

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

**max\_size()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::vector<_Tp, _Alloc>::max_size() const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns the `size()` of the largest possible vector.

Referenced by [reserve\(\)](#).

**operator=()** [1/3]

```
template<typename _Tp, typename _Alloc>
vector<_Tp, _Alloc> & vector::operator= (
    const vector<_Tp, _Alloc> & __x) [constexpr]
```

Vector assignment operator.

**Parameters**

|                  |                                                    |
|------------------|----------------------------------------------------|
| <code>__x</code> | A vector of identical element and allocator types. |
|------------------|----------------------------------------------------|

All the elements of `__x` are copied, but any unused capacity in `__x` will not be copied.

Whether the allocator is copied depends on the allocator traits.

References [vector\(\)](#), [std::\\_\\_addressof\(\)](#), [std::\\_Destroy\(\)](#), [\\_M\\_allocate\\_and\\_copy\(\)](#), [begin\(\)](#), [capacity\(\)](#), [clear\(\)](#), [std::end\(\)](#), [end\(\)](#), [std::size\(\)](#), and [size\(\)](#).

**operator=()** [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
vector & std::vector<_Tp, _Alloc>::operator= (
    initializer_list<value_type> __l) [inline], [constexpr]
```

Vector list assignment operator.

**Parameters**

|                  |                                    |
|------------------|------------------------------------|
| <code>__l</code> | An <code>initializer_list</code> . |
|------------------|------------------------------------|

This function fills a vector with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
vector & std::vector<_Tp, _Alloc>::operator= (
    vector<_Tp, _Alloc> && __x) [inline], [constexpr], [noexcept]
```

Vector move assignment operator.

## Parameters

|                  |                                                    |
|------------------|----------------------------------------------------|
| <code>__x</code> | A vector of identical element and allocator types. |
|------------------|----------------------------------------------------|

The contents of `__x` are moved into this vector (without copying, if the allocators permit it). Afterwards `__x` is a valid, but unspecified vector.

Whether the allocator is moved depends on the allocator traits.

**operator[]()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector<_Tp, _Alloc >::operator[] (
    size_type __n) const [inline], [nodiscard], [constexpr], [noexcept]
```

Subscript access to the data contained in the vector.

## Parameters

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| <code>__n</code> | The index of the element for which data should be accessed. |
|------------------|-------------------------------------------------------------|

## Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

**operator[]()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector<_Tp, _Alloc >::operator[] (
    size_type __n) [inline], [nodiscard], [constexpr], [noexcept]
```

Subscript access to the data contained in the vector.

## Parameters

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| <code>__n</code> | The index of the element for which data should be accessed. |
|------------------|-------------------------------------------------------------|

## Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

**pop\_back()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc >::pop_back () [inline], [constexpr], [noexcept]
```

Removes last element.

This is a typical stack operation. It shrinks the vector by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

**push\_back()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::push_back (
    const value_type & __x) [inline], [constexpr]
```

Add data to the end of the vector.

**Parameters**

|                                                                                   |                   |
|-----------------------------------------------------------------------------------|-------------------|
|  | Data to be added. |
| <code>__x</code>                                                                  |                   |

This is a typical stack operation. The function creates an element at the end of the vector and assigns the given data to it. Due to the nature of a vector this operation can be done in constant time if the vector has preallocated space available.

**rbegin()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector< _Tp, _Alloc >::rbegin () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

**rbegin()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::vector< _Tp, _Alloc >::rbegin () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

**rend()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector< _Tp, _Alloc >::rend () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

**rend()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::vector< _Tp, _Alloc >::rend () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

**reserve()**

```
template<typename _Tp, typename _Alloc>
void vector::reserve (
    size_type __n) [constexpr]
```

Attempt to preallocate enough memory for specified number of elements.

## Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__n</code> | Number of elements required. |
|------------------|------------------------------|

## Exceptions

|                                |                                               |
|--------------------------------|-----------------------------------------------|
| <code>std::length_error</code> | If <i>n</i> exceeds <code>max_size()</code> . |
|--------------------------------|-----------------------------------------------|

This function attempts to reserve enough memory for the vector to hold the specified number of elements. If the number requested is more than `max_size()`, `length_error` is thrown.

The advantage of this function is that if optimal code is a necessity and the user can determine the number of elements that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of vector data.

References [std::Destroy\(\)](#), [\\_M\\_allocate\\_and\\_copy\(\)](#), [capacity\(\)](#), [max\\_size\(\)](#), and [std::size\(\)](#).

**resize()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::resize (
    size_type __new_size) [inline], [constexpr]
```

Resizes the vector to the specified number of elements.

## Parameters

|                         |                                               |
|-------------------------|-----------------------------------------------|
| <code>__new_size</code> | Number of elements the vector should contain. |
|-------------------------|-----------------------------------------------|

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise default constructed elements are appended.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_shrink\\_and\\_double\(\)](#), and [\\_\\_gnu\\_parallel::multiway\\_merge\\_exact\\_splitting\(\)](#).

**resize()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::resize (
    size_type __new_size,
    const value_type & __x) [inline], [constexpr]
```

Resizes the vector to the specified number of elements.

## Parameters

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__new_size</code> | Number of elements the vector should contain.     |
| <code>__x</code>        | Data with which new elements should be populated. |

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise the vector is extended and new elements are populated with given data.

**shrink\_to\_fit()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::shrink_to_fit () [inline], [constexpr]
```

A non-binding request to reduce `capacity()` to `size()`.

**size()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::vector< _Tp, _Alloc >::size () const [inline], [nodiscard], [constexpr], [noexcept]
```

Returns the number of elements in the vector.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_shrink\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_shrink\\_and\\_double\(\)](#), [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::\\_\\_gnu\\_parallel::list\\_partition\(\)](#), [operator=\(\)](#), [std::operator==\(\)](#), [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::resize\(\)](#), and [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::resize\(\)](#).

**swap()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::swap (
    vector< _Tp, _Alloc > & __x) [inline], [constexpr], [noexcept]
```

Swaps data with another vector.

**Parameters**

|                      |                                                   |
|----------------------|---------------------------------------------------|
| <a href="#">_↔_X</a> | A vector of the same element and allocator types. |
|----------------------|---------------------------------------------------|

This exchanges the elements between two vectors in constant time. (Three pointers, so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(v1,v2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

### 6.1013.1 Detailed Description

```
template<typename _Alloc>
class std::vector< bool, _Alloc >
```

A specialization of vector for booleans which offers fixed time access to individual elements in any order.

Since

C++98

#### Template Parameters

|                     |                 |
|---------------------|-----------------|
| <code>_Alloc</code> | Allocator type. |
|---------------------|-----------------|

Note that `vector<bool>` does not actually meet the requirements for being a container. This is because the reference and pointer types are not really references and pointers to `bool`. See DR96 for details.

See also

[vector](#) for function documentation.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ( `[]` ) access is also provided as with C-style arrays.

### 6.1013.2 Member Function Documentation

#### `_M_allocate_and_copy()`

```
pointer std::vector< bool, _Alloc >::_M_allocate_and_copy (
    size_type __n,
    _ForwardIterator __first,
    _ForwardIterator __last) [inline], [constexpr], [protected]
```

Memory expansion handler. Uses the member allocation function to obtain *n* bytes of memory, and then copies `[first,last)` into it.

#### `get_allocator()`

```
() const
```

Get a copy of the memory allocation object.

### 6.1016.1 Detailed Description

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
class std::wbuffer_convert< _Codecvt, _Elem, _Tr >
```

Buffer conversions.

### 6.1016.2 Member Typedef Documentation

#### **\_\_streambuf\_type**

```
template<typename _CharT, typename _Traits>
typedef basic_streambuf<char_type, traits_type> std::basic_streambuf< _CharT, _Traits >::__↵
streambuf_type [inherited]
This is a non-standard type.
```

#### **char\_type**

```
template<typename _CharT, typename _Traits>
typedef _CharT std::basic_streambuf< _CharT, _Traits >::char_type [inherited]
These are standard types. They permit a standardized way of referring to names of (or names dependent on) the
template parameters, which are specific to the implementation.
```

#### **int\_type**

```
template<typename _CharT, typename _Traits>
typedef traits_type::int_type std::basic_streambuf< _CharT, _Traits >::int_type [inherited]
These are standard types. They permit a standardized way of referring to names of (or names dependent on) the
template parameters, which are specific to the implementation.
```

#### **off\_type**

```
template<typename _CharT, typename _Traits>
typedef traits_type::off_type std::basic_streambuf< _CharT, _Traits >::off_type [inherited]
These are standard types. They permit a standardized way of referring to names of (or names dependent on) the
template parameters, which are specific to the implementation.
```

#### **pos\_type**

```
template<typename _CharT, typename _Traits>
typedef traits_type::pos_type std::basic_streambuf< _CharT, _Traits >::pos_type [inherited]
These are standard types. They permit a standardized way of referring to names of (or names dependent on) the
template parameters, which are specific to the implementation.
```

#### **traits\_type**

```
template<typename _CharT, typename _Traits>
typedef _Traits std::basic_streambuf< _CharT, _Traits >::traits_type [inherited]
These are standard types. They permit a standardized way of referring to names of (or names dependent on) the
template parameters, which are specific to the implementation.
```

### 6.1016.3 Constructor & Destructor Documentation

#### **wbuffer\_convert()** [1/2]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert () [inline]
```

Default constructor.

References [wbuffer\\_convert\(\)](#).

Referenced by [wbuffer\\_convert\(\)](#).

## wbuffer\_convert() [2/2]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
std::wbuffer_convert<_Codecvt, _Elem, _Tr>::wbuffer_convert (
    streambuf * __bytebuf,
    _Codecvt * __pcvt = new _Codecvt,
    state_type __state = state_type()) [inline], [explicit]
```

Constructor.

### Parameters

|                        |                                    |
|------------------------|------------------------------------|
| <code>__bytebuf</code> | The underlying byte stream buffer. |
| <code>__pcvt</code>    | The facet to use for conversions.  |
| <code>__state</code>   | Initial conversion state.          |

Takes ownership of `__pcvt` and will delete it in the destructor.

References [std::basic\\_streambuf<\\_CharT, \\_Traits>::setg\(\)](#), and [std::basic\\_streambuf<\\_CharT, \\_Traits>::setp\(\)](#).

## 6.1016.4 Member Function Documentation

### eback()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf<_CharT, _Traits>::eback () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by [std::basic\\_filebuf<char\\_type, traits\\_type>::M\\_destroy\\_pback\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::imbue\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::overflow\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::pbackfail\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::seekoff\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::seekpos\(\)](#), [std::basic\\_streambuf<char\\_type, traits\\_type>::sputbackc\(\)](#), [std::basic\\_streambuf<char\\_type, traits\\_type>::sungetc\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::underflow\(\)](#), and [std::basic\\_filebuf<\\_CharT, \\_Traits>::xsgetn\(\)](#).

### egptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf<_CharT, _Traits>::egptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::basic_filebuf< char_type, traits_type >::_M_create_pback()`, `std::basic_streambuf< char_type, traits_type >::in_avail()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow()`, `std::basic_streambuf< char_type, traits_type >::sbumpc()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos()`, `std::basic_streambuf< char_type, traits_type >::sgetc()`, `std::basic_filebuf< _CharT, _Traits >::showmanyc()`, `std::basic_stringbuf< char_type, traits_type >::sputc()`, `std::basic_filebuf< _CharT, _Traits >::underflow()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::underflow()`, `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow()`, `std::basic_filebuf< _CharT, _Traits >::xsgetn()`, and `xsgetn()`.

### epptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::epptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

Referenced by `std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos()`, `std::basic_streambuf< char_type, traits_type >::sputc()`, `std::basic_filebuf< _CharT, _Traits >::xsputn()`, and `xsputn()`.

### gbump()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::gbump (
    int __n) [inline], [protected], [inherited]
```

Moving the read position.

#### Parameters

|                  |                             |
|------------------|-----------------------------|
| <code>__n</code> | The delta by which to move. |
|------------------|-----------------------------|

This just advances the read position without returning any data.

Referenced by `std::basic_filebuf< _CharT, _Traits >::pbackfail()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::pbackfail()`, `std::basic_streambuf< char_type, traits_type >::sbumpc()`, `std::basic_streambuf< char_type, traits_type >::sputbackc()`, `std::basic_streambuf< char_type, traits_type >::sungetc()`, `std::basic_streambuf< char_type, traits_type >::uflow()`, and `std::basic_filebuf< _CharT, _Traits >::xsgetn()`.

### getloc()

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::getloc () const [inline], [inherited]
```

Locale access.

#### Returns

The current locale in effect.

If `pubimbue(loc)` has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.

Referenced by `std::basic_streambuf< char_type, traits_type >::pubimbue()`.

**gptr()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::gptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Referenced by `std::basic_filebuf< char_type, traits_type >::M_create_pback()`, `std::basic_filebuf< char_type, traits_type >::M_destroy`, `std::basic_filebuf< _CharT, _Traits >::imbue()`, `std::basic_streambuf< char_type, traits_type >::in_avail()`, `std::basic_stringbuf< _CharT, _Traits >::pbackfail()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::pbackfail()`, `std::basic_streambuf< char_type, traits_type >::seekoff()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_streambuf< char_type, traits_type >::sgetc()`, `std::basic_filebuf< _CharT, _Traits >::showmanyc()`, `std::basic_stringbuf< char >::showmanyc()`, `std::basic_streambuf< char_type, traits_type >::sungetc()`, `std::basic_streambuf< char_type, traits_type >::uflow()`, `std::basic_filebuf< _CharT, _Traits >::underflow()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::underflow()`, `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow()`, `std::basic_filebuf< _CharT, _Traits >::xsgetn()`, and `xsgetn()`.

**imbue()**

```
template<typename _CharT, typename _Traits>
virtual void std::basic_streambuf< _CharT, _Traits >::imbue (
    const locale & __loc) [inline], [protected], [virtual], [inherited]
```

Changes translations.

**Parameters**

|                    |               |
|--------------------|---------------|
| <code>__loc</code> | A new locale. |
|--------------------|---------------|

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

**Note**

Base class version does nothing.

Reimplemented in `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >`, `std::basic_filebuf< _CharT, std::char_traits< _CharT > >`, `std::basic_filebuf< char >`, `std::basic_filebuf< char_type, traits_type >`, and `std::basic_filebuf< wchar_t >`.

Referenced by `std::basic_streambuf< char_type, traits_type >::pubimbue()`.

**in\_avail()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::in_avail () [inline], [inherited]
```

Looking ahead into the stream.

**Returns**

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

**overflow()**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
_Wide_streambuf::int_type std::wbuffer_convert< _Codecvt, _Elem, _Tr >::overflow (
    typename _Wide_streambuf::int_type __c) [inline], [protected], [virtual]
```

Consumes data from the buffer; writes to the controlled sequence.

**Parameters**

|                  |                                     |
|------------------|-------------------------------------|
| <code>__c</code> | An additional character to consume. |
|------------------|-------------------------------------|

**Returns**

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

References `std::basic_streambuf< _CharT, _Traits >::sputc()`.

**pbackfail()**

```
template<typename _CharT, typename _Traits>
virtual int_type std::basic_streambuf< _CharT, _Traits >::pbackfail (
    int_type __c = traits_type::eof()) [inline], [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

**Parameters**

|                  |                                                      |
|------------------|------------------------------------------------------|
| <code>__c</code> | The character to be inserted back into the sequence. |
|------------------|------------------------------------------------------|

**Returns**

`eof()` on failure, *some other value* on success

**Postcondition**

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented in `__gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< char >`, `std::basic_filebuf< char_type, traits_type >`, `std::basic_filebuf< wchar_t >`, `std::basic_stringbuf< _CharT, _Traits >`, `std::basic_stringbuf< char >`, and `std::basic_stringbuf< wchar_t >`.

Referenced by `std::basic_streambuf< char_type, traits_type >::sputback()`, and `std::basic_streambuf< char_type, traits_type >::sungetc()`.

**pbase()**

```
template<typename _CharT, typename _Traits>
```

```
char_type * std::basic_streambuf< _CharT, _Traits >::pbase () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Referenced by [std::basic\\_filebuf< \\_CharT, \\_Traits >::overflow\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::overflow\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::seekoff\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::seekoff\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::str\(\)](#), [std::basic\\_stringbuf< char >::str\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::sync\(\)](#), and [std::basic\\_filebuf< \\_CharT, \\_Traits >::xsputn\(\)](#).

