The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

**Returns**

codecvt\_base::result.

**unshift() [1/2]**

```
result std::__codecvt_abstract_base< char16_t, char, mbstate_t >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling codecvt::do\_unshift().

For example, if 4 external characters always converted to 1 internal character, and input to in() had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of codecvt\_base::result. If the state could be reset and data written, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the output has insufficient space, returns codecvt\_base::partial. Otherwise the reset failed and codecvt\_base::error is returned.

**Parameters**

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

**Returns**

codecvt\_base::result.

**unshift() [2/2]**

```
result std::__codecvt_abstract_base< char16_t, char, mbstate_t >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling codecvt::do\_unshift().

For example, if 4 external characters always converted to 1 internal character, and input to in() had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of codecvt\_base::result. If the state could be reset and data written, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the output has insufficient space, returns codecvt\_base::partial. Otherwise the reset failed and codecvt\_base::error is returned.

## Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

## Returns

`codecvt_base::result`.

**6.281.1 Detailed Description**

Class `codecvt<char32_t, char, mbstate_t>` specialization.  
Converts between UTF-32 and UTF-8.

**6.281.2 Member Function Documentation****do\_always\_noconv()**

```
virtual bool std::codecvt< char32_t, char, mbstate_t >::do_always_noconv () const throw ( )    [protected],
[virtual]
```

Implements `std::__codecvt_abstract_base< char32_t, char, mbstate_t >`.

**do\_encoding()**

```
virtual int std::codecvt< char32_t, char, mbstate_t >::do_encoding () const throw ( )    [protected],
[virtual]
```

Implements `std::__codecvt_abstract_base< char32_t, char, mbstate_t >`.

**do\_in()**

```
virtual result std::codecvt< char32_t, char, mbstate_t >::do_in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const    [protected], [virtual]
```

Implements `std::__codecvt_abstract_base< char32_t, char, mbstate_t >`.

**do\_length()**

```
virtual int std::codecvt< char32_t, char, mbstate_t >::do_length (
    state_type & ,
    const extern_type * __from,
    const extern_type * __end,
    size_t __max) const    [protected], [virtual]
```

Implements `std::__codecvt_abstract_base< char32_t, char, mbstate_t >`.

**do\_max\_length()**

```
virtual int std::codecvt< char32_t, char, mbstate_t >::do_max_length () const throw ( )    [protected],
[virtual]
```

Implements `std::__codecvt_abstract_base< char32_t, char, mbstate_t >`.

**do\_out()**

```
virtual result std::codecvt< char32_t, char, mbstate_t >::do_out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
```

```

const intern_type * __from_next,
extern_type * __to,
extern_type * __to_end,
extern_type * __to_next) const [protected], [virtual]

```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This function is a hook for derived classes to change the value returned.

See also

out for more information.

Implements `std::__codecvt_abstract_base< char32_t, char, mbstate_t >`.

### do\_unshift()

```

virtual result std::codecvt< char32_t, char, mbstate_t >::do_unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type * __to_next) const [protected], [virtual]

```

Implements `std::__codecvt_abstract_base< char32_t, char, mbstate_t >`.

### in() [1/2]

```

result std::__codecvt_abstract_base< char32_t, char, mbstate_t >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type * __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type * __to_next) const [inline], [inherited]

```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

---

**Returns**

codecvt\_base::result.

**in() [2/2]**

```

result std::__codecvt_abstract_base< char32_t, char, mbstate_t >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [inline]

```

Convert from external to internal character set.

Converts input string of extern\_type to output string of intern\_type. This is analogous to mbsrtowcs. It does this by calling codecvt::do\_in.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from\_end) are converted and written to [to,to\_end). from\_next and to\_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from\_next and to\_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt\_base::result. If all the input is converted, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt\_base::partial. Otherwise the conversion failed and codecvt\_base::error is returned.

**Parameters**

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

**Returns**

codecvt\_base::result.

**out() [1/2]**

```

result std::__codecvt_abstract_base< char32_t, char, mbstate_t >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,

```

```
extern_type * __to_end,
extern_type *& __to_next) const [inline], [inherited]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

#### Returns

`codecvt_base::result`.

#### out() [2/2]

```
result std::__codecvt_abstract_base< char32_t, char, mbstate_t >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

## Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

## Returns

`codecvt_base::result`.

**unshift()** [1/2]

```
result std::__codecvt_abstract_base< char32_t, char, mbstate_t >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

## Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

## Returns

`codecvt_base::result`.

**unshift()** [2/2]

```
result std::__codecvt_abstract_base< char32_t, char, mbstate_t >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

#### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

#### Returns

`codecvt_base::result`.

`intern_type * __to_end,`  
`intern_type *& __to_next) const` [protected], [virtual]

Implements `std::__codecvt_abstract_base< wchar_t, char, mbstate_t >`.

**do\_length()**

```
virtual int std::codecvt< wchar_t, char, mbstate_t >::do_length (
    state_type & ,
    const extern_type * __from,
    const extern_type * __end,
    size_t __max) const [protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< wchar\\_t, char, mbstate\\_t >](#).

**do\_max\_length()**

```
virtual int std::codecvt< wchar_t, char, mbstate_t >::do_max_length () const throw ( ) [protected],
[virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< wchar\\_t, char, mbstate\\_t >](#).

**do\_out()**

```
virtual result std::codecvt< wchar_t, char, mbstate_t >::do_out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [protected], [virtual]
```

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This function is a hook for derived classes to change the value returned.

See also

[do\\_in](#) for more information.

Implements [std::\\_\\_codecvt\\_abstract\\_base< wchar\\_t, char, mbstate\\_t >](#).

**do\_unshift()**

```
virtual result std::codecvt< wchar_t, char, mbstate_t >::do_unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [protected], [virtual]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base< wchar\\_t, char, mbstate\\_t >](#).

**in() [1/2]**

```
result std::__codecvt_abstract_base< wchar_t, char, mbstate_t >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [inline], [inherited]
```

Convert from external to internal character set.

Converts input string of extern\_type to output string of intern\_type. This is analogous to mbsrtowcs. It does this by calling codecvt::do\_in.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

#### Returns

`codecvt_base::result`.

#### in() [2/2]

```
result std::__codecvt_abstract_base< wchar_t, char, mbstate_t >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [inline]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.

## Parameters

<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

## Returns

codecvt\_base::result.

**out()** [1/2]

```
result std::__codecvt_abstract_base< wchar_t, char, mbstate_t >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This is analogous to wcsrtombs. It does this by calling codecvt::do\_out.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from\_end) are converted and written to [to,to\_end). from\_next and to\_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from\_next and to\_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt\_base::result. If all the input is converted, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt\_base::partial. Otherwise the conversion failed and codecvt\_base::error is returned.

## Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

## Returns

codecvt\_base::result.

**out()** [2/2]

```
result std::__codecvt_abstract_base< wchar_t, char, mbstate_t >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

**Parameters**

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

**Returns**

`codecvt_base::result`.

**unshift()** [1/2]

```
result std::__codecvt_abstract_base< wchar_t, char, mbstate_t >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Reset conversion state.

Writes characters to output that would restore `state` to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

## Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

## Returns

`codecvt_base::result`.

**unshift()** [2/2]

```
result std::__codecvt_abstract_base< wchar_t, char, mbstate_t >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

## Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

## Returns

`codecvt_base::result`.

    state_type & __state,
    extern_type * __to,
```

```
extern_type * __to_end,
extern_type *& __to_next) const [protected], [virtual], [inherited]
```

Implements [std::\\_\\_codecvt\\_abstract\\_base<\\_InternT, \\_ExternT, \\_StateT >](#).

### in()

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base<_InternT, _ExternT, _StateT >::in (
    state_type & __state,
    const extern_type * __from,
    const extern_type * __from_end,
    const extern_type *& __from_next,
    intern_type * __to,
    intern_type * __to_end,
    intern_type *& __to_next) const [inline], [inherited]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

### Returns

`codecvt_base::result`.

### out()

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base<_InternT, _ExternT, _StateT >::out (
    state_type & __state,
    const intern_type * __from,
    const intern_type * __from_end,
    const intern_type *& __from_next,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

#### Returns

`codecvt_base::result`.

References [do\\_out\(\)](#).

#### unshift()

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::unshift (
    state_type & __state,
    extern_type * __to,
    extern_type * __to_end,
    extern_type *& __to_next) const [inline], [inherited]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

#### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.

<code>__to_next</code>	Returns start of unused output area.
------------------------	--------------------------------------

#### Returns

`codecvt_base::result`.

**6.285.1 Detailed Description**

**template<typename \_CharT>**  
**class std::\_\_cxx11::collate<\_CharT>**

Facet for localized string comparison.

This facet encapsulates the code to compare strings in a localized manner.

The collate template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the collate facet.

**6.285.2 Member Typedef Documentation****char\_type**

```
template<typename _CharT>
typedef _CharT std::__cxx11::collate<_CharT>::char_type
```

Public typedefs.

**string\_type**

```
template<typename _CharT>
typedef basic_string<_CharT> std::__cxx11::collate<_CharT>::string_type
```

Public typedefs.

**6.285.3 Constructor & Destructor Documentation****collate()** [1/2]

```
template<typename _CharT>
std::__cxx11::collate<_CharT>::collate (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

## Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

References [std::locale::facet::facet\(\)](#).

Referenced by [do\\_compare\(\)](#), [do\\_hash\(\)](#), and [do\\_transform\(\)](#).

**collate()** [2/2]

```
template<typename _CharT>
std::__cxx11::collate< _CharT >::collate (
    __c_locale __cloc,
    size_t __refs = 0) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

## Parameters

<code>__cloc</code>	The C locale.
<code>__refs</code>	Passed to the base facet class.

References [std::locale::facet::facet\(\)](#).

**~collate()**

```
template<typename _CharT>
virtual std::__cxx11::collate< _CharT >::~~collate () [inline], [protected], [virtual]
Destructor.
```

**6.285.4 Member Function Documentation****compare()**

```
template<typename _CharT>
int std::__cxx11::collate< _CharT >::compare (
    const _CharT * __lo1,
    const _CharT * __hi1,
    const _CharT * __lo2,
    const _CharT * __hi2) const [inline]
```

Compare two strings.

This function compares two strings and returns the result by calling `collate::do_compare()`.

## Parameters

<code>__lo1</code>	Start of string 1.
<code>__hi1</code>	End of string 1.
<code>__lo2</code>	Start of string 2.
<code>__hi2</code>	End of string 2.

## Returns

1 if `string1 > string2`, -1 if `string1 < string2`, else 0.

References [do\\_compare\(\)](#).

**do\_compare()**

```
template<typename _CharT>
int std::collate<_CharT>::do_compare (
    const _CharT * __lo1,
    const _CharT * __hi1,
    const _CharT * __lo2,
    const _CharT * __hi2) const [protected], [virtual]
```

Compare two strings.

This function is a hook for derived classes to change the value returned.

See also

[compare\(\)](#).

**Parameters**

<code>__lo1</code>	Start of string 1.
<code>__hi1</code>	End of string 1.
<code>__lo2</code>	Start of string 2.
<code>__hi2</code>	End of string 2.

**Returns**

1 if `string1 > string2`, -1 if `string1 < string2`, else 0.

References [collate\(\)](#), [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::c\\_str\(\)](#), [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::data\(\)](#), and [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::length\(\)](#).

Referenced by [compare\(\)](#).

**do\_hash()**

```
template<typename _CharT>
long std::collate<_CharT>::do_hash (
    const _CharT * __lo,
    const _CharT * __hi) const [protected], [virtual]
```

Return hash of a string.

This function computes and returns a hash on the input string. This function is a hook for derived classes to change the value returned.

**Parameters**

<code>__lo</code>	Start of string.
<code>__hi</code>	End of string.

**Returns**

Hash value.

References [collate\(\)](#).

Referenced by [hash\(\)](#).

**do\_transform()**

```
template<typename _CharT>
collate< _CharT >::string_type std::collate< _CharT >::do_transform (
    const _CharT * __lo,
    const _CharT * __hi) const [protected], [virtual]
```

Transform string to comparable form.

This function is a hook for derived classes to change the value returned.

**Parameters**

$\leftrightarrow$ __lo	Start.
$\leftrightarrow$ __hi	End.

**Returns**

transformed string.

References [collate\(\)](#), [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::append\(\)](#), [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::c\\_str\(\)](#), [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::clear\(\)](#), [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::data\(\)](#), [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::push\\_back\(\)](#) and [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::push\\_back\(\)](#).

Referenced by [transform\(\)](#).

**hash()**

```
template<typename _CharT>
long std::__cxx11::collate< _CharT >::hash (
    const _CharT * __lo,
    const _CharT * __hi) const [inline]
```

Return hash of a string.

This function computes and returns a hash on the input string. It does so by returning [collate::do\\_hash\(\)](#).

**Parameters**

$\leftrightarrow$ __lo	Start of string.
$\leftrightarrow$ __hi	End of string.

**Returns**

Hash value.

References [do\\_hash\(\)](#).

**transform()**

```
template<typename _CharT>
string_type std::__cxx11::collate< _CharT >::transform (
    const _CharT * __lo,
    const _CharT * __hi) const [inline]
```

Transform string to comparable form.

This function is a wrapper for strxfrm functionality. It takes the input string and returns a modified string that can be directly compared to other transformed strings. In the C locale, this function just returns a copy of the input string. In some other locales, it may replace two chars with one, change a char for another, etc. It does so by returning `collate::do_transform()`.

#### Parameters

<code>_↔ _lo</code>	Start of string.
<code>_↔ _hi</code>	End of string.

#### Returns

Transformed `string_type`.

References [do\\_transform\(\)](#).

### 6.285.5 Member Data Documentation

- constexpr void `real` (`_Tp` \_\_val)

### 6.296.1 Detailed Description

```
template<typename _Tp>
class std::complex< _Tp >
```

Template to represent complex numbers.

Specializations for float, double, and long double are part of the library. Results with any other type are not guaranteed.

#### Parameters

<code><i>Tp</i></code>	Type of real and imaginary values.
------------------------	------------------------------------

### 6.296.2 Member Typedef Documentation

#### value\_type

```
template<typename _Tp>
typedef _Tp std::complex< _Tp >::value_type
```

Value typedef.

### 6.296.3 Constructor & Destructor Documentation

#### `complex()` [1/2]

```
template<typename _Tp>
std::complex< _Tp >::complex (
    const _Tp & __r = _Tp(),
    const _Tp & __i = _Tp()) [inline], [constexpr]
```

Default constructor. First parameter is x, second parameter is y. Unspecified parameters default to 0. Referenced by [complex\(\)](#), [operator\\*=\(\(\)\)](#), [operator+=\(\(\)\)](#), [operator-=\(\(\)\)](#), [operator/=\(\(\)\)](#), and [operator=\(\)](#).

#### `complex()` [2/2]

```
template<typename _Tp>
template<typename _Up>
std::complex< _Tp >::complex (
    const complex< _Up > & __z) [inline], [constexpr]
```

Converting constructor.

References [complex\(\)](#).

### 6.296.4 Member Function Documentation

#### `operator+=(())`

```
template<typename _Tp>
complex< _Tp > & std::complex< _Tp >::operator+= (
    const _Tp & __t) [inline], [constexpr]
```

Add a scalar to this complex number.

#### `operator-=(())`

```
template<typename _Tp>
complex< _Tp > & std::complex< _Tp >::operator-= (
    const _Tp & __t) [inline], [constexpr]
```

Subtract a scalar from this complex number.

The documentation for this class was generated from the following file:

- [complex](#)

`constexpr complex & operator= (const complex< _Tp > &__z)`
- `constexpr complex & operator= (long double __r)`
- `constexpr void real (long double __val)`

### 6.299.1 Detailed Description

26.2.3 `complex` specializations `complex<long double>` specialization

The documentation for this class was generated from the following file:

- [complex](#)

## 6.300 `__gnu_pbds::detail::cond_dealtor< Entry, _Alloc >` Class Template Reference

```
#include <cond_key_dtor_entry_dealtor.hpp>
```

### Public Types

- `typedef HT_Map::entry entry`
- `typedef HT_Map::entry_allocator entry\_allocator`
- `typedef alloc_traits::allocator_type entry\_allocator`
- `typedef alloc_traits::pointer entry\_pointer`
- `typedef HT_Map::key_type key\_type`

### Public Member Functions

- `cond\_dealtor (entry_allocator *p_a, entry *p_e)`
- `cond\_dealtor (entry_pointer p_e)`
- `void set\_key\_destruct ()`
- `void set\_no\_action ()`
- `void set\_no\_action\_destructor ()`

### Protected Attributes

- `bool m\_key\_destruct`
- `entry_allocator *const m\_p\_a`
- `entry *const m\_p\_e`

### 6.300.1 Detailed Description

```
template<typename Entry, typename _Alloc>
```

```
class __gnu_pbds::detail::cond_dealtor< Entry, _Alloc >
```

Conditional deallocate constructor argument.

Conditional key destructor, `cc_hash`.

The documentation for this class was generated from the following files:

- [cond\\_dealtor.hpp](#)
- [cond\\_key\\_dtor\\_entry\\_dealtor.hpp](#)

## 6.301 `__gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::cond_dtor< Size_Type >` Class Template Reference

```
#include <ov_tree_map_.hpp>
```

**Public Member Functions**

- **cond\_dtor** (value\_vector a\_vec, iterator &r\_last\_it, Size\_Type total\_size)
- void **set\_no\_action** ()

**Protected Attributes**

- value\_vector **m\_a\_vec**
- const Size\_Type **m\_max\_size**
- bool **m\_no\_action**
- iterator & **m\_r\_last\_it**

**6.301.1 Detailed Description**

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>
template<typename Size_Type>
class __gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::cond_dtor<
Size_Type >
```

Conditional destructor.

The documentation for this class was generated from the following file:

- [ov\\_tree\\_map.hpp](#)

**6.302 \_\_gnu\_cxx::condition\_base Struct Reference**

```
#include <throw_allocator.h>
```

Inheritance diagram for \_\_gnu\_cxx::condition\_base:

**Public Member Functions**

- **condition\_base** (const [condition\\_base](#) &)=default
- **condition\_base & operator=** (const [condition\\_base](#) &)=default

**6.302.1 Detailed Description**

Base struct for condition policy.

Requires a public member function with the signature void throw\_conditionally()

The documentation for this struct was generated from the following file:

- [throw\\_allocator.h](#)

## 6.303 std::condition\_variable Class Reference

```
#include <condition_variable>
```

### Public Types

- typedef \_\_gthread\_cond\_t \* **native\_handle\_type**

### Public Member Functions

- **condition\_variable** (const [condition\\_variable](#) &)=delete
- native\_handle\_type **native\_handle** ()
- void **notify\_all** () noexcept
- void **notify\_one** () noexcept
- [condition\\_variable](#) & **operator=** (const [condition\\_variable](#) &)=delete

- `template<typename _Lock, typename _Clock, typename _Duration>`  
`cv_status wait_until ( _Lock &__lock, const chrono::time_point< _Clock, _Duration > &__atime)`
- `template<typename _Lock, typename _Clock, typename _Duration, typename _Predicate>`  
`bool wait_until ( _Lock &__lock, const chrono::time_point< _Clock, _Duration > &__atime, _Predicate __p)`

### 6.304.1 Detailed Description

condition\_variable\_any

The documentation for this class was generated from the following file:

- [condition\\_variable](#)

## 6.305 std::conditional< \_Cond, \_Iftrue, \_Iffalse > Struct Template Reference

```
#include <type_traits>
```

### Public Types

- using `type`

### 6.305.1 Detailed Description

```
template<bool _Cond, typename _Iftrue, typename _Iffalse>
struct std::conditional< _Cond, _Iftrue, _Iffalse >
```

Define a member typedef `type` to one of two argument types.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.306 \_\_gnu\_pbds::detail::pat\_trie\_base::\_Inode< \_ATraits, Metadata >::const\_iterator Struct Reference

```
#include <pat_trie_base.hpp>
```

Inheritance diagram for `__gnu_pbds::detail::pat_trie_base::_Inode<_ATraits, Metadata>::const_iterator`:

### Public Types

- typedef `_Alloc::difference_type` **difference\_type**
- typedef `std::forward_iterator_tag` **iterator\_category**
- typedef `node_pointer_pointer` **pointer**
- typedef `node_pointer_reference` **reference**
- typedef `node_pointer` **value\_type**

### Public Member Functions

- **const\_iterator** (`node_pointer_pointer p_p_cur=0, node_pointer_pointer p_p_end=0`)
- bool **operator!=** (`const const_iterator &other`) const
- `node_const_pointer` **operator\*** () const
- `const_iterator &` **operator++** ()
- `const_iterator` **operator++** (int)
- `const node_pointer_pointer` **operator->** () const
- bool **operator==** (`const const_iterator &other`) const

### Public Attributes

- `node_pointer_pointer` **m\_p\_p\_cur**
- `node_pointer_pointer` **m\_p\_p\_end**

### 6.306.1 Detailed Description

```
template<typename _ATraits, typename Metadata>
struct __gnu_pbds::detail::pat_trie_base::_Inode<_ATraits, Metadata>::const_iterator
```

Constant child iterator.

The documentation for this struct was generated from the following file:

- [pat\\_trie\\_base.hpp](#)

## 6.307 std::chrono::tzdb\_list::const\_iterator Class Reference

```
#include <chrono>
```

### Public Types

- using **difference\_type**
- using **iterator\_category**
- using **pointer**
- using **reference**
- using **value\_type**

### Public Member Functions

- **const\_iterator** (const [const\\_iterator](#) &)=default
- **const\_iterator** ([const\\_iterator](#) &&)=default
- reference **operator\*** () const noexcept
- [const\\_iterator](#) & **operator++** ()
- [const\\_iterator](#) **operator++** (int)
- pointer **operator->** () const noexcept
- [const\\_iterator](#) & **operator=** (const [const\\_iterator](#) &)=default
- [const\\_iterator](#) & **operator=** ([const\\_iterator](#) &&)=default
- bool **operator==** (const [const\\_iterator](#) &) const noexcept=default

### Friends

- class **tzdb\_list**

#### 6.307.1 Detailed Description

An iterator into the `tzdb_list`

As a extension, in libstdc++ each `tzdb` is reference-counted and the `const_iterator` type shares ownership of the object it refers to. This ensures that a `tzdb` erased from the list will not be destroyed while there is an iterator that refers to it.

The documentation for this class was generated from the following file:

- [chrono](#)

## 6.308 std::const\_mem\_fun1\_ref\_t<\_Ret, \_Tp, \_Arg> Class Template Reference

```
#include <stl_function.h>
```

Inheritance diagram for `std::const_mem_fun1_ref_t<_Ret, _Tp, _Arg>`:

### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)
- typedef `_Ret` [result\\_type](#)
- typedef `_Arg` [second\\_argument\\_type](#)

### Public Member Functions

- `const_mem_fun1_ref_t` (`_Ret` (`_Tp::*__pf`) (`_Arg`) `const`)
- `_Ret operator()` (`const _Tp &__r, _Arg __x`) `const`

#### 6.308.1 Detailed Description

template<typename `_Ret`, typename `_Tp`, typename `_Arg`>  
 class `std::const_mem_fun1_ref_t<_Ret, _Tp, _Arg>`

One of the [adaptors for member pointers](#).

#### 6.308.2 Member Typedef Documentation

##### `first_argument_type`

typedef `_Tp` [std::binary\\_function<\\_Tp, \\_Arg, \\_Ret>::first\\_argument\\_type](#) [inherited]  
`first_argument_type` is the type of the first argument

##### `result_type`

typedef `_Ret` [std::binary\\_function<\\_Tp, \\_Arg, \\_Ret>::result\\_type](#) [inherited]  
`result_type` is the return type

##### `second_argument_type`

typedef `_Arg` [std::binary\\_function<\\_Tp, \\_Arg, \\_Ret>::second\\_argument\\_type](#) [inherited]  
`second_argument_type` is the type of the second argument

The documentation for this class was generated from the following file:

- [stl\\_function.h](#)

## 6.309 std::const\_mem\_fun1\_t< \_Ret, \_Tp, \_Arg > Class Template Reference

```
#include <stl_function.h>
```

Inheritance diagram for std::const\_mem\_fun1\_t< \_Ret, \_Tp, \_Arg >:

### Public Types

- typedef const \_Tp \* [first\\_argument\\_type](#)
- typedef \_Ret [result\\_type](#)
- typedef \_Arg [second\\_argument\\_type](#)

### Public Member Functions

- `const_mem_fun1_t` (\_Ret(\_Tp::\*\_\_pf)(\_Arg) const)
- `_Ret operator()` (const \_Tp \*\_\_p, \_Arg \_\_x) const

#### 6.309.1 Detailed Description

```
template<typename _Ret, typename _Tp, typename _Arg>
class std::const_mem_fun1_t< _Ret, _Tp, _Arg >
```

One of the [adaptors for member pointers](#).

#### 6.309.2 Member Typedef Documentation

##### first\_argument\_type

```
typedef const _Tp * std::binary\_function< const _Tp *, _Arg, _Ret >::first_argument_type [inherited]
first_argument_type is the type of the first argument
```

##### result\_type

```
typedef _Ret std::binary\_function< const _Tp *, _Arg, _Ret >::result_type [inherited]
result_type is the return type
```

**second\_argument\_type**

```
typedef _Arg std::binary_function< const _Tp *, _Arg, _Ret >::second_argument_type [inherited]
```

second\_argument\_type is the type of the second argument

The documentation for this class was generated from the following file:

- [stl\\_function.h](#)

**6.310 std::const\_mem\_fun\_ref\_t< \_Ret, \_Tp > Class Template Reference**

```
#include <stl_function.h>
```

Inheritance diagram for std::const\_mem\_fun\_ref\_t< \_Ret, \_Tp >:

**Public Types**

- typedef \_Tp [argument\\_type](#)
- typedef \_Ret [result\\_type](#)

**Public Member Functions**

- **const\_mem\_fun\_ref\_t** (\_Ret(\_Tp::\*\_\_pf)() const)
- \_Ret **operator()** (const \_Tp &\_\_r) const

**6.310.1 Detailed Description**

```
template<typename _Ret, typename _Tp>
class std::const_mem_fun_ref_t< _Ret, _Tp >
```

One of the [adaptors for member pointers](#).

**6.310.2 Member Typedef Documentation****argument\_type**

```
typedef _Tp std::unary_function< _Tp, _Ret >::argument_type [inherited]
```

argument\_type is the type of the argument

**result\_type**

```
typedef _Ret std::unary_function< _Tp, _Ret >::result_type [inherited]
```

result\_type is the return type

The documentation for this class was generated from the following file:

- [stl\\_function.h](#)

**6.311 std::const\_mem\_fun\_t< \_Ret, \_Tp > Class Template Reference**

```
#include <stl_function.h>
```

Inheritance diagram for std::const\_mem\_fun\_t< \_Ret, \_Tp >:

**Public Types**

- typedef const \_Tp \* [argument\\_type](#)
- typedef \_Ret [result\\_type](#)

**Public Member Functions**

- **const\_mem\_fun\_t** (\_Ret(\_Tp::\*\_\_pf)() const)
- **\_Ret operator()** (const \_Tp \*\_\_p) const

**6.311.1 Detailed Description**

```
template<typename _Ret, typename _Tp>
class std::const_mem_fun_t< _Ret, _Tp >
```

One of the [adaptors for member pointers](#).

**6.311.2 Member Typedef Documentation****argument\_type**

```
typedef const _Tp * std::unary_function< const _Tp *, _Ret >::argument_type [inherited]
```

argument\_type is the type of the argument

**result\_type**

```
typedef _Ret std::unary\_function< const _Tp *, _Ret >::result_type [inherited]  
result_type is the return type
```

The documentation for this class was generated from the following file:

- [stl\\_function.h](#)

**6.312 \_\_gnu\_cxx::constant\_binary\_fun< \_Result, \_Arg1, \_Arg2 > Struct Template Reference**

```
#include <functional>
```

**Public Types**

- typedef \_Arg1 **first\_argument\_type**
- typedef \_Result **result\_type**
- typedef \_Arg2 **second\_argument\_type**

**Public Member Functions**

- **constant\_binary\_fun** (const \_Result &\_\_v)
- const result\_type & **operator()** (const \_Arg1 &, const \_Arg2 &) const

**Public Attributes**

- \_Result **\_M\_val**

**6.312.1 Detailed Description**

```
template<class _Result, class _Arg1 = _Result, class _Arg2 = _Arg1>  
struct __gnu_cxx::constant_binary_fun< _Result, _Arg1, _Arg2 >
```

An [SGI extension](#) .

The documentation for this struct was generated from the following file:

- [ext/functional](#)

**6.313 \_\_gnu\_parallel::constant\_size\_blocks\_tag Struct Reference**

```
#include <tags.h>
```

Inheritance diagram for `__gnu_parallel::constant_size_blocks_tag`:

### 6.313.1 Detailed Description

Selects the constant block size variant for `std::find()`.

See also

`_GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS`

The documentation for this struct was generated from the following file:

- [tags.h](#)

## 6.314 `__gnu_cxx::constant_unary_fun<_Result, _Argument>` Struct Template Reference

```
#include <functional>
```

### Public Types

- typedef `_Argument` **argument\_type**
- typedef `_Result` **result\_type**

### Public Member Functions

- **constant\_unary\_fun** (`const _Result &__v`)
- `const result_type &operator()` (`const _Argument &`) `const`

### Public Attributes

- `result_type` **\_M\_val**

### 6.314.1 Detailed Description

```
template<class _Result, class _Argument = _Result>
struct __gnu_cxx::constant_unary_fun<_Result, _Argument>
```

An [SGI extension](#) .

The documentation for this struct was generated from the following file:

- [ext/functional](#)

### 6.315 `__gnu_cxx::constant_void_fun<_Result>` Struct Template Reference

```
#include <functional>
```

#### Public Types

- typedef `_Result` `result_type`

#### Public Member Functions

- `constant_void_fun` (const `_Result` &\_\_v)
- const `result_type` & `operator()` () const

#### Public Attributes

- `result_type` `_M_val`

#### 6.315.1 Detailed Description

```
template<class _Result>
struct __gnu_cxx::constant_void_fun<_Result>
```

An [SGI extension](#) .

The documentation for this struct was generated from the following file:

- [ext/functional](#)

### 6.316 `__gnu_pbds::detail::container_base_dispatch<Key, Mapped, _Alloc, Tag, Policy_TI>` Struct Template Reference

#### 6.316.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Tag, typename Policy_TI = null_type>
struct __gnu_pbds::detail::container_base_dispatch<Key, Mapped, _Alloc, Tag, Policy_TI>
```

Dispatch mechanism, primary template for associative types.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

### 6.317 `__gnu_pbds::detail::container_base_dispatch<_VTp, Cmp_Fn, _Alloc, binary_heap_tag, null_type>` Struct Template Reference

```
#include <priority_queue_base_dispatch.hpp>
```

#### Public Types

- typedef [binary\\_heap](#)<\_VTp, Cmp\_Fn, \_Alloc> [type](#)

#### 6.317.1 Detailed Description

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
struct __gnu_pbds::detail::container_base_dispatch<_VTp, Cmp_Fn, _Alloc, binary_heap_tag, null_type>
```

Specialization for `binary_heap`.

### 6.317.2 Member Typedef Documentation

#### type

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
typedef binary\_heap<_VTp, Cmp_Fn, _Alloc> \_\_gnu\_pbds::detail::container\_base\_dispatch<_VTp,
Cmp_Fn, _Alloc, binary\_heap\_tag, null\_type>::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [priority\\_queue\\_base\\_dispatch.hpp](#)

### 6.318 `__gnu_pbds::detail::container_base_dispatch<_VTp, Cmp_Fn, _Alloc, binomial_heap_tag, null_type>` Struct Template Reference

```
#include <priority_queue_base_dispatch.hpp>
```

#### Public Types

- typedef [binomial\\_heap](#)<\_VTp, Cmp\_Fn, \_Alloc> [type](#)

#### 6.318.1 Detailed Description

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
struct \_\_gnu\_pbds::detail::container\_base\_dispatch<_VTp, Cmp_Fn, _Alloc, binomial_heap_tag, null_type>
```

Specialization for `binomial_heap`.

### 6.318.2 Member Typedef Documentation

#### type

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
typedef binomial\_heap<_VTp, Cmp_Fn, _Alloc> \_\_gnu\_pbds::detail::container\_base\_dispatch<_VTp,
Cmp_Fn, _Alloc, binomial\_heap\_tag, null\_type>::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [priority\\_queue\\_base\\_dispatch.hpp](#)

### 6.319 `__gnu_pbds::detail::container_base_dispatch<_VTp, Cmp_Fn, _Alloc, pairing_heap_tag, null_type>` Struct Template Reference

```
#include <priority_queue_base_dispatch.hpp>
```

#### Public Types

- typedef [pairing\\_heap](#)<\_VTp, Cmp\_Fn, \_Alloc> [type](#)

#### 6.319.1 Detailed Description

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
struct \_\_gnu\_pbds::detail::container\_base\_dispatch<_VTp, Cmp_Fn, _Alloc, pairing_heap_tag, null_type>
```

Specialization for `pairing_heap`.

### 6.319.2 Member Typedef Documentation

#### type

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
typedef pairing\_heap<_VTp, Cmp_Fn, _Alloc> \_\_gnu\_pbds::detail::container\_base\_dispatch< _VTp,
Cmp_Fn, _Alloc, pairing\_heap\_tag, null\_type >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [priority\\_queue\\_base\\_dispatch.hpp](#)

### 6.320 [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch](#)< \_VTp, Cmp\_Fn, \_Alloc, rc\_binomial\_heap\_tag, null\_type > Struct Template Reference

```
#include <priority_queue_base_dispatch.hpp>
```

#### Public Types

- typedef [rc\\_binomial\\_heap](#)< \_VTp, Cmp\_Fn, \_Alloc > [type](#)

#### 6.320.1 Detailed Description

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
struct \_\_gnu\_pbds::detail::container\_base\_dispatch< _VTp, Cmp_Fn, _Alloc, rc_binomial_heap_tag, null_type
>
```

Specialization for rc\_binary\_heap.

### 6.320.2 Member Typedef Documentation

#### type

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
typedef rc\_binomial\_heap<_VTp, Cmp_Fn, _Alloc> \_\_gnu\_pbds::detail::container\_base\_dispatch< _VTp,
Cmp_Fn, _Alloc, rc\_binomial\_heap\_tag, null\_type >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [priority\\_queue\\_base\\_dispatch.hpp](#)

### 6.321 [\\_\\_gnu\\_pbds::detail::container\\_base\\_dispatch](#)< \_VTp, Cmp\_Fn, \_Alloc, thin\_heap\_tag, null\_type > Struct Template Reference

```
#include <priority_queue_base_dispatch.hpp>
```

#### Public Types

- typedef [thin\\_heap](#)< \_VTp, Cmp\_Fn, \_Alloc > [type](#)

#### 6.321.1 Detailed Description

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
struct \_\_gnu\_pbds::detail::container\_base\_dispatch< _VTp, Cmp_Fn, _Alloc, thin_heap_tag, null_type >
```

Specialization for thin\_heap.

### 6.321.2 Member Typedef Documentation

#### type

```
template<typename _VTp, typename Cmp_Fn, typename _Alloc>
typedef thin\_heap<_VTp, Cmp_Fn, _Alloc> \_\_gnu\_pbds::detail::container\_base\_dispatch< _VTp, Cmp_Fn, _Alloc, thin\_heap\_tag, null\_type >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [priority\\_queue\\_base\\_dispatch.hpp](#)

### 6.322 `__gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, cc_hash_tag, Policy_TI >` Struct Template Reference

```
#include <container_base_dispatch.hpp>
```

#### Public Types

- typedef [cc\\_ht\\_map](#)< Key, Mapped, at0t, at1t, \_Alloc, at3t::value, at4t, at2t > [type](#)

#### 6.322.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_TI>
struct \_\_gnu\_pbds::detail::container\_base\_dispatch< Key, Mapped, _Alloc, cc_hash_tag, Policy_TI >
```

Specialization colision-chaining hash map.

### 6.322.2 Member Typedef Documentation

#### type

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_TI>
typedef cc\_ht\_map<Key, Mapped, at0t, at1t, _Alloc, at3t::value, at4t, at2t> \_\_gnu\_pbds::detail::container\_base\_dispatch< Key, Mapped, _Alloc, cc\_hash\_tag, Policy_TI >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

### 6.323 `__gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, gp_hash_tag, Policy_TI >` Struct Template Reference

```
#include <container_base_dispatch.hpp>
```

#### Public Types

- typedef [gp\\_ht\\_map](#)< Key, Mapped, at0t, at1t, \_Alloc, at3t::value, at4t, at5t, at2t > [type](#)

#### 6.323.1 Detailed Description

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_TI>
struct \_\_gnu\_pbds::detail::container\_base\_dispatch< Key, Mapped, _Alloc, gp_hash_tag, Policy_TI >
```

Specialization general-probe hash map.

### 6.323.2 Member Typedef Documentation

#### type

```
template<typename Key, typename Mapped, typename _Alloc, typename Policy_Tl>
```

### 6.334 `__gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, rb_tree_tag, Policy_Tl >` Struct Template Reference

```
#include <container_base_dispatch.hpp>
```

#### Public Types

- typedef `rb_tree_set< Key, null\_type, at0t, at1t, _Alloc >` `type`

#### 6.334.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, rb_tree_tag, Policy_Tl >
```

Specialization for R-B tree set.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

### 6.335 `__gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, splay_tree_tag, Policy_Tl >` Struct Template Reference

```
#include <container_base_dispatch.hpp>
```

#### Public Types

- typedef `splay_tree_set< Key, null\_type, at0t, at1t, _Alloc >` `type`

#### 6.335.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Policy_Tl>
struct __gnu_pbds::detail::container_base_dispatch< Key, null_type, _Alloc, splay_tree_tag, Policy_Tl >
```

Specialization splay tree set.

#### 6.335.2 Member Typedef Documentation

##### type

```
template<typename Key, typename _Alloc, typename Policy_Tl>
typedef splay_tree_set<Key, null\_type, at0t, at1t, _Alloc> \_\_gnu\_pbds::detail::container\_base\_dispatch<
Key, null\_type, _Alloc, splay\_tree\_tag, Policy_Tl >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [container\\_base\\_dispatch.hpp](#)

### 6.336 `__gnu_pbds::container_error` Struct Reference

```
#include <exception.hpp>
```

Inheritance diagram for `__gnu_pbds::container_error`:

### Public Member Functions

- virtual const char \* [what](#) () const noexcept

#### 6.336.1 Detailed Description

Base class for exceptions.

#### 6.336.2 Member Function Documentation

##### what()

```
virtual const char * std::logic_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this struct was generated from the following file:

- [exception.hpp](#)

#### 6.337 \_\_gnu\_pbds::container\_tag Struct Reference

```
#include <tag_and_trait.hpp>
```

## Public Types

### 6.353.1 Detailed Description

`template<typename _Res, typename... _ArgTypes, bool _Noex>`  
`class std::copyable_function<_Res(_ArgTypes...) _GLIBCXX_MOF_CV` noexcept(`_Noex`)>

Polymorphic copyable function wrapper.

Since

C++26

The `std::copyable_function` class template is a call wrapper similar to `std::function`, but it does not provide information about its target, and preserves constness.

It also supports const-qualification, ref-qualification, and no-throw guarantees. The qualifications and exception-specification of the `copyable_function::operator()` member function are respected when invoking the target function.

## 6.353.2 Constructor & Destructor Documentation

### `copyable_function()` [1/7]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::copyable_function
() [inline], [noexcept]
```

Creates an empty object.

References [copyable\\_function\(\)](#).

Referenced by [copyable\\_function\(\)](#), [copyable\\_function\(\)](#), [copyable\\_function\(\)](#), [copyable\\_function\(\)](#), [copyable\\_function\(\)](#), [copyable\\_function\(\)](#), [copyable\\_function\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator==](#), [swap\(\)](#), and [swap](#).

### `copyable_function()` [2/7]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::copyable_function (
    nullptr_t ) [inline], [noexcept]
```

Creates an empty object.

References [copyable\\_function\(\)](#).

### `copyable_function()` [3/7]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::copyable_function (
    copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> && __x)
[inline], [noexcept]
```

Moves the target object, leaving the source empty.

References [copyable\\_function\(\)](#).

### `copyable_function()` [4/7]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::copyable_function (
    copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> const & __x)
[inline]
```

Copies the target object.

References [copyable\\_function\(\)](#).

### `copyable_function()` [5/7]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Fn, typename _Vt = decay_t<_Fn>>
requires (!is_same_v<_Vt, copyable_function>) && (!__is_in_place_type_v<_Vt>) && __is_callable<
    _from<_Vt>
std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::copyable_function (
    _Fn && __f) [inline], [noexcept]
```

Stores a target object initialized from the argument.

References [copyable\\_function\(\)](#), and [std::forward\(\)](#).

### `copyable_function()` [6/7]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Tp, typename... _Args>
requires is_constructible_v<_Tp, _Args...> && __is_callable_from<_Tp>
std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::copyable_function (
```

```
in_place_type_t< _Tp > ,
_Args &&... __args) [inline], [explicit], [noexcept]
```

Stores a target object initialized from the arguments.

References [copyable\\_function\(\)](#), and [std::forward\(\)](#).

### copyable\_function() [7/7]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Tp, typename _Up, typename... _Args>
requires is_constructible_v<_Tp, initializer_list<_Up>&, _Args...> && __is_callable_from<_Tp>
std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::copyable_function (
    in_place_type_t< _Tp > ,
    initializer_list< _Up > __il,
    _Args &&... __args) [inline], [explicit], [noexcept]
```

Stores a target object initialized from the arguments.

References [copyable\\_function\(\)](#), and [std::forward\(\)](#).

## 6.353.3 Member Function Documentation

### operator bool()

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator bool ()
const [inline], [explicit], [noexcept]
```

True if a target object is present, false otherwise.

### operator>()()

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
_Res std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator() (
    _ArgTypes... __args) [inline], [noexcept]
```

Invoke the target object.

The target object will be invoked using the supplied arguments, and as an lvalue or rvalue, and as const or non-const, as dictated by the template arguments of the `copyable_function` specialization.

#### Precondition

Must not be empty.

References [std::forward\(\)](#), and [operator>\(\)\(\)](#).

Referenced by [operator>\(\)\(\)](#).

### operator=() [1/4]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Fn>
requires is_constructible_v<copyable_function, _Fn>
copyable_function & std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator= (
    _Fn && __f) [inline], [noexcept]
```

Stores a new target object, initialized from the argument.

References [copyable\\_function\(\)](#), [std::forward\(\)](#), and [operator=\(\)](#).

### operator=() [2/4]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
copyable_function & std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator= (
    _Res && __r) [inline], [noexcept]
```

```
Noex)>::operator= (
    const copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __x)
[inline]
```

Stores a copy of the source target object.

References [copyable\\_function\(\)](#), and [operator=\(\)](#).

#### **operator=()** [3/4]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
copyable_function & std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator= (
    copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> && __x)
[inline], [noexcept]
```

Stores a new target object, leaving `x` empty.

References [copyable\\_function\(\)](#), [std::addressof\(\)](#), and [operator=\(\)](#).

Referenced by [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), and [operator=\(\)](#).

#### **operator=()** [4/4]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
copyable_function & std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator= (
    nullptr_t ) [inline], [noexcept]
```

Destroys the target object (if any).

References [copyable\\_function\(\)](#), and [operator=\(\)](#).

#### **swap()**

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
void std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::swap (
    copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __x) [inline],
[noexcept]
```

Exchange the target objects (if any).

References [copyable\\_function\(\)](#), and [swap\(\)](#).

Referenced by [swap\(\)](#), and [swap](#).

### 6.353.4 Friends And Related Symbol Documentation

#### **operator==**

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
bool operator== (
    const copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __x,
    nullptr_t ) [friend]
```

Check for emptiness by comparing with `nullptr`.

References [copyable\\_function\(\)](#), and [operator==](#).

Referenced by [operator==](#).

#### **swap**

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
void swap (
    copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __x,
    copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __y) [friend]
```

Exchange the target objects (if any).

References [copyable\\_function\(\)](#), and [swap\(\)](#).

#### 6.355.1 Detailed Description

**template<typename \_CharT>**  
**class std::ctype<\_CharT>**

Primary class template ctype facet.

This template class defines classification and conversion functions for character sets. It wraps ctype functionality. Ctype gets used by streams for many I/O operations.

This template provides the protected virtual functions the developer will have to replace in a derived class or specialization to make a working facet. The public functions that access them are defined in \_\_ctype\_abstract\_base, to allow for implementation flexibility. See ctype<wchar\_t> for an example. The functions are documented in \_\_ctype\_abstract\_base.

Note: implementations are provided for all the protected virtual functions, but will likely not be useful.

#### 6.355.2 Member Function Documentation

##### do\_is() [1/2]

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [protected], [virtual]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

##### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

##### Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

##### do\_is() [2/2]

```
template<typename _CharT>
virtual bool std::ctype<_CharT>::do_is (
```

```
mask __m,
char_type __c) const [protected], [virtual]
```

Test char\_type classification.

This function finds a mask M for *c* and compares it to mask *m*.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

#### Parameters

$\leftrightarrow$ __c	The char_type to find the mask of.
$\leftrightarrow$ __m	The mask to compare against.

#### Returns

(M & \_\_m) != 0.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

#### do\_narrow() [1/2]

```
template<typename _CharT>
virtual char std::ctype<_CharT>::do_narrow (
    char_type __c,
    char __default) const [protected], [virtual]
```

Narrow char\_type to char.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, default is returned instead.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

__c	The char_type to convert.
__default	Char to return if conversion fails.

#### Returns

The converted char.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by [std::ctype<char>::narrow\(\)](#), and [std::ctype<char>::narrow\(\)](#).

#### do\_narrow() [2/2]

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [protected], [virtual]
```

Narrow char\_type array to char.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to `char` using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__default` is used instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

Implements [std::ctype\\_abstract\\_base<\\_CharT>](#).

#### do\_scan\_is()

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Find `char_type` matching mask.

This function searches for and returns the first `char_type` `c` in `[__lo,__hi)` for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

#### Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

#### Returns

Pointer to a matching `char_type` if found, else `__hi`.

Implements [std::ctype\\_abstract\\_base<\\_CharT>](#).

#### do\_scan\_not()

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Find `char_type` not matching mask.

This function searches for and returns a pointer to the first `char_type` `c` of `[lo,hi)` for which `is(m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

#### Parameters

<code>↔ _m</code>	The mask to compare against.
<code>↔ _lo</code>	Pointer to start of range.
<code>↔ _hi</code>	Pointer to end of range.

#### Returns

Pointer to a non-matching `char_type` if found, else `__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

#### `do_tolower()` [1/2]

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_tolower (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Convert array to lowercase.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

#### Parameters

<code>↔ _lo</code>	Pointer to start of range.
<code>↔ _hi</code>	Pointer to end of range.

#### Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

#### `do_tolower()` [2/2]

```
template<typename _CharT>
virtual char_type std::ctype<_CharT>::do_tolower (
    char_type __c) const [protected], [virtual]
```

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

## Parameters

<a href="#"></a> <a href="#"></a> <code>_c</code>	The char_type to convert.
------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	---------------------------

## Returns

The lowercase char\_type if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#).

Referenced by [std::ctype< char >::tolower\(\)](#), and [std::ctype< char >::tolower\(\)](#).

**do\_toupper()** [1/2]

```
template<typename _CharT>
virtual const char_type * std::ctype< _CharT >::do_toupper (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Convert array to uppercase.

This virtual function converts each char\_type in the range [`__lo`,`__hi`) to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

<a href="#"></a> <code>__lo</code>	Pointer to start of range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#).

**do\_toupper()** [2/2]

```
template<typename _CharT>
virtual char_type std::ctype< _CharT >::do_toupper (
    char_type __c) const [protected], [virtual]
```

Convert to uppercase.

This virtual function converts the char\_type argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

<a href="#"></a> <code>__c</code>	The char_type to convert.
-------------------------------------------------------------------------------------------------------------------------	---------------------------

**Returns**

The uppercase `char_type` if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by [std::ctype<char>::toupper\(\)](#), and [std::ctype<char>::toupper\(\)](#).

**do\_widen()** [1/2]

```
template<typename _CharT>
virtual char_type std::ctype<_CharT>::do_widen (
    char __c) const [protected], [virtual]
```

Widen char.

This virtual function converts the char to `char_type` using the simplest reasonable transformation.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

<code>__c</code>	The char to convert.
------------------	----------------------

**Returns**

The converted `char_type`

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by [std::ctype<char>::widen\(\)](#), and [std::ctype<char>::widen\(\)](#).

**do\_widen()** [2/2]

```
template<typename _CharT>
virtual const char * std::ctype<_CharT>::do_widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [protected], [virtual]
```

Widen char array.

This function converts each char in the input to `char_type` using the simplest reasonable transformation.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

<code>__lo</code>	Pointer to start range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

**Returns**

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**is()** [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [inline], [inherited]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char\_type>::do\_is().

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

**Returns**

`__hi`.

**is()** [2/2]

```
template<typename _CharT>
bool std::__ctype_abstract_base< _CharT >::is (
    mask __m,
    char_type __c) const [inline], [inherited]
```

Test char\_type classification.

This function finds a mask M for \_\_c and compares it to mask \_\_m. It does so by returning the value of ctype<char\_type>::do\_is().

**Parameters**

<code>__c</code>	The char_type to compare the mask of.
<code>__m</code>	The mask to compare against.

**Returns**

$(M \& \text{__m}) \neq 0$ .

Referenced by `std::time_get<_CharT, _InIter>::get()`.

**narrow()** [1/2]

```
template<typename _CharT>
char std::__ctype_abstract_base< _CharT >::narrow (
    char_type __c,
    char __dfault) const [inline], [inherited]
```

Narrow char\_type to char.

This function converts the char\_type to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_c).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<code>__c</code>	The <code>char_type</code> to convert.
<code>__default</code>	Char to return if conversion fails.

**Returns**

The converted char.

Referenced by `std::time_get<_CharT, _InIter>::do_get_year()`, `std::time_get<_CharT, _InIter>::get()`, and `std::time_put<_CharT, _OutIter>::put()`.

**narrow()** [2/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline], [inherited]
```

Narrow array to char array.

This function converts each `char_type` in the input to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `char_type` in the input that cannot be converted, *default* is used instead. It does so by returning `ctype<char_type>::do_narrow(__lo, __hi, __default, __to)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

**Returns**

`__hi`.

**scan\_is()**

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Find `char_type` matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is true. It does so by returning `ctype<char_type>::do_scan_is()`.

**Parameters**

<code>__m</code>	The mask to compare against.
------------------	------------------------------

## Parameters

<a href="#"></a> <code>__lo</code>	Pointer to start of range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.

## Returns

Pointer to matching char\_type if found, else `__hi`.

**scan\_not()**

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Find char\_type not matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char\_type>::do\_scan\_not().

## Parameters

<a href="#"></a> <code>__m</code>	The mask to compare against.
<a href="#"></a> <code>__lo</code>	Pointer to first char in range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.

## Returns

Pointer to non-matching char if found, else `__hi`.

**tolower()** [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::tolower (
    char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Convert array to lowercase.

This function converts each char\_type in the range [\_\_lo,\_\_hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_tolower(\_\_lo,\_\_hi).

## Parameters

<a href="#"></a> <code>__lo</code>	Pointer to start of range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.

**Returns**

`__hi`.

**tolower() [2/2]**

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::tolower (
    char_type __c) const [inline], [inherited]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_tolower(c)`.

**Parameters**

<code>__c</code>	The char_type to convert.
------------------	---------------------------

**Returns**

The lowercase char\_type if convertible, else `__c`.

Referenced by `std::time_get< _CharT, _InIter >::get()`.

**toupper() [1/2]**

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

**Returns**

`__hi`.

**toupper() [2/2]**

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::toupper (
    char_type __c) const [inline], [inherited]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

## Parameters

$\leftrightarrow$ _c	The char_type to convert.
-------------------------	---------------------------

## Returns

The uppercase char\_type if convertible, else \_\_c.

Referenced by [std::time\\_get<\\_CharT, \\_InIter >::get\(\)](#).

**widen()** [1/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base<_CharT >::widen (
    char __c) const [inline], [inherited]
```

Widen char to char\_type.

This function converts the char argument to char\_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

$\leftrightarrow$ _c	The char to convert.
-------------------------	----------------------

## Returns

The converted char\_type.

Referenced by [std::money\\_get<\\_CharT, \\_InIter >::do\\_get\(\)](#), [std::time\\_get<\\_CharT, \\_InIter >::do\\_get\(\)](#), [std::money\\_put<\\_CharT, \\_OutIter >::do\\_put\(\)](#) and [std::time\\_put<\\_CharT, \\_OutIter >::do\\_put\(\)](#).

**widen()** [2/2]

```
template<typename _CharT>
const char * std::__ctype_abstract_base<_CharT >::widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline], [inherited]
```

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

$\leftrightarrow$ _lo	Pointer to start of range.
$\leftrightarrow$ _hi	Pointer to end of range.
$\leftrightarrow$ _to	Pointer to the destination array.

## Returns

`__hi`.

### 6.355.3 Member Data Documentation

**6.356.1 Detailed Description**

The `ctype<char>` specialization.

This class defines classification and conversion functions for the `char` type. It gets used by `char` streams for many I/O operations. The `char` specialization provides a number of optimizations as well.

**6.356.2 Member Typedef Documentation****char\_type**

```
typedef char std::ctype< char >::char_type
```

Typedef for the template parameter `char`.

**6.356.3 Constructor & Destructor Documentation****ctype() [1/2]**

```
std::ctype< char >::ctype (
    const mask * __table = 0,
    bool __del = false,
    size_t __refs = 0) [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

**Parameters**

<code>__table</code>	If non-zero, table is used as the per-char mask. Else <code>classic_table()</code> is used.
<code>__del</code>	If true, passes ownership of table to this facet.
<code>__refs</code>	Passed to the base facet class.

Referenced by `~ctype()`.

**ctype() [2/2]**

```
std::ctype< char >::ctype (
    __c_locale __cloc,
    const mask * __table = 0,
    bool __del = false,
    size_t __refs = 0) [explicit]
```

Constructor performs static initialization.

This constructor is used to construct the initial C locale facet.

## Parameters

<code>__cloc</code>	Handle to C locale data.
<code>__table</code>	If non-zero, table is used as the per-char mask.
<code>__del</code>	If true, passes ownership of table to this facet.
<code>__refs</code>	Passed to the base facet class.

`~ctype()`

```
virtual std::ctype< char >::~~ctype () [protected], [virtual]
```

Destructor.

This function deletes table() if *del* was true in the constructor.

References [ctype\(\)](#).

## 6.356.4 Member Function Documentation

`classic_table()`

```
const mask * std::ctype< char >::classic_table () throw ( ) [static]
```

Returns a pointer to the C locale mask table.

`do_is()` [1/3]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [protected], [pure virtual], [inherited]
```

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the input.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

## Returns

`__hi`.

Implemented in [std::ctype< \\_CharT >](#), and [std::mask< \\_CharT >](#).

`do_is()` [2/3]

```
template<typename _CharT>
virtual bool std::__ctype_abstract_base< _CharT >::do_is (
    mask __m,
    char_type __c) const [protected], [pure virtual], [inherited]
```

Test `char_type` classification.

This function finds a mask *M* for *c* and compares it to mask *m*.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

#### Parameters

$\leftrightarrow$ _c	The char_type to find the mask of.
$\leftrightarrow$ _m	The mask to compare against.

#### Returns

$(M \ \& \ \_m) \neq 0$ .

Implemented in [std::ctype< \\_CharT >](#), [std::ctype< wchar\\_t >](#), and [std::mask< \\_CharT >](#).

Referenced by [std::mask< \\_CharT >::is\(\)](#), and [std::mask< \\_CharT >::is\(\)](#).

#### do\_is() [3/3]

```
virtual bool std::ctype< char >::do_is (
    mask __m,
    char_type __c) const [protected], [virtual]
```

Test char\_type classification.

This function finds a mask *M* for *c* and compares it to mask *m*.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

#### Parameters

$\leftrightarrow$ _c	The char_type to find the mask of.
$\leftrightarrow$ _m	The mask to compare against.

#### Returns

$(M \ \& \ \_m) \neq 0$ .

#### do\_narrow() [1/4]

```
template<typename _CharT>
virtual char std::__ctype_abstract_base< _CharT >::do_narrow (
    char_type __c,
    char __default) const [protected], [pure virtual], [inherited]
```

Narrow char\_type to char.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, default is returned instead.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<code>__c</code>	The <code>char_type</code> to convert.
<code>__default</code>	Char to return if conversion fails.

**Returns**

The converted char.

Implemented in [std::ctype<\\_CharT>](#), [std::ctype<wchar\\_t>](#), and [std::mask<\\_CharT>](#).

Referenced by [std::mask<\\_CharT>::narrow\(\)](#), and [std::mask<\\_CharT>::narrow\(\)](#).

**do\_narrow()** [2/4]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base<_CharT>::do_narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [protected], [pure virtual], [inherited]
```

Narrow `char_type` array to char.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to char using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__default` is used instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

**Returns**

`__hi`.

Implemented in [std::ctype<\\_CharT>](#), and [std::mask<\\_CharT>](#).

**do\_narrow()** [3/4]

```
virtual char std::ctype<char>::do_narrow (
    char_type __c,
    char __default) const [inline], [protected], [virtual]
```

Narrow char.

This virtual function converts the char to char using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead. For an underived `ctype<char>` facet, `c` will be returned unchanged.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__c</code>	The char to convert.
<code>__default</code>	Char to return if conversion fails.

## Returns

The converted char.

**do\_narrow()** [4/4]

```
virtual const char_type * std::ctype< char >::do_narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline], [protected], [virtual]
```

Narrow char array to char array.

This virtual function converts each char in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *default* is used instead. For an undervied ctype<char> facet, the argument will be copied unchanged.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

## Returns

`__hi`.

**do\_scan\_is()** [1/2]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [pure virtual], [inherited]
```

Find char\_type matching mask.

This function searches for and returns the first char\_type c in [\_\_lo,\_\_hi) for which is(\_\_m,c) is true.

do\_scan\_is() is a hook for a derived facet to change the behavior of match searching. do\_is() must always return the same result for the same input.

## Parameters

<code>__m</code>	The mask to compare against.
------------------	------------------------------

**Parameters**

<a href="#"><code>__lo</code></a>	Pointer to start of range.
<a href="#"><code>__hi</code></a>	Pointer to end of range.

**Returns**

Pointer to a matching `char_type` if found, else `__hi`.

Implemented in [std::ctype< \\_CharT >](#), [std::ctype< wchar\\_t >](#), and [std::mask< \\_CharT >](#).

Referenced by [std::mask< \\_CharT >::scan\\_is\(\)](#).

**do\_scan\_is()** [2/2]

```
virtual const char_type * std::ctype< char >::do_scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Find `char_type` matching mask.

This function searches for and returns the first `char_type` `c` in `[__lo,__hi)` for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

**Parameters**

<a href="#"><code>__m</code></a>	The mask to compare against.
<a href="#"><code>__lo</code></a>	Pointer to start of range.
<a href="#"><code>__hi</code></a>	Pointer to end of range.

**Returns**

Pointer to a matching `char_type` if found, else `__hi`.

**do\_scan\_not()** [1/2]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [pure virtual], [inherited]
```

Find `char_type` not matching mask.

This function searches for and returns a pointer to the first `char_type` `c` of `[lo,hi)` for which `is(m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

**Parameters**

<a href="#"><code>__m</code></a>	The mask to compare against.
----------------------------------	------------------------------

## Parameters

<a href="#"></a> <code>__lo</code>	Pointer to start of range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.

## Returns

Pointer to a non-matching `char_type` if found, else `__hi`.

Implemented in [std::ctype< \\_CharT >](#), [std::ctype< wchar\\_t >](#), and [std::mask< \\_CharT >](#).

Referenced by [std::mask< \\_CharT >::scan\\_not\(\)](#).

**do\_scan\_not()** [2/2]

```
virtual const char_type * std::ctype< char >::do_scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Find `char_type` not matching mask.

This function searches for and returns a pointer to the first `char_type` `c` of `[lo,hi)` for which `is(m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

## Parameters

<a href="#"></a> <code>__m</code>	The mask to compare against.
<a href="#"></a> <code>__lo</code>	Pointer to start of range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.

## Returns

Pointer to a non-matching `char_type` if found, else `__hi`.

**do\_tolower()** [1/4]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_tolower (
    char_type * __lo,
    const char_type * __hi) const [protected], [pure virtual], [inherited]
```

Convert array to lowercase.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

## Parameters

<a href="#"></a> <code>__lo</code>	Pointer to start of range.
--------------------------------------------------------------------------------------------------------------------------	----------------------------

<a href="#"></a> <a href="#"></a> <i>hi</i>	Pointer to end of range.
------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	--------------------------

**Returns***\_\_hi*.

Implemented in [std::ctype< \\_CharT >](#), and [std::mask< \\_CharT >](#).

**do\_tolower()** [2/4]

```
template<typename _CharT>
virtual char_type std::__ctype_abstract_base< _CharT >::do_tolower (
    char_type __c) const [protected], [pure virtual], [inherited]
```

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

**Parameters**

<a href="#"></a> <a href="#"></a> <i>c</i>	The char_type to convert.
-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	---------------------------

**Returns**

The lowercase char\_type if convertible, else *\_\_c*.

Implemented in [std::ctype< \\_CharT >](#), [std::ctype< wchar\\_t >](#), and [std::mask< \\_CharT >](#).

Referenced by [std::mask< \\_CharT >::tolower\(\)](#), and [std::mask< \\_CharT >::tolower\(\)](#).

**do\_tolower()** [3/4]

```
virtual const char_type * std::ctype< char >::do_tolower (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Convert array to lowercase.

This virtual function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

**Parameters**

<a href="#"></a> <a href="#"></a> <i>lo</i>	Pointer to first char in range.
<a href="#"></a> <a href="#"></a> <i>hi</i>	Pointer to end of range.

**Returns***\_\_hi*.

References [do\\_tolower\(\)](#).

**do\_tolower()** [4/4]

```
virtual char_type std::ctype< char >::do_tolower (
    char_type __c) const [protected], [virtual]
```

Convert to lowercase.

This virtual function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

**Parameters**

 <code>__c</code>	The char to convert.
----------------------------------------------------------------------------------------------------	----------------------

**Returns**

The lowercase char if convertible, else `__c`.

References [do\\_tolower\(\)](#).

Referenced by [do\\_tolower\(\)](#), and [do\\_tolower\(\)](#).