**pbump()**

```
template<typename _CharT, typename _Traits>
```

```
void std::basic_streambuf< _CharT, _Traits >::pbump (
    int __n) [inline], [protected], [inherited]
```

Moving the write position.

**Parameters**

|                  |                             |
|------------------|-----------------------------|
| <code>__n</code> | The delta by which to move. |
|------------------|-----------------------------|

This just advances the write position without returning any data.

Referenced by [std::basic\\_filebuf< \\_CharT, \\_Traits >::overflow\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::overflow\(\)](#), and [std::basic\\_streambuf< char\\_type, traits\\_type >::sputc\(\)](#).

**pptr()**

```
template<typename _CharT, typename _Traits>
```

```
char_type * std::basic_streambuf< _CharT, _Traits >::pptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Referenced by [std::basic\\_filebuf< \\_CharT, \\_Traits >::overflow\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::overflow\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::seekoff\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::seekoff\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sputc\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::sync\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::xsputn\(\)](#), and [xsputn\(\)](#).

**pubimbue()**

```
template<typename _CharT, typename _Traits>
```

```
locale std::basic_streambuf< _CharT, _Traits >::pubimbue (
    const locale & __loc) [inline], [inherited]
```

Entry point for imbue().

**Parameters**

|                    |                 |
|--------------------|-----------------|
| <code>__loc</code> | The new locale. |
|--------------------|-----------------|

**Returns**

The previous locale.

Calls the derived `imbue(__loc)`.

**pubseekoff()**

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
    off_type __off,
    ios_base::seekdir __way,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

**Parameters**

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__off</code>  | Offset.                                     |
| <code>__way</code>  | Value for <code>ios_base::seekdir</code> .  |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual `seekoff` function.

**pubseekpos()**

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
    pos_type __sp,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

**Parameters**

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__sp</code>   | Position                                    |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual `seekpos` function.

**pubsetbuf()**

```
template<typename _CharT, typename _Traits>
basic_streambuf * std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

**pubsync()**

```
template<typename _CharT, typename _Traits>
int std::basic_streambuf< _CharT, _Traits >::pubsync () [inline], [inherited]
```

Calls virtual sync function.

Referenced by [std::basic\\_istream< \\_CharT, \\_Traits >::sync\(\)](#).

**sbumpc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sbumpc () [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.

Referenced by [std::basic\\_istream< \\_CharT, \\_Traits >::ignore\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::snextc\(\)](#), and [std::basic\\_istream< \\_CharT, char\\_traits< \\_CharT > >::ungetc\(\)](#).

**seekoff()**

```
template<typename _CharT, typename _Traits>
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekoff (
    off_type ,
    ios_base::seekdir ,
    ios_base::openmode = ios_base::in | ios_base::out) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in [std::basic\\_filebuf< \\_CharT, \\_Traits >](#), [std::basic\\_filebuf< \\_CharT, encoding\\_char\\_traits< \\_CharT > >](#), [std::basic\\_filebuf< char >](#), [std::basic\\_filebuf< char\\_type, traits\\_type >](#), [std::basic\\_filebuf< wchar\\_t >](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits >](#), [std::basic\\_stringbuf< char >](#), and [std::basic\\_stringbuf< wchar\\_t >](#).

Referenced by [std::basic\\_streambuf< char\\_type, traits\\_type >::pubseekoff\(\)](#).

**seekpos()**

```
template<typename _CharT, typename _Traits>
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekpos (
    pos_type ,
    ios_base::openmode = ios_base::in | ios_base::out) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in [std::basic\\_filebuf< \\_CharT, \\_Traits >](#), [std::basic\\_filebuf< \\_CharT, encoding\\_char\\_traits< \\_CharT > >](#), [std::basic\\_filebuf< char >](#), [std::basic\\_filebuf< char\\_type, traits\\_type >](#), [std::basic\\_filebuf< wchar\\_t >](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits >](#), [std::basic\\_stringbuf< char >](#), and [std::basic\\_stringbuf< wchar\\_t >](#).

Referenced by [std::basic\\_streambuf< char\\_type, traits\\_type >::pubseekpos\(\)](#).

**setbuf()**

```
template<typename _CharT, typename _Traits>
virtual basic_streambuf< char_type, _Traits > * std::basic_streambuf< _CharT, _Traits >::setbuf
(
    char_type * ,
    streamsize ) [inline], [protected], [virtual], [inherited]
```

Manipulates the buffer.

Each derived class provides its own appropriate behavior. See the next-to-last paragraph of <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering> for more on this function.

**Note**

Base class version does nothing, returns `this`.

Reimplemented in `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >`, `std::basic_filebuf< _CharT, std::char_traits< _CharT > >`, `std::basic_filebuf< char >`, `std::basic_filebuf< char_type, traits_type >`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >`, and `std::basic_stringbuf< char >`.

Referenced by `std::basic_streambuf< char_type, traits_type >::pubsetbuf()`.

**setg()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setg (
    char_type * __gbeg,
    char_type * __gnext,
    char_type * __gend) [inline], [protected], [inherited]
```

Setting the three read area pointers.

**Parameters**

|                      |            |
|----------------------|------------|
| <code>__gbeg</code>  | A pointer. |
| <code>__gnext</code> | A pointer. |
| <code>__gend</code>  | A pointer. |

**Postcondition**

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

Referenced by `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert()`, `std::basic_filebuf< char_type, traits_type >::_M_create()`, `std::basic_filebuf< char_type, traits_type >::_M_destroy_pback()`, `std::basic_filebuf< char_type, traits_type >::_M_set_buffer()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos()`, and `std::basic_filebuf< _CharT, _Traits >::xsgetn()`.

**setp()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setp (
    char_type * __pbeg,
    char_type * __pend) [inline], [protected], [inherited]
```

Setting the three write area pointers.

**Parameters**

|                     |            |
|---------------------|------------|
| <code>__pbeg</code> | A pointer. |
|---------------------|------------|

**Note**

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to underflow or uflow] will not return eof() but that they will return immediately.*

The standard adds that *the morphemes of showmanyc are **es-how-many-see**, not **show-manic**.*

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, `std::basic_filebuf<char>`, `std::basic_filebuf<char_type, traits_type>`, `std::basic_filebuf<wchar_t>`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>`, `std::basic_stringbuf<char>`, and `std::basic_stringbuf<wchar_t>`.

Referenced by `std::basic_streambuf<char_type, traits_type>::in_avail()`.

**snextc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::snextc() [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

Referenced by `std::basic_istream<_CharT, char_traits<_CharT>>::get()`, `std::basic_istream<char_type, traits_type>::ignore()`, and `std::basic_istream<_CharT, char_traits<_CharT>>::readsome()`.

**sputbackc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputbackc (
    char_type __c) [inline], [inherited]
```

Pushing characters back into the input stream.

**Parameters**

|                  |                             |
|------------------|-----------------------------|
| <code>__c</code> | The character to push back. |
|------------------|-----------------------------|

**Returns**

The previous character, if possible.

Similar to `sungetc()`, but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

Referenced by `std::basic_istream<_CharT, _Traits>::putback()`.

**sputc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputc (
    char_type __c) [inline], [inherited]
```

Entry point for all single-character output functions.

## Parameters

|                  |                        |
|------------------|------------------------|
| <code>__c</code> | A character to output. |
|------------------|------------------------|

## Returns

`__c`, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores `__c` in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(__c)`.

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::overflow()`.

**sputn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sputn (
    const char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for all single-character output functions.

## Parameters

|                  |                     |
|------------------|---------------------|
| <code>__s</code> | A buffer read area. |
| <code>__n</code> | A count.            |

One of two public output functions.

Returns `xsputn(__s, __n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

**state()**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
state_type std::wbuffer_convert<_Codecvt, _Elem, _Tr>::state () const [inline], [noexcept]
```

The conversion state following the last conversion.

**sungetc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sungetc () [inline], [inherited]
```

Moving backwards in the input stream.

## Returns

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbackfail()`. The effect is to *unget* the last character *gotten*.

Referenced by `std::basic_istream<_CharT, _Traits>::unget()`.

**sync()**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
int std::wbuffer_convert< _Codecvt, _Elem, _Tr >::sync () [inline], [protected], [virtual]
```

Synchronizes the buffer arrays with the controlled sequences.

**Returns**

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

**Note**

Base class version does nothing, returns zero.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

**uflow()**

```
template<typename _CharT, typename _Traits>
virtual int_type std::basic_streambuf< _CharT, _Traits >::uflow () [inline], [protected], [virtual],
[inherited]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Reimplemented in `__gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >`.

Referenced by `std::basic_streambuf< char_type, traits_type >::sbumpc()`, and `xsgetn()`.

**underflow()**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
_Wide_streambuf::int_type std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow () [inline],
[protected], [virtual]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

References `std::basic_streambuf< _CharT, _Traits >::egptr()`, and `std::basic_streambuf< _CharT, _Traits >::gptr()`.

**xsggetn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::xsggetn (
    char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character extraction.

**Parameters**

|                                  |                                         |
|----------------------------------|-----------------------------------------|
| <a href="#"><code>__s</code></a> | A buffer area.                          |
| <a href="#"><code>__n</code></a> | Maximum number of characters to assign. |

**Returns**

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in [std::basic\\_filebuf<\\_CharT, \\_Traits>](#), [std::basic\\_filebuf<\\_CharT, encoding\\_char\\_traits<\\_CharT>>](#), [std::basic\\_filebuf<\\_CharT, std::char\\_traits<\\_CharT>>](#), [std::basic\\_filebuf<char>](#), and [std::basic\\_filebuf<char\\_type, traits\\_type>](#).

References [egptr\(\)](#), [gptr\(\)](#), [std::min\(\)](#), and [uflow\(\)](#).

Referenced by [std::basic\\_streambuf<char\\_type, traits\\_type>::sgetn\(\)](#).

**xsputn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::xsputn (
    const char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character insertion.

**Parameters**

|                                  |                                        |
|----------------------------------|----------------------------------------|
| <a href="#"><code>__s</code></a> | A buffer area.                         |
| <a href="#"><code>__n</code></a> | Maximum number of characters to write. |

**Returns**

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in [std::basic\\_filebuf<\\_CharT, \\_Traits>](#), [std::basic\\_filebuf<\\_CharT, encoding\\_char\\_traits<\\_CharT>>](#), [std::basic\\_filebuf<\\_CharT, std::char\\_traits<\\_CharT>>](#), [std::basic\\_filebuf<char>](#), and [std::basic\\_filebuf<char\\_type, traits\\_type>](#).

References [epptr\(\)](#), [std::min\(\)](#), [overflow\(\)](#), and [pptr\(\)](#).

Referenced by [std::basic\\_streambuf<char\\_type, traits\\_type>::sputn\(\)](#).

**6.1017.1 Detailed Description**

**template<typename \_Tp>**  
**class std::weak\_ptr<\_Tp>**

A non-owning observer for a pointer owned by a [shared\\_ptr](#).

Since

C++11

A [weak\\_ptr](#) provides a safe alternative to a raw pointer when you want a non-owning reference to an object that is managed by a [shared\\_ptr](#).

Unlike a raw pointer, a [weak\\_ptr](#) can be converted to a new [shared\\_ptr](#) that shares ownership with every other [shared\\_ptr](#) that already owns the pointer. In other words you can upgrade from a non-owning "weak" reference to an owning [shared\\_ptr](#), without having access to any of the existing [shared\\_ptr](#) objects.

Also unlike a raw pointer, a [weak\\_ptr](#) does not become "dangling" after the object it points to has been destroyed. Instead, a [weak\\_ptr](#) becomes *expired* and can no longer be converted to a [shared\\_ptr](#) that owns the freed pointer, so you cannot accidentally access the pointed-to object after it has been destroyed.

The documentation for this class was generated from the following file:

- [bits/shared\\_ptr.h](#)

### Friends

- `bool operator==` (`const weibull_distribution &__d1, const weibull_distribution &__d2`)

### 6.1018.1 Detailed Description

```
template<typename _RealType = double>
class std::weibull_distribution<_RealType>
```

A weibull\_distribution random number distribution.

The formula for the normal probability density function is:

$$p(x|\alpha, \beta) = \frac{\alpha}{\beta} \left(\frac{x}{\beta}\right)^{\alpha-1} \exp\left(-\left(\frac{x}{\beta}\right)^{\alpha}\right)$$

Since

C++11

### 6.1018.2 Member Typedef Documentation

#### `result_type`

```
template<typename _RealType = double>
typedef _RealType std::weibull_distribution< _RealType >::result_type
```

The type of the range of the distribution.

### 6.1018.3 Member Function Documentation

#### `a()`

```
template<typename _RealType = double>
_RealType std::weibull_distribution< _RealType >::a () const [inline]
```

Return the *a* parameter of the distribution.

#### `b()`

```
template<typename _RealType = double>
_RealType std::weibull_distribution< _RealType >::b () const [inline]
```

Return the *b* parameter of the distribution.

#### `max()`

```
template<typename _RealType = double>
result_type std::weibull_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### `min()`

```
template<typename _RealType = double>
result_type std::weibull_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

#### `operator()()`

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::weibull_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by `operator()()`.

#### `param()` [1/2]

```
template<typename _RealType = double>
param_type std::weibull_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Referenced by `std::operator>>()`.

#### `param()` [2/2]

```
template<typename _RealType = double>
void std::weibull_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

#### Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

#### reset()

```
template<typename _RealType = double>
void std::weibull_distribution< _RealType >::reset () [inline]
Resets the distribution state.
```

### 6.1018.4 Friends And Related Symbol Documentation

#### operator==

```
template<typename _RealType = double>
bool operator== (
    const weibull_distribution< _RealType > & __d1,
    const weibull_distribution< _RealType > & __d2) [friend]
```

Return true if two Weibull distributions have the same parameters.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

### 6.1019 std::wstring\_convert< \_Codecvt, \_Elem, \_Wide\_alloc, \_Byte\_alloc > Class Template Reference

### 6.1019.1 Detailed Description

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>, type-
name _Byte_alloc = allocator<char>>
```

```
class std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >
```

String conversions.

### 6.1019.2 Constructor & Destructor Documentation

#### wstring\_convert() [1/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
```

```
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert () [inline]
```

Default constructor.

#### wstring\_convert() [2/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
```

```
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
    _Codecvt * __pcvt) [inline], [explicit]
```

Constructor.

#### Parameters

|                     |                                   |
|---------------------|-----------------------------------|
| <code>__pcvt</code> | The facet to use for conversions. |
|---------------------|-----------------------------------|

Takes ownership of `__pcvt` and will delete it in the destructor.

#### wstring\_convert() [3/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
```

```
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
    _Codecvt * __pcvt,
    state_type __state) [inline]
```

Construct with an initial conversion state.

#### Parameters

|                      |                                   |
|----------------------|-----------------------------------|
| <code>__pcvt</code>  | The facet to use for conversions. |
| <code>__state</code> | Initial conversion state.         |

Takes ownership of `__pcvt` and will delete it in the destructor. The object's conversion state will persist between conversions.

**wstring\_convert()** [4/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
    const byte\_string & __byte_err,
    const wide\_string & __wide_err = wide\_string()) [inline], [explicit]
```

Construct with error strings.

**Parameters**

|                         |                                                |
|-------------------------|------------------------------------------------|
| <code>__byte_err</code> | A string to return on failed conversions.      |
| <code>__wide_err</code> | A wide string to return on failed conversions. |

**6.1019.3 Member Function Documentation****converted()**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
size_t std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::converted () const
[inline], [noexcept]
```

The number of elements successfully converted in the last conversion.

**from\_bytes()** [1/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
wide\_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
    char __byte) [inline]
```

Convert from bytes.

References [from\\_bytes\(\)](#).

Referenced by [from\\_bytes\(\)](#), [from\\_bytes\(\)](#), and [from\\_bytes\(\)](#).

**from\_bytes()** [2/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
wide\_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
    const byte\_string & __str) [inline]
```

Convert from bytes.

References [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::data\(\)](#), [from\\_bytes\(\)](#), and [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::size\(\)](#).

**from\_bytes()** [3/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
wide\_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
    const char * __first,
    const char * __last) [inline]
```

Convert from bytes.

**from\_bytes()** [4/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
    const char * __ptr) [inline]
```

Convert from bytes.

References [from\\_bytes\(\)](#).

**state()**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
state_type std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::state () const
[inline]
```

The final conversion state of the last conversion.

**to\_bytes()** [1/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
    _Elem __wchar) [inline]
```

Convert to bytes.

References [to\\_bytes\(\)](#).

Referenced by [to\\_bytes\(\)](#), [to\\_bytes\(\)](#), and [to\\_bytes\(\)](#).

**to\_bytes()** [2/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
    const _Elem * __first,
    const _Elem * __last) [inline]
```

Convert to bytes.

**to\_bytes()** [3/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
    const _Elem * __ptr) [inline]
```

Convert to bytes.

References [std::basic\\_string<\\_Elem, char\\_traits<\\_Elem>, \\_Wide\\_alloc>::length\(\)](#), and [to\\_bytes\(\)](#).

**to\_bytes()** [4/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
    const wide_string & __wstr) [inline]
```

Convert to bytes.

References [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::data\(\)](#), [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::size\(\)](#), and [to\\_bytes\(\)](#).

The documentation for this class was generated from the following file:

### 7.9.1 Detailed Description

This is a Standard C++ Library header.

## 7.10 auto\_ptr.h File Reference

### Classes

- class [std::auto\\_ptr<\\_Tp>](#)
- struct [std::auto\\_ptr\\_ref<\\_Tp1>](#)

### Namespaces

- namespace [std](#)

### 7.10.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<memory>`.

## 7.11 backward\_warning.h File Reference

### 7.11.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iosfwd>`.

## 7.12 hash\_fun.h File Reference

### Namespaces

- namespace [\\_\\_gnu\\_cxx](#)

### Typedefs

- typedef `__SIZE_TYPE__` [\\_\\_gnu\\_cxx::size\\_t](#)

### Functions

- `size_t` [\\_\\_gnu\\_cxx::stl\\_hash\\_string](#) (const char \* \_\_s)

### 7.12.1 Detailed Description

This file is a GNU extension to the Standard C++ Library (possibly containing extensions from the HP/SGI STL subset).

## 7.13 hash\_map File Reference

### Classes

- class [\\_\\_gnu\\_cxx::allocator< \\_Tp >](#)
- struct [\\_\\_gnu\\_cxx::equal\\_to< \\_Tp >](#)
- class [\\_\\_gnu\\_cxx::hash\\_map< \\_Key, \\_Tp, \\_HashFn, \\_EqualKey, \\_Alloc >](#)

### 7.19.1 Detailed Description

This file is a GNU parallel extension to the Standard C++ Library.

## 7.20 align.h File Reference

### Namespaces

- namespace [std](#)

### Functions

- `void * std::align (size_t __align, size_t __size, void *&__ptr, size_t &__space) noexcept`
- `template<size_t _Align, class _Tp>`  
`constexpr _Tp * std::assume\_aligned (_Tp * __ptr) noexcept`

### 7.20.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<memory>`.

## 7.21 bits/alloc\_traits.h File Reference

### Classes

- struct [std::allocator\\_traits< \\_Alloc >](#)
- struct [std::allocator\\_traits< allocator< \\_Tp > >](#)
- struct [std::allocator\\_traits< allocator< void > >](#)

### Namespaces

- namespace [std](#)

### 7.21.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<memory>`.

## 7.22 ext/alloc\_traits.h File Reference

### Classes

- struct [\\_\\_gnu\\_cxx::\\_\\_alloc\\_traits<\\_Alloc, typename >](#)

### Namespaces

- namespace [\\_\\_gnu\\_cxx](#)

#### 7.22.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

## 7.23 allocated\_ptr.h File Reference

### Namespaces

- namespace [std](#)

#### 7.23.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<memory>`.

## 7.24 allocator.h File Reference

### Classes

- class [std::allocator<\\_Tp >](#)

### Namespaces

- namespace [std](#)

#### 7.24.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<memory>`.

## 7.25 atomic\_base.h File Reference

### Classes

- struct [std::atomic\\_flag](#)

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_ALWAYS_INLINE`
- `#define ATOMIC_FLAG_INIT`
- `#define ATOMIC_VAR_INIT(_VI)`

## Typedefs

- typedef unsigned char **std::\_\_atomic\_flag\_data\_type**

## Enumerations

- enum class **std::memory\_order** : int {  
    **relaxed** , **consume** , **acquire** , **release** ,  
    **acq\_rel** , **seq\_cst** }

## Functions

- void **std::atomic\_signal\_fence** (**memory\_order** \_\_m) noexcept
- void **std::atomic\_thread\_fence** (**memory\_order** \_\_m) noexcept
- template<typename \_Tp>  
    \_\_Tp **std::kill\_dependency** (\_Tp \_\_y) noexcept

### 7.39.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<chrono>`.

## 7.39.2 Function Documentation

### ceil()

```
template<typename _ToDur, typename _Rep, typename _Period>
__enable_if_is_duration< _ToDur > std::chrono::ceil (
    const duration< _Rep, _Period > & __d) [nodiscard], [constexpr]
```

Convert a duration to type `ToDur` and round up.

If the duration cannot be represented exactly in the result type, returns the closest value that is greater than the argument.

#### Template Parameters

<code>_ToDur</code>	The result type must be a duration.
---------------------	-------------------------------------

#### Parameters

<code>__d</code>	A duration.
------------------	-------------

#### Returns

The value of `__d` converted to type `_ToDur`.

#### Since

C++17

- class `std::codecvt<wchar_t, char, mbstate_t>`
- class `std::codecvt_base`
- class `std::codecvt_byname<_InternT, _ExternT, _StateT>`

### Namespaces

- namespace `std`

### Functions

- template bool `std::has_facet<codecvt<char, char, mbstate_t>>` (const `locale` &)
- template bool `std::has_facet<codecvt<wchar_t, char, mbstate_t>>` (const `locale` &)
- template const `codecvt<char, char, mbstate_t> & std::use_facet<codecvt<char, char, mbstate_t>>` (const `locale` &)
- template const `codecvt<wchar_t, char, mbstate_t> & std::use_facet<codecvt<wchar_t, char, mbstate_t>>` (const `locale` &)

### Variables

- template<typename \_InternT, typename \_ExternT, typename \_StateT>  
`locale::id std::codecvt<_InternT, _ExternT, _StateT>::id`

#### 7.41.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

## 7.42 `concept_check.h` File Reference

### Macros

- `#define __glibcxx_class_requires(_a, _b)`
- `#define __glibcxx_class_requires2(_a, _b, _c)`
- `#define __glibcxx_class_requires3(_a, _b, _c, _d)`
- `#define __glibcxx_class_requires4(_a, _b, _c, _d, _e)`
- `#define __glibcxx_function_requires(...)`

#### 7.42.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iterator>`.

## 7.43 `cow_string.h` File Reference

### Classes

- class `std::basic_string<_CharT, _Traits, _Alloc>`

## Namespaces

- namespace [std](#)

## Functions

- `template<typename _Operation>`  
`void std::basic_string<_CharT, _Traits, _Alloc >__resize_and_overwrite` (const [size\\_type](#) \_\_n, \_Operation \_\_op)

## Variables

- `template<typename _CharT, typename _Traits, typename _Alloc>`  
`const basic\_string<_CharT, _Traits, _Alloc >::size_type std::basic_string<_CharT, _Traits, _Alloc >::npos`

### 7.43.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<string>`.

Defines the reference-counted COW string implementation.

## 7.44 `cpp_type_traits.h` File Reference

## Namespaces

- namespace [std](#)

## Macros

- `#define __INT_N(TYPE)`

## Functions

- `template<typename _Iterator>`  
`constexpr _Iterator std::__miter_base (_Iterator __it)`

## Variables

- `template<typename _ValT, typename _Tp>`  
`constexpr bool std::__can_use_memchr_for_find`

### 7.44.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ext/type_traits.h>`.

## 7.45 `cpyfunc_impl.h` File Reference

## Classes

- class [std::copyable\\_function](#)<\_Res(\_ArgTypes...) \_GLIBCXX\_MOF\_CV noexcept(\_Noex)>

## Namespaces

### 7.159.2 Macro Definition Documentation

#### `_GLIBCXX_DEQUE_BUF_SIZE`

```
#define _GLIBCXX_DEQUE_BUF_SIZE
```

This function controls the size of memory nodes.

## Parameters

<code>__size</code>	The size of an element.
---------------------	-------------------------

## Returns

The number (not byte size) of elements per node.

This function started off as a compiler kludge from SGI, but seems to be a useful wrapper around a repeated constant expression. The **512** is tunable (and no other code needs to change), but no investigation has been done since inheriting the SGI code. Touch `_GLIBCXX_DEQUE_BUF_SIZE` only if you know what you are doing, however: changing it breaks the binary compatibility!!

`constexpr bool std::disable_sized_sentinel_for< reverse_iterator< _Iterator1 >, reverse_iterator< _`  
`Iterator2 > >`

### 7.162.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iterator>`.

This file implements `reverse_iterator`, `back_insert_iterator`, `front_insert_iterator`, `insert_iterator`, `__normal_iterator`, and their supporting functions and overloaded operators.

### 7.198.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<valarray>`.

## 7.199 valarray\_array.h File Reference

### 7.205.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

## 7.206 **cassert** File Reference

### 7.206.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `assert.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.207 **ccomplex** File Reference

### Macros

- `#define _GLIBCXX_CCOMPLEX`

### 7.207.1 Detailed Description

This is a Standard C++ Library header.

Since

C++11 (removed in C++20)

## 7.208 **tr1/ccomplex** File Reference

### Macros

- `#define _GLIBCXX_TR1_CCOMPLEX`

### 7.208.1 Detailed Description

This is a TR1 C++ Library header.

## 7.209 **cctype** File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CCTYPE`

### 7.209.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `cctype.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.210 **tr1/cctype** File Reference

### Macros

- `#define _GLIBCXX_TR1_CCTYPE`

### 7.210.1 Detailed Description

This is a TR1 C++ Library header.

## 7.211 cerrno File Reference

### Macros

- `#define _GLIBCXX_CERRNO`
- `#define errno`

### 7.211.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `errno.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.212 cfenv File Reference

### Macros

- `#define _GLIBCXX_CFENV`

### 7.212.1 Detailed Description

This is a Standard C++ Library header.

## 7.213 tr1/cfenv File Reference

### Macros

- `#define _GLIBCXX_TR1_CFENV`

### 7.213.1 Detailed Description

This is a TR1 C++ Library header.

## 7.214 cfloat File Reference

### Macros

- `#define _GLIBCXX_CFLOAT`
- `#define DECIMAL_DIG`
- `#define FLT_EVAL_METHOD`

### 7.214.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `float.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.215 tr1/cfloat File Reference

### Macros

- `#define _GLIBCXX_TR1_CFLOAT`

### 7.215.1 Detailed Description

This is a TR1 C++ Library header.

## 7.216 charconv File Reference

### Classes

- struct [std::from\\_chars\\_result](#)
- struct [std::to\\_chars\\_result](#)

### Namespaces

- namespace [std](#)
- namespace [std::\\_\\_detail](#)

### Macros

- `#define __glibcxx_want_constexpr_charconv`
- `#define __glibcxx_want_to_chars`
- `#define _GLIBCXX_CHARCONV`
- `#define _GLIBCXX_TO_CHARS(T)`

### Typedefs

- `template<typename _Tp>`  
using [std::\\_\\_detail::\\_\\_unsigned\\_least\\_t](#)

### Enumerations

#### 7.217.1 Detailed Description

This is a Standard C++ Library header.

## 7.218 experimental/chrono File Reference

### Namespaces

- namespace `std`
- namespace `std::chrono`

### Macros

- `#define _GLIBCXX_EXPERIMENTAL_CHRONO`

### Variables

- `template<typename _Rep>`  
constexpr bool `std::chrono::experimental::treat_as_floating_point_v`

#### 7.218.1 Detailed Description

This is a TS C++ Library header.

## 7.219 cinttypes File Reference

### Namespaces

- namespace `std`

### Macros

- `#define _GLIBCXX_CINTTYPES`

#### 7.219.1 Detailed Description

This is a Standard C++ Library header.

## 7.220 tr1/cinttypes File Reference

### Macros

- `#define _GLIBCXX_TR1_CINTTYPES`

### 7.220.1 Detailed Description

This is a TR1 C++ Library header.

## 7.221 `ciso646` File Reference

### 7.221.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `iso646.h`, which is empty in C++.

Since

C++11 (removed in C++20)

## 7.222 `climits` File Reference

### Macros

- `#define _GLIBCXX_CLIMITS`
- `#define LLONG_MAX`
- `#define LLONG_MIN`
- `#define ULLONG_MAX`

### 7.222.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `limits.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.223 `tr1/climits` File Reference

### Macros

- `#define _GLIBCXX_TR1_CLIMITS`

### 7.223.1 Detailed Description

This is a TR1 C++ Library header.

## 7.224 `locale` File Reference

### Namespaces

- namespace `std`

### Macros

- `#define _GLIBCXX_CLOCALE`

### 7.224.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `locale.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.225 cmath File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define __glibcxx_want_hypot`

### 7.225.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `math.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

### 7.230.1 Detailed Description

This is a TR1 C++ Library header.

## 7.231 complex.h File Reference

### 7.231.1 Detailed Description

This is a Standard C++ Library header.

## 7.232 Concepts

Here is a list of all documented concepts with brief descriptions:

<a href="#"><code>std::assignable_from</code></a>	
[concept.assignable], concept assignable_from	737
<a href="#"><code>std::common_reference_with</code></a>	
[concept.commonref], concept common_reference_with	738
<a href="#"><code>std::common_with</code></a>	
[concept.common], concept common_with	738
<a href="#"><code>std::constructible_from</code></a>	
[concept.constructible], concept constructible_from	738

<a href="#"><code>std::convertible_to</code></a>	
[concept.convertible], concept convertible_to	738
<a href="#"><code>std::copy_constructible</code></a>	
[concept.copyconstructible], concept copy_constructible	739
<a href="#"><code>std::default_initializable</code></a>	
[concept.defaultinitializable], concept default_initializable	739
<a href="#"><code>std::derived_from</code></a>	
[concept.derived], concept derived_from	739
<a href="#"><code>std::destructible</code></a>	
[concept.destructible], concept destructible	739
<a href="#"><code>std::equivalence_relation</code></a>	
[concept.equiv], concept equivalence_relation	740
<a href="#"><code>std::indirectly_comparable</code></a>	
[alg.req.ind.cmp], concept indirectly_comparable	740
<a href="#"><code>std::indirectly_copyable</code></a>	
[alg.req.ind.copy], concept indirectly_copyable	740
<a href="#"><code>std::indirectly_movable</code></a>	
[alg.req.ind.move], concept indirectly_movable	740
<a href="#"><code>std::indirectly_readable</code></a>	
Requirements for types that are readable by applying operator*	741
<a href="#"><code>std::indirectly_swappable</code></a>	
[alg.req.ind.swap], concept indirectly_swappable	741
<a href="#"><code>std::indirectly_writable</code></a>	
Requirements for writing a value into an iterator's referenced object	741
<a href="#"><code>std::invocable</code></a>	
[concept.invocable], concept invocable	741
<a href="#"><code>std::mergeable</code></a>	
[alg.req.mergeable], concept mergeable	742
<a href="#"><code>std::move_constructible</code></a>	
[concept.moveconstructible], concept move_constructible	742
<a href="#"><code>std::permutable</code></a>	
[alg.req.permutable], concept permutable	742
<a href="#"><code>std::predicate</code></a>	
[concept.predicate], concept predicate	742
<a href="#"><code>std::ranges::bidirectional_range</code></a>	
A range for which ranges::begin returns a bidirectional iterator	743
<a href="#"><code>std::ranges::borrowed_range</code></a>	
[range.range] The borrowed_range concept	743

<a href="#"><code>std::ranges::common_range</code></a>	A range for which <code>ranges::begin</code> and <code>ranges::end</code> return the same type	743
<a href="#"><code>std::ranges::contiguous_range</code></a>	A range for which <code>ranges::begin</code> returns a contiguous iterator	743
<a href="#"><code>std::ranges::forward_range</code></a>	A range for which <code>ranges::begin</code> returns a forward iterator	744
<a href="#"><code>std::ranges::input_range</code></a>	A range for which <code>ranges::begin</code> returns an input iterator	744
<a href="#"><code>std::ranges::output_range</code></a>	A range for which <code>ranges::begin</code> returns an output iterator	744
<a href="#"><code>std::ranges::random_access_range</code></a>	A range for which <code>ranges::begin</code> returns a random access iterator	744
<a href="#"><code>std::ranges::range</code></a>	[ <code>range.range</code> ] The range concept	744
<a href="#"><code>std::ranges::sized_range</code></a>	[ <code>range.sized</code> ] The <code>sized_range</code> concept	745
<a href="#"><code>std::ranges::view</code></a>	[ <code>range.view</code> ] The <code>ranges::view</code> concept	745
<a href="#"><code>std::ranges::viewable_range</code></a>	A range which can be safely converted to a view	745
<a href="#"><code>std::regular_invocable</code></a>	[ <code>concept.regularinvocable</code> ], concept <code>regular_invocable</code>	745
<a href="#"><code>std::relation</code></a>	[ <code>concept.relation</code> ], concept <code>relation</code>	746
<a href="#"><code>std::same_as</code></a>	[ <code>concept.same</code> ], concept <code>same_as</code>	746
<a href="#"><code>std::sortable</code></a>	[ <code>alg.req.sortable</code> ], concept <code>sortable</code>	746
<a href="#"><code>std::strict_weak_order</code></a>	[ <code>concept.strictweakorder</code> ], concept <code>strict_weak_order</code>	746
<a href="#"><code>std::uniform_random_bit_generator</code></a>	Requirements for a uniform random bit generator	747
<a href="#"><code>std::weakly_incrementable</code></a>	Requirements on types that can be incremented with <code>++</code>	747

## 7.233 `condition_variable` File Reference

### Classes

- class [`std::condition\_variable`](#)
- class [`std::condition\_variable\_any`](#)

### Namespaces

- namespace `std`

### Macros

- `#define _GLIBCXX_CONDITION_VARIABLE`

### Enumerations

- enum class `std::cv_status` { `no_timeout` , `timeout` }

### Functions

- void `std::notify_all_at_thread_exit` (`condition_variable` &, `unique_lock`< `mutex` >)

#### 7.233.1 Detailed Description

This is a Standard C++ Library header.

## 7.234 csetjmp File Reference

### Namespaces

- namespace `std`

### Macros

- `#define _GLIBCXX_CSETJMP`
- `#define setjmp(env)`

#### 7.234.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `setjmp.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.235 csignal File Reference

### Namespaces

- namespace `std`

### Macros

- `#define _GLIBCXX_CSIGNAL`

#### 7.235.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `signal.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.236 `cstdalign` File Reference

### Macros

- `#define _GLIBCXX_CSTDALIGN`

### 7.236.1 Detailed Description

This is a Standard C++ Library header.

Since

C++11 (removed in C++20)

## 7.237 `cstdarg` File Reference

### Namespaces

- namespace `std`

### Macros

- `#define _GLIBCXX_CSTDARG`
- `#define va_end(ap)`

### 7.237.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdarg.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.238 `tr1/cstdarg` File Reference

### Macros

- `#define _GLIBCXX_TR1_CSTDARG`

### 7.238.1 Detailed Description

This is a TR1 C++ Library header.

## 7.239 `cstdbool` File Reference

### Macros

- `#define _GLIBCXX_CSTDBOOL`

### 7.239.1 Detailed Description

This is a Standard C++ Library header.

Since

C++11 (removed in C++20)

## 7.240 tr1/cstdbool File Reference

### Macros

- `#define _GLIBCXX_TR1_CSTDBOOL`

#### 7.240.1 Detailed Description

This is a TR1 C++ Library header.

## 7.241 cstdint File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define __glibcxx_want_byte`
- `#define _GLIBCXX_CSTDDEF`

#### 7.241.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the \*.h implementation files.

This is the C++ version of the Standard C Library header `stdint.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.242 cstdint File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CSTDINT`

#### 7.242.1 Detailed Description

This is a Standard C++ Library header.

## 7.243 tr1/cstdint File Reference

### Namespaces

- namespace [std](#)
- namespace [std::tr1](#)

### Macros

- `#define _GLIBCXX_TR1_CSTDINT`

#### 7.243.1 Detailed Description

This is a TR1 C++ Library header.

## 7.244 cstdio File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CSTDIO`

#### 7.244.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdio.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.245 tr1/cstdio File Reference

### Macros

- `#define _GLIBCXX_TR1_CSTDIO`

#### 7.245.1 Detailed Description

This is a TR1 C++ Library header.

## 7.246 cstdlib File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CSTDLIB`
- `#define _GLIBCXX_INCLUDE_NEXT_C_HEADERS`

### Functions

- `ldiv_t std::div (long __i, long __j) noexcept`

#### 7.246.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdlib.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.247 tr1/stdlib File Reference

### Macros

- `#define _GLIBCXX_TR1_CSTDLIB`

### 7.247.1 Detailed Description

This is a TR1 C++ Library header.

## 7.248 `cstring` File Reference

### Namespaces

- namespace `std`

### Macros

- `#define __glibcxx_want_freestanding_cstring`
- `#define _GLIBCXX_CSTRING`

### Functions

- `void * std::memchr (void *__s, int __c, size_t __n)`
- `char * std::strchr (char *__s, int __n)`
- `char * std::strpbrk (char *__s1, const char *__s2)`
- `char * std::strrchr (char *__s, int __n)`
- `char * std::strstr (char *__s1, const char *__s2)`

### 7.248.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `string.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.249 `ctgmath` File Reference

### Macros

- `#define _GLIBCXX_CTGMATH`

### 7.249.1 Detailed Description

This is a Standard C++ Library header.

Since

C++11 (removed in C++20)

## 7.250 `tr1/ctgmath` File Reference

### Macros

- `#define _GLIBCXX_TR1_CTGMATH`

### 7.250.1 Detailed Description

This is a TR1 C++ Library header.

## 7.251 ctime File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CTIME`

#### 7.251.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `time.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.252 tr1/ctime File Reference

### Macros

- `#define _GLIBCXX_TR1_CTIME`

#### 7.252.1 Detailed Description

This is a TR1 C++ Library header.

## 7.253 cuchar File Reference

### Macros

- `#define _GLIBCXX_CUCHAR`

#### 7.253.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `uchar.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.254 wchar File Reference

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBCXX_CWCHAR`

### Functions

- `wchar_t * std::wcschr (wchar_t *__p, wchar_t __c)`
- `wchar_t * std::wcspbrk (wchar_t *__s1, const wchar_t *__s2)`
- `wchar_t * std::wcsrchr (wchar_t *__p, wchar_t __c)`
- `wchar_t * std::wcsstr (wchar_t *__s1, const wchar_t *__s2)`
- `wchar_t * std::wmemchr (wchar_t *__p, wchar_t __c, size_t __n)`

### 7.254.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `wchar.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.255 tr1/cwchar File Reference

### Namespaces

- namespace `std`
- namespace `std::tr1`

### Macros

- `#define _GLIBCXX_TR1_CWCHAR`

### 7.255.1 Detailed Description

This is a TR1 C++ Library header.

## 7.256 cwctype File Reference

### Namespaces

- namespace `std`

### Macros

- `#define _GLIBCXX_CWCTYPE`

### 7.256.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `wctype.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

## 7.257 tr1/cwctype File Reference

### Namespaces

- namespace `std`
- namespace `std::tr1`

### Macros

- `#define _GLIBCXX_TR1_CWCTYPE`

### 7.257.1 Detailed Description

This is a TR1 C++ Library header.

## 7.258 assertions.h File Reference

### Macros

- `#define __glibcxx_requires_non_empty_range(_First, _Last)`
- `#define __glibcxx_requires_nonempty()`
- `#define __glibcxx_requires_subscript(_N)`
- `#define _GLIBCXX_DEBUG_ASSERT(_Condition)`

#### **`__glibcxx_check_erase`**