**do\_toupper()** [1/4]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_toupper (
    char_type * __lo,
    const char_type * __hi) const [protected], [pure virtual], [inherited]
```

Convert array to uppercase.

This virtual function converts each char\_type in the range [`__lo`,`__hi`) to uppercase if possible. Other elements remain untouched.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

**Parameters**

 <code>__lo</code>	Pointer to start of range.
 <code>__hi</code>	Pointer to end of range.

**Returns**

`__hi`.

Implemented in [std::ctype< \\_CharT >](#), and [std::mask< \\_CharT >](#).

**do\_toupper()** [2/4]

```
template<typename _CharT>
virtual char_type std::__ctype_abstract_base< _CharT >::do_toupper (
    char_type __c) const [protected], [pure virtual], [inherited]
```

Convert to uppercase.

This virtual function converts the char\_type argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

## Parameters

<a href="#"><code>__c</code></a>	The char_type to convert.
----------------------------------	---------------------------

## Returns

The uppercase char\_type if convertible, else `__c`.

Implemented in [std::ctype< \\_CharT >](#), [std::ctype< wchar\\_t >](#), and [std::mask< \\_CharT >](#).

Referenced by [std::mask< \\_CharT >::toupper\(\)](#), and [std::mask< \\_CharT >::toupper\(\)](#).

**do\_toupper()** [3/4]

```
virtual const char_type * std::ctype< char >::do_toupper (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Convert array to uppercase.

This virtual function converts each char in the range [lo,hi) to uppercase if possible. Other chars remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

<a href="#"><code>__lo</code></a>	Pointer to start of range.
<a href="#"><code>__hi</code></a>	Pointer to end of range.

## Returns

`__hi`.

References [do\\_toupper\(\)](#).

**do\_toupper()** [4/4]

```
virtual char_type std::ctype< char >::do_toupper (
    char_type __c) const [protected], [virtual]
```

Convert to uppercase.

This virtual function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

<a href="#"><code>__c</code></a>	The char to convert.
----------------------------------	----------------------

## Returns

The uppercase char if convertible, else `__c`.

References [do\\_toupper\(\)](#).

Referenced by [do\\_toupper\(\)](#), and [do\\_toupper\(\)](#).

**do\_widen()** [1/3]

```
template<typename _CharT>
virtual const char * std::__ctype_abstract_base< _CharT >::do_widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [protected], [pure virtual], [inherited]
```

Widen char array.

This function converts each char in the input to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<a href="#"><code>__lo</code></a>	Pointer to start range.
<a href="#"><code>__hi</code></a>	Pointer to end of range.
<a href="#"><code>__to</code></a>	Pointer to the destination array.

**Returns**

[`\_\_hi`](#).

Implemented in [std::ctype< \\_CharT >](#), and [std::mask< \\_CharT >](#).

**do\_widen()** [2/3]

```
virtual char_type std::ctype< char >::do_widen (
    char __c) const [inline], [protected], [virtual]
```

Widen char.

This virtual function converts the char to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be returned unchanged.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<a href="#"><code>__c</code></a>	The char to convert.
----------------------------------	----------------------

**Returns**

The converted character.

Implements [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#).

References [do\\_widen\(\)](#).

Referenced by [do\\_widen\(\)](#).

**do\_widen()** [3/3]

```
virtual const char * std::ctype< char >::do_widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline], [protected], [virtual]
```

Widen char array.

This function converts each char in the range [lo,hi) to char using the simplest reasonable transformation. For an undervied ctype<char> facet, the argument will be copied unchanged.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

**Returns**

`__hi`.

**is()** [1/6]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [inline], [inherited]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char\_type>::do\_is().

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

**Returns**

`__hi`.

**is()** [2/6]

```
template<typename _CharT>
bool std::__ctype_abstract_base< _CharT >::is (
    mask __m,
    char_type __c) const [inline], [inherited]
```

Test char\_type classification.

This function finds a mask M for \_\_c and compares it to mask \_\_m. It does so by returning the value of ctype<char\_↔type>::do\_is().

#### Parameters

<a href="#">↔</a> __c	The char_type to compare the mask of.
<a href="#">↔</a> __m	The mask to compare against.

#### Returns

(M & \_\_m) != 0.

Referenced by [std::time\\_get< \\_CharT, \\_InIter >::get\(\)](#).

#### is() [3/6]

```
const char * std::ctype< char >::is (
    const char * __lo,
    const char * __hi,
    mask * __vec) const [inline]
```

Return a mask array.

This function finds the mask for each char in the range [lo, hi) and successively writes it to vec. vec must have as many elements as the char array.

#### Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

#### Returns

\_\_hi.

#### is() [4/6]

```
const char_type * std::__ctype_abstract_base< char >::is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [inline]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char\_type>::do\_is().

#### Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

**Returns**

`__hi`.

**is()** [5/6]

```
bool std::ctype< char >::is (
    mask __m,
    char __c) const [inline]
```

Test char classification.

This function compares the mask table[c] to `__m`.

**Parameters**

<code>__c</code>	The char to compare the mask of.
<code>__m</code>	The mask to compare against.

**Returns**

True if `__m & table[__c]` is true, false otherwise.

**is()** [6/6]

```
bool std::__ctype_abstract_base< char >::is (
    mask __m,
    char_type __c) const [inline]
```

Test `char_type` classification.

This function finds a mask M for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_type>::do_is()`.

**Parameters**

<code>__c</code>	The <code>char_type</code> to compare the mask of.
<code>__m</code>	The mask to compare against.

**Returns**

`(M & __m) != 0`.

**narrow()** [1/6]

```
template<typename _CharT>
char std::__ctype_abstract_base< _CharT >::narrow (
    char_type __c,
    char __default) const [inline], [inherited]
```

Narrow `char_type` to `char`.

This function converts the `char_type` to `char` using the simplest reasonable transformation. If the conversion fails, `default` is returned instead. It does so by returning `ctype<char_type>::do_narrow(__c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__c</code>	The <code>char_type</code> to convert.
<code>__default</code>	Char to return if conversion fails.

## Returns

The converted char.

Referenced by `std::time_get<_CharT, _InIter>::do_get_year()`, `std::time_get<_CharT, _InIter>::get()`, and `std::time_put<_CharT, _OutIter>::put()`.

**narrow()** [2/6]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline], [inherited]
```

Narrow array to char array.

This function converts each `char_type` in the input to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `char_type` in the input that cannot be converted, *default* is used instead. It does so by returning `ctype<char_type>::do_narrow(__lo, __hi, __default, __to)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

## Returns

`__hi`.

**narrow()** [3/6]

```
char std::__ctype_abstract_base< char >::narrow (
    char_type __c,
    char __default) const [inline]
```

Narrow `char_type` to `char`.

This function converts the `char_type` to `char` using the simplest reasonable transformation. If the conversion fails, *default* is returned instead. It does so by returning `ctype<char_type>::do_narrow(__c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__c</code>	The <code>char_type</code> to convert.
<code>__default</code>	Char to return if conversion fails.

**Returns**

The converted char.

**narrow()** [4/6]

```
char std::ctype< char >::narrow (
    char_type __c,
    char __default) const [inline]
```

Narrow char.

This function converts the char to char using the simplest reasonable transformation. If the conversion fails, *default* is returned instead. For an underived `ctype<char>` facet, *c* will be returned unchanged.

This function works as if it returns `ctype<char>::do_narrow(c)`. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

<code>__c</code>	The char to convert.
<code>__default</code>	Char to return if conversion fails.

**Returns**

The converted character.

References [std::ctype<\\_CharT>::do\\_narrow\(\)](#).

**narrow()** [5/6]

```
const char_type * std::__ctype_abstract_base< char >::narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline]
```

Narrow array to char array.

This function converts each `char_type` in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any `char_type` in the input that cannot be converted, *default* is used instead. It does so by returning `ctype<char_type>::do_narrow(__lo, __hi, __default, __to)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

**Returns**

`__hi`.

**narrow()** [6/6]

```
const char_type * std::ctype< char >::narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline]
```

Narrow char array.

This function converts each char in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *default* is used instead. For an undervived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns ctype<char>::do\_narrow(lo, hi, default, to). do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

**Returns**

`__hi`.

References [std::ctype< \\_CharT >::do\\_narrow\(\)](#).

**scan\_is()** [1/3]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Find char\_type matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char\_type>::do\_scan\_is().

**Parameters**

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

**Returns**

Pointer to matching char\_type if found, else `__hi`.

**scan\_is()** [2/3]

```
const char * std::ctype< char >::scan_is (
    mask __m,
    const char * __lo,
    const char * __hi) const [inline]
```

Find char matching a mask.

This function searches for and returns the first char in [lo,hi) for which is(m,char) is true.

**Parameters**

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

**Returns**

Pointer to a matching char if found, else `__hi`.

**scan\_is()** [3/3]

```
const char_type * std::__ctype_abstract_base< char >::scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline]
```

Find char\_type matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char\_type>::do\_scan\_is().

**Parameters**

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

**Returns**

Pointer to matching char\_type if found, else `__hi`.

**scan\_not()** [1/3]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Find char\_type not matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is false. It does so by returning `ctype<char_type>::do_scan_not()`.

**Parameters**

<a href="#"></a> __m	The mask to compare against.
<a href="#"></a> __lo	Pointer to first char in range.
<a href="#"></a> __hi	Pointer to end of range.

**Returns**

Pointer to non-matching char if found, else \_\_hi.

**scan\_not() [2/3]**

```
const char * std::ctype< char >::scan_not (
    mask __m,
    const char * __lo,
    const char * __hi) const [inline]
```

Find char not matching a mask.

This function searches for and returns a pointer to the first char in [\_\_lo,\_\_hi) for which is(m,char) is false.

**Parameters**

<a href="#"></a> __m	The mask to compare against.
<a href="#"></a> __lo	Pointer to start of range.
<a href="#"></a> __hi	Pointer to end of range.

**Returns**

Pointer to a non-matching char if found, else \_\_hi.

**scan\_not() [3/3]**

```
const char\_type * std::\_\_ctype\_abstract\_base< char >::scan_not (
    mask __m,
    const char\_type * __lo,
    const char\_type * __hi) const [inline]
```

Find char\_type not matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char\_type>::do\_scan\_not().

**Parameters**

<a href="#"></a> __m	The mask to compare against.
<a href="#"></a> __lo	Pointer to first char in range.
<a href="#"></a> __hi	Pointer to end of range.

**Returns**

Pointer to non-matching char if found, else `__hi`.

**table()**

```
const mask * std::ctype< char >::table () const throw ( ) [inline]
```

Returns a pointer to the mask table provided to the constructor, or the default from `classic_table()` if none was provided.

**tolower()** [1/6]

```
template<typename _CharT>
```

```
const char_type * std::__ctype_abstract_base< _CharT >::tolower (
    char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo, __hi)`.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

**Returns**

`__hi`.

**tolower()** [2/6]

```
template<typename _CharT>
```

```
char_type std::__ctype_abstract_base< _CharT >::tolower (
    char_type __c) const [inline], [inherited]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_tolower(c)`.

**Parameters**

<code>__c</code>	The <code>char_type</code> to convert.
------------------	----------------------------------------

**Returns**

The lowercase `char_type` if convertible, else `__c`.

Referenced by `std::time_get< _CharT, _InIter >::get()`.

**tolower()** [3/6]

```
const char_type * std::__ctype_abstract_base< char >::tolower (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to lowercase.

This function converts each char\_type in the range [\_\_lo,\_\_hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_tolower(\_\_lo, \_\_hi).

**Parameters**

$\leftarrow$ __lo	Pointer to start of range.
$\leftarrow$ __hi	Pointer to end of range.

**Returns**

\_\_hi.

**tolower()** [4/6]

```
const char_type * std::ctype< char >::tolower (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to lowercase.

This function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

tolower() acts as if it returns ctype<char>::do\_tolower(\_\_lo, \_\_hi). do\_tolower() must always return the same result for the same input.

**Parameters**

$\leftarrow$ __lo	Pointer to first char in range.
$\leftarrow$ __hi	Pointer to end of range.

**Returns**

\_\_hi.

References [std::ctype<\\_CharT>::do\\_tolower\(\)](#).

**tolower()** [5/6]

```
char_type std::__ctype_abstract_base< char >::tolower (
    char_type __c) const [inline]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char\_type>::do\_tolower(c).

## Parameters

<code>↔</code> <code>__c</code>	The <code>char_type</code> to convert.
------------------------------------	----------------------------------------

## Returns

The lowercase `char_type` if convertible, else `__c`.

**tolower()** [6/6]

```
char_type std::ctype< char >::tolower (
    char_type __c) const [inline]
```

Convert to lowercase.

This function converts the `char` argument to lowercase if possible. If not possible (for example, '2'), returns the argument. `tolower()` acts as if it returns `ctype<char>::do_tolower(__c)`. `do_tolower()` must always return the same result for the same input.

## Parameters

<code>↔</code> <code>__c</code>	The <code>char</code> to convert.
------------------------------------	-----------------------------------

## Returns

The lowercase `char` if convertible, else `__c`.

References `std::ctype< _CharT >::do_tolower()`.

**toupper()** [1/6]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Convert array to uppercase.

This function converts each `char_type` in the range `[lo,hi)` to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

## Parameters

<code>↔</code> <code>__lo</code>	Pointer to start of range.
<code>↔</code> <code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

**toupper()** [2/6]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::toupper (
    char_type __c) const [inline], [inherited]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char\_type>::do\_toupper().

**Parameters**

$\leftrightarrow$ __c	The char_type to convert.
--------------------------	---------------------------

**Returns**

The uppercase char\_type if convertible, else \_\_c.

Referenced by [std::time\\_get< \\_CharT, \\_Inlter >::get\(\)](#).

**toupper()** [3/6]

```
const char_type * std::__ctype_abstract_base< char >::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_toupper(lo, hi).

**Parameters**

$\leftrightarrow$ __lo	Pointer to start of range.
$\leftrightarrow$ __hi	Pointer to end of range.

**Returns**

\_\_hi.

**toupper()** [4/6]

```
const char_type * std::ctype< char >::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to uppercase.

This function converts each char in the range [\_\_lo,\_\_hi) to uppercase if possible. Other chars remain untouched.

toupper() acts as if it returns ctype<char>::do\_toupper(\_\_lo, \_\_hi). do\_toupper() must always return the same result for the same input.

**Parameters**

$\leftrightarrow$ __lo	Pointer to first char in range.
---------------------------	---------------------------------

<a href="#"></a> <a href="#"><u>__hi</u></a>	Pointer to end of range.
----------------------------------------------------------------------------------------------------------------------------------	--------------------------

**Returns**[\\_\\_hi](#).References [std::ctype< \\_CharT >::do\\_toupper\(\)](#).**toupper()** [5/6]

```
char_type std::__ctype_abstract_base< char >::toupper (
    char_type __c) const [inline]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

**Parameters**

<a href="#"></a> <a href="#"><u>__c</u></a>	The char_type to convert.
---------------------------------------------------------------------------------------------------------------------------------	---------------------------

**Returns**The uppercase char\_type if convertible, else [\\_\\_c](#).**toupper()** [6/6]

```
char_type std::ctype< char >::toupper (
    char_type __c) const [inline]
```

Convert to uppercase.

This function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument. `toupper()` acts as if it returns `ctype<char>::do_toupper(c)`. `do_toupper()` must always return the same result for the same input.

**Parameters**

<a href="#"></a> <a href="#"><u>__c</u></a>	The char to convert.
-----------------------------------------------------------------------------------------------------------------------------------	----------------------

**Returns**The uppercase char if convertible, else [\\_\\_c](#).References [std::ctype< \\_CharT >::do\\_toupper\(\)](#).**widen()** [1/5]

```
template<typename _CharT>
const char * std::__ctype_abstract_base< _CharT >::widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline], [inherited]
```

Widen array to `char_type`.

This function converts each char in the input to `char_type` using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecv`t for that.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

#### **widen()** [2/5]

```
char_type std::__ctype_abstract_base< char >::widen (  
    char __c) const [inline]
```

Widen char to `char_type`.

This function converts the char argument to `char_type` using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecv`t for that.

#### Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

#### Returns

The converted `char_type`.

#### **widen()** [3/5]

```
char_type std::ctype< char >::widen (  
    char __c) const [inline]
```

Widen char.

This function converts the char to `char_type` using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be returned unchanged.

This function works as if it returns `ctype<char>::do_widen(c)`. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecv`t for that.

#### Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

**Returns**

The converted character.

References [std::ctype< \\_CharT >::do\\_widen\(\)](#).

**widen()** [4/5]

```
const char * std::__ctype_abstract_base< char >::widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline]
```

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<a href="#"> <code>__lo</code></a>	Pointer to start of range.
<a href="#"> <code>__hi</code></a>	Pointer to end of range.
<a href="#"> <code>__to</code></a>	Pointer to the destination array.

**Returns**

`__hi`.

**widen()** [5/5]

```
const char * std::ctype< char >::widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline]
```

Widen char array.

This function converts each char in the input to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns ctype<char>::do\_widen(c). do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<a href="#"> <code>__lo</code></a>	Pointer to first char in range.
<a href="#"> <code>__hi</code></a>	Pointer to end of range.
<a href="#"> <code>__to</code></a>	Pointer to the destination array.

**Returns**

`__hi`.

References [std::ctype< \\_CharT >::do\\_widen\(\)](#).

### 6.356.5 Member Data Documentation

#### id

```
locale::id std::ctype< char >::id [static]
```

The facet id for ctype<char>

#### table\_size

```
const size_t std::ctype< char >::table_size [static]
```

The size of the mask table. It is SCHAR\_MAX + 1.

The documentation for this class was generated from the following files:

### 6.357.1 Detailed Description

The ctype<wchar\_t> specialization.

This class defines classification and conversion functions for the wchar\_t type. It gets used by wchar\_t streams for many I/O operations. The wchar\_t specialization provides a number of optimizations as well. ctype<wchar\_t> inherits its public methods from \_\_ctype\_abstract\_base<wchar\_t>.

### 6.357.2 Member Typedef Documentation

#### char\_type

```
typedef wchar_t std::ctype< wchar_t >::char_type
```

Typedef for the template parameter wchar\_t.

### 6.357.3 Constructor & Destructor Documentation

#### ctype() [1/2]

```
std::ctype< wchar_t >::ctype (
    size_t __refs = 0) [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

#### Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

#### ctype() [2/2]

```
std::ctype< wchar_t >::ctype (
    __c_locale __cloc,
    size_t __refs = 0) [explicit]
```

Constructor performs static initialization.

This constructor is used to construct the initial C locale facet.

#### Parameters

<code>__cloc</code>	Handle to C locale data.
<code>__refs</code>	Passed to the base facet class.

#### ~ctype()

```
virtual std::ctype< wchar_t >::~~ctype () [protected], [virtual]
```

Destructor.

### 6.357.4 Member Function Documentation

#### do\_is() [1/2]

```
virtual const char_type * std::ctype< wchar_t >::do_is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [protected], [virtual]
```

Return a mask array.

This function finds the mask for each wchar\_t in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

#### Returns

`__hi`.

#### do\_is() [2/2]

```
virtual bool std::ctype< wchar_t >::do_is (
    mask __m,
    char_type __c) const [protected], [virtual]
```

Test wchar\_t classification.

This function finds a mask M for c and compares it to mask m.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

#### Parameters

<code>__c</code>	The wchar_t to find the mask of.
<code>__m</code>	The mask to compare against.

#### Returns

$(M \& \_m) \neq 0$ .

Implements `std::__ctype_abstract_base< wchar_t >`.

#### do\_narrow() [1/2]

```
virtual char std::ctype< wchar_t >::do_narrow (
    char_type __c,
    char __dfault) const [protected], [virtual]
```

Narrow wchar\_t to char.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, *dfault* is returned instead. For an underived `ctype<wchar_t>` facet, *c* will be cast to char and returned. `do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

<code>__c</code>	The <code>wchar_t</code> to convert.
<code>__dfault</code>	Char to return if conversion fails.

#### Returns

The converted char.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

#### `do_narrow()` [2/2]

```
virtual const char_type * std::ctype< wchar_t >::do_narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __dfault,
    char * __to) const [protected], [virtual]
```

Narrow `wchar_t` array to char array.

This virtual function converts each `wchar_t` in the range `[lo,hi)` to char using the simplest reasonable transformation and writes the results to the destination array. For any `wchar_t` in the input that cannot be converted, *dfault* is used instead. For an underived `ctype<wchar_t>` facet, the argument will be copied, casting each element to char.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

#### `do_scan_is()`

```
virtual const char_type * std::ctype< wchar_t >::do_scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Find `wchar_t` matching mask.

This function searches for and returns the first `wchar_t` *c* in `[__lo,__hi)` for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

## Parameters

<a href="#"></a> <code>__m</code>	The mask to compare against.
<a href="#"></a> <code>__lo</code>	Pointer to start of range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.

## Returns

Pointer to a matching `wchar_t` if found, else `__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**do\_scan\_not()**

```
virtual const char_type * std::ctype< wchar_t >::do_scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Find `wchar_t` not matching mask.

This function searches for and returns a pointer to the first `wchar_t` `c` of `[__lo,__hi)` for which `is(__m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

## Parameters

<a href="#"></a> <code>__m</code>	The mask to compare against.
<a href="#"></a> <code>__lo</code>	Pointer to start of range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.

## Returns

Pointer to a non-matching `wchar_t` if found, else `__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**do\_tolower()** [1/2]

```
virtual const char_type * std::ctype< wchar_t >::do_tolower (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Convert array to lowercase.

This virtual function converts each `wchar_t` in the range `[lo,hi)` to lowercase if possible. Other elements remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

**Parameters**

<a href="#"></a> <code>__lo</code>	Pointer to start of range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.

**Returns**

`__hi`.

**do\_tolower() [2/2]**

```
virtual char\_type std::ctype< wchar\_t >::do_tolower (  
    char\_type __c) const    [protected], [virtual]
```

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

**Parameters**

<a href="#"></a> <code>__c</code>	The <a href="#">wchar_t</a> to convert.
-----------------------------------------------------------------------------------------------------------------------	-----------------------------------------

**Returns**

The lowercase [wchar\\_t](#) if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**do\_toupper() [1/2]**

```
virtual const char\_type * std::ctype< wchar\_t >::do_toupper (  
    char\_type * __lo,  
    const char\_type * __hi) const    [protected], [virtual]
```

Convert array to uppercase.

This virtual function converts each [wchar\\_t](#) in the range [lo,hi) to uppercase if possible. Other elements remain untouched.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

**Parameters**

<a href="#"></a> <code>__lo</code>	Pointer to start of range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.

**Returns**

`__hi`.

**do\_toupper()** [2/2]

```
virtual char_type std::ctype< wchar_t >::do_toupper (
    char_type __c) const [protected], [virtual]
```

Convert to uppercase.

This virtual function converts the wchar\_t argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

**Parameters**

<code>__c</code>	The wchar_t to convert.
<code>__C</code>	

**Returns**

The uppercase wchar\_t if convertible, else \_\_c.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**do\_widen()** [1/2]

```
virtual char_type std::ctype< wchar_t >::do_widen (
    char __c) const [protected], [virtual]
```

Widen char to wchar\_t.

This virtual function converts the char to wchar\_t using the simplest reasonable transformation. For an underived ctype<wchar\_t> facet, the argument will be cast to wchar\_t.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<code>__c</code>	The char to convert.
<code>__C</code>	

**Returns**

The converted wchar\_t.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**do\_widen()** [2/2]

```
virtual const char * std::ctype< wchar_t >::do_widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [protected], [virtual]
```

Widen char array to wchar\_t array.

This function converts each char in the input to wchar\_t using the simplest reasonable transformation. For an underived ctype<wchar\_t> facet, the argument will be copied, casting each element to wchar\_t.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<code>__lo</code>	Pointer to start range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

**Returns**

`__hi`.

**is()** [1/2]

```
const char_type * std::__ctype_abstract_base< wchar_t >::is (  
    const char_type * __lo,  
    const char_type * __hi,  
    mask * __vec) const [inline]
```

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the char array. It does so by returning the value of `ctype<char_type>::do_is()`.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

**Returns**

`__hi`.

**is()** [2/2]

```
bool std::__ctype_abstract_base< wchar_t >::is (  
    mask __m,  
    char_type __c) const [inline]
```

Test `char_type` classification.

This function finds a mask `M` for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_type>::do_is()`.

**Parameters**

<code>__c</code>	The <code>char_type</code> to compare the mask of.
<code>__m</code>	The mask to compare against.

**Returns**

`(M & __m) != 0`.

**narrow()** [1/2]

```
char std::__ctype_abstract_base< wchar_t >::narrow (
    char_type __c,
    char __default) const [inline]
```

Narrow char\_type to char.

This function converts the char\_type to char using the simplest reasonable transformation. If the conversion fails, default is returned instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_c).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<code>__c</code>	The char_type to convert.
<code>__default</code>	Char to return if conversion fails.

**Returns**

The converted char.

**narrow()** [2/2]

```
const char_type * std::__ctype_abstract_base< wchar_t >::narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline]
```

Narrow array to char array.

This function converts each char\_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char\_type in the input that cannot be converted, default is used instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_lo, \_\_hi, \_\_default, \_\_to).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

**Returns**

`__hi`.

**scan\_is()**

```
const char_type * std::__ctype_abstract_base< wchar_t >::scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline]
```

Find char\_type matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char\_type>::do\_scan\_is().

**Parameters**

<a href="#"></a> <code>__m</code>	The mask to compare against.
<a href="#"></a> <code>__lo</code>	Pointer to start of range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.

**Returns**

Pointer to matching `char_type` if found, else `__hi`.

**scan\_not()**

```
const char_type * std::__ctype_abstract_base< wchar_t >::scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline]
```

Find `char_type` not matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is false. It does so by returning `ctype<char_type>::do_scan_not()`.

**Parameters**

<a href="#"></a> <code>__m</code>	The mask to compare against.
<a href="#"></a> <code>__lo</code>	Pointer to first char in range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.

**Returns**

Pointer to non-matching char if found, else `__hi`.

**tolower() [1/2]**

```
const char_type * std::__ctype_abstract_base< wchar_t >::tolower (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo,__hi)`.

**Parameters**

<a href="#"></a> <code>__lo</code>	Pointer to start of range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.**tolower()** [2/2]

```
char_type std::__ctype_abstract_base< wchar_t >::tolower (
    char_type __c) const [inline]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_tolower(c)`.

## Parameters

<code>__c</code>	The char_type to convert.
------------------	---------------------------

## Returns

The lowercase char\_type if convertible, else `__c`.**toupper()** [1/2]

```
const char_type * std::__ctype_abstract_base< wchar_t >::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.**toupper()** [2/2]

```
char_type std::__ctype_abstract_base< wchar_t >::toupper (
    char_type __c) const [inline]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

## Parameters

<code>__c</code>	The char_type to convert.
------------------	---------------------------

**Returns**

The uppercase `char_type` if convertible, else `__c`.

**widen()** [1/2]

```
char_type std::__ctype_abstract_base< wchar_t >::widen (
    char __c) const [inline]
```

Widen `char` to `char_type`.

This function converts the `char` argument to `char_type` using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

<code>__c</code>	The char to convert.
------------------	----------------------

**Returns**

The converted `char_type`.

**widen()** [2/2]

```
const char * std::__ctype_abstract_base< wchar_t >::widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline]
```

Widen array to `char_type`.

This function converts each `char` in the input to `char_type` using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

**Returns**

`__hi`.

**6.357.5 Member Data Documentation****id**

```
locale::id std::ctype< wchar_t >::id [static]
```

The facet id for `ctype<wchar_t>`

#### 6.359.1 Detailed Description

```
template<typename _CharT>
class std::ctype_byname<_CharT>
```

class ctype\_byname [22.2.1.2].

## 6.359.2 Member Function Documentation

### do\_is() [1/2]

```
template<typename _CharT>
virtual const char_type * std::ctype< _CharT >::do_is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [protected], [virtual], [inherited]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

#### Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#).

### do\_is() [2/2]

```
template<typename _CharT>
virtual bool std::ctype< _CharT >::do_is (
    mask __m,
    char_type __c) const [protected], [virtual], [inherited]
```

Test char\_type classification.

This function finds a mask M for c and compares it to mask m.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

#### Parameters

<code>__c</code>	The char_type to find the mask of.
<code>__m</code>	The mask to compare against.

#### Returns

$(M \& \_m) \neq 0$ .

Implements [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#).

### do\_narrow() [1/2]

```
template<typename _CharT>
virtual char std::ctype< _CharT >::do_narrow (
```

```
char_type __c,
char __default) const [protected], [virtual], [inherited]
```

Narrow char\_type to char.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, `__default` is returned instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

<code>__c</code>	The char_type to convert.
<code>__default</code>	Char to return if conversion fails.

#### Returns

The converted char.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by [std::ctype<char>::narrow\(\)](#), and [std::ctype<char>::narrow\(\)](#).

#### do\_narrow() [2/2]

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [protected], [virtual], [inherited]
```

Narrow char\_type array to char.

This virtual function converts each char\_type in the range `[__lo,__hi)` to char using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__default` is used instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

#### do\_scan\_is()

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_scan_is (
```

```

mask __m,
const char_type * __lo,
const char_type * __hi) const [protected], [virtual], [inherited]

```

Find char\_type matching mask.

This function searches for and returns the first char\_type c in [`__lo`,`__hi`) for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

#### Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

#### Returns

Pointer to a matching char\_type if found, else `__hi`.

Implements `std::__ctype_abstract_base<_CharT>`.

#### `do_scan_not()`

```

template<typename _CharT>
virtual const char_type * std::__ctype<_CharT>::do_scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual], [inherited]

```

Find char\_type not matching mask.

This function searches for and returns a pointer to the first char\_type c of [`lo`,`hi`) for which `is(m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

#### Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

#### Returns

Pointer to a non-matching char\_type if found, else `__hi`.

Implements `std::__ctype_abstract_base<_CharT>`.

#### `do_tolower()` [1/2]

```

template<typename _CharT>
virtual const char_type * std::__ctype<_CharT>::do_tolower (

```

```
char_type * __lo,
const char_type * __hi) const [protected], [virtual], [inherited]
```

Convert array to lowercase.

This virtual function converts each char\_type in the range [\_\_lo,\_\_hi) to lowercase if possible. Other elements remain untouched.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

#### Parameters

 <code>__lo</code>	Pointer to start of range.
 <code>__hi</code>	Pointer to end of range.

#### Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

#### do\_tolower() [2/2]

```
template<typename _CharT>
virtual char_type std::ctype<_CharT>::do_tolower (
    char_type __c) const [protected], [virtual], [inherited]
```

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

#### Parameters

 <code>__c</code>	The char_type to convert.
------------------------------------------------------------------------------------------------------	---------------------------

#### Returns

The lowercase char\_type if convertible, else \_\_c.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by [std::ctype<char>::tolower\(\)](#), and [std::ctype<char>::tolower\(\)](#).

#### do\_toupper() [1/2]

```
template<typename _CharT>
virtual const char_type * std::ctype<_CharT>::do_toupper (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual], [inherited]
```

Convert array to uppercase.

This virtual function converts each char\_type in the range [\_\_lo,\_\_hi) to uppercase if possible. Other elements remain untouched.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

**Parameters**

<a href="#"></a> <code>_lo</code>	Pointer to start of range.
<a href="#"></a> <code>_hi</code>	Pointer to end of range.

**Returns**

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**do\_toupper()** [2/2]

```
template<typename _CharT>
virtual char\_type std::ctype<_CharT>::do_toupper (
    char\_type __c) const [protected], [virtual], [inherited]
```

Convert to uppercase.

This virtual function converts the `char_type` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

**Parameters**

<a href="#"></a> <code>_c</code>	The <code>char_type</code> to convert.
-----------------------------------------------------------------------------------------------------------------------	----------------------------------------

**Returns**

The uppercase `char_type` if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by [std::ctype<char>::toupper\(\)](#), and [std::ctype<char>::toupper\(\)](#).

**do\_widen()** [1/2]

```
template<typename _CharT>
virtual char\_type std::ctype<_CharT>::do_widen (
    char __c) const [protected], [virtual], [inherited]
```

Widen `char`.

This virtual function converts the `char` to `char_type` using the simplest reasonable transformation.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

<a href="#"></a> <code>_c</code>	The <code>char</code> to convert.
------------------------------------------------------------------------------------------------------------------------	-----------------------------------

**Returns**

The converted `char_type`

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by [std::ctype<char>::widen\(\)](#), and [std::ctype<char>::widen\(\)](#).

**do\_widen()** [2/2]

```
template<typename _CharT>
virtual const char * std::ctype<_CharT>::do_widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [protected], [virtual], [inherited]
```

Widen char array.

This function converts each char in the input to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<a href="#"><code>__lo</code></a>	Pointer to start range.
<a href="#"><code>__hi</code></a>	Pointer to end of range.
<a href="#"><code>__to</code></a>	Pointer to the destination array.

**Returns**

[`\_\_hi`](#).

Implements [`std::\_\_ctype\_abstract\_base<\_CharT>`](#).

**is()** [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [inline], [inherited]
```

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char\_type>::do\_is().

**Parameters**

<a href="#"><code>__lo</code></a>	Pointer to start of range.
<a href="#"><code>__hi</code></a>	Pointer to end of range.
<a href="#"><code>__vec</code></a>	Pointer to an array of mask storage.

**Returns**

[`\_\_hi`](#).

**is()** [2/2]

```
template<typename _CharT>
bool std::__ctype_abstract_base<_CharT>::is (
```

```
mask __m,
char_type __c) const [inline], [inherited]
```

Test char\_type classification.

This function finds a mask M for \_\_c and compares it to mask \_\_m. It does so by returning the value of ctype<char\_↔type>::do\_is().

#### Parameters

<a href="#">↔</a> __c	The char_type to compare the mask of.
<a href="#">↔</a> __m	The mask to compare against.

#### Returns

(M & \_\_m) != 0.

Referenced by [std::time\\_get<\\_CharT, \\_InIter >::get\(\)](#).

#### narrow() [1/2]

```
template<typename _CharT>
char std::__ctype_abstract_base<_CharT >::narrow (
    char_type __c,
    char __default) const [inline], [inherited]
```

Narrow char\_type to char.

This function converts the char\_type to char using the simplest reasonable transformation. If the conversion fails, default is returned instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_c).

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

__c	The char_type to convert.
__default	Char to return if conversion fails.

#### Returns

The converted char.

Referenced by [std::time\\_get<\\_CharT, \\_InIter >::do\\_get\\_year\(\)](#), [std::time\\_get<\\_CharT, \\_InIter >::get\(\)](#), and [std::time\\_put<\\_CharT, \\_OutIter >::put\(\)](#).

#### narrow() [2/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT >::narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline], [inherited]
```

Narrow array to char array.

This function converts each char\_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char\_type in the input that cannot be converted, default is used instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_lo, \_\_hi, \_\_default, \_\_to).

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

## Returns

`__hi`.

**scan\_is()**

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Find char\_type matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char\_type>::do\_scan\_is().

## Parameters

<code>↔ __m</code>	The mask to compare against.
<code>↔ __lo</code>	Pointer to start of range.
<code>↔ __hi</code>	Pointer to end of range.

## Returns

Pointer to matching char\_type if found, else `__hi`.

**scan\_not()**

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Find char\_type not matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char\_type>::do\_scan\_not().

## Parameters

<code>↔ __m</code>	The mask to compare against.
<code>↔ __lo</code>	Pointer to first char in range.

<a href="#"></a> <a href="#"><u>__hi</u></a>	Pointer to end of range.
----------------------------------------------------------------------------------------------------------------------------------	--------------------------

#### Returns

Pointer to non-matching char if found, else `__hi`.

#### `tolower()` [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::tolower (
    char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo, __hi)`.

#### Parameters

<a href="#"></a> <a href="#"><u>__lo</u></a>	Pointer to start of range.
<a href="#"></a> <a href="#"><u>__hi</u></a>	Pointer to end of range.

#### Returns

`__hi`.

#### `tolower()` [2/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::tolower (
    char_type __c) const [inline], [inherited]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_tolower(c)`.

#### Parameters

<a href="#"></a> <a href="#"><u>__c</u></a>	The <code>char_type</code> to convert.
-----------------------------------------------------------------------------------------------------------------------------------	----------------------------------------

#### Returns

The lowercase `char_type` if convertible, else `__c`.

Referenced by `std::time_get< _CharT, _InIter >::get()`.

**toupper()** [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base<_CharT>::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_toupper(lo, hi).

**Parameters**

 __lo	Pointer to start of range.
 __hi	Pointer to end of range.

**Returns**

\_\_hi.

**toupper()** [2/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base<_CharT>::toupper (
    char_type __c) const [inline], [inherited]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char\_type>::do\_toupper(c).

**Parameters**

 __c	The char_type to convert.
--------------------------------------------------------------------------------------------	---------------------------

**Returns**

The uppercase char\_type if convertible, else \_\_c.

Referenced by [std::time\\_get<\\_CharT, \\_InIter>::get\(\)](#).

**widen()** [1/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base<_CharT>::widen (
    char __c) const [inline], [inherited]
```

Widen char to char\_type.

This function converts the char argument to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<a href="#"><code>_↔</code></a>	The char to convert.
<a href="#"><code>_c</code></a>	

**Returns**

The converted `char_type`.

Referenced by [std::money\\_get<\\_CharT, \\_Inlter >::do\\_get\(\)](#), [std::time\\_get<\\_CharT, \\_Inlter >::do\\_get\(\)](#), [std::money\\_put<\\_CharT, \\_Outlter >::do\\_put\(\)](#) and [std::time\\_put<\\_CharT, \\_Outlter >::do\\_put\(\)](#).

**widen()** [2/2]

```
template<typename _CharT>
const char * std::\_\_ctype\_abstract\_base<\_CharT >::widen (
    const char * __lo,
    const char * __hi,
    char\_type * __to) const [inline], [inherited]
```

Widen array to `char_type`.

This function converts each char in the input to `char_type` using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecv`t for that.

**Parameters**

<a href="#"><code>_↔</code></a> <a href="#"><code>_lo</code></a>	Pointer to start of range.
<a href="#"><code>_↔</code></a> <a href="#"><code>_hi</code></a>	Pointer to end of range.
<a href="#"><code>_↔</code></a> <a href="#"><code>_to</code></a>	Pointer to the destination array.

**Returns**

[`\_\_hi`](#).

**6.359.3 Member Data Documentation****id**

```
template<typename _CharT>
locale::id std::ctype<\_CharT >::id [static], [inherited]
```

The facet id for `ctype<char_type>`

The documentation for this class was generated from the following file:

- [locale\\_facets.h](#)

**6.360 std::ctype\_byname< char > Class Reference**

## 6.360.1 Detailed Description

22.2.1.4 Class `ctype_byname` specializations.

## 6.360.2 Member Function Documentation

### `classic_table()`

```
const mask * std::ctype< char >::classic_table () throw ( )    [static], [inherited]
```

Returns a pointer to the C locale mask table.

### `do_is()` [1/3]

```
virtual bool std::ctype< char >::do_is (
    mask __m,
    char_type __c) const    [protected], [virtual], [inherited]
```

Test `char_type` classification.

This function finds a mask `M` for `c` and compares it to mask `m`.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

### Parameters

<code>__c</code>	The <code>char_type</code> to find the mask of.
------------------	-------------------------------------------------

<code>__m</code>	The mask to compare against.
------------------	------------------------------

**Returns**

$(M \& \text{__m}) \neq 0$ .

**do\_is()** [2/3]

```
virtual const char_type * std::ctype< char >::do_is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [protected], [virtual]
```

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the input.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

**Returns**

`__hi`.

**do\_is()** [3/3]

```
virtual bool std::ctype< char >::do_is (
    mask __m,
    char_type __c) const [protected], [virtual]
```

Test `char_type` classification.

This function finds a mask `M` for `c` and compares it to mask `m`.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

**Parameters**

<code>__c</code>	The <code>char_type</code> to find the mask of.
<code>__m</code>	The mask to compare against.

**Returns**

$(M \& \text{__m}) \neq 0$ .

**do\_narrow()** [1/4]

```
virtual char std::ctype< char >::do_narrow (
    char_type __c,
    char __dfault) const [inline], [protected], [virtual], [inherited]
```

Narrow char.

This virtual function converts the char to char using the simplest reasonable transformation. If the conversion fails, *dfault* is returned instead. For an underived ctype<char> facet, *c* will be returned unchanged.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<code>__c</code>	The char to convert.
<code>__dfault</code>	Char to return if conversion fails.

**Returns**

The converted char.

**do\_narrow()** [2/4]

```
virtual const char_type * std::ctype< char >::do_narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __dfault,
    char * __to) const [inline], [protected], [virtual], [inherited]
```

Narrow char array to char array.

This virtual function converts each char in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an underived ctype<char> facet, the argument will be copied unchanged.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

**Returns**

`__hi`.

**do\_narrow()** [3/4]

```
virtual char std::ctype< char >::do_narrow (
    char_type ,
    char __dfault) const [protected], [virtual]
```

Narrow `char_type` to `char`.

This virtual function converts the argument to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

<code>__c</code>	The <code>char_type</code> to convert.
<code>__dfault</code>	Char to return if conversion fails.

#### Returns

The converted `char`.

### `do_narrow()` [4/4]

```
virtual const char_type * std::ctype< char >::do_narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __dfault,
    char * __to) const [protected], [virtual]
```

Narrow `char_type` array to `char`.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to `char` using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__dfault` is used instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

### `do_scan_is()` [1/2]

```
virtual const char_type * std::ctype< char >::do_scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual], [inherited]
```

Find `char_type` matching mask.

This function searches for and returns the first `char_type` `c` in `[__lo,__hi)` for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

## Parameters

 <code>__m</code>	The mask to compare against.
 <code>__lo</code>	Pointer to start of range.
 <code>__hi</code>	Pointer to end of range.

## Returns

Pointer to a matching `char_type` if found, else `__hi`.

**do\_scan\_is()** [2/2]

```
virtual const char_type * std::ctype< char >::do_scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Find `char_type` matching mask.

This function searches for and returns the first `char_type` `c` in `[__lo,__hi)` for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

## Parameters

 <code>__m</code>	The mask to compare against.
 <code>__lo</code>	Pointer to start of range.
 <code>__hi</code>	Pointer to end of range.

## Returns

Pointer to a matching `char_type` if found, else `__hi`.

**do\_scan\_not()** [1/2]

```
virtual const char_type * std::ctype< char >::do_scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual], [inherited]
```

Find `char_type` not matching mask.

This function searches for and returns a pointer to the first `char_type` `c` of `[lo,hi)` for which `is(m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

## Parameters

 <code>__m</code>	The mask to compare against.
------------------------------------------------------------------------------------------------------	------------------------------

## Parameters

<a href="#"></a> <code>__lo</code>	Pointer to start of range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.

## Returns

Pointer to a non-matching `char_type` if found, else `__hi`.

**do\_scan\_not()** [2/2]

```
virtual const char_type * std::ctype< char >::do_scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Find `char_type` not matching mask.

This function searches for and returns a pointer to the first `char_type` `c` of `[lo,hi)` for which `is(m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

## Parameters

<a href="#"></a> <code>__m</code>	The mask to compare against.
<a href="#"></a> <code>__lo</code>	Pointer to start of range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.

## Returns

Pointer to a non-matching `char_type` if found, else `__hi`.

**do\_tolower()** [1/4]

```
virtual const char_type * std::ctype< char >::do_tolower (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual], [inherited]
```

Convert array to lowercase.

This virtual function converts each char in the range `[lo,hi)` to lowercase if possible. Other chars remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

## Parameters

<a href="#"></a> <code>__lo</code>	Pointer to first char in range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.References [do\\_tolower\(\)](#).**do\_tolower()** [2/4]

```
virtual char_type std::ctype< char >::do_tolower (
    char_type __c) const [protected], [virtual], [inherited]
```

Convert to lowercase.

This virtual function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

## Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

## Returns

The lowercase char if convertible, else `__c`.References [do\\_tolower\(\)](#).Referenced by [do\\_tolower\(\)](#), and [do\\_tolower\(\)](#).**do\_tolower()** [3/4]

```
virtual const char_type * std::ctype< char >::do_tolower (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Convert array to lowercase.

This virtual function converts each char\_type in the range [`__lo`,`__hi`) to lowercase if possible. Other elements remain untouched.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.**do\_tolower()** [4/4]

```
virtual char_type std::ctype< char >::do_tolower (
    char_type __c) const [protected], [virtual]
```

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

#### Parameters

$\leftrightarrow$ __c	The char_type to convert.
--------------------------	---------------------------

#### Returns

The lowercase char\_type if convertible, else \_\_c.

### **do\_toupper()** [1/4]

```
virtual const char_type * std::ctype< char >::do_toupper (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual], [inherited]
```

Convert array to uppercase.

This virtual function converts each char in the range [lo,hi) to uppercase if possible. Other chars remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

#### Parameters

$\leftrightarrow$ __lo	Pointer to start of range.
$\leftrightarrow$ __hi	Pointer to end of range.

#### Returns

\_\_hi.

References [do\\_toupper\(\)](#).

### **do\_toupper()** [2/4]

```
virtual char_type std::ctype< char >::do_toupper (
    char_type __c) const [protected], [virtual], [inherited]
```

Convert to uppercase.

This virtual function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

#### Parameters

$\leftrightarrow$ __c	The char to convert.
--------------------------	----------------------

#### Returns

The uppercase char if convertible, else \_\_c.

References [do\\_toupper\(\)](#).

Referenced by [do\\_toupper\(\)](#), and [do\\_toupper\(\)](#).

**do\_toupper()** [3/4]

```
virtual const char_type * std::ctype< char >::do_toupper (
    char_type * __lo,
    const char_type * __hi) const [protected], [virtual]
```

Convert array to uppercase.

This virtual function converts each char\_type in the range [\_\_lo,\_\_hi) to uppercase if possible. Other elements remain untouched.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

**Parameters**

 __lo	Pointer to start of range.
 __hi	Pointer to end of range.

**Returns**

\_\_hi.

**do\_toupper()** [4/4]

```
virtual char_type std::ctype< char >::do_toupper (
    char_type __c) const [protected], [virtual]
```

Convert to uppercase.

This virtual function converts the char\_type argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

**Parameters**

 __c	The char_type to convert.
--------------------------------------------------------------------------------------------	---------------------------

**Returns**

The uppercase char\_type if convertible, else \_\_c.

**do\_widen()** [1/3]

```
virtual const char * std::ctype< char >::do_widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline], [protected], [virtual], [inherited]
```

Widen char array.

This function converts each char in the range [lo,hi) to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be copied unchanged.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<a href="#"></a> <code>__lo</code>	Pointer to start of range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.
<a href="#"></a> <code>__to</code>	Pointer to the destination array.

**Returns**

`__hi`.

**do\_widen() [2/3]**

```
virtual char_type std::ctype< char >::do_widen (  
    char __c) const    [protected], [virtual]
```

Widen char.

This virtual function converts the char to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<a href="#"></a> <code>__c</code>	The char to convert.
------------------------------------------------------------------------------------------------------------------------	----------------------

**Returns**

The converted char\_type

**do\_widen() [3/3]**

```
virtual const char * std::ctype< char >::do_widen (  
    const char * __lo,  
    const char * __hi,  
    char_type * __dest) const    [protected], [virtual]
```

Widen char array.

This function converts each char in the input to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<a href="#"></a> <code>__lo</code>	Pointer to start range.
<a href="#"></a> <code>__hi</code>	Pointer to end of range.
<a href="#"></a> <code>__to</code>	Pointer to the destination array.

## Returns

`__hi.`**is()** [1/4]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [inline], [inherited]
```

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the char array. It does so by returning the value of `ctype<char_type>::do_is()`.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

## Returns

`__hi.`**is()** [2/4]

```
template<typename _CharT>
bool std::__ctype_abstract_base< _CharT >::is (
    mask __m,
    char_type __c) const [inline], [inherited]
```

Test `char_type` classification.

This function finds a mask `M` for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_↵type>::do_is()`.

## Parameters

<code>_↵c</code>	The <code>char_type</code> to compare the mask of.
<code>_↵m</code>	The mask to compare against.

## Returns

`(M & __m) != 0.`

Referenced by `std::time_get< _CharT, _InIter >::get()`.

**is()** [3/4]

```
const char_type * std::__ctype_abstract_base< char >::is (
    const char_type * __lo,
    const char_type * __hi,
    mask * __vec) const [inline]
```

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the char array. It does so by returning the value of `ctype<char_type>::do_is()`.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

#### Returns

`__hi`.

#### `is()` [4/4]

```
bool std::__ctype_abstract_base< char >::is (
    mask __m,
    char_type __c) const [inline]
```

Test `char_type` classification.

This function finds a mask `M` for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_↵type>::do_is()`.

#### Parameters

<code>_↵c</code>	The <code>char_type</code> to compare the mask of.
<code>_↵m</code>	The mask to compare against.

#### Returns

`(M & __m) != 0`.

#### `narrow()` [1/4]

```
template<typename _CharT>
char std::__ctype_abstract_base< _CharT >::narrow (
    char_type __c,
    char __dfault) const [inline], [inherited]
```

Narrow `char_type` to `char`.

This function converts the `char_type` to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead. It does so by returning `ctype<char_type>::do_narrow(__c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

<code>__c</code>	The <code>char_type</code> to convert.
<code>__dfault</code>	Char to return if conversion fails.

#### Returns

The converted `char`.

Referenced by `std::time_get< _CharT, _InIter >::do_get_year()`, `std::time_get< _CharT, _InIter >::get()`, and `std::time_put< _CharT, _OutIter >::put()`.

**narrow()** [2/4]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline], [inherited]
```

Narrow array to char array.

This function converts each char\_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char\_type in the input that cannot be converted, *default* is used instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_lo, \_\_hi, \_\_default, \_\_to).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

**Returns**

`__hi`.

**narrow()** [3/4]

```
char std::__ctype_abstract_base< char >::narrow (
    char_type __c,
    char __default) const [inline]
```

Narrow char\_type to char.

This function converts the char\_type to char using the simplest reasonable transformation. If the conversion fails, *default* is returned instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_c).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<code>__c</code>	The char_type to convert.
<code>__default</code>	Char to return if conversion fails.

**Returns**

The converted char.

**narrow()** [4/4]

```
const char_type * std::__ctype_abstract_base< char >::narrow (
    const char_type * __lo,
    const char_type * __hi,
    char __default,
    char * __to) const [inline]
```

Narrow array to char array.

This function converts each `char_type` in the input to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `char_type` in the input that cannot be converted, *default* is used instead. It does so by returning `ctype<char_type>::do_narrow(__lo, __hi, __default, __to)`.

Note: this is not what you want for codepage conversions. See `codecv` for that.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

#### `scan_is()` [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Find `char_type` matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is true. It does so by returning `ctype<char_type>::do_scan_is()`.

#### Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

#### Returns

Pointer to matching `char_type` if found, else `__hi`.

#### `scan_is()` [2/2]

```
const char_type * std::__ctype_abstract_base< char >::scan_is (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline]
```

Find `char_type` matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is true. It does so by returning `ctype<char_type>::do_scan_is()`.

## Parameters

 <code>__m</code>	The mask to compare against.
 <code>__lo</code>	Pointer to start of range.
 <code>__hi</code>	Pointer to end of range.

## Returns

Pointer to matching char\_type if found, else `__hi`.

**scan\_not()** [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Find char\_type not matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char\_type>::do\_scan\_not().

## Parameters

 <code>__m</code>	The mask to compare against.
 <code>__lo</code>	Pointer to first char in range.
 <code>__hi</code>	Pointer to end of range.

## Returns

Pointer to non-matching char if found, else `__hi`.

**scan\_not()** [2/2]

```
const char_type * std::__ctype_abstract_base< char >::scan_not (
    mask __m,
    const char_type * __lo,
    const char_type * __hi) const [inline]
```

Find char\_type not matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char\_type>::do\_scan\_not().

## Parameters

 <code>__m</code>	The mask to compare against.
 <code>__lo</code>	Pointer to first char in range.

<code>__↔ __hi</code>	Pointer to end of range.
---------------------------	--------------------------

**Returns**

Pointer to non-matching char if found, else `__hi`.

**table()**

```
const mask * std::ctype< char >::table () const throw ( )    [inline], [inherited]
```

Returns a pointer to the mask table provided to the constructor, or the default from `classic_table()` if none was provided.

**tolower() [1/4]**

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::tolower (
    char_type * __lo,
    const char_type * __hi) const    [inline], [inherited]
```

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo, __hi)`.

**Parameters**

<code>__↔ __lo</code>	Pointer to start of range.
<code>__↔ __hi</code>	Pointer to end of range.

**Returns**

`__hi`.

**tolower() [2/4]**

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::tolower (
    char_type __c) const    [inline], [inherited]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_tolower(c)`.

**Parameters**

<code>__↔ __c</code>	The <code>char_type</code> to convert.
--------------------------	----------------------------------------

**Returns**

The lowercase `char_type` if convertible, else `__c`.

Referenced by `std::time_get< _CharT, _InIter >::get()`.

**tolower()** [3/4]

```
const char_type * std::__ctype_abstract_base< char >::tolower (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to lowercase.

This function converts each char\_type in the range [\_\_lo,\_\_hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_tolower(\_\_lo, \_\_hi).

**Parameters**

 __lo	Pointer to start of range.
 __hi	Pointer to end of range.

**Returns**

\_\_hi.

**tolower()** [4/4]

```
char_type std::__ctype_abstract_base< char >::tolower (
    char_type __c) const [inline]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char\_type>::do\_tolower(c).

**Parameters**

 __c	The char_type to convert.
--------------------------------------------------------------------------------------------	---------------------------

**Returns**

The lowercase char\_type if convertible, else \_\_c.

**toupper()** [1/4]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline], [inherited]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char\_type>::do\_toupper(lo, hi).

**Parameters**

 __lo	Pointer to start of range.
 __hi	Pointer to end of range.

**Returns**

`__hi`.

**toupper() [2/4]**

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::toupper (
    char_type __c) const [inline], [inherited]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

**Parameters**

<code>__c</code>	The char_type to convert.
------------------	---------------------------

**Returns**

The uppercase char\_type if convertible, else `__c`.

Referenced by `std::time_get< _CharT, _InIter >::get()`.

**toupper() [3/4]**

```
const char_type * std::__ctype_abstract_base< char >::toupper (
    char_type * __lo,
    const char_type * __hi) const [inline]
```

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

**Returns**

`__hi`.

**toupper() [4/4]**

```
char_type std::__ctype_abstract_base< char >::toupper (
    char_type __c) const [inline]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

## Parameters

$\leftrightarrow$ _c	The char_type to convert.
-------------------------	---------------------------

## Returns

The uppercase char\_type if convertible, else \_\_c.

**widen()** [1/3]

```
template<typename _CharT>
const char * std::__ctype_abstract_base< _CharT >::widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline], [inherited]
```

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

$\leftrightarrow$ _lo	Pointer to start of range.
$\leftrightarrow$ _hi	Pointer to end of range.
$\leftrightarrow$ _to	Pointer to the destination array.

## Returns

\_\_hi.

**widen()** [2/3]

```
char_type std::__ctype_abstract_base< char >::widen (
    char __c) const [inline]
```

Widen char to char\_type.

This function converts the char argument to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

$\leftrightarrow$ _c	The char to convert.
-------------------------	----------------------

## Returns

The converted char\_type.

**widen()** [3/3]

```
const char * std::__ctype_abstract_base< char >::widen (
    const char * __lo,
    const char * __hi,
    char_type * __to) const [inline]
```

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning ctype<char\_type>::do\_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

**Parameters**

<a href="#"> <code>__lo</code></a>	Pointer to start of range.
<a href="#"> <code>__hi</code></a>	Pointer to end of range.
<a href="#"> <code>__to</code></a>	Pointer to the destination array.

**Returns**

`__hi`.

**6.360.3 Member Data Documentation****id**

```
locale::id std::ctype< char >::id [static]
```

The facet id for ctype<char\_type>

**table\_size**

```
const size_t std::ctype< char >::table_size [static], [inherited]
```

The size of the mask table. It is SCHAR\_MAX + 1.

The documentation for this class was generated from the following file:

- [locale\\_facets.h](#)

### 6.366.1 Detailed Description

3.2.3 Class decimal64.

### 6.366.2 Constructor & Destructor Documentation

#### decimal64()

```
std::decimal::decimal64::decimal64 (
    __decfloat64 __z) [inline]
```

Conforming extension: Conversion from scalar decimal type.

The documentation for this class was generated from the following file:

- [decimal](#)

## 6.367 simd\_abi::deduce< \_Tp, \_Np,... > Struct Template Reference

```
#include <simd.h>
```

### 6.367.1 Detailed Description

```
template<typename _Tp, size_t _Np, typename...>
struct simd_abi::deduce< _Tp, _Np,... >
```

## Template Parameters

<code>_Tp</code>	The requested <code>value_type</code> for the elements.
<code>_Np</code>	The requested number of elements.
<code>_Abis</code>	This parameter is ignored, since this implementation cannot make any use of it. Either <code>__a</code> a good native ABI is matched and used as <code>type</code> alias, or the <code>fixed_size&lt;_Np&gt;</code> ABI is used, which internally is built from the best matching native ABIs.

The documentation for this struct was generated from the following file:

- `simd.h`

**6.368 `__gnu_pbds::detail::default_comb_hash_fn` Struct Reference**

```
#include <standard_policies.hpp>
```

**Public Types**

- typedef [direct\\_mask\\_range\\_hashing](#) type

**6.368.1 Detailed Description**

Primary template, `default_comb_hash_fn`.

**6.368.2 Member Typedef Documentation****type**

```
typedef direct\_mask\_range\_hashing __gnu_pbds::detail::default_comb_hash_fn::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

**6.369 `std::default_delete<_Tp>` Struct Template Reference**

```
#include <memory>
```

**Public Member Functions**

- constexpr [default\\_delete](#) () noexcept=default
- template<typename `_Up`, typename = `_Require<is_convertible<_Up*,_Tp*>>>`  
constexpr [default\\_delete](#) (const [default\\_delete](#)< `_Up` > &) noexcept
- constexpr void [operator\(\)](#) (`_Tp` \*`__ptr`) const

**6.369.1 Detailed Description**

```
template<typename _Tp>
struct std::default_delete< _Tp >
```

Primary template of `default_delete`, used by `unique_ptr` for single objects

Since

C++11

### 6.369.2 Constructor & Destructor Documentation

#### default\_delete() [1/2]

```
template<typename _Tp>
std::default_delete< _Tp >::default_delete () [constexpr], [default], [noexcept]
```

Default constructor.

Referenced by [default\\_delete\(\)](#).

#### default\_delete() [2/2]

```
template<typename _Tp>
template<typename _Up, typename = _Require<is_convertible<_Up*, _Tp*>>>
std::default_delete< _Tp >::default_delete (
    const default_delete< _Up > & ) [inline], [constexpr], [noexcept]
```

Converting constructor.

Allows conversion from a deleter for objects of another type, `_Up`, only if `_Up*` is convertible to `_Tp*`.

References [default\\_delete\(\)](#).

### 6.369.3 Member Function Documentation

#### operator>()()

```
template<typename _Tp>
void std::default_delete< _Tp >::operator() (
    _Tp * __ptr) const [inline], [constexpr]
```

Calls `delete __ptr`

The documentation for this struct was generated from the following file:

- [unique\\_ptr.h](#)

### 6.370 std::default\_delete< \_Tp[]> Struct Template Reference

```
#include <memory>
```

#### Public Member Functions

- constexpr [default\\_delete](#) () noexcept=default
- template<typename \_Up, typename = \_Require<is\_convertible<\_Up(\*)[], \_Tp(\*)[]>>> constexpr [default\\_delete](#) (const [default\\_delete](#)< \_Up[]> &) noexcept
- template<typename \_Up> constexpr [enable\\_if](#)< is\_convertible< \_Up(\*)[], \_Tp(\*)[]>::value >::type [operator](#)() (\_Up \* \_\_ptr) const

#### 6.370.1 Detailed Description

```
template<typename _Tp>
struct std::default_delete< _Tp[]>
```

Specialization of `default_delete` for arrays, used by `unique_ptr<T[]>`

Since

C++11

### 6.370.2 Constructor & Destructor Documentation

#### default\_delete() [1/2]

```
template<typename _Tp>
std::default_delete< _Tp[]>::default_delete () [constexpr], [default], [noexcept]
```

Default constructor.  
Referenced by [default\\_delete\(\)](#).

#### default\_delete() [2/2]

```
template<typename _Tp>
template<typename _Up, typename = _Require<is_convertible<_Up(*)[], _Tp(*)[]>>>
std::default_delete< _Tp[]>::default_delete (
    const default_delete< _Up[]> & ) [inline], [constexpr], [noexcept]
```

Converting constructor.

Allows conversion from a deleter for arrays of another type, such as a const-qualified version of `_Tp`.

Conversions from types derived from `_Tp` are not allowed because it is undefined to `delete[]` an array of derived types through a pointer to the base type.

References [default\\_delete\(\)](#).

### 6.370.3 Member Function Documentation

#### operator>()()

```
template<typename _Tp>
template<typename _Up>
enable_if< is_convertible< _Up(*)[], _Tp(*)[]>::value >::type std::default_delete< _Tp[]>↵
::operator() (
    _Up * __ptr) const [inline], [constexpr]
```

Calls `delete[] __ptr`

The documentation for this struct was generated from the following file:

- [unique\\_ptr.h](#)

## 6.371 \_\_gnu\_pbds::detail::default\_eq\_fn< Key > Struct Template Reference

```
#include <standard_policies.hpp>
```

### Public Types

- typedef [std::equal\\_to< Key > type](#)

### 6.371.1 Detailed Description

```
template<typename Key>
struct __gnu_pbds::detail::default_eq_fn< Key >
```

Primary template, `default_eq_fn`.

### 6.371.2 Member Typedef Documentation

#### type

```
template<typename Key>
typedef std::equal_to<Key> __gnu_pbds::detail::default_eq_fn< Key >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

## 6.372 \_\_gnu\_pbds::detail::default\_hash\_fn< Key > Struct Template Reference

```
#include <standard_policies.hpp>
```

### Public Types

- typedef std::tr1::hash< Key > [type](#)

### 6.372.1 Detailed Description

```
template<typename Key>
struct __gnu_pbds::detail::default_hash_fn< Key >
```

Primary template, default\_hash\_fn.

### 6.372.2 Member Typedef Documentation

#### type

```
template<typename Key>
typedef std::tr1::hash<Key> __gnu_pbds::detail::default_hash_fn< Key >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

## 6.373 \_\_gnu\_parallel::default\_parallel\_tag Struct Reference

```
#include <tags.h>
```

Inheritance diagram for \_\_gnu\_parallel::default\_parallel\_tag:

### Public Member Functions

- `default_parallel_tag` ([\\_ThreadIndex](#) \_\_num\_threads)
- `_ThreadIndex` `__get_num_threads` ()
- void `set_num_threads` ([\\_ThreadIndex](#) \_\_num\_threads)

### 6.373.1 Detailed Description

Recommends parallel execution using the default parallel algorithm.