```
#define __glibcxx_check_erase(  
    _Position)
```

Verify that we can erase the element referenced by the iterator `_Position`. We can erase the element if the `_Position` iterator is dereferenceable and references this sequence.

#### **`__glibcxx_check_erase_after`**

```
#define __glibcxx_check_erase_after(  
    _Position)
```

Verify that we can erase the element after the iterator `_Position`. We can erase the element if the `_Position` iterator is before a dereferenceable one and references this sequence.

#### **`__glibcxx_check_erase_range`**

```
#define __glibcxx_check_erase_range(  
    _First,  
    _Last)
```

Verify that we can erase the elements in the iterator range `[_First, _Last)`. We can erase the elements if `[_First, _Last)` is a valid iterator range within this sequence.

#### **`__glibcxx_check_erase_range_after`**

```
#define __glibcxx_check_erase_range_after(  
    _First,  
    _Last)
```

Verify that we can erase the elements in the iterator range `(_First, _Last)`. We can erase the elements if `(_First, _Last)` is a valid iterator range within this sequence.

#### **`__glibcxx_check_heap_pred`**

```
#define __glibcxx_check_heap_pred(  
    _First,  
    _Last,  
    _Pred)
```

Verify that the iterator range `[_First, _Last)` is a heap w.r.t. the predicate `_Pred`.

#### **`__glibcxx_check_insert`**

```
#define __glibcxx_check_insert(  
    _Position)
```

Verify that we can insert into `*this` with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular, either dereferenceable or past-the-end, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

#### **`__glibcxx_check_insert_after`**

```
#define __glibcxx_check_insert_after(  
    _Position)
```

Verify that we can insert into *\*this* after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular, either dereferenceable or before-begin, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_↔` iterator.

### **`__glibcxx_check_insert_range`**

```
#define __glibcxx_check_insert_range(
    _Position,
    _First,
    _Last,
    _Dist)
```

Verify that we can insert the values in the iterator range `[_First, _Last)` into *\*this* with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

### **`__glibcxx_check_insert_range_after`**

```
#define __glibcxx_check_insert_range_after(
    _Position,
    _First,
    _Last,
    _Dist)
```

Verify that we can insert the values in the iterator range `[_First, _Last)` into *\*this* after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

### **`__glibcxx_check_partitioned_lower`**

```
#define __glibcxx_check_partitioned_lower(
    _First,
    _Last,
    _Value)
```

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value`.

### **`__glibcxx_check_partitioned_lower_pred`**

```
#define __glibcxx_check_partitioned_lower_pred(
    _First,
    _Last,
    _Value,
    _Pred)
```

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

### **`__glibcxx_check_partitioned_upper_pred`**

```
#define __glibcxx_check_partitioned_upper_pred(
    _First,
    _Last,
    _Value,
    _Pred)
```

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

### `__glibcxx_check_sorted_pred`

```
#define __glibcxx_check_sorted_pred(
    _First,
    _Last,
    _Pred)
```

Verify that the iterator range `[_First, _Last)` is sorted by the predicate `_Pred`.

### `_GLIBCXX_DEBUG_VERIFY_AT_F`

```
#define _GLIBCXX_DEBUG_VERIFY_AT_F(
    _Cond,
    _ErrMsg,
    _File,
    _Line,
    _Func)
```

Macros used by the implementation to verify certain properties. These macros may only be used directly by the debug wrappers. Note that these are macros (instead of the more obviously *correct* choice of making them functions) because we need line and file information at the call site, to minimize the distance between the user error and where the error is reported.

### **7.330.1 Detailed Description**

Contains an implementation class for `bin_search_tree_`.

**7.331 binary\_heap\_/debug\_fn\_imps.hpp File Reference****7.331.1 Detailed Description**

Contains an implementation class for a binary\_heap.

**7.332 binomial\_heap\_/debug\_fn\_imps.hpp File Reference****7.332.1 Detailed Description**

Contains an implementation for binomial\_heap\_.

**7.333 binomial\_heap\_base\_/debug\_fn\_imps.hpp File Reference****7.333.1 Detailed Description**

Contains an implementation class for a base of binomial heaps.

**7.334 cc\_hash\_table\_map\_/debug\_fn\_imps.hpp File Reference****7.334.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s debug-mode functions.

**7.335 gp\_hash\_table\_map\_/debug\_fn\_imps.hpp File Reference****7.335.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s debug-mode functions.

**7.336 left\_child\_next\_sibling\_heap\_/debug\_fn\_imps.hpp File Reference****7.336.1 Detailed Description**

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

**7.337 list\_update\_map\_/debug\_fn\_imps.hpp File Reference****7.337.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s debug-mode functions.

**7.338 ov\_tree\_map\_/debug\_fn\_imps.hpp File Reference****7.338.1 Detailed Description**

Contains an implementation class for ov\_tree\_.

**7.339 pairing\_heap\_/debug\_fn\_imps.hpp File Reference****7.339.1 Detailed Description**

Contains an implementation class for a pairing heap.

**7.340 pat\_trie\_/debug\_fn\_imps.hpp File Reference****7.340.1 Detailed Description**

Contains an implementation class for pat\_trie\_.

## 7.341 rb\_tree\_map\_/debug\_fn\_imps.hpp File Reference

### 7.341.1 Detailed Description

Contains an implementation for rb\_tree\_.

## 7.342 rc\_binomial\_heap\_/debug\_fn\_imps.hpp File Reference

### 7.342.1 Detailed Description

Contains an implementation for rc\_binomial\_heap\_.

## 7.343 splay\_tree\_/debug\_fn\_imps.hpp File Reference

### 7.343.1 Detailed Description

Contains an implementation class for splay\_tree\_.

## 7.344 thin\_heap\_/debug\_fn\_imps.hpp File Reference

### 7.344.1 Detailed Description

Contains an implementation for thin\_heap\_.

## 7.345 entry\_cmp.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::entry\\_cmp<\\_VTp, Cmp\\_Fn, \\_Alloc, false >](#)

### 7.346.1 Detailed Description

Contains an implementation class for a binary\_heap.

**7.347 bin\_search\_tree\_/erase\_fn\_imps.hpp File Reference****7.347.1 Detailed Description**

Contains an implementation class for bin\_search\_tree\_.

**7.348 binary\_heap\_/erase\_fn\_imps.hpp File Reference****7.348.1 Detailed Description**

Contains an implementation class for a binary\_heap.

**7.349 binomial\_heap\_base\_/erase\_fn\_imps.hpp File Reference****7.349.1 Detailed Description**

Contains an implementation class for a base of binomial heaps.

**7.350 cc\_hash\_table\_map\_/erase\_fn\_imps.hpp File Reference****7.350.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s erase related functions.

**7.351 gp\_hash\_table\_map\_/erase\_fn\_imps.hpp File Reference****7.351.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s erase related functions.

**7.352 left\_child\_next\_sibling\_heap\_/erase\_fn\_imps.hpp File Reference****7.352.1 Detailed Description**

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

**7.353 list\_update\_map\_/erase\_fn\_imps.hpp File Reference****7.353.1 Detailed Description**

Contains implementations of lu\_map\_.

**7.354 ov\_tree\_map\_/erase\_fn\_imps.hpp File Reference****7.354.1 Detailed Description**

Contains an implementation class for ov\_tree\_.

**7.355 pairing\_heap\_/erase\_fn\_imps.hpp File Reference****7.355.1 Detailed Description**

Contains an implementation class for a pairing heap.

**7.356 pat\_trie\_/erase\_fn\_imps.hpp File Reference****7.356.1 Detailed Description**

Contains an implementation class for pat\_trie.

## 7.357 `rb_tree_map_/erase_fn_imps.hpp` File Reference

### 7.357.1 Detailed Description

Contains an implementation for `rb_tree_`.

## 7.358 `rc_binomial_heap_/erase_fn_imps.hpp` File Reference

### 7.358.1 Detailed Description

Contains an implementation for `rc_binomial_heap_`.

## 7.359 `splay_tree_/erase_fn_imps.hpp` File Reference

### 7.359.1 Detailed Description

Contains an implementation class for `splay_tree_`.

## 7.360 `thin_heap_/erase_fn_imps.hpp` File Reference

### 7.360.1 Detailed Description

Contains an implementation for `thin_heap_`.

## 7.361 `bin_search_tree_/find_fn_imps.hpp` File Reference

### 7.361.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

## 7.362 `binary_heap_/find_fn_imps.hpp` File Reference

### 7.362.1 Detailed Description

Contains an implementation class for a `binary_heap`.

## 7.363 `binomial_heap_base_/find_fn_imps.hpp` File Reference

### 7.363.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

## 7.364 `cc_hash_table_map_/find_fn_imps.hpp` File Reference

### 7.364.1 Detailed Description

Contains implementations of `cc_ht_map_`'s find related functions.

## 7.365 `gp_hash_table_map_/find_fn_imps.hpp` File Reference

### 7.365.1 Detailed Description

Contains implementations of `gp_ht_map_`'s find related functions.

## 7.366 `list_update_map_/find_fn_imps.hpp` File Reference

### 7.366.1 Detailed Description

Contains implementations of `lu_map_`.

**7.367 pairing\_heap\_/find\_fn\_imps.hpp File Reference****7.367.1 Detailed Description**

Contains an implementation class for a pairing heap.

**7.368 pat\_trie\_/find\_fn\_imps.hpp File Reference****7.368.1 Detailed Description**

Contains an implementation class for pat\_trie\_.

**7.369 rb\_tree\_map\_/find\_fn\_imps.hpp File Reference****7.369.1 Detailed Description**

Contains an implementation for rb\_tree\_.

**7.370 splay\_tree\_/find\_fn\_imps.hpp File Reference****7.370.1 Detailed Description**

Contains an implementation class for splay\_tree\_.

**7.371 thin\_heap\_/find\_fn\_imps.hpp File Reference****7.371.1 Detailed Description**

Contains an implementation for thin\_heap\_.

**7.372 bin\_search\_tree\_/info\_fn\_imps.hpp File Reference****7.372.1 Detailed Description**

Contains an implementation class for bin\_search\_tree\_.

**7.373 binary\_heap\_/info\_fn\_imps.hpp File Reference****7.373.1 Detailed Description**

Contains an implementation class for a binary\_heap.

**7.374 cc\_hash\_table\_map\_/info\_fn\_imps.hpp File Reference****7.374.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s entire container info related functions.

**7.375 gp\_hash\_table\_map\_/info\_fn\_imps.hpp File Reference****7.375.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s entire container info related functions.

**7.376 left\_child\_next\_sibling\_heap\_/info\_fn\_imps.hpp File Reference****7.376.1 Detailed Description**

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

## 7.377 list\_update\_map\_/info\_fn\_imps.hpp File Reference

### 7.377.1 Detailed Description

Contains implementations of lu\_map\_.

## 7.378 ov\_tree\_map\_/info\_fn\_imps.hpp File Reference

### 7.378.1 Detailed Description

Contains an implementation class for ov\_tree\_.

## 7.379 pat\_trie\_/info\_fn\_imps.hpp File Reference

### 7.379.1 Detailed Description

Contains an implementation class for pat\_trie.

## 7.380 rb\_tree\_map\_/info\_fn\_imps.hpp File Reference

### 7.380.1 Detailed Description

Contains an implementation for rb\_tree\_.

## 7.381 splay\_tree\_/info\_fn\_imps.hpp File Reference

### 7.381.1 Detailed Description

Contains an implementation.

## 7.382 bin\_search\_tree\_/insert\_fn\_imps.hpp File Reference

### 7.382.1 Detailed Description

Contains an implementation class for bin\_search\_tree\_.

## 7.383 binary\_heap\_/insert\_fn\_imps.hpp File Reference

### 7.383.1 Detailed Description

Contains an implementation class for a binary\_heap.

## 7.384 binomial\_heap\_base\_/insert\_fn\_imps.hpp File Reference

### 7.384.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

## 7.385 cc\_hash\_table\_map\_/insert\_fn\_imps.hpp File Reference

### 7.385.1 Detailed Description

Contains implementations of cc\_ht\_map\_'s insert related functions.

## 7.386 gp\_hash\_table\_map\_/insert\_fn\_imps.hpp File Reference

### 7.386.1 Detailed Description

Contains implementations of gp\_ht\_map\_'s insert related functions.

**7.387 left\_child\_next\_sibling\_heap\_/insert\_fn\_imps.hpp File Reference****7.387.1 Detailed Description**

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

**7.388 list\_update\_map\_/insert\_fn\_imps.hpp File Reference****7.388.1 Detailed Description**

Contains implementations of lu\_map\_.

**7.389 ov\_tree\_map\_/insert\_fn\_imps.hpp File Reference****7.389.1 Detailed Description**

Contains an implementation class for ov\_tree\_.

**7.390 pairing\_heap\_/insert\_fn\_imps.hpp File Reference****7.390.1 Detailed Description**

Contains an implementation class for a pairing heap.

**7.391 rb\_tree\_map\_/insert\_fn\_imps.hpp File Reference****7.391.1 Detailed Description**

Contains an implementation for rb\_tree\_.

**7.392 rc\_binomial\_heap\_/insert\_fn\_imps.hpp File Reference****7.392.1 Detailed Description**

Contains an implementation for rc\_binomial\_heap\_.

**7.393 splay\_tree\_/insert\_fn\_imps.hpp File Reference****7.393.1 Detailed Description**

Contains an implementation class for splay\_tree\_.

**7.394 thin\_heap\_/insert\_fn\_imps.hpp File Reference****7.394.1 Detailed Description**

Contains an implementation for thin\_heap\_.

**7.395 bin\_search\_tree\_/iterators\_fn\_imps.hpp File Reference****7.395.1 Detailed Description**

Contains an implementation class for bin\_search\_tree\_.

**7.396 binary\_heap\_/iterators\_fn\_imps.hpp File Reference****7.396.1 Detailed Description**

Contains an implementation class for a binary\_heap\_.

## 7.397 cc\_hash\_table\_map\_/iterators\_fn\_imps.hpp File Reference

### 7.397.1 Detailed Description

Contains implementations of cc\_ht\_map\_'s iterators related functions, e.g., begin().

## 7.398 left\_child\_next\_sibling\_heap\_/iterators\_fn\_imps.hpp File Reference

### 7.398.1 Detailed Description

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

## 7.399 list\_update\_map\_/iterators\_fn\_imps.hpp File Reference

### 7.399.1 Detailed Description

Contains implementations of lu\_map\_.

## 7.400 ov\_tree\_map\_/iterators\_fn\_imps.hpp File Reference

### 7.400.1 Detailed Description

Contains an implementation class for ov\_tree\_.

## 7.401 pat\_trie\_/iterators\_fn\_imps.hpp File Reference

### 7.401.1 Detailed Description

Contains an implementation class for pat\_trie.

## 7.402 binary\_heap\_/point\_const\_iterator.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::binary\\_heap\\_point\\_const\\_iterator\\_< Value\\_Type, Entry, Simple, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.402.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

## 7.403 left\_child\_next\_sibling\_heap\_/point\_const\_iterator.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::left\\_child\\_next\\_sibling\\_heap\\_node\\_point\\_const\\_iterator\\_< Node, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

#### **7.403.1 Detailed Description**

Contains an iterator class returned by the table's const find and insert methods.

### **7.404 unordered\_iterator/point\_const\_iterator.hpp File Reference**

#### **7.404.1 Detailed Description**

Contains an iterator class returned by the tables' const find and insert methods.

- This file is intended to be included inside a class definition, with PB\_DS\_CLASS\_C\_DEC defined to the name of the enclosing class.

### **7.405 bin\_search\_tree\_/policy\_access\_fn\_imps.hpp File Reference**

#### **7.405.1 Detailed Description**

Contains an implementation class for bin\_search\_tree\_.

### **7.406 binary\_heap\_/policy\_access\_fn\_imps.hpp File Reference**

#### **7.406.1 Detailed Description**

Contains an implementation class for a binary\_heap.

### **7.407 cc\_hash\_table\_map\_/policy\_access\_fn\_imps.hpp File Reference**

#### **7.407.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s policy access functions.

### **7.408 gp\_hash\_table\_map\_/policy\_access\_fn\_imps.hpp File Reference**

#### **7.408.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s policy access functions.

### **7.409 left\_child\_next\_sibling\_heap\_/policy\_access\_fn\_imps.hpp File Reference**

#### **7.409.1 Detailed Description**

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

### **7.410 ov\_tree\_map\_/policy\_access\_fn\_imps.hpp File Reference**

#### **7.410.1 Detailed Description**

Contains an implementation class for ov\_tree.

### **7.411 pat\_trie\_/policy\_access\_fn\_imps.hpp File Reference**

#### **7.411.1 Detailed Description**

Contains an implementation class for pat\_trie.

## 7.412 `resize_policy.hpp` File Reference

### Classes

- class `__gnu_pbds::detail::resize_policy<_Tp>`

### Namespaces

- namespace `__gnu_pbds`

### Variables

- `template<typename _Tp>`  
`const _Tp __gnu_pbds::detail::resize_policy<_Tp>::min_size`

#### 7.412.1 Detailed Description

Contains an implementation class for a `binary_heap`.

## 7.413 `bin_search_tree_/split_join_fn_imps.hpp` File Reference

### 7.413.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

## 7.414 `binary_heap_/split_join_fn_imps.hpp` File Reference

### 7.414.1 Detailed Description

Contains an implementation class for a `binary_heap`.

## 7.415 `binomial_heap_base_/split_join_fn_imps.hpp` File Reference

### 7.415.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

## 7.416 `ov_tree_map_/split_join_fn_imps.hpp` File Reference

### 7.416.1 Detailed Description

Contains an implementation class for `ov_tree_`.

## 7.417 `pairing_heap_/split_join_fn_imps.hpp` File Reference

### 7.417.1 Detailed Description

Contains an implementation class for a pairing heap.

## 7.418 `rb_tree_map_/split_join_fn_imps.hpp` File Reference

### 7.418.1 Detailed Description

Contains an implementation for `rb_tree_`.

**7.419 rc\_binomial\_heap\_/split\_join\_fn\_imps.hpp File Reference****7.419.1 Detailed Description**

Contains an implementation for rc\_binomial\_heap\_.

**7.420 splay\_tree\_/split\_join\_fn\_imps.hpp File Reference****7.420.1 Detailed Description**

Contains an implementation class for splay\_tree\_.

**7.421 thin\_heap\_/split\_join\_fn\_imps.hpp File Reference****7.421.1 Detailed Description**

Contains an implementation for thin\_heap\_.

**7.422 binary\_heap\_/trace\_fn\_imps.hpp File Reference****7.422.1 Detailed Description**

Contains an implementation class for a binary\_heap.

**7.423 cc\_hash\_table\_map\_/trace\_fn\_imps.hpp File Reference****7.423.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s trace-mode functions.

**7.424 gp\_hash\_table\_map\_/trace\_fn\_imps.hpp File Reference****7.424.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s trace-mode functions.

**7.425 left\_child\_next\_sibling\_heap\_/trace\_fn\_imps.hpp File Reference****7.425.1 Detailed Description**

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

**7.426 list\_update\_map\_/trace\_fn\_imps.hpp File Reference****7.426.1 Detailed Description**

Contains implementations of lu\_map\_.

**7.427 pat\_trie\_/trace\_fn\_imps.hpp File Reference****7.427.1 Detailed Description**

Contains an implementation class for pat\_trie\_.

**7.428 rc\_binomial\_heap\_/trace\_fn\_imps.hpp File Reference****7.428.1 Detailed Description**

Contains an implementation for rc\_binomial\_heap\_.

## 7.429 thin\_heap\_/trace\_fn\_imps.hpp File Reference

### 7.429.1 Detailed Description

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

## 7.430 binomial\_heap\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::binomial\\_heap< Value\\_Type, Cmp\\_Fn, \\_Alloc >](#)

#### 7.434.1 Detailed Description

Contains an implementation class for `cc_ht_map_`.

### 7.435 cmp\_fn\_imps.hpp File Reference

#### 7.435.1 Detailed Description

Contains implementations of `cc_ht_map_`'s entire container comparison related functions.

### 7.436 cond\_key\_dtor\_entry\_dealtor.hpp File Reference

#### Classes

- class `__gnu_pbds::detail::cond_dealtor< Entry, _Alloc >`

#### Namespaces

- namespace `__gnu_pbds`

#### 7.436.1 Detailed Description

Contains a conditional key destructor, used for exception handling.

### 7.437 cc\_hash\_table\_map\_/constructor\_destructor\_fn\_imps.hpp File Reference

#### 7.437.1 Detailed Description

Contains implementations of `cc_ht_map_`'s constructors, destructor, and related functions.

### 7.438 gp\_hash\_table\_map\_/constructor\_destructor\_fn\_imps.hpp File Reference

#### 7.438.1 Detailed Description

Contains implementations of `gp_ht_map_`'s constructors, destructor, and related functions.

### 7.439 list\_update\_map\_/constructor\_destructor\_fn\_imps.hpp File Reference

### 7.440 cc\_hash\_table\_map\_/constructor\_destructor\_no\_store\_hash\_fn\_imps.hpp File Reference

#### 7.440.1 Detailed Description

Contains implementations of `cc_ht_map_`'s constructors, destructor, and related functions.

### 7.441 gp\_hash\_table\_map\_/constructor\_destructor\_no\_store\_hash\_fn\_imps.hpp File Reference

#### 7.441.1 Detailed Description

Contains implementations of `gp_ht_map_`'s constructors, destructor, and related functions.

#### **7.442 cc\_hash\_table\_map\_/constructor\_destructor\_store\_hash\_fn\_imps.hpp File Reference**

##### **7.442.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s constructors, destructor, and related functions.

#### **7.443 gp\_hash\_table\_map\_/constructor\_destructor\_store\_hash\_fn\_imps.hpp File Reference**

##### **7.443.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s constructors, destructor, and related functions.

#### **7.444 cc\_hash\_table\_map\_/debug\_no\_store\_hash\_fn\_imps.hpp File Reference**

##### **7.444.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s debug-mode functions.

#### **7.445 gp\_hash\_table\_map\_/debug\_no\_store\_hash\_fn\_imps.hpp File Reference**

##### **7.445.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s debug-mode functions.

#### **7.446 cc\_hash\_table\_map\_/debug\_store\_hash\_fn\_imps.hpp File Reference**

##### **7.446.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s debug-mode functions.

#### **7.447 gp\_hash\_table\_map\_/debug\_store\_hash\_fn\_imps.hpp File Reference**

##### **7.447.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s debug-mode functions.

#### **7.448 entry\_list\_fn\_imps.hpp File Reference**

##### **7.448.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s entry-list related functions.

#### **7.449 cc\_hash\_table\_map\_/erase\_no\_store\_hash\_fn\_imps.hpp File Reference**

##### **7.449.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s erase related functions, when the hash value is not stored.

#### **7.450 gp\_hash\_table\_map\_/erase\_no\_store\_hash\_fn\_imps.hpp File Reference**

##### **7.450.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s erase related functions, when the hash value is not stored.

**7.451 cc\_hash\_table\_map\_/erase\_store\_hash\_fn\_imps.hpp File Reference****7.451.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s erase related functions, when the hash value is stored.

**7.452 gp\_hash\_table\_map\_/erase\_store\_hash\_fn\_imps.hpp File Reference****7.452.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s erase related functions, when the hash value is stored.

**7.453 cc\_hash\_table\_map\_/find\_store\_hash\_fn\_imps.hpp File Reference****7.453.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s find related functions, when the hash value is stored.

**7.454 gp\_hash\_table\_map\_/find\_store\_hash\_fn\_imps.hpp File Reference****7.454.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s insert related functions, when the hash value is stored.

**7.455 cc\_hash\_table\_map\_/insert\_no\_store\_hash\_fn\_imps.hpp File Reference****7.455.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s insert related functions, when the hash value is not stored.

**7.456 gp\_hash\_table\_map\_/insert\_no\_store\_hash\_fn\_imps.hpp File Reference****7.456.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s insert related functions, when the hash value is not stored.

**7.457 cc\_hash\_table\_map\_/insert\_store\_hash\_fn\_imps.hpp File Reference****7.457.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s insert related functions, when the hash value is stored.

**7.458 gp\_hash\_table\_map\_/insert\_store\_hash\_fn\_imps.hpp File Reference****7.458.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s find related functions, when the hash value is stored.

**7.459 cc\_hash\_table\_map\_/resize\_fn\_imps.hpp File Reference****7.459.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s resize related functions.

**7.460 gp\_hash\_table\_map\_/resize\_fn\_imps.hpp File Reference****7.460.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s resize related functions.

## 7.461 `cc_hash_table_map_/resize_no_store_hash_fn_imps.hpp` File Reference

### 7.461.1 Detailed Description

Contains implementations of `cc_ht_map_'s` resize related functions, when the hash value is not stored.

## 7.462 `gp_hash_table_map_/resize_no_store_hash_fn_imps.hpp` File Reference

### 7.462.1 Detailed Description

Contains implementations of `gp_ht_map_'s` resize related functions, when the hash value is not stored.

## 7.463 `cc_hash_table_map_/resize_store_hash_fn_imps.hpp` File Reference

### 7.463.1 Detailed Description

Contains implementations of `cc_ht_map_'s` resize related functions, when the hash value is stored.

## 7.464 `gp_hash_table_map_/resize_store_hash_fn_imps.hpp` File Reference

### 7.464.1 Detailed Description

Contains implementations of `gp_ht_map_'s` resize related functions, when the hash value is stored.

## 7.465 `size_fn_imps.hpp` File Reference

### 7.465.1 Detailed Description

Contains implementations of `cc_ht_map_'s` entire container size related functions.

## 7.466 `cond_dealtor.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::cond\\_dealtor< Entry, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Variables

- template<typename Entry, class \_Alloc>  
[cond\\_dealtor< Entry, \\_Alloc >::entry\\_allocator](#) [\\_\\_gnu\\_pbds::detail::cond\\_dealtor< Entry, \\_Alloc >::s\\_alloc](#)

### 7.466.1 Detailed Description

Contains a conditional deallocator.

## 7.467 `container_base_dispatch.hpp` File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, Mapped, \\_Alloc, cc\\_hash\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, Mapped, \\_Alloc, gp\\_hash\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, Mapped, \\_Alloc, list\\_update\\_tag, Policy\\_TI >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, Mapped, \\_Alloc, ov\\_tree\\_tag, Policy\\_TI >](#)

- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, Mapped, \\_Alloc, pat\\_trie\\_tag, Policy\\_Tl >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, Mapped, \\_Alloc, rb\\_tree\\_tag, Policy\\_Tl >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, Mapped, \\_Alloc, splay\\_tree\\_tag, Policy\\_Tl >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, cc\\_hash\\_tag, Policy\\_Tl >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, gp\\_hash\\_tag, Policy\\_Tl >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, list\\_update\\_tag, Policy\\_Tl >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, ov\\_tree\\_tag, Policy\\_Tl >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, pat\\_trie\\_tag, Policy\\_Tl >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, rb\\_tree\\_tag, Policy\\_Tl >](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch< Key, null\\_type, \\_Alloc, splay\\_tree\\_tag, Policy\\_Tl >](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

## Macros

- `#define PB_DS_ASSERT_VALID(X)`
- `#define PB_DS_CHECK_KEY_DOES_NOT_EXIST(_Key)`
- `#define PB_DS_CHECK_KEY_EXISTS(_Key)`
- `#define PB_DS_DATA_FALSE_INDICATOR`
- `#define PB_DS_DATA_TRUE_INDICATOR`

- `#define PB_DS_V2F(X)`
- `#define PB_DS_V2S(X)`
- `#define PB_DS_V2S(X)`

### 7.467.1 Detailed Description

Contains associative container dispatching.

## 7.468 debug\_map\_base.hpp File Reference

### 7.468.1 Detailed Description

Contains a debug-mode base for all maps.

## 7.469 eq\_by\_less.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::eq\\_by\\_less< Key, Cmp\\_Fn >](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.469.1 Detailed Description

Contains an equivalence function.