### 6.373.2 Member Function Documentation

#### `__get_num_threads()`

`__ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline], [inherited]`

Find out desired number of threads.

#### Returns

Desired number of threads.

Referenced by `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, and `__gnu_parallel::__parallel_sort()`.

#### `set_num_threads()`

`void __gnu_parallel::parallel_tag::set_num_threads (   
 __ThreadIndex __num_threads) [inline], [inherited]`

Set the desired number of threads.

#### Parameters

<code>__num_threads</code>	Desired number of threads.
----------------------------	----------------------------

The documentation for this struct was generated from the following file:

- [tags.h](#)

## 6.374 `__gnu_pbds::detail::default_probe_fn< Comb_Probe_Fn >` Struct Template Reference

```
#include <standard_policies.hpp>
```

### Public Types

- `typedef cond_type::__type type`

### 6.374.1 Detailed Description

```
template<typename Comb_Probe_Fn>
struct __gnu_pbds::detail::default_probe_fn< Comb_Probe_Fn >
```

Primary template, `default_probe_fn`.

### 6.374.2 Member Typedef Documentation

#### `type`

```
template<typename Comb_Probe_Fn>
typedef cond_type::__type __gnu_pbds::detail::default_probe_fn< Comb_Probe_Fn >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

### 6.375 `__gnu_pbds::detail::default_resize_policy< Comb_Hash_Fn >` Struct Template Reference

```
#include <standard_policies.hpp>
```

#### Public Types

- typedef `hash_standard_resize_policy< size_policy_type, trigger, false, size_type >` `type`

#### 6.375.1 Detailed Description

```
template<typename Comb_Hash_Fn>
struct __gnu_pbds::detail::default_resize_policy< Comb_Hash_Fn >
```

Primary template, default\_resize\_policy.

#### 6.375.2 Member Typedef Documentation

##### type

```
template<typename Comb_Hash_Fn>
typedef hash_standard_resize_policy<size_policy_type, trigger, false, size_type> __gnu_pbds::detail::default_res
Comb_Hash_Fn >::type
```

Dispatched type.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

### 6.376 `std::default_sentinel_t` Struct Reference

```
#include <iterator_concepts.h>
```

#### 6.376.1 Detailed Description

A sentinel type that can be used to check for the end of a range.

For some iterator types the past-the-end sentinel value is independent of the underlying sequence, and a default sentinel can be used with them. For example, a `std::counted_iterator` keeps a count of how many elements remain, and so checking for the past-the-end value only requires checking if that count has reached zero. A past-the-end `std::istream_iterator` is equal to the default-constructed value, which can be easily checked.

Comparing iterators of these types to `std::default_sentinel` is a convenient way to check if the end has been reached.

Since

C++20

The documentation for this struct was generated from the following file:

- [iterator\\_concepts.h](#)

### 6.377 `__gnu_pbds::detail::default_trie_access_traits< Key >` Struct Template Reference

#### 6.377.1 Detailed Description

```
template<typename Key>
struct __gnu_pbds::detail::default_trie_access_traits< Key >
```

Primary template, default\_trie\_access\_traits.

The documentation for this struct was generated from the following file:

- [standard\\_policies.hpp](#)

## 6.378 `__gnu_pbds::detail::default_trie_access_traits< std::basic_string< Char, Char_Traits, std::allocator< char > > >` Struct Template Reference

`#include <standard_policies.hpp>`

### Public Types

- typedef `trie_string_access_traits< string_type > type`

#### 6.378.1 Detailed Description

```
template<typename Char, typename Char_Traits>
struct __gnu_pbds::detail::default_trie_access_traits< std::basic_string< Char, Char_Traits, std::allocator<
char > > >
```

Partial specialization, `default_trie_access_traits`.

#### 6.378.2 Member Typedef Documentation

##### type

```
template<typename Char, typename Char_Traits>
typedef trie_string_access_traits<string_type> __gnu_pbds::detail::default_trie_access_traits<
std::basic_string< Char, Char_Traits, std::allocator< char > > >::type
Dispatched type.
```

The documentation for this struct was generated from the following file:

- `standard_policies.hpp`

## 6.379 `__gnu_pbds::detail::default_update_policy` Struct Reference

`#include <standard_policies.hpp>`

### Public Types

- typedef `lu_move_to_front_policy type`

#### 6.379.1 Detailed Description

Default update policy.

#### 6.379.2 Member Typedef Documentation

##### type

```
typedef lu_move_to_front_policy __gnu_pbds::detail::default_update_policy::type
Dispatched type.
```

The documentation for this struct was generated from the following file:

- `standard_policies.hpp`

## 6.380 `std::defer_lock_t` Struct Reference

`#include <std_mutex.h>`

### 6.380.1 Detailed Description

Do not acquire ownership of the mutex.

The documentation for this struct was generated from the following file:

- [std\\_mutex.h](#)

### 6.381 std::\_\_debug::deque< \_Tp, \_Allocator > Class Template Reference

```

#### 6.382.1 Detailed Description

```
template<typename \_Tp, typename \_Alloc = std::allocator<\_Tp>>
class std::deque<\_Tp, \_Alloc>
```

A standard container using fixed-size memory allocation and constant-time manipulation of elements at either end.

### Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#).

In previous HP/SGI versions of deque, there was an extra template parameter so users could control the node size. This extension turned out to violate the C++ standard (it can be detected using template template parameters), and it was removed.

Here's how a `deque<Tp>` manages memory. Each deque has 4 members:

- `Tp** _M_map`
- `size_t _M_map_size`
- `iterator _M_start, _M_finish`

`map_size` is at least 8. `map` is an array of `map_size` pointers-to-*nodes*. (The name `map` has nothing to do with the `std::map` class, and **nodes** should not be confused with `std::list`'s usage of *node*.)

A *node* has no specific type name as such, but it is referred to as *node* in this file. It is a simple array-of-`Tp`. If `Tp` is very large, there will be one `Tp` element per node (i.e., an *array* of one). For non-huge `Tp`'s, node size is inversely related to `Tp` size: the larger the `Tp`, the fewer `Tp`'s will fit in a node. The goal here is to keep the total size of a node relatively small and constant over different `Tp`'s, to improve allocator efficiency.

Not every pointer in the `map` array will point to a node. If the initial number of elements in the deque is small, the /middle/ `map` pointers will be valid, and the ones at the edges will be unused. This same situation will arise as the `map` grows: available `map` pointers, if any, will be on the ends. As new nodes are created, only a subset of the `map`'s pointers need to be copied *outward*.

Class invariants:

- For any nonsingular iterator `i`:
  - `i.node` points to a member of the `map` array. (Yes, you read that correctly: `i.node` does not actually point to a node.) The member of the `map` array is what actually points to the node.
  - `i.first == *(i.node)` (This points to the node (first `Tp` element).)
  - `i.last == i.first + node_size`
  - `i.cur` is a pointer in the range `[i.first, i.last)`. NOTE: the implication of this is that `i.cur` is always a dereferenceable pointer, even if `i` is a past-the-end iterator.
- `Start` and `Finish` are always nonsingular iterators. NOTE: this means that an empty deque must have one node, a deque with `<N` elements (where `N` is the node buffer size) must have one node, a deque with `N` through `(2N-1)` elements must have two nodes, etc.
- For every node other than `start.node` and `finish.node`, every element in the node is an initialized object. If `start.cur == finish.cur`, then `[start.cur, finish.cur)` are initialized objects, and the elements outside that range are uninitialized storage. Otherwise, `[start.cur, start.last)` and `[finish.first, finish.cur)` are initialized objects, and `[start.cur, start.first)` and `[finish.cur, finish.last)` are uninitialized storage.
- `[map, map + map_size)` is a valid, non-empty range.
- `[start.node, finish.node]` is a valid range contained within `[map, map + map_size)`.
- A pointer in the range `[map, map + map_size)` points to an allocated node if and only if the pointer is in the range `[start.node, finish.node]`.

Here's the magic: nothing in deque is **aware** of the discontinuous storage!

The memory setup and layout occurs in the parent, `_Base`, and the iterator class is entirely responsible for *leaping* from one node to the next. All the implementation routines for deque itself work only through the `start` and `finish` iterators. This keeps the routines simple and sane, and we can use other standard algorithms as well.

### 6.382.2 Constructor & Destructor Documentation

#### deque() [1/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque<_Tp, _Alloc >::deque () [default]
```

Creates a deque with no elements.

Referenced by [insert\(\)](#), and [operator=\(\)](#).

#### deque() [2/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque<_Tp, _Alloc >::deque (
    const allocator_type & __a) [inline], [explicit]
```

Creates a deque with no elements.

##### Parameters

<a href="#"></a> <code>__a</code>	An allocator object.
-----------------------------------------------------------------------------------------------------------------------	----------------------

#### deque() [3/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque<_Tp, _Alloc >::deque (
    size_type __n,
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a deque with default constructed elements.

##### Parameters

<a href="#"></a> <code>__n</code>	The number of elements to initially create.
<a href="#"></a> <code>__a</code>	An allocator.

This constructor fills the deque with *n* default constructed elements.

#### deque() [4/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque<_Tp, _Alloc >::deque (
    size_type __n,
    const value_type & __value,
    const allocator_type & __a = allocator_type()) [inline]
```

Creates a deque with copies of an exemplar element.

##### Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__a</code>	An allocator.

This constructor fills the deque with `__n` copies of `__value`.

**deque()** [5/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
    const deque< _Tp, _Alloc > & __x) [inline]
```

Deque copy constructor.

**Parameters**

<code>__x</code>	A deque of identical element and allocator types.
------------------	---------------------------------------------------

The newly-created deque uses a copy of the allocator object used by `__x` (unless the allocator traits dictate a different object).

**deque()** [6/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
    deque< _Tp, _Alloc > && ) [default]
```

Deque move constructor.

The newly-created deque contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified deque.

**deque()** [7/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
    const deque< _Tp, _Alloc > & __x,
    const __type_identity_t< allocator_type > & __a) [inline]
```

Copy constructor with alternative allocator.

**deque()** [8/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
    deque< _Tp, _Alloc > && __x,
    const __type_identity_t< allocator_type > & __a) [inline]
```

Move constructor with alternative allocator.

**deque()** [9/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
    initializer_list< value_type > __l,
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a deque from an initializer list.

**Parameters**

<code>__l</code>	An <code>initializer_list</code> .
<code>__a</code>	An allocator object.

---

Create a deque consisting of copies of the elements in the initializer\_list \_\_l.  
This will call the element type's copy constructor N times (where N is \_\_l.size()) and do no memory reallocation.

**deque()** [10/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
std::deque< _Tp, _Alloc >::deque (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a deque from a range.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__a</code>	An allocator object.

Create a deque consisting of copies of the elements from [\_\_first, \_\_last).  
If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor N times (where N is distance(\_\_first, \_\_last)) and do no memory reallocation. But if only input iterators are used, then this will do at most 2N calls to the copy constructor, and logN memory reallocations.

**~deque()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::~~deque () [inline]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**6.382.3 Member Function Documentation****\_M\_fill\_initialize()**

```
template<typename _Tp, typename _Alloc>
void deque::_M_fill_initialize (
    const value_type & __value) [protected]
```

Fills the deque with copies of value.

**Parameters**

<code>__value</code>	Initial value.
----------------------	----------------

**Returns**

Nothing.

**Precondition**

\_M\_start and \_M\_finish have already been initialized, but none of the deque's elements have yet been constructed.

This function is called only when the user provides an explicit size (with or without an explicit exemplar value).

References [std::\\_Destroy\(\)](#).

Referenced by [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::deque\(\)](#).

**\_M\_new\_elements\_at\_back()**

```
template<typename _Tp, typename _Alloc>
void deque::_M_new_elements_at_back (
    size_type __new_elements) [protected]
```

Memory-handling helpers for the previous internal insert functions.

References [\\_M\\_reserve\\_map\\_at\\_back\(\)](#), [max\\_size\(\)](#), and [std::size\(\)](#).

Referenced by [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::\\_M\\_reserve\\_elements\\_at\\_back\(\)](#).

**\_M\_new\_elements\_at\_front()**

```
template<typename _Tp, typename _Alloc>
void deque::_M_new_elements_at_front (
    size_type __new_elements) [protected]
```

Memory-handling helpers for the previous internal insert functions.

References [\\_M\\_reserve\\_map\\_at\\_front\(\)](#), [max\\_size\(\)](#), and [std::size\(\)](#).

Referenced by [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::\\_M\\_reserve\\_elements\\_at\\_front\(\)](#).

**\_M\_pop\_back\_aux()**

```
template<typename _Tp, typename _Alloc>
void deque::_M_pop_back_aux () [protected]
```

Helper functions for `push_*` and `pop_*`.

Referenced by [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::pop\\_back\(\)](#).

**\_M\_pop\_front\_aux()**

```
template<typename _Tp, typename _Alloc>
void deque::_M_pop_front_aux () [protected]
```

Helper functions for `push_*` and `pop_*`.

Referenced by [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::pop\\_front\(\)](#).

**\_M\_push\_back\_aux()**

```
template<typename _Tp, typename _Alloc>
template<typename... _Args>
void deque::_M_push_back_aux (
    _Args &&... __args) [protected]
```

Helper functions for `push_*` and `pop_*`.

References [\\_M\\_reserve\\_map\\_at\\_back\(\)](#), [std::forward\(\)](#), [max\\_size\(\)](#), and [std::size\(\)](#).

Referenced by [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::push\\_back\(\)](#).

**\_M\_push\_front\_aux()**

```
template<typename _Tp, typename _Alloc>
template<typename... _Args>
void deque::_M_push_front_aux (
    _Args &&... __args) [protected]
```

Helper functions for `push_*` and `pop_*`.

References [\\_M\\_reserve\\_map\\_at\\_front\(\)](#), [std::forward\(\)](#), [max\\_size\(\)](#), and [std::size\(\)](#).

Referenced by [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::push\\_front\(\)](#).

**\_M\_range\_check()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
```

```
void std::deque< _Tp, _Alloc >::_M_range_check (
    size_type __n) const [inline], [protected]
```

Safety check used only from at().

Referenced by [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::at\(\)](#), and [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::at\(\)](#).

### **`_M_range_initialize()`** [1/2]

```
template<typename _Tp, typename _Alloc>
template<typename _ForwardIterator>
void deque::_M_range_initialize (
    _ForwardIterator __first,
    _ForwardIterator __last,
    std::forward_iterator_tag ) [protected]
```

Fills the deque with whatever is in [first,last).

#### Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

#### Returns

Nothing.

If the iterators are actually forward iterators (or better), then the memory layout can be done all at once. Else we move forward using `push_back` on each value from the iterator.

References [std::\\_Destroy\(\)](#), [std::advance\(\)](#), and [std::distance\(\)](#).

### **`_M_range_initialize()`** [2/2]

```
template<typename _Tp, typename _Alloc>
template<typename _InputIterator>
void deque::_M_range_initialize (
    _InputIterator __first,
    _InputIterator __last,
    std::input_iterator_tag ) [protected]
```

Fills the deque with whatever is in [first,last).

#### Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

#### Returns

Nothing.

If the iterators are actually forward iterators (or better), then the memory layout can be done all at once. Else we move forward using `push_back` on each value from the iterator.

References [clear\(\)](#), and [push\\_back\(\)](#).

Referenced by [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::deque\(\)](#), and [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::deque\(\)](#).

### **`_M_reallocate_map()`**

```
template<typename _Tp, typename _Alloc>
void deque::_M_reallocate_map (
    size_type __nodes_to_add,
    bool __add_at_front) [protected]
```

Memory-handling helpers for the major map.

Makes sure the `_M_map` has space for new nodes. Does not actually add the nodes. Can invalidate `_M_map` pointers.

(And consequently, deque iterators.)

References [std::max\(\)](#), and [max\\_size\(\)](#).

Referenced by [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::\\_M\\_reserve\\_map\\_at\\_back\(\)](#), and [std::deque< \\_Tp, polymorphic\\_allocator< \\_Tp > >::\\_M\\_reserve\\_map\\_at\\_front\(\)](#).

### **`_M_reserve_elements_at_back()`**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::_M_reserve_elements_at_back (
    size_type __n) [inline], [protected]
```

Memory-handling helpers for the previous internal insert functions.

### **`_M_reserve_elements_at_front()`**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::_M_reserve_elements_at_front (
    size_type __n) [inline], [protected]
```

Memory-handling helpers for the previous internal insert functions.

### **`_M_reserve_map_at_back()`**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::_M_reserve_map_at_back (
    size_type __nodes_to_add = 1) [inline], [protected]
```

Memory-handling helpers for the major map.

Makes sure the `_M_map` has space for new nodes. Does not actually add the nodes. Can invalidate `_M_map` pointers.

(And consequently, deque iterators.)

Referenced by [\\_M\\_new\\_elements\\_at\\_back\(\)](#), and [\\_M\\_push\\_back\\_aux\(\)](#).

### **`_M_reserve_map_at_front()`**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::_M_reserve_map_at_front (
    size_type __nodes_to_add = 1) [inline], [protected]
```

Memory-handling helpers for the major map.

Makes sure the `_M_map` has space for new nodes. Does not actually add the nodes. Can invalidate `_M_map` pointers.

(And consequently, deque iterators.)

Referenced by [\\_M\\_new\\_elements\\_at\\_front\(\)](#), and [\\_M\\_push\\_front\\_aux\(\)](#).

### **`assign()` [1/3]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
void std::deque< _Tp, _Alloc >::assign (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Assigns a range to a deque.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a deque with copies of the elements in the range `[__first,__last)`.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

**assign()** [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque<_Tp, _Alloc >::assign (
    initializer_list< value_type > __l) [inline]
```

Assigns an initializer list to a deque.

## Parameters

<code>↵</code>	An initializer_list.
<code>__↵</code>	
<code>↵</code>	
<code>__↵</code>	
<code>/</code>	

This function fills a deque with copies of the elements in the initializer\_list `__l`.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

**assign()** [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque<_Tp, _Alloc >::assign (
    size_type __n,
    const value_type & __val) [inline]
```

Assigns a given value to a deque.

## Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a deque with *n* copies of the given value. Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

**at()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::deque<_Tp, _Alloc >::at (
    size_type __n) [inline]
```

Provides access to the data contained in the deque.

**Parameters**

<b><code>_↔</code></b>	The index of the element for which data should be accessed.
<b><code>_n</code></b>	

**Returns**

Read/write reference to data.

**Exceptions**

<i><code>std::out_of_range</code></i>	If <code>__n</code> is an invalid index.
---------------------------------------	------------------------------------------

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws `out_of_range` if the check fails.

**at()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque<_Tp, _Alloc>::at (
    size_type __n) const [inline]
```

Provides access to the data contained in the deque.

**Parameters**

<b><code>_↔</code></b>	The index of the element for which data should be accessed.
<b><code>_n</code></b>	

**Returns**

Read-only (constant) reference to data.

**Exceptions**

<i><code>std::out_of_range</code></i>	If <code>__n</code> is an invalid index.
---------------------------------------	------------------------------------------

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws `out_of_range` if the check fails.

**back()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque<_Tp, _Alloc>::back () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the deque.

**back()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::deque<_Tp, _Alloc>::back () [inline], [nodiscard], [noexcept]
```

Returns a read/write reference to the data at the last element of the deque.

**begin()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque<_Tp, _Alloc>::begin () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

**begin()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque<_Tp, _Alloc>::begin () [inline], [nodiscard], [noexcept]
```

Returns a read/write iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Referenced by `std::deque<_Tp, polymorphic_allocator<_Tp>>::deque()`, `std::deque<_Tp, polymorphic_allocator<_Tp>>::deque(std::deque<_Tp, polymorphic_allocator<_Tp>>::~~deque(), std::deque<_Tp, polymorphic_allocator<_Tp>>::clear(), std::deque<_Tp, polymorphic_allocator<_Tp>>::front(), std::deque<_Tp, polymorphic_allocator<_Tp>>::front(), std::deque<_Tp, polymorphic_allocator<_Tp>>::insert(), std::deque<_Tp, polymorphic_allocator<_Tp>>::insert(), std::deque<_Tp, polymorphic_allocator<_Tp>>::insert(), std::operator<=>(), and operator=()`.

**cbegin()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque<_Tp, _Alloc>::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Referenced by `std::deque<_Tp, polymorphic_allocator<_Tp>>::insert()`, `std::deque<_Tp, polymorphic_allocator<_Tp>>::insert()` and `std::deque<_Tp, polymorphic_allocator<_Tp>>::insert()`.

**cend()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque<_Tp, _Alloc>::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

**clear()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque<_Tp, _Alloc>::clear () [inline], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Referenced by `_M_range_initialize()`.

**crbegin()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque<_Tp, _Alloc>::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

**crend()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque<_Tp, _Alloc>::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

**emplace()**

```
template<typename _Tp, typename _Alloc>
template<typename... _Args>
deque<_Tp, _Alloc>::iterator deque::emplace (
    const_iterator __position,
    _Args &&... __args)
```

Inserts an object in deque before specified iterator.

**Parameters**

<code>__position</code>	A const_iterator into the deque.
<code>__args</code>	Arguments.

**Returns**

An iterator that points to the inserted data.

This function will insert an object of type T constructed with `T(std::forward<Args>(args)...) before the specified location.`

References [std::forward\(\)](#).

Referenced by [std::deque<\\_Tp, polymorphic\\_allocator<\\_Tp>>::insert\(\)](#).

**empty()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
bool std::deque<_Tp, _Alloc>::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the deque is empty. (Thus `begin()` would equal `end()`.)

**end() [1/2]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque<_Tp, _Alloc>::end () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

**end() [2/2]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque<_Tp, _Alloc>::end () [inline], [nodiscard], [noexcept]
```

Returns a read/write iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Referenced by [std::deque<\\_Tp, polymorphic\\_allocator<\\_Tp>>::deque\(\)](#), [std::deque<\\_Tp, polymorphic\\_allocator<\\_Tp>>::deque](#), [std::deque<\\_Tp, polymorphic\\_allocator<\\_Tp>>::~deque\(\)](#), [std::deque<\\_Tp, polymorphic\\_allocator<\\_Tp>>::back\(\)](#), [std::deque<\\_Tp, polymorphic\\_allocator<\\_Tp>>::back\(\)](#), [std::operator<=>\(\)](#), and [operator=\(\)](#).

**erase() [1/2]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque<_Tp, _Alloc>::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Remove a range of elements.

**Parameters**

<code>__first</code>	Iterator pointing to the first element to be erased.
----------------------	------------------------------------------------------

<code>__last</code>	Iterator pointing to one past the last element to be erased.
---------------------	--------------------------------------------------------------

**Returns**

An iterator pointing to the element pointed to by *last* prior to erasing (or end()).

This function will erase the elements in the range [`__first`,`__last`) and shorten the deque accordingly.

The user is cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::erase (
    const_iterator __position) [inline]
```

Remove element at given position.

**Parameters**

<code>__position</code>	Iterator pointing to element to be erased.
-------------------------	--------------------------------------------

**Returns**

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the deque by one.

The user is cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**front()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque< _Tp, _Alloc >::front () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the deque.

**front()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::deque< _Tp, _Alloc >::front () [inline], [nodiscard], [noexcept]
```

Returns a read/write reference to the data at the first element of the deque.

**get\_allocator()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
allocator_type std::deque< _Tp, _Alloc >::get_allocator () const [inline], [nodiscard], [noexcept]
```

Get a copy of the memory allocation object.

Referenced by `operator=()`.

**insert()** [1/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::insert (
    const_iterator __p,
    initializer_list< value_type > __l) [inline]
```

Inserts an initializer list into the deque.

**Parameters**

<code>__p</code>	An iterator into the deque.
<code>__l</code>	An initializer_list.

**Returns**

An iterator that points to the inserted data.

This function will insert copies of the data in the initializer\_list `__l` into the deque before the location specified by `__p`. This is known as *list insert*.

**insert()** [2/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
iterator std::deque< _Tp, _Alloc >::insert (
    const_iterator __position,
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Inserts a range into the deque.

**Parameters**

<code>__position</code>	A const_iterator into the deque.
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

**Returns**

An iterator that points to the inserted data.

This function will insert copies of the data in the range `[__first,__last)` into the deque before the location specified by `__position`. This is known as *range insert*.

**insert()** [3/5]

```
template<typename _Tp, typename _Alloc>
deque< _Tp, _Alloc >::iterator deque::insert (
    const_iterator __position,
    const value_type & __x)
```

Inserts given value into deque before specified iterator.

**Parameters**

<code>__position</code>	A const_iterator into the deque.
<code>__x</code>	Data to be inserted.

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location.

References [deque\(\)](#), [insert\(\)](#), [push\\_back\(\)](#), and [push\\_front\(\)](#).

Referenced by [insert\(\)](#).

**insert()** [4/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque<_Tp, _Alloc>::insert (
    const_iterator __position,
    size_type __n,
    const value_type & __x) [inline]
```

Inserts a number of copies of given data into the deque.

**Parameters**

<code>__position</code>	A const_iterator into the deque.
<code>__n</code>	Number of elements to be inserted.
<code>__x</code>	Data to be inserted.

**Returns**

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by `__position`.

**insert()** [5/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque<_Tp, _Alloc>::insert (
    const_iterator __position,
    value_type && __x) [inline]
```

Inserts given rvalue into deque before specified iterator.

**Parameters**

<code>__position</code>	A const_iterator into the deque.
<code>__x</code>	Data to be inserted.

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location.

**max\_size()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::deque<_Tp, _Alloc>::max_size () const [inline], [nodiscard], [noexcept]
```

Returns the size() of the largest possible deque.

Referenced by [\\_M\\_new\\_elements\\_at\\_back\(\)](#), [\\_M\\_new\\_elements\\_at\\_front\(\)](#), [\\_M\\_push\\_back\\_aux\(\)](#), [\\_M\\_push\\_front\\_aux\(\)](#), and [\\_M\\_reallocate\\_map\(\)](#).

**operator=()** [1/3]

```
template<typename _Tp, typename _Alloc>
deque<_Tp, _Alloc> & deque::operator= (
    const deque<_Tp, _Alloc> & __x)
```

Deque assignment operator.

**Parameters**

<a href="#"><code>_</code></a> <a href="#"><code>__x</code></a>	A deque of identical element and allocator types.
--------------------------------------------------------------------	---------------------------------------------------

All the elements of `x` are copied.

The newly-created deque uses a copy of the allocator object used by `__x` (unless the allocator traits dictate a different object).

References [deque\(\)](#), [std::\\_\\_addressof\(\)](#), [begin\(\)](#), [end\(\)](#), [get\\_allocator\(\)](#), [size\(\)](#), and [std::size\(\)](#).

**operator=()** [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
deque & std::deque< _Tp, _Alloc >::operator= (
    deque< _Tp, _Alloc > && __x) [inline], [noexcept]
```

Deque move assignment operator.

**Parameters**

<a href="#"><code>_</code></a> <a href="#"><code>__x</code></a>	A deque of identical element and allocator types.
--------------------------------------------------------------------	---------------------------------------------------

The contents of `__x` are moved into this deque (without copying, if the allocators permit it). `__x` is a valid, but unspecified deque.

**operator=()** [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
deque & std::deque< _Tp, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Assigns an initializer list to a deque.

**Parameters**

<a href="#"><code>↵</code></a> <a href="#"><code>__</code></a> <a href="#"><code>↵</code></a> <a href="#"><code>↵</code></a> <a href="#"><code>__</code></a> <a href="#"><code>l</code></a>	An initializer_list.
------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------

This function fills a deque with copies of the elements in the initializer\_list `__l`.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

**operator[]()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque< _Tp, _Alloc >::operator[] (
    size_type __n) const [inline], [nodiscard], [noexcept]
```

Subscript access to the data contained in the deque.

**Parameters**

<a href="#"><code>_</code></a> <a href="#"><code>__n</code></a>	The index of the element for which data should be accessed.
--------------------------------------------------------------------	-------------------------------------------------------------

**Returns**

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

**operator[]() [2/2]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::deque< _Tp, _Alloc >::operator[] (
    size_type __n) [inline], [nodiscard], [noexcept]
```

Subscript access to the data contained in the deque.

**Parameters**

<code>__n</code>	The index of the element for which data should be accessed.
------------------	-------------------------------------------------------------

**Returns**

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

**pop\_back()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::pop_back () [inline], [noexcept]
```

Removes last element.

This is a typical stack operation. It shrinks the deque by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

**pop\_front()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::pop_front () [inline], [noexcept]
```

Removes first element.

This is a typical stack operation. It shrinks the deque by one.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

**push\_back()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::push_back (
    const value_type & __x) [inline]
```

Add data to the end of the deque.

**Parameters**

<a href="#"><code>_↔</code></a>	Data to be added.
<a href="#"><code>_X</code></a>	

This is a typical stack operation. The function creates an element at the end of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.

Referenced by [\\_M\\_range\\_initialize\(\)](#), and [insert\(\)](#).

**push\_front()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::push_front (
    const value_type & __x) [inline]
```

Add data to the front of the deque.

**Parameters**

<a href="#"><code>_↔</code></a>	Data to be added.
<a href="#"><code>_X</code></a>	

This is a typical stack operation. The function creates an element at the front of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.

Referenced by [insert\(\)](#).

**rbegin() [1/2]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque< _Tp, _Alloc >::rbegin () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

**rbegin() [2/2]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::deque< _Tp, _Alloc >::rbegin () [inline], [nodiscard], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

**rend() [1/2]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque< _Tp, _Alloc >::rend () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

**rend() [2/2]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::deque< _Tp, _Alloc >::rend () [inline], [nodiscard], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

**resize()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::resize (
    size_type __new_size) [inline]
```

Resizes the deque to the specified number of elements.

**Parameters**

<code>__new_size</code>	Number of elements the deque should contain.
-------------------------	----------------------------------------------

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise default constructed elements are appended.

**resize()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::resize (
    size_type __new_size,
    const value_type & __x) [inline]
```

Resizes the deque to the specified number of elements.

**Parameters**

<code>__new_size</code>	Number of elements the deque should contain.
<code>__x</code>	Data with which new elements should be populated.

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise the deque is extended and new elements are populated with given data.

**shrink\_to\_fit()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::shrink_to_fit () [inline], [noexcept]
```

A non-binding request to reduce memory use.

**size()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::deque< _Tp, _Alloc >::size () const [inline], [nodiscard], [noexcept]
```

Returns the number of elements in the deque.

Referenced by `std::deque< _Tp, polymorphic_allocator< _Tp > >::M_range_check()`, `std::operator<=>()`, `operator=()`, `std::deque< _Tp, polymorphic_allocator< _Tp > >::resize()`, and `std::deque< _Tp, polymorphic_allocator< _Tp > >::resize()`.

**swap()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::swap (
    deque< _Tp, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another deque.

**Parameters**

<code>__x</code>	A deque of the same element and allocator types.
------------------	--------------------------------------------------

---

This exchanges the elements between two deques in constant time. (Four pointers, so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(d1,d2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

The documentation for this class was generated from the following files:

## 6.383 `std::destroying_delete_t` Struct Reference

```
#include <new>
```

### 6.383.1 Detailed Description

Tag type used to declare a class-specific operator delete that can invoke the destructor before deallocating the memory.

The documentation for this struct was generated from the following file:

- [new](#)

## 6.384 `std::tr2::direct_bases<_Tp>` Struct Template Reference

```
#include <type_traits>
```

### Public Types

- typedef [\\_\\_reflection\\_typelist](#)< `__direct_bases(_Tp)...` > `type`

### 6.384.1 Detailed Description

```
template<typename _Tp>  
struct std::tr2::direct_bases<_Tp>
```

Enumerate all the direct base classes of a class. Form of a typelist.

The documentation for this struct was generated from the following file:

- [tr2/type\\_traits](#)

## 6.385 `__gnu_pbds::direct_mask_range_hashing<Size_Type>` Class Template Reference

```
#include <hash_policy.hpp>
```

Inheritance diagram for `__gnu_pbds::direct_mask_range_hashing< Size_Type >`:

### Public Types

- typedef `Size_Type` **size\_type**

### Public Member Functions

- void **swap** (`direct_mask_range_hashing< Size_Type > &other`)

### Protected Member Functions

- void **notify\_resized** (`size_type size`)
- `size_type operator()` (`size_type hash`) const
- `size_type range_hash` (`size_type hash`) const
- void **swap** (`mask_based_range_hashing &other`)

#### 6.385.1 Detailed Description

```
template<typename Size_Type = std::size_t>
class __gnu_pbds::direct_mask_range_hashing< Size_Type >
```

A mask range-hashing class (uses a bitmask).

#### 6.385.2 Member Function Documentation

##### `operator()()`

```
template<typename Size_Type>
direct_mask_range_hashing< Size_Type >::size_type __gnu_pbds::direct_mask_range_hashing< Size_Type >::operator() (
    size_type hash) const [inline], [protected]
```

Transforms the `__hash` value hash into a ranged-hash value (using a bit-mask).

The documentation for this class was generated from the following file:

- [hash\\_policy.hpp](#)

## 6.386 `__gnu_pbds::direct_mod_range_hashing< Size_Type >` Class Template Reference

```
#include <hash_policy.hpp>
```

Inheritance diagram for `__gnu_pbds::direct_mod_range_hashing< Size_Type >`:

### Public Types

- typedef `Size_Type` **size\_type**

### Public Member Functions

- void **swap** (`direct_mod_range_hashing< Size_Type > &other`)

### Protected Member Functions

- void **notify\_resized** (`size_type s`)
- void **notify\_resized** (`size_type size`)
- `size_type` **operator()** (`size_type hash`) const
- `size_type` **range\_hash** (`size_type s`) const
- void **swap** (`mod_based_range_hashing &other`)

#### 6.386.1 Detailed Description

```
template<typename Size_Type = std::size_t>
class __gnu_pbds::direct_mod_range_hashing< Size_Type >
```

A mod range-hashing class (uses the modulo function).

#### 6.386.2 Member Function Documentation

##### **operator()()**

```
template<typename Size_Type>
direct_mod_range_hashing< Size_Type >::size_type __gnu_pbds::direct_mod_range_hashing< Size_Type
>::operator() (
    size_type hash) const [inline], [protected]
```

Transforms the `__hash` value hash into a ranged-hash value (using a modulo operation).  
 The documentation for this class was generated from the following file:

- [hash\\_policy.hpp](#)

### 6.389.1 Detailed Description

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
class std::discard_block_engine< _RandomNumberEngine, __p, __r >
```

Produces random numbers from some base engine by discarding blocks of data.

Precondition

$$0 \leq r \leq p$$

Since

C++11

### 6.389.2 Member Typedef Documentation

#### result\_type

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
typedef _RandomNumberEngine::result_type std::discard\_block\_engine< _RandomNumberEngine, __p, __r
>::result_type
```

The type of the generated random value.

### 6.389.3 Constructor & Destructor Documentation

#### discard\_block\_engine() [1/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard\_block\_engine< _RandomNumberEngine, __p, __r >::discard_block_engine () [inline]
```

Constructs a default `discard_block_engine` engine.

The underlying engine is default constructed as well.

#### discard\_block\_engine() [2/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard\_block\_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
    const _RandomNumberEngine & __rng) [inline], [explicit]
```

Copy constructs a `discard_block_engine` engine.

Copies an existing base class random number generator.

## Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	-----------------------------------------

**discard\_block\_engine()** [3/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard_block_engine<_RandomNumberEngine, __p, __r>::discard_block_engine (
    _RandomNumberEngine && __rng) [inline], [explicit]
```

Move constructs a discard\_block\_engine engine.

Copies an existing base class random number generator.

## Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	-----------------------------------------

**discard\_block\_engine()** [4/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard_block_engine<_RandomNumberEngine, __p, __r>::discard_block_engine (
    result_type __s) [inline], [explicit]
```

Seed constructs a discard\_block\_engine engine.

Constructs the underlying generator engine seeded with \_\_s.

## Parameters

<code>__s</code>	A seed value for the base class engine.
------------------	-----------------------------------------

**discard\_block\_engine()** [5/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::discard_block_engine<_RandomNumberEngine, __p, __r>::discard_block_engine (
    _Sseq & __q) [inline], [explicit]
```

Generator construct a discard\_block\_engine engine.

## Parameters

<code>__q</code>	A seed sequence.
------------------	------------------

**6.389.4 Member Function Documentation****base()**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
const _RandomNumberEngine & std::discard_block_engine<_RandomNumberEngine, __p, __r>::base ()
const [inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

**discard()**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
void std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard (
    unsigned long long __z) [inline]
```

Discard a sequence of random numbers.

**max()**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
constexpr result_type std::discard_block_engine< _RandomNumberEngine, __p, __r >::max () [inline],
[static], [constexpr]
```

Gets the maximum value in the generated random number range.

**min()**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
constexpr result_type std::discard_block_engine< _RandomNumberEngine, __p, __r >::min () [inline],
[static], [constexpr]
```

Gets the minimum value in the generated random number range.

**operator()()**

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
discard_block_engine< _RandomNumberEngine, __p, __r >::result_type std::discard_block_engine< _↵
RandomNumberEngine, __p, __r >::operator() ()
```

Gets the next value in the generated random number sequence.

**seed()** [1/3]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
void std::discard_block_engine< _RandomNumberEngine, __p, __r >::seed () [inline]
```

Reseeds the discard\_block\_engine object with the default seed for the underlying base class generator engine.

**seed()** [2/3]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
template<typename _Sseq>
_If_seed_seq< _Sseq > std::discard_block_engine< _RandomNumberEngine, __p, __r >::seed (
    _Sseq & __q) [inline]
```

Reseeds the discard\_block\_engine object with the given seed sequence.

**Parameters**

<code>_↵</code>	A seed generator function.
<code>_q</code>	

**seed()** [3/3]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
void std::discard_block_engine< _RandomNumberEngine, __p, __r >::seed (
    result_type __s) [inline]
```

Reseeds the discard\_block\_engine object with the default seed for the underlying base class generator engine.

### 6.389.5 Friends And Related Symbol Documentation

#### operator<<

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
template<typename _RandomNumberEngine1, size_t __p1, size_t __r1, typename _CharT, typename _Traits>
```

```
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::discard_block_engine< _RandomNumberEngine1, __p1, __r1 > & __x) [friend]
```

Inserts the current state of a discard\_block\_engine random number generator engine \_\_x into the output stream \_\_os.

#### Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A discard_block_engine random number generator engine.

#### Returns

The output stream with the state of \_\_x inserted or in an error state.

#### operator==

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
bool operator== (
    const discard_block_engine< _RandomNumberEngine, __p, __r > & __lhs,
    const discard_block_engine< _RandomNumberEngine, __p, __r > & __rhs) [friend]
```

Compares two discard\_block\_engine random number generator objects of the same type for equality.

#### Parameters

<code>__lhs</code>	A discard_block_engine random number generator object.
<code>__rhs</code>	Another discard_block_engine random number generator object.

#### Returns

true if the infinite sequences of generated values would be equal, false otherwise.

#### operator>>

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
template<typename _RandomNumberEngine1, size_t __p1, size_t __r1, typename _CharT, typename _Traits>
```

```
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::discard_block_engine< _RandomNumberEngine1, __p1, __r1 > & __x) [friend]
```

Extracts the current state of a % subtract\_with\_carry\_engine random number generator engine \_\_x from the input stream \_\_is.

#### Parameters

<code>__is</code>	An input stream.
-------------------	------------------

<a href="#">↩</a>	A discard_block_engine random number generator engine.
<a href="#">X</a>	

## Returns

The input stream with the state of `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

### 6.390.1 Detailed Description

template<typename \_IntType = int>  
class std::discrete\_distribution< \_IntType >

A discrete\_distribution random number distribution.

This distribution produces random numbers  $i, 0 \leq i < n$ , distributed according to the probability mass function  $p(i|p_0, \dots, p_{n-1}) = p_i$ .

Since

C++11

### 6.390.2 Member Typedef Documentation

#### result\_type

```
template<typename _IntType = int>
typedef _IntType std::discrete_distribution< _IntType >::result_type
```

The type of the range of the distribution.

### 6.390.3 Member Function Documentation

#### max()

```
template<typename _IntType = int>
result_type std::discrete_distribution< _IntType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### min()

```
template<typename _IntType = int>
result_type std::discrete_distribution< _IntType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

#### operator()()

```
template<typename _IntType = int>
template<typename _UniformRandomNumberGenerator>
result_type std::discrete_distribution< _IntType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

**param()** [1/2]

```
template<typename _IntType = int>
param_type std::discrete_distribution< _IntType >::param () const [inline]
```

Returns the parameter set of the distribution.

**param()** [2/2]

```
template<typename _IntType = int>
void std::discrete_distribution< _IntType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

**probabilities()**

```
template<typename _IntType = int>
std::vector< double > std::discrete_distribution< _IntType >::probabilities () const [inline]
```

Returns the probabilities of the distribution.

**reset()**

```
template<typename _IntType = int>
void std::discrete_distribution< _IntType >::reset () [inline]
```

Resets the distribution state.

**6.390.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::discrete_distribution< _IntType1 > & __x) [friend]
```

Inserts a discrete\_distribution random number distribution `__x` into the output stream `__os`.

**Parameters**

<code>__os</code>	An output stream.
<code>__x</code>	A discrete_distribution random number distribution.

**Returns**

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _IntType = int>
bool operator== (
    const discrete\_distribution< _IntType > & __d1,
    const discrete\_distribution< _IntType > & __d2) [friend]
```

Return true if two discrete distributions have the same parameters.

**operator>>**

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic\_istream< _CharT, _Traits > & operator>> (
    std::basic\_istream< _CharT, _Traits > & __is,
    std::discrete\_distribution< _IntType1 > & __x) [friend]
```

Extracts a [discrete\\_distribution](#) random number distribution \_\_x from the input stream \_\_is.

**Parameters**

<a href="#">__is</a>	An input stream.
<a href="#">__x</a>	A <a href="#">discrete_distribution</a> random number generator engine.

**Returns**

The input stream with \_\_x extracted or in an error state.

- virtual const char \* **what** () const noexcept

#### 6.393.1 Detailed Description

Thrown by the library, or by you, to report domain errors (domain in the mathematical sense).

#### 6.393.2 Member Function Documentation

##### what()

```
virtual const char * std::logic_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

### 6.397.1 Detailed Description

**template<typename \_WordT = unsigned long long, typename \_Alloc = std::allocator<\_WordT>>**  
**class std::tr2::dynamic\_bitset<\_WordT, \_Alloc >**

The `dynamic_bitset` class represents a sequence of bits.

See N2050, Proposal to Add a Dynamically Sizeable Bitset to the Standard Library. <http://www.open-std.org/jtc1/sc22/wg21/docs/papers/2006/n2050.pdf>

In the general unoptimized case, storage is allocated in word-sized blocks. Let B be the number of bits in a word, then  $(Nb+(B-1))/B$  words will be used for storage. B - NbB bits are unused. (They are the high-order bits in the highest word.) It is a class invariant that those unused bits are always zero.

If you think of `dynamic_bitset` as "a simple array of bits," be aware that your mental picture is reversed: a `dynamic_bitset` behaves the same way as bits in integers do, with the bit at index 0 in the "least significant / right-hand" position, and the bit at index Nb-1 in the "most significant / left-hand" position. Thus, unlike other containers, a `dynamic_bitset`'s index "counts from right to left," to put it very loosely.

This behavior is preserved when translating to and from strings. For example, the first line of the following program probably prints "b('a') is 0001100001" on a modern ASCII system.

```
#include <dynamic_bitset>
#include <iostream>
#include <sstream>

using namespace std;

int main()
{
    long    a = 'a';
    dynamic_bitset<> b(a);

    cout << "b('a') is " << b << endl;

    ostringstream s;
    s << b;
    string str = s.str();
    cout << "index 3 in the string is " << str[3] << " but\n"
         << "index 3 in the bitset is " << b[3] << endl;
}
```

Most of the actual code isn't contained in `dynamic_bitset<>` itself, but in the base class `__dynamic_bitset_base`. The base class works with whole words, not with individual bits. This allows us to specialize `__dynamic_bitset_base` for the important special case where the `dynamic_bitset` is only a single word.

Extra confusion can result due to the fact that the storage for `__dynamic_bitset_base` *is* a vector, and is indexed as such. This is carefully encapsulated.

## 6.397.2 Constructor & Destructor Documentation

### dynamic\_bitset() [1/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset () [default]
```

All bits set to zero.

Referenced by [dynamic\\_bitset\(\)](#), [dynamic\\_bitset\(\)](#), [operator&=\(\)](#), [operator&=\(\)](#), [operator-=\(\)](#), [operator<<\(\)](#), [operator<<=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator>>\(\)](#), [operator^=\(\)](#), [operator|=\(\)](#), [operator~\(\)](#), and [swap\(\)](#).

### dynamic\_bitset() [2/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
    const allocator_type & __alloc) [inline], [explicit]
```

All bits set to zero.

### dynamic\_bitset() [3/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
    size_type __nbits,
    unsigned long long __val = 0ULL,
    const allocator_type & __alloc = allocator_type()) [inline], [explicit]
```

Initial bits bitwise-copied from a single word (others set to zero).

### dynamic\_bitset() [4/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
template<typename _CharT, typename _Traits, typename _Alloc1>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
    const std::basic_string< _CharT, _Traits, _Alloc1 > & __str,
    typename basic_string< _CharT, _Traits, _Alloc1 >::size_type __pos = 0,
    typename basic_string< _CharT, _Traits, _Alloc1 >::size_type __n = std::basic_string<↵
    _CharT, _Traits, _Alloc1>::npos,
    _CharT __zero = _CharT('0'),
    _CharT __one = _CharT('1'),
    const allocator_type & __alloc = allocator_type()) [inline], [explicit]
```

Use a subset of a string.

#### Parameters

<code>__str</code>	A string of '0' and '1' characters.
<code>__pos</code>	Index of the first character in <code>__str</code> to use.
<code>__n</code>	The number of characters to copy.
<code>__zero</code>	The character to use for unset bits.
<code>__one</code>	The character to use for set bits.
<code>__alloc</code>	An allocator.

#### Exceptions

<code>std::out_of_range</code>	If <code>__pos</code> is bigger the size of <code>__str</code> .
<code>std::invalid_argument</code>	If a character appears in the string which is neither '0' nor '1'.

References [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc >::npos](#), and [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc >::size\(\)](#).

### dynamic\_bitset() [5/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset<_WordT, _Alloc >::dynamic_bitset (
    const char * __str,
    const allocator_type & __alloc = allocator_type()) [inline], [explicit]
```

Construct from a string.

#### Parameters

<code>__str</code>	A string of '0' and '1' characters.
<code>__alloc</code>	An allocator.

#### Exceptions

<code>std::invalid_argument</code>	If a character appears in the string which is neither '0' nor '1'.
------------------------------------	--------------------------------------------------------------------

### dynamic\_bitset() [6/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset<_WordT, _Alloc >::dynamic_bitset (
    const dynamic_bitset<_WordT, _Alloc > & ) [default]
```

Copy constructor.

References [dynamic\\_bitset\(\)](#).

### dynamic\_bitset() [7/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset<_WordT, _Alloc >::dynamic_bitset (
    dynamic_bitset<_WordT, _Alloc > && __b) [inline], [noexcept]
```

Move constructor.

References [dynamic\\_bitset\(\)](#), and [std::move\(\)](#).

## 6.397.3 Member Function Documentation

### all()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset<_WordT, _Alloc >::all () const [inline]
```

Tests whether all the bits are on.

#### Returns

True if all the bits are set.

**any()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::any () const [inline]
```

Tests whether any of the bits are on.

**Returns**

True if at least one bit is set.

**append() [1/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
template<typename _BlockInputIterator>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::append (
    _BlockInputIterator __first,
    _BlockInputIterator __last) [inline]
```

Append an iterator range of blocks.

References [append\(\)](#).

**append() [2/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::append (
    block_type __block) [inline]
```

Append a block.

Referenced by [append\(\)](#).

**clear()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::clear () [inline]
```

Clear the bitset.

**count()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::count () const [inline], [noexcept]
```

Returns the number of bits which are set.

**empty()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the dynamic\_bitset is empty.

**find\_first()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::find_first () const [inline]
```

Finds the index of the first "on" bit.

**Returns**

The index of the first bit set, or size() if not found.

See also

[find\\_next](#)

### find\_next()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset<_WordT, _Alloc >::find_next (
    size_t __prev) const [inline]
```

Finds the index of the next "on" bit after prev.

Returns

The index of the next bit set, or size() if not found.

Parameters

<code>__prev</code>	Where to start searching.
---------------------	---------------------------

See also

[find\\_first](#)

### flip() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset<_WordT, _Alloc >::flip () [inline]
```

Toggles every bit to its opposite value.

Referenced by [operator~\(\)](#).

### flip() [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset<_WordT, _Alloc >::flip (
    size_type __pos) [inline]
```

Toggles a given bit to its opposite value.

Parameters

<code>__pos</code>	The index of the bit.
--------------------	-----------------------

Exceptions

<code>std::out_of_range</code>	If <code>__pos</code> is bigger the size of the set.
--------------------------------	------------------------------------------------------

### get\_allocator()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
allocator_type std::tr2::dynamic_bitset<_WordT, _Alloc >::get_allocator () const [inline],
[noexcept]
```

Return the allocator for the bitset.

Referenced by [operator=\(\)](#).

**max\_size()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::max_size () [inline], [constexpr], [noexcept]
```

Returns the maximum size of a `dynamic_bitset` object having the same type as `*this`. The real answer is `max() * bits_per_block` but is likely to overflow.

References [std::numeric\\_limits<\\_Tp>::max\(\)](#).

**none()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::none () const [inline]
```

Tests whether any of the bits are on.

**Returns**

True if none of the bits are set.

**num\_blocks()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::num_blocks () const [inline], [noexcept]
```

Returns the total number of blocks.

**operator&=() [1/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator&= (
    const dynamic_bitset< _WordT, _Alloc > & __rhs) [inline]
```

Operations on `dynamic_bitsets`.

**Parameters**

<code>__rhs</code>	A same-sized <code>dynamic_bitset</code> .
--------------------	--------------------------------------------

These should be self-explanatory.

References [dynamic\\_bitset\(\)](#).

**operator&=() [2/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator&= (
    dynamic_bitset< _WordT, _Alloc > && __rhs) [inline]
```

Operations on `dynamic_bitsets`.

**Parameters**

<code>__rhs</code>	A same-sized <code>dynamic_bitset</code> .
--------------------	--------------------------------------------

These should be self-explanatory.

References [dynamic\\_bitset\(\)](#), and [std::move\(\)](#).

**operator-=()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset<_WordT, _Alloc >::operator-= (
    const dynamic_bitset<_WordT, _Alloc > & __rhs) [inline]
```

Operations on dynamic\_bitsets.

**Parameters**

<code>__rhs</code>	A same-sized dynamic_bitset.
--------------------	------------------------------

These should be self-explanatory.

References [dynamic\\_bitset\(\)](#).

**operator<<()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset std::tr2::dynamic_bitset<_WordT, _Alloc >::operator<< (
    size_type __pos) const [inline]
```

Self-explanatory.

References [dynamic\\_bitset\(\)](#).

**operator<<=()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset<_WordT, _Alloc >::operator<<= (
    size_type __pos) [inline]
```

Operations on dynamic\_bitsets.

**Parameters**

<code>__pos</code>	The number of places to shift.
--------------------	--------------------------------

These should be self-explanatory.

References [dynamic\\_bitset\(\)](#).

**operator=() [1/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset<_WordT, _Alloc >::operator= (
    const dynamic_bitset<_WordT, _Alloc > & ) [default]
```

Copy assignment operator.

References [dynamic\\_bitset\(\)](#).

**operator=() [2/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset<_WordT, _Alloc >::operator= (
    dynamic_bitset<_WordT, _Alloc > && __b) [inline], [noexcept]
```

Move assignment operator.

References [dynamic\\_bitset\(\)](#), and [get\\_allocator\(\)](#).

**operator>>()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset< std::tr2::dynamic_bitset< _WordT, _Alloc >::operator>> (
    size_type __pos) const [inline]
```

Self-explanatory.

References [dynamic\\_bitset\(\)](#).

**operator>>=()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator>>= (
    size_type __pos) [inline]
```

Operations on dynamic\_bitsets.

**Parameters**

<code>__pos</code>	The number of places to shift.
--------------------	--------------------------------

These should be self-explanatory.

**operator[]() [1/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
reference std::tr2::dynamic_bitset< _WordT, _Alloc >::operator[] (
    size_type __pos) [inline]
```

Array-indexing support.

**Parameters**

<code>__pos</code>	Index into the dynamic_bitset.
--------------------	--------------------------------

**Returns**

A bool for a 'const dynamic\_bitset'. For non-const bitsets, an instance of the reference proxy class.

**Note**

These operators do no range checking and throw no exceptions, as required by DR 11 to the standard.

**operator[]() [2/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
const_reference std::tr2::dynamic_bitset< _WordT, _Alloc >::operator[] (
    size_type __pos) const [inline]
```

Array-indexing support.

**Parameters**

<code>__pos</code>	Index into the dynamic_bitset.
--------------------	--------------------------------

**Returns**

A bool for a 'const dynamic\_bitset'. For non-const bitsets, an instance of the reference proxy class.

**Note**

These operators do no range checking and throw no exceptions, as required by DR 11 to the standard.

**operator^=()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator^= (
    const dynamic_bitset< _WordT, _Alloc > & __rhs) [inline]
```

Operations on dynamic\_bitsets.

**Parameters**

<code>__rhs</code>	A same-sized dynamic_bitset.
--------------------	------------------------------

These should be self-explanatory.

References [dynamic\\_bitset\(\)](#).

**operator" |=()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator|= (
    const dynamic_bitset< _WordT, _Alloc > & __rhs) [inline]
```

Operations on dynamic\_bitsets.

**Parameters**

<code>__rhs</code>	A same-sized dynamic_bitset.
--------------------	------------------------------

These should be self-explanatory.

References [dynamic\\_bitset\(\)](#).

**operator~()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset std::tr2::dynamic_bitset< _WordT, _Alloc >::operator~ () const [inline]
```

See the no-argument [flip\(\)](#).

References [dynamic\\_bitset\(\)](#), and [flip\(\)](#).

**push\_back()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::push_back (
    bool __bit) [inline]
```

Push a bit onto the high end of the bitset.

References [size\(\)](#).

**reset() [1/2]**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::reset () [inline]
```

Sets every bit to false.

**reset()** [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::reset (
    size_type __pos) [inline]
```

Sets a given bit to false.

**Parameters**

<code>__pos</code>	The index of the bit.
--------------------	-----------------------

**Exceptions**

<code>std::out_of_range</code>	If <code>__pos</code> is bigger the size of the set.
--------------------------------	------------------------------------------------------

Same as writing `set (__pos, false)`.

**resize()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::resize (
    size_type __nbits,
    bool __value = false) [inline]
```

Resize the bitset.

Referenced by `std::tr2::operator>>()`.

**set()** [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::set () [inline]
```

Sets every bit to true.

**set()** [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::set (
    size_type __pos,
    bool __val = true) [inline]
```

Sets a given bit to a particular value.

**Parameters**

<code>__pos</code>	The index of the bit.
<code>__val</code>	Either true or false, defaults to true.

**Exceptions**

<code>std::out_of_range</code>	If <code>__pos</code> is bigger the size of the set.
--------------------------------	------------------------------------------------------

**size()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::size () const [inline], [noexcept]
```

Returns the total number of bits.

Referenced by [std::tr2::operator>>\(\)](#), and [push\\_back\(\)](#).

**swap()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::swap (
    dynamic_bitset< _WordT, _Alloc > & __b) [inline], [noexcept]
```

Swap with another bitset.

References [dynamic\\_bitset\(\)](#).

**test()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::test (
    size_type __pos) const [inline]
```

Tests the value of a bit.

**Parameters**

<code>__pos</code>	The index of a bit.
--------------------	---------------------

**Returns**

The value at `__pos`.

**Exceptions**

<code>std::out_of_range</code>	If <code>__pos</code> is bigger the size of the set.
--------------------------------	------------------------------------------------------

**to\_string()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
template<typename _CharT = char, typename _Traits = std::char_traits<_CharT>, typename _Alloc1 =
std::allocator<_CharT>>
std::basic_string< _CharT, _Traits, _Alloc1 > std::tr2::dynamic_bitset< _WordT, _Alloc >::to_↵
string (
    _CharT __zero = _CharT('0'),
    _CharT __one = _CharT('1')) const [inline]
```

Returns a character interpretation of the `dynamic_bitset`.

**Returns**

The string equivalent of the bits.

Note the ordering of the bits: decreasing character positions correspond to increasing bit positions (see the main class notes for an example).

**to\_ullong()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
unsigned long long std::tr2::dynamic_bitset< _WordT, _Alloc >::to_ullong () const [inline]
```

Returns a numerical interpretation of the `dynamic_bitset`.

**Returns**

The integral equivalent of the bits.

**Exceptions**

<code>std::overflow_error</code>	If there are too many bits to be represented in an unsigned long.
----------------------------------	-------------------------------------------------------------------

**to\_ulong()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
unsigned long std::tr2::dynamic_bitset< _WordT, _Alloc >::to_ulong () const [inline]
```

Returns a numerical interpretation of the `dynamic_bitset`.

**Returns**

The integral equivalent of the bits.

**Exceptions**

<code>std::overflow_error</code>	If there are too many bits to be represented in an unsigned long.
----------------------------------	-------------------------------------------------------------------

### 6.401.1 Detailed Description

```
template<typename _CharT>
class __gnu_cxx::enc_filebuf<_CharT>
```

class `enc_filebuf`.

### 6.401.2 Member Function Documentation

#### `_M_create_pback()`

```
void std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_create_pback () [inline],
[protected], [inherited]
```

Initializes pback buffers, and moves normal buffers to safety. Assumptions: `_M_in_cur` has already been moved back

#### `_M_destroy_pback()`

```
void std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_destroy_pback () throw ( )
[inline], [protected], [inherited]
```

Deactivates pback buffer contents, and restores normal buffer. Assumptions: The pback buffer has only moved forward.

#### `_M_set_buffer()`

```
void std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_set_buffer (
    streamsize __off) [inline], [protected], [inherited]
```

This function sets the pointers of the internal buffer, both get and put areas. Typically:

`__off == egptr() - eback()` upon underflow/uflow (**read** mode); `__off == 0` upon overflow (**write** mode); `__off == -1` upon open, setbuf, seekoff/pos (**uncommitted** mode).

NB: `egptr() - pbase() == _M_buf_size - 1`, since `_M_buf_size` reflects the actual allocated memory and the last cell is reserved for the overflow char of a full put area.

Referenced by [seekpos\(\)](#), and [setbuf\(\)](#).

#### `close()`

```
basic_filebuf<_CharT, encoding_char_traits<_CharT>>::__filebuf_type * std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::close () [inherited]
```

Closes the currently associated file.

#### Returns

`this` on success, NULL on failure

If no file is currently open, this function immediately fails.

If a *put buffer area* exists, `overflow(eof)` is called to flush all the characters. The file is then closed.

If any operations fail, this function also fails.

#### `eback()`

```
char_type * std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::eback () const [inline],
[protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

**egptr()**

```
char_type * std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::egptr () const [inline],  
[protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

**epptr()**

```
char_type * std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::epptr () const [inline],  
[protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

**gbump()**

```
void std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::gbump (  
    int __n) [inline], [protected], [inherited]
```

Moving the read position.

**Parameters**

<code>__n</code>	The delta by which to move.
------------------	-----------------------------

This just advances the read position without returning any data.

**getloc()**

```
locale std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::getloc () const [inline],  
[inherited]
```

Locale access.

**Returns**

The current locale in effect.

If `pubimbue(loc)` has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.

**gptr()**

```
char_type * std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::gptr () const [inline],
[protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

**imbue()**

```
void std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::imbue (
    const locale & __loc) [protected], [virtual], [inherited]
```

Changes translations.

**Parameters**

<code>__loc</code>	A new locale.
--------------------	---------------

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

**Note**

Base class version does nothing.

Reimplemented from `std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>`.

**in\_avail()**

```
streamsize std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::in_avail () [inline],
[inherited]
```

Looking ahead into the stream.

**Returns**

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

**is\_open()**

```
bool std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::is_open () const throw ( )
[inline], [nodiscard], [inherited]
```

Returns true if the external file is open.

**open()**

```
basic_filebuf<_CharT, encoding_char_traits<_CharT>>::__filebuf_type * std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::open (
    const char * __s,
    ios_base::openmode __mode) [inherited]
```

Opens an external file.

**Parameters**

<code>__s</code>	The name of the file.
<code>__mode</code>	The open mode flags.

**Returns**

`this` on success, NULL on failure

If a file is already open, this function immediately fails. Otherwise it tries to open the file named `__s` using the flags given in `__mode`.

Table 92, adapted here, gives the relation between openmode combinations and the equivalent `fopen()` flags. (NB: lines `app`, `in|out|app`, `in|app`, `binary|app`, `binary|in|out|app`, and `binary|in|app` per DR 596)

ios_base Flag combination					stdio equivalent
binary	in	out	trunc	app	
-----					-----
		+			w
		+		+	a
				+	a
		+	+		w
	+				r
	+	+			r+
	+	+	+		w+
	+	+		+	a+
	+			+	a+
-----					-----
+		+			wb
+		+		+	ab
+				+	ab
+		+	+		wb
+	+				rb
+	+	+			r+b
+	+	+	+		w+b
+	+	+		+	a+b
+	+			+	a+b
-----					-----

**overflow()**

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::int_type std::basic_filebuf< _CharT,
encoding_char_traits< _CharT > >::overflow (
    int_type __c = _Traits::eof()) [protected], [virtual], [inherited]
```

Consumes data from the buffer; writes to the controlled sequence.

**Parameters**

<code>__c</code>	An additional character to consume.
------------------	-------------------------------------

**Returns**

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>`.

References `_M_ext_buf`, `_M_ext_next`, and `eback()`.

**pbackfail()**

```
basic_filebuf<_CharT, encoding_char_traits<_CharT>>::int_type std::basic_filebuf<_CharT,
encoding_char_traits<_CharT>>::pbackfail (
    int_type __c = _Traits::eof()) [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

**Parameters**

<code>__c</code>	The character to be inserted back into the sequence.
------------------	------------------------------------------------------

**Returns**

`eof()` on failure, *some other value* on success

**Postcondition**

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>`.

References `_M_ext_buf`, `_M_ext_next`, and `eback()`.

**pbase()**

```
char_type * std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::pbase () const [inline],
[protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `eptr()` returns the end pointer for the output sequence

**pbump()**

```
void std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::pbump (
    int __n) [inline], [protected], [inherited]
```

Moving the write position.

**Parameters**

<code>_↔</code>	The delta by which to move.
<code>_n</code>	

This just advances the write position without returning any data.