## 7.470 hash\_eq\_fn.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::hash\\_eq\\_fn< Key, Eq\\_Fn, \\_Alloc, false >](#)
- struct [\\_\\_gnu\\_pbds::detail::hash\\_eq\\_fn< Key, Eq\\_Fn, \\_Alloc, true >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.470.1 Detailed Description

Contains 2 equivalence functions, one employing a hash value, and one ignoring it.

## 7.471 find\_no\_store\_hash\_fn\_imps.hpp File Reference

### 7.471.1 Detailed Description

Contains implementations of `gp_ht_map_'s` find related functions, when the hash value is not stored.

## 7.472 gp\_ht\_map\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::gp\\_ht\\_map< Key, Mapped, Hash\\_Fn, Eq\\_Fn, \\_Alloc, Store\\_Hash, Comb\\_Probe\\_Fn, Probe\\_Fn, Resize\\_Policy >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_GEN_POS`
- `#define PB_DS_GP_HASH_NAME`
- `#define PB_DS_GP_HASH_TRAITS_BASE`
- `#define PB_DS_HASH_EQ_FN_C_DEC`
- `#define PB_DS_RANGED_PROBE_FN_C_DEC`

### Variables

- `template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>  
gp\_ht\_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_Fn, Probe_Fn, Resize_Policy >::const_iterator \_\_gnu\_pbds::detail::gp\_ht\_map< Key, Mapped, Hash\_Fn, Eq\_Fn, \_Alloc, Store\_Hash, Comb\_Probe\_Fn, Probe\_Fn, Resize\_Policy >::s\_const\_end\_it`
- `template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>  
gp\_ht\_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_Fn, Probe_Fn, Resize_Policy >::iterator \_\_gnu\_pbds::detail::gp\_ht\_map< Key, Mapped, Hash\_Fn, Eq\_Fn, \_Alloc, Store\_Hash, Comb\_Probe\_Fn, Probe\_Fn, Resize\_Policy >::s\_end\_it`

- `template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>

>::entry_allocator __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,  
Comb_Probe_Fn, Probe_Fn, Resize_Policy >::s_entry_allocator`

#### 7.472.1 Detailed Description

Contains an implementation class for general probing hash.

### 7.473 iterator\_fn\_imps.hpp File Reference

#### 7.473.1 Detailed Description

Contains implementations of `gp_ht_map`'s iterators related functions, e.g., `begin()`.

### 7.474 direct\_mask\_range\_hashing\_imp.hpp File Reference

#### 7.474.1 Detailed Description

Contains a range-hashing policy implementation

### 7.475 direct\_mod\_range\_hashing\_imp.hpp File Reference

#### 7.475.1 Detailed Description

Contains a range-hashing policy implementation

### 7.476 linear\_probe\_fn\_imp.hpp File Reference

#### 7.476.1 Detailed Description

Contains a probe policy implementation

### 7.477 mask\_based\_range\_hashing.hpp File Reference

#### Classes

- class `__gnu_pbds::detail::mask_based_range_hashing< Size_Type >`

#### Namespaces

- namespace `__gnu_pbds`

#### Variables

- `template<typename Size_Type>  
const mask_based_range_hashing< Size_Type >::size_type __gnu_pbds::detail::mask_based_range_hashing< Size_Type >::s_highest_bit_1`
- `template<typename Size_Type>  
const mask_based_range_hashing< Size_Type >::size_type __gnu_pbds::detail::mask_based_range_hashing< Size_Type >::s_num_bits_in_size_type`

#### 7.477.1 Detailed Description

Contains a range hashing policy base.

## 7.478 mod\_based\_range\_hashing.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::mod\\_based\\_range\\_hashing< Size\\_Type >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.478.1 Detailed Description

Contains a range hashing policy base.

## 7.479 probe\_fn\_base.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::probe\\_fn\\_base< \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.479.1 Detailed Description

Contains a probe policy base.

## 7.480 quadratic\_probe\_fn\_imp.hpp File Reference

#### 7.480.1 Detailed Description

Contains a probe policy implementation

## 7.481 ranged\_hash\_fn.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::ranged\\_hash\\_fn< Key, Hash\\_Fn, \\_Alloc, Comb\\_Hash\\_Fn, false >](#)
- class [\\_\\_gnu\\_pbds::detail::ranged\\_hash\\_fn< Key, Hash\\_Fn, \\_Alloc, Comb\\_Hash\\_Fn, true >](#)

- class [\\_\\_gnu\\_pbds::detail::ranged\\_hash\\_fn< Key, null\\_type, \\_Alloc, Comb\\_Hash\\_Fn, true >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CLASS_T_DEC`

### 7.481.1 Detailed Description

Contains a unified ranged hash functor, allowing the hash tables to deal with a single class for ranged hashing.

## 7.482 `ranged_probe_fn.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::ranged\\_probe\\_fn< Key, Hash\\_Fn, \\_Alloc, Comb\\_Probe\\_Fn, Probe\\_Fn, false >](#)
- class [\\_\\_gnu\\_pbds::detail::ranged\\_probe\\_fn< Key, Hash\\_Fn, \\_Alloc, Comb\\_Probe\\_Fn, Probe\\_Fn, true >](#)
- class [\\_\\_gnu\\_pbds::detail::ranged\\_probe\\_fn< Key, null\\_type, \\_Alloc, Comb\\_Probe\\_Fn, null\\_type, false >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CLASS_T_DEC`

### 7.482.1 Detailed Description

Contains a unified ranged probe functor, allowing the probe tables to deal with a single class for ranged probing.

## 7.483 `sample_probe_fn.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_probe\\_fn](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.483.1 Detailed Description

Contains a sample probe policy.

## 7.484 `sample_range_hashing.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_range\\_hashing](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.484.1 Detailed Description

Contains a range hashing policy.

## 7.485 sample\_ranged\_hash\_fn.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_ranged\\_hash\\_fn](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.485.1 Detailed Description

Contains a ranged hash policy.

## 7.486 sample\_ranged\_probe\_fn.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_ranged\\_probe\\_fn](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.486.1 Detailed Description

Contains a ranged probe policy.

## 7.487 left\_child\_next\_sibling\_heap\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::left\\_child\\_next\\_sibling\\_heap< Value\\_Type, Cmp\\_Fn, Node\\_Metadata, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

### Variables

- `template<typename Value_Type, typename Cmp_Fn, typename Node_Metadata, typename _Alloc>  
left\_child\_next\_sibling\_heap< Value_Type, Cmp_Fn, Node_Metadata, _Alloc >::no_throw_copies_t \_\_gnu\_↔  
\_pbds::detail::left\_child\_next\_sibling\_heap< Value_Type, Cmp_Fn, Node_Metadata, _Alloc >::s_no_↔  
throw_copies_ind`
- `template<typename Value_Type, typename Cmp_Fn, typename Node_Metadata, typename _Alloc>  
left\_child\_next\_sibling\_heap< Value_Type, Cmp_Fn, Node_Metadata, _Alloc >::node_allocator \_\_gnu\_↔  
pbds::detail::left\_child\_next\_sibling\_heap< Value_Type, Cmp_Fn, Node_Metadata, _Alloc >::s_node_↔  
allocator`

#### 7.487.1 Detailed Description

Contains an implementation class for a basic heap.

## 7.488 left\_child\_next\_sibling\_heap\_/node.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::left\\_child\\_next\\_sibling\\_heap\\_node\\_< \\_Value, \\_Metadata, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.488.1 Detailed Description

Contains an implementation struct for this type of heap's node.

## 7.489 rb\_tree\_map\_/node.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::rb\\_tree\\_node\\_< Value\\_Type, Metadata, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.489.1 Detailed Description

Contains an implementation for rb\_tree\_.

## 7.490 splay\_tree\_/node.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::splay\\_tree\\_node\\_< Value\\_Type, Metadata, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.490.1 Detailed Description

Contains an implementation struct for splay\_tree\_'s node.

## 7.491 entry\_metadata\_base.hpp File Reference

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.491.1 Detailed Description

Contains an implementation for a list update map.

## 7.492 lu\_map\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::lu\\_map< Key, Mapped, Eq\\_Fn, \\_Alloc, Update\\_Policy >](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

## Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_GEN_POS`
- `#define PB_DS_LU_NAME`
- `#define PB_DS_LU_TRAITS_BASE`

## Variables

- `template<typename Key, typename Mapped, typename Eq_Fn, typename _Alloc, typename Update_Policy>  
lu\_map< Key, Mapped, Eq_Fn, _Alloc, Update_Policy >::entry_allocator \_\_gnu\_pbds::detail::lu\_map< Key, Mapped, Eq_Fn, _Alloc, Update_Policy >::s_entry_allocator`
- `template<typename Key, typename Mapped, typename Eq_Fn, typename _Alloc, typename Update_Policy>  
Eq_Fn \_\_gnu\_pbds::detail::lu\_map< Key, Mapped, Eq_Fn, _Alloc, Update_Policy >::s_eq_fn`
- `template<typename Key, typename Mapped, typename Eq_Fn, typename _Alloc, typename Update_Policy>

- `template<typename Key, typename Mapped, typename Eq_Fn, typename _Alloc, typename Update_Policy>  
Update_Policy \_\_gnu\_pbds::detail::lu\_map< Key, Mapped, Eq_Fn, _Alloc, Update_Policy >::s_update_↵  
policy`

### 7.492.1 Detailed Description

Contains a list update map.

## 7.493 [lu\\_counter\\_metadata.hpp](#) File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::lu\\_counter\\_metadata](#)< [Size\\_Type](#) >
- class [\\_\\_gnu\\_pbds::detail::lu\\_counter\\_policy\\_base](#)< [Size\\_Type](#) >

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.493.1 Detailed Description

Contains implementation of a lu counter policy's metadata.

## 7.494 [sample\\_update\\_policy.hpp](#) File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::sample\\_update\\_policy](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.494.1 Detailed Description

Contains a sample policy for list update containers.

## 7.495 ov\_tree\_map\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::ov\\_tree\\_map< Key, Mapped, Cmp\\_Fn, Node\\_And\\_It\\_Traits, \\_Alloc >::cond\\_dtor< Size\\_Type >](#)
- class [\\_\\_gnu\\_pbds::detail::ov\\_tree\\_map< Key, Mapped, Cmp\\_Fn, Node\\_And\\_It\\_Traits, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

### 7.495.1 Detailed Description

Contains an implementation class for ov\_tree.

## 7.496 pairing\_heap\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::pairing\\_heap< Value\\_Type, Cmp\\_Fn, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_ASSERT_NODE_CONSISTENT(_Node, _Bool)`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_P_HEAP_BASE`

### 7.496.1 Detailed Description

Contains an implementation class for a pairing heap.

## 7.497 insert\_join\_fn\_imps.hpp File Reference

### 7.497.1 Detailed Description

Contains an implementation class for pat\_trie.

## 7.498 pat\_trie.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::pat\\_trie\\_map](#)< Key, Mapped, Node\_And\_It\_Traits, \_Alloc >

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- #define **PB\_DS\_ASSERT\_NODE\_VALID(X)**

### 7.499.1 Detailed Description

Contains the base class for a patricia tree.

## 7.500 split\_fn\_imps.hpp File Reference

### 7.500.1 Detailed Description

Contains an implementation class for pat\_trie.

## 7.501 synth\_access\_traits.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::synth\\_access\\_traits<Type\\_Traits, Set, \\_ATraits>](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

## Macros

- `#define PB_DS_SYNTH_E_ACCESS_TRAITS_C_DEC`
- `#define PB_DS_SYNTH_E_ACCESS_TRAITS_T_DEC`

## Variables

- `template<typename Type_Traits, bool Set, typename _ATraits>`  
`integral_constant< int, Set > \_\_gnu\_pbds::detail::synth\_access\_traits<Type\_Traits, Set, \_ATraits>::s\_`  
`set_ind`

### 7.501.1 Detailed Description

Contains an implementation class for a patricia tree.

## 7.502 `update_fn_imps.hpp` File Reference

### 7.502.1 Detailed Description

Contains an implementation class for `pat_trie_`.

## 7.503 `priority_queue_base_dispatch.hpp` File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch<\\_VTp, Cmp\\_Fn, \\_Alloc, binary\\_heap\\_tag, null\\_type>](#)
- struct [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch<\\_VTp, Cmp\\_Fn, \\_Alloc, binomial\\_heap\\_tag, null\\_type>](#)

- `#define PB_DS_RB_TREE_NAME`
- `#define PB_DS_STRUCT_ONLY_ASSERT_VALID(X)`

### 7.504.1 Detailed Description

Contains an implementation for Red Black trees.

## 7.505 `rc.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::rc<\\_Node, \\_Alloc>](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.505.1 Detailed Description

Contains a redundant (binary counter).

## 7.506 rc\_binomial\_heap\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::rc\\_binomial\\_heap< Value\\_Type, Cmp\\_Fn, \\_Alloc >](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

## Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_RC_C_DEC`

### 7.506.1 Detailed Description

Contains an implementation for redundant-counter binomial heap.

## 7.507 cc\_hash\_max\_collision\_check\_resize\_trigger\_imp.hpp File Reference

### 7.507.1 Detailed Description

Contains a resize trigger implementation.

## 7.508 hash\_exponential\_size\_policy\_imp.hpp File Reference

### 7.508.1 Detailed Description

Contains a resize size policy implementation.

## 7.509 hash\_load\_check\_resize\_trigger\_imp.hpp File Reference

### 7.509.1 Detailed Description

Contains a resize trigger implementation.

## 7.510 hash\_load\_check\_resize\_trigger\_size\_base.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::hash\\_load\\_check\\_resize\\_trigger\\_size\\_base< Size\\_Type, true >](#)

## Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.510.1 Detailed Description

Contains an base holding size for some resize policies.

## 7.511 hash\_prime\_size\_policy\_imp.hpp File Reference

### 7.511.1 Detailed Description

Contains a resize size policy implementation.

## 7.512 hash\_standard\_resize\_policy\_imp.hpp File Reference

### 7.512.1 Detailed Description

Contains a resize policy implementation.

## 7.513 sample\_resize\_policy.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_resize\\_policy](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.513.1 Detailed Description

Contains a sample resize policy for hash tables.

## 7.514 sample\_resize\_trigger.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_resize\\_trigger](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.514.1 Detailed Description

Contains a sample resize trigger policy class.

## 7.515 sample\_size\_policy.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_size\\_policy](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.515.1 Detailed Description

Contains a sample size resize-policy.

## 7.516 splay\_fn\_imps.hpp File Reference

### 7.516.1 Detailed Description

Contains an implementation class for splay\_tree\_.

## 7.517 splay\_tree\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::splay\\_tree\\_map](#)< Key, Mapped, Cmp\_Fn, Node\_And\_It\_Traits, \_Alloc >

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- #define **PB\_DS\_ASSERT\_BASE\_NODE\_CONSISTENT**(\_Node)
- #define **PB\_DS\_CLASS\_C\_DEC**
- #define **PB\_DS\_CLASS\_T\_DEC**
- #define **PB\_DS\_S\_TREE\_BASE**
- #define **PB\_DS\_S\_TREE\_BASE\_NAME**
- #define **PB\_DS\_S\_TREE\_NAME**

### 7.517.1 Detailed Description

Contains an implementation class for splay trees.

## 7.518 standard\_policies.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::default\\_comb\\_hash\\_fn](#)
- struct [\\_\\_gnu\\_pbds::detail::default\\_eq\\_fn](#)< Key >
- struct [\\_\\_gnu\\_pbds::detail::default\\_hash\\_fn](#)< Key >
- struct [\\_\\_gnu\\_pbds::detail::default\\_probe\\_fn](#)< Comb\_Probe\_Fn >
- struct [\\_\\_gnu\\_pbds::detail::default\\_resize\\_policy](#)< Comb\_Hash\_Fn >
- struct [\\_\\_gnu\\_pbds::detail::default\\_trie\\_access\\_traits](#)< std::basic\_string< Char, Char\_Traits, std::allocator< char > > >
- struct [\\_\\_gnu\\_pbds::detail::default\\_update\\_policy](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- #define **\_\_dtrie\_alloc**
- #define **\_\_dtrie\_string**

### Enumerations

- enum { **default\_store\_hash** }

### 7.518.1 Detailed Description

Contains standard policies for containers.

### 7.518.2 Enumeration Type Documentation

#### anonymous enum

`anonymous enum`

Enumeration for default behavior of stored hash data.

## 7.519 thin\_heap\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::thin\\_heap< Value\\_Type, Cmp\\_Fn, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_ASSERT_AUX_NULL(X)`
- `#define PB_DS_ASSERT_NODE_CONSISTENT(_Node, _Bool)`
- `#define PB_DS_BASE_T_P`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

### Enumerations

- enum { `num_distinct_rank_bounds` }

### Variables

- static const std::size\_t [\\_\\_gnu\\_pbds::detail::g\\_a\\_rank\\_bounds](#) [num\_distinct\_rank\_bounds]

### 7.519.1 Detailed Description

Contains an implementation class for a thin heap.

## 7.520 tree\_policy/node\_metadata\_selector.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::tree\\_metadata\\_helper< Node\\_Update, false >](#)
- struct [\\_\\_gnu\\_pbds::detail::tree\\_metadata\\_helper< Node\\_Update, true >](#)
- struct [\\_\\_gnu\\_pbds::detail::tree\\_node\\_metadata\\_dispatch< Key, Data, Cmp\\_Fn, Node\\_Update, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 7.520.1 Detailed Description

Contains an implementation class for trees.

## 7.521 trie\_policy/node\_metadata\_selector.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::trie\\_metadata\\_helper< Node\\_Update, false >](#)
- struct [\\_\\_gnu\\_pbds::detail::trie\\_metadata\\_helper< Node\\_Update, true >](#)
- struct [\\_\\_gnu\\_pbds::detail::trie\\_node\\_metadata\\_dispatch< Key, Data, Cmp\\_Fn, Node\\_Update, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.521.1 Detailed Description

Contains an implementation class for tries.

## 7.522 tree\_policy/order\_statistics\_imp.hpp File Reference

#### 7.522.1 Detailed Description

Contains forward declarations for order\_statistics\_key

## 7.523 trie\_policy/order\_statistics\_imp.hpp File Reference

#### 7.523.1 Detailed Description

Contains forward declarations for order\_statistics\_key

## 7.524 sample\_tree\_node\_update.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_tree\\_node\\_update< Const\\_Node\\_Iter, Node\\_Iter, Cmp\\_Fn, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.524.1 Detailed Description

Contains a samle node update functor.

## 7.525 tree\_trace\_base.hpp File Reference

#### 7.525.1 Detailed Description

Contains tree-related policies.

## 7.526 prefix\_search\_node\_update\_imp.hpp File Reference

#### 7.526.1 Detailed Description

Contains an implementation of prefix\_search\_node\_update.

## 7.527 `sample_trie_access_traits.hpp` File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::sample\\_trie\\_access\\_traits](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.527.1 Detailed Description

Contains a sample probe policy.

## 7.528 `sample_trie_node_update.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::sample\\_trie\\_node\\_update< Node\\_Cltr, Node\\_Itr, \\_ATraits, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

#### 7.528.1 Detailed Description

Contains a samle node update functor.

## 7.529 `trie_policy_base.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::trie\\_policy\\_base< Node\\_Cltr, Node\\_Itr, \\_ATraits, \\_Alloc >](#)

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

#### 7.529.1 Detailed Description

Contains an implementation of `trie_policy_base`.

## 7.530 `trie_string_access_traits_imp.hpp` File Reference

#### 7.530.1 Detailed Description

Contains a policy for extracting character positions from a string for a vector-based PATRICIA tree

## 7.531 `type_utils.hpp` File Reference

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

## Macros

- `#define PB_DS_STATIC_ASSERT(UNIQUE, E)`

## Typedefs

- `typedef std::tr1::integral_constant< int, 0 > __gnu_pbds::detail::false_type`
- `typedef std::tr1::integral_constant< int, 1 > __gnu_pbds::detail::true_type`

### 7.531.1 Detailed Description

Contains utilities for handling types. All of these classes are based on Modern C++ by Andrei Alexandrescu.

## 7.532 types\_traits.hpp File Reference

### Classes

- `struct __gnu_pbds::detail::maybe_null_type< Key, Mapped, _Alloc, Store_Hash >`
- `struct __gnu_pbds::detail::maybe_null_type< Key, null_type, _Alloc, Store_Hash >`
- `struct __gnu_pbds::detail::no_throw_copies< Key, Mapped >`
- `struct __gnu_pbds::detail::no_throw_copies< Key, null_type >`
- `struct __gnu_pbds::detail::rebind_traits< _Alloc, T >`
- `struct __gnu_pbds::detail::select_value_type< Key, Mapped >`
- `struct __gnu_pbds::detail::select_value_type< Key, null_type >`
- `struct __gnu_pbds::detail::stored_data< _Tv, _Th, Store_Hash >`
- `struct __gnu_pbds::detail::stored_data< _Tv, _Th, false >`
- `struct __gnu_pbds::detail::stored_hash< _Th >`
- `struct __gnu_pbds::detail::stored_value< _Tv >`
- `struct __gnu_pbds::detail::types_traits< Key, Mapped, _Alloc, Store_Hash >`

### Namespaces

- namespace `__gnu_pbds`

### Variables

- `template<typename Key, typename _Alloc, bool Store_Hash>`  
`null_type __gnu_pbds::detail::maybe_null_type< Key, null_type, _Alloc, Store_Hash >::s_null_type`

### 7.532.1 Detailed Description

Contains a traits class of types used by containers.

## 7.533 iterator.hpp File Reference

### 7.533.1 Detailed Description

Contains an `iterator_class` used for ranging over the elements of the table.

This file is intended to be included inside a class definition, with `PB_DS_CLASS_C_DEC` defined to the name of the enclosing class.

## 7.534 point\_iterator.hpp File Reference

### 7.534.1 Detailed Description

Contains an iterator class returned by the tables' find and insert methods.

This file is intended to be included inside a class definition, with PB\_DS\_CLASS\_C\_DEC defined to the name of the enclosing class.

## 7.535 exception.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::container\\_error](#)
- struct [\\_\\_gnu\\_pbds::insert\\_error](#)
- struct [\\_\\_gnu\\_pbds::join\\_error](#)

#### 7.543.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Author

Bob Walters

Provides reusable `_Pointer_adapter` for assisting in the development of custom pointer types that can be used with the standard containers via the `allocator::pointer` and `allocator::const_pointer` typedefs.

### 7.544 `pool_allocator.h` File Reference

#### Classes

- class `\_\_gnu\_cxx::\_\_pool\_alloc< _Tp >`
- class `\_\_gnu\_cxx::\_\_pool\_alloc\_base`

#### Namespaces

- namespace `\_\_gnu\_cxx`

#### Functions

- `template<typename _Tp>`  
`bool __gnu_cxx::operator== (const \_\_pool\_alloc< _Tp > &, const \_\_pool\_alloc< _Tp > &)`

#### Variables

- `template<typename _Tp>`  
`_Atomic_word \_\_gnu\_cxx::\_\_pool\_alloc< _Tp >::__S_force_new`

#### 7.544.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

### 7.545 `rb_tree` File Reference

#### Classes

- struct `\_\_gnu\_cxx::rb\_tree< _Key, _Value, _KeyOfValue, _Compare, _Alloc >`

**Namespaces**

- namespace [\\_\\_gnu\\_cxx](#)

**Macros**

- `#define _RB_TREE`

**7.545.1 Detailed Description**

This file is a GNU extension to the Standard C++ Library (possibly containing extensions from the HP/SGI STL subset).

**7.546 rc\_string\_base.h File Reference****Classes**

- class [\\_\\_gnu\\_cxx::\\_\\_rc\\_string\\_base<\\_CharT, \\_Traits, \\_Alloc>](#)

**Namespaces**

- namespace [\\_\\_gnu\\_cxx](#)

**Variables**

- `template<typename _CharT, typename _Traits, typename _Alloc>  
\_\_rc\_string\_base<\_CharT, \_Traits, \_Alloc>::Rep\_empty \_\_gnu\_cxx::\_\_rc\_string\_base<\_CharT, \_Traits, \_Alloc>::S\_empty\_rep`

**7.546.1 Detailed Description**

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ext/vstring.h>`.

**7.547 rope File Reference****Classes**

- class [\\_\\_gnu\\_cxx::rope<\\_CharT, \\_Alloc>](#)

**Namespaces**

### 7.554.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Contains two exception-generating types (`throw_value`, `throw_allocator`) intended to be used as value and allocator types while testing exception safety in templated containers and algorithms. The allocator has additional log and debug features. The exception generated is of type `forced_exception_error`.

## 7.555 `type_traits.h` File Reference

### Namespaces

### 7.579.1 Detailed Description

This is a Standard C++ Library header.

## 7.580 iostream File Reference

### Namespaces

- namespace `std`

### Macros

- #define `_GLIBCXX_IOSTREAM`

### Variables

- static `ios_base::Init` `std::__ioinit`

### Standard Stream Objects

The `<iostream>` header declares the eight standard stream objects. For other declarations, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/io.html> and the *I/O forward declarations*

They are required by default to cooperate with the global C library's *FILE* streams, and to be available during program startup and termination. For more information, see the section of the manual linked to above.

- `ostream` `std::cerr`
- `istream` `std::cin`
- `ostream` `std::clog`
- `ostream` `std::cout`
- `wostream` `std::wcerr`
- `wistream` `std::wcin`
- `wostream` `std::wclog`
- `wostream` `std::wcout`

### 7.580.1 Detailed Description

This is a Standard C++ Library header.

### 7.594.1 Detailed Description

This is a Standard C++ Library header.

### 7.594.2 Function Documentation

#### abs()

```
template<typename _Tp>
_Tp std::abs (
    const complex< _Tp > & __z) [inline]
```

Return magnitude of z.

**cos()**

```
template<typename _Tp>
complex< _Tp > std::cos (
    const complex< _Tp > & __z) [inline]
```

Return complex cosine of  $z$ .

**cosh()**

```
template<typename _Tp>
complex< _Tp > std::cosh (
    const complex< _Tp > & __z) [inline]
```

Return complex hyperbolic cosine of  $z$ .

**exp()**

```
template<typename _Tp>
complex< _Tp > std::exp (
    const complex< _Tp > & __z) [inline]
```

Return complex base  $e$  exponential of  $z$ .

**fabs()**

```
template<typename _Tp>
_Tp std::fabs (
    const std::complex< _Tp > & __z) [inline]
```

`fabs(__z)` TR1 8.1.8 [tr.c99.cmplx.fabs]

**log()**

```
template<typename _Tp>
complex< _Tp > std::log (
    const complex< _Tp > & __z) [inline]
```

Return complex natural logarithm of  $z$ .

**log10()**

```
template<typename _Tp>
complex< _Tp > std::log10 (
    const complex< _Tp > & __z) [inline]
```

Return complex base 10 logarithm of  $z$ .

**pow()**

```
template<typename _Tp>
complex< _Tp > std::pow (
    const complex< _Tp > & __z,
    int __n) [inline]
```

Return  $x$  to the  $y$ 'th power.

**sin()**

```
template<typename _Tp>
complex< _Tp > std::sin (
    const complex< _Tp > & __z) [inline]
```

Return complex sine of  $z$ .

**sinh()**

```
template<typename _Tp>
complex< _Tp > std::sinh (
    const complex< _Tp > & __z) [inline]
```

Return complex hyperbolic sine of z.

**sqrt()**

```
template<typename _Tp>
complex< _Tp > std::sqrt (
    const complex< _Tp > & __z) [inline]
```

Return complex square root of z.

**tan()**

```
template<typename _Tp>
complex< _Tp > std::tan (
    const complex< _Tp > & __z) [inline]
```

Return complex tangent of z.

**tanh()**

```
template<typename _Tp>
complex< _Tp > std::tanh (
    const complex< _Tp > & __z) [inline]
```

Return complex hyperbolic tangent of z.

**7.595 mdspan File Reference****Macros**

### 7.599.1 Detailed Description

This is a TS C++ Library header.

### 7.599.2 Function Documentation

#### get\_default\_resource()

```
memory_resource * std::experimental::fundamentals_v2::pmr::get_default_resource () [inline],
[noexcept]
```

Get the current default resource.

#### set\_default\_resource()

```
memory_resource * std::experimental::fundamentals_v2::pmr::set_default_resource (
    memory_resource * __r) [inline], [noexcept]
```

Change the default resource and return the previous one.

## 7.600 memory\_resource File Reference

### Classes

- class [std::pmr::monotonic\\_buffer\\_resource](#)

### 7.600.1 Detailed Description

This is a Standard C++ Library header.

This header declares the [pmr](#) (std::pmr) memory resources.

### 7.600.2 Function Documentation

#### get\_default\_resource()

```
memory_resource * std::pmr::get_default_resource () [noexcept]
```

Get the current default memory resource pointer.

#### null\_memory\_resource()

```
memory_resource * std::pmr::null_memory_resource () [nodiscard], [noexcept]
```

A [pmr::memory\\_resource](#) that always throws `bad_alloc`

**set\_default\_resource()**

```
memory_resource * std::pmr::set_default_resource (
    memory_resource * __r) [noexcept]
```

Replace the default memory resource pointer.

### 7.606.1 Detailed Description

Parallel STL function calls corresponding to `stl_numeric.h`. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

### 7.610.1 Detailed Description

Parallel STL function calls corresponding to the `std::algo.h` header.

The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

### 7.611.1 Detailed Description

Parallel STL function calls corresponding to the `stl_algobase.h` header. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

### 7.612.1 Detailed Description

Implementation of a dynamically load-balanced parallel quicksort.

It works in-place and needs only logarithmic extra memory. The algorithm is similar to the one proposed in

P. Tsigas and Y. Zhang. A simple, fast parallel implementation of quicksort and its performance evaluation on SUN enterprise 10000. In 11th Euromicro Conference on Parallel, Distributed and Network-Based Processing, page 372, 2003.

This file is a GNU parallel extension to the Standard C++ Library.

- `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB`
- `#define _GLIBCXX_SCALE_DOWN_FPU`
- `#define _GLIBCXX_VERBOSE_LEVEL`

### 7.616.1 Detailed Description

Defines on options concerning debugging and performance, at compile-time. This file is a GNU parallel extension to the Standard C++ Library.

### 7.616.2 Macro Definition Documentation

#### `_GLIBCXX_CALL`