**pptr()**

```
char_type * std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::pptr () const [inline],  
[protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

**pubimbue()**

```
locale std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::pubimbue (  
    const locale & __loc) [inline], [inherited]
```

Entry point for imbue().

**Parameters**

<code>__loc</code>	The new locale.
--------------------	-----------------

**Returns**

The previous locale.

Calls the derived imbue(\_\_loc).

**pubseekoff()**

```
pos_type std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::pubseekoff (  
    off_type __off,  
    ios_base::seekdir __way,  
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

**Parameters**

<code>__off</code>	Offset.
<code>__way</code>	Value for ios_base::seekdir.
<code>__mode</code>	Value for ios_base::openmode.

Calls virtual seekoff function.

**pubseekpos()**

```
pos_type std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::pubseekpos (
    pos_type __sp,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

**Parameters**

<code>__sp</code>	Position
<code>__mode</code>	Value for <code>ios_base::openmode</code> .

Calls virtual `seekpos` function.

**pubsetbuf()**

```
basic_streambuf * std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::pubsetbuf (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

**pubsync()**

```
int std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::pubsync () [inline], [inherited]
```

Calls virtual `sync` function.

**sbumpc()**

```
int_type std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::sbumpc () [inline],
[inherited]
```

Getting the next character.

**Returns**

The next character, or `eof`.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.

**seekoff()**

```
basic_filebuf<_CharT, encoding_char_traits<_CharT>>::pos_type std::basic_filebuf<_CharT,
encoding_char_traits<_CharT>>::seekoff (
    off_type __off,
    ios_base::seekdir __way,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from `std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>`.

References `gptr()`.

**seekpos()**

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::pos_type std::basic_filebuf< _CharT,
encoding_char_traits< _CharT > >::seekpos (
    pos_type __pos,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from `std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >`.

References `_M_reading`, and `_M_set_buffer()`.

**setbuf()**

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::__streambuf_type * std::basic_filebuf<
_CharT, encoding_char_traits< _CharT > >::setbuf (
    char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Manipulates the buffer.

**Parameters**

<code>__s</code>	Pointer to a buffer area.
<code>__n</code>	Size of <code>__s</code> .

**Returns**

`this`

If no file has been opened, and both `__s` and `__n` are zero, then the stream becomes unbuffered. Otherwise, `__s` is used as a buffer; see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering> for more.

Reimplemented from `std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >`.

References `_M_reading`, and `_M_set_buffer()`.

**setg()**

```
void std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::setg (
    char_type * __gbeg,
    char_type * __gnext,
    char_type * __gend) [inline], [protected], [inherited]
```

Setting the three read area pointers.

**Parameters**

<code>__gbeg</code>	A pointer.
<code>__gnext</code>	A pointer.
<code>__gend</code>	A pointer.

**Postcondition**

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

**setp()**

```
void std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::setp (
    char_type * __pbeg,
    char_type * __pend) [inline], [protected], [inherited]
```

Setting the three write area pointers.

**Parameters**

<code>__pbeg</code>	A pointer.
<code>__pend</code>	A pointer.

**Postcondition**

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == epptr()`

**sgetc()**

```
int_type std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::sgetc () [inline],
[inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

**sgetn()**

```
streamsize std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::sgetn (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for `xsgetn`.

**Parameters**

<code>__s</code>	A buffer area.
<code>__n</code>	A count.

Returns `xsgetn(__s,__n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

**showmanyc()**

```
streamsize std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::showmanyc () [protected],
[virtual], [inherited]
```

Investigating the data available.

### Returns

An estimate of the number of characters available in the input sequence, or -1.

*If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail.* [27.5.2.4.3]/1

### Note

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to `underflow` or `uflow`] will not return `eof()` but that they will return immediately.*

The standard adds that *the morphemes of `showmanyc` are **es-how-many-see**, not **show-manic**.*

Reimplemented from `std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>>`.

### `snextc()`

```
int_type std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::snextc() [inline],
[inherited]
```

Getting the next character.

### Returns

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

### `sputbackc()`

```
int_type std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::sputbackc (
    char_type __c) [inline], [inherited]
```

Pushing characters back into the input stream.

### Parameters

<code>__c</code>	The character to push back.
------------------	-----------------------------

### Returns

The previous character, if possible.

Similar to `sungetc()`, but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

### `sputc()`

```
int_type std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::sputc (
    char_type __c) [inline], [inherited]
```

Entry point for all single-character output functions.

### Parameters

<code>__c</code>	A character to output.
------------------	------------------------

**Returns**

`__c`, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores `__c` in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(↵__c)`.

**sputn()**

```
streamsize std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::sputn (
    const char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

<code>↵__s</code>	A buffer read area.
<code>↵__n</code>	A count.

One of two public output functions.

Returns `xsputn(__s,__n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

**sungetc()**

```
int_type std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::sungetc () [inline],
[inherited]
```

Moving backwards in the input stream.

**Returns**

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbackfail()`. The effect is to *unget* the last character *gotten*.

**sync()**

```
int std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::sync () [protected], [virtual],
[inherited]
```

Synchronizes the buffer arrays with the controlled sequences.

**Returns**

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

**Note**

Base class version does nothing, returns zero.

Reimplemented from `std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>`.

**uflow()**

```
virtual int_type std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::uflow () [inline],
[protected], [virtual], [inherited]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

**underflow()**

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::int_type std::basic_filebuf< _CharT,
encoding_char_traits< _CharT > >::underflow () [protected], [virtual], [inherited]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >`.

**xsgetn()**

```
streamsize std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::xsgetn (
    char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character extraction.

**Parameters**

<code>__s</code>	A buffer area.
<code>__n</code>	Maximum number of characters to assign.

**Returns**

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented from `std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >`.

**xspn()**

```
streamsize std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::xspn (
    const char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character insertion.

**Parameters**

<code>__s</code>	A buffer area.
<code>__n</code>	Maximum number of characters to write.

**Returns**

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented from `std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>`.

**6.401.3 Member Data Documentation****`_M_buf`**

```
char_type* std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_buf [protected],
[inherited]
```

Pointer to the beginning of internal buffer.

**`_M_buf_locale`**

```
locale std::basic_streambuf<_CharT, encoding_char_traits<_CharT>>::_M_buf_locale [protected],
[inherited]
```

Current locale setting.

**`_M_buf_size`**

```
size_t std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_buf_size [protected],
[inherited]
```

Actual size of internal buffer. This number is equal to the size of the put area + 1 position, reserved for the overflow char of a full area.

**`_M_ext_buf`**

```
char* std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_ext_buf [protected],
[inherited]
```

Buffer for external characters. Used for input when `codecvt::always_noconv() == false`. When valid, this corresponds to `eback()`.

Referenced by `overflow()`, and `pbackfail()`.

**`_M_ext_buf_size`**

```
streamsize std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_ext_buf_size [protected],
[inherited]
```

Size of buffer held by `_M_ext_buf`.

**\_M\_ext\_next**

```
const char* std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_ext_next [protected],  
[inherited]
```

Pointers into the buffer held by `_M_ext_buf` that delimit a subsequence of bytes that have been read but not yet converted. When valid, `_M_ext_next` corresponds to `egptr()`.

Referenced by [overflow\(\)](#), and [pbackfail\(\)](#).

**\_M\_in\_beg**

```
char_type* std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::_M_in_beg [protected],  
[inherited]
```

Start of get area.

**\_M\_in\_cur**

```
char_type* std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::_M_in_cur [protected],  
[inherited]
```

Current read area.

**\_M\_in\_end**

```
char_type* std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::_M_in_end [protected],  
[inherited]
```

End of get area.

**\_M\_mode**

```
ios_base::openmode std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_mode [protected],  
[inherited]
```

Place to stash in || out || in | out settings for current filebuf.

**\_M\_out\_beg**

```
char_type* std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::_M_out_beg [protected],  
[inherited]
```

Start of put area.

**\_M\_out\_cur**

```
char_type* std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::_M_out_cur [protected],  
[inherited]
```

Current put area.

**\_M\_out\_end**

```
char_type* std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::_M_out_end [protected],  
[inherited]
```

End of put area.

**\_M\_pback**

```
char_type std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_pback [protected],  
[inherited]
```

Necessary bits for putback buffer management.

**Note**

pbacks of over one character are not currently supported.

**`_M_pback_cur_save`**

```
char_type* std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_pback_cur_save [protected],  
[inherited]
```

Necessary bits for putback buffer management.

**Note**

pbacks of over one character are not currently supported.

**`_M_pback_end_save`**

```
char_type* std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_pback_end_save [protected],  
[inherited]
```

Necessary bits for putback buffer management.

**Note**

pbacks of over one character are not currently supported.

**`_M_pback_init`**

```
bool std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_pback_init [protected],  
[inherited]
```

Necessary bits for putback buffer management.

**Note**

pbacks of over one character are not currently supported.

**`_M_reading`**

```
bool std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_reading [protected],  
[inherited]
```

`_M_reading == false && _M_writing == false` for **uncommitted** mode; `_M_reading == true` for **read** mode; `_M_writing == true` for **write** mode;

NB: `_M_reading == true && _M_writing == true` is unused.

Referenced by [seekpos\(\)](#), and [setbuf\(\)](#).

The documentation for this class was generated from the following file:

- [enc\\_filebuf.h](#)

**6.402 `__gnu_cxx::encoding_char_traits<_CharT>` Struct Template Reference**

```

- bool **operator==** (const [error\\_category](#) &\_\_other) const noexcept

### 6.416.1 Detailed Description

Abstract base class for types defining a category of error codes.

An error category defines a context that gives meaning to the integer stored in an [error\\_code](#) or [error\\_condition](#) object. For example, the standard `errno` constants such as `EINVAL` and `ENOMEM` are associated with the "generic" category and other OS-specific error numbers are associated with the "system" category, but a user-defined category might give different meanings to the same numerical values.

A user-defined category can override the `equivalent` member functions to define correspondence between errors in different categories. For example, a category for errors from disk I/O could consider some of its error numbers equivalent to `ENOSPC` and `ENOENT` in the generic category.

Since

C++11

### 6.416.2 Member Function Documentation

#### **default\_error\_condition()**

```
virtual error\_condition std::error_category::default_error_condition (
    int __i) const [virtual], [noexcept]
```

Return an [error\\_condition](#) corresponding to `i` in this category.

#### **equivalent()** [1/2]

```
virtual bool std::error_category::equivalent (
    const error\_code & __code,
    int __i) const [virtual], [noexcept]
```

Test whether `code` corresponds to `i` for this category.

#### **equivalent()** [2/2]

```
virtual bool std::error_category::equivalent (
    int __i,
    const error\_condition & __cond) const [virtual], [noexcept]
```

Test whether `cond` corresponds to `i` for this category.

**message()**

```
virtual string std::error_category::message (
    int ) const [pure virtual]
```

A description of the error condition corresponding to the number.

References [message\(\)](#).

Referenced by [message\(\)](#), [std::error\\_code::message\(\)](#), and [std::error\\_condition::message\(\)](#).

**name()**

```
virtual const char * std::error_category::name () const [pure virtual], [noexcept]
```

A string that identifies the error category.

**operator<=>()**

```
strong_ordering std::error_category::operator<=> (
    const error_category & __rhs) const [inline], [nodiscard], [noexcept]
```

Ordered comparison that defines a total order for error categories.

References [operator<=>\(\)](#).

Referenced by [operator<=>\(\)](#).

**operator==()**

```
bool std::error_category::operator== (
    const error_category & __other) const [inline], [noexcept]
```

An error\_category only compares equal to itself.

### 6.417.1 Detailed Description

Class `error_code`

This class is a value type storing an integer error number and a category that gives meaning to the error number. Typically this is done close to the point where the error happens, to capture the original error value.

An `error_code` object can be used to store the original error value emitted by some subsystem, with a category relevant to the subsystem. For example, errors from POSIX library functions can be represented by an `errno` value and the "generic" category, but errors from an HTTP library might be represented by an HTTP response status code (e.g. 404) and a custom category defined by the library.

Since

C++11

### 6.417.2 Constructor & Destructor Documentation

#### `error_code()`

```
template<typename _ErrorCodeEnum, typename = _Check<_ErrorCodeEnum>>
std::error_code::error_code (
    _ErrorCodeEnum __e) [inline], [noexcept]
```

Initialize with a user-defined type, by calling `make_error_code`.

References [make\\_error\\_code\(\)](#).

### 6.417.3 Member Function Documentation

#### `category()`

```
const error_category & std::error_code::category () const [inline], [noexcept]
```

The error category that this error belongs to.

Referenced by [message\(\)](#).

#### `default_error_condition()`

```
error_condition std::error_code::default_error_condition () const [noexcept]
```

An `error_condition` for this error's category and value.

#### `message()`

```
string std::error_code::message () const [inline]
```

The category's description of the value.

References [category\(\)](#), [std::error\\_category::message\(\)](#), [message\(\)](#), and [value\(\)](#).

Referenced by [message\(\)](#).

#### `operator bool()`

```
std::error_code::operator bool () const [inline], [explicit], [noexcept]
```

Test whether `value()` is non-zero.

**value()**

```
int std::error_code::value () const [inline], [noexcept]
```

The error value.

Referenced by [message\(\)](#).

- bool [operator==](#) (const [error\\_condition](#) &\_\_lhs, const [error\\_condition](#) &\_\_rhs) noexcept

**6.418.1 Detailed Description**

Class `error_condition`

This class represents error conditions that may be visible at an API boundary. Different `error_code` values that can occur within a library or module might map to the same `error_condition`.

An `error_condition` represents something that the program can test for, and subsequently take appropriate action.

Since

C++11

**6.418.2 Constructor & Destructor Documentation****`error_condition()` [1/3]**

```
std::error_condition::error_condition () [inline], [noexcept]
```

Initialize with a zero (no error) value and the generic category.

References [std::generic\\_category\(\)](#).

Referenced by [make\\_error\\_condition\(\)](#), [operator<=>\(\)](#), [operator==\(\)](#), and [operator==\(\)](#).

**error\_condition()** [2/3]

```
std::error_condition::error_condition (
    int __v,
    const error\_category & __cat) [inline], [noexcept]
```

Initialize with the specified value and category.

**error\_condition()** [3/3]

```
template<typename _ErrorConditionEnum, typename = _Check<_ErrorConditionEnum>>
std::error_condition::error_condition (
    _ErrorConditionEnum __e) [inline], [noexcept]
```

Initialize with a user-defined type, by calling `make_error_condition`.

References [make\\_error\\_condition\(\)](#).

**6.418.3 Member Function Documentation****assign()**

```
void std::error_condition::assign (
    int __v,
    const error\_category & __cat) [inline], [noexcept]
```

Set the value and category.

Referenced by [clear\(\)](#).

**category()**

```
const error\_category & std::error_condition::category () const [inline], [noexcept]
```

The error category that this error belongs to.

Referenced by [message\(\)](#).

**clear()**

```
void std::error_condition::clear () [inline], [noexcept]
```

Reset the value and category to the default-constructed state.

References [assign\(\)](#), and [std::generic\\_category\(\)](#).

**message()**

```
string std::error_condition::message () const [inline]
```

The category's description of the value.

References [category\(\)](#), [std::error\\_category::message\(\)](#), and [value\(\)](#).

**operator bool()**

```
std::error_condition::operator bool () const [inline], [explicit], [noexcept]
```

Test whether `value()` is non-zero.

**value()**

```
int std::error_condition::value () const [inline], [noexcept]
```

The error value.

Referenced by [message\(\)](#).

## 6.419 `__gnu_parallel::exact_tag` Struct Reference

```
#include <tags.h>
```

Inheritance diagram for `__gnu_parallel::exact_tag`:

### Public Member Functions

- **`exact_tag`** ([\\_ThreadIndex](#) \_\_num\_threads)
- [\\_ThreadIndex](#) `__get_num_threads` ()
- void `set_num_threads` ([\\_ThreadIndex](#) \_\_num\_threads)

#### 6.419.1 Detailed Description

Forces parallel merging with exact splitting, at compile time.

#### 6.419.2 Member Function Documentation

##### `__get_num_threads()`

```
\_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline], [inherited]
```

Find out desired number of threads.

##### Returns

Desired number of threads.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), and [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#).

##### `set_num_threads()`

```
void __gnu_parallel::parallel_tag::set_num_threads (
    \_ThreadIndex __num_threads) [inline], [inherited]
```

Set the desired number of threads.

##### Parameters

<code>__num_threads</code>	Desired number of threads.

## 6.420 std::exception Class Reference

```
#include <exception.h>
```

Inheritance diagram for std::exception:

### Public Member Functions

- `_GLIBCXX26_CONSTEXPR exception (const exception &)=default`
- `_GLIBCXX26_CONSTEXPR exception (exception &&)=default`
- `_GLIBCXX26_CONSTEXPR exception & operator= (const exception &)=default`
- `_GLIBCXX26_CONSTEXPR exception & operator= (exception &&)=default`
- `virtual const char * what () const noexcept`

#### 6.420.1 Detailed Description

Base class for all library exceptions.

This is the base class for all exceptions thrown by the standard library, and by certain language expressions. You are free to derive your own exception classes, or use a different hierarchy, or to throw non-class data (e.g., fundamental types).

## 6.420.2 Member Function Documentation

### `what()`

```
virtual const char * std::exception::what () const [virtual], [noexcept]
```

Returns a C-style character string describing the general cause of the current error.

Reimplemented in `std::bad_alloc`, `std::bad_cast`, `std::bad_exception`, `std::bad_function_call`, `std::bad_typeid`, `std::bad_weak_ptr`, `std::experimental::filesystem::v1::filesystem_error`, `std::experimental::fundamentals_v1::bad_any_cast`, `std::filesystem::filesystem_error`, `std::future_error`, `std::logic_error`, and `std::runtime_error`.

The documentation for this class was generated from the following file:

### 6.423.1 Detailed Description

```
template<typename _RealType = double>
class std::exponential_distribution<_RealType>
```

An exponential continuous distribution for random numbers.

The formula for the exponential probability density function is  $p(x|\lambda) = \lambda e^{-\lambda x}$ .

**Table 2299 Distribution Statistics**

Mean	$\frac{1}{\lambda}$
Median	$\frac{\ln 2}{\lambda}$
Mode	<i>zero</i>
Range	$[0, \infty]$
Standard Deviation	$\frac{1}{\lambda}$

Since

C++11

### 6.423.2 Member Typedef Documentation

#### result\_type

```
template<typename _RealType = double>
typedef _RealType std::exponential\_distribution<_RealType>::result_type
```

The type of the range of the distribution.

### 6.423.3 Constructor & Destructor Documentation

#### **exponential\_distribution()** [1/2]

```
template<typename _RealType = double>
std::exponential_distribution< _RealType >::exponential_distribution () [inline]
```

Constructs an exponential distribution with inverse scale parameter 1.0.

#### **exponential\_distribution()** [2/2]

```
template<typename _RealType = double>
std::exponential_distribution< _RealType >::exponential_distribution (
    _RealType __lambda) [inline], [explicit]
```

Constructs an exponential distribution with inverse scale parameter  $\lambda$ .

### 6.423.4 Member Function Documentation

#### **lambda()**

```
template<typename _RealType = double>
_RealType std::exponential_distribution< _RealType >::lambda () const [inline]
```

Returns the inverse scale parameter of the distribution.

#### **max()**

```
template<typename _RealType = double>
result_type std::exponential_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### **min()**

```
template<typename _RealType = double>
result_type std::exponential_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

#### **operator>()()**

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::exponential_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator>\(\)\(\)](#).

#### **param()** [1/2]

```
template<typename _RealType = double>
param_type std::exponential_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Referenced by [std::operator>>\(\)](#).

#### **param()** [2/2]

```
template<typename _RealType = double>
void std::exponential_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

## Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

**reset()**

```
template<typename _RealType = double>
void std::exponential_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.  
Has no effect on exponential distributions.

**6.423.5 Friends And Related Symbol Documentation****operator==**

```
template<typename _RealType = double>
bool operator== (
    const exponential_distribution< _RealType > & __d1,
    const exponential_distribution< _RealType > & __d2) [friend]
```

Return true if two exponential distributions have the same parameters.

## Friends

- bool `operator==` (const `extreme_value_distribution` &\_\_d1, const `extreme_value_distribution` &\_\_d2)

### 6.425.1 Detailed Description

```
template<typename _RealType = double>
class std::extreme_value_distribution< _RealType >
```

A `extreme_value_distribution` random number distribution.  
The formula for the normal probability mass function is

$$p(x|a,b) = \frac{1}{b} \exp\left(\frac{a-x}{b} - \exp\left(\frac{a-x}{b}\right)\right)$$

Since

C++11

### 6.425.2 Member Typedef Documentation

#### `result_type`

```
template<typename _RealType = double>
typedef _RealType std::extreme_value_distribution< _RealType >::result_type
```

The type of the range of the distribution.

### 6.425.3 Member Function Documentation

#### `a()`

```
template<typename _RealType = double>
_RealType std::extreme_value_distribution< _RealType >::a () const [inline]
```

Return the *a* parameter of the distribution.

#### `b()`

```
template<typename _RealType = double>
_RealType std::extreme_value_distribution< _RealType >::b () const [inline]
```

Return the *b* parameter of the distribution.

#### `max()`

```
template<typename _RealType = double>
result_type std::extreme_value_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### `min()`

```
template<typename _RealType = double>
result_type std::extreme_value_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

**operator()()**

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::extreme_value_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

**param() [1/2]**

```
template<typename _RealType = double>
param_type std::extreme_value_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Referenced by [std::operator>>\(\)](#).

**param() [2/2]**

```
template<typename _RealType = double>
void std::extreme_value_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

**reset()**

```
template<typename _RealType = double>
void std::extreme_value_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

**6.425.4 Friends And Related Symbol Documentation****operator==**

```
template<typename _RealType = double>
bool operator== (
    const extreme_value_distribution< _RealType > & __d1,
    const extreme_value_distribution< _RealType > & __d2) [friend]
```

Return true if two extreme value distributions have the same parameters.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

**6.426 std::locale::facet Class Reference**

### Friends

- class `locale`
- class `locale::_Impl`

#### 6.426.1 Detailed Description

Localization functionality base class.

The facet class is the base class for a localization feature, such as money, time, and number printing. It provides common support for facets and reference management.

Facets may not be copied or assigned.

#### 6.426.2 Constructor & Destructor Documentation

##### facet()

```
std::locale::facet::facet (
    size_t __refs = 0) throw ( )    [inline], [explicit], [protected]
```

Facet constructor.

This is the constructor provided by the standard. If refs is 0, the facet is destroyed when the last referencing locale is destroyed. Otherwise the facet will never be destroyed.

##### Parameters

<code>__refs</code>	The initial value for reference count.
---------------------	----------------------------------------

Referenced by `std::__cxx11::collate<_CharT>::collate()`, `std::__cxx11::collate<_CharT>::collate()`, `std::messages<_CharT>::messages()`, `std::messages<_CharT>::messages()`, `std::money_get<_CharT, _InIter>::money_get()`, `std::money_put<_CharT, _OutIter>::money_put()`, `std::moneypunct<_CharT, _Intl>::moneypunct()`, `std::moneypunct<_CharT, _Intl>::moneypunct()`, `std::moneypunct<_CharT, _Intl>::moneypunct()`, `std::num_get<_CharT, istreambuf_iterator<_CharT, _Traits>>::num_get()`, `std::num_put<_CharT, ostreambuf_iterator<_CharT, _Traits>>::num_put()`, `std::num_punct<_CharT>::num_punct()`, `std::num_punct<_CharT>::num_punct()`, `std::num_punct<_CharT>::num_punct()`, `std::time_get<_CharT, _InIter>::time_get()`, `std::time_put<_CharT, _OutIter>::time_put()`, and `~facet()`.

##### ~facet()

```
virtual std::locale::facet::~~facet ()    [protected], [virtual]
```

Facet destructor.

### 6.431.1 Detailed Description

**template<typename \_RealType = double>**  
**class std::fisher\_f\_distribution< \_RealType >**

A fisher\_f\_distribution random number distribution.

The formula for the normal probability mass function is

$$p(x|m, n) = \frac{\Gamma((m+n)/2)}{\Gamma(m/2)\Gamma(n/2)} \left(\frac{m}{n}\right)^{m/2} x^{(m/2)-1} \left(1 + \frac{mx}{n}\right)^{-(m+n)/2}$$

Since

C++11

### 6.431.2 Member Typedef Documentation

#### result\_type

```
template<typename _RealType = double>
typedef _RealType std::fisher_f_distribution< _RealType >::result_type
```

The type of the range of the distribution.

### 6.431.3 Member Function Documentation

#### max()

```
template<typename _RealType = double>
result_type std::fisher_f_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### min()

```
template<typename _RealType = double>
result_type std::fisher_f_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

#### operator>()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::fisher_f_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

#### param() [1/2]

```
template<typename _RealType = double>
param_type std::fisher_f_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

#### param() [2/2]

```
template<typename _RealType = double>
void std::fisher_f_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

#### Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

#### reset()

```
template<typename _RealType = double>
void std::fisher_f_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

#### 6.431.4 Friends And Related Symbol Documentation

##### operator<<

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::fisher_f_distribution< _RealType1 > & __x) [friend]
```

Inserts a fisher\_f\_distribution random number distribution \_\_x into the output stream \_\_os.

##### Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A fisher_f_distribution random number distribution.

##### Returns

The output stream with the state of \_\_x inserted or in an error state.

##### operator==

```
template<typename _RealType = double>
bool operator== (
    const fisher_f_distribution< _RealType > & __d1,
    const fisher_f_distribution< _RealType > & __d2) [friend]
```

Return true if two Fisher f distributions have the same parameters and the sequences that would be generated are equal.

##### operator>>

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::fisher_f_distribution< _RealType1 > & __x) [friend]
```

Extracts a fisher\_f\_distribution random number distribution \_\_x from the input stream \_\_is.

##### Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A fisher_f_distribution random number generator engine.

##### Returns

The input stream with \_\_x extracted or in an error state.

### 6.435.1 Detailed Description

template<typename \_Tp, typename \_Alloc = allocator<\_Tp>>  
class std::forward\_list<\_Tp, \_Alloc >

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

Since

C++11

#### Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> .

Meets the requirements of a [container](#), a [sequence](#), including the [optional sequence requirements](#) with the exception of `at` and `operator[]`.

This is a *singly linked* list. Traversal up the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike `std::vector` and `std::deque`, random-access iterators are not provided, so subscripting (`[]`) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.

Also unlike the other standard containers, `std::forward_list` provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

## 6.435.2 Constructor & Destructor Documentation

### forward\_list() [1/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list () [default]
```

Creates a forward\_list with no elements.

Referenced by [insert\\_after\(\)](#), [insert\\_after\(\)](#), [merge\(\)](#), [operator=\(\)](#), [remove\(\)](#), [resize\(\)](#), [resize\(\)](#), [sort\(\)](#), and [splice\\_after\(\)](#).

### forward\_list() [2/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    const _Alloc & __al) [inline], [explicit], [noexcept]
```

Creates a forward\_list with no elements.

#### Parameters

<code>__al</code>	An allocator object.
-------------------	----------------------

### forward\_list() [3/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    const forward_list< _Tp, _Alloc > & __list,
    const __type_identity_t< _Alloc > & __al) [inline]
```

Copy constructor with allocator argument.

#### Parameters

<code>__list</code>	Input list to copy.
<code>__al</code>	An allocator object.

### forward\_list() [4/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    forward_list< _Tp, _Alloc > && __list,
    const __type_identity_t< _Alloc > & __al) [inline], [noexcept]
```

Move constructor with allocator argument.

#### Parameters

<code>__list</code>	Input list to move.
<code>__al</code>	An allocator object.

### forward\_list() [5/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
```

```

    size_type __n,
    const _Alloc & __al = _Alloc()) [inline], [explicit]

```

Creates a forward\_list with default constructed elements.

#### Parameters

<code>__n</code>	The number of elements to initially create.
<code>__al</code>	An allocator object.

This constructor creates the forward\_list with `__n` default constructed elements.

#### forward\_list() [6/10]

```

template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list<_Tp, _Alloc >::forward_list (
    size_type __n,
    const _Tp & __value,
    const _Alloc & __al = _Alloc()) [inline]

```

Creates a forward\_list with copies of an exemplar element.

#### Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__al</code>	An allocator object.

This constructor fills the forward\_list with `__n` copies of `__value`.

#### forward\_list() [7/10]

```

template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
std::forward_list<_Tp, _Alloc >::forward_list (
    _InputIterator __first,
    _InputIterator __last,
    const _Alloc & __al = _Alloc()) [inline]

```

Builds a forward\_list from a range.

#### Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__al</code>	An allocator object.

Create a forward\_list consisting of copies of the elements from `[__first, __last)`. This is linear in `N` (where `N` is `distance(__first, __last)`).

#### forward\_list() [8/10]

```

template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list<_Tp, _Alloc >::forward_list (
    const forward_list<_Tp, _Alloc > & __list) [inline]

```

The forward\_list copy constructor.

## Parameters

<code>__list</code>	A forward_list of identical element and allocator types.
---------------------	----------------------------------------------------------

**forward\_list()** [9/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    forward_list< _Tp, _Alloc > && ) [default]
```

The forward\_list move constructor.

## Parameters

<code>__list</code>	A forward_list of identical element and allocator types.
---------------------	----------------------------------------------------------

The newly-created forward\_list contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified forward\_list.

**forward\_list()** [10/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    std::initializer_list< _Tp > __il,
    const _Alloc & __al = _Alloc()) [inline]
```

Builds a forward\_list from an initializer\_list.

## Parameters

<code>__il</code>	An initializer_list of value_type.
<code>__al</code>	An allocator object.

Create a forward\_list consisting of copies of the elements in the initializer\_list `__il`. This is linear in `__il.size()`.

**~forward\_list()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::~~forward_list () [inline], [noexcept]
```

The forward\_list dtor.

**6.435.3 Member Function Documentation****assign()** [1/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
void std::forward_list< _Tp, _Alloc >::assign (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Assigns a range to a forward\_list.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a `forward_list` with copies of the elements in the range `[ __first, __last)`.

Note that the assignment completely changes the `forward_list` and that the number of elements of the resulting `forward_list` is the same as the number of elements assigned.

Referenced by `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::assign()`, `operator=()`, `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::operator=()` and `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::operator=()`.

**assign()** [2/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::assign (
    size_type __n,
    const _Tp & __val) [inline]
```

Assigns a given value to a `forward_list`.

## Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a `forward_list` with `__n` copies of the given value. Note that the assignment completely changes the `forward_list`, and that the resulting `forward_list` has `__n` elements.

**assign()** [3/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::assign (
    std::initializer_list< _Tp > __il) [inline]
```

Assigns an `initializer_list` to a `forward_list`.

## Parameters

<code>__il</code>	An <code>initializer_list</code> of <code>value_type</code> .
-------------------	---------------------------------------------------------------

Replace the contents of the `forward_list` with copies of the elements in the `initializer_list` `__il`. This is linear in `__il.size()`.

**before\_begin()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list< _Tp, _Alloc >::before_begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points before the first element in the `forward_list`. Iteration is done in ordinary element order.

**before\_begin()** [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::before_begin () [inline], [noexcept]
```

Returns a read/write iterator that points before the first element in the `forward_list`. Iteration is done in ordinary element order.

Referenced by `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::assign()`, `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::insert_after()`, `insert_after()`, `resize()`, and `resize()`.

### **begin()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list<_Tp, _Alloc>::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

### **begin()** [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list<_Tp, _Alloc>::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

Referenced by `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::assign()`, and `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::push_back()`.

### **cbegin\_begin()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list<_Tp, _Alloc>::cbegin_begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points before the first element in the `forward_list`. Iteration is done in ordinary element order.

Referenced by `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::assign()`, `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::emplace_front()`, `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::push_back()`, and `remove()`.

### **cbegin()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list<_Tp, _Alloc>::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

Referenced by `std::operator==()`.

### **cend()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list<_Tp, _Alloc>::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `forward_list`. Iteration is done in ordinary element order.

Referenced by `std::operator==()`.

### **clear()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list<_Tp, _Alloc>::clear () [inline], [noexcept]
```

Erases all the elements.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Referenced by `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::assign()`, `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::operator=()`, and `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::operator=()`.

**emplace\_after()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename... _Args>
iterator std::forward\_list< _Tp, _Alloc >::emplace_after (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Constructs object in `forward_list` after the specified iterator.

**Parameters**

<code>__pos</code>	A <code>const_iterator</code> into the <code>forward_list</code> .
<code>__args</code>	Arguments.

**Returns**

An iterator that points to the inserted data.

This function will insert an object of type `T` constructed with `T(std::forward<Args>(args) ...)` after the specified location. Due to the nature of a `forward_list` this operation can be done in constant time, and does not invalidate iterators and references.

**emplace\_front()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename... _Args>
reference std::forward\_list< _Tp, _Alloc >::emplace_front (
    _Args &&... __args) [inline]
```

Constructs object in `forward_list` at the front of the list.

**Parameters**

<code>__args</code>	Arguments.
---------------------	------------

This function will insert an object of type `Tp` constructed with `Tp(std::forward<Args>(args) ...)` at the front of the list. Due to the nature of a `forward_list` this operation can be done in constant time, and does not invalidate iterators and references.

**empty()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
bool std::forward\_list< _Tp, _Alloc >::empty () const [inline], [noexcept]
```

Returns true if the `forward_list` is empty. (Thus `begin()` would equal `end()`.)  
Referenced by [insert\\_after\(\)](#), and [sort\(\)](#).

**end()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward\_list< _Tp, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only iterator that points one past the last element in the `forward_list`. Iteration is done in ordinary element order.

**end()** [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list<_Tp, _Alloc>::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the `forward_list`. Iteration is done in ordinary element order.

Referenced by `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::assign()`, `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::insert_after()`, `insert_after()`, `resize()`, and `resize()`.

**erase\_after()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list<_Tp, _Alloc>::erase_after (
    const_iterator __pos) [inline]
```

Removes the element pointed to by the iterator following `pos`.

**Parameters**

<code>__pos</code>	Iterator pointing before element to be erased.
--------------------	------------------------------------------------

**Returns**

An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

This function will erase the element at the given position and thus shorten the `forward_list` by one.

Due to the nature of a `forward_list` this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Referenced by `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::assign()`, `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::resize()`, and `resize()`.

**erase\_after()** [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list<_Tp, _Alloc>::erase_after (
    const_iterator __pos,
    const_iterator __last) [inline]
```

Remove a range of elements.

**Parameters**

<code>__pos</code>	Iterator pointing before the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

**Returns**

`__last`

This function will erase the elements in the range `(__pos, __last)` and shorten the `forward_list` accordingly.

This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed.

The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**front()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
reference std::forward\_list< _Tp, _Alloc >::front () [inline]
Returns a read/write reference to the data at the first element of the forward_list.
Referenced by std::forward\_list< \_Tp, polymorphic\_allocator< \_Tp > >::emplace\_front\(\).
```

**front()** [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_reference std::forward\_list< _Tp, _Alloc >::front () const [inline]
Returns a read-only (constant) reference to the data at the first element of the forward_list.
```

**get\_allocator()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
allocator_type std::forward\_list< _Tp, _Alloc >::get_allocator () const [inline], [noexcept]
Get a copy of the memory allocation object.
Referenced by insert\_after\(\), insert\_after\(\), and remove\(\).
```

**insert\_after()** [1/4]

```
template<typename _Tp, typename _Alloc>
template<typename _InputIterator, typename>
forward\_list< _Tp, _Alloc >::iterator forward\_list::insert\_after (
    const_iterator __pos,
    _InputIterator __first,
    _InputIterator __last)
Inserts a range into the forward_list.
```

**Parameters**

<code>__pos</code>	An iterator into the forward_list.
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

**Returns**

An iterator pointing to the last inserted element or `__pos` if `__first == __last`.

This function will insert copies of the data in the range [ `__first`, `__last`) into the forward\_list after the location specified by `__pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

References [forward\\_list\(\)](#), [before\\_begin\(\)](#), [empty\(\)](#), [end\(\)](#), and [get\\_allocator\(\)](#).

**insert\_after()** [2/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward\_list< _Tp, _Alloc >::insert_after (
    const_iterator __pos,
    const _Tp & __val) [inline]
Inserts given value into forward_list after specified iterator.
```

## Parameters

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__val</code>	Data to be inserted.

## Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value after the specified location. Due to the nature of a `forward_list` this operation can be done in constant time, and does not invalidate iterators and references.

Referenced by [std::forward\\_list<\\_Tp, polymorphic\\_allocator<\\_Tp>>::assign\(\)](#), [std::forward\\_list<\\_Tp, polymorphic\\_allocator<\\_Tp>>::insert\\_after\(\)](#), and [resize\(\)](#).

**insert\_after()** [3/4]

```
template<typename _Tp, typename _Alloc>
forward_list<_Tp, _Alloc>::iterator forward_list::insert_after (
    const_iterator __pos,
    size_type __n,
    const _Tp & __val)
```

Inserts a number of copies of given data into the `forward_list`.

## Parameters

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__n</code>	Number of elements to be inserted.
<code>__val</code>	Data to be inserted.

## Returns

An iterator pointing to the last inserted copy of `val` or `pos` if `n == 0`.

This function will insert a specified number of copies of the given data after the location specified by `pos`. This operation is linear in the number of elements inserted and does not invalidate iterators and references. References [forward\\_list\(\)](#), [before\\_begin\(\)](#), [end\(\)](#), and [get\\_allocator\(\)](#).

**insert\_after()** [4/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list<_Tp, _Alloc>::insert_after (
    const_iterator __pos,
    std::initializer_list<_Tp> __il) [inline]
```

Inserts the contents of an `initializer_list` into `forward_list` after the specified iterator.

## Parameters

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__il</code>	An <code>initializer_list</code> of <code>value_type</code> .

## Returns

An iterator pointing to the last inserted element or `__pos` if `__il` is empty.

This function will insert copies of the data in the `initializer_list` `__il` into the `forward_list` before the location specified by `__pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

**max\_size()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
size_type std::forward_list< _Tp, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the largest possible number of elements of `forward_list`.

**merge()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::merge (
    forward_list< _Tp, _Alloc > && __list) [inline]
```

Merge sorted lists.

**Parameters**

<code>__list</code>	Sorted list to merge.
---------------------	-----------------------

Assumes that both `__list` and this list are sorted according to `operator<()`. Merges elements of `__list` into this list in sorted order, leaving `__list` empty when complete. Elements in this list precede elements in `__list` that are equal.

Referenced by `std::forward_list< _Tp, polymorphic_allocator< _Tp > >::merge()`.

**merge()** [2/2]

```
template<typename _Tp, typename _Alloc>
template<typename _Comp>
void forward_list::merge (
    forward_list< _Tp, _Alloc > && __list,
    _Comp __comp)
```

Merge sorted lists according to comparison function.

**Parameters**

<code>__list</code>	Sorted list to merge.
<code>__comp</code>	Comparison function defining sort order.

Assumes that both `__list` and this list are sorted according to `comp`. Merges elements of `__list` into this list in sorted order, leaving `__list` empty when complete. Elements in this list precede elements in `__list` that are equivalent according to `comp()`.

References `forward_list()`, `std::__addressof()`, and `std::move()`.

**operator=()** [1/3]

```
template<typename _Tp, typename _Alloc>
forward_list< _Tp, _Alloc > & forward_list::operator= (
    const forward_list< _Tp, _Alloc > & __list)
```

The `forward_list` assignment operator.

**Parameters**

<code>__list</code>	A <code>forward_list</code> of identical element and allocator types.
---------------------	-----------------------------------------------------------------------

All the elements of `__list` are copied.

Whether the allocator is copied depends on the allocator traits.

References `forward_list()`, `std::__addressof()`, `assign()`, and `clear()`.

**operator=()** [2/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
forward_list & std::forward_list< _Tp, _Alloc >::operator= (
    forward_list< _Tp, _Alloc > && __list) [inline], [noexcept]
```

The forward\_list move assignment operator.

**Parameters**

<code>__list</code>	A forward_list of identical element and allocator types.
---------------------	----------------------------------------------------------

The contents of `__list` are moved into this forward\_list (without copying, if the allocators permit it).

Afterwards `__list` is a valid, but unspecified forward\_list

Whether the allocator is moved depends on the allocator traits.

**operator=()** [3/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
forward_list & std::forward_list< _Tp, _Alloc >::operator= (
    std::initializer_list< _Tp > __il) [inline]
```

The forward\_list initializer list assignment operator.

**Parameters**

<code>__il</code>	An initializer_list of value_type.
-------------------	------------------------------------

Replace the contents of the forward\_list with copies of the elements in the initializer\_list `__il`. This is linear in `__il.size()`.

**pop\_front()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::pop_front () [inline]
```

Removes first element.

This is a typical stack operation. It shrinks the forward\_list by one. Due to the nature of a forward\_list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

**push\_front()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::push_front (
    const _Tp & __val) [inline]
```

Add data to the front of the forward\_list.

**Parameters**

<code>__val</code>	Data to be added.
--------------------	-------------------

This is a typical stack operation. The function creates an element at the front of the forward\_list and assigns the given data to it. Due to the nature of a forward\_list this operation can be done in constant time, and does not invalidate iterators and references.

**remove()**

```
template<typename _Tp, typename _Alloc>
auto forward_list::remove (
    const _Tp & __val)
```

Remove all elements equal to value.

**Parameters**

<code>__val</code>	The value to remove.
--------------------	----------------------

Removes every element in the list equal to `__val`. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [forward\\_list\(\)](#), [cbefore\\_begin\(\)](#), [get\\_allocator\(\)](#), and [splice\\_after\(\)](#).

**remove\_if()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename _Pred>
__remove_return_type std::forward_list< _Tp, _Alloc >::remove_if (
    _Pred __pred)
```

Remove all elements satisfying a predicate.

**Parameters**

<code>__pred</code>	Unary predicate function or object.
---------------------	-------------------------------------

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**resize()** [1/2]

```
template<typename _Tp, typename _Alloc>
void forward_list::resize (
    size_type __sz)
```

Resizes the `forward_list` to the specified number of elements.

**Parameters**

<code>__sz</code>	Number of elements the <code>forward_list</code> should contain.
-------------------	------------------------------------------------------------------

This function will resize the `forward_list` to the specified number of elements. If the number is smaller than the `forward_list`'s current number of elements the `forward_list` is truncated, otherwise the `forward_list` is extended and the new elements are default constructed.

References [forward\\_list\(\)](#), [before\\_begin\(\)](#), [end\(\)](#), and [erase\\_after\(\)](#).

**resize()** [2/2]

```
template<typename _Tp, typename _Alloc>
void forward_list::resize (
    size_type __sz,
    const value_type & __val)
```

Resizes the `forward_list` to the specified number of elements.

## Parameters

<code>__sz</code>	Number of elements the forward_list should contain.
<code>__val</code>	Data with which new elements should be populated.

This function will resize the forward\_list to the specified number of elements. If the number is smaller than the forward\_list's current number of elements the forward\_list is truncated, otherwise the forward\_list is extended and new elements are populated with given data.

References [forward\\_list\(\)](#), [before\\_begin\(\)](#), [end\(\)](#), [erase\\_after\(\)](#), and [insert\\_after\(\)](#).

**reverse()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::reverse () [inline], [noexcept]
```

Reverse the elements in list.

Reverse the order of elements in the list in linear time.

**sort()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::sort () [inline]
```

Sort the elements of the list.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Referenced by [std::forward\\_list< \\_Tp, polymorphic\\_allocator< \\_Tp > >::sort\(\)](#).

**sort()** [2/2]

```
template<typename _Tp, class _Alloc>
template<typename _Comp>
void forward_list::sort (
    _Comp __comp)
```

Sort the forward\_list using a comparison function.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

References [forward\\_list\(\)](#), and [empty\(\)](#).

**splice\_after()** [1/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::splice_after (
    const_iterator __pos,
    forward_list< _Tp, _Alloc > && ,
    const_iterator __before,
    const_iterator __last) [inline], [noexcept]
```

Insert range from another forward\_list.

## Parameters

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.
<code>__before</code>	Iterator referencing before the start of range in <code>__list</code> .
<code>__last</code>	Iterator referencing the end of range in <code>__list</code> .

Removes elements in the range (`__before`, `__last`) and inserts them after `__pos` in constant time. Undefined if `__pos` is in (`__before`, `__last`).

**splice\_after()** [2/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::splice_after (
    const_iterator __pos,
    forward_list< _Tp, _Alloc > && __list) [inline], [noexcept]
```

Insert contents of another forward\_list.

**Parameters**

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.

The elements of `list` are inserted in constant time after the element referenced by `pos`. `list` becomes an empty list.

Requires `this != &x`.

Referenced by [remove\(\)](#), and [std::forward\\_list< \\_Tp, polymorphic\\_allocator< \\_Tp > >::splice\\_after\(\)](#).

**splice\_after()** [3/4]

```
template<typename _Tp, typename _Alloc>
void forward_list::splice_after (
    const_iterator __pos,
    forward_list< _Tp, _Alloc > && __list,
    const_iterator __i) [noexcept]
```

Insert element from another forward\_list.

**Parameters**

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.
<code>__i</code>	Iterator referencing the element before the element to move.

Removes the element in list `__list` referenced by `__i` and inserts it into the current list after `__pos`.

References [forward\\_list\(\)](#).

**splice\_after()** [4/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::splice_after (
    const_iterator __pos,
    forward_list< _Tp, _Alloc > & ,
    const_iterator __before,
    const_iterator __last) [inline], [noexcept]
```

Insert range from another forward\_list.

**Parameters**

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.
<code>__before</code>	Iterator referencing before the start of range in <code>__list</code> .
<code>__last</code>	Iterator referencing the end of range in <code>__list</code> .

Removes elements in the range `(__before, __last)` and inserts them after `__pos` in constant time.

Undefined if `__pos` is in `(__before, __last)`.

**swap()**

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list<_Tp, _Alloc>::swap (
    forward_list<_Tp, _Alloc> & __list) [inline], [noexcept]
```

Swaps data with another `forward_list`.

**Parameters**

<code>__list</code>	A <code>forward_list</code> of the same element and allocator types.
---------------------	----------------------------------------------------------------------

This exchanges the elements between two lists in constant time. Note that the global `std::swap()` function is overloaded such that `std::swap(l1, l2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

**unique()** [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
__remove_return_type std::forward_list<_Tp, _Alloc>::unique () [inline]
```

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Referenced by `std::forward_list<_Tp, polymorphic_allocator<_Tp>>::unique()`.

**unique()** [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename _BinPred>
__remove_return_type std::forward_list<_Tp, _Alloc>::unique (
    _BinPred __binary_pred)
```

Remove consecutive elements satisfying a predicate.

**Parameters**

<code>__binary_pred</code>	Binary predicate function or object.
----------------------------	--------------------------------------

For each consecutive set of elements `[first,last)` that satisfy `predicate(first,i)` where `i` is an iterator in `[first,last)`, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**6.436 `std::fpos<_StateT>` Class Template Reference**

```
#include <postypes.h>
```

**Public Member Functions**

- `fpos` (const `fpos` &)=default
- `fpos` (streamoff \_\_off)
- `operator streamoff` () const

- `fpos operator+ (streamoff __off) const`
- `fpos & operator+= (streamoff __off)`
- `streamoff operator- (const fpos & __other) const`
- `fpos operator- (streamoff __off) const`
- `fpos & operator-= (streamoff __off)`
- `fpos & operator= (const fpos &)=default`
- `_StateT state () const`
- `void state (_StateT __st)`

### 6.436.1 Detailed Description

```
template<typename _StateT>
class std::fpos< _StateT >
```

Class representing stream positions.

The standard places no requirements upon the template parameter StateT. In this implementation StateT must be DefaultConstructible, CopyConstructible and Assignable. The standard only requires that fpos should contain a member of type StateT. In this implementation it also contains an offset stored as a signed integer.

#### Parameters

<i>StateT</i>	Type passed to and returned from state().
---------------	-------------------------------------------

### 6.436.2 Constructor & Destructor Documentation

#### fpos()

```
template<typename _StateT>
std::fpos< _StateT >::fpos (
    streamoff __off) [inline]
```

Construct position from offset.

### 6.436.3 Member Function Documentation

#### operator streamoff()

```
template<typename _StateT>
std::fpos< _StateT >::operator streamoff () const [inline]
```

Convert to streamoff.

#### operator+()

```
template<typename _StateT>
fpos std::fpos< _StateT >::operator+ (
    streamoff __off) const [inline]
```

Add position and offset.

#### operator+=()

```
template<typename _StateT>
fpos & std::fpos< _StateT >::operator+= (
    streamoff __off) [inline]
```

Add offset to this position.

**operator-()** [1/2]

```
template<typename _StateT>
streamoff std::fpos< _StateT >::operator- (
    const fpos< _StateT > & __other) const [inline]
```

Subtract position to return offset.

**operator-()** [2/2]

```
template<typename _StateT>
fpos std::fpos< _StateT >::operator- (
    streamoff __off) const [inline]
```

Subtract offset from position.

**operator-=()**

```
template<typename _StateT>
fpos & std::fpos< _StateT >::operator-= (
    streamoff __off) [inline]
```

Subtract offset from this position.

**state()** [1/2]

```
template<typename _StateT>
_StateT std::fpos< _StateT >::state () const [inline]
```

Return the last set value of *st*.

**state()** [2/2]

```
template<typename _StateT>
void std::fpos< _StateT >::state (
    _StateT __st) [inline]
```

Remember the value of *st*.

The documentation for this class was generated from the following file:

- [postypes.h](#)

**6.437 \_\_gnu\_cxx::free\_list Class Reference**

```
#include <bitmap_allocator.h>
```

Inheritance diagram for \_\_gnu\_cxx::free\_list:

## Public Types

- typedef \_\_mutex **\_\_mutex\_type**
- typedef vector\_type::iterator **iterator**
- typedef std::size\_t \* **value\_type**
- typedef \_\_detail::\_\_mini\_vector< value\_type > **vector\_type**

## Public Member Functions

- void **\_M\_clear** ()
- std::size\_t \* **\_M\_get** (std::size\_t \_\_sz)
- void **\_M\_insert** (std::size\_t \* \_\_addr) throw ()

### 6.437.1 Detailed Description

The free list class for managing chunks of memory to be given to and returned by the bitmap\_allocator.

### 6.437.2 Member Function Documentation

#### **\_M\_clear()**

```
void __gnu_cxx::free_list::_M_clear ()
```

This function just clears the internal Free List, and gives back all the memory to the OS.

#### **\_M\_get()**

```
std::size_t * __gnu_cxx::free_list::_M_get (  
    std::size_t __sz)
```

This function gets a block of memory of the specified size from the free list.

#### Parameters

<code>__sz</code>	The size in bytes of the memory required.
-------------------	-------------------------------------------

#### Returns

A pointer to the new memory block of size at least equal to that requested.

#### **\_M\_insert()**

```
void __gnu_cxx::free_list::_M_insert (  
    std::size_t * __addr) throw ( ) [inline]
```

This function returns the block of memory to the internal free list.

#### Parameters

<code>__addr</code>	The pointer to the memory block that was given by a call to the <code>_M_get</code> function.
---------------------	-----------------------------------------------------------------------------------------------

Referenced by `__gnu_cxx::bitmap_allocator< _Tp1 >::_M_deallocate_single_object()`.

The documentation for this class was generated from the following file:

- [bitmap\\_allocator.h](#)

## 6.438 std::from\_chars\_result Struct Reference

```
#include <charconv>
```

### Public Attributes

- `errc ec`
- `const char * ptr`

### Friends

- `bool operator== (const from_chars_result &, const from_chars_result &)=default`

#### 6.438.1 Detailed Description

Result type of `std::from_chars`.

The documentation for this struct was generated from the following file:

- [charconv](#)

## 6.439 std::front\_insert\_iterator< \_Container > Class Template Reference

```
#include <stl_iterator.h>
```

Inheritance diagram for `std::front_insert_iterator< _Container >`:

### Public Types

- `typedef _Container container_type`
- `using difference_type`
- `typedef output_iterator_tag iterator_category`
- `typedef void pointer`
- `typedef void reference`
- `typedef void value_type`

## Public Member Functions

- constexpr [front\\_insert\\_iterator](#) ([\\_Container](#) &\_\_x)
- constexpr [front\\_insert\\_iterator](#) & [operator\\*](#) ()
- constexpr [front\\_insert\\_iterator](#) & [operator++](#) ()
- constexpr [front\\_insert\\_iterator](#) [operator++](#) (int)
- constexpr [front\\_insert\\_iterator](#) & [operator=](#) (const typename [\\_Container::value\\_type](#) &\_\_value)
- constexpr [front\\_insert\\_iterator](#) & [operator=](#) (typename [\\_Container::value\\_type](#) &&\_\_value)

## Protected Attributes

- [\\_Container](#) \* **container**

### 6.439.1 Detailed Description

```
template<typename _Container>
class std::front_insert_iterator< _Container >
```

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator prepends it to the container using [push\\_front](#).

Tip: Using the [front\\_inserter](#) function to create these iterators can save typing.

### 6.439.2 Member Typedef Documentation

#### **container\_type**

```
template<typename _Container>
typedef _Container std::front_insert_iterator< _Container >::container_type
```

A nested typedef for the type of whatever container you used.

#### **iterator\_category**

```
typedef output\_iterator\_tag std::iterator< output\_iterator\_tag, void, void, void, void >::iterator_category [inherited]
```

One of the [tag types](#).

#### **pointer**

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::pointer [inherited]
```

This type represents a pointer-to-[value\\_type](#).

#### **reference**

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::reference [inherited]
```

This type represents a reference-to-[value\\_type](#).

#### **value\_type**

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::value_type [inherited]
```

The type "pointed to" by the iterator.

### 6.439.3 Constructor & Destructor Documentation

#### front\_insert\_iterator()

```
template<typename _Container>
std::front_insert_iterator< _Container >::front_insert_iterator (
    _Container & __x) [inline], [explicit], [constexpr]
```

The only way to create this iterator is with a container.

References [std::\\_\\_addressof\(\)](#).

### 6.439.4 Member Function Documentation

#### operator\*()

```
template<typename _Container>
front_insert_iterator & std::front_insert_iterator< _Container >::operator* () [inline], [nodiscard],
[constexpr]
```

Simply returns *\*this*.

#### operator++() [1/2]

```
template<typename _Container>
front_insert_iterator & std::front_insert_iterator< _Container >::operator++ () [inline], [constexpr]
```

Simply returns *\*this*. (This iterator does not *move*.)

#### operator++() [2/2]

```
template<typename _Container>
front_insert_iterator std::front_insert_iterator< _Container >::operator++ (
    int ) [inline], [constexpr]
```

Simply returns *\*this*. (This iterator does not *move*.)

#### operator=()

```
template<typename _Container>
front_insert_iterator & std::front_insert_iterator< _Container >::operator= (
    const typename _Container::value_type & __value) [inline], [constexpr]
```

#### Parameters

<code>__value</code>	An instance of whatever type <code>container_type::const_reference</code> is; presumably a reference-to-const T for <code>container&lt;T&gt;</code> .
----------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------

#### Returns

This iterator, for chained operations.

This kind of iterator doesn't really have a *position* in the container (you can think of the position as being permanently at the front, if you like). Assigning a value to the iterator will always prepend the value to the front of the container.

The documentation for this class was generated from the following file:

- [bits/stl\\_iterator.h](#)

## 6.440 std::function< \_Res(\_ArgTypes...)> Class Template Reference

```
#include <std_function.h>
```

Inheritance diagram for std::function< \_Res(\_ArgTypes...)>:

### Public Types

- typedef `_Res` **result\_type**

### Public Member Functions

- `function` () noexcept
- template<typename \_Functor, typename \_Constraints = \_Requires<\_Callable<\_Functor>>>>  
`function` (\_Functor &&\_\_f) noexcept(\_Handler<\_Functor>::template \_S\_nothrow\_init<\_Functor>())

- void `swap` (function &\_\_x) noexcept
- const `type_info` & `target_type` () const noexcept
- template<typename \_Functor>  
`_Functor * target` () noexcept
- template<typename \_Functor>  
const `_Functor * target` () const noexcept

### 6.440.1 Detailed Description

```
template<typename _Res, typename... _ArgTypes>
class std::function<_Res(_ArgTypes...)>
```

Polymorphic function wrapper.

Since

C++11

### 6.440.2 Constructor & Destructor Documentation

#### function() [1/5]

```
template<typename _Res, typename... _ArgTypes>
std::function<_Res(_ArgTypes...)>::function () [inline], [noexcept]
```

Default construct creates an empty function call wrapper.

#### Postcondition

```
!(bool)*this
```

References [function\(\)](#).

Referenced by [function\(\)](#), [function\(\)](#), [function\(\)](#), [function\(\)](#), [function\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [swap\(\)](#), and [target\(\)](#).

#### function() [2/5]

```
template<typename _Res, typename... _ArgTypes>
std::function<_Res(_ArgTypes...)>::function (
    nullptr_t ) [inline], [noexcept]
```

Creates an empty function call wrapper.

#### Postcondition

```
!(bool)*this
```

References [function\(\)](#).

#### function() [3/5]

```
template<typename _Res, typename... _ArgTypes>
std::function<_Res(_ArgTypes...)>::function (
    const function<_Res(_ArgTypes...)> & __x) [inline]
```

Function copy constructor.

#### Parameters

<a href="#">__x</a>	A function object with identical call signature.
---------------------	--------------------------------------------------

#### Postcondition

```
bool(*this) == bool(__x)
```

The newly-created function contains a copy of the target of `__x` (if it has one).

References [function\(\)](#).

**function()** [4/5]

```
template<typename _Res, typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::function (
    function< _Res(_ArgTypes...)> && __x) [inline], [noexcept]
```

Function move constructor.

**Parameters**

<code>__x</code>	A function object rvalue with identical call signature.
------------------	---------------------------------------------------------

The newly-created function contains the target of `__x` (if it has one).

References [function\(\)](#).

**function()** [5/5]

```
template<typename _Res, typename... _ArgTypes>
template<typename _Functor, typename _Constraints = _Requires<_Callable<_Functor>>>
std::function< _Res(_ArgTypes...)>::function (
    _Functor && __f) [inline], [noexcept]
```

Builds a function that targets a copy of the incoming function object.

**Parameters**

<code>__f</code>	A function object that is callable with parameters of type <code>ArgTypes...</code> and returns a value convertible to <code>Res</code> .
------------------	-------------------------------------------------------------------------------------------------------------------------------------------

The newly-created function object will target a copy of `__f`. If `__f` is `reference_wrapper<F>`, then this function object will contain a reference to the function object `__f.get()`. If `__f` is a null function pointer, null pointer-to-member, or empty `std::function`, the newly-created object will be empty.

If `__f` is a non-null function pointer or an object of type `reference_wrapper<F>`, this function will not throw.

References [function\(\)](#), and [std::forward\(\)](#).

**6.440.3 Member Function Documentation****operator bool()**

```
template<typename _Res, typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::operator bool () const [inline], [explicit], [noexcept]
```

Determine if the function wrapper has a target.

**Returns**

`true` when this function object contains a target, or `false` when it is empty.

This function will not throw exceptions.

**operator()()**

```
template<typename _Res, typename... _ArgTypes>
_Res std::function< _Res(_ArgTypes...)>::operator() (
    _ArgTypes... __args) const [inline]
```

Invokes the function targeted by `*this`.

**Returns**

the result of the target.

**Exceptions**

<code>'bad_function_call'</code>	when <code>!(bool)*this</code>
----------------------------------	--------------------------------

The function call operator invokes the target function object stored by `this`.

References [std::forward\(\)](#), and [operator\(\)](#).

Referenced by [operator\(\)](#).

**operator=()** [1/5]

```
template<typename _Res, typename... _ArgTypes>
template<typename _Functor>
_requires<_Callable<_Functor>, function &> std::function<_Res(_ArgTypes...)>::operator= (
    _Functor && __f) [inline], [noexcept]
```

Function assignment to a new target.

**Parameters**

<code>←</code>	A function object that is callable with parameters of type <code>_ArgTypes...</code> and returns a value convertible to
<code>←</code>	<code>_Res</code> .
<code>←</code>	
<code>←</code>	
<code>f</code>	

**Returns**

`*this`

**Since**

C++11

This function object wrapper will target a copy of `__f`. If `__f` is `reference_wrapper<F>`, then this function object will contain a reference to the function object `__f.get()`. If `__f` is a null function pointer or null pointer-to-member, this object will be empty.

If `__f` is a non-null function pointer or an object of type `reference_wrapper<F>`, this function will not throw.

References [function\(\)](#), [std::forward\(\)](#), and [operator=\(\)](#).

**operator=()** [2/5]

```
template<typename _Res, typename... _ArgTypes>
function & std::function<_Res(_ArgTypes...)>::operator= (
    const function<_Res(_ArgTypes...)> & __x) [inline]
```

Function assignment operator.

**Parameters**

<code>←</code>	A function with identical call signature.
<code>x</code>	

**Postcondition**

```
(bool)*this == (bool)x
```

**Returns**

```
*this
```

The target of `__x` is copied to `*this`. If `__x` has no target, then `*this` will be empty.

If `__x` targets a function pointer or a reference to a function object, then this operation will not throw an exception.

References [function\(\)](#), and [operator=\(\)](#).

Referenced by [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), and [operator=\(\)](#).

**operator=()** [3/5]

```
template<typename _Res, typename... _ArgTypes>
function & std::function< _Res(_ArgTypes...)>::operator= (
    function< _Res(_ArgTypes...)> && __x) [inline], [noexcept]
```

Function move-assignment operator.

**Parameters**

<code>__x</code>	A function rvalue with identical call signature.
------------------	--------------------------------------------------

**Returns**

```
*this
```

The target of `__x` is moved to `*this`. If `__x` has no target, then `*this` will be empty.

If `__x` targets a function pointer or a reference to a function object, then this operation will not throw an exception.

References [function\(\)](#), [std::move\(\)](#), and [operator=\(\)](#).

**operator=()** [4/5]

```
template<typename _Res, typename... _ArgTypes>
function & std::function< _Res(_ArgTypes...)>::operator= (
    nullptr_t ) [inline], [noexcept]
```

Function assignment to empty.

**Postcondition**

```
!(bool)*this
```

**Returns**

```
*this
```

The target of `*this` is deallocated, leaving it empty.

References [function\(\)](#), and [operator=\(\)](#).

**operator=()** [5/5]

```
template<typename _Res, typename... _ArgTypes>
template<typename _Functor>
function & std::function< _Res(_ArgTypes...)>::operator= (
    reference_wrapper< _Functor > __f) [inline], [noexcept]
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

References [function\(\)](#), and [operator=\(\)](#).

**swap()**

```
template<typename _Res, typename... _ArgTypes>
void std::function<_Res(_ArgTypes...)>::swap (
    function<_Res(_ArgTypes...)> & __x) [inline], [noexcept]
```

Swap the targets of two function objects.

**Parameters**

<code>__x</code>	A function with identical call signature.
------------------	-------------------------------------------

Swap the targets of `this` function object and `__x`. This function will not throw exceptions.

References [function\(\)](#), and [swap\(\)](#).

Referenced by [swap\(\)](#).

**target() [1/2]**

```
template<typename _Res, typename... _ArgTypes>
template<typename _Functor>
const _Functor * std::function<_Res(_ArgTypes...)>::target () const [inline], [noexcept]
```

Access the stored target function object.

**Returns**

Returns a pointer to the stored target function object, if `typeid(_Functor).equals(target_type())`; otherwise, a null pointer.

This function does not throw exceptions.

References [target\(\)](#), and [target\\_type\(\)](#).

**target() [2/2]**

```
template<typename _Res, typename... _ArgTypes>
template<typename _Functor>
_Functor * std::function<_Res(_ArgTypes...)>::target () [inline], [noexcept]
```

Access the stored target function object.

**Returns**

Returns a pointer to the stored target function object, if `typeid(_Functor).equals(target_type())`; otherwise, a null pointer.

This function does not throw exceptions.

References [function\(\)](#), and [target\(\)](#).

Referenced by [target\(\)](#), and [target\\_type\(\)](#).

**target\_type()**

```
template<typename _Res, typename... _ArgTypes>
const type_info & std::function<_Res(_ArgTypes...)>::target_type () const [inline], [noexcept]
```

Determine the type of the target of this function object wrapper.

**Returns**

the type identifier of the target function object, or `typeid(void)` if `!(bool)*this`.

This function will not throw exceptions.

References [target\\_type\(\)](#).

Referenced by [target\(\)](#), and [target\\_type\(\)](#).

`function_ref & operator= (_Tp)=delete`

**6.441.1 Detailed Description**

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
class std::function_ref<_Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>
```

Non-owning polymorphic function wrapper.

Since

C++26

The `std::function_ref` class template is a non-owning call wrapper, that refers to a bound object. Using `function_ref` outside of the lifetime of the bound object has undefined behavior.

It supports const-qualification and no-throw guarantees. The qualifications and exception-specification of the signature are respected when invoking the reference function.

## 6.441.2 Constructor &amp; Destructor Documentation

**function\_ref()** [1/5]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Fn>
requires is_function_v<_Fn> && __is_invocable_using<_Fn*>
std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref (
    _Fn * __fn) [inline], [noexcept]
```

Target and bound object is function pointed by parameter.

**function\_ref()** [2/5]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Fn, typename _Vt = remove_reference_t<_Fn>>
requires (!is_same_v<remove_cv_t<_Vt>, function_ref>) && (!is_member_pointer_v<_Vt>) && (!is_
function_v<_Vt>) && __is_invocable_using<_Vt _GLIBCXX_MOF_CV*>
std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref (
    _Fn && __f) [inline], [constexpr], [noexcept]
```

Target and bound object is object referenced by parameter.

References [std::addressof\(\)](#).

**function\_ref()** [3/5]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<auto __fn>
requires __is_invocable_using<const decltype(__fn)&>
std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref (
    nontype_t< __fn > ) [inline], [constexpr], [noexcept]
```

Target object is \_\_fn. There is no bound object.

**function\_ref()** [4/5]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<auto __fn, typename _Up, typename _Td = remove_reference_t<_Up>>
requires (!is_rvalue_reference_v<_Up&&>) && __is_invocable_using<const decltype(__fn)&, _Td &
GLIBCXX_MOF_CV*>
std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref (
    nontype_t< __fn > ,
    _Up && __ref) [inline], [constexpr], [noexcept]
```

Target object is equivalent to `std::bind_front<_fn>(std::ref(__ref))`. Bound object is object referenced by second parameter.

References [std::addressof\(\)](#).

**function\_ref()** [5/5]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<auto __fn, typename _Td>
requires __is_invocable_using<const decltype(__fn)&, _Td _GLIBCXX_MOF_CV*>
std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref (
    nontype_t< __fn > ,
    _Td _GLIBCXX_MOF_CV * __ptr) [inline], [constexpr], [noexcept]
```

Target object is equivalent to `std::bind_front<_fn>(__ptr)`. Bound object is object pointed by second parameter (if any).

### 6.441.3 Member Function Documentation

#### operator>()

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
_Res std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator() (
    _ArgTypes... __args) const [inline], [noexcept]
```

Invoke the target object.

The bound object will be invoked using the supplied arguments, and as const or non-const, as dictated by the template arguments of the `function_ref` specialization.

References [std::forward\(\)](#).

### 6.446.1 Detailed Description

```
template<typename _RealType = double>
class std::gamma_distribution< _RealType >
```

A gamma continuous distribution for random numbers.  
The formula for the gamma probability density function is:

$$p(x|\alpha, \beta) = \frac{1}{\beta\Gamma(\alpha)} (x/\beta)^{\alpha-1} e^{-x/\beta}$$

Since

C++11

### 6.446.2 Member Typedef Documentation

#### result\_type

```
template<typename _RealType = double>
typedef _RealType std::gamma_distribution< _RealType >::result_type
```

The type of the range of the distribution.

### 6.446.3 Constructor & Destructor Documentation

#### gamma\_distribution() [1/2]

```
template<typename _RealType = double>
std::gamma_distribution< _RealType >::gamma_distribution () [inline]
```

Constructs a gamma distribution with parameters 1 and 1.

#### gamma\_distribution() [2/2]

```
template<typename _RealType = double>
std::gamma_distribution< _RealType >::gamma_distribution (
    _RealType __alpha_val,
    _RealType __beta_val = _RealType(1)) [inline], [explicit]
```

Constructs a gamma distribution with parameters  $\alpha$  and  $\beta$ .

### 6.446.4 Member Function Documentation

#### alpha()

```
template<typename _RealType = double>
_RealType std::gamma_distribution< _RealType >::alpha () const [inline]
```

Returns the  $\alpha$  of the distribution.

#### beta()

```
template<typename _RealType = double>
_RealType std::gamma_distribution< _RealType >::beta () const [inline]
```

Returns the  $\beta$  of the distribution.

#### max()

```
template<typename _RealType = double>
result_type std::gamma_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### min()

```
template<typename _RealType = double>
result_type std::gamma_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

**operator>() [1/2]**

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::gamma_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)](#).

**operator>() [2/2]**

```
template<typename _RealType>
template<typename _UniformRandomNumberGenerator>
gamma_distribution< _RealType >::result_type std::gamma_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng,
    const param_type & __param)
```

Marsaglia, G. and Tsang, W. W. "A Simple Method for Generating Gamma Variables" ACM Transactions on Mathematical Software, 26, 3, 363-372, 2000.

References [std::log\(\)](#), and [std::pow\(\)](#).

**param() [1/2]**

```
template<typename _RealType = double>
param_type std::gamma_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

**param() [2/2]**

```
template<typename _RealType = double>
void std::gamma_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

**reset()**

```
template<typename _RealType = double>
void std::gamma_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

**6.446.5 Friends And Related Symbol Documentation****operator<<**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::gamma_distribution< _RealType1 > & __x) [friend]
```

Inserts a `gamma_distribution` random number distribution `__x` into the output stream `__os`.

## Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>gamma_distribution</code> random number distribution.

## Returns

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _RealType = double>
bool operator== (
    const gamma\_distribution< _RealType > & __d1,
    const gamma\_distribution< _RealType > & __d2) [friend]
```

Return true if two gamma distributions have the same parameters and the sequences that would be generated are equal.

**operator>>**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic\_istream< _CharT, _Traits > & operator>> (
    std::basic\_istream< _CharT, _Traits > & __is,
    std::gamma\_distribution< _RealType1 > & __x) [friend]
```

Extracts a `gamma_distribution` random number distribution `__x` from the input stream `__is`.

## Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>gamma_distribution</code> random number generator engine.

## Returns

The input stream with `__x` extracted or in an error state.

### 6.447.1 Detailed Description

```
template<typename _IntType = int>
class std::geometric_distribution< _IntType >
```

A discrete geometric random number distribution.

The formula for the geometric probability density function is  $p(i|p) = p(1 - p)^i$  where  $p$  is the parameter of the distribution.

Since

C++11

### 6.447.2 Member Typedef Documentation

#### result\_type

```
template<typename _IntType = int>
typedef _IntType std::geometric\_distribution< _IntType >::result_type
```

The type of the range of the distribution.

### 6.447.3 Member Function Documentation

#### max()

```
template<typename _IntType = int>
result\_type std::geometric\_distribution< _IntType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

**min()**

```
template<typename _IntType = int>
result_type std::geometric_distribution<_IntType>::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

**operator()()**

```
template<typename _IntType = int>
template<typename _UniformRandomNumberGenerator>
result_type std::geometric_distribution<_IntType>::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

**p()**

```
template<typename _IntType = int>
double std::geometric_distribution<_IntType>::p () const [inline]
```

Returns the distribution parameter p.

**param() [1/2]**

```
template<typename _IntType = int>
param_type std::geometric_distribution<_IntType>::param () const [inline]
```

Returns the parameter set of the distribution.

Referenced by [std::operator>>\(\)](#).

**param() [2/2]**

```
template<typename _IntType = int>
void std::geometric_distribution<_IntType>::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

**reset()**

```
template<typename _IntType = int>
void std::geometric_distribution<_IntType>::reset () [inline]
```

Resets the distribution state.

Does nothing for the geometric distribution.

**6.447.4 Friends And Related Symbol Documentation****operator==**

```
template<typename _IntType = int>
bool operator== (
    const geometric_distribution<_IntType> & __d1,
    const geometric_distribution<_IntType> & __d2) [friend]
```

Return true if two geometric distributions have the same parameters.

### 6.448.1 Detailed Description

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn = detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
class __gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy, Store_Hash, _Alloc >
```

A general-probing hash-based associative container.

#### Template Parameters

<i>Key</i>	Key type.
<i>Mapped</i>	Map type.
<i>Hash_Fn</i>	Hashing functor.
<i>Eq_Fn</i>	Equal functor.
<i>Comb_Probe_Fn</i>	Combining probe functor. If Hash_Fn is not null_type, then this is the ranged-probe functor; otherwise, this is the range-hashing functor. XXX See Design::Hash-Based Containers::Hash Policies.
<i>Probe_Fn</i>	Probe functor.
<i>Resize_Policy</i>	Resizes hash.
<i>Store_Hash</i>	Indicates whether the hash value will be stored along with each key. If Hash_Fn is null_type, then the container will not compile if this value is true
<i>_Alloc</i>	Allocator type.

Base tag choices are: `gp_hash_tag`.

Base is `basic_hash_table`.

### 6.448.2 Constructor & Destructor Documentation

#### `gp_hash_table()` [1/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn = detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy, Store_Hash, _Alloc >::gp_hash_table () [inline]
```

Default constructor.

**gp\_hash\_table()** [2/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<←
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_←
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>←
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    const hash_fn & h) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object.

**gp\_hash\_table()** [3/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<←
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_←
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>←
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    const hash_fn & h,
    const eq_fn & e) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, and `r_eq_fn` will be copied by the `eq_fn` object of the container object.

**gp\_hash\_table()** [4/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<←
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_←
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>←
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    const hash_fn & h,
    const eq_fn & e,
    const comb_probe_fn & cp) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, `r_eq_fn` will be copied by the `eq_fn` object of the container object, and `r_comb_probe_fn` will be copied by the `comb_probe_fn` object of the container object.

**gp\_hash\_table()** [5/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<←
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_←
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>←
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    const hash_fn & h,
    const eq_fn & e,
    const comb_probe_fn & cp,
    const probe_fn & p) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, `r_eq_fn` will be copied by the `eq_fn` object of the container object, `r_comb_probe_fn` will be copied by the `comb_probe_fn` object of the container object, and `r_probe_fn` will be copied by the `probe_fn` object of the container object.

#### `gp_hash_table()` [6/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type,
typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type,
typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash =
detail::default_store_hash, typename _Alloc = std::allocator<char>>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    const hash_fn & h,
    const eq_fn & e,
    const comb_probe_fn & cp,
    const probe_fn & p,
    const resize_policy & rp) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, `r_eq_fn` will be copied by the `eq_fn` object of the container object, `r_comb_probe_fn` will be copied by the `comb_probe_fn` object of the container object, `r_probe_fn` will be copied by the `probe_fn` object of the container object, and `r_resize_policy` will be copied by the `Resize_Policy` object of the container object.

#### `gp_hash_table()` [7/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type,
typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type,
typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash =
detail::default_store_hash, typename _Alloc = std::allocator<char>>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    It first,
    It last) [inline]
```

Constructor taking `__iterators` to a range of `value_types`. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

#### `gp_hash_table()` [8/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type,
typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type,
typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash =
detail::default_store_hash, typename _Alloc = std::allocator<char>>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    It first,
    It last,
    const hash_fn & h) [inline]
```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and `last_it` will be inserted into the container object. `r_hash_fn` will be copied by the `hash_fn` object of the container object.

**gp\_hash\_table()** [9/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<←
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_←
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>←
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    It first,
    It last,
    const hash_fn & h,
    const eq_fn & e) [inline]
```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and `last_it` will be inserted into the container object. `r_hash_fn` will be copied by the `hash_fn` object of the container object, and `r_eq_fn` will be copied by the `eq_fn` object of the container object.

**gp\_hash\_table()** [10/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<←
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_←
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>←
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    It first,
    It last,
    const hash_fn & h,
    const eq_fn & e,
    const comb_probe_fn & cp) [inline]
```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and `last_it` will be inserted into the container object. `r_hash_fn` will be copied by the `hash_fn` object of the container object, `r_eq_fn` will be copied by the `eq_fn` object of the container object, and `r_comb_probe_fn` will be copied by the `comb_probe_fn` object of the container object.

**gp\_hash\_table()** [11/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<←
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_←
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>←
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    It first,
    It last,
    const hash_fn & h,
    const eq_fn & e,
    const comb_probe_fn & cp,
    const probe_fn & p) [inline]
```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and

last\_it will be inserted into the container object. r\_hash\_fn will be copied by the hash\_fn object of the container object, r\_eq\_fn will be copied by the eq\_fn object of the container object, r\_comb\_probe\_fn will be copied by the comb\_probe\_fn object of the container object, and r\_probe\_fn will be copied by the probe\_fn object of the container object.

### gp\_hash\_table() [12/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type,
typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type,
typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash =
detail::default_store_hash, typename _Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    It first,
    It last,
    const hash_fn & h,
    const eq_fn & e,
    const comb_probe_fn & cp,
    const probe_fn & p,
    const resize_policy & rp) [inline]
```

Constructor taking \_\_iterators to a range of value\_types and some policy objects. The value\_types between first\_it and last\_it will be inserted into the container object. r\_hash\_fn will be copied by the hash\_fn object of the container object, r\_eq\_fn will be copied by the eq\_fn object of the container object, r\_comb\_probe\_fn will be copied by the comb\_probe\_fn object of the container object, r\_probe\_fn will be copied by the probe\_fn object of the container object, and r\_resize\_policy will be copied by the resize\_policy object of the container object.

### 6.450.1 Detailed Description

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
class __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_Fn,
Probe_Fn, Resize_Policy >
```

A general-probing hash-based container.

#### Template Parameters

<i>Key</i>	Key type.
<i>Mapped</i>	Map type.
<i>Hash_Fn</i>	Hashing functor. Default is <code>__gnu_cxx::hash</code> .
<i>Eq_Fn</i>	Equal functor. Default <code>std::equal_to&lt;Key&gt;</code>
<i>_Alloc</i>	Allocator type.
<i>Store_Hash</i>	If key type stores extra metadata. Defaults to false.
<i>Comb_Probe_Fn</i>	Combining probe functor. If <i>Hash_Fn</i> is not null_type, then this is the ranged-probe functor; otherwise, this is the range-hashing functor. XXX See Design::Hash-Based Containers::Hash Policies. Default <code>direct_mask_range_hashing</code> .
<i>Probe_Fn</i>	Probe functor. Defaults to <code>linear_probe_fn</code> , also <code>quadratic_probe_fn</code> .
<i>Resize_Policy</i>	Resizes hash. Defaults to <code>hash_standard_resize_policy</code> , using <code>hash_exponential_size_policy</code> and <code>hash_load_check_resize_trigger</code> .

Bases are: `detail::hash_eq_fn`, `Resize_Policy`, `detail::ranged_probe_fn`, `detail::types_traits`. (Optional: `detail::debug_map_base`.)

### 6.450.2 Member Enumeration Documentation

#### anonymous enum

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
anonymous enum
Value stores hash, true or false.
```

### 6.450.3 Member Function Documentation

#### `empty()`

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
bool __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_
Fn, Probe_Fn, Resize_Policy >::empty () const [inline], [nodiscard]
True if size() == 0.
```

#### `get_comb_probe_fn()` [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
Comb_Probe_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_comb_probe_fn ()
Return current comb_probe_fn.
```

**get\_comb\_probe\_fn()** [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
const Comb_Probe_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_↵
Hash, Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_comb_probe_fn () const
Return current const comb_probe_fn.
```

**get\_eq\_fn()** [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
Eq_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_↵
Probe_Fn, Probe_Fn, Resize_Policy >::get_eq_fn ()
Return current eq_fn.
```

**get\_eq\_fn()** [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
const Eq_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_eq_fn () const
Return current const eq_fn.
```

**get\_hash\_fn()** [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
Hash_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_↵
Probe_Fn, Probe_Fn, Resize_Policy >::get_hash_fn ()
Return current hash_fn.
```

**get\_hash\_fn()** [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
const Hash_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_hash_fn () const
Return current const hash_fn.
```

**get\_probe\_fn()** [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
Probe_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_↵
Probe_Fn, Probe_Fn, Resize_Policy >::get_probe_fn ()
Return current probe_fn.
```

**get\_probe\_fn()** [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
const Probe_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_probe_fn () const
Return current const probe_fn.
```

**get\_resize\_policy()** [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
Resize_Policy & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_resize_policy ()
```

Return current resize\_policy.

**get\_resize\_policy()** [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
const Resize_Policy & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_↵
Hash, Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_resize_policy () const
```

Return current const resize\_policy.

### Friends

- template<typename \_Tp>  
class [valarray](#)

#### 6.460.1 Detailed Description

Class defining multi-dimensional subset of an array.

The slice class represents a multi-dimensional subset of an array, specified by three parameter sets: start offset, size array, and stride array. The start offset is the index of the first element of the array that is part of the subset. The size and stride array describe each dimension of the slice. Size is the number of elements in that dimension, and stride is the distance in the array between successive elements in that dimension. Each dimension's size and stride is taken to begin at an array element described by the previous dimension. The size array and stride array must be the same size. For example, if you have offset==3, stride[0]==11, size[1]==3, stride[1]==3, then slice[0,0]==array[3], slice[0,1]==array[6], slice[0,2]==array[9], slice[1,0]==array[14], slice[1,1]==array[17], slice[1,2]==array[20].

The documentation for this class was generated from the following file:

## Friends

- class `valarray`< \_Tp >

### 6.461.1 Detailed Description

`template<typename _Tp>`  
**class** `std::gslice_array`< \_Tp >

Reference to multi-dimensional subset of an array.

A `gslice_array` is a reference to the actual elements of an array specified by a `gslice`. The way to get a `gslice_array` is to call `operator[]`(`gslice`) on a `valarray`. The returned `gslice_array` then permits carrying operations out on the referenced subset of elements in the original `valarray`. For example, `operator+=(valarray)` will add values to the subset of elements in the underlying `valarray` this `gslice_array` refers to.

#### Parameters

<i>Tp</i>	Element type.
-----------	---------------

### 6.461.2 Member Function Documentation

#### **operator%=( )**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator%= (
    const valarray< _Tp > & ) const
```

Modulo slice elements by corresponding elements of *v*.

**operator&=()**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator&= (
    const valarray< _Tp > & ) const
```

Logical and slice elements with corresponding elements of *v*.

**operator\*=()**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator*= (
    const valarray< _Tp > & ) const
```

Multiply slice elements by corresponding elements of *v*.

**operator+=()**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator+= (
    const valarray< _Tp > & ) const
```

Add corresponding elements of *v* to slice elements.

**operator-=()**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator-= (
    const valarray< _Tp > & ) const
```

Subtract corresponding elements of *v* from slice elements.

**operator/=(**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator/= (
    const valarray< _Tp > & ) const
```

Divide slice elements by corresponding elements of *v*.

**operator<<=()**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator<<= (
    const valarray< _Tp > & ) const
```

Left shift slice elements by corresponding elements of *v*.

**operator>>=()**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator>>= (
    const valarray< _Tp > & ) const
```

Right shift slice elements by corresponding elements of *v*.

**operator^=()**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator^= (
    const valarray< _Tp > & ) const
```

Logical xor slice elements with corresponding elements of *v*.

**operator" | =()**

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator|= (
    const valarray< _Tp > & ) const
```

Logical or slice elements with corresponding elements of v.

### 6.470.1 Detailed Description

Explicit specialization of `std::hash` for `__gnu_cxx::throw_value_limit`.

### 6.470.2 Member Typedef Documentation

#### `argument_type`

```
typedef __gnu_cxx::throw_value_limit std::unary_function< __gnu_cxx::throw_value_limit, size_t>::argument_type [inherited]
```

`argument_type` is the type of the argument

#### `result_type`

```
typedef size_t std::unary_function< __gnu_cxx::throw_value_limit, size_t>::result_type [inherited]
```

`result_type` is the return type

The documentation for this struct was generated from the following file:

- [throw\\_allocator.h](#)

## 6.471 `std::hash< __gnu_cxx::throw_value_random >` Struct Reference

```
#include <throw_allocator.h>
```

Inheritance diagram for `std::hash< __gnu_cxx::throw_value_random >`:

### Public Types

- typedef `__gnu_cxx::throw_value_random` `argument_type`
- typedef `size_t` `result_type`

### Public Member Functions

- `size_t operator()` (const `__gnu_cxx::throw_value_random` &\_\_val) const

### 6.471.1 Detailed Description

Explicit specialization of `std::hash` for `__gnu_cxx::throw_value_random`.

### 6.471.2 Member Typedef Documentation

#### argument\_type

```
typedef __gnu_cxx::throw_value_random std::unary_function< __gnu_cxx::throw_value_random, size_t
>::argument_type [inherited]
```

argument\_type is the type of the argument

#### result\_type

```
typedef size_t std::unary_function< __gnu_cxx::throw_value_random, size_t >::result_type [inherited]
```

result\_type is the return type

The documentation for this struct was generated from the following file:

- [throw\\_allocator.h](#)

## 6.472 std::hash< \_\_gnu\_debug::basic\_string< \_CharT > > Struct Template Reference

```
#include <string>
```

Inheritance diagram for std::hash< \_\_gnu\_debug::basic\_string< \_CharT > >:

### 6.472.1 Detailed Description

```
template<typename _CharT>
```

```
struct std::hash< __gnu_debug::basic_string< _CharT > >
```

std::hash specialization for \_\_gnu\_debug::basic\_string.

The documentation for this struct was generated from the following file:

- [debug/string](#)

## 6.473 std::hash< \_\_shared\_ptr< \_Tp, \_Lp > > Struct Template Reference

```
#include <shared_ptr_base.h>
```

### Public Member Functions

- `size_t operator() (const __shared_ptr< _Tp, _Lp > &__s) const` noexcept

#### 6.473.1 Detailed Description

```
template<typename _Tp, _Lock_policy _Lp>
struct std::hash< __shared_ptr< _Tp, _Lp > >
```

std::hash specialization for \_\_shared\_ptr.

The documentation for this struct was generated from the following file:

- [shared\\_ptr\\_base.h](#)

### 6.474 std::hash< \_Tp \* > Struct Template Reference

```
#include <functional_hash.h>
```

#### Public Member Functions

- `size_t operator() (_Tp * __p) const` noexcept

#### 6.474.1 Detailed Description

```
template<typename _Tp>
struct std::hash< _Tp * >
```

Partial specializations for pointer types.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

### 6.475 std::hash< basic\_string< char, char\_traits< char >, \_Alloc > > Struct Template Reference

```
#include <basic_string.h>
```

#### Public Member Functions

- `size_t operator() (const _StrT & __s) const` noexcept

#### 6.475.1 Detailed Description

```
template<typename _Alloc>
struct std::hash< basic_string< char, char_traits< char >, _Alloc > >
```

std::hash specialization for string.

The documentation for this struct was generated from the following file:

- [basic\\_string.h](#)

### 6.476 std::hash< basic\_string< char16\_t, char\_traits< char16\_t >, \_Alloc > > Struct Template Reference

```
#include <basic_string.h>
```

#### Public Member Functions

- `size_t operator() (const _StrT & __s) const` noexcept

#### 6.476.1 Detailed Description

```
template<typename _Alloc>
```

```
struct std::hash< basic_string< char16_t, char_traits< char16_t >, _Alloc > >
```

`std::hash` specialization for `u16string`.

The documentation for this struct was generated from the following file:

- [basic\\_string.h](#)

### 6.477 `std::hash< basic_string< char32_t, char_traits< char32_t >, _Alloc > >` Struct Template Reference

```
#include <basic_string.h>
```

#### Public Member Functions

- `size_t operator() (const _StrT &__s) const` noexcept

#### 6.477.1 Detailed Description

```
template<typename _Alloc>
```

```
struct std::hash< basic_string< char32_t, char_traits< char32_t >, _Alloc > >
```

`std::hash` specialization for `u32string`.

The documentation for this struct was generated from the following file:

- [basic\\_string.h](#)

### 6.478 `std::hash< basic_string< wchar_t, char_traits< wchar_t >, _Alloc > >` Struct Template Reference

```
#include <basic_string.h>
```

#### Public Member Functions

- `size_t operator() (const _StrT &__s) const` noexcept

#### 6.478.1 Detailed Description

```
template<typename _Alloc>
```

```
struct std::hash< basic_string< wchar_t, char_traits< wchar_t >, _Alloc > >
```

`std::hash` specialization for `wstring`.

The documentation for this struct was generated from the following file:

- [basic\\_string.h](#)

### 6.479 `std::hash< bool >` Struct Reference

```
#include <functional_hash.h>
```

#### Public Member Functions

- `size_t operator() (bool __val) const` noexcept

#### 6.479.1 Detailed Description

Explicit specialization for bool.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

#### 6.480 `std::hash< char >` Struct Reference

```
#include <functional_hash.h>
```

##### Public Member Functions

- `size_t operator() (char __val) const` noexcept

##### 6.480.1 Detailed Description

Explicit specialization for char.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

#### 6.481 `std::hash< char16_t >` Struct Reference

```
#include <functional_hash.h>
```

##### Public Member Functions

- `size_t operator() (char16_t __val) const` noexcept

##### 6.481.1 Detailed Description

Explicit specialization for char16\_t.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

#### 6.482 `std::hash< char32_t >` Struct Reference

```
#include <functional_hash.h>
```

##### Public Member Functions

- `size_t operator() (char32_t __val) const` noexcept

##### 6.482.1 Detailed Description

Explicit specialization for char32\_t.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

#### 6.483 `std::hash< double >` Struct Reference

```
#include <functional_hash.h>
```

**Public Member Functions**

- `size_t operator()` (double \_\_val) const noexcept

**6.483.1 Detailed Description**

Specialization for double.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

**6.484 `std::hash< error_code >` Struct Reference**

```
#include <system_error>
```

**Public Member Functions**

- `size_t operator()` (const [error\\_code](#) &\_\_e) const noexcept

**6.484.1 Detailed Description**

`std::hash` specialization for `error_code`.

The documentation for this struct was generated from the following file:

- [system\\_error](#)

**6.485 `std::hash< error_condition >` Struct Reference**

```
#include <system_error>
```

**Public Member Functions**

- `size_t operator()` (const [error\\_condition](#) &\_\_e) const noexcept

**6.485.1 Detailed Description**

`std::hash` specialization for `error_condition`.

The documentation for this struct was generated from the following file:

- [system\\_error](#)

**6.486 `std::hash< experimental::optional< _Tp > >` Struct Template Reference**

```
#include <optional>
```

**Public Types**

- using `argument_type`
- using `result_type`

**Public Member Functions**

- `size_t operator()` (const [experimental::optional](#)< \_Tp > &\_\_t) const noexcept(noexcept([hash](#)< \_Tp > {}(\*\_\_t)))

### 6.486.1 Detailed Description

```
template<typename _Tp>
struct std::hash< experimental::optional< _Tp > >
```

std::hash partial specialization for experimental::optional

The documentation for this struct was generated from the following file:

- [experimental/optional](#)

## 6.487 std::hash< experimental::shared\_ptr< \_Tp > > Struct Template Reference

```
#include <shared_ptr.h>
```

### Public Member Functions

- `size_t operator()` (const experimental::shared\_ptr< \_Tp > &\_\_s) const noexcept

### 6.487.1 Detailed Description

```
template<typename _Tp>
struct std::hash< experimental::shared_ptr< _Tp > >
```

std::hash specialization for shared\_ptr.

The documentation for this struct was generated from the following file:

- [experimental/bits/shared\\_ptr.h](#)

## 6.488 std::hash< float > Struct Reference

```
#include <functional_hash.h>
```

### Public Member Functions

- `size_t operator()` (float \_\_val) const noexcept

### 6.488.1 Detailed Description

Specialization for float.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 6.489 std::hash< int > Struct Reference

```
#include <functional_hash.h>
```

### Public Member Functions

- `size_t operator()` (int \_\_val) const noexcept

### 6.489.1 Detailed Description

Explicit specialization for int.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 6.490 `std::hash< long >` Struct Reference

```
#include <functional_hash.h>
```

### Public Member Functions

- `size_t operator() (long __val) const` noexcept

#### 6.490.1 Detailed Description

Explicit specialization for `long`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 6.491 `std::hash< long double >` Struct Reference

```
#include <functional_hash.h>
```

### Public Member Functions

- `size_t operator() (long double __val) const` noexcept

#### 6.491.1 Detailed Description

Specialization for `long double`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 6.492 `std::hash< long long >` Struct Reference

```
#include <functional_hash.h>
```

### Public Member Functions

- `size_t operator() (long long __val) const` noexcept

#### 6.492.1 Detailed Description

Explicit specialization for `long long`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 6.493 `std::hash< shared_ptr< _Tp > >` Struct Template Reference

```
#include <shared_ptr.h>
```

### Public Member Functions

- `size_t operator() (const shared\_ptr< _Tp > &__s) const` noexcept

#### 6.493.1 Detailed Description

```
template<typename _Tp>
struct std::hash< shared_ptr< _Tp > >
```

std::hash specialization for shared\_ptr.

The documentation for this struct was generated from the following file:

- [bits/shared\\_ptr.h](#)

#### 6.494 std::hash< short > Struct Reference

```
#include <functional_hash.h>
```

##### Public Member Functions

- `size_t operator() (short __val) const` noexcept

##### 6.494.1 Detailed Description

Explicit specialization for short.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

#### 6.495 std::hash< signed char > Struct Reference

```
#include <functional_hash.h>
```

##### Public Member Functions

- `size_t operator() (signed char __val) const` noexcept

##### 6.495.1 Detailed Description

Explicit specialization for signed char.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

#### 6.496 std::hash< thread::id > Struct Reference

```
#include <std_thread.h>
```

##### Public Member Functions

- `size_t operator() (const thread::id &__id) const` noexcept

##### 6.496.1 Detailed Description

std::hash specialization for thread::id.

The documentation for this struct was generated from the following file:

- [std\\_thread.h](#)

#### 6.497 std::hash< type\_index > Struct Reference

```
#include <typeindex>
```

### Public Types

- typedef [type\\_index](#) `argument_type`
- typedef `size_t` `result_type`

### Public Member Functions

- `size_t operator()` (const [type\\_index](#) &\_\_ti) const noexcept

#### 6.497.1 Detailed Description

`std::hash` specialization for `type_index`.

The documentation for this struct was generated from the following file:

- [typeidindex](#)

## 6.498 `std::hash< unique_ptr< _Tp, _Dp > >` Struct Template Reference

```
#include <unique_ptr.h>
```

### 6.498.1 Detailed Description

```
template<typename _Tp, typename _Dp>  
struct std::hash< unique_ptr< _Tp, _Dp > >
```

`std::hash` specialization for `unique_ptr`.

The documentation for this struct was generated from the following file:

- [unique\\_ptr.h](#)

## 6.499 `std::hash< unsigned char >` Struct Reference

```
#include <functional_hash.h>
```

### Public Member Functions

- `size_t operator()` (unsigned char \_\_val) const noexcept

#### 6.499.1 Detailed Description

Explicit specialization for unsigned char.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 6.500 `std::hash< unsigned int >` Struct Reference

```
#include <functional_hash.h>
```

### Public Member Functions

- `size_t operator()` (unsigned int \_\_val) const noexcept

#### 6.500.1 Detailed Description

Explicit specialization for unsigned int.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 6.501 `std::hash< unsigned long >` Struct Reference

```
#include <functional_hash.h>
```

### Public Member Functions

- `size_t operator()` (unsigned long \_\_val) const noexcept

#### 6.501.1 Detailed Description

Explicit specialization for unsigned long.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 6.502 `std::hash< unsigned long long >` Struct Reference

```
#include <functional_hash.h>
```

### Public Member Functions

- `size_t operator()` (unsigned long long \_\_val) const noexcept

#### 6.502.1 Detailed Description

Explicit specialization for unsigned long long.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 6.503 `std::hash< unsigned short >` Struct Reference

```
#include <functional_hash.h>
```

### Public Member Functions

- `size_t operator()` (unsigned short \_\_val) const noexcept

#### 6.503.1 Detailed Description

Explicit specialization for unsigned short.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 6.504 `std::hash< wchar_t >` Struct Reference

```
#include <functional_hash.h>
```

### Public Member Functions

- `size_t operator()` (wchar\_t \_\_val) const noexcept

#### 6.504.1 Detailed Description

Explicit specialization for wchar\_t.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 6.505 `std::hash<::bitset<_Nb>>` Struct Template Reference

```
#include <bitset>
```

### Public Member Functions

- `size_t operator()` (`const ::bitset<_Nb> &__b`) `const noexcept`

#### 6.505.1 Detailed Description

```
template<size_t _Nb>
```

```
struct std::hash<::bitset<_Nb>>
```

`std::hash` specialization for `bitset`.

The documentation for this struct was generated from the following file:

- [bitset](#)

## 6.506 `std::hash<::vector<bool,_Alloc>>` Struct Template Reference

```
#include <stl_bvector.h>
```

### Public Member Functions

- `size_t operator()` (`const ::vector<bool,_Alloc> &`) `const noexcept`

#### 6.506.1 Detailed Description

```
template<typename _Alloc>
```

```
struct std::hash<::vector<bool,_Alloc>>
```

`std::hash` specialization for `vector<bool>`.

The documentation for this struct was generated from the following files:

- [stl\\_bvector.h](#)
- [vector.tcc](#)

## 6.507 `__gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, Store_Hash >` Struct Template Reference

Inheritance diagram for `__gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, Store_Hash >`:

### 6.507.1 Detailed Description

```
template<typename Key, typename Eq_Fn, typename _Alloc, bool Store_Hash>
struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, Store_Hash >
```

Primary template.

The documentation for this struct was generated from the following file:

- [hash\\_eq\\_fn.hpp](#)

## 6.508 `__gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, false >` Struct Template Reference

```
#include <hash_eq_fn.hpp>
```

### Public Types

- typedef Eq\_Fn `eq_fn_base`

- typedef `rebind_traits< _Alloc, Key >::const_reference` `key_const_reference`

#### Public Member Functions

- `hash_eq_fn` (const Eq\_Fn &r\_eq\_fn)
- bool `operator()` (key\_const\_reference r\_lhs\_key, key\_const\_reference r\_rhs\_key) const
- void `swap` (const `hash_eq_fn` &other)

#### 6.508.1 Detailed Description

```
template<typename Key, typename Eq_Fn, typename _Alloc>
struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, false >
```

Specialization 1 - The client requests that hash values not be stored.  
The documentation for this struct was generated from the following file:

- [hash\\_eq\\_fn.hpp](#)

### 6.509 `__gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, true >` Struct Template Reference

```
#include <hash_eq_fn.hpp>
```

#### Public Types

- typedef Eq\_Fn `eq_fn_base`
- typedef `rebind_traits< _Alloc, Key >::const_reference` `key_const_reference`
- typedef `_Alloc::size_type` `size_type`

#### Public Member Functions

- `hash_eq_fn` (const Eq\_Fn &r\_eq\_fn)
- bool `operator()` (key\_const\_reference r\_lhs\_key, size\_type lhs\_hash, key\_const\_reference r\_rhs\_key, size\_type rhs\_hash) const
- void `swap` (const `hash_eq_fn` &other)

#### 6.509.1 Detailed Description

```
template<typename Key, class Eq_Fn, class _Alloc>
struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, true >
```

Specialization 2 - The client requests that hash values be stored.  
The documentation for this struct was generated from the following file:

- [hash\\_eq\\_fn.hpp](#)

### 6.510 `__gnu_pbds::hash_exponential_size_policy< Size_Type >` Class Template Reference

```
#include <hash_policy.hpp>
```

Inheritance diagram for `__gnu_pbds::hash_exponential_size_policy< Size_Type >`:

### Public Types

- typedef `Size_Type` **size\_type**

### Public Member Functions

- [hash\\_exponential\\_size\\_policy](#) (`size_type start_size=8, size_type grow_factor=2`)
- void **swap** ([hash\\_exponential\\_size\\_policy](#) < `Size_Type` > &other)

### Protected Member Functions

- `size_type` **get\_nearest\_larger\_size** (`size_type size`) const
- `size_type` **get\_nearest\_smaller\_size** (`size_type size`) const

#### 6.510.1 Detailed Description

```
template<typename Size_Type = std::size_t>
class __gnu_pbds::hash_exponential_size_policy< Size_Type >
```

A size policy whose sequence of sizes form an exponential sequence (typically powers of 2).

#### 6.510.2 Constructor & Destructor Documentation

**hash\_exponential\_size\_policy()**

```
template<typename Size_Type>
__gnu_pbds::hash_exponential_size_policy< Size_Type >::hash_exponential_size_policy (
    size_type start_size = 8,
    size_type grow_factor = 2)
```

Default constructor, or onstructor taking a `start_size`, or constructor taking a `start_size` and `grow_factor`. The policy will use the sequence of sizes `start_size`, `start_size* grow_factor`, `start_size* grow_factor^2`, ...

The documentation for this class was generated from the following file:

- [hash\\_policy.hpp](#)

### 6.511 \_\_gnu\_pbds::hash\_load\_check\_resize\_trigger< External\_Load\_Access, Size\_Type > Class Template Reference

```
#include <hash_policy.hpp>
```

Inheritance diagram for `__gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >`:

## Public Types

- enum { [external\\_load\\_access](#) }
- typedef `Size_Type` **size\_type**

## Public Member Functions

- [hash\\_load\\_check\\_resize\\_trigger](#) (float load\_min=0.125, float load\_max=0.5)
- `std::pair< float, float >` [get\\_loads](#) () const
- void [set\\_loads](#) (`std::pair< float, float >` load\_pair)
- void **swap** ([hash\\_load\\_check\\_resize\\_trigger](#) &other)

## Protected Member Functions

- bool **is\_grow\_needed** (size\_type size, size\_type num\_entries) const
- bool **is\_resize\_needed** () const
- void [notify\\_cleared](#) ()
- void **notify\_erase\_search\_collision** ()
- void **notify\_erase\_search\_end** ()
- void **notify\_erase\_search\_start** ()
- void **notify\_erased** (size\_type num\_entries)
- void **notify\_externally\_resized** (size\_type new\_size)
- void **notify\_find\_search\_collision** ()
- void **notify\_find\_search\_end** ()
- void **notify\_find\_search\_start** ()
- void **notify\_insert\_search\_collision** ()
- void **notify\_insert\_search\_end** ()
- void **notify\_insert\_search\_start** ()
- void [notify\\_inserted](#) (size\_type num\_entries)
- void [notify\\_resized](#) (size\_type new\_size)

### 6.511.1 Detailed Description

```

template<bool External_Load_Access = false, typename Size_Type = std::size_t>
class __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >

```

A resize trigger policy based on a load check. It keeps the load factor between some load factors load\_min and load\_max.

### 6.511.2 Member Enumeration Documentation

#### anonymous enum

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
anonymous enum
```

##### Enumerator

external_load_access	Specifies whether the load factor can be accessed externally. The two options have different trade-offs in terms of flexibility, genericity, and encapsulation.
----------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------

### 6.511.3 Constructor & Destructor Documentation

#### hash\_load\_check\_resize\_trigger()

```
template<bool External_Load_Access, typename Size_Type>
__gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::hash_load_check_↵
resize_trigger (
    float load_min = 0.125,
    float load_max = 0.5)
```

Default constructor, or constructor taking load\_min and load\_max load factors between which this policy will keep the actual load.

### 6.511.4 Member Function Documentation

#### get\_loads()

```
template<bool External_Load_Access, typename Size_Type>
std::pair< float, float > __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_↵
_Type >::get_loads () const [inline]
```

Returns a pair of the minimal and maximal loads, respectively.

#### notify\_cleared()

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::notify_↵
cleared () [protected]
```

Notifies the table was cleared.

#### notify\_inserted()

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::notify_↵
inserted (
```

```
    size_type num_entries) [inline], [protected]
```

Notifies an element was inserted. The total number of entries in the table is num\_entries.

#### notify\_resized()

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::notify_↵
resized (
```

```
    size_type new_size) [protected]
```

Notifies the table was resized as a result of this object's signifying that a resize is needed.

References [notify\\_resized\(\)](#).  
Referenced by [notify\\_resized\(\)](#).

### set\_loads()

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::set_loads (
    std::pair< float, float > load_pair)
```

Sets the loads through a pair of the minimal and maximal loads, respectively.  
The documentation for this class was generated from the following file:

- [hash\\_policy.hpp](#)

## 6.512 `__gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, Hold_Size >` Class Template Reference

Inheritance diagram for `__gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, Hold_Size >`:

### 6.512.1 Detailed Description

```
template<typename Size_Type, bool Hold_Size>
class __gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, Hold_Size >
```

Primary template.  
The documentation for this class was generated from the following file:

- [hash\\_load\\_check\\_resize\\_trigger\\_size\\_base.hpp](#)

## 6.513 `__gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, true >` Class Template Reference

```
#include <hash_load_check_resize_trigger_size_base.hpp>
```

### Protected Types

- typedef Size\_Type **size\_type**

### Protected Member Functions

- size\_type **get\_size** () const
- void **set\_size** (size\_type size)
- void **swap** ([hash\\_load\\_check\\_resize\\_trigger\\_size\\_base](#) &other)

#### 6.513.1 Detailed Description

```
template<typename Size_Type>
class __gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, true >
```

Specializations.

The documentation for this class was generated from the following file:

#### 6.517.1 Detailed Description

A size policy whose sequence of sizes form a nearly-exponential sequence of primes.

#### 6.517.2 Member Typedef Documentation

##### size\_type

```
typedef std::size_t __gnu_pbds::hash_prime_size_policy::size_type
```

Size type.

#### 6.517.3 Constructor & Destructor Documentation

##### hash\_prime\_size\_policy()

```
__gnu_pbds::hash_prime_size_policy::hash_prime_size_policy (
    size\_type start_size = 8) [inline]
```

Default constructor, or onstructor taking a start\_size The policy will use the sequence of sizes approximately start\_size, start\_size\* 2, start\_size\* 2^2, ...

The documentation for this class was generated from the following file:

#### 6.519.1 Detailed Description

```
template<typename Size_Policy = hash_exponential_size_policy<>, typename Trigger_Policy = hash_load_↵
check_resize_trigger<>, bool External_Size_Access = false, typename Size_Type = std::size_t>
class __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_↵
Type >
```

A resize policy which delegates operations to size and trigger policies.

#### 6.519.2 Member Enumeration Documentation

##### anonymous enum

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
anonymous enum [inherited]
```

##### Enumerator

external_load_access	Specifies whether the load factor can be accessed externally. The two options have different trade-offs in terms of flexibility, genericity, and encapsulation.
----------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------

### 6.519.3 Constructor & Destructor Documentation

#### `hash_standard_resize_policy()` [1/3]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↵_Type>
```

```
__gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size↵_Type >::hash_standard_resize_policy ()
```

Default constructor.

#### `hash_standard_resize_policy()` [2/3]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↵_Type>
```

```
__gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size↵_Type >::hash_standard_resize_policy (  
    const Size_Policy & r_size_policy)
```

constructor taking some policies `r_size_policy` will be copied by the `Size_Policy` object of this object.

#### `hash_standard_resize_policy()` [3/3]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↵_Type>
```

```
__gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size↵_Type >::hash_standard_resize_policy (  
    const Size_Policy & r_size_policy,  
    const Trigger_Policy & r_trigger_policy)
```

constructor taking some policies. `r_size_policy` will be copied by the `Size_Policy` object of this object. `r_trigger_policy` will be copied by the `Trigger_Policy` object of this object.

### 6.519.4 Member Function Documentation

#### `get_actual_size()`

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↵_Type>
```

```
hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_Type >↵  
::size_type __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size↵_Access, Size_Type >::get_actual_size () const [inline]
```

Returns the actual size of the container.

#### `get_loads()`

```
template<bool External_Load_Access, typename Size_Type>
```

```
std::pair< float, float > __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size↵_Type >::get_loads () const [inline], [inherited]
```

Returns a pair of the minimal and maximal loads, respectively.

#### `get_new_size()`

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↵_Type>
```

```
hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_Type >↵  
::size_type __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size↵_Access, Size_Type >::get_new_size ()
```

```
        size_type size,  
        size_type num_used_e) const [protected]
```

Queries what the new size should be, when the container is resized naturally. The current `__size` of the container is `size`, and the number of used entries within the container is `num_used_e`.

#### **get\_size\_policy()** [1/2]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size_↵  
_Type>  
Size_Policy & __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_↵  
Size_Access, Size_Type >::get_size_policy ()
```

Access to the `Size_Policy` object used.

#### **get\_size\_policy()** [2/2]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size_↵  
_Type>  
const Size_Policy & __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_↵  
_Size_Access, Size_Type >::get_size_policy () const
```

Const access to the `Size_Policy` object used.

#### **get\_trigger\_policy()** [1/2]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size_↵  
_Type>  
Trigger_Policy & __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_↵  
Size_Access, Size_Type >::get_trigger_policy ()
```

Access to the `Trigger_Policy` object used.

#### **get\_trigger\_policy()** [2/2]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size_↵  
_Type>  
const Trigger_Policy & __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy,  
External_Size_Access, Size_Type >::get_trigger_policy () const
```

Access to the `Trigger_Policy` object used.

#### **resize()**

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size_↵  
_Type>  
void __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access,  
Size_Type >::resize (  
    size_type suggested_new_size)
```

Resizes the container to `suggested_new_size`, a suggested size (the actual size will be determined by the `Size_Policy` object).

#### **set\_loads()**

```
template<bool External_Load_Access, typename Size_Type>  
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::set_loads (  
    std::pair< float, float > load_pair) [inherited]
```

Sets the loads through a pair of the minimal and maximal loads, respectively.

The documentation for this class was generated from the following file:

- [hash\\_policy.hpp](#)

## 6.520 std::chrono::hh\_mm\_ss<\_Duration> Class Template Reference

```
#include <chrono>
```

### Public Types

- using **precision**

### Public Member Functions

- constexpr **hh\_mm\_ss** (\_Duration \_\_d)
- constexpr **chrono::hours** **hours** () const noexcept
- constexpr bool **is\_negative** () const noexcept
- constexpr **chrono::minutes** **minutes** () const noexcept
- constexpr **operator precision** () const noexcept
- constexpr **chrono::seconds** **seconds** () const noexcept
- constexpr **precision** **subseconds** () const noexcept
- constexpr **precision** **to\_duration** () const noexcept

### Static Public Attributes

- static constexpr unsigned **fractional\_width**

#### 6.520.1 Detailed Description

```
template<typename _Duration>
class std::chrono::hh_mm_ss<_Duration>
```

Utility for splitting a duration into hours, minutes, and seconds

This is a convenience type that provides accessors for the constituent parts (hours, minutes, seconds and subseconds) of a duration.

Since

C++20

The documentation for this class was generated from the following file:

- [chrono](#)

## 6.521 std::locale::id Class Reference

```
#include <locale_classes.h>
```

### Public Member Functions

- **id** ()
- **size\_t** **\_M\_id** () const throw ()

### Friends

- template<typename \_Facet>  
const \_Facet \* **\_\_try\_use\_facet** (const **locale** &\_\_loc)
- template<typename \_Facet>  
bool **has\_facet** (const **locale** &\_\_loc) throw ()
- class **locale**
- class **locale::\_Impl**
- template<typename \_Facet>  
const \_Facet & **use\_facet** (const **locale** &\_\_loc)

### 6.521.1 Detailed Description

Facet ID class.

The ID class provides facets with an index used to identify them. Every facet class must define a public static member `locale::id`, or be derived from a facet that provides this member, otherwise the facet cannot be used in a locale. The `locale::id` ensures that each class type gets a unique identifier.

### 6.521.2 Constructor & Destructor Documentation

#### `id()`

```
std::locale::id::id () [inline]
```

Constructor.

### 6.521.3 Friends And Related Symbol Documentation

#### `has_facet`

```
template<typename _Facet>
bool has_facet (
    const locale & __loc) throw ( ) [friend]
```

Test for the presence of a facet.

`has_facet` tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

#### Template Parameters

<code>_Facet</code>	The facet type to test the presence of.
---------------------	-----------------------------------------

#### Parameters

<code>__loc</code>	The locale to test.
--------------------	---------------------

#### Returns

true if `__loc` contains a facet of type `_Facet`, else false.

#### `use_facet`

```
template<typename _Facet>
const _Facet & use_facet (
    const locale & __loc) [friend]
```

Return a facet.

`use_facet` looks for and returns a reference to a facet of type `Facet` where `Facet` is the template parameter. If `has_facet(locale)` is true, there is a suitable facet to return. It throws `std::bad_cast` if the locale doesn't contain a facet of type `Facet`.

#### Template Parameters

<code>_Facet</code>	The facet type to access.
---------------------	---------------------------

## Parameters

<code>__loc</code>	The locale to use.
--------------------	--------------------

## Returns

Reference to facet of type Facet.

## Exceptions

<code>std::bad_cast</code>	if <code>__loc</code> doesn't contain a facet of type <code>_Facet</code> .
----------------------------	-----------------------------------------------------------------------------

The documentation for this class was generated from the following file:

- [locale\\_classes.h](#)

#### 6.525.1 Detailed Description

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
class std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType >
```

Produces random numbers by combining random numbers from some base engine to produce random numbers with a specified number of bits \_\_w.

Since

C++11

#### 6.525.2 Member Typedef Documentation

##### result\_type

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
typedef _UIntType std::independent\_bits\_engine<_RandomNumberEngine, __w, _UIntType >::result_type
```

The type of the generated random value.

#### 6.525.3 Constructor & Destructor Documentation

##### independent\_bits\_engine() [1/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
std::independent\_bits\_engine<_RandomNumberEngine, __w, _UIntType >::independent_bits_engine ()
[inline]
```

Constructs a default [independent\\_bits\\_engine](#) engine.

The underlying engine is default constructed as well.

Referenced by [operator==](#).

##### independent\_bits\_engine() [2/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
std::independent\_bits\_engine<_RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
    const _RandomNumberEngine & __rng) [inline], [explicit]
```

Copy constructs a [independent\\_bits\\_engine](#) engine.

Copies an existing base class random number generator.

##### Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	-----------------------------------------

**independent\_bits\_engine()** [3/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
    _RandomNumberEngine && __rng) [inline], [explicit]
```

Move constructs a `independent_bits_engine` engine.

Copies an existing base class random number generator.

**Parameters**

<code>__rng</code>	An existing (base class) engine object.
--------------------	-----------------------------------------

References [std::move\(\)](#).

**independent\_bits\_engine()** [4/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
    result_type __s) [inline], [explicit]
```

Seed constructs a `independent_bits_engine` engine.

Constructs the underlying generator engine seeded with `__s`.

**Parameters**

<code>__s</code>	A seed value for the base class engine.
------------------	-----------------------------------------

**independent\_bits\_engine()** [5/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
    _Sseq & __q) [inline], [explicit]
```

Generator construct a `independent_bits_engine` engine.

**Parameters**

<code>__q</code>	A seed sequence.
------------------	------------------

## 6.525.4 Member Function Documentation

**base()**

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
const _RandomNumberEngine & std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::base () const [inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

**discard()**

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::discard (
    unsigned long long __z) [inline]
```

Discard a sequence of random numbers.

**max()**

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
constexpr result\_type std::independent\_bits\_engine<_RandomNumberEngine, __w, _UIntType>::max ()
[inline], [static], [constexpr]
```

Gets the maximum value in the generated random number range.

**min()**

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
constexpr result\_type std::independent\_bits\_engine<_RandomNumberEngine, __w, _UIntType>::min ()
[inline], [static], [constexpr]
```

Gets the minimum value in the generated random number range.

**operator()()**

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
independent\_bits\_engine<_RandomNumberEngine, __w, _UIntType>::result_type std::independent\_bits\_engine<
_RandomNumberEngine, __w, _UIntType>::operator() ()
```

Gets the next value in the generated random number sequence.

References [std::\\_\\_lg\(\)](#), [std::\\_\\_numeric\\_limits\\_base::digits](#), and [std::numeric\\_limits<\\_Tp>::max\(\)](#).

**seed()** [1/3]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
void std::independent\_bits\_engine<_RandomNumberEngine, __w, _UIntType>::seed () [inline]
```

Reseeds the `independent_bits_engine` object with the default seed for the underlying base class generator engine.

**seed()** [2/3]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
template<typename _Sseq>
_If_seed_seq<_Sseq> < std::independent\_bits\_engine<_RandomNumberEngine, __w, _UIntType>::seed
(
    _Sseq & __q) [inline]
```

Reseeds the `independent_bits_engine` object with the given seed sequence.

**Parameters**

<code>__q</code>	A seed generator function.
------------------	----------------------------

**seed()** [3/3]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
void std::independent\_bits\_engine<_RandomNumberEngine, __w, _UIntType>::seed (
    result\_type __s) [inline]
```

Reseeds the `independent_bits_engine` object with the default seed for the underlying base class generator engine.

**6.525.5 Friends And Related Symbol Documentation****operator==**

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
bool operator== (
```

```
const independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __lhs,
const independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __rhs) [friend]
```

Compares two independent\_bits\_engine random number generator objects of the same type for equality.

#### Parameters

<code>__lhs</code>	A independent_bits_engine random number generator object.
<code>__rhs</code>	Another independent_bits_engine random number generator object.

#### Returns

true if the infinite sequences of generated values would be equal, false otherwise.

References [independent\\_bits\\_engine\(\)](#).

#### operator>>

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
template<typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __x) [friend]
```

Extracts the current state of a % subtract\_with\_carry\_engine random number generator engine `__x` from the input stream `__is`.

#### Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A independent_bits_engine random number generator engine.

#### Returns

The input stream with the state of `__x` extracted or in an error state.

## Friends

- class **gslice\_array**< \_Tp >
- class **valarray**< \_Tp >

### 6.526.1 Detailed Description

**template<class \_Tp>**

**class std::indirect\_array< \_Tp >**

Reference to arbitrary subset of an array.

An **indirect\_array** is a reference to the actual elements of an array specified by an ordered array of indices. The way to get an **indirect\_array** is to call **operator[]**(valarray<size\_t>) on a valarray. The returned **indirect\_array** then permits carrying operations out on the referenced subset of elements in the original valarray.

For example, if an **indirect\_array** is obtained using the array (4,2,0) as an argument, and then assigned to an array containing (1,2,3), then the underlying array will have **array**[0]==3, **array**[2]==2, and **array**[4]==1.

## Parameters

<i>Tp</i>	Element type.
-----------	---------------

## 6.526.2 Member Function Documentation

### **operator%=( )**

```
template<class _Tp>
void std::indirect_array< _Tp >::operator%= (
    const valarray< _Tp > & ) const
```

Modulo slice elements by corresponding elements of *v*.

### **operator&=( )**

```
template<class _Tp>
void std::indirect_array< _Tp >::operator&= (
    const valarray< _Tp > & ) const
```

Logical and slice elements with corresponding elements of *v*.

### **operator\*=( )**

```
template<class _Tp>
void std::indirect_array< _Tp >::operator*= (
    const valarray< _Tp > & ) const
```

Multiply slice elements by corresponding elements of *v*.

### **operator+=( )**

```
template<class _Tp>
void std::indirect_array< _Tp >::operator+= (
    const valarray< _Tp > & ) const
```

Add corresponding elements of *v* to slice elements.

### **operator-=( )**

```
template<class _Tp>
void std::indirect_array< _Tp >::operator-= (
    const valarray< _Tp > & ) const
```

Subtract corresponding elements of *v* from slice elements.

### **operator/=( )**

```
template<class _Tp>
void std::indirect_array< _Tp >::operator/= (
    const valarray< _Tp > & ) const
```

Divide slice elements by corresponding elements of *v*.

### **operator<<=( )**

```
template<class _Tp>
void std::indirect_array< _Tp >::operator<<= (
    const valarray< _Tp > & ) const
```

Left shift slice elements by corresponding elements of *v*.

### **operator>>=( )**

```
template<class _Tp>
void std::indirect_array< _Tp >::operator>>= (
    const valarray< _Tp > & ) const
```

Right shift slice elements by corresponding elements of *v*.

### `operator^=()`

```
template<class _Tp>
void std::indirect_array<_Tp>::operator^= (
    const valarray<_Tp> & ) const
```

Logical xor slice elements with corresponding elements of *v*.

### `operator" |=()`

```
template<class _Tp>
void std::indirect_array<_Tp>::operator|= (
    const valarray<_Tp> & ) const
```

Logical or slice elements with corresponding elements of *v*.

The documentation for this class was generated from the following files:

- [valarray](#)
- [indirect\\_array.h](#)

## 6.527 `std::initializer_list<_E>` Class Template Reference

constexpr const *\_Tp* \* **end** ([initializer\\_list](#)<*\_Tp*> \_\_ils) noexcept

#### 6.527.1 Detailed Description

```
template<class _E>
```

```
class std::initializer_list<_E>
```

```
initializer_list
```

### 6.527.2 Friends And Related Symbol Documentation

#### begin()

```
template<class _Tp>
const _Tp * begin (
    initializer_list< _Tp > __ils) [related]
```

Return an iterator pointing to the first element of the initializer\_list.

##### Parameters

<code><a href="#">_↔</a></code>	Initializer list.
<code><a href="#">_ils</a></code>	

#### end()

```
template<class _Tp>
const _Tp * end (
    initializer_list< _Tp > __ils) [related]
```

Return an iterator pointing to one past the last element of the initializer\_list.

##### Parameters

<code><a href="#">_↔</a></code>	Initializer list.
<code><a href="#">_ils</a></code>	

The documentation for this class was generated from the following file:

- [initializer\\_list](#)

### 6.528 std::input\_iterator\_tag Struct Reference

```
#include <stl_iterator_base_types.h>
```

Inheritance diagram for std::input\_iterator\_tag:

#### 6.528.1 Detailed Description

Marking input iterators.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

#### 6.529 \_\_gnu\_pbds::insert\_error Struct Reference

```
#include <exception.hpp>
```

Inheritance diagram for `__gnu_pbds::insert_error`:

### Public Member Functions

- virtual const char \* [what](#) () const noexcept

#### 6.529.1 Detailed Description

An entry cannot be inserted into a container object for logical reasons (not, e.g., if memory is unavailable, in which case the `allocator_type`'s exception will be thrown).

#### 6.529.2 Member Function Documentation

##### `what()`

```
virtual const char * std::logic_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this struct was generated from the following file:

- [exception.hpp](#)

### 6.530 `std::insert_iterator<_Container>` Class Template Reference

```
#include <stl_iterator.h>
```

Inheritance diagram for std::insert\_iterator< \_Container >:

### Public Types

- typedef `_Container` `container_type`
- using `difference_type`
- typedef `output_iterator_tag` `iterator_category`
- typedef void `pointer`
- typedef void `reference`
- typedef void `value_type`

### Public Member Functions

- constexpr `insert_iterator` (`_Container &__x`, `_Iter __i`)
- constexpr `insert_iterator` & `operator*` ()
- constexpr `insert_iterator` & `operator++` ()
- constexpr `insert_iterator` & `operator++` (int)
- constexpr `insert_iterator` & `operator=` (const typename `_Container::value_type` &\_\_value)
- constexpr `insert_iterator` & `operator=` (typename `_Container::value_type` &&\_\_value)

### Protected Attributes

- `_Container *` `container`
- `_Iter` `iter`

#### 6.530.1 Detailed Description

**template**<typename `_Container`>  
**class** `std::insert_iterator`< `_Container` >

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator inserts it in the container at the iterator's position, rather than overwriting the value at that position.

(Sequences will actually insert a *copy* of the value before the iterator's position.)

Tip: Using the inserter function to create these iterators can save typing.

### 6.530.2 Member Typedef Documentation

#### container\_type

```
template<typename _Container>
typedef _Container std::insert_iterator< _Container >::container_type
```

A nested typedef for the type of whatever container you used.

#### iterator\_category

```
typedef output_iterator_tag std::iterator< output_iterator_tag, void, void, void, void >::iterator←_category [inherited]
```

One of the [tag types](#).

#### pointer

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::pointer [inherited]
```

This type represents a pointer-to-value\_type.

#### reference

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::reference [inherited]
```

This type represents a reference-to-value\_type.

#### value\_type

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type [inherited]
```

The type "pointed to" by the iterator.

### 6.530.3 Constructor & Destructor Documentation

#### insert\_iterator()

```
template<typename _Container>
std::insert_iterator< _Container >::insert_iterator (
    _Container & __x,
    _Iter __i) [inline], [constexpr]
```

The only way to create this iterator is with a container and an initial position (a normal iterator into the container).

References [std::\\_\\_addressof\(\)](#).

### 6.530.4 Member Function Documentation

#### operator\*()

```
template<typename _Container>
insert_iterator & std::insert_iterator< _Container >::operator* () [inline], [nodiscard], [constexpr]
```

Simply returns \*this.

#### operator++() [1/2]

```
template<typename _Container>
insert_iterator & std::insert_iterator< _Container >::operator++ () [inline], [constexpr]
```

Simply returns \*this. (This iterator does not *move*.)

**operator++()** [2/2]

```
template<typename _Container>
insert_iterator & std::insert_iterator< _Container >::operator++ (
    int ) [inline], [constexpr]
```

Simply returns \*this. (This iterator does not *move*.)

**operator=()**

```
template<typename _Container>
insert_iterator & std::insert_iterator< _Container >::operator= (
    const typename _Container::value_type & __value) [inline], [constexpr]
```

**Parameters**

<code>__value</code>	An instance of whatever type <code>container_type::const_reference</code> is; presumably a reference-to-const T for <code>container&lt;T&gt;</code> .
----------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------

**Returns**

This iterator, for chained operations.