```
#define _GLIBCXX_CALL(  
    __n)
```

Macro to produce log message when entering a function.

#### Parameters

<code>__n</code>	Input size.
------------------	-------------

See also

`_GLIBCXX_VERBOSE_LEVEL`

Referenced by `__gnu_parallel::__find_template()`, `__gnu_parallel::__find_template()`, `__gnu_parallel::__find_template()`, `__gnu_parallel::__for_each_template_random_access_workstealing()`, `__gnu_parallel::__merge_advance()`, `__gnu_parallel::__parallel_n`, `__gnu_parallel::__parallel_partial_sum()`, `__gnu_parallel::__parallel_partition()`, `__gnu_parallel::__parallel_random_shuffle_drs()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort_qsb()`, `__gnu_parallel::__parallel_sort_qsb()`, `__gnu_parallel::__parallel_unique_copy()`, `__gnu_parallel::__search_template()`, `__gnu_parallel::__sequential_multiway_merge()`, `__gnu_parallel::__multiseq_partition()`, `__gnu_parallel::__multiseq_selection()`, `__gnu_parallel::multiway_merge()`, `__gnu_parallel::multiway_merge_3_variant()`, `__gnu_parallel::multiway_merge_4_variant()`, `__gnu_parallel::multiway_merge_loser_tree()`, `__gnu_parallel::multiway_merge_loser_tree_sentinel()`, `__gnu_parallel::multiway_merge_lo`, `__gnu_parallel::multiway_merge_sentinels()`, `__gnu_parallel::parallel_multiway_merge()`, and `__gnu_parallel::parallel_sort_mwms()`.

## `_GLIBCXX_PARALLEL_ASSERTIONS`

```
#define _GLIBCXX_PARALLEL_ASSERTIONS
```

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Should be switched on only locally.

Referenced by `__gnu_parallel::__qsb_local_sort_with_helping()`.

## `_GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1`

```
#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1
```

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Consider the size of the L1 cache for `gnu_↵`  
`parallel::__parallel_random_shuffle()`.

## `_GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB`

```
#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB
```

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Consider the size of the TLB for `gnu_parallel↵`  
`::__parallel_random_shuffle()`.

## `_GLIBCXX_SCALE_DOWN_FPU`

```
#define _GLIBCXX_SCALE_DOWN_FPU
```

Use floating-point scaling instead of modulo for mapping random numbers to a range. This can be faster on certain CPUs.

## `_GLIBCXX_VERBOSE_LEVEL`

```
#define _GLIBCXX_VERBOSE_LEVEL
```

Determine verbosity level of the parallel mode. Level 1 prints a message each time a parallel-mode function is entered.

## 7.617 `equally_split.h` File Reference

### Namespaces

- namespace `__gnu_parallel`

### Functions

- `template<typename _DifferenceType, typename _OutputIterator>`  
`_OutputIterator __gnu_parallel::__equally_split` (`_DifferenceType __n`, `_ThreadIndex __num_threads`, `_Output↵`  
`Iterator __s`)

### 7.618.1 Detailed Description

Defines on whether to include algorithm variants.

Less variants reduce executable size and compile time. This file is a GNU parallel extension to the Standard C++ Library.

### 7.618.2 Macro Definition Documentation

#### `_GLIBCXX_BAL_QUICKSORT`

```
#define _GLIBCXX_BAL_QUICKSORT
```

Include parallel dynamically load-balanced quicksort.

See also

`__gnu_parallel::_Settings::sort_algorithm`

#### `_GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS`

```
#define _GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS
```

Include the equal-sized blocks variant for `std::find`.

See also

`__gnu_parallel::_Settings::find_algorithm`

#### `_GLIBCXX_FIND_EQUAL_SPLIT`

```
#define _GLIBCXX_FIND_EQUAL_SPLIT
```

Include the equal splitting variant for `std::find`.

See also

`__gnu_parallel::_Settings::find_algorithm`

**\_GLIBCXX\_FIND\_GROWING\_BLOCKS**

```
#define _GLIBCXX_FIND_GROWING_BLOCKS
```

Include the growing blocks variant for `std::find`.

See also

`__gnu_parallel::_Settings::find_algorithm`

**\_GLIBCXX\_MERGESORT**

```
#define _GLIBCXX_MERGESORT
```

Include parallel multi-way mergesort.

See also

`__gnu_parallel::_Settings::sort_algorithm`

**\_GLIBCXX\_QUICKSORT**

```
#define _GLIBCXX_QUICKSORT
```

Include parallel unbalanced quicksort.

See also

`__gnu_parallel::_Settings::sort_algorithm`

**\_GLIBCXX\_TREE\_DYNAMIC\_BALANCING**

```
#define _GLIBCXX_TREE_DYNAMIC_BALANCING
```

Include the dynamic balancing variant for `_Rb_tree::insert_unique(_Iter beg, _Iter __end)`.

See also

`__gnu_parallel::_Rb_tree`

**\_GLIBCXX\_TREE\_FULL\_COPY**

```
#define _GLIBCXX_TREE_FULL_COPY
```

In order to sort the input sequence of `_Rb_tree::insert_unique(_Iter beg, _Iter __end)` a full copy of the input elements is done.

See also

`__gnu_parallel::_Rb_tree`

**\_GLIBCXX\_TREE\_INITIAL\_SPLITTING**

```
#define _GLIBCXX_TREE_INITIAL_SPLITTING
```

Include the initial splitting variant for `_Rb_tree::insert_unique(_Iter beg, _Iter __end)`.

See also

`__gnu_parallel::_Rb_tree`

### 7.627.1 Detailed Description

Functions to find elements of a certain global `__rank` in multiple sorted sequences. Also serves for splitting such sequence sets.

The algorithm description can be found in

P. J. Varman, S. D. Scheufler, B. R. Iyer, and G. R. Ricard. Merging Multiple Lists on Hierarchical-Memory Multiprocessors. Journal of Parallel and Distributed Computing, 12(2):171-177, 1991.

This file is a GNU parallel extension to the Standard C++ Library.

### 7.628.1 Detailed Description

Implementation of sequential and parallel multiway merge.

Explanations on the high-speed merging routines in the appendix of

P. Sanders. Fast priority queues for cached memory. ACM Journal of Experimental Algorithmics, 5, 2000.

This file is a GNU parallel extension to the Standard C++ Library.

### 7.628.2 Macro Definition Documentation

#### GLIBCXX\_PARALLEL\_LENGTH

```
#define GLIBCXX_PARALLEL_LENGTH(  
    __s)
```

Length of a sequence described by a pair of iterators.

Referenced by [gnu\\_parallel::sequential\\_multiway\\_merge\(\)](#), [gnu\\_parallel::multiway\\_merge\\_exact\\_splitting\(\)](#), [gnu\\_parallel::multiway\\_merge\\_loser\\_tree\(\)](#), [gnu\\_parallel::multiway\\_merge\\_sampling\\_splitting\(\)](#), and [gnu\\_parallel::parallel\\_multiway\\_merge\(\)](#).

### 7.642.1 Detailed Description

Parallel implementations of set operations for random-access iterators. This file is a GNU parallel extension to the Standard C++ Library.

## 7.643 `settings.h` File Reference

### Classes

- struct [\\_\\_gnu\\_parallel::\\_Settings](#)

### Namespaces

- namespace [\\_\\_gnu\\_parallel](#)

## Macros

- `#define _GLIBCXX_PARALLEL_CONDITION(__c)`

### 7.643.1 Detailed Description

Runtime settings and tuning parameters, heuristics to decide whether to use parallelized algorithms. This file is a GNU parallel extension to the Standard C++ Library.

### 7.643.2 Deciding whether to run an algorithm in parallel.

There are several ways the user can switch on and off the parallel execution of an algorithm, both at compile- and run-time.

Only sequential execution can be forced at compile-time. This reduces code size and protects code parts that have non-thread-safe side effects.

Ultimately, forcing parallel execution at compile-time makes sense. Often, the sequential algorithm implementation is used as a subroutine, so no reduction in code size can be achieved. Also, the machine the program is run on might have only one processor core, so to avoid overhead, the algorithm is executed sequentially.

To force sequential execution of an algorithm ultimately at compile-time, the user must add the tag `gnu_parallel::sequential_tag()` to the end of the parameter list, e. g.

```
std::sort(__v.begin(), __v.end(), __gnu_parallel::sequential_tag());
```

This is compatible with all overloaded algorithm variants. No additional code will be instantiated, at all. The same holds for most algorithm calls with iterators not providing random access.

If the algorithm call is not forced to be executed sequentially at compile-time, the decision is made at run-time. The global variable `__gnu_parallel::_Settings::algorithm_strategy` is checked. It is a tristate variable corresponding to:

- a. `force_sequential`, meaning the sequential algorithm is executed.
- b. `force_parallel`, meaning the parallel algorithm is executed.
- c. `heuristic`

For heuristic, the parallel algorithm implementation is called only if the input size is sufficiently large. For most algorithms, the input size is the (combined) length of the input sequence(`__s`). The threshold can be set by the user, individually for each algorithm. The according variables are called `gnu_parallel::_Settings::[algorithm]_minimal_n`.

For some of the algorithms, there are even more tuning options, e. g. the ability to choose from multiple algorithm variants. See below for details.

### 7.643.3 Macro Definition Documentation

#### `_GLIBCXX_PARALLEL_CONDITION`

```
#define _GLIBCXX_PARALLEL_CONDITION(  
    __c)
```

Determine at compile(?)-time if the parallel variant of an algorithm should be called.

#### Parameters

<code>__c</code>	A condition that is convertible to bool that is overruled by <code>__gnu_parallel::_Settings::algorithm_strategy</code> .
<code>__c</code>	Usually a decision based on the input size.

- `template<class _CharT, class _Traits, class _Allocator>`  
`void std::swap (basic_stringstream<_CharT, _Traits, _Allocator> &__x, basic_stringstream<_CharT, _Traits, _Allocator> &__y)`

### 7.667.1 Detailed Description

This is a Standard C++ Library header.

## 7.668 `stack` File Reference

### Macros

- `#define __glibcxx_want_adaptor_iterator_pair_constructor`
- `#define __glibcxx_want_containers_ranges`
- `#define _GLIBCXX_STACK`

### 7.668.1 Detailed Description

This is a Standard C++ Library header.

## 7.669 `stdatomic.h` File Reference

### 7.669.1 Detailed Description

This is a Standard C++ Library header.

## 7.670 `stdbit.h` File Reference

### 7.670.1 Detailed Description

This is a Standard C++ Library header.

## 7.671 `stdckdint.h` File Reference

### 7.671.1 Detailed Description

This is a Standard C++ Library header.

## 7.672 `stdexcept` File Reference

### Classes

- class [`std::range\_error`](#)

### Namespaces

- namespace [`std`](#)

### Macros

- `#define _GLIBCXX_STDEXCEPT`

### 7.672.1 Detailed Description

This is a Standard C++ Library header.

## 7.673 `stdlib.h` File Reference

### Functions

- `template<typename _Tp>`  
`_Tp` [abs](#) (const `complex< _Tp >` &)
- `ldiv_t` [div](#) (long `__i`, long `__j`) noexcept

#### 7.673.1 Detailed Description

This is a Standard C++ Library header.

#### 7.673.2 Function Documentation

##### `abs()`

```
template<typename _Tp>
_Tp std::abs (
    const complex< _Tp > & __z) [inline]
```

Return magnitude of `z`.

## 7.674 `stop_token` File Reference

#### 7.674.1 Detailed Description

This is a Standard C++ Library header.

## 7.675 `streambuf` File Reference

### Classes

- class [std::basic\\_streambuf< \\_CharT, \\_Traits >](#)

### Namespaces

- namespace [std](#)

### Macros

- `#define _GLIBXX_STREAMBUF`

### 7.693.1 Detailed Description

This is a TS C++ Library header.

This header defines variable templates for the C++14 type traits.

Equivalent variable templates are defined in namespace `std` since C++17.

See also

[variable\\_templates](#)

Since

C++14

### 7.732.1 Detailed Description

The header provides an interface to the C++ ABI.

### 7.732.2 Function Documentation

#### **\_\_cxa\_demangle()**

```
char * __cxxabiv1::__cxa_demangle (
    const char * __mangled_name,
    char * __output_buffer,
    size_t * __length,
    int * __status)
```

Demangling routine. ABI-mandated entry point in the C++ runtime library for demangling.

#### Parameters

<code>__mangled_name</code>	A NUL-terminated character string containing the name to be demangled.
<code>__output_buffer</code>	A region of memory, allocated with malloc, of * <code>__length</code> bytes, into which the demangled name is stored. If <code>__output_buffer</code> is not long enough, it is expanded using realloc. <code>__output_buffer</code> may instead be null; in that case, the demangled name is placed in a region of memory allocated with malloc.

## Parameters

<code>__length</code>	If <code>__length</code> is non-null, the length of the buffer containing the demangled name is placed in <code>*__length</code> .
<code>__status</code>	If <code>__status</code> is non-null, <code>*__status</code> is set to one of the following values: 0: The demangling operation succeeded. -1: A memory allocation failure occurred. -2: <i>mangled_name</i> is not a valid name under the C++ ABI mangling rules. -3: One of the arguments is invalid.

## Returns

A pointer to the start of the NUL-terminated demangled name, or a null pointer if the demangling fails. The caller is responsible for deallocating this memory using `free`.

The demangling is performed using the C++ ABI mangling rules, with GNU extensions. For example, this function is used in `__gnu_cxx::__verbose_terminate_handler`.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/ext\\_demangling.html](https://gcc.gnu.org/onlinedocs/libstdc++/manual/ext_demangling.html) for other examples of use.

## Note

The same demangling functionality is available via `libiberty` (`<libiberty/demangle.h>` and `libiberty.a`) in GCC 3.1 and later, but that requires explicit installation (`-enable-install-libiberty`) and uses a different API, although the ABI is unchanged.

### 7.733.1 Detailed Description

This is a Standard C++ Library header.

## 7.734 `initializer_list` File Reference

### Classes

- class `std::initializer_list<_E>`

### Namespaces

- namespace `std`

#### 7.734.1 Detailed Description

This is a Standard C++ Library header.

## 7.735 `new` File Reference

### Classes

- struct `std::destroying_delete_t`

### Namespaces

- namespace `std`

### Macros

- `#define __glibcxx_want_constexpr_new`
- `#define __glibcxx_want_destroying_delete`
- `#define __glibcxx_want_hardware_interference_size`
- `#define __glibcxx_want_launder`
- `#define _GLIBCXX_PLACEMENT_CONSTEXPR`
- `#define _NEW`

### Typedefs

- typedef void(\* `std::new_handler`) ()

### Enumerations

- enum class `align_val_t` : `size_t`

### Functions

- `new_handler` `std::get_new_handler` () noexcept
- void **operator delete** (void \*) noexcept
- void **operator delete** (void \*, const std::nothrow\_t &) noexcept
- void **operator delete** (void \*, std::align\_val\_t) noexcept
- void **operator delete** (void \*, std::align\_val\_t, const std::nothrow\_t &) noexcept
- void **operator delete** (void \*, std::size\_t) noexcept
- void **operator delete** (void \*, std::size\_t, std::align\_val\_t) noexcept
- void **operator delete** (void \*, void \*) noexcept
- void **operator delete[]** (void \*) noexcept
- void **operator delete[]** (void \*, const std::nothrow\_t &) noexcept
- void **operator delete[]** (void \*, std::align\_val\_t) noexcept

- **new\_handler** std::set\_new\_handler (**new\_handler**) throw ()

### Variables

- constexpr **destroying\_delete\_t** std::destroying\_delete
- const nothrow\_t **std::nothrow**

### 7.735.1 Detailed Description

This is a Standard C++ Library header.

The header `new` defines several functions to manage dynamic memory and handling memory allocation errors; see [https://gcc.gnu.org/onlinedocs/libstdc++/manual/dynamic\\_memory.html](https://gcc.gnu.org/onlinedocs/libstdc++/manual/dynamic_memory.html) for more.

### 7.735.2 Function Documentation

#### **operator new()**

```
void * operator new (
    std::size_t ) [nodiscard]
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

## 7.736 typeinfo File Reference

### Classes

- class `std::bad_cast`
- class `std::bad_typeid`
- class `std::type_info`

### Namespaces

- namespace `std`

## Macros

- `#define __glibcxx_want_constexpr_typeinfo`
- `#define __GXX_MERGED_TYPEINFO_NAMES`
- `#define __GXX_TYPEINFO_EQUALITY_INLINE`
- `#define _TYPEINFO`

### 7.736.1 Detailed Description

This is a Standard C++ Library header.