This kind of iterator maintains its own position in the container. Assigning a value to the iterator will insert the value into the container at the place before the iterator.

The position is maintained such that subsequent assignments will insert values immediately after one another. For example,

```
// vector v contains A and Z
insert_iterator i (v, ++v.begin());
i = 1;
i = 2;
i = 3;
```

```
// vector v contains A, 1, 2, 3, and Z
```

#### 6.534.1 Detailed Description

The base of the I/O class hierarchy.

This class defines everything that can be defined about I/O that does not depend on the type of characters being input or output. Most people will only see `ios_base` when they need to specify the full name of the various I/O flags (e.g., the openmodes).

#### 6.534.2 Member Typedef Documentation

##### `event_callback`

```
typedef void(* std::ios_base::event_callback) (event __e, ios_base &__b, int __i)
```

The type of an event callback function.

**Parameters**

<code>_e</code>	One of the members of the event enum.
<code>_b</code>	Reference to the ios_base object.
<code>_i</code>	The integer provided when the callback was registered.

Event callbacks are user defined functions that get called during several ios\_base and basic\_ios functions, specifically imbue(), copyfmt(), and ~ios().

**iostate**

```
typedef _Ios_Iostate std::ios_base::iostate
```

This is a bitmask type.

`_Ios_Iostate` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type iostate are:

- badbit
- eofbit
- failbit
- goodbit

**openmode**

```
typedef _Ios_Openmode std::ios_base::openmode
```

This is a bitmask type.

`_Ios_Openmode` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type openmode are:

- app
- ate
- binary
- in
- out
- trunc

**seekdir**

```
typedef _Ios_Seekdir std::ios_base::seekdir
```

This is an enumerated type.

`_Ios_Seekdir` is implementation-defined. Defined values of type seekdir are:

- beg
- cur, equivalent to `SEEK_CUR` in the C standard library.
- end, equivalent to `SEEK_END` in the C standard library.

### 6.534.3 Member Enumeration Documentation

#### event

```
enum std::ios_base::event
```

The set of events that may be passed to an event callback.

`erase_event` is used during `~ios()` and `copyfmt()`. `imbue_event` is used during `imbue()`. `copyfmt_event` is used during `copyfmt()`.

### 6.534.4 Constructor & Destructor Documentation

#### `~ios_base()`

```
virtual std::ios_base::~~ios_base () [virtual]
```

Invokes each callback with `erase_event`. Destroys local storage.

Note that the `ios_base` object for the standard streams never gets destroyed. As a result, any callbacks registered with the standard streams will not get invoked with `erase_event` (unless `copyfmt` is used).

### 6.534.5 Member Function Documentation

#### `_M_getloc()`

```
const locale & std::ios_base::_M_getloc () const [inline]
```

Locale access.

#### Returns

A reference to the current locale.

Like `getloc` above, but returns a reference instead of generating a copy.

Referenced by `std::money_get<_CharT, _InIter>::do_get()`, `std::num_get<_CharT, _InIter>::do_get()`, `std::time_get<_CharT, _InIter>::do_get_date()`, `std::time_get<_CharT, _InIter>::do_get_monthname()`, `std::time_get<_CharT, _InIter>::do_get_weekday()`, `std::time_get<_CharT, _InIter>::do_get_year()`, `std::num_put<_CharT, _OutIter>::do_put()`, `std::time_put<_CharT, _OutIter>::do_put()`, and `std::time_put<_CharT, _OutIter>::put()`.

#### `flags()` [1/2]

```
fmtflags std::ios_base::flags () const [inline], [nodiscard]
```

Access to format flags.

#### Returns

The format control flags for both input and output.

Referenced by `std::basic_ios<_CharT, _Traits>::copyfmt()`, `std::num_get<_CharT, _InIter>::do_get()`, `std::num_get<_CharT, _InIter>::do_put()`, `std::num_put<_CharT, _OutIter>::do_put()`, `std::chrono::operator<<()`, `std::operator<<()`, `std::__detail::operator>>()`, `std::operator>>()`, `std::operator>>()`, `std::operator>>()`, `std::operator>>()`, and `std::operator>>()`.

#### `flags()` [2/2]

```
fmtflags std::ios_base::flags (
    fmtflags __fmtfl) [inline]
```

Setting new format flags all at once.

#### Parameters

<code>__fmtfl</code>	The new flags to set.
----------------------	-----------------------

**Returns**

The previous format control flags.

This function overwrites all the format flags with `__fmtfl`.

References [fmtflags](#).

**getloc()**

```
locale std::ios_base::getloc () const [inline], [nodiscard]
```

Locale access.

**Returns**

A copy of the current locale.

If `imbue(loc)` has previously been called, then this function returns `loc`. Otherwise, it returns a copy of `std::locale()`, the global C++ locale.

Referenced by [std::basic\\_ios<\\_CharT, \\_Traits>::copyfmt\(\)](#), [std::money\\_put<\\_CharT, \\_OutIter>::do\\_put\(\)](#), [std::basic\\_ios<\\_CharT, \\_Traits>::do\\_get\(\)](#), [std::chrono::operator<<\(\)](#), [std::operator>>\(\)](#), [std::operator>>\(\)](#), and [std::ws\(\)](#).

**imbue()**

```
locale std::ios_base::imbue (
    const locale & __loc) throw ( )
```

Setting a new locale.

**Parameters**

<code>__loc</code>	The new locale.
--------------------	-----------------

**Returns**

The previous locale.

Sets the new locale for this stream, and then invokes each callback with `imbue_event`.

Referenced by [std::basic\\_ios<\\_CharT, \\_Traits>::imbue\(\)](#).

**iword()**

```
long & std::ios_base::iword (
    int __ix) [inline]
```

Access to integer array.

**Parameters**

<code>__ix</code>	Index into the array.
-------------------	-----------------------

**Returns**

A reference to an integer associated with the index.

The `iword` function provides access to an array of integers that can be used for any purpose. The array grows as required to hold the supplied index. All integers in the array are initialized to 0.

The implementation reserves several indices. You should use `xalloc` to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

References [iword\(\)](#).

Referenced by [iword\(\)](#).

**precision()** [1/2]

```
streamsize std::ios_base::precision () const [inline], [nodiscard]
```

Flags access.

**Returns**

The precision to generate on certain output operations.

Be careful if you try to give a definition of *precision* here; see DR 189.

Referenced by [std::basic\\_ios<\\_CharT, \\_Traits >::copyfmt\(\)](#), and [std::chrono::operator<<\(\)](#).

**precision()** [2/2]

```
streamsize std::ios_base::precision (  
    streamsize __prec) [inline]
```

Changing flags.

**Parameters**

<code>__prec</code>	The new precision value.
---------------------	--------------------------

**Returns**

The previous value of `precision()`.

**pword()**

```
void *& std::ios_base::pword (  
    int __ix) [inline]
```

Access to void pointer array.

**Parameters**

<code>↔ __ix</code>	Index into the array.
-------------------------	-----------------------

**Returns**

A reference to a `void*` associated with the index.

The `pword` function provides access to an array of pointers that can be used for any purpose. The array grows as required to hold the supplied index. All pointers in the array are initialized to 0.

The implementation reserves several indices. You should use `xalloc` to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

**register\_callback()**

```
void std::ios_base::register_callback (  
    event_callback __fn,  
    int __index)
```

Add the callback `__fn` with parameter `__index`.

**Parameters**

<code>__fn</code>	The function to add.
-------------------	----------------------

<code>__index</code>	The integer to pass to the function when invoked.
----------------------	---------------------------------------------------

Registers a function as an event callback with an integer parameter to be passed to the function when invoked. Multiple copies of the function are allowed. If there are multiple callbacks, they are invoked in the order they were registered. References [fmtflags](#).

### setf() [1/2]

```
fmtflags std::ios_base::setf (
    fmtflags __fmtfl) [inline]
```

Setting new format flags.

#### Parameters

<code>__fmtfl</code>	Additional flags to set.
----------------------	--------------------------

#### Returns

The previous format control flags.

This function sets additional flags in format control. Flags that were previously set remain set.

References [fmtflags](#).

Referenced by [std::\\_\\_detail::operator>>\(\)](#).

### setf() [2/2]

```
fmtflags std::ios_base::setf (
    fmtflags __fmtfl,
    fmtflags __mask) [inline]
```

Setting new format flags.

#### Parameters

<code>__fmtfl</code>	Additional flags to set.
<code>__mask</code>	The flags mask for <i>fmtfl</i> .

#### Returns

The previous format control flags.

This function clears *mask* in the format flags, then sets *fmtfl* & *mask*. An example mask is `ios_base::adjustfield`.

References [fmtflags](#).

### sync\_with\_stdio()

```
bool std::ios_base::sync_with_stdio (
    bool __sync = true) [static]
```

Interaction with the standard C I/O objects.

#### Parameters

<code>__sync</code>	Whether to synchronize or not.
---------------------	--------------------------------

**Returns**

True if the standard streams were previously synchronized.

The synchronization referred to is *only* that between the standard C facilities (e.g., stdout) and the standard C++ objects (e.g., cout). User-declared streams are unaffected. See <https://gcc.gnu.org/onlinedocs/libstdc++/manual/fstream.html#std.io.filestreams.binary>

**unsetf()**

```
void std::ios_base::unsetf (
    fmtflags __mask) [inline]
```

Clearing format flags.

**Parameters**

<code>__mask</code>	The flags to unset.
---------------------	---------------------

This function clears `__mask` in the format flags.

References [fmtflags](#).

**width() [1/2]**

```
streamsize std::ios_base::width () const [inline], [nodiscard]
```

Flags access.

**Returns**

The minimum field width to generate on output operations.

*Minimum field width* refers to the number of characters.

Referenced by [std::basic\\_ios<\\_CharT, \\_Traits>::copyfmt\(\)](#), [std::num\\_put<\\_CharT, \\_Outiter>::do\\_put\(\)](#), [std::operator>>\(\)](#), and [std::operator>>\(\)](#).

**width() [2/2]**

```
streamsize std::ios_base::width (
    streamsize __wide) [inline]
```

Changing flags.

**Parameters**

<code>__wide</code>	The new width value.
---------------------	----------------------

**Returns**

The previous value of `width()`.

**xalloc()**

```
int std::ios_base::xalloc () throw ( ) [static]
```

Access to unique indices.

**Returns**

An integer different from all previous calls.

This function returns a unique integer every time it is called. It can be used for any purpose, but is primarily intended to be a unique index for the `iword` and `pword` functions. The expectation is that an application calls `xalloc` in order to obtain an index in the `iword` and `pword` arrays that can be used without fear of conflict.

The implementation maintains a static variable that is incremented and returned on each invocation. `xalloc` is guaranteed to return an index that is safe to use in the `iword` and `pword` arrays.

**6.534.6 Member Data Documentation****adjustfield**

```
const fmtflags std::ios_base::adjustfield [static]
```

A mask of left|right|internal. Useful for the 2-arg form of `setf`.

Referenced by `std::num_put< _CharT, _OutIter >::do_put()`, `std::internal()`, `std::left()`, and `std::right()`.

**app**

```
const openmode std::ios_base::app [static]
```

Seek to end before each write.

Referenced by `std::basic_filebuf< char_type, traits_type >::_M_set_buffer()`, `std::basic_filebuf< _CharT, _Traits >::overflow()`, and `std::basic_filebuf< _CharT, _Traits >::xsputn()`.

**ate**

```
const openmode std::ios_base::ate [static]
```

Open and seek to end immediately after opening.

Referenced by `std::basic_filebuf< _CharT, _Traits >::open()`.

**badbit**

```
const iostate std::ios_base::badbit [static]
```

Indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file).

Referenced by `std::basic_istream< _CharT, _Traits >::sentry::sentry()`, `std::basic_ostream< _CharT, _Traits >::sentry::~~sentry()`, `std::basic_ios< _CharT, _Traits >::clear()`, `std::basic_ostream< _CharT, _Traits >::flush()`, `std::basic_iostream< char_type, traits_type >::clear()`, `std::basic_istream< _CharT, _Traits >::get()`, `std::basic_istream< _CharT, _Traits >::get()`, `std::basic_iostream< char_type, traits_type >::get()`, `std::basic_ostream< _CharT, _Traits >::operator<<()`, `std::basic_istream< _CharT, _Traits >::operator>>()`, `std::operator>>()`, `std::basic_ostream< _CharT, _Traits >::put()`, `std::basic_istream< _CharT, _Traits >::putback()`, `std::basic_istream< _CharT, _Traits >::read()`, `std::basic_istream< _CharT, char_traits< _CharT > >::read()`, `std::basic_istream< _CharT, _Traits >::readsome()`, `std::basic_istream< _CharT, _Traits >::seekg()`, `std::basic_istream< _CharT, _Traits >::seekg()`, `std::basic_istream< _CharT, _Traits >::tellg()`, `std::basic_istream< _CharT, _Traits >::tellg()`, and `std::ws()`.

**basefield**

```
const fmtflags std::ios_base::basefield [static]
```

A mask of dec|oct|hex. Useful for the 2-arg form of `setf`.

Referenced by `std::dec()`, `std::num_get< _CharT, _InIter >::do_get()`, `std::num_put< _CharT, _OutIter >::do_put()`, `std::hex()`, and `std::oct()`.

**beg**

```
const seekdir std::ios_base::beg [static]
```

Request a seek relative to the beginning of the stream.

Referenced by `std::basic_filebuf< _CharT, _Traits >::seekpos()`.

## binary

```
const openmode std::ios_base::binary [static]
```

Perform input and output in binary mode (as opposed to text mode). This is probably not what you think it is; see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/fstreams.html#std.io.↔filestreams.binary>.

Referenced by `std::basic_filebuf<_CharT, _Traits>::showmanyc()`.

## boolalpha

```
const fmtflags std::ios_base::boolalpha [static]
```

Insert/extract `bool` in alphabetic rather than numeric format.

Referenced by `std::boolalpha()`, `std::num_get<_CharT, _InIter>::do_get()`, `std::num_put<_CharT, _OutIter>::do_put()`, and `std::noboolalpha()`.

## cur

```
const seekdir std::ios_base::cur [static]
```

Request a seek relative to the current position within the sequence.

Referenced by `std::basic_filebuf<_CharT, _Traits>::imbue()`, `std::basic_filebuf<_CharT, _Traits>::overflow()`, `std::basic_filebuf<_CharT, _Traits>::pbackfail()`, `std::basic_filebuf<_CharT, _Traits>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, std::basic_istream<_CharT, _Traits>::tellg()`, and `std::basic_ostream<_CharT, _Traits>::tellp()`.

## dec

```
const fmtflags std::ios_base::dec [static]
```

Converts integer input or generates integer output in decimal base.

Referenced by `std::dec()`.

## end

```
const seekdir std::ios_base::end [static]
```

Request a seek relative to the current end of the sequence.

Referenced by `std::basic_filebuf<_CharT, _Traits>::open()`, and `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`.

## eofbit

```
const iostate std::ios_base::eofbit [static]
```

Indicates that an input operation reached the end of an input sequence.

Referenced by `std::num_get<_CharT, _InIter>::do_get()`, `std::num_get<_CharT, _InIter>::do_get()`, `std::num_get<_CharT, _InIter>::do_get()`, `std::time_get<_CharT, _InIter>::do_get()`, `std::time_get<_CharT, _InIter>::do_get_date()`, `std::time_get<_CharT, _InIter>::do_get_monthname()`, `std::time_get<_CharT, _InIter>::do_get_time()`, `std::time_get<_CharT, _InIter>::do_get_year()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::time_get<_CharT, _InIter>::get()`, `std::basic_istream<_CharT, _Traits>::ignore()`, `std::basic_istream<_CharT, _Traits>::operator>>()`, `std::operator>>()`, `std::basic_istream<_CharT, char_traits<_CharT>>::peek()`, `std::basic_istream<_CharT, _Traits>::putback()`, `std::basic_istream<_CharT, _Traits>::read()`, `std::basic_istream<_CharT, _Traits>::readsome()`, `std::basic_istream<_CharT, _Traits>::seekg()`, `std::basic_istream<_CharT, _Traits>::seekg()`, `std::basic_istream<_CharT, char_traits<_CharT>>::seekg()`, `std::basic_istream<_CharT, _Traits>::unget()`, `std::basic_istream<_CharT, char_traits<_CharT>>::unget()`, and `std::ws()`.

## failbit

```
const iostate std::ios_base::failbit [static]
```

Indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.

Referenced by [std::basic\\_ostream<\\_CharT, \\_Traits>::sentry::sentry\(\)](#), [std::basic\\_fstream<char>::close\(\)](#), [std::basic\\_ifstream<char>::close\(\)](#), [std::basic\\_ofstream<char>::close\(\)](#), [std::num\\_get<\\_CharT, \\_InIter>::do\\_get\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::do\\_get\\_monthname\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::do\\_get\\_weekday\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::do\\_get\\_year\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::get\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::get\(\)](#), [std::basic\\_fstream<char>::open\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::open\(\)](#), [std::basic\\_ifstream<char>::open\(\)](#), [std::basic\\_ofstream<char>::open\(\)](#), [std::basic\\_ostream<char>::open\(\)](#), [std::operator<<\(\)](#), [std::basic\\_iostream<char\\_type, traits\\_type>::operator<<\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::operator>>\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::operator>>\(\)](#), [std::operator>>\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::read\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::seekg\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::seekp\(\)](#), and [std::basic\\_ostream<\\_CharT, \\_Traits>::seekp\(\)](#).

### fixed

```
const fmtflags std::ios_base::fixed [static]
```

Generate floating-point output in fixed-point notation.

Referenced by [std::fixed\(\)](#), and [std::hexfloat\(\)](#).

### floatfield

```
const fmtflags std::ios_base::floatfield [static]
```

A mask of scientific|fixed. Useful for the 2-arg form of `setf`.

Referenced by [std::defaultfloat\(\)](#), [std::fixed\(\)](#), [std::hexfloat\(\)](#), and [std::scientific\(\)](#).

### goodbit

```
const iostate std::ios_base::goodbit [static]
```

Indicates all is well.

Referenced by [std::basic\\_istream<\\_CharT, \\_Traits>::sentry::sentry\(\)](#), [std::num\\_get<\\_CharT, \\_InIter>::do\\_get\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::do\\_get\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::do\\_get\\_monthname\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::do\\_get\\_year\(\)](#), [std::basic\\_ostream<\\_CharT, \\_Traits>::flush\(\)](#), [std::basic\\_iostream<char\\_type, traits\\_type>::get\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::get\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::get\(\)](#), [std::time\\_get<\\_CharT, \\_InIter>::get\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::ignore\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::ignore\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::ignore\(\)](#), [std::basic\\_iostream<char\\_type, traits\\_type>::operator<<\(\)](#), [std::basic\\_iostream<char\\_type, traits\\_type>::operator>>\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::operator>>\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::operator>>\(\)](#), [std::operator>>\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::peek\(\)](#), [std::basic\\_ostream<\\_CharT, \\_Traits>::put\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::put\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::read\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::readsome\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::seekg\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::sync\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::unget\(\)](#), and [std::ws\(\)](#).

### hex

```
const fmtflags std::ios_base::hex [static]
```

Converts integer input or generates integer output in hexadecimal base.

Referenced by [std::num\\_get<\\_CharT, \\_InIter>::do\\_get\(\)](#), [std::num\\_put<\\_CharT, \\_OutIter>::do\\_put\(\)](#), and [std::hex\(\)](#).

### in

```
const openmode std::ios_base::in [static]
```

Open for input. Default for `ifstream` and `fstream`.

Referenced by [std::basic\\_fstream<char>::basic\\_fstream\(\)](#), [std::basic\\_fstream<char>::basic\\_fstream\(\)](#), [std::basic\\_fstream<char>::basic\\_fstream\(\)](#), [std::basic\\_ifstream<char>::basic\\_ifstream\(\)](#), [std::basic\\_ifstream<char>::basic\\_ifstream\(\)](#), [std::basic\\_ifstream<char>::basic\\_ifstream\(\)](#), [std::basic\\_istringstream<char>::basic\\_istringstream\(\)](#), [std::basic\\_stringbuf<char>::basic\\_stringbuf\(\)](#), [std::basic\\_stringstream<char>::basic\\_stringstream\(\)](#), [std::basic\\_filebuf<char\\_type, traits\\_type>::M\\_set\\_buffer\(\)](#), [std::basic\\_fstream<char>::open\(\)](#), [std::basic\\_fstream<char>::open\(\)](#), [std::basic\\_fstream<char>::open\(\)](#), [std::basic\\_ifstream<char>::open\(\)](#), [std::basic\\_ifstream<char>::open\(\)](#), and [std::basic\\_ifstream<char>::open\(\)](#).

**showbase**

```
const fmtflags std::ios_base::showbase [static]
```

Generates a prefix indicating the numeric base of generated integer output.

Referenced by [std::num\\_put<\\_CharT, \\_OutIter>::do\\_put\(\)](#), [std::noshowbase\(\)](#), and [std::showbase\(\)](#).

**showpoint**

```
const fmtflags std::ios_base::showpoint [static]
```

Generates a decimal-point character unconditionally in generated floating-point output.

Referenced by [std::noshowpoint\(\)](#), and [std::showpoint\(\)](#).

**showpos**

```
const fmtflags std::ios_base::showpos [static]
```

Generates a + sign in non-negative generated numeric output.

Referenced by [std::noshowpos\(\)](#), and [std::showpos\(\)](#).

**skipws**

```
const fmtflags std::ios_base::skipws [static]
```

Skips leading white space before certain input operations.

Referenced by [std::noskipws\(\)](#), [std::\\_\\_detail::operator>>\(\)](#), and [std::skipws\(\)](#).

**trunc**

```
const openmode std::ios_base::trunc [static]
```

Truncate an existing stream when opening. Default for `ofstream`.

**unitbuf**

```
const fmtflags std::ios_base::unitbuf [static]
```

Flushes output after each output operation.

Referenced by [std::basic\\_ostream<\\_CharT, \\_Traits>::sentry::~sentry\(\)](#), [std::nounitbuf\(\)](#), and [std::unitbuf\(\)](#).

**uppercase**

```
const fmtflags std::ios_base::uppercase [static]
```

Replaces certain lowercase letters with their uppercase equivalents in generated output.

Referenced by [std::num\\_put<\\_CharT, \\_OutIter>::do\\_put\(\)](#), [std::nouppercase\(\)](#), and [std::uppercase\(\)](#).

The documentation for this class was generated from the following file:

### 6.536 `std::is_arithmetic< _Tp >` Struct Template Reference

```
#include <type_traits>
```

#### 6.536.1 Detailed Description

```
template<typename _Tp>
struct std::is_arithmetic< _Tp >
```

`is_arithmetic`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

### 6.537 `std::is_array< _Tp >` Struct Template Reference

```
#include <type_traits>
```

#### 6.537.1 Detailed Description

```
template<typename _Tp>
struct std::is_array< _Tp >
```

`is_array`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

### 6.538 `std::is_assignable< _Tp, _Up >` Struct Template Reference

```
#include <type_traits>
```

#### 6.538.1 Detailed Description

```
template<typename _Tp, typename _Up>
struct std::is_assignable< _Tp, _Up >
```

`is_assignable`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

### 6.539 `std::is_base_of< _Base, _Derived >` Struct Template Reference

```
#include <type_traits>
```

#### 6.539.1 Detailed Description

```
template<typename _Base, typename _Derived>
struct std::is_base_of< _Base, _Derived >
```

`is_base_of`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

### 6.540 `std::is_bind_expression< _Tp >` Struct Template Reference

```
#include <functional>
```

### 6.540.1 Detailed Description

```
template<typename _Tp>
struct std::is_bind_expression<_Tp>
```

Trait that identifies a bind expression.

Determines if the given type `_Tp` is a function object that should be treated as a subexpression when evaluating calls to function objects returned by `std::bind`.

C++11 [func.bind.isbind].

Since

C++11

The documentation for this struct was generated from the following file:

- [functional](#)

## 6.541 `std::is_bind_expression<_Bind<_Signature>>` Struct Template Reference

```
#include <functional>
```

### 6.541.1 Detailed Description

```
template<typename _Signature>
struct std::is_bind_expression<_Bind<_Signature>>
```

Class template `_Bind` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

## 6.542 `std::is_bind_expression<_Bind_result<_Result, _Signature>>` Struct Template Reference

```
#include <functional>
```

### 6.542.1 Detailed Description

```
template<typename _Result, typename _Signature>
struct std::is_bind_expression<_Bind_result<_Result, _Signature>>
```

Class template `_Bind_result` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

## 6.543 `std::is_bind_expression<const _Bind<_Signature>>` Struct Template Reference

```
#include <functional>
```

### 6.543.1 Detailed Description

```
template<typename _Signature>
struct std::is_bind_expression<const _Bind<_Signature>>
```

Class template `_Bind` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

### 6.544 `std::is_bind_expression< const _Bind_result< _Result, _Signature > >` Struct Template Reference

```
#include <functional>
```

#### 6.544.1 Detailed Description

```
template<typename _Result, typename _Signature>
struct std::is_bind_expression< const _Bind_result< _Result, _Signature > >
```

Class template `_Bind_result` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

### 6.545 `std::is_bind_expression< const volatile _Bind< _Signature > >` Struct Template Reference

```
#include <functional>
```

#### 6.545.1 Detailed Description

```
template<typename _Signature>
struct std::is_bind_expression< const volatile _Bind< _Signature > >
```

Class template `_Bind` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

### 6.546 `std::is_bind_expression< const volatile _Bind_result< _Result, _Signature > >` Struct Template Reference

```
#include <functional>
```

#### 6.546.1 Detailed Description

```
template<typename _Result, typename _Signature>
struct std::is_bind_expression< const volatile _Bind_result< _Result, _Signature > >
```

Class template `_Bind_result` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

### 6.547 `std::is_bind_expression< volatile _Bind< _Signature > >` Struct Template Reference

```
#include <functional>
```

#### 6.547.1 Detailed Description

```
template<typename _Signature>
struct std::is_bind_expression< volatile _Bind< _Signature > >
```

Class template `_Bind` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

## 6.548 `std::is_bind_expression< volatile _Bind_result< _Result, _Signature > >` Struct Template Reference

```
#include <functional>
```

### 6.548.1 Detailed Description

```
template<typename _Result, typename _Signature>  
struct std::is_bind_expression< volatile _Bind_result< _Result, _Signature > >
```

Class template `_Bind_result` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

## 6.549 `std::is_class< _Tp >` Struct Template Reference

```
#include <type_traits>

## 6.581 `std::is_nothrow_move_constructible<_Tp>` Struct Template Reference

```
#include <type_traits>
```

### 6.581.1 Detailed Description

```
template<typename _Tp>
struct std::is_nothrow_move_constructible<_Tp>
```

`is_nothrow_move_constructible`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.582 `std::is_object<_Tp>` Struct Template Reference

```
#include <type_traits>
```

### 6.582.1 Detailed Description

```
template<typename _Tp>
struct std::is_object<_Tp>
```

`is_object`

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.583 `std::is_placeholder<_Tp>` Struct Template Reference

```
#include <functional>
```

Inheritance diagram for `std::is_placeholder<_Tp>`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr int **value**

#### 6.583.1 Detailed Description

```
template<typename _Tp>
struct std::is_placeholder<_Tp>
```

Determines if the given type `_Tp` is a placeholder in a `bind()` expression and, if so, which placeholder it is.  
C++11 [func.bind.isplace].

Since

C++11

The documentation for this struct was generated from the following file:

- [functional](#)

#### 6.584 `std::is_placeholder<_Placeholder<_Num>>` Struct Template Reference

```
#include <functional>
```

Inheritance diagram for std::is\_placeholder< \_Placeholder< \_Num > >:

### Public Types

- using **type**
- using **value\_type**

### Public Member Functions

- constexpr **operator value\_type** () const noexcept

### Static Public Attributes

- static constexpr int **value**

#### 6.584.1 Detailed Description

```
template<int _Num>
struct std::is_placeholder< _Placeholder< _Num > >
```

Partial specialization of `is_placeholder` that provides the placeholder number for the placeholder objects defined by `libstdc++`.

Since

C++11

The documentation for this struct was generated from the following file:

- [functional](#)

## 6.585 std::is\_pod< \_Tp > Struct Template Reference

```
#include <type_traits>
```

#### 6.585.1 Detailed Description

```
template<typename _Tp>
struct std::is_pod< _Tp >
```

`is_pod`

**Deprecated** Deprecated in C++20. Use `is_standard_layout` && `is_trivial` instead.

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

## 6.586 `std::is_pointer<_Tp>` Struct Template Reference

```
#include <type_traits>
```

### 6.586.1 Detailed Description

```
template<typename _Tp>
struct std::is_pointer<_Tp>
```

`is_pointer`

The documentation for this struct was generated from the following file:

### 6.609.1 Detailed Description

**template<typename \_Tp, typename \_CharT = char, typename \_Traits = char\_traits<\_CharT>, typename \_Dist = ptrdiff\_t>**

**class std::istream\_iterator<\_Tp, \_CharT, \_Traits, \_Dist>**

Provides input iterator semantics for streams.

### 6.609.2 Member Typedef Documentation

#### difference\_type

```
typedef ptrdiff_t std::iterator< input_iterator_tag, _Tp, ptrdiff_t, const _Tp *, const _Tp & >::difference_type [inherited]
```

Distance between iterators is represented as this type.

#### iterator\_category

```
typedef input_iterator_tag std::iterator< input_iterator_tag, _Tp, ptrdiff_t, const _Tp *, const _Tp & >::iterator_category [inherited]
```

One of the [tag types](#).

#### pointer

```
typedef const _Tp * std::iterator< input_iterator_tag, _Tp, ptrdiff_t, const _Tp *, const _Tp & >::pointer [inherited]
```

This type represents a pointer-to-value\_type.

#### reference

```
typedef const _Tp & std::iterator< input_iterator_tag, _Tp, ptrdiff_t, const _Tp *, const _Tp & >::reference [inherited]
```

This type represents a reference-to-value\_type.

#### value\_type

```
typedef _Tp std::iterator< input_iterator_tag, _Tp, ptrdiff_t, const _Tp *, const _Tp & >::value_type [inherited]
```

The type "pointed to" by the iterator.

### 6.609.3 Constructor & Destructor Documentation

#### istream\_iterator() [1/2]

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename _Dist = ptrdiff_t>
std::istream_iterator<_Tp, _CharT, _Traits, _Dist>::istream_iterator () [inline], [constexpr], [noexcept]
```

Construct end of input stream iterator.

Referenced by [operator==](#).

#### istream\_iterator() [2/2]

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename _Dist = ptrdiff_t>
std::istream_iterator<_Tp, _CharT, _Traits, _Dist>::istream_iterator (
    istream_type & __s) [inline]
```

Construct start of input stream iterator.

References [std::\\_\\_addressof\(\)](#).

#### 6.609.4 Friends And Related Symbol Documentation

##### operator==

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename
_Dist = ptrdiff_t>
bool operator== (
    const istream\_iterator< _Tp, _CharT, _Traits, _Dist > & __x,
    const istream\_iterator< _Tp, _CharT, _Traits, _Dist > & __y) [friend]
```

Return true if the iterators refer to the same stream, or are both at end-of-stream.

References [istream\\_iterator\(\)](#).

The documentation for this class was generated from the following file:

- [stream\\_iterator.h](#)

#### 6.610 std::istreambuf\_iterator< \_CharT, \_Traits > Class Template Reference

### 6.610.1 Detailed Description

template<typename \_CharT, typename \_Traits>  
class std::istreambuf\_iterator< \_CharT, \_Traits >

Provides input iterator semantics for streambufs.

### 6.610.2 Member Typedef Documentation

#### char\_type

```
template<typename _CharT, typename _Traits>
typedef _CharT std::istreambuf\_iterator< _CharT, _Traits >::char_type
```

Public typedefs.

#### difference\_type

```
typedef _Traits::off_type std::iterator< input\_iterator\_tag, _CharT, _Traits::off_type, _CharT *,  
_CharT >::difference_type [inherited]
```

Distance between iterators is represented as this type.

### int\_type

```
template<typename _CharT, typename _Traits>
typedef _Traits::int_type std::istreambuf_iterator< _CharT, _Traits >::int_type
Public typedefs.
```

### istream\_type

```
template<typename _CharT, typename _Traits>
typedef basic_istream<_CharT, _Traits> std::istreambuf_iterator< _CharT, _Traits >::istream_type
Public typedefs.
```

### iterator\_category

```
typedef input_iterator_tag std::iterator< input_iterator_tag, _CharT, _Traits::off_type, _CharT *,
_CharT >::iterator_category [inherited]
One of the tag types.
```

### pointer

```
template<typename _CharT, typename _Traits>
using std::istreambuf_iterator< _CharT, _Traits >::pointer
Public typedefs.
```

### reference

```
typedef _CharT std::iterator< input_iterator_tag, _CharT, _Traits::off_type, _CharT *, _CharT >↵
::reference [inherited]
This type represents a reference-to-value_type.
```

### streambuf\_type

```
template<typename _CharT, typename _Traits>
typedef basic_streambuf<_CharT, _Traits> std::istreambuf_iterator< _CharT, _Traits >::streambuf↵
_type
Public typedefs.
```

### traits\_type

```
template<typename _CharT, typename _Traits>
typedef _Traits std::istreambuf_iterator< _CharT, _Traits >::traits_type
Public typedefs.
```

### value\_type

```
typedef _CharT std::iterator< input_iterator_tag, _CharT, _Traits::off_type, _CharT *, _CharT >↵
::value_type [inherited]
The type "pointed to" by the iterator.
```

## 6.610.3 Constructor & Destructor Documentation

### istreambuf\_iterator() [1/3]

```
template<typename _CharT, typename _Traits>
std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator () [inline], [constexpr], [noexcept]
Construct end of input stream iterator.
Referenced by equal\(\), and operator++\(\).
```

**istreambuf\_iterator()** [2/3]

```
template<typename _CharT, typename _Traits>
std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator (
    istream_type & __s) [inline], [noexcept]
```

Construct start of input stream iterator.

**istreambuf\_iterator()** [3/3]

```
template<typename _CharT, typename _Traits>
std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator (
    streambuf_type * __s) [inline], [noexcept]
```

Construct start of streambuf iterator.

**6.610.4 Member Function Documentation****equal()**

```
template<typename _CharT, typename _Traits>
bool std::istreambuf_iterator< _CharT, _Traits >::equal (
    const istreambuf_iterator< _CharT, _Traits > & __b) const [inline], [nodiscard]
```

Return true both iterators are end or both are not end.

References [istreambuf\\_iterator\(\)](#).

**operator\*()**

```
template<typename _CharT, typename _Traits>
char_type std::istreambuf_iterator< _CharT, _Traits >::operator* () const [inline], [nodiscard]
```

Return the current character pointed to by iterator. This returns `streambuf.sgetc()`. It cannot be assigned. NB: The result of `operator*()` on an end of stream is undefined.

**operator++()** [1/2]

```
template<typename _CharT, typename _Traits>
istreambuf_iterator & std::istreambuf_iterator< _CharT, _Traits >::operator++ () [inline]
```

Advance the iterator. Calls `streambuf.sbumpc()`.

**operator++()** [2/2]

```
template<typename _CharT, typename _Traits>
istreambuf_iterator std::istreambuf_iterator< _CharT, _Traits >::operator++ (
    int ) [inline]
```

Advance the iterator. Calls `streambuf.sbumpc()`.

References [istreambuf\\_iterator\(\)](#).

The documentation for this class was generated from the following files:

- [iosfwd](#)
- [streambuf\\_iterator.h](#)

**6.611 `__gnu_pbds::detail::pat_trie_base::_Inode<_ATraits, Metadata>::iterator` Struct Reference**

### 6.613.1 Detailed Description

An iterator for the components of a path.

Since

C++17

The documentation for this class was generated from the following file:

- [bits/fs\\_path.h](#)

### 6.614 std::iterator< \_Category, \_Tp, \_Distance, \_Pointer, \_Reference > Struct Template Reference

```
#include <std_iterator_base_types.h>
```

Inheritance diagram for std::iterator< \_Category, \_Tp, \_Distance, \_Pointer, \_Reference >:

## Public Types

- typedef \_Distance [difference\\_type](#)
- typedef \_Category [iterator\\_category](#)
- typedef \_Pointer [pointer](#)
- typedef \_Reference [reference](#)
- typedef \_Tp [value\\_type](#)

### 6.614.1 Detailed Description

**template**<typename \_Category, typename \_Tp, typename \_Distance = ptrdiff\_t, typename \_Pointer = \_Tp\*, typename \_Reference = \_Tp&>

**struct** std::iterator< \_Category, \_Tp, \_Distance, \_Pointer, \_Reference >

Common iterator class.

This class does nothing but define nested typedefs. Iterator classes can inherit from this class to save some work. The typedefs are then used in specializations and overloading.

In particular, there are no default implementations of requirements such as `operator++` and the like. (How could there be?)

### 6.614.2 Member Typedef Documentation

#### difference\_type

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,
typename _Reference = _Tp&>
typedef _Distance std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::difference_type
```

Distance between iterators is represented as this type.

#### iterator\_category

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,
typename _Reference = _Tp&>
typedef _Category std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::iterator_category
```

One of the [tag types](#).

#### pointer

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,
typename _Reference = _Tp&>
typedef _Pointer std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::pointer
```

This type represents a pointer-to-value\_type.

#### reference

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,
typename _Reference = _Tp&>
typedef _Reference std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::reference
```

This type represents a reference-to-value\_type.

#### value\_type

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,
typename _Reference = _Tp&>
typedef _Tp std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::value_type
```

The type "pointed to" by the iterator.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

## 6.615 `std::iterator_traits<_Iterator>` Struct Template Reference

### 6.615.1 Detailed Description

**template<typename \_Iterator>**

**struct `std::iterator_traits<_Iterator>`**

Traits class for iterators.

This class does nothing but define nested typedefs. The general version simply *forwards* the nested typedefs from the `Iterator` argument. Specialized versions for pointers and pointers-to-const provide tighter, more correct semantics.

The documentation for this struct was generated from the following file:

- [iterator\\_concepts.h](#)

## 6.616 `std::iterator_traits<_Tp*>` Struct Template Reference

```
#include <stl_iterator_base_types.h>
```

### Public Types

- using `difference_type`
- using `iterator_category`
- using `iterator_concept`
- using `pointer`
- using `reference`
- using `value_type`

### 6.616.1 Detailed Description

**template<typename \_Tp>**

**requires `is_object_v<_Tp>`**

**struct `std::iterator_traits<_Tp*>`**

Partial specialization for object pointer types.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

## 6.617 `__gnu_pbds::join_error` Struct Reference

```
#include <exception.hpp>
```

Inheritance diagram for `__gnu_pbds::join_error`:

## Public Member Functions

- virtual const char \* [what](#) () const noexcept

### 6.617.1 Detailed Description

A join cannot be performed logical reasons (i.e., the ranges of the two container objects being joined overlaps.

### 6.617.2 Member Function Documentation

#### what()

virtual const char \* std::logic\_error::what () const [virtual], [noexcept], [inherited]

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this struct was generated from the following file:

- [exception.hpp](#)

## 6.618 `__gnu_pbds::detail::left_child_next_sibling_heap< Value_Type, Cmp_Fn, Node_Metadata, _Alloc >` Class Template Reference

## Public Attributes

- `node_pointer m_p_nd`

### 6.619.1 Detailed Description

`template<typename Node, typename _Alloc>`

`class __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >`

Const point-type iterator.

### 6.619.2 Member Typedef Documentation

#### `const_pointer`

`template<typename Node, typename _Alloc>`

`typedef base_type::const_pointer __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >::const_pointer`

Iterator's const pointer type.

#### `const_reference`

`template<typename Node, typename _Alloc>`

`typedef base_type::const_reference __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >::const_reference`

Iterator's const reference type.

**difference\_type**

```
template<typename Node, typename _Alloc>
typedef __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::difference_type
Difference type.
```

**iterator\_category**

```
template<typename Node, typename _Alloc>
typedef std::forward_iterator_tag __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::iterator_category
Category.
```

**pointer**

```
template<typename Node, typename _Alloc>
typedef base_type::pointer __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::pointer
Iterator's pointer type.
```

**reference**

```
template<typename Node, typename _Alloc>
typedef base_type::reference __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::reference
Iterator's reference type.
```

**value\_type**

```
template<typename Node, typename _Alloc>
typedef base_type::value_type __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::value_type
Iterator's value type.
```

**6.619.3 Constructor & Destructor Documentation****left\_child\_next\_sibling\_heap\_const\_iterator\_() [1/2]**

```
template<typename Node, typename _Alloc>
__gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >::left_child_↵
next_sibling_heap_const_iterator_ () [inline]
Default constructor.
```

**left\_child\_next\_sibling\_heap\_const\_iterator\_() [2/2]**

```
template<typename Node, typename _Alloc>
__gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >::left_child_↵
next_sibling_heap_const_iterator_ (
    const left_child_next_sibling_heap_const_iterator_< Node, _Alloc > & other) [inline]
Copy constructor.
```

### 6.630.1 Detailed Description

**template<typename \_UIntType, \_UIntType \_\_a, \_UIntType \_\_c, \_UIntType \_\_m>**  
**class std::linear\_congruential\_engine<\_UIntType, \_\_a, \_\_c, \_\_m>**

A model of a linear congruential random number generator.

A random number generator that produces pseudorandom numbers via linear function:

$$x_{i+1} \leftarrow (ax_i + c) \bmod m$$

The template parameter `_UIntType` must be an unsigned integral type large enough to store values up to `(__m-1)`. If the template parameter `__m` is 0, the modulus `__m` used is `std::numeric_limits<_UIntType>::max()` plus 1. Otherwise, the template parameters `__a` and `__c` must be less than `__m`.

The size of the state is 1.

Since

C++11

## 6.630.2 Member Typedef Documentation

### result\_type

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
typedef _UIntType std::linear\_congruential\_engine< _UIntType, __a, __c, __m >::result_type
```

The type of the generated random value.

## 6.630.3 Constructor & Destructor Documentation

### linear\_congruential\_engine() [1/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
std::linear\_congruential\_engine< _UIntType, __a, __c, __m >::linear_congruential_engine () [inline]
```

Constructs a linear\_congruential\_engine random number generator engine with seed 1.

### linear\_congruential\_engine() [2/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
std::linear\_congruential\_engine< _UIntType, __a, __c, __m >::linear_congruential_engine (
    result_type __s) [inline], [explicit]
```

Constructs a linear\_congruential\_engine random number generator engine with seed \_\_s. The default seed value is 1.

#### Parameters

|                          |                         |
|--------------------------|-------------------------|
| <a href="#">↔</a><br>__s | The initial seed value. |
|--------------------------|-------------------------|

### linear\_congruential\_engine() [3/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::linear\_congruential\_engine< _UIntType, __a, __c, __m >::linear_congruential_engine (
    _Sseq & __q) [inline], [explicit]
```

Constructs a linear\_congruential\_engine random number generator engine seeded from the seed sequence \_\_q.

#### Parameters

|                          |                    |
|--------------------------|--------------------|
| <a href="#">↔</a><br>__q | the seed sequence. |
|--------------------------|--------------------|

## 6.630.4 Member Function Documentation

### discard()

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
void std::linear\_congruential\_engine< _UIntType, __a, __c, __m >::discard (
    unsigned long long __z) [inline]
```

Discard a sequence of random numbers.

**max()**

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
constexpr result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::max () [inline],
[static], [constexpr]
```

Gets the largest possible value in the output range.

**min()**

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
constexpr result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::min () [inline],
[static], [constexpr]
```

Gets the smallest possible value in the output range.

The minimum depends on the \_\_c parameter: if it is zero, the minimum generated must be > 0, otherwise 0 is allowed.

**operator()()**

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::operator() () [inline]
```

Gets the next random number in the sequence.

**seed()** [1/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq>
_If_seed_seq< _Sseq > std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed (
    _Sseq & __q)
```

Reseeds the linear\_congruential\_engine random number generator engine sequence using values from the seed sequence \_\_q.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__q</code> | the seed sequence. |
|------------------|--------------------|

**seed()** [2/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq>
auto std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed (
    _Sseq & __q) -> _If_seed_seq<_Sseq>
```

Seeds the LCR engine with a value generated by \_\_q.

**seed()** [3/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
void std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed (
    result_type __s = default_seed)
```

Reseeds the linear\_congruential\_engine random number generator engine sequence to the seed \_\_s.

**Parameters**

|                  |               |
|------------------|---------------|
| <code>__s</code> | The new seed. |
|------------------|---------------|

Seeds the LCR with integral value `__s`, adjusted so that the ring identity is never a member of the convergence set. Referenced by `std::linear_congruential_engine< uint_fast32_t, 16807UL, 0UL, 2147483647UL >::linear_congruential_engine()`, and `std::linear_congruential_engine< uint_fast32_t, 16807UL, 0UL, 2147483647UL >::linear_congruential_engine()`.

### 6.630.5 Friends And Related Symbol Documentation

#### **operator<<**

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _UIntType1, _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT,
typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::linear_congruential_engine< _UIntType1, __a1, __c1, __m1 > & __lcr) [friend]
```

Writes the textual representation of the state `x(i)` of `x` to `__os`.

#### Parameters

|                    |                                                                      |
|--------------------|----------------------------------------------------------------------|
| <code>__os</code>  | The output stream.                                                   |
| <code>__lcr</code> | A % <code>linear_congruential_engine</code> random number generator. |

#### Returns

`__os`.

#### **operator==**

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
bool operator== (
    const linear_congruential_engine< _UIntType, __a, __c, __m > & __lhs,
    const linear_congruential_engine< _UIntType, __a, __c, __m > & __rhs) [friend]
```

Compares two linear congruential random number generator objects of the same type for equality.

#### Parameters

|                    |                                                             |
|--------------------|-------------------------------------------------------------|
| <code>__lhs</code> | A linear congruential random number generator object.       |
| <code>__rhs</code> | Another linear congruential random number generator object. |

#### Returns

true if the infinite sequences of generated values would be equal, false otherwise.

#### **operator>>**

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _UIntType1, _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT,
typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::linear_congruential_engine< _UIntType1, __a1, __c1, __m1 > & __lcr) [friend]
```

Sets the state of the engine by reading its textual representation from `__is`.

The textual representation must have been previously written using an output stream whose imbued locale and whose type's template specialization arguments `_CharT` and `_Traits` were the same as those of `__is`.

**Parameters**

|                    |                                                         |
|--------------------|---------------------------------------------------------|
| <code>__is</code>  | The input stream.                                       |
| <code>__lcr</code> | A % linear_congruential_engine random number generator. |

**Returns**

`__is`.

**6.630.6 Member Data Documentation****increment**

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::increment [static],
[constexpr]
An increment.
```

**modulus**

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::modulus [static], [constexpr]
The modulus.
```

**multiplier**

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::multiplier [static],
[constexpr]
The multiplier.
```

### 6.633.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::list<_Tp, _Alloc>
```

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

#### Template Parameters

|                     |                                                                 |
|---------------------|-----------------------------------------------------------------|
| <code>_Tp</code>    | Type of element.                                                |
| <code>_Alloc</code> | Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> . |

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `at` and `operator[]`.

This is a *doubly linked* list. Traversal up and down the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike `std::vector` and `std::deque`, random-access iterators are not provided, so subscripting (`[]`) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.

Also unlike the other standard containers, `std::list` provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

A couple points on memory allocation for `list<Tp>`:

First, we never actually allocate a `Tp`, we allocate `List_node<Tp>`'s and trust [20.1.5]/4 to DTRT. This is to ensure that after elements from `list<X,Alloc1>` are spliced into `list<X,Alloc2>`, destroying the memory of the second list is a valid operation, i.e., `Alloc1` giveth and `Alloc2` taketh away.

Second, a list conceptually represented as

```
A <---> B <---> C <---> D
```

is actually circular; a link exists between A and D. The list class holds (as its only data member) a private `list::iterator` pointing to *D*, not to *A*! To get to the head of the list, we start at the tail and move forward by one. When this member iterator's `next/previous` pointers refer to itself, the list is empty.

### 6.633.2 Constructor & Destructor Documentation

#### `list()` [1/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc>::list () [default]
```

Creates a list with no elements.

Referenced by [erase\(\)](#), [insert\(\)](#), [insert\(\)](#), [insert\(\)](#), [merge\(\)](#), [merge\(\)](#), [operator=\(\)](#), [remove\(\)](#), [remove\\_if\(\)](#), [unique\(\)](#), and [unique\(\)](#).

#### `list()` [2/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc>::list (
    const allocator_type & __a) [inline], [explicit], [noexcept]
```

Creates a list with no elements.

#### Parameters

|                  |                      |
|------------------|----------------------|
| <code>__a</code> | An allocator object. |
|------------------|----------------------|

**list()** [3/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
    size_type __n,
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a list with default constructed elements.

**Parameters**

|                  |                                             |
|------------------|---------------------------------------------|
| <code>__n</code> | The number of elements to initially create. |
| <code>__a</code> | An allocator object.                        |

This constructor fills the list with `__n` default constructed elements.

**list()** [4/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
    size_type __n,
    const value_type & __value,
    const allocator_type & __a = allocator_type()) [inline]
```

Creates a list with copies of an exemplar element.

**Parameters**

|                      |                                             |
|----------------------|---------------------------------------------|
| <code>__n</code>     | The number of elements to initially create. |
| <code>__value</code> | An element to copy.                         |
| <code>__a</code>     | An allocator object.                        |

This constructor fills the list with `__n` copies of `__value`.

**list()** [5/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
    const list< _Tp, _Alloc > & __x) [inline]
```

List copy constructor.

**Parameters**

|                  |                                                  |
|------------------|--------------------------------------------------|
| <code>__x</code> | A list of identical element and allocator types. |
|------------------|--------------------------------------------------|

The newly-created list uses a copy of the allocation object used by `__x` (unless the allocator traits dictate a different object).

**list()** [6/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
    list< _Tp, _Alloc > && ) [default]
```

List move constructor.

The newly-created list contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified list.

#### list() [7/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc>::list (
    initializer_list< value_type > __l,
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a list from an initializer\_list.

##### Parameters

|                     |                                    |
|---------------------|------------------------------------|
| $\leftarrow$<br>__l | An initializer_list of value_type. |
| $\leftarrow$<br>__a | An allocator object.               |

Create a list consisting of copies of the elements in the initializer\_list \_\_l. This is linear in \_\_l.size().

#### list() [8/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
std::list<_Tp, _Alloc>::list (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a list from a range.

##### Parameters

|         |                      |
|---------|----------------------|
| __first | An input iterator.   |
| __last  | An input iterator.   |
| __a     | An allocator object. |

Create a list consisting of copies of the elements from [\_\_first, \_\_last). This is linear in N (where N is distance(\_\_first,  $\leftarrow$  \_\_last)).

#### ~list()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc>::~list () [default]
```

No explicit dtor needed as the \_Base dtor takes care of things. The \_Base dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

### 6.633.3 Member Function Documentation

#### \_M\_create\_node()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename... _Args>
```

```
_Node_ptr std::list< _Tp, _Alloc >::_M_create_node (  
    _Args &&... __args) [inline], [protected]
```

## Parameters

|                     |                           |
|---------------------|---------------------------|
| <code>__args</code> | An instance of user data. |
|---------------------|---------------------------|

Allocates space for a new node and constructs a copy of `__args` in it.  
Referenced by [emplace\(\)](#), and [insert\(\)](#).

**assign()** [1/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
void std::list<_Tp, _Alloc>::assign (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Assigns a range to a list.

## Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

This function fills a list with copies of the elements in the range `[__first, __last)`.

Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned.

**assign()** [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::assign (
    initializer_list<value_type> __l) [inline]
```

Assigns an `initializer_list` to a list.

## Parameters

|                  |                                                               |
|------------------|---------------------------------------------------------------|
| <code>__l</code> | An <code>initializer_list</code> of <code>value_type</code> . |
|------------------|---------------------------------------------------------------|

Replace the contents of the list with copies of the elements in the `initializer_list __l`. This is linear in `__l.size()`.

**assign()** [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::assign (
    size_type __n,
    const value_type & __val) [inline]
```

Assigns a given value to a list.

## Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Number of elements to be assigned. |
| <code>__val</code> | Value to be assigned.              |

This function fills a list with `__n` copies of the given value. Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned.

**back()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::list< _Tp, _Alloc >::back () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the list.

**back()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::list< _Tp, _Alloc >::back () [inline], [nodiscard], [noexcept]
```

Returns a read/write reference to the data at the last element of the list.

**begin()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::list< _Tp, _Alloc >::begin () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

**begin()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::begin () [inline], [nodiscard], [noexcept]
```

Returns a read/write iterator that points to the first element in the list. Iteration is done in ordinary element order.

Referenced by `std::list< _Tp, polymorphic_allocator< _Tp > >::list()`, `insert()`, `insert()`, `merge()`, `merge()`, `std::operator<=>()`, `operator=()`, `std::list< _Tp, polymorphic_allocator< _Tp > >::operator=()`, `remove()`, `remove_if()`, `std::list< _Tp, polymorphic_allocator< _Tp > >::unique()`, and `unique()`.

**cbegin()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::list< _Tp, _Alloc >::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

**cend()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::list< _Tp, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

**clear()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::clear () [inline], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Referenced by `operator=()`.

**crbegin()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list<_Tp, _Alloc>::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

**crend()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list<_Tp, _Alloc>::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

**emplace()**

```
template<typename _Tp, typename _Alloc>
template<typename... _Args>
list<_Tp, _Alloc>::iterator list::emplace (
    const_iterator __position,
    _Args &&... __args)
```

Constructs object in list before specified iterator.

**Parameters**

|                         |                                 |
|-------------------------|---------------------------------|
| <code>__position</code> | A const_iterator into the list. |
| <code>__args</code>     | Arguments.                      |

**Returns**

An iterator that points to the inserted data.

This function will insert an object of type T constructed with `T(std::forward<Args>(args)...) before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references. References \_M\_create\_node\(\), and std::forward\(\).`

**empty()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
bool std::list<_Tp, _Alloc>::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the list is empty. (Thus `begin()` would equal `end()`.)

Referenced by [insert\(\)](#), and [std::list<\\_Tp, polymorphic\\_allocator<\\_Tp>>::splice\(\)](#).

**end()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::list<_Tp, _Alloc>::end () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

**end()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list<_Tp, _Alloc>::end () [inline], [nodiscard], [noexcept]
```

Returns a read/write iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Referenced by [std::list<\\_Tp, polymorphic\\_allocator<\\_Tp>>::list\(\)](#), [merge\(\)](#), [merge\(\)](#), [std::operator<=>\(\)](#), [operator=\(\)](#), [std::list<\\_Tp, polymorphic\\_allocator<\\_Tp>>::operator=\(\)](#), and [std::list<\\_Tp, polymorphic\\_allocator<\\_Tp>>::splice\(\)](#).

**erase()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline], [noexcept]
```

Remove a range of elements.

**Parameters**

|                      |                                                              |
|----------------------|--------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the first element to be erased.         |
| <code>__last</code>  | Iterator pointing to one past the last element to be erased. |

**Returns**

An iterator pointing to the element pointed to by *last* prior to erasing (or end()).

This function will erase the elements in the range [first,last) and shorten the list accordingly.

This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [2/2]

```
template<typename _Tp, typename _Alloc>
list< _Tp, _Alloc >::iterator list::erase (
    const_iterator __position) [noexcept]
```

Remove element at given position.

**Parameters**

|                         |                                            |
|-------------------------|--------------------------------------------|
| <code>__position</code> | Iterator pointing to element to be erased. |
|-------------------------|--------------------------------------------|

**Returns**

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the list by one.

Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [list\(\)](#), and [erase\(\)](#).

Referenced by [erase\(\)](#), [resize\(\)](#), and [resize\(\)](#).

**front()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::list< _Tp, _Alloc >::front () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the list.

**front()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::list< _Tp, _Alloc >::front () [inline], [nodiscard], [noexcept]
```

Returns a read/write reference to the data at the first element of the list.

**get\_allocator()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
allocator_type std::list<_Tp, _Alloc>::get_allocator () const [inline], [noexcept]
```

Get a copy of the memory allocation object.

Referenced by [insert\(\)](#), [insert\(\)](#), [remove\(\)](#), [remove\\_if\(\)](#), [unique\(\)](#), and [unique\(\)](#).

**insert()** [1/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list<_Tp, _Alloc>::insert (
    const_iterator __p,
    initializer_list<value_type> __l) [inline]
```

Inserts the contents of an initializer\_list into list before specified const\_iterator.

**Parameters**

|                                  |                                    |
|----------------------------------|------------------------------------|
| <a href="#"><code>__p</code></a> | A const_iterator into the list.    |
| <a href="#"><code>__l</code></a> | An initializer_list of value_type. |

**Returns**

An iterator pointing to the first element inserted (or `__p`).

This function will insert copies of the data in the initializer\_list `__l` into the list before the location specified by `__p`. This operation is linear in the number of elements inserted and does not invalidate iterators and references.

**insert()** [2/5]

```
template<typename _Tp, typename _Alloc>
template<typename _InputIterator, typename>
list<_Tp, _Alloc>::iterator list::insert (
    const_iterator __position,
    _InputIterator __first,
    _InputIterator __last)
```

Inserts a range into the list.

**Parameters**

|                                         |                            |
|-----------------------------------------|----------------------------|
| <a href="#"><code>__position</code></a> | An iterator into the list. |
| <a href="#"><code>__first</code></a>    | An input iterator.         |
| <a href="#"><code>__last</code></a>     | An input iterator.         |

**Returns**

Since C++11, an iterator pointing to the first element inserted (or `__position`). In C++98 this returns void.

This function will insert copies of the data in the range `[__first, __last)` into the list before the location specified by `__position`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

References [list\(\)](#), [begin\(\)](#), [empty\(\)](#), [get\\_allocator\(\)](#), and [splice\(\)](#).

**insert()** [3/5]

```
template<typename _Tp, typename _Alloc>
list< _Tp, _Alloc >::iterator list::insert (
    const_iterator __position,
    const value_type & __x)
```

Inserts given value into list before specified iterator.

**Parameters**

|                         |                            |
|-------------------------|----------------------------|
| <code>__position</code> | An iterator into the list. |
| <code>__x</code>        | Data to be inserted.       |

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

References [list\(\)](#), [\\_M\\_create\\_node\(\)](#), and [insert\(\)](#).

Referenced by [insert\(\)](#), and [resize\(\)](#).

**insert()** [4/5]

```
template<typename _Tp, typename _Alloc>
list< _Tp, _Alloc >::iterator list::insert (
    const_iterator __position,
    size_type __n,
    const value_type & __x)
```

Inserts a number of copies of given data into the list.

**Parameters**

|                         |                                    |
|-------------------------|------------------------------------|
| <code>__position</code> | An iterator into the list.         |
| <code>__n</code>        | Number of elements to be inserted. |
| <code>__x</code>        | Data to be inserted.               |

**Returns**

Since C++11, an iterator pointing to the first element inserted (or `__position`). In C++98 this returns void.

This function will insert a specified number of copies of the given data before the location specified by `__position`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

References [list\(\)](#), [begin\(\)](#), [get\\_allocator\(\)](#), and [splice\(\)](#).

**insert()** [5/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::insert (
    const_iterator __position,
    value_type && __x) [inline]
```

Inserts given value into list before specified iterator.

## Parameters

|                         |                            |
|-------------------------|----------------------------|
| <code>__position</code> | An iterator into the list. |
| <code>__x</code>        | Data to be inserted.       |

## Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

**max\_size()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::list<_Tp, _Alloc>::max_size () const [inline], [nodiscard], [noexcept]
```

Returns the size() of the largest possible list.

**merge()** [1/2]

```
template<typename _Tp, typename _Alloc>
void list::merge (
    list<_Tp, _Alloc> && __x)
```

Merge sorted lists.

## Parameters

|                  |                       |
|------------------|-----------------------|
| <code>__x</code> | Sorted list to merge. |
|------------------|-----------------------|

Assumes that both `__x` and this list are sorted according to `operator<()`. Merges elements of `__x` into this list in sorted order, leaving `__x` empty when complete. Elements in this list precede elements in `__x` that are equal.

References [list\(\)](#), [std::\\_\\_addressof\(\)](#), [std::begin\(\)](#), [begin\(\)](#), [std::end\(\)](#), [end\(\)](#), and [merge\(\)](#).

Referenced by [merge\(\)](#), and [merge\(\)](#).

**merge()** [2/2]

```
template<typename _Tp, typename _Alloc>
template<typename _StrictWeakOrdering>
void list::merge (
    list<_Tp, _Alloc> && __x,
    _StrictWeakOrdering __comp)
```

Merge sorted lists according to comparison function.

## Template Parameters

|                                  |                                          |
|----------------------------------|------------------------------------------|
| <code>_StrictWeakOrdering</code> | Comparison function defining sort order. |
|----------------------------------|------------------------------------------|

## Parameters

|                     |                       |
|---------------------|-----------------------|
| <code>__x</code>    | Sorted list to merge. |
| <code>__comp</code> | Comparison functor.   |

Assumes that both `__x` and this list are sorted according to `StrictWeakOrdering`. Merges elements of `__x` into this list in sorted order, leaving `__x` empty when complete. Elements in this list precede elements in `__x` that are equivalent according to `StrictWeakOrdering()`.

References [list\(\)](#), [std::\\_\\_addressof\(\)](#), [std::begin\(\)](#), [begin\(\)](#), [std::end\(\)](#), [end\(\)](#), and [merge\(\)](#).

### **operator=()** [1/3]

```
template<typename _Tp, typename _Alloc>
list< _Tp, _Alloc > & list::operator= (
    const list< _Tp, _Alloc > & __x)
```

List assignment operator.

#### Parameters

|                  |                                                  |
|------------------|--------------------------------------------------|
| <code>__x</code> | A list of identical element and allocator types. |
|------------------|--------------------------------------------------|

All the elements of `__x` are copied.

Whether the allocator is copied depends on the allocator traits.

References [list\(\)](#), [std::\\_\\_addressof\(\)](#), [begin\(\)](#), [clear\(\)](#), and [end\(\)](#).

### **operator=()** [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
list & std::list< _Tp, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

List initializer list assignment operator.

#### Parameters

|                  |                                    |
|------------------|------------------------------------|
| <code>__l</code> | An initializer_list of value_type. |
|------------------|------------------------------------|

Replace the contents of the list with copies of the elements in the initializer\_list `__l`. This is linear in `l.size()`.

### **operator=()** [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
list & std::list< _Tp, _Alloc >::operator= (
    list< _Tp, _Alloc > && __x) [inline], [noexcept]
```

List move assignment operator.

#### Parameters

|                  |                                                  |
|------------------|--------------------------------------------------|
| <code>__x</code> | A list of identical element and allocator types. |
|------------------|--------------------------------------------------|

The contents of `__x` are moved into this list (without copying).

Afterwards `__x` is a valid, but unspecified list

Whether the allocator is moved depends on the allocator traits.

**pop\_back()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::pop_back () [inline], [noexcept]
```

Removes last element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before pop\_back() is called.

**pop\_front()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::pop_front () [inline], [noexcept]
```

Removes first element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop\_front() is called.

**push\_back()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::push_back (
    const value_type & __x) [inline]
```

Add data to the end of the list.

**Parameters**

|                   |                   |
|-------------------|-------------------|
| $\leftrightarrow$ | Data to be added. |
| $\_x$             |                   |

This is a typical stack operation. The function creates an element at the end of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

**push\_front()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::push_front (
    const value_type & __x) [inline]
```

Add data to the front of the list.

**Parameters**

|                   |                   |
|-------------------|-------------------|
| $\leftrightarrow$ | Data to be added. |
| $\_x$             |                   |

This is a typical stack operation. The function creates an element at the front of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

**rbegin()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list< _Tp, _Alloc >::rbegin () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

**rbegin()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::list< _Tp, _Alloc >::rbegin () [inline], [nodiscard], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

**remove()**

```
template<typename _Tp, typename _Alloc>
list< _Tp, _Alloc >::__remove_return_type list::remove (
    const _Tp & __value)
```

Remove all elements equal to *value*.

**Parameters**

|                      |                      |
|----------------------|----------------------|
| <code>__value</code> | The value to remove. |
|----------------------|----------------------|

Removes every element in the list equal to *value*. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.  
References [list\(\)](#), [std::begin\(\)](#), [begin\(\)](#), [std::end\(\)](#), [get\\_allocator\(\)](#), [size\(\)](#), and [splice\(\)](#).

**remove\_if()**

```
template<typename _Tp, typename _Alloc>
template<typename _Predicate>
list< _Tp, _Alloc >::__remove_return_type list::remove_if (
    _Predicate __pred)
```

Remove all elements satisfying a predicate.

**Template Parameters**

|                         |                                     |
|-------------------------|-------------------------------------|
| <code>_Predicate</code> | Unary predicate function or object. |
|-------------------------|-------------------------------------|

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.  
References [list\(\)](#), [std::begin\(\)](#), [begin\(\)](#), [std::end\(\)](#), [get\\_allocator\(\)](#), [size\(\)](#), and [splice\(\)](#).

**rend()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list< _Tp, _Alloc >::rend () const [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

**rend()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::list<_Tp, _Alloc>::rend () [inline], [nodiscard], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

**resize()** [1/2]

```
template<typename _Tp, typename _Alloc>
void list::resize (
    size_type __new_size)
```

Resizes the list to the specified number of elements.

**Parameters**

|                         |                                             |
|-------------------------|---------------------------------------------|
| <code>__new_size</code> | Number of elements the list should contain. |
|-------------------------|---------------------------------------------|

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise default constructed elements are appended.

References [std::end\(\)](#), and [erase\(\)](#).

**resize()** [2/2]

```
template<typename _Tp, typename _Alloc>
void list::resize (
    size_type __new_size,
    const value_type & __x)
```

Resizes the list to the specified number of elements.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__new_size</code> | Number of elements the list should contain.       |
| <code>__x</code>        | Data with which new elements should be populated. |

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise the list is extended and new elements are populated with given data.

References [std::end\(\)](#), [erase\(\)](#), and [insert\(\)](#).

**reverse()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::reverse () [inline], [noexcept]
```

Reverse the elements in list.

Reverse the order of elements in the list in linear time.

**size()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::list<_Tp, _Alloc>::size () const [inline], [nodiscard], [noexcept]
```

Returns the number of elements in the list.

Referenced by [std::operator<=>\(\)](#), [remove\(\)](#), [remove\\_if\(\)](#), [unique\(\)](#), and [unique\(\)](#).

**sort()** [1/2]

```
template<typename _Tp, typename _Alloc>
void list::sort ()
```

Sort the elements.

Sorts the elements of this list in  $N \log N$  time. Equivalent elements remain in list order.

References [std::begin\(\)](#), [std::empty\(\)](#), and [std::end\(\)](#).

**sort()** [2/2]

```
template<typename _Tp, typename _Alloc>
template<typename _StrictWeakOrdering>
void list::sort (
    _StrictWeakOrdering __comp)
```

Sort the elements according to comparison function.

Sorts the elements of this list in  $N \log N$  time. Equivalent elements remain in list order.

References [std::begin\(\)](#), [std::empty\(\)](#), and [std::end\(\)](#).

**splice()** [1/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
    const_iterator __position,
    list< _Tp, _Alloc > && __x) [inline], [noexcept]
```

Insert contents of another list.

**Parameters**

|                         |                                                    |
|-------------------------|----------------------------------------------------|
| <code>__position</code> | Iterator referencing the element to insert before. |
| <code>__x</code>        | Source list.                                       |

The elements of `__x` are inserted in constant time in front of the element referenced by `__position`. `__x` becomes an empty list.

Requires this  $\neq$  `__x`.

Referenced by [insert\(\)](#), [insert\(\)](#), [remove\(\)](#), [remove\\_if\(\)](#), [unique\(\)](#), and [unique\(\)](#).

**splice()** [2/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
    const_iterator __position,
    list< _Tp, _Alloc > && __x,
    const_iterator __first,
    const_iterator __last) [inline], [noexcept]
```

Insert range from another list.

**Parameters**

|                         |                                                             |
|-------------------------|-------------------------------------------------------------|
| <code>__position</code> | Iterator referencing the element to insert before.          |
| <code>__x</code>        | Source list.                                                |
| <code>__first</code>    | Iterator referencing the start of range in <code>x</code> . |
| <code>__last</code>     | Iterator referencing the end of range in <code>x</code> .   |

Removes elements in the range `[__first,__last)` and inserts them before `__position` in constant time.

Undefined if `__position` is in `[__first,__last)`.

**splice()** [3/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::splice (
    const_iterator __position,
    list<_Tp, _Alloc> && __x,
    const_iterator __i) [inline], [noexcept]
```

Insert element from another list.

**Parameters**

|                         |                                                    |
|-------------------------|----------------------------------------------------|
| <code>__position</code> | Iterator referencing the element to insert before. |
| <code>__x</code>        | Source list.                                       |
| <code>__i</code>        | Iterator referencing the element to move.          |

Removes the element in list `__x` referenced by `__i` and inserts it into the current list before `__position`.

**splice()** [4/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::splice (
    const_iterator __position,
    list<_Tp, _Alloc> & __x,
    const_iterator __first,
    const_iterator __last) [inline], [noexcept]
```

Insert range from another list.

**Parameters**

|                         |                                                          |
|-------------------------|----------------------------------------------------------|
| <code>__position</code> | Const_iterator referencing the element to insert before. |
| <code>__x</code>        | Source list.                                             |
| <code>__first</code>    | Const_iterator referencing the start of range in x.      |
| <code>__last</code>     | Const_iterator referencing the end of range in x.        |

Removes elements in the range `[__first,__last)` and inserts them before `__position` in constant time. Undefined if `__position` is in `[__first,__last)`.

**splice()** [5/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::splice (
    const_iterator __position,
    list<_Tp, _Alloc> & __x,
    const_iterator __i) [inline], [noexcept]
```

Insert element from another list.

**Parameters**

|                         |                                                    |
|-------------------------|----------------------------------------------------|
| <code>__position</code> | Iterator referencing the element to insert before. |
| <code>__x</code>        | Source list.                                       |
| <code>__i</code>        | Iterator referencing the element to move.          |

Removes the element in list `__x` referenced by `__i` and inserts it into the current list before `__position`.

**swap()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc >::swap (
    list<_Tp, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another list.

**Parameters**

|                  |                                                 |
|------------------|-------------------------------------------------|
| <code>__x</code> | A list of the same element and allocator types. |
|------------------|-------------------------------------------------|

This exchanges the elements between two lists in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(l1,l2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

**unique() [1/2]**

```
template<typename _Tp, typename _Alloc>
list<_Tp, _Alloc >::__remove_return_type list::unique ()
```

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [list\(\)](#), [std::begin\(\)](#), [begin\(\)](#), [std::end\(\)](#), [get\\_allocator\(\)](#), [size\(\)](#), and [splice\(\)](#).

**unique() [2/2]**

```
template<typename _Tp, typename _Alloc>
template<typename _BinaryPredicate>
list<_Tp, _Alloc >::__remove_return_type list::unique (
    _BinaryPredicate __binary_pred)
```

Remove consecutive elements satisfying a predicate.

**Template Parameters**

|                               |                                      |
|-------------------------------|--------------------------------------|
| <code>_BinaryPredicate</code> | Binary predicate function or object. |
|-------------------------------|--------------------------------------|

For each consecutive set of elements `[first,last)` that satisfy `predicate(first,i)` where `i` is an iterator in `[first,last)`, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [list\(\)](#), [std::begin\(\)](#), [begin\(\)](#), [std::end\(\)](#), [get\\_allocator\(\)](#), [size\(\)](#), and [splice\(\)](#).

- void **swap** ([list\\_update](#) &other)

### 6.634.1 Detailed Description

template<typename Key, typename Mapped, class Eq\_Fn = typename detail::default\_eq\_fn<Key>::type, class Update\_Policy = detail::default\_update\_policy::type, class \_Alloc = std::allocator<char>>  
class \_\_gnu\_pbds::list\_update< Key, Mapped, Eq\_Fn, Update\_Policy, \_Alloc >

A list-update based associative container.

#### Template Parameters

|                      |                                                                                   |
|----------------------|-----------------------------------------------------------------------------------|
| <i>Key</i>           | Key type.                                                                         |
| <i>Mapped</i>        | Map type.                                                                         |
| <i>Eq_Fn</i>         | Equal functor.                                                                    |
| <i>Update_Policy</i> | Update policy, determines when an element will be moved to the front of the list. |
| <i>_Alloc</i>        | Allocator type.                                                                   |

Base is detail::lu\_map.

### 6.634.2 Constructor & Destructor Documentation

#### list\_update()

```
template<typename Key, typename Mapped, class Eq_Fn = typename detail::default_eq_fn<Key>::type,
class Update_Policy = detail::default_update_policy::type, class _Alloc = std::allocator<char>>
template<typename It>
```

```
__gnu_pbds::list_update< Key, Mapped, Eq_Fn, Update_Policy, _Alloc >::list_update (
    It first,
    It last) [inline]
```

Constructor taking \_\_iterators to a range of value\_types. The value\_types between first\_it and last\_it will be inserted into the container object.

#### 6.636.1 Detailed Description

Container class for localization functionality.

The locale class is first a class wrapper for C library locales. It is also an extensible container for user-defined localization. A locale is a collection of facets that implement various localization features such as money, time, and number printing. Constructing C++ locales does not change the C library locale.

This library supports efficient construction and copying of locales through a reference counting implementation of the locale class.

### 6.636.2 Member Typedef Documentation

#### category

```
typedef int std::locale::category
```

Definition of `locale::category`.

### 6.636.3 Constructor & Destructor Documentation

#### locale() [1/8]

```
std::locale::locale () throw ( )
```

Default constructor.

Constructs a copy of the global locale. If no locale has been explicitly set, this is the C locale.

Referenced by [locale\(\)](#), [locale\(\)](#), [locale\(\)](#), [locale\(\)](#), [locale\(\)](#), [locale\(\)](#), [locale\(\)](#), [~locale\(\)](#), [combine\(\)](#), [global\(\)](#), [has\\_facet, operator\(\)\(\)](#), [operator=\(\)](#), [operator==\(\)](#), and [use\\_facet](#).

#### locale() [2/8]

```
std::locale::locale (
    const locale & __other) throw ( )
```

Copy constructor.

Constructs a copy of *other*.

#### Parameters

|                      |                     |
|----------------------|---------------------|
| <code>__other</code> | The locale to copy. |
|----------------------|---------------------|

References [locale\(\)](#).

#### locale() [3/8]

```
std::locale::locale (
    const char * __s) [explicit]
```

Named locale constructor.

Constructs a copy of the named C library locale.

#### Parameters

|                  |                                  |
|------------------|----------------------------------|
| <code>__s</code> | Name of the locale to construct. |
|------------------|----------------------------------|

#### Exceptions

|                                 |                                                     |
|---------------------------------|-----------------------------------------------------|
| <code>std::runtime_error</code> | if <code>__s</code> is null or an undefined locale. |
|---------------------------------|-----------------------------------------------------|

References [locale\(\)](#).

#### locale() [4/8]

```
std::locale::locale (
    const locale & __base,
    const char * __s,
    category __cat)
```

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If *base* is named, this locale instance will also be named.

#### Parameters

|                     |                                                                      |
|---------------------|----------------------------------------------------------------------|
| <code>__base</code> | The locale to copy.                                                  |
| <code>__s</code>    | Name of the locale to use facets from.                               |
| <code>__cat</code>  | Set of categories defining the facets to use from <code>__s</code> . |

#### Exceptions

|                                 |                                                     |
|---------------------------------|-----------------------------------------------------|
| <code>std::runtime_error</code> | if <code>__s</code> is null or an undefined locale. |
|---------------------------------|-----------------------------------------------------|

References [locale\(\)](#).

#### locale() [5/8]

```
std::locale::locale (
    const std::string & __s) [inline], [explicit]
```

Named locale constructor.

Constructs a copy of the named C library locale.

#### Parameters

|                  |                                  |
|------------------|----------------------------------|
| <code>__s</code> | Name of the locale to construct. |
|------------------|----------------------------------|

#### Exceptions

|                                 |                                             |
|---------------------------------|---------------------------------------------|
| <code>std::runtime_error</code> | if <code>__s</code> is an undefined locale. |
|---------------------------------|---------------------------------------------|

References [locale\(\)](#).

#### locale() [6/8]

```
std::locale::locale (
    const locale & __base,
    const std::string & __s,
    category __cat) [inline]
```

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If *base* is named, this locale instance will also be named.

#### Parameters

|                     |                                                                      |
|---------------------|----------------------------------------------------------------------|
| <code>__base</code> | The locale to copy.                                                  |
| <code>__s</code>    | Name of the locale to use facets from.                               |
| <code>__cat</code>  | Set of categories defining the facets to use from <code>__s</code> . |

## Exceptions

|                                 |                                             |
|---------------------------------|---------------------------------------------|
| <code>std::runtime_error</code> | if <code>__s</code> is an undefined locale. |
|---------------------------------|---------------------------------------------|

References [locale\(\)](#).

## locale() [7/8]

```
std::locale::locale (
    const locale & __base,
    const locale & __add,
    category __cat)
```

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale *add*. If *base* and *add* are named, this locale instance will also be named.

## Parameters

|                     |                                                        |
|---------------------|--------------------------------------------------------|
| <code>__base</code> | The locale to copy.                                    |
| <code>__add</code>  | The locale to use facets from.                         |
| <code>__cat</code>  | Set of categories defining the facets to use from add. |

References [locale\(\)](#).

## locale() [8/8]

```
template<typename _Facet>
std::locale::locale (
    const locale & __other,
    _Facet * __f)
```

Construct locale with another facet.

Constructs a copy of the locale *\_\_other*. The facet *\_\_f* is added to *\_\_other*, replacing an existing facet of type *Facet* if there is one. If *\_\_f* is null, this locale is a copy of *\_\_other*.

## Parameters

|                      |                      |
|----------------------|----------------------|
| <code>__other</code> | The locale to copy.  |
| <code>__f</code>     | The facet to add in. |

References [locale\(\)](#).

## ~locale()

```
std::locale::~~locale () throw ( )
```

Locale destructor.

References [locale\(\)](#).

## 6.636.4 Member Function Documentation

### classic()

```
const locale & std::locale::classic () [static], [nodiscard]
```

Return reference to the C locale.

**combine()**

```
template<typename _Facet>
locale std::locale::combine (
    const locale & __other) const [nodiscard]
```

Construct locale with another facet.

Constructs and returns a new copy of this locale. Adds or replaces an existing facet of type `Facet` from the locale *other* into the new locale.

**Template Parameters**

|                     |                                   |
|---------------------|-----------------------------------|
| <code>_Facet</code> | The facet type to copy from other |
|---------------------|-----------------------------------|

**Parameters**

|                      |                          |
|----------------------|--------------------------|
| <code>__other</code> | The locale to copy from. |
|----------------------|--------------------------|

**Returns**

Newly constructed locale.

**Exceptions**

|                                 |                                                                    |
|---------------------------------|--------------------------------------------------------------------|
| <code>std::runtime_error</code> | if <code>__other</code> has no facet of type <code>_Facet</code> . |
|---------------------------------|--------------------------------------------------------------------|

References [locale\(\)](#).

Referenced by [operator=\(\)](#).

**global()**

```
locale std::locale::global (
    const locale & __loc) [static]
```

Set global locale.

This function sets the global locale to the argument and returns a copy of the previous global locale. If the argument has a name, it will also call `std::setlocale(LC_ALL, loc.name())`.

**Parameters**

|                    |                                |
|--------------------|--------------------------------|
| <code>__loc</code> | The new locale to make global. |
|--------------------|--------------------------------|

**Returns**

Copy of the old global locale.

References [locale\(\)](#).

**name()**

```
string std::locale::name () const [nodiscard]
```

Return locale name.

**Returns**

Locale name or "\*" if unnamed.

References [name\(\)](#).

Referenced by [name\(\)](#).

**operator()()**

```
template<typename _Char, typename _Traits, typename _Alloc>
bool std::locale::operator() (
    const basic_string< _Char, _Traits, _Alloc > & __s1,
    const basic_string< _Char, _Traits, _Alloc > & __s2) const [nodiscard]
```

Compare two strings according to collate.

Template operator to compare two strings using the compare function of the collate facet in this locale. One use is to provide the locale to the sort function. For example, a vector *v* of strings could be sorted according to locale *loc* by doing:

```
std::sort(v.begin(), v.end(), loc);
```

**Parameters**

|                   |                           |
|-------------------|---------------------------|
| <code>__s1</code> | First string to compare.  |
| <code>__s2</code> | Second string to compare. |

**Returns**

True if `collate<_Char>` facet compares `__s1 < __s2`, else false.

References [locale\(\)](#).

**operator=()**

```
const locale & std::locale::operator= (
    const locale & __other) throw ( )
```

Assignment operator.

Set this locale to be a copy of *other*.

**Parameters**

|                      |                     |
|----------------------|---------------------|
| <code>__other</code> | The locale to copy. |
|----------------------|---------------------|

**Returns**

A reference to this locale.

References [locale\(\)](#), and [combine\(\)](#).

**operator==( )**

```
bool std::locale::operator== (
    const locale & __other) const throw ( ) [nodiscard]
```

Locale equality.

**Parameters**

|                      |                                |
|----------------------|--------------------------------|
| <code>__other</code> | The locale to compare against. |
|----------------------|--------------------------------|

**Returns**

True if *other* and this refer to the same locale instance, are copies, or have the same name. False otherwise.

References [locale\(\)](#), and [operator==\( \)](#).

Referenced by [operator==\( \)](#).

### 6.636.5 Friends And Related Symbol Documentation

#### has\_facet

```
template<typename _Facet>
bool has_facet (
    const locale & __loc) throw ( )    [friend]
```

Test for the presence of a facet.

has\_facet tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

#### Template Parameters

|                     |                                         |
|---------------------|-----------------------------------------|
| <code>_Facet</code> | The facet type to test the presence of. |
|---------------------|-----------------------------------------|

#### Parameters

|                    |                     |
|--------------------|---------------------|
| <code>__loc</code> | The locale to test. |
|--------------------|---------------------|

#### Returns

true if `__loc` contains a facet of type `_Facet`, else false.

References [locale\(\)](#).

#### use\_facet

```
template<typename _Facet>
const _Facet & use_facet (
    const locale & __loc)    [friend]
```

Return a facet.

use\_facet looks for and returns a reference to a facet of type `Facet` where `Facet` is the template parameter. If `has_↔facet(locale)` is true, there is a suitable facet to return. It throws `std::bad_cast` if the locale doesn't contain a facet of type `Facet`.

#### Template Parameters

|                     |                           |
|---------------------|---------------------------|
| <code>_Facet</code> | The facet type to access. |
|---------------------|---------------------------|

#### Parameters

|                    |                    |
|--------------------|--------------------|
| <code>__loc</code> | The locale to use. |
|--------------------|--------------------|

#### Returns

Reference to facet of type `Facet`.

#### Exceptions

|                            |                                                                             |
|----------------------------|-----------------------------------------------------------------------------|
| <code>std::bad_cast</code> | if <code>__loc</code> doesn't contain a facet of type <code>_Facet</code> . |
|----------------------------|-----------------------------------------------------------------------------|

References [locale\(\)](#).

### 6.636.6 Member Data Documentation

#### **all**

```
const category std::locale::all [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

#### **collate**

```
const category std::locale::collate [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

#### **ctype**

```
const category std::locale::ctype [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

#### **messages**

```
const category std::locale::messages [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

#### **monetary**

```
const category std::locale::monetary [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

#### **none**

```
const category std::locale::none [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

#### **numeric**

```
const category std::locale::numeric [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

## time

```
const category std::locale::time [static]
```

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

## 6.637 `std::lock_guard<_Mutex>` Class Template Reference

```
#include <mutex>
```

### Public Types

- typedef `_Mutex` **mutex\_type**

### Public Member Functions

- **lock\_guard** (const [lock\\_guard](#) &)=delete
- **lock\_guard** (mutex\_type &\_\_m)
- **lock\_guard** (mutex\_type &\_\_m, [adopt\\_lock\\_t](#)) noexcept
- [lock\\_guard](#) & **operator=** (const [lock\\_guard](#) &)=delete

### 6.637.1 Detailed Description

```
template<typename _Mutex>
```

```
class std::lock_guard<_Mutex>
```

A simple scoped lock type.

A `lock_guard` controls mutex ownership within a scope, releasing ownership in the destructor.

Since

C++11

The documentation for this class was generated from the following file:

- [std\\_mutex.h](#)

## 6.638 `std::logic_error` Class Reference

```
#include <stdexcept_except.h>
```

Inheritance diagram for `std::logic_error`:

## Public Member Functions

- **logic\_error** (const char \*)
- **logic\_error** (const [logic\\_error](#) &) noexcept
- **logic\_error** (const [string](#) &\_\_arg)
- **logic\_error** ([logic\\_error](#) &&) noexcept
- **logic\_error** & **operator=** (const [logic\\_error](#) &) noexcept
- **logic\_error** & **operator=** ([logic\\_error](#) &&) noexcept
- virtual const char \* **what** () const noexcept

### 6.638.1 Detailed Description

One of two subclasses of exception.

Logic errors represent problems in the internal logic of a program; in theory, these are preventable, and even detectable before the program runs (e.g., violations of class invariants).

### 6.638.2 Constructor & Destructor Documentation

#### **logic\_error()**

```
std::logic_error::logic_error (
    const string & __arg) [explicit]
```

Takes a character string describing the error.

References [logic\\_error\(\)](#).

Referenced by [logic\\_error\(\)](#).

### 6.638.3 Member Function Documentation

#### **what()**

```
virtual const char * std::logic_error::what () const [virtual], [noexcept]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

std::lognormal_distribution< _RealType1 > &__x)`

### 6.645.1 Detailed Description

`template<typename _RealType = double>  
class std::lognormal_distribution< _RealType >`

A lognormal\_distribution random number distribution.  
The formula for the normal probability mass function is

$$p(x|m, s) = \frac{1}{sx\sqrt{2\pi}} \exp - \frac{(\ln x - m)^2}{2s^2}$$

Since

C++11

### 6.645.2 Member Typedef Documentation

#### result\_type

`template<typename _RealType = double>  
typedef _RealType std::lognormal_distribution< _RealType >::result_type`  
The type of the range of the distribution.

### 6.645.3 Member Function Documentation

#### max()

`template<typename _RealType = double>  
result_type std::lognormal_distribution< _RealType >::max () const [inline]`  
Returns the least upper bound value of the distribution.

#### min()

`template<typename _RealType = double>  
result_type std::lognormal_distribution< _RealType >::min () const [inline]`  
Returns the greatest lower bound value of the distribution.

**operator()()**

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::lognormal_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

**param() [1/2]**

```
template<typename _RealType = double>
param_type std::lognormal_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

**param() [2/2]**

```
template<typename _RealType = double>
void std::lognormal_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _RealType = double>
void std::lognormal_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

**6.645.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::lognormal_distribution< _RealType1 > & __x) [friend]
```

Inserts a lognormal\_distribution random number distribution `__x` into the output stream `__os`.

**Parameters**

|                   |                                                      |
|-------------------|------------------------------------------------------|
| <code>__os</code> | An output stream.                                    |
| <code>__x</code>  | A lognormal_distribution random number distribution. |

**Returns**

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _RealType = double>
bool operator== (
    const lognormal_distribution< _RealType > & __d1,
    const lognormal_distribution< _RealType > & __d2) [friend]
```

Return true if two lognormal distributions have the same parameters and the sequences that would be generated are equal.

**operator>>**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::lognormal_distribution< _RealType1 > & __x) [friend]
```

Extracts a lognormal\_distribution random number distribution \_\_x from the input stream \_\_is.

**Parameters**

|                   |                                                          |
|-------------------|----------------------------------------------------------|
| <code>__is</code> | An input stream.                                         |
| <code>__x</code>  | A lognormal_distribution random number generator engine. |

**Returns**

The input stream with \_\_x extracted or in an error state.

### 6.649.1 Detailed Description

```
template<typename Key, typename Mapped, typename Eq_Fn, typename _Alloc, typename Update_Policy>
class __gnu_pbds::detail::lu_map< Key, Mapped, Eq_Fn, _Alloc, Update_Policy >
```

list-based (with updates) associative container. Skip to the lu, my darling.  
The documentation for this class was generated from the following file:

- [lu\\_map\\_.hpp](#)

## 6.650 \_\_gnu\_pbds::lu\_move\_to\_front\_policy< \_Alloc > Class Template Reference

```
#include <list_update_policy.hpp>
```

### Public Types

- typedef `_Alloc` `allocator_type`
- typedef `detail::rebind_traits< _Alloc, metadata\_type >::reference` `metadata_reference`
- typedef `null_type` `metadata_type`

### Public Member Functions

- `metadata\_type operator() () const`
- `bool operator\(\) \(metadata\_reference r\_metadata\) const`

### 6.650.1 Detailed Description

```
template<typename _Alloc = std::allocator<char>>
class __gnu_pbds::lu_move_to_front_policy< _Alloc >
```

A list-update policy that unconditionally moves elements to the front of the list. A null type means that each link in a list-based container does not actually need metadata.

### 6.650.2 Member Typedef Documentation

#### `metadata_reference`

```
template<typename _Alloc = std::allocator<char>>
typedef detail::rebind\_traits<\_Alloc, metadata\_type>::reference \_\_gnu\_pbds::lu\_move\_to\_front\_policy<\_Alloc>::metadata\_reference
```

Reference to metadata on which this functor operates.

#### `metadata_type`

```
template<typename _Alloc = std::allocator<char>>
typedef null\_type \_\_gnu\_pbds::lu\_move\_to\_front\_policy<\_Alloc>::metadata\_type
```

Metadata on which this functor operates.

### 6.650.3 Member Function Documentation

#### `operator()()` [1/2]

```
template<typename _Alloc = std::allocator<char>>
metadata\_type \_\_gnu\_pbds::lu\_move\_to\_front\_policy<\_Alloc>::operator\(\) \(\) const [inline]
```

Creates a metadata object.

**operator>()** [2/2]

```
template<typename _Alloc = std::allocator<char>>
bool __gnu_pbds::lu_move_to_front_policy<_Alloc>::operator() (
    metadata_reference r_metadata) const [inline]
```

Decides whether a metadata object should be moved to the front of the list.

The documentation for this class was generated from the following file:

- [list\\_update\\_policy.hpp](#)

**6.651 `std::make_signed<_Tp>` Struct Template Reference**

constexpr bool **operator==** (const [malloc\\_allocator](#) &, const [malloc\\_allocator](#)< [\\_Up](#) > &) noexcept

### 6.653.1 Detailed Description

template<typename [\\_Tp](#)>  
class [\\_\\_gnu\\_cxx::malloc\\_allocator](#)< [\\_Tp](#) >

An allocator that uses malloc.

This is precisely the allocator defined in the C++ Standard.

- all allocation calls malloc
- all deallocation calls free

The documentation for this class was generated from the following files:

- [experimental/memory\\_resource](#)
- [malloc\\_allocator.h](#)

### 6.655.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
class std::map< _Key, _Tp, _Compare, _Alloc >
```

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

Since

C++98

## Template Parameters

|                       |                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------|
| <code>_Key</code>     | Type of key objects.                                                                    |
| <code>_Tp</code>      | Type of mapped objects.                                                                 |
| <code>_Compare</code> | Comparison function object type, defaults to <code>less&lt;_Key&gt;</code> .            |
| <code>_Alloc</code>   | Allocator type, defaults to <code>allocator&lt;pair&lt;const _Key, _Tp&gt;&gt;</code> . |

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys). For a `map<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `std::pair<const Key, T>`.

Maps support bidirectional iterators.

The private tree data is declared exactly the same way for `map` and `multimap`; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

## 6.655.2 Constructor &amp; Destructor Documentation

**map()** [1/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::map< _Key, _Tp, _Compare, _Alloc >::map () [default]
```

Default constructor creates no elements.

**map()** [2/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a map with no elements.

## Parameters

|                     |                      |
|---------------------|----------------------|
| <code>__comp</code> | A comparison object. |
| <code>__a</code>    | An allocator object. |

**map()** [3/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    const map< _Key, _Tp, _Compare, _Alloc > & ) [default]
```

Map copy constructor.

Whether the allocator is copied depends on the allocator traits.

**map()** [4/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    map< _Key, _Tp, _Compare, _Alloc > && ) [default]
```

Map move constructor.

The newly-created map contains the exact contents of the moved instance. The moved instance is a valid, but unspecified, map.

### map() [5/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map<_Key, _Tp, _Compare, _Alloc >::map (
    initializer_list< value_type > __l,
    const _Compare & __comp = _Compare(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a map from an initializer\_list.

#### Parameters

|                     |                      |
|---------------------|----------------------|
| <code>__l</code>    | An initializer_list. |
| <code>__comp</code> | A comparison object. |
| <code>__a</code>    | An allocator object. |

Create a map consisting of copies of the elements in the initializer\_list `__l`. This is linear in N if the range is already sorted, and NlogN otherwise (where N is `__l.size()`).

### map() [6/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map<_Key, _Tp, _Compare, _Alloc >::map (
    const allocator_type & __a) [inline], [explicit]
```

Allocator-extended default constructor.

### map() [7/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map<_Key, _Tp, _Compare, _Alloc >::map (
    const map<_Key, _Tp, _Compare, _Alloc > & __m,
    const __type_identity_t< allocator_type > & __a) [inline]
```

Allocator-extended copy constructor.

### map() [8/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map<_Key, _Tp, _Compare, _Alloc >::map (
    map<_Key, _Tp, _Compare, _Alloc > && __m,
    const __type_identity_t< allocator_type > & __a) [inline], [noexcept]
```

Allocator-extended move constructor.

### map() [9/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map<_Key, _Tp, _Compare, _Alloc >::map (
    initializer_list< value_type > __l,
    const allocator_type & __a) [inline]
```

Allocator-extended initialier-list constructor.

### map() [10/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a) [inline]
```

Allocator-extended range constructor.

### map() [11/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Builds a map from a range.

#### Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

Create a map consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

### map() [12/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a map from a range.

#### Parameters

|                      |                       |
|----------------------|-----------------------|
| <code>__first</code> | An input iterator.    |
| <code>__last</code>  | An input iterator.    |
| <code>__comp</code>  | A comparison functor. |
| <code>__a</code>     | An allocator object.  |

Create a map consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

**~map()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
std::map<_Key, _Tp, _Compare, _Alloc >::~~map () [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**6.655.3 Member Function Documentation****\_\_attribute()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
std::map<_Key, _Tp, _Compare, _Alloc >::__attribute (
    (__abi_tag__("cxx11")) ) [inline]
```

Erases an element from a map.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**at()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
mapped_type & std::map<_Key, _Tp, _Compare, _Alloc >::at (
    const key_type & __k) [inline]
```

Access to map data.

**Parameters**

|                  |                                             |
|------------------|---------------------------------------------|
| <code>__k</code> | The key for which data should be retrieved. |
|------------------|---------------------------------------------|

**Returns**

A reference to the data whose key is equivalent to `__k`, if such a data is present in the map.

**Exceptions**

|                                |                             |
|--------------------------------|-----------------------------|
| <code>std::out_of_range</code> | If no such data is present. |
|--------------------------------|-----------------------------|

**begin()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

**begin()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
iterator std::map< _Key, _Tp, _Compare, _Alloc >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

**cbegin()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

**cend()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

**clear()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
void std::map< _Key, _Tp, _Compare, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in a map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
template<typename _Kt>
```

```
auto std::map< _Key, _Tp, _Compare, _Alloc >::contains (
    const _Kt & __x) const -> decltype(_M_t._M_find_tr(__x), void(), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                                                                                     |                                          |
|-------------------------------------------------------------------------------------|------------------------------------------|
|  | Key of (key, value) pairs to be located. |
| <b>__x</b>                                                                          |                                          |

**Returns**

True if there is an element with the specified key.

**contains()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
bool std::map< _Key, _Tp, _Compare, _Alloc >::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                  |                                          |
|------------------|------------------------------------------|
| <code>__x</code> | Key of (key, value) pairs to be located. |
|------------------|------------------------------------------|

**Returns**

True if there is an element with the specified key.

**count()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map< _Key, _Tp, _Compare, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements with given key.

**Parameters**

|                  |                                          |
|------------------|------------------------------------------|
| <code>__x</code> | Key of (key, value) pairs to be located. |
|------------------|------------------------------------------|

**Returns**

Number of elements with specified key.

This function only makes sense for multimaps; for map the result will either be 0 (not present) or 1 (present).

**crbegin()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

**crend()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

**emplace()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
std::pair< iterator, bool > std::map< _Key, _Tp, _Compare, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Attempts to build and insert a `std::pair` into the map.

**Parameters**

|                     |                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__args</code> | Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor). |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

**emplace\_hint()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Attempts to build and insert a `std::pair` into the map.

**Parameters**

|                     |                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the pair should be inserted.                                                                             |
| <code>__args</code> | Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor). |

**Returns**

An iterator that points to the element with key of the `std::pair` built from `__args` (may or may not be that `std::pair`).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Referenced by `std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::emplace()`, `std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert()`, `std::map< _Key, _Tp, _Cmp, polymorphic_allocator< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert_or_assign()`.

**empty()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
bool std::map<_Key, _Tp, _Compare, _Alloc>::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the map is empty. (Thus begin() would equal end().)

**end()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

**end()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
iterator std::map<_Key, _Tp, _Compare, _Alloc>::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Referenced by `std::map<_Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp >>>::at()`, `std::map<_Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp >>>::insert()`, `std::map<_Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp >>>::operator[]()` and `std::map<_Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp >>>::operator[]()`.

**equal\_range()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::pair< iterator, iterator > std::map<_Key, _Tp, _Compare, _Alloc>::equal_range (
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                  |                                          |
|------------------|------------------------------------------|
| <code>__x</code> | Key of (key, value) pairs to be located. |
|------------------|------------------------------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

**equal\_range()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::pair< const_iterator, const_iterator > std::map<_Key, _Tp, _Compare, _Alloc>::equal_range
(
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                  |                                          |
|------------------|------------------------------------------|
| <code>__x</code> | Key of (key, value) pairs to be located. |
|------------------|------------------------------------------|

**Returns**

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

**erase() [1/3]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map<_Key, _Tp, _Compare, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <code>__x</code> | Key of element to be erased. |
|------------------|------------------------------|

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase() [2/3]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map<_Key, _Tp, _Compare, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [first,last) range of elements from a map.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [3/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map<_Key, _Tp, _Compare, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from a map.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map<_Key, _Tp, _Compare, _Alloc >::find (
    const key_type & __x) [inline]
```

Tries to locate an element in a map.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

**find()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map<_Key, _Tp, _Compare, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in a map.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

**Returns**

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**get\_allocator()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
allocator_type std::map<_Key, _Tp, _Compare, _Alloc >::get_allocator () const [inline], [noexcept]
```

Get a copy of the memory allocation object.

**insert() [1/8]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
void std::map<_Key, _Tp, _Compare, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Template function that attempts to insert a range of elements.

**Parameters**

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

**insert() [2/8]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair >::value, pair< iterator, bool > > std::map<
_Key, _Tp, _Compare, _Alloc >::insert (
    _Pair && __x) [inline]
```

Attempts to insert a `std::pair` into the map.

**Parameters**

|                  |                                                                                   |
|------------------|-----------------------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |
|------------------|-----------------------------------------------------------------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

**insert()** [3/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair< iterator, bool > std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    const value_type & __x) [inline]
```

Attempts to insert a `std::pair` into the map.

**Parameters**

|                  |                                                                                   |
|------------------|-----------------------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |
|------------------|-----------------------------------------------------------------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

Referenced by `std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert()`, and `std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::operator[]()`.

**insert()** [4/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair >::value, iterator > std::map< _Key, _Tp, _Cmp,
_Alloc >::insert (
    const_iterator __position,
    _Pair && __x) [inline]
```

Attempts to insert a `std::pair` into the map.

**Parameters**

|                         |                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>        | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

**insert()** [5/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
iterator std::map<_Key, _Tp, _Compare, _Alloc >::insert (
    const_iterator __position,
    const value_type & __x) [inline]
```

Attempts to insert a std::pair into the map.

#### Parameters

|                         |                                                                            |
|-------------------------|----------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the pair should be inserted. |
| <code>__x</code>        | Pair to be inserted (see std::make_pair for easy creation of pairs).       |

#### Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

#### insert() [6/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map<_Key, _Tp, _Compare, _Alloc >::insert (
    const_iterator __position,
    value_type && __x) [inline]
```

Attempts to insert a std::pair into the map.

#### Parameters

|                         |                                                                            |
|-------------------------|----------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the pair should be inserted. |
| <code>__x</code>        | Pair to be inserted (see std::make_pair for easy creation of pairs).       |

#### Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

#### insert() [7/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::map<_Key, _Tp, _Compare, _Alloc >::insert (
    std::initializer_list< value_type > __list) [inline]
```

Attempts to insert a list of std::pairs into the map.

**Parameters**

|                     |                                                                                 |
|---------------------|---------------------------------------------------------------------------------|
| <code>__list</code> | A <code>std::initializer_list&lt;value_type&gt;</code> of pairs to be inserted. |
|---------------------|---------------------------------------------------------------------------------|

Complexity similar to that of the range constructor.

**insert()** [8/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::pair< iterator, bool > std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    value_type && __x) [inline]
```

Attempts to insert a `std::pair` into the map.

**Parameters**

|                  |                                                                                   |
|------------------|-----------------------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |
|------------------|-----------------------------------------------------------------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

**insert\_or\_assign()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
template<typename _Obj>
pair< iterator, bool > std::map< _Key, _Tp, _Compare, _Alloc >::insert_or_assign (
    const key_type & __k,
    _Obj && __obj) [inline]
```

Attempts to insert or assign a `std::pair` into the map.

**Parameters**

|                    |                                                             |
|--------------------|-------------------------------------------------------------|
| <code>__k</code>   | Key to use for finding a possibly existing pair in the map. |
| <code>__obj</code> | Argument used to generate the .second for a pair instance.  |

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map. If the pair was already in the map, the .second of the pair is assigned from `__obj`.

Insertion requires logarithmic time.

**insert\_or\_assign()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Obj>
iterator std::map<_Key, _Tp, _Compare, _Alloc >::insert_or_assign (
    const_iterator __hint,
    const key_type & __k,
    _Obj && __obj) [inline]
```

Attempts to insert or assign a std::pair into the map.

**Parameters**

|                     |                                                                            |
|---------------------|----------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted. |
| <code>__k</code>    | Key to use for finding a possibly existing pair in the map.                |
| <code>__obj</code>  | Argument used to generate the .second for a pair instance.                 |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map. If the pair was already in the map, the .second of the pair is assigned from `__obj`.

Insertion requires logarithmic time.

**key\_comp()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
key_compare std::map<_Key, _Tp, _Compare, _Alloc >::key_comp () const [inline]
```

Returns the key comparison object out of which the map was constructed.

Referenced by `std::map<_Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::at()`, `std::map<_Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert()`, `std::map<_Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::operator[]()`, and `std::map<_Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::operator[]()`.

**lower\_bound()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map<_Key, _Tp, _Compare, _Alloc >::lower_bound (
    const key_type & __x) [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Referenced by `std::map<_Key, _Tp, _Compare, polymorphic_allocator<pair<const _Key, _Tp>>>::at()`, `std::map<_Key, _Tp, _Compare, polymorphic_allocator<pair<const _Key, _Tp>>>::insert()`, `std::map<_Key, _Tp, _Compare, polymorphic_allocator<pair<const _Key, _Tp>>>::operator[]()`.

**lower\_bound()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::lower_bound (
    const key_type & __x) const [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

**Returns**

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

**max\_size()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
size_type std::map<_Key, _Tp, _Compare, _Alloc>::max_size () const [inline], [noexcept]
```

Returns the maximum size of the map.

**operator=()** [1/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
map & std::map<_Key, _Tp, _Compare, _Alloc>::operator= (
    const map<_Key, _Tp, _Compare, _Alloc> & ) [default]
```

Map assignment operator.

Whether the allocator is copied depends on the allocator traits.

**operator=()** [2/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
map & std::map<_Key, _Tp, _Compare, _Alloc>::operator= (
    initializer_list<value_type> & __l) [inline]
```

Map list assignment operator.

**Parameters**

|    |                      |
|----|----------------------|
| ↵  | An initializer_list. |
| _↵ |                      |
| ↵  |                      |
| _↵ |                      |
| /  |                      |

This function fills a map with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the map and that the resulting map's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
map & std::map<_Key, _Tp, _Compare, _Alloc >::operator= (
    map<_Key, _Tp, _Compare, _Alloc > && ) [default]
```

Move assignment operator.

**operator[]()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
mapped_type & std::map<_Key, _Tp, _Compare, _Alloc >::operator[] (
    const key_type & __k) [inline]
```

Subscript ( [] ) access to map data.

**Parameters**

|    |                                             |
|----|---------------------------------------------|
| _↵ | The key for which data should be retrieved. |
| _k |                                             |

**Returns**

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ( [] ) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires logarithmic time.

**rbegin()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc >::rbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

**rbegin()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc >::rbegin () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

**rend()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

**rend()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rend () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

**size()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map< _Key, _Tp, _Compare, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the map.

**swap()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::map< _Key, _Tp, _Compare, _Alloc >::swap (
    map< _Key, _Tp, _Compare, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another map.

**Parameters**

|                                                                                     |                                                |
|-------------------------------------------------------------------------------------|------------------------------------------------|
|  | A map of the same element and allocator types. |
|  |                                                |

This exchanges the elements between two maps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function. Whether the allocators are swapped depends on the allocator traits.

**upper\_bound()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (
    const key_type & __x) [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

|                                                                                     |                                         |
|-------------------------------------------------------------------------------------|-----------------------------------------|
|  | Key of (key, value) pair to be located. |
|  |                                         |

**Returns**

Iterator pointing to the first element greater than key, or end().

**upper\_bound()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::upper_bound (
    const key_type & __x) const [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

|              |                                         |
|--------------|-----------------------------------------|
| $\leftarrow$ | Key of (key, value) pair to be located. |
| $\_X$        |                                         |

**Returns**

Read-only (constant) iterator pointing to first iterator greater than key, or end().

**value\_comp()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
value_compare std::map<_Key, _Tp, _Compare, _Alloc>::value_comp () const [inline]
```

Returns a value comparison object, built from the key comparison object out of which the map was constructed.

### 6.656.1 Detailed Description

`template<class _Tp>`  
**class** `std::mask_array< _Tp >`

Reference to selected subset of an array.

A `mask_array` is a reference to the actual elements of an array specified by a bitmask in the form of an array of `bool`. The way to get a `mask_array` is to call `operator[](valarray<bool>)` on a `valarray`. The returned `mask_array` then permits carrying operations out on the referenced subset of elements in the original `valarray`.

For example, if a `mask_array` is obtained using the array `(false, true, false, true)` as an argument, the mask array has two elements referring to `array[1]` and `array[3]` in the underlying array.

#### Parameters

|           |               |
|-----------|---------------|
| <i>Tp</i> | Element type. |
|-----------|---------------|

### 6.656.2 Member Function Documentation

#### **operator%=()**

```
template<class _Tp>
void std::mask\_array< _Tp >::operator%= (
    const valarray< _Tp > & ) const
```

Modulo slice elements by corresponding elements of *v*.

**operator&=()**

```
template<class _Tp>
void std::mask_array<_Tp>::operator&= (
    const valarray<_Tp> & ) const
```

Logical and slice elements with corresponding elements of *v*.

**operator\*=()**

```
template<class _Tp>
void std::mask_array<_Tp>::operator*= (
    const valarray<_Tp> & ) const
```

Multiply slice elements by corresponding elements of *v*.

**operator+=()**

```
template<class _Tp>
void std::mask_array<_Tp>::operator+= (
    const valarray<_Tp> & ) const
```

Add corresponding elements of *v* to slice elements.

**operator-=()**

```
template<class _Tp>
void std::mask_array<_Tp>::operator-= (
    const valarray<_Tp> & ) const
```

Subtract corresponding elements of *v* from slice elements.

**operator/=()**

```
template<class _Tp>
void std::mask_array<_Tp>::operator/= (
    const valarray<_Tp> & ) const
```

Divide slice elements by corresponding elements of *v*.

**operator<<=()**

```
template<class _Tp>
void std::mask_array<_Tp>::operator<<= (
    const valarray<_Tp> & ) const
```

Left shift slice elements by corresponding elements of *v*.

**operator>>=()**

```
template<class _Tp>
void std::mask_array<_Tp>::operator>>= (
    const valarray<_Tp> & ) const
```

Right shift slice elements by corresponding elements of *v*.

**operator^=()**

```
template<class _Tp>
void std::mask_array<_Tp>::operator^= (
    const valarray<_Tp> & ) const
```

Logical xor slice elements with corresponding elements of *v*.

**operator" | =()**

```
template<class _Tp>
void std::mask_array< _Tp >::operator|= (
    const valarray< _Tp > & ) const
```

Logical or slice elements with corresponding elements of v.

The documentation for this class was generated from the following files:

### 6.658.1 Detailed Description

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
class std::match_results<_Bi_iter, _Alloc >
```

The results of a match or search operation.

A collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template `match_results`.

This class satisfies the Sequence requirements, with the exception that only the operations defined for a const-qualified Sequence are supported.

The `sub_match` object stored at index 0 represents sub-expression 0, i.e. the whole match. In this case the `sub_match` member `matched` is always true. The `sub_match` object stored at index `n` denotes what matched the marked sub-expression `n` within the matched expression. If the sub-expression `n` participated in a regular expression match then the `sub_match` member `matched` evaluates to true, and members `first` and `second` denote the range of characters [`first`, `second`) which formed that match. Otherwise `matched` is false, and members `first` and `second` point to the end of the sequence that was searched.

Since

C++11

### 6.658.2 Constructor & Destructor Documentation

#### **match\_results()** [1/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results<_Bi_iter, _Alloc >::match_results () [inline]
```

Constructs a default `match_results` container.

**Postcondition**

`size()` returns 0 and `str()` returns an empty string.

#### **match\_results()** [2/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results<_Bi_iter, _Alloc >::match_results (
    const _Alloc & __a) [inline], [explicit], [noexcept]
```

Constructs a default `match_results` container.

**Postcondition**

`size()` returns 0 and `str()` returns an empty string.

**match\_results()** [3/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
    const match_results< _Bi_iter, _Alloc > & ) [default]
```

Copy constructs a match\_results.

**match\_results()** [4/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
    match_results< _Bi_iter, _Alloc > && ) [default], [noexcept]
```

Move constructs a match\_results.

**~match\_results()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::~~match_results () [default]
```

Destroys a match\_results object.

**match\_results()** [5/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
    const match_results< _Bi_iter, _Alloc > & __m,
    const _Alloc & __a) [inline]
```

Constructs a default match\_results container.

**Postcondition**

size() returns 0 and str() returns an empty string.

**match\_results()** [6/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
    match_results< _Bi_iter, _Alloc > && __m,
    const _Alloc & __a) [inline], [noexcept]
```

Constructs a default match\_results container.

**Postcondition**

size() returns 0 and str() returns an empty string.

### 6.658.3 Member Function Documentation

**begin()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results< _Bi_iter, _Alloc >::begin () const [inline], [noexcept]
```

Gets an iterator to the start of the sub\_match collection.

Referenced by `std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > >>< const char * >` and `std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > >>< const char * >::operator`

**cbegin()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>>
const_iterator std::match\_results<\_Bi\_iter, \_Alloc>::cbegin () const [inline], [noexcept]
```

Gets an iterator to the start of the `sub_match` collection.

**cend()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>>
const_iterator std::match\_results<\_Bi\_iter, \_Alloc>::cend () const [inline], [noexcept]
```

Gets an iterator to one-past-the-end of the collection.

**empty()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>>
bool std::match\_results<\_Bi\_iter, \_Alloc>::empty () const [inline], [nodiscard], [noexcept]
```

Indicates if the `match_results` contains no results.

**Return values**

|              |                                                     |
|--------------|-----------------------------------------------------|
| <i>true</i>  | The <code>match_results</code> object is empty.     |
| <i>false</i> | The <code>match_results</code> object is not empty. |

Referenced by `std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>><const char*>`, `std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>><const char*>::prefix()`, and `std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>><const char*>::suffix()`.

**end()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>>
const_iterator std::match\_results<\_Bi\_iter, \_Alloc>::end () const [inline], [noexcept]
```

Gets an iterator to one-past-the-end of the collection.

Referenced by `std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>><const char*>` and `std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>><const char*>::operator`.

**format() [1/4]**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>>
template<typename _Out_iter, typename _St, typename _Sa>
_Out_iter std::match\_results<\_Bi\_iter, \_Alloc>::format (
    _Out_iter __out,
    const basic\_string<char\_type, \_St, \_Sa> & __fmt,
    match\_flag\_type __flags = regex\_constants::format\_default) const [inline]
```

**Precondition**

`ready() == true`

**format() [2/4]**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>>
template<typename _Out_iter>
_Out_iter std::match\_results<\_Bi\_iter, \_Alloc>::format (
    _Out_iter __out,
    const char\_type * __fmt_first,
    const char\_type * __fmt_last,
    match\_flag\_type __flags = regex\_constants::format\_default) const
```

**Precondition**

ready() == true

Referenced by `std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>><const char*>::format()`,  
`std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>><const char*>::format()`,  
and `std::match_results<_BidirectionalIterator, polymorphic_allocator<sub_match<_BidirectionalIterator>>><const char*>::format()`

**format() [3/4]**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>>>
template<typename _St, typename _Sa>
basic_string<char_type, _St, _Sa> std::match_results<_Bi_iter, _Alloc>::format (
    const basic_string<char_type, _St, _Sa> & __fmt,
    match_flag_type __flags = regex_constants::format_default) const [inline]
```

**Precondition**

ready() == true

**format() [4/4]**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>>>
string_type std::match_results<_Bi_iter, _Alloc>::format (
    const char_type * __fmt,
    match_flag_type __flags = regex_constants::format_default) const [inline]
```

**Precondition**

ready() == true

**get\_allocator()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>>>
allocator_type std::match_results<_Bi_iter, _Alloc>::get_allocator () const [inline], [noexcept]
Gets a copy of the allocator.
```

**length()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>>>
difference_type std::match_results<_Bi_iter, _Alloc>::length (
    size_type __sub = 0) const [inline]
```

Gets the length of the indicated submatch.

**Parameters**

|                    |                         |
|--------------------|-------------------------|
| <code>__sub</code> | indicates the submatch. |
|--------------------|-------------------------|

**Precondition**

ready() == true

This function returns the length of the indicated submatch, or the length of the entire match if `__sub` is zero (the default).

**max\_size()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
size_type std::match_results<_Bi_iter, _Alloc >::max_size () const [inline], [noexcept]
```

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or mark\_count() + 1 if a match was successful. Some matches may be empty.

**Returns**

the number of matches found.

**operator=() [1/2]**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
match_results & std::match_results<_Bi_iter, _Alloc >::operator= (
    const match_results<_Bi_iter, _Alloc > & ) [default]
```

Assigns rhs to \*this.

**operator=() [2/2]**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
match_results & std::match_results<_Bi_iter, _Alloc >::operator= (
    match_results<_Bi_iter, _Alloc > && ) [default]
```

Move-assigns rhs to \*this.

**operator[]()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_reference std::match_results<_Bi_iter, _Alloc >::operator[] (
    size_type __sub) const [inline]
```

Gets a sub\_match reference for the match or submatch.

**Parameters**

|                    |                         |
|--------------------|-------------------------|
| <code>__sub</code> | indicates the submatch. |
|--------------------|-------------------------|

**Precondition**

ready() == true

This function gets a reference to the indicated submatch, or the entire match if `__sub` is zero.

If `__sub` >= size() then this function returns a sub\_match with a special value indicating no submatch.

**position()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
difference_type std::match_results<_Bi_iter, _Alloc >::position (
    size_type __sub = 0) const [inline]
```

Gets the offset of the beginning of the indicated submatch.

**Parameters**

|                    |                         |
|--------------------|-------------------------|
| <code>__sub</code> | indicates the submatch. |
|--------------------|-------------------------|

**Precondition**

`ready() == true`

This function returns the offset from the beginning of the target sequence to the beginning of the submatch, unless the value of `__sub` is zero (the default), in which case this function returns the offset from the beginning of the target sequence to the beginning of the match.

**prefix()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_reference std::match_results< _Bi_iter, _Alloc >::prefix () const [inline]
```

Gets a `sub_match` representing the match prefix.

**Precondition**

`ready() == true`

This function gets a reference to a `sub_match` object representing the part of the target range between the start of the target range and the start of the match.

Referenced by `std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char*`

**ready()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
bool std::match_results< _Bi_iter, _Alloc >::ready () const [inline], [noexcept]
```

Indicates if the `match_results` is ready.

**Return values**

|              |                                                  |
|--------------|--------------------------------------------------|
| <i>true</i>  | The object has a fully-established result state. |
| <i>false</i> | The object is not ready.                         |

Referenced by `std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char*`  
`std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::operator`  
`std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::prefix()`,  
and `std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::suffi`

**size()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
size_type std::match_results< _Bi_iter, _Alloc >::size () const [inline], [noexcept]
```

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or `mark_count() + 1` if a match was successful. Some matches may be empty.

**Returns**

the number of matches found.

Referenced by `std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char*`  
and `std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::ope`

**str()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
string_type std::match_results< _Bi_iter, _Alloc >::str (
    size_type __sub = 0) const [inline]
```

Gets the match or submatch converted to a string type.

## Parameters

|                    |                         |
|--------------------|-------------------------|
| <code>__sub</code> | indicates the submatch. |
|--------------------|-------------------------|

## Precondition

`ready() == true`

This function gets the submatch (or match, if `__sub` is zero) extracted from the target range and converted to the associated string type.

**suffix()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_reference std::match_results< _Bi_iter, _Alloc >::suffix () const [inline]
```

Gets a `sub_match` representing the match suffix.

## Precondition

`ready() == true`

This function gets a reference to a `sub_match` object representing the part of the target range between the end of the match and the end of the target range.

Referenced by `std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char*`

**swap()**

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
void std::match_results< _Bi_iter, _Alloc >::swap (
    match_results< _Bi_iter, _Alloc > & __that) [inline], [noexcept]
```

Swaps the contents of two `match_results`.

Referenced by `std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char*`

### 6.666.1 Detailed Description

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
class std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f
>
```

A generalized feedback shift register discrete random number generator.

This algorithm avoids multiplication and division and is designed to be friendly to a pipelined architecture. If the parameters are chosen correctly, this generator will produce numbers with a very long period and fairly good apparent entropy, although still not cryptographically strong.

The best way to use this generator is with the predefined mt19937 class.

This algorithm was originally invented by Makoto Matsumoto and Takuji Nishimura.

#### Template Parameters

|                  |                                                                    |
|------------------|--------------------------------------------------------------------|
| <code>__w</code> | Word size, the number of bits in each element of the state vector. |
| <code>__n</code> | The degree of recursion.                                           |
| <code>__m</code> | The period parameter.                                              |
| <code>__r</code> | The separation point bit index.                                    |
| <code>__a</code> | The last row of the twist matrix.                                  |
| <code>__u</code> | The first right-shift tempering matrix parameter.                  |
| <code>__d</code> | The first right-shift tempering matrix mask.                       |
| <code>__s</code> | The first left-shift tempering matrix parameter.                   |
| <code>__b</code> | The first left-shift tempering matrix mask.                        |
| <code>__t</code> | The second left-shift tempering matrix parameter.                  |
| <code>__c</code> | The second left-shift tempering matrix mask.                       |
| <code>__l</code> | The second right-shift tempering matrix parameter.                 |
| <code>__f</code> | Initialization multiplier.                                         |

Since

C++11

### 6.666.2 Member Typedef Documentation

#### result\_type

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType
```

```
__f>
typedef _UIntType std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::result_type
The type of the generated random value.
```

### 6.666.3 Constructor & Destructor Documentation

#### mersenne\_twister\_engine()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::mersenne_twister_engine (
    _Sseq & __q) [inline], [explicit]
```

Constructs a mersenne\_twister\_engine random number generator engine seeded from the seed sequence \_\_q.

#### Parameters

|                  |                    |
|------------------|--------------------|
| <code>__q</code> | the seed sequence. |
|------------------|--------------------|

### 6.666.4 Member Function Documentation

#### discard()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
void std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::discard (
    unsigned long long __z)
```

Discard a sequence of random numbers.

#### max()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::max () [inline], [static], [constexpr]
Gets the largest possible value in the output range.
```

#### min()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::min () [inline], [static], [constexpr]
Gets the smallest possible value in the output range.
```

## 6.666.5 Friends And Related Symbol Documentation

### operator<<

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
template<typename _UIntType1, size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::mersenne_twister_engine< _UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1, __f1 > & __x) [friend]
```

Inserts the current state of a % mersenne\_twister\_engine random number generator engine \_\_x into the output stream \_\_os.

#### Parameters

|                   |                                                             |
|-------------------|-------------------------------------------------------------|
| <code>__os</code> | An output stream.                                           |
| <code>__x</code>  | A % mersenne_twister_engine random number generator engine. |

#### Returns

The output stream with the state of \_\_x inserted or in an error state.

### operator==

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
bool operator== (
    const mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & __lhs,
    const mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & __rhs) [friend]
```

Compares two % mersenne\_twister\_engine random number generator objects of the same type for equality.

#### Parameters

|                    |                                                                   |
|--------------------|-------------------------------------------------------------------|
| <code>__lhs</code> | A % mersenne_twister_engine random number generator object.       |
| <code>__rhs</code> | Another % mersenne_twister_engine random number generator object. |

#### Returns

true if the infinite sequences of generated values would be equal, false otherwise.

### operator>>

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
```

```
template<typename _UIntType1, size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __↵
__a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1,
size_t __l1, _UIntType1 __f1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::mersenne_twister_engine< _UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1,
__s1, __b1, __t1, __c1, __l1, __f1 > & __x) [friend]
```

Extracts the current state of a % mersenne\_twister\_engine random number generator engine \_\_x from the input stream \_\_is.

#### Parameters

|                   |                                                             |
|-------------------|-------------------------------------------------------------|
| <code>__is</code> | An input stream.                                            |
| <code>__x</code>  | A % mersenne_twister_engine random number generator engine. |

#### Returns

The input stream with the state of \_\_x extracted or in an error state.

### 6.667.1 Detailed Description

`template<typename _CharT>`  
`class std::messages<_CharT>`

Primary class template `messages`.

This facet encapsulates the code to retrieve messages from message catalogs. The only thing defined by the standard for this facet is the interface. All underlying functionality is implementation-defined.

This library currently implements 3 versions of the message facet. The first version (gnu) is a wrapper around gettext, provided by libintl. The second version (ieee) is a wrapper around catgets. The final version (default) does no actual translation. These implementations are only provided for char and wchar\_t instantiations.

The messages template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the messages facet.

### 6.667.2 Member Typedef Documentation

#### char\_type

```
template<typename _CharT>
typedef _CharT std::messages< _CharT >::char_type
Public typedefs.
```

#### string\_type

```
template<typename _CharT>
typedef basic_string<_CharT> std::messages< _CharT >::string_type
Public typedefs.
```

### 6.667.3 Constructor & Destructor Documentation

#### messages() [1/2]

```
template<typename _CharT>
std::messages< _CharT >::messages (
    size_t __refs = 0) [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

##### Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

References [std::locale::facet::facet\(\)](#).

#### messages() [2/2]

```
template<typename _CharT>
std::messages< _CharT >::messages (
    __c_locale __cloc,
    const char * __s,
    size_t __refs = 0) [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

##### Parameters

|                     |                                     |
|---------------------|-------------------------------------|
| <code>__cloc</code> | The C locale.                       |
| <code>__s</code>    | The name of a locale.               |
| <code>__refs</code> | Refcount to pass to the base class. |

References [std::locale::facet::facet\(\)](#).

**~messages()**

```
template<typename _CharT>
std::messages< _CharT >::~~messages () [protected], [virtual]
Destructor.
```

**6.667.4 Member Function Documentation****do\_get()**

- static const pattern **\_S\_default\_pattern**

#### 6.675.1 Detailed Description

Money format ordering data.

This class contains an ordered array of 4 fields to represent the pattern for formatting a money amount. Each field may contain one entry from the part enum. symbol, sign, and value must be present and the remaining field must contain either none or space.

#### See also

`moneypunct::pos_format()` and `moneypunct::neg_format()` for details of how these fields are interpreted.

The documentation for this class was generated from the following file:

#### 6.676.1 Detailed Description

```
template<typename _CharT, typename _InIter>
class std::money_get< _CharT, _InIter >
```

Primary class template `money_get`.

This facet encapsulates the code to parse and return a monetary amount from a string.

The `money_get` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `money_get` facet.

#### 6.676.2 Member Typedef Documentation

##### `char_type`

```
template<typename _CharT, typename _InIter>
typedef _CharT std::money_get< _CharT, _InIter >::char_type
Public typedefs.
```

##### `iter_type`

```
template<typename _CharT, typename _InIter>
typedef _InIter std::money_get< _CharT, _InIter >::iter_type
Public typedefs.
```

##### `string_type`

```
template<typename _CharT, typename _InIter>
typedef basic_string<_CharT> std::money_get< _CharT, _InIter >::string_type
Public typedefs.
```

#### 6.676.3 Constructor & Destructor Documentation

##### `money_get()`

```
template<typename _CharT, typename _InIter>
std::money_get< _CharT, _InIter >::money_get (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

##### Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

References [std::locale::facet::facet\(\)](#).

**~money\_get()**

```
template<typename _CharT, typename _InIter>
virtual std::money_get< _CharT, _InIter >::~~money_get () [inline], [protected], [virtual]
Destructor.
```

**6.676.4 Member Function Documentation****do\_get()** [1/2]

```
template<typename _CharT, typename _InIter>
_InIter std::money_get< _CharT, _InIter >::do_get (
    iter_type __s,
    iter_type __end,
    bool __intl,
    ios_base & __io,
    ios_base::iostate & __err,
    long double & __units) const [protected], [virtual]
```

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for details.

References [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::c\\_str\(\)](#).

Referenced by [get\(\)](#), and [get\(\)](#).

**do\_get()** [2/2]

```
template<typename _CharT, typename _InIter>
_InIter std::money_get< _CharT, _InIter >::do_get (
    iter_type __s,
    iter_type __end,
    bool __intl,
    ios_base & __io,
    ios_base::iostate & __err,
    string_type & __digits) const [protected], [virtual]
```

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for details.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::use\\_facet\(\)](#), and [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>::widen\(\)](#).

**get()** [1/2]

```
template<typename _CharT, typename _InIter>
iter_type std::money_get< _CharT, _InIter >::get (
    iter_type __s,
    iter_type __end,
    bool __intl,
    ios_base & __io,
```

```
ios_base::iostate & __err,
long double & __units) const [inline]
```

Read and parse a monetary value.

This function reads characters from `__s`, interprets them as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and returns the result in `units` as an integral value `moneypunct::frac_digits() * the actual amount`. For example, the string \$10.01 in a US locale would store 1001 in `units`.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets `err=(err|io.failbit)`. If the stream is consumed before finishing parsing, sets `err=(err|io.failbit|io.eofbit)`. `units` is unchanged if parsing fails.

This function works by returning the result of `do_get()`.

#### Parameters

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| <code>__s</code>     | Start of characters to parse.                                               |
| <code>__end</code>   | End of characters to parse.                                                 |
| <code>__intl</code>  | Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt; &gt;</code> . |
| <code>__io</code>    | Source of facets and io state.                                              |
| <code>__err</code>   | Error field to set if parsing fails.                                        |
| <code>__units</code> | Place to store result of parsing.                                           |

#### Returns

Iterator referencing first character beyond valid money amount.

References `do_get()`.

#### get() [2/2]

```
template<typename _CharT, typename _InIter>
iter_type std::money_get< _CharT, _InIter >::get (
    iter_type __s,
    iter_type __end,
    bool __intl,
    ios_base & __io,
    ios_base::iostate & __err,
    string_type & __digits) const [inline]
```

Read and parse a monetary value.

This function reads characters from `__s`, interprets them as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and returns the result in `digits`. For example, the string \$10.01 in a US locale would store 1001 in `digits`.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets `err=(err|io.failbit)`. If the stream is consumed before finishing parsing, sets `err=(err|io.failbit|io.eofbit)`.

This function works by returning the result of `do_get()`.

#### Parameters

|                       |                                                                             |
|-----------------------|-----------------------------------------------------------------------------|
| <code>__s</code>      | Start of characters to parse.                                               |
| <code>__end</code>    | End of characters to parse.                                                 |
| <code>__intl</code>   | Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt; &gt;</code> . |
| <code>__io</code>     | Source of facets and io state.                                              |
| <code>__err</code>    | Error field to set if parsing fails.                                        |
| <code>__digits</code> | Place to store result of parsing.                                           |

## Returns

Iterator referencing first character beyond valid money amount.

References [do\\_get\(\)](#).

### 6.677.1 Detailed Description

```
template<typename _CharT, typename _OutIter>
class std::money_put< _CharT, _OutIter >
```

Primary class template `money_put`.

This facet encapsulates the code to format and output a monetary amount.

The `money_put` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `money_put` facet.

### 6.677.2 Member Typedef Documentation

#### `char_type`

```
template<typename _CharT, typename _OutIter>
typedef _CharT std::money_put< _CharT, _OutIter >::char_type
```

Public typedefs.

#### `iter_type`

```
template<typename _CharT, typename _OutIter>
typedef _OutIter std::money_put< _CharT, _OutIter >::iter_type
```

Public typedefs.

#### `string_type`

```
template<typename _CharT, typename _OutIter>
typedef basic_string<_CharT> std::money_put< _CharT, _OutIter >::string_type
```

Public typedefs.

### 6.677.3 Constructor & Destructor Documentation

#### money\_put()

```
template<typename _CharT, typename _OutIter>
std::money_put< _CharT, _OutIter >::money_put (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

#### Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

References [std::locale::facet::facet\(\)](#).

#### ~money\_put()

```
template<typename _CharT, typename _OutIter>
virtual std::money_put< _CharT, _OutIter >::~money_put () [inline], [protected], [virtual]
Destructor.
```

### 6.677.4 Member Function Documentation

#### do\_put() [1/2]

```
template<typename _CharT, typename _OutIter>
_OutIter std::money_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    bool __intl,
    ios_base & __io,
    char_type __fill,
    const string_type & __digits) const [protected], [virtual]
```

Format and output a monetary value.

This function formats *digits* as a monetary value according to moneypunct and ctype facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the string `1001` in a US locale would write `$10.01` to `__s`.

This function is a hook for derived classes to change the value returned.

#### See also

`put()`.

#### Parameters

|                       |                                                                            |
|-----------------------|----------------------------------------------------------------------------|
| <code>__s</code>      | The stream to write to.                                                    |
| <code>__intl</code>   | Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt;&gt;</code> . |
| <code>__io</code>     | Source of facets and io state.                                             |
| <code>__fill</code>   | <code>char_type</code> to use for padding.                                 |
| <code>__digits</code> | Place to store result of parsing.                                          |

#### Returns

Iterator after writing.

**do\_put()** [2/2]

```
template<typename _CharT, typename _OutIter>
_OutIter std::money_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    bool __intl,
    ios_base & __io,
    char_type __fill,
    long double __units) const [protected], [virtual]
```

Format and output a monetary value.

This function formats *units* as a monetary value according to moneypunct and ctype facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the value 1001 in a US locale would write \$10.01 to `__s`.

This function is a hook for derived classes to change the value returned.

**See also**

`put()`.

**Parameters**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| <code>__s</code>     | The stream to write to.                                                     |
| <code>__intl</code>  | Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt; &gt;</code> . |
| <code>__io</code>    | Source of facets and io state.                                              |
| <code>__fill</code>  | <code>char_type</code> to use for padding.                                  |
| <code>__units</code> | Place to store result of parsing.                                           |

**Returns**

Iterator after writing.

References `std::ios_base::getloc()`, `std::use_facet()`, and `std::__ctype_abstract_base< _CharT >::widen()`.

Referenced by `put()`, and `put()`.

**put()** [1/2]

```
template<typename _CharT, typename _OutIter>
iter_type std::money_put< _CharT, _OutIter >::put (
    iter_type __s,
    bool __intl,
    ios_base & __io,
    char_type __fill,
    const string_type & __digits) const [inline]
```

Format and output a monetary value.

This function formats *digits* as a monetary value according to moneypunct and ctype facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the string 1001 in a US locale would write \$10.01 to `__s`.

This function works by returning the result of `do_put()`.

**Parameters**

|                       |                                                                             |
|-----------------------|-----------------------------------------------------------------------------|
| <code>__s</code>      | The stream to write to.                                                     |
| <code>__intl</code>   | Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt; &gt;</code> . |
| <code>__io</code>     | Source of facets and io state.                                              |
| <code>__fill</code>   | <code>char_type</code> to use for padding.                                  |
| <code>__digits</code> | Place to store result of parsing.                                           |

**Returns**

Iterator after writing.

References [do\\_put\(\)](#).

**put()** [2/2]

```
template<typename _CharT, typename _OutIter>
iter_type std::money_put<_CharT, _OutIter>::put (
    iter_type __s,
    bool __intl,
    ios_base & __io,
    char_type __fill,
    long double __units) const [inline]
```

Format and output a monetary value.

This function formats *units* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to \_\_s. For example, the value 1001 in a US locale would write \$10.01 to \_\_s. This function works by returning the result of do\_put().

**Parameters**

|                      |                                                   |
|----------------------|---------------------------------------------------|
| <code>__s</code>     | The stream to write to.                           |
| <code>__intl</code>  | Parameter to use_facet<moneypunct<CharT,intl>> >. |
| <code>__io</code>    | Source of facets and io state.                    |
| <code>__fill</code>  | char_type to use for padding.                     |
| <code>__units</code> | Place to store result of parsing.                 |

**Returns**

Iterator after writing.

References [do\\_put\(\)](#).

#### 6.678.1 Detailed Description

```
template<typename _CharT, bool _Intl>
class std::moneypunct<_CharT, _Intl>
```

Primary class template moneypunct.

This facet encapsulates the punctuation, grouping and other formatting features of money amount string representations.

#### 6.678.2 Member Typedef Documentation

##### char\_type

```
template<typename _CharT, bool _Intl>
typedef _CharT std::moneypunct<_CharT, _Intl>::char_type
```

Public typedefs.

## string\_type

```
template<typename _CharT, bool _Intl>
typedef basic\_string<_CharT> std::moneypunct< _CharT, _Intl >::string_type
Public typedefs.
```

### 6.678.3 Constructor & Destructor Documentation

#### **moneypunct()** [1/3]

```
template<typename _CharT, bool _Intl>
std::moneypunct< _CharT, _Intl >::moneypunct (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

##### Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

References [std::locale::facet::facet\(\)](#).

#### **moneypunct()** [2/3]

```
template<typename _CharT, bool _Intl>
std::moneypunct< _CharT, _Intl >::moneypunct (
    __cache_type * __cache,
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is an internal constructor.

##### Parameters

|                      |                                 |
|----------------------|---------------------------------|
| <code>__cache</code> | Cache for optimization.         |
| <code>__refs</code>  | Passed to the base facet class. |

References [std::locale::facet::facet\(\)](#).

#### **moneypunct()** [3/3]

```
template<typename _CharT, bool _Intl>
std::moneypunct< _CharT, _Intl >::moneypunct (
    __c_locale __cloc,
    const char * __s,
    size_t __refs = 0) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

##### Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__cloc</code> | The C locale.                   |
| <code>__s</code>    | The name of a locale.           |
| <code>__refs</code> | Passed to the base facet class. |

References [std::locale::facet::facet\(\)](#).

**~moneypunct()**

```
template<typename _CharT, bool _Intl>
virtual std::moneypunct< _CharT, _Intl >::~~moneypunct () [protected], [virtual]
Destructor.
```

**6.678.4 Member Function Documentation****curr\_symbol()**

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct< _CharT, _Intl >::curr_symbol () const [inline]
```

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. It does so by returning `moneypunct<char_↵_type>::do_curr_symbol()`.

**Returns**

*string\_type* representing a currency symbol.

References [do\\_curr\\_symbol\(\)](#).

**decimal\_point()**

```
template<typename _CharT, bool _Intl>
char_type std::moneypunct< _CharT, _Intl >::decimal_point () const [inline]
```

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `moneypunct<char_↵type>::do_decimal_point()`.

**Returns**

*char\_type* representing a decimal point.

References [do\\_decimal\\_point\(\)](#).

**do\_curr\_symbol()**

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_curr_symbol () const [inline], [protected], [virtual]
```

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. This function is a hook for derived classes to change the value returned.

**See also**

[curr\\_symbol\(\)](#) for details.

**Returns**

*string\_type* representing a currency symbol.

Referenced by [curr\\_symbol\(\)](#).

**do\_decimal\_point()**

```
template<typename _CharT, bool _Intl>
virtual char_type std::moneypunct< _CharT, _Intl >::do_decimal_point () const [inline], [protected], [virtual]
```

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a decimal point.

Referenced by [decimal\\_point\(\)](#).

**do\_frac\_digits()**

```
template<typename _CharT, bool _Intl>
virtual int std::moneypunct< _CharT, _Intl >::do_frac_digits () const [inline], [protected],
[virtual]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

**See also**

[frac\\_digits\(\)](#) for details.

**Returns**

Number of digits in amount fraction.

Referenced by [frac\\_digits\(\)](#).

**do\_grouping()**

```
template<typename _CharT, bool _Intl>
virtual string std::moneypunct< _CharT, _Intl >::do_grouping () const [inline], [protected],
[virtual]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

**See also**

[grouping\(\)](#) for details.

**Returns**

String representing grouping specification.

Referenced by [grouping\(\)](#).

**do\_neg\_format()**

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_neg_format () const [inline], [protected],
[virtual]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

**See also**

[neg\\_format\(\)](#) for details.

**Returns**

Pattern for money values.

Referenced by [neg\\_format\(\)](#).

**do\_negative\_sign()**

```
template<typename _CharT, bool _Intl>
virtual string\_type std::moneypunct< _CharT, _Intl >::do_negative_sign () const [inline], [protected],
[virtual]
```

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

**See also**

`negative_sign()` for details.

**Returns**

*string\_type* representing a negative sign.

Referenced by [negative\\_sign\(\)](#).

**do\_pos\_format()**

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_pos_format () const [inline], [protected],
[virtual]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

**See also**

`pos_format()` for details.

**Returns**

Pattern for money values.

Referenced by [pos\\_format\(\)](#).

**do\_positive\_sign()**

```
template<typename _CharT, bool _Intl>
virtual string\_type std::moneypunct< _CharT, _Intl >::do_positive_sign () const [inline], [protected],
[virtual]
```

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

**See also**

`positive_sign()` for details.

**Returns**

*string\_type* representing a positive sign.

Referenced by [positive\\_sign\(\)](#).

**do\_thousands\_sep()**

```
template<typename _CharT, bool _Intl>
virtual char_type std::moneypunct< _CharT, _Intl >::do_thousands_sep () const [inline], [protected],
[virtual]
```

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a thousands separator.

Referenced by [thousands\\_sep\(\)](#).

**frac\_digits()**

```
template<typename _CharT, bool _Intl>
int std::moneypunct< _CharT, _Intl >::frac_digits () const [inline]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning `moneypunct<char_type>::do_frac_digits()`.

The fractional part of a money amount is optional. But if it is present, there must be `frac_digits()` digits.

**Returns**

Number of digits in amount fraction.

References [do\\_frac\\_digits\(\)](#).

**grouping()**

```
template<typename _CharT, bool _Intl>
string std::moneypunct< _CharT, _Intl >::grouping () const [inline]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the `grouping()` returns `\003\002` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was 32, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `moneypunct<char_type>::do_grouping()`.

**Returns**

string representing grouping specification.

References [do\\_grouping\(\)](#).

**neg\_format()**

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct< _CharT, _Intl >::neg_format () const [inline]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field. The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

#### Returns

Pattern for money values.

References [do\\_neg\\_format\(\)](#).

### negative\_sign()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct<_CharT, _Intl>::negative_sign () const [inline]
```

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. It does so by returning `returning moneypunct<char_type>::do_negative_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `neg_format()` and the remainder appear at the end of the formatted string.

#### Returns

*string\_type* representing a negative sign.

References [do\\_negative\\_sign\(\)](#).

### pos\_format()

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct<_CharT, _Intl>::pos_format () const [inline]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `returning moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

#### Returns

Pattern for money values.

References [do\\_pos\\_format\(\)](#).

### positive\_sign()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct<_CharT, _Intl>::positive_sign () const [inline]
```

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. It does so by returning `money_punct<char_type>::do_positive_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `pos_format()` and the remainder appear at the end of the formatted string.

#### Returns

*string\_type* representing a positive sign.

References [do\\_positive\\_sign\(\)](#).

#### thousands\_sep()

```
template<typename _CharT, bool _Intl>
```

```
char_type std::money_punct<_CharT, _Intl >::thousands_sep () const [inline]
```

Return thousands separator character.

This function returns a `char_type` to use as a thousands separator. It does so by returning `money_punct<char_type>::do_thousands_sep()`.

#### Returns

`char_type` representing a thousands separator.

References [do\\_thousands\\_sep\(\)](#).

### 6.679.1 Detailed Description

```
template<typename _CharT, bool _Intl>
class std::moneypunct_byname< _CharT, _Intl >
```

class moneypunct\_byname [22.2.6.4].

### 6.679.2 Member Function Documentation

#### curr\_symbol()

```
template<typename _CharT, bool _Intl>
string\_type std::moneypunct< _CharT, _Intl >::curr_symbol () const [inline], [inherited]
```

Return currency symbol string.

This function returns a [string\\_type](#) to use as a currency symbol. It does so by returning `moneypunct<char, _Intl>::do_curr_symbol()`.

#### Returns

*string\_type* representing a currency symbol.

References [do\\_curr\\_symbol\(\)](#).

**decimal\_point()**

```
template<typename _CharT, bool _Intl>
char_type std::moneypunct< _CharT, _Intl >::decimal_point () const [inline], [inherited]
```

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `moneypunct<char_↵type>::do_decimal_point()`.

**Returns**

*char\_type* representing a decimal point.

References [do\\_decimal\\_point\(\)](#).

**do\_curr\_symbol()**

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_curr_symbol () const [inline], [protected],
[virtual], [inherited]
```

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. This function is a hook for derived classes to change the value returned.

**See also**

[curr\\_symbol\(\)](#) for details.

**Returns**

*string\_type* representing a currency symbol.

Referenced by [curr\\_symbol\(\)](#).

**do\_decimal\_point()**

```
template<typename _CharT, bool _Intl>
virtual char_type std::moneypunct< _CharT, _Intl >::do_decimal_point () const [inline], [protected],
[virtual], [inherited]
```

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a decimal point.

Referenced by [decimal\\_point\(\)](#).

**do\_frac\_digits()**

```
template<typename _CharT, bool _Intl>
virtual int std::moneypunct< _CharT, _Intl >::do_frac_digits () const [inline], [protected],
[virtual], [inherited]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

**See also**

[frac\\_digits\(\)](#) for details.

**Returns**

Number of digits in amount fraction.

Referenced by [frac\\_digits\(\)](#).

**do\_grouping()**

```
template<typename _CharT, bool _Intl>
virtual string std::moneypunct< _CharT, _Intl >::do_grouping () const [inline], [protected],
[virtual], [inherited]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

**See also**

[grouping\(\)](#) for details.

**Returns**

String representing grouping specification.

Referenced by [grouping\(\)](#).

**do\_neg\_format()**

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_neg_format () const [inline], [protected],
[virtual], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

**See also**

[neg\\_format\(\)](#) for details.

**Returns**

Pattern for money values.

Referenced by [neg\\_format\(\)](#).

**do\_negative\_sign()**

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_negative_sign () const [inline], [protected],
[virtual], [inherited]
```

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

**See also**

[negative\\_sign\(\)](#) for details.

**Returns**

*string\_type* representing a negative sign.

Referenced by [negative\\_sign\(\)](#).

**do\_pos\_format()**

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_pos_format () const [inline], [protected],
[virtual], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

**See also**

`pos_format()` for details.

**Returns**

Pattern for money values.

Referenced by [pos\\_format\(\)](#).

**do\_positive\_sign()**

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_positive_sign () const [inline], [protected],
[virtual], [inherited]
```

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

**See also**

`positive_sign()` for details.

**Returns**

*string\_type* representing a positive sign.

Referenced by [positive\\_sign\(\)](#).

**do\_thousands\_sep()**

```
template<typename _CharT, bool _Intl>
virtual char_type std::moneypunct< _CharT, _Intl >::do_thousands_sep () const [inline], [protected],
[virtual], [inherited]
```

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a thousands separator.

Referenced by [thousands\\_sep\(\)](#).

**frac\_digits()**

```
template<typename _CharT, bool _Intl>
int std::moneypunct< _CharT, _Intl >::frac_digits () const [inline], [inherited]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning `std::moneypunct<char_type>::do_frac_digits()`.

The fractional part of a money amount is optional. But if it is present, there must be `frac_digits()` digits.

### Returns

Number of digits in amount fraction.

References [do\\_frac\\_digits\(\)](#).

### grouping()

```
template<typename _CharT, bool _Intl>
string std::moneypunct< _CharT, _Intl >::grouping () const [inline], [inherited]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the `grouping()` returns `\003\002` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was 32, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `moneypunct<char_type>::do_grouping()`.

### Returns

string representing grouping specification.

References [do\\_grouping\(\)](#).

### neg\_format()

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct< _CharT, _Intl >::neg_format () const [inline], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

### Returns

Pattern for money values.

References [do\\_neg\\_format\(\)](#).

### negative\_sign()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct< _CharT, _Intl >::negative_sign () const [inline], [inherited]
```

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. It does so by returning `moneypunct<char_type>::do_negative_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `neg_format()` and the remainder appear at the end of the formatted string.

**Returns**

*string\_type* representing a negative sign.

References [do\\_negative\\_sign\(\)](#).

**pos\_format()**

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct<_CharT, _Intl >::pos_format () const [inline], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

**Returns**

Pattern for money values.

References [do\\_pos\\_format\(\)](#).

**positive\_sign()**

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct<_CharT, _Intl >::positive_sign () const [inline], [inherited]
```

Return positive sign string.

This function returns a *string\_type* to use as a sign for positive amounts. It does so by returning `moneypunct<char_type>::do_positive_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `pos_format()` and the remainder appear at the end of the formatted string.

**Returns**

*string\_type* representing a positive sign.

References [do\\_positive\\_sign\(\)](#).

**thousands\_sep()**

```
template<typename _CharT, bool _Intl>
char_type std::moneypunct<_CharT, _Intl >::thousands_sep () const [inline], [inherited]
```

Return thousands separator character.

This function returns a *char\_type* to use as a thousands separator. It does so by returning `moneypunct<char_type>::do_thousands_sep()`.

**Returns**

*char\_type* representing a thousands separator.

References [do\\_thousands\\_sep\(\)](#).

### 6.680.1 Detailed Description

A memory resource that allocates from a fixed-size buffer.

The main feature of a `pmr::monotonic_buffer_resource` is that its `do_deallocate` does nothing. This makes it very fast because there is no need to manage a free list, and every allocation simply returns a new block of memory, rather than searching for a suitably-sized free block. Because deallocating is a no-op, the amount of memory used by the resource only grows until `release()` (or the destructor) is called to return all memory to upstream.

A `monotonic_buffer_resource` can be initialized with a buffer that will be used to satisfy all allocation requests, until the buffer is full. After that a new buffer will be allocated from the upstream resource. By using a stack buffer and `pmr::null_memory_resource()` as the upstream you can get a memory resource that only uses the stack and never dynamically allocates.

Since

C++17

### 6.680.2 Member Function Documentation

#### `do_allocate()`

```
void * std::pmr::monotonic_buffer_resource::do_allocate (
    size_t __bytes,
    size_t __alignment) [inline], [override], [protected], [virtual]
```

Implements [std::pmr::memory\\_resource](#).

#### `do_deallocate()`

```
void std::pmr::monotonic_buffer_resource::do_deallocate (
    void * ,
    size_t ,
    size_t ) [inline], [override], [protected], [virtual]
```

Implements [std::pmr::memory\\_resource](#).

#### `do_is_equal()`

```
bool std::pmr::monotonic_buffer_resource::do_is_equal (
    const memory\_resource & __other) const [inline], [override], [protected], [virtual],
[noexcept]
```

Implements [std::pmr::memory\\_resource](#).

### 6.681.1 Detailed Description

`template<typename _Iterator>`  
**class** `std::move_iterator< _Iterator >`

An iterator adaptor that yields an rvalue reference.

Class template `move_iterator` is an iterator adapter with the same behavior as the underlying iterator except that its dereference operator implicitly converts the value returned by the underlying iterator's dereference operator to an rvalue reference. Some generic algorithms can be called with move iterators to replace copying with moving.

The documentation for this class was generated from the following file:

- [bits/stl\\_iterator.h](#)

#### 6.682.1 Detailed Description

```
template<typename _Res, typename... _ArgTypes, bool _Noex>  
class std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>
```

Polymorphic function wrapper.

Since

C++23

The `std::move_only_function` class template is a call wrapper similar to `std::function`, but does not require the stored target function to be copyable.

It also supports const-qualification, ref-qualification, and no-throw guarantees. The qualifications and exception-specification of the `move_only_function::operator()` member function are respected when invoking the target function.

## 6.682.2 Constructor & Destructor Documentation

### `move_only_function()` [1/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
() [inline], [noexcept]
```

Creates an empty object.

References [move\\_only\\_function\(\)](#).

Referenced by [move\\_only\\_function\(\)](#), [move\\_only\\_function\(\)](#), [move\\_only\\_function\(\)](#), [move\\_only\\_function\(\)](#), [move\\_only\\_function\(\)](#), [move\\_only\\_function\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [swap\(\)](#), and [swap\(\)](#).

### `move_only_function()` [2/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
(
    nullptr_t ) [inline], [noexcept]
```

Creates an empty object.

References [move\\_only\\_function\(\)](#).

### `move_only_function()` [3/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
(
    move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> && __x)
[inline], [noexcept]
```

Moves the target object, leaving the source empty.

References [move\\_only\\_function\(\)](#).

### `move_only_function()` [4/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Fn, typename _Vt = decay_t<_Fn>>
requires (!is_same_v<_Vt, move_only_function>) && (!__is_in_place_type_v<_Vt>) && __is_callable<
_from<_Vt>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
(
    _Fn && __f) [inline], [noexcept]
```

Stores a target object initialized from the argument.

References [move\\_only\\_function\(\)](#), and [std::forward\(\)](#).

### `move_only_function()` [5/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Tp, typename... _Args>
```

```
requires is_constructible_v<_Tp, _Args...> && __is_callable_from<_Tp>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
(
    in_place_type_t< _Tp > ,
    _Args &&... __args) [inline], [explicit], [noexcept]
```

Stores a target object initialized from the arguments.

References [move\\_only\\_function\(\)](#), and [std::forward\(\)](#).

### **move\_only\_function()** [6/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Tp, typename _Up, typename... _Args>
requires is_constructible_v<_Tp, initializer_list<_Up>&, _Args...> && __is_callable_from<_Tp>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
(
    in_place_type_t< _Tp > ,
    initializer_list<_Up> __il,
    _Args &&... __args) [inline], [explicit], [noexcept]
```

Stores a target object initialized from the arguments.

References [move\\_only\\_function\(\)](#), and [std::forward\(\)](#).

## **6.682.3 Member Function Documentation**

### **operator bool()**

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator bool ()
const [inline], [explicit], [noexcept]
```

True if a target object is present, false otherwise.

### **operator()()**

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
_Res std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator() (
    _ArgTypes... __args) [inline], [noexcept]
```

Invoke the target object.

The target object will be invoked using the supplied arguments, and as an lvalue or rvalue, and as const or non-const, as dictated by the template arguments of the `move_only_function` specialization.

#### **Precondition**

Must not be empty.

References [std::forward\(\)](#), and [operator\(\)\(\)](#).

Referenced by [operator\(\)\(\)](#).

### **operator=()** [1/3]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Fn>
requires is_constructible_v<move_only_function, _Fn>
move_only_function & std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_↵
Noex)>::operator= (
    _Fn && __f) [inline], [noexcept]
```

Stores a new target object, initialized from the argument.

References [move\\_only\\_function\(\)](#), [std::forward\(\)](#), and [operator=\(\)](#).

**operator=()** [2/3]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
move_only_function & std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_↵
Noex)>::operator= (
    move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> && __x)
[inline], [noexcept]
```

Stores a new target object, leaving `x` empty.

References [move\\_only\\_function\(\)](#), [std::addressof\(\)](#), and [operator=\(\)](#).

Referenced by [operator=\(\)](#), [operator=\(\)](#), and [operator=\(\)](#).

**operator=()** [3/3]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
move_only_function & std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_↵
Noex)>::operator= (
    nullptr_t ) [inline], [noexcept]
```

Destroys the target object (if any).

References [move\\_only\\_function\(\)](#), and [operator=\(\)](#).

**swap()**

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
void std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::swap (
    move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __x)
[inline], [noexcept]
```

Exchange the target objects (if any).

References [move\\_only\\_function\(\)](#), and [swap\(\)](#).

Referenced by [swap\(\)](#), and [swap\(\)](#).

**6.682.4 Friends And Related Symbol Documentation****operator==**

```

### 6.683.1 Detailed Description

```
template<semiregular _Sent>
class std::move_sentinel<_Sent>
```

A sentinel adaptor for use with std::move\_iterator.

The documentation for this class was generated from the following file:

- [bits/stl\\_iterator.h](#)

## 6.684 std::\_\_debug::multimap<\_Key, \_Tp, \_Compare, \_Allocator> Class Template Reference

```
#include <multimap.h>
```

Inheritance diagram for std::\_\_debug::multimap<\_Key, \_Tp, \_Compare, \_Allocator>:

### Public Types

- typedef \_Allocator **allocator\_type**
- typedef [\\_\\_gnu\\_debug::\\_Safe\\_iterator](#)<\_Base\_const\_iterator, [multimap](#)> **const\_iterator**
- typedef \_Base::const\_pointer **const\_pointer**

### 6.685.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::
allocator<std::pair<const _Key, _Tp> >>
class std::multimap< _Key, _Tp, _Compare, _Alloc >
```

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

Since

C++98

### Template Parameters

|                       |                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------|
| <code>_Key</code>     | Type of key objects.                                                                |
| <code>_Tp</code>      | Type of mapped objects.                                                             |
| <code>_Compare</code> | Comparison function object type, defaults to <code>less&lt;_Key&gt;</code> .        |
| <code>_Alloc</code>   | Allocator type, defaults to <code>allocator&lt;pair&lt;const _Key, _Tp&gt;</code> . |

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using equivalent keys). For a `multimap<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `std::pair<const Key,T>`.

Multimaps support bidirectional iterators.

The private tree data is declared exactly the same way for `map` and `multimap`; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

### 6.685.2 Constructor & Destructor Documentation

#### `multimap()` [1/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap () [default]
```

Default constructor creates no elements.

**multimap()** [2/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a multimap with no elements.

**Parameters**

|                     |                      |
|---------------------|----------------------|
| <code>__comp</code> | A comparison object. |
| <code>__a</code>    | An allocator object. |

**multimap()** [3/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (
    const multimap<_Key, _Tp, _Compare, _Alloc> & ) [default]
```

Multimap copy constructor.

Whether the allocator is copied depends on the allocator traits.

**multimap()** [4/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (
    multimap<_Key, _Tp, _Compare, _Alloc> && ) [default]
```

Multimap move constructor.

The newly-created multimap contains the exact contents of the moved instance. The moved instance is a valid, but unspecified multimap.

**multimap()** [5/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (
    initializer_list<value_type> & __l,
    const _Compare & __comp = _Compare(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a multimap from an initializer\_list.

**Parameters**

|                     |                       |
|---------------------|-----------------------|
| <code>__l</code>    | An initializer_list.  |
| <code>__comp</code> | A comparison functor. |
| <code>__a</code>    | An allocator object.  |

Create a multimap consisting of copies of the elements from the initializer\_list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is `__l.size()`).

**multimap()** [6/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    const allocator_type & __a) [inline], [explicit]
```

Allocator-extended default constructor.

**multimap()** [7/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    const multimap< _Key, _Tp, _Compare, _Alloc > & __m,
    const __type_identity_t< allocator_type > & __a) [inline]
```

Allocator-extended copy constructor.

**multimap()** [8/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    multimap< _Key, _Tp, _Compare, _Alloc > && __m,
    const __type_identity_t< allocator_type > & __a) [inline], [noexcept]
```

Allocator-extended move constructor.

**multimap()** [9/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    initializer_list< value_type > __l,
    const allocator_type & __a) [inline]
```

Allocator-extended initializer-list constructor.

**multimap()** [10/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a) [inline]
```

Allocator-extended range constructor.

**multimap()** [11/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Builds a multimap from a range.

## Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

Create a multimap consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

**multimap()** [12/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::multimap<_Key, _Tp, _Compare, _Alloc >::multimap (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a multimap from a range.

## Parameters

|                      |                       |
|----------------------|-----------------------|
| <code>__first</code> | An input iterator.    |
| <code>__last</code>  | An input iterator.    |
| <code>__comp</code>  | A comparison functor. |
| <code>__a</code>     | An allocator object.  |

Create a multimap consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

**~multimap()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap<_Key, _Tp, _Compare, _Alloc >::~~multimap () [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**6.685.3 Member Function Documentation****begin()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

**begin()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

**cbegin()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

**cend()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

**clear()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::multimap<_Key, _Tp, _Compare, _Alloc>::clear () [inline], [noexcept]
```

Erases all elements in a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt>
auto std::multimap<_Key, _Tp, _Compare, _Alloc>::contains (
    const _Kt & __x) const -> decltype(_M_t._M_find_tr(__x), void()), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                                                                                                      |                                          |
|------------------------------------------------------------------------------------------------------|------------------------------------------|
|  <code>__x</code> | Key of (key, value) pairs to be located. |
|------------------------------------------------------------------------------------------------------|------------------------------------------|

**Returns**

True if there is any element with the specified key.

**contains()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
bool std::multimap<_Key, _Tp, _Compare, _Alloc>::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                                                                                                      |                                          |
|------------------------------------------------------------------------------------------------------|------------------------------------------|
|  <code>__x</code> | Key of (key, value) pairs to be located. |
|------------------------------------------------------------------------------------------------------|------------------------------------------|

**Returns**

True if there is any element with the specified key.

**count()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap<_Key, _Tp, _Compare, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements with given key.

**Parameters**

|                  |                                          |
|------------------|------------------------------------------|
| <code>__x</code> | Key of (key, value) pairs to be located. |
|------------------|------------------------------------------|

**Returns**

Number of elements with specified key.

**crbegin()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::crbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

**crend()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::crend () const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

**emplace()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Build and insert a std::pair into the multimap.

**Parameters**

|                     |                                                                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__args</code> | Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor). |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------|

**Returns**

An iterator that points to the inserted (key,value) pair.

This function builds and inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

**emplace\_hint()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Builds and inserts a `std::pair` into the multimap.

**Parameters**

|                     |                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the pair should be inserted.                                                                             |
| <code>__args</code> | Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor). |

**Returns**

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

**empty()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
bool std::multimap<_Key, _Tp, _Compare, _Alloc>::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the multimap is empty.

**end() [1/2]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

**end() [2/2]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

**equal\_range()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::pair< iterator, iterator > std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_range (
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                  |                                          |
|------------------|------------------------------------------|
| <code>__x</code> | Key of (key, value) pairs to be located. |
|------------------|------------------------------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

**equal\_range()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::pair< const_iterator, const_iterator > std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                  |                                          |
|------------------|------------------------------------------|
| <code>__x</code> | Key of (key, value) pairs to be located. |
|------------------|------------------------------------------|

**Returns**

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

**erase()** [1/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                    |                              |
|--------------------|------------------------------|
| <code>__key</code> | Key of element to be erased. |
| <code>__x</code>   |                              |

**Returns**

The number of elements erased.

This function erases all elements located by the given key from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase() [2/4]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [first,last) range of elements from a multimap.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased .  |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase() [3/4]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from a multimap.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [4/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
_GLIBCXX_ABI_TAG_CXX11 iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
    iterator __position) [inline]
```

Erases an element from a multimap.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::find (
    const key_type & __x) [inline]
```

Tries to locate an element in a multimap.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

**find()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in a multimap.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

**Returns**

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**get\_allocator()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
allocator_type std::multimap< _Key, _Tp, _Compare, _Alloc >::get_allocator () const [inline],
[noexcept]
```

Get a copy of the memory allocation object.

**insert() [1/8]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
void std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

**Parameters**

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

**insert() [2/8]**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair >::value, iterator > std::multimap< _Key, _Tp,
_Tp, _Compare, _Alloc >::insert (
    _Pair && __x) [inline]
```

Inserts a `std::pair` into the multimap.

**Parameters**

|                  |                                                                                   |
|------------------|-----------------------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |
|------------------|-----------------------------------------------------------------------------------|

**Returns**

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

**insert()** [3/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::insert (
    const value_type & __x) [inline]
```

Inserts a std::pair into the multimap.

**Parameters**

|                  |                                                                      |
|------------------|----------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see std::make_pair for easy creation of pairs). |
|------------------|----------------------------------------------------------------------|

**Returns**

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

Referenced by `std::multimap<_Key, _Tp, _Cmp, polymorphic_allocator<pair<const _Key, _Tp>>>::insert()`.

**insert()** [4/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair>
__enable_if_t<is_constructible<value_type, _Pair &&>::value, iterator> std::multimap<_Key,
_Tp, _Compare, _Alloc>::insert (
    const_iterator __position,
    _Pair && __x) [inline]
```

Inserts a std::pair into the multimap.

**Parameters**

|                         |                                                                            |
|-------------------------|----------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the pair should be inserted. |
| <code>__x</code>        | Pair to be inserted (see std::make_pair for easy creation of pairs).       |

**Returns**

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

**insert()** [5/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::insert (
    const_iterator __position,
    const value_type & __x) [inline]
```

Inserts a std::pair into the multimap.

## Parameters

|                         |                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>        | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

## Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

**insert()** [6/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    const_iterator __position,
    value_type && __x) [inline]
```

Inserts a `std::pair` into the multimap.

## Parameters

|                         |                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>        | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

## Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

**insert()** [7/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of `std::pairs` into the multimap.

## Parameters

|                                                                                   |                                                              |
|-----------------------------------------------------------------------------------|--------------------------------------------------------------|
|  | A std::initializer_list<value_type> of pairs to be inserted. |
|  |                                                              |
|  |                                                              |
|  |                                                              |
|  |                                                              |

Complexity similar to that of the range constructor.

**insert()** [8/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    value_type && __x) [inline]
```

Inserts a std::pair into the multimap.

## Parameters

|                                                                                   |                                                                      |
|-----------------------------------------------------------------------------------|----------------------------------------------------------------------|
|  | Pair to be inserted (see std::make_pair for easy creation of pairs). |
|  |                                                                      |

## Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

**key\_comp()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
key_compare std::multimap< _Key, _Tp, _Compare, _Alloc >::key_comp () const [inline]
```

Returns the key comparison object out of which the multimap was constructed.

**lower\_bound()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (
    const key_type & __x) [inline]
```

Finds the beginning of a subsequence matching given key.

## Parameters

|                                                                                     |                                         |
|-------------------------------------------------------------------------------------|-----------------------------------------|
|  | Key of (key, value) pair to be located. |
|  |                                         |

## Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

**lower\_bound()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (
    const key_type & __x) const [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

**Returns**

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful the iterator will point to the next greatest element or, if no such greater element exists, to end().

**max\_size()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the maximum size of the multimap.

**operator=()** [1/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
multimap & std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
    const multimap< _Key, _Tp, _Compare, _Alloc > & ) [default]
```

Multimap assignment operator.

Whether the allocator is copied depends on the allocator traits.

**operator=()** [2/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
multimap & std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Multimap list assignment operator.

**Parameters**

|                  |                      |
|------------------|----------------------|
| <code>__l</code> | An initializer_list. |
|------------------|----------------------|

This function fills a multimap with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the multimap and that the resulting multimap's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
multimap & std::multimap<_Key, _Tp, _Compare, _Alloc>::operator= (
    multimap<_Key, _Tp, _Compare, _Alloc> && ) [default]
```

Move assignment operator.

**rbegin()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
const_reverse_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::rbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

**rbegin()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
reverse_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::rbegin () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

**rend()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
const_reverse_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::rend () const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

**rend()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
reverse_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::rend () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

**size()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
size_type std::multimap<_Key, _Tp, _Compare, _Alloc>::size () const [inline], [noexcept]
```

Returns the size of the multimap.

**swap()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
void std::multimap<_Key, _Tp, _Compare, _Alloc>::swap (
    multimap<_Key, _Tp, _Compare, _Alloc> & __x) [inline], [noexcept]
```

Swaps data with another multimap.

## Parameters

|                                                                                                   |                                                     |
|---------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| <a href="#"></a> | A multimap of the same element and allocator types. |
| <a href="#"></a> |                                                     |

This exchanges the elements between two multimaps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Referenced by [std::swap\(\)](#).

**upper\_bound()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
    const key_type & __x) [inline]
```

Finds the end of a subsequence matching given key.

## Parameters

|                                                                                                   |                                         |
|---------------------------------------------------------------------------------------------------|-----------------------------------------|
| <a href="#"></a> | Key of (key, value) pair to be located. |
| <a href="#"></a> |                                         |

## Returns

Iterator pointing to the first element greater than key, or end().

**upper\_bound()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
    const key_type & __x) const [inline]
```

Finds the end of a subsequence matching given key.

## Parameters

|                                                                                                     |                                         |
|-----------------------------------------------------------------------------------------------------|-----------------------------------------|
| <a href="#"></a> | Key of (key, value) pair to be located. |
| <a href="#"></a> |                                         |

## Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

**value\_comp()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
value_compare std::multimap< _Key, _Tp, _Compare, _Alloc >::value_comp () const [inline]
```

Returns a value comparison object, built from the key comparison object out of which the multimap was constructed.

### 6.689.1 Detailed Description

**template**<typename `_Key`, typename `_Compare` = `std::less`<`_Key`>, typename `_Alloc` = `std::allocator`<`_Key`>>  
**class** `std::multiset`< `_Key`, `_Compare`, `_Alloc` >

A standard container made up of elements, which can be retrieved in logarithmic time.

Since

C++98

### Template Parameters

|                       |                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------|
| <code>_Key</code>     | Type of key objects.                                                                  |
| <code>_Compare</code> | Comparison function object type, defaults to <code>less</code> < <code>_Key</code> >. |
| <code>_Alloc</code>   | Allocator type, defaults to <code>allocator</code> < <code>_Key</code> >.             |

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using equivalent keys). For a `multiset`<`Key`> the `key_type` and `value_type` are `Key`.

Multisets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

### 6.689.2 Constructor & Destructor Documentation

#### `multiset()` [1/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset () [default]
```

Default constructor creates no elements.

**multiset()** [2/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a multiset with no elements.

**Parameters**

|                     |                      |
|---------------------|----------------------|
| <code>__comp</code> | Comparator to use.   |
| <code>__a</code>    | An allocator object. |

**multiset()** [3/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Builds a multiset from a range.

**Parameters**

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

Create a multiset consisting of copies of the elements from [first,last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(\_\_first,\_\_last)).

**multiset()** [4/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a multiset from a range.

**Parameters**

|                      |                       |
|----------------------|-----------------------|
| <code>__first</code> | An input iterator.    |
| <code>__last</code>  | An input iterator.    |
| <code>__comp</code>  | A comparison functor. |
| <code>__a</code>     | An allocator object.  |

Create a multiset consisting of copies of the elements from [\_\_first,\_\_last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(\_\_first,\_\_last)).

**multiset()** [5/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    const multiset< _Key, _Compare, _Alloc > & ) [default]
```

Multiset copy constructor.

Whether the allocator is copied depends on the allocator traits.

**multiset()** [6/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    multiset< _Key, _Compare, _Alloc > && ) [default]
```

Multiset move constructor.

The newly-created multiset contains the exact contents of the moved instance. The moved instance is a valid, but unspecified multiset.

**multiset()** [7/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    initializer_list< value_type > __l,
    const _Compare & __comp = _Compare(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a multiset from an `initializer_list`.

**Parameters**

|                     |                                    |
|---------------------|------------------------------------|
| <code>__l</code>    | An <code>initializer_list</code> . |
| <code>__comp</code> | A comparison functor.              |
| <code>__a</code>    | An allocator object.               |

Create a multiset consisting of copies of the elements from the list. This is linear in  $N$  if the list is already sorted, and  $N \log N$  otherwise (where  $N$  is `__l.size()`).

**multiset()** [8/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    const allocator_type & __a) [inline], [explicit]
```

Allocator-extended default constructor.

**multiset()** [9/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    const multiset< _Key, _Compare, _Alloc > & __m,
    const __type_identity_t< allocator_type > & __a) [inline]
```

Allocator-extended copy constructor.

**multiset()** [10/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc>::multiset (
    multiset<_Key, _Compare, _Alloc> && __m,
    const __type_identity_t< allocator_type > & __a) [inline], [noexcept]
```

Allocator-extended move constructor.

**multiset()** [11/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc>::multiset (
    initializer_list< value_type > __l,
    const allocator_type & __a) [inline]
```

Allocator-extended initializer-list constructor.

**multiset()** [12/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator>
std::multiset<_Key, _Compare, _Alloc>::multiset (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a) [inline]
```

Allocator-extended range constructor.

**~multiset()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc>::~~multiset () [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**6.689.3 Member Function Documentation****begin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset<_Key, _Compare, _Alloc>::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

**cbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset<_Key, _Compare, _Alloc>::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

**cend()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>>
```

```
iterator std::multiset< _Key, _Compare, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

**clear()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>>
```

```
void std::multiset< _Key, _Compare, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains() [1/2]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>>
```

```
template<typename _Kt>
```

```
auto std::multiset< _Key, _Compare, _Alloc >::contains (  
    const _Kt & __x) const -> decltype(_M_t._M_find_tr(__x), void(), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                       |                                |
|-----------------------|--------------------------------|
| <code>↵<br/>_x</code> | Key of elements to be located. |
|-----------------------|--------------------------------|

**Returns**

True if there is any element with the specified key.

**contains() [2/2]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>>
```

```
bool std::multiset< _Key, _Compare, _Alloc >::contains (  
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                       |                                |
|-----------------------|--------------------------------|
| <code>↵<br/>_x</code> | Key of elements to be located. |
|-----------------------|--------------------------------|

**Returns**

True if there is any element with the specified key.

**count()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::multiset<_Key, _Compare, _Alloc>::count (
    const key_type & __x) const [inline]
```

Finds the number of elements with given key.

**Parameters**

|                  |                                |
|------------------|--------------------------------|
| <code>__x</code> | Key of elements to be located. |
|------------------|--------------------------------|

**Returns**

Number of elements with specified key.

**crbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset<_Key, _Compare, _Alloc>::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

**crend()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset<_Key, _Compare, _Alloc>::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

**emplace()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args>
```

```
iterator std::multiset<_Key, _Compare, _Alloc>::emplace (
    _Args &&... __args) [inline]
```

Builds and inserts an element into the multiset.

**Parameters**

|                     |                                                                 |
|---------------------|-----------------------------------------------------------------|
| <code>__args</code> | Arguments used to generate the element instance to be inserted. |
|---------------------|-----------------------------------------------------------------|

**Returns**

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

**emplace\_hint()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args>
iterator std::multiset< _Key, _Compare, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Builds and inserts an element into the multiset.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__args</code> | Arguments used to generate the element instance to be inserted.               |

**Returns**

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

**empty()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
bool std::multiset< _Key, _Compare, _Alloc >::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the set is empty.

**end()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

**equal\_range()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair< iterator, iterator > std::multiset< _Key, _Compare, _Alloc >::equal_range (
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

**equal\_range()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::pair< const_iterator, const_iterator > std::multiset< _Key, _Compare, _Alloc >::equal_range
(
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                                    |                    |
|------------------------------------|--------------------|
| <code>↵</code><br><code>__x</code> | Key to be located. |
|------------------------------------|--------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

**erase()** [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                                    |                              |
|------------------------------------|------------------------------|
| <code>↵</code><br><code>__x</code> | Key of element to be erased. |
|------------------------------------|------------------------------|

**Returns**

The number of elements erased.

This function erases all elements located by the given key from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::multiset< _Key, _Compare, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [first,last) range of elements from a multiset.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator *last*.

This function erases a sequence of elements from a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::multiset< _Key, _Compare, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from a multiset.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::find (
    const key_type & __x) [inline]
```

Tries to locate an element in a set.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__x</code> | Element to be located. |
|------------------|------------------------|

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

**find()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in a set.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__x</code> | Element to be located. |
|------------------|------------------------|

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

**get\_allocator()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
allocator_type std::multiset< _Key, _Compare, _Alloc >::get_allocator () const [inline], [noexcept]
```

Returns the memory allocation object.

**insert()** [1/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator>
void std::multiset< _Key, _Compare, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that tries to insert a range of elements.

**Parameters**

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

**insert()** [2/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
iterator std::multiset< _Key, _Compare, _Alloc >::insert (  
    const value_type & __x) [inline]
```

Inserts an element into the multiset.

**Parameters**

|                  |                         |
|------------------|-------------------------|
| <code>↵</code>   | Element to be inserted. |
| <code>__x</code> |                         |

**Returns**

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

Referenced by [std::multiset< \\_Key, \\_Cmp, polymorphic\\_allocator< \\_Key > >::insert\(\)](#).

**insert() [3/4]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::insert (
    const_iterator __position,
    const value_type & __x) [inline]
```

Inserts an element into the multiset.

**Parameters**

|                         |                                                                               |
|-------------------------|-------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>        | Element to be inserted.                                                       |

**Returns**

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

**insert() [4/4]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
void std::multiset< _Key, _Compare, _Alloc >::insert (
    initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of elements into the multiset.

**Parameters**

|                  |                                                                                    |
|------------------|------------------------------------------------------------------------------------|
| <code>↵</code>   | A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted. |
| <code>__↵</code> |                                                                                    |
| <code>↵</code>   |                                                                                    |
| <code>__↵</code> |                                                                                    |
| <code>/</code>   |                                                                                    |

Complexity similar to that of the range constructor.

**key\_comp()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
key_compare std::multiset< _Key, _Compare, _Alloc >::key_comp () const [inline]
```

Returns the comparison object.

**lower\_bound()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound (
    const key_type & __x) [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>↵</code>   | Key to be located. |
| <code>__x</code> |                    |

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

**lower\_bound()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
const_iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound (
    const key_type & __x) const [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>↵</code>   | Key to be located. |
| <code>__x</code> |                    |

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

**max\_size()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
size_type std::multiset< _Key, _Compare, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the maximum size of the set.

**operator=()** [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
multiset & std::multiset< _Key, _Compare, _Alloc >::operator= (
    const multiset< _Key, _Compare, _Alloc > & ) [default]
```

Multiset assignment operator.

Whether the allocator is copied depends on the allocator traits.

**operator=()** [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
multiset & std::multiset< _Key, _Compare, _Alloc >::operator= (
    initializer_list< value_type > __l ) [inline]
```

Multiset list assignment operator.

**Parameters**

|   |                      |
|---|----------------------|
| ↵ | An initializer_list. |
| ↵ |                      |
| ↵ |                      |
| ↵ |                      |
| / |                      |

This function fills a multiset with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the multiset and that the resulting multiset's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
multiset & std::multiset< _Key, _Compare, _Alloc >::operator= (
    multiset< _Key, _Compare, _Alloc > && ) [default]
```

Move assignment operator.

**rbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

**rend()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

**size()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
size_type std::multiset< _Key, _Compare, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the set.

**swap()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
void std::multiset< _Key, _Compare, _Alloc >::swap (
    multiset< _Key, _Compare, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another multiset.

**Parameters**

|                                    |                                                     |
|------------------------------------|-----------------------------------------------------|
| <code>↵</code><br><code>__x</code> | A multiset of the same element and allocator types. |
|------------------------------------|-----------------------------------------------------|

This exchanges the elements between two multisets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Referenced by [std::swap\(\)](#).

**upper\_bound() [1/2]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
iterator std::multiset< _Key, _Compare, _Alloc >::upper_bound (
    const key_type & __x) [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

|                                    |                    |
|------------------------------------|--------------------|
| <code>↵</code><br><code>__x</code> | Key to be located. |
|------------------------------------|--------------------|

**Returns**

Iterator pointing to the first element greater than key, or `end()`.

**upper\_bound() [2/2]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
const_iterator std::multiset< _Key, _Compare, _Alloc >::upper_bound (
    const key_type & __x) const [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

|                                    |                    |
|------------------------------------|--------------------|
| <code>↵</code><br><code>__x</code> | Key to be located. |
|------------------------------------|--------------------|

**Returns**

Iterator pointing to the first element greater than key, or end().

**value\_comp()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
value_compare std::multiset< _Key, _Compare, _Alloc >::value_comp () const [inline]
```

Returns the comparison object.

### 6.696.1 Detailed Description

**template<typename \_IntType = int>**

**class std::negative\_binomial\_distribution< \_IntType >**

A [negative\\_binomial\\_distribution](#) random number distribution.

The formula for the negative binomial probability mass function is  $p(i) = \binom{n}{i} p^i (1-p)^{t-i}$  where  $t$  and  $p$  are the parameters of the distribution.

Since

C++11

## 6.696.2 Member Typedef Documentation

### result\_type

```
template<typename _IntType = int>
```

```
typedef _IntType std::negative_binomial_distribution< _IntType >::result_type
```

The type of the range of the distribution.

## 6.696.3 Member Function Documentation

### k()

```
template<typename _IntType = int>
```

```
_IntType std::negative_binomial_distribution< _IntType >::k () const [inline]
```

Return the  $k$  parameter of the distribution.

### max()

```
template<typename _IntType = int>
```

```
result_type std::negative_binomial_distribution< _IntType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

### min()

```
template<typename _IntType = int>
```

```
result_type std::negative_binomial_distribution< _IntType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

### operator>()

```
template<typename _IntType>
```

```
template<typename _UniformRandomNumberGenerator>
```

```
negative_binomial_distribution< _IntType >::result_type std::negative_binomial_distribution< _↵
```

```
_IntType >::operator() (
```

```
    _UniformRandomNumberGenerator & __urng)
```

Generating functions.

### p()

```
template<typename _IntType = int>
```

```
double std::negative_binomial_distribution< _IntType >::p () const [inline]
```

Return the  $p$  parameter of the distribution.

### param() [1/2]

```
template<typename _IntType = int>
```

```
param_type std::negative_binomial_distribution< _IntType >::param () const [inline]
```

Returns the parameter set of the distribution.

### param() [2/2]

```
template<typename _IntType = int>
```

```
void std::negative_binomial_distribution< _IntType >::param (
```

```
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

## Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _IntType = int>
void std::negative_binomial_distribution< _IntType >::reset () [inline]
Resets the distribution state.
```

**6.696.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::negative_binomial_distribution< _IntType1 > & __x) [friend]
Inserts a negative_binomial_distribution random number distribution __x into the output stream __os.
```

## Parameters

|                   |                                                              |
|-------------------|--------------------------------------------------------------|
| <code>__os</code> | An output stream.                                            |
| <code>__x</code>  | A negative_binomial_distribution random number distribution. |

## Returns

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _IntType = int>
bool operator== (
    const negative_binomial_distribution< _IntType > & __d1,
    const negative_binomial_distribution< _IntType > & __d2) [friend]
```

Return true if two negative binomial distributions have the same parameters and the sequences that would be generated are equal.

**operator>>**

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::negative_binomial_distribution< _IntType1 > & __x) [friend]
Extracts a negative_binomial_distribution random number distribution __x from the input stream __is.
```

## Parameters

|                   |                  |
|-------------------|------------------|
| <code>__is</code> | An input stream. |
|-------------------|------------------|

|                  |                                                                  |
|------------------|------------------------------------------------------------------|
| <code>_↵</code>  | A negative_binomial_distribution random number generator engine. |
| <code>__X</code> |                                                                  |

#### Returns

The input stream with `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

- void [rethrow\\_nested](#) () const

#### 6.697.1 Detailed Description

Mixin class that stores the current exception.

This type can be used via `std::throw_with_nested` to store the current exception nested within another exception.

Since

C++11

See also

`std::throw_with_nested`

#### 6.697.2 Constructor & Destructor Documentation

##### `nested_exception()`

```
std::nested_exception::nested_exception () [inline], [noexcept]
```

The default constructor stores the current exception (if any).

References [std::current\\_exception\(\)](#).

#### 6.697.3 Member Function Documentation

##### `nested_ptr()`

```
exception\_ptr std::nested_exception::nested_ptr () const [inline], [noexcept]
```

Access the stored exception.

**rethrow\_nested()**

```
void std::nested_exception::rethrow_nested () const [inline]
```

Rethrow the stored exception, or terminate if none was stored.

References [std::rethrow\\_exception\(\)](#), and [std::terminate\(\)](#).

- typedef std::size\_t **size\_type**
- typedef \_Tp **value\_type**

### Public Member Functions

- **new\_allocator** (const [new\\_allocator](#) &) noexcept
- template<typename \_Tp1>  
  **new\_allocator** (const [new\\_allocator](#)<\_Tp1> &) noexcept
- \_Tp \* **allocate** (size\_type \_\_n, const void \* \_\_p) noexcept
- void **deallocate** (\_Tp \* \_\_p, size\_type \_\_n)

#### 6.700.1 Detailed Description

```
template<typename _Tp>
class __gnu_cxx::new_allocator<_Tp>
```

An allocator that uses global `new`, as per C++03 [20.4.1].  
This is precisely the allocator defined in the C++ Standard.

- all allocation calls `operator new`
- all deallocation calls `operator delete`

This is a non-standard extension that can be used to guarantee allocation from `new` even if the library has been configured to use a different implementation for `std::allocator`.

#### Template Parameters

|                  |                           |
|------------------|---------------------------|
| <code>_Tp</code> | Type of allocated object. |
|------------------|---------------------------|

`std::basic_istream< _CharT, _Traits > & operator>> (std::basic_istream< _CharT, _Traits > &__is, std::normal_distribution< _RealType1 > &__x)`

### 6.703.1 Detailed Description

`template<typename _RealType = double>`  
`class std::normal_distribution< _RealType >`

A normal continuous distribution for random numbers.  
The formula for the normal probability density function is

$$p(x|\mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{x-\mu}{2\sigma^2}}$$

Since

C++11

### 6.703.2 Member Typedef Documentation

#### result\_type

`template<typename _RealType = double>`  
`typedef _RealType std::normal_distribution< _RealType >::result_type`  
The type of the range of the distribution.

### 6.703.3 Constructor & Destructor Documentation

#### normal\_distribution()

`template<typename _RealType = double>`  
`std::normal_distribution< _RealType >::normal_distribution (`  
`result_type __mean,`  
`result_type __stddev = result_type(1)) [inline], [explicit]`  
Constructs a normal distribution with parameters *mean* and standard deviation.

### 6.703.4 Member Function Documentation

#### max()

`template<typename _RealType = double>`  
`result_type std::normal_distribution< _RealType >::max () const [inline]`  
Returns the least upper bound value of the distribution.

#### mean()

`template<typename _RealType = double>`  
`_RealType std::normal_distribution< _RealType >::mean () const [inline]`  
Returns the mean of the distribution.

**min()**

```
template<typename _RealType = double>
result_type std::normal_distribution<_RealType>::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

**operator>() [1/2]**

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::normal_distribution<_RealType>::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator>\(\)](#).

**operator>() [2/2]**

```
template<typename _RealType>
template<typename _UniformRandomNumberGenerator>
normal_distribution<_RealType>::result_type std::normal_distribution<_RealType>::operator()
(
    _UniformRandomNumberGenerator & __urng,
    const param_type & __param)
```

Polar method due to Marsaglia.

Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. V, Sect. 4.4.

References [std::log\(\)](#), and [std::sqrt\(\)](#).

**param() [1/2]**

```
template<typename _RealType = double>
param_type std::normal_distribution<_RealType>::param () const [inline]
```

Returns the parameter set of the distribution.

**param() [2/2]**

```
template<typename _RealType = double>
void std::normal_distribution<_RealType>::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _RealType = double>
void std::normal_distribution<_RealType>::reset () [inline]
```

Resets the distribution state.

**stddev()**

```
template<typename _RealType = double>
_RealType std::normal_distribution<_RealType>::stddev () const [inline]
```

Returns the standard deviation of the distribution.

## 6.703.5 Friends And Related Symbol Documentation

### operator<<

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::normal_distribution< _RealType1 > & __x) [friend]
```

Inserts a normal\_distribution random number distribution \_\_x into the output stream \_\_os.

#### Parameters

|                   |                                                   |
|-------------------|---------------------------------------------------|
| <code>__os</code> | An output stream.                                 |
| <code>__x</code>  | A normal_distribution random number distribution. |

#### Returns

The output stream with the state of \_\_x inserted or in an error state.

### operator==

```
template<typename _RealType = double>
template<typename _RealType1>
bool operator== (
    const std::normal_distribution< _RealType1 > & __d1,
    const std::normal_distribution< _RealType1 > & __d2) [friend]
```

Return true if two normal distributions have the same parameters and the sequences that would be generated are equal.

### operator>>

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::normal_distribution< _RealType1 > & __x) [friend]
```

Extracts a normal\_distribution random number distribution \_\_x from the input stream \_\_is.

#### Parameters

|                   |                                                       |
|-------------------|-------------------------------------------------------|
| <code>__is</code> | An input stream.                                      |
| <code>__x</code>  | A normal_distribution random number generator engine. |

#### Returns

The input stream with \_\_x extracted or in an error state.

The documentation for this class was generated from the following files:

## 6.707 `__gnu_pbds::null_node_update< _Tp1, _Tp2, _Tp3, _Tp4 >` Struct Template Reference

`#include <tag_and_trait.hpp>`

Inheritance diagram for `__gnu_pbds::null_node_update< _Tp1, _Tp2, _Tp3, _Tp4 >`:

### 6.707.1 Detailed Description

```
template<typename _Tp1, typename _Tp2, typename _Tp3, typename _Tp4>
struct __gnu_pbds::null_node_update< _Tp1, _Tp2, _Tp3, _Tp4 >
```

A null node updatator, indicating that no node updates are required.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

### 6.708 \_\_gnu\_pbds::null\_type Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for \_\_gnu\_pbds::null\_type:

### 6.708.1 Detailed Description

Represents no type, or absence of type, for template tricks.

In a mapped-policy, indicates that an associative container is a set.

In a list-update policy, indicates that each link does not need metadata.

In a hash policy, indicates that the combining hash function is actually a ranged hash function.

In a probe policy, indicates that the combining probe function is actually a ranged probe function.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.709 std::experimental::fundamentals\_v1::nullopt\_t Struct Reference

```
#include <optional>
```

### Public Types

- enum class **\_Construct** { **\_Token** }

### Public Member Functions

- constexpr **nullopt\_t** (\_Construct)

#### 6.709.1 Detailed Description

Tag type to disengage optional objects.

The documentation for this struct was generated from the following file:

- [experimental/optional](#)

**6.710.1 Detailed Description**

template<typename \_CharT, typename \_InIter>  
class std::num\_get<\_CharT, \_InIter>

Primary class template num\_get.

This facet encapsulates the code to parse and return a number from a string. It is used by the istream numeric extraction operators.

The num\_get template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the num\_get facet.

**6.710.2 Member Typedef Documentation****char\_type**

```
template<typename _CharT, typename _InIter>
typedef _CharT std::num_get<_CharT, _InIter>::char_type
```

Public typedefs.

**iter\_type**

```
template<typename _CharT, typename _InIter>
typedef _InIter std::num_get<_CharT, _InIter>::iter_type
```

Public typedefs.

**6.710.3 Constructor & Destructor Documentation****num\_get()**

```
template<typename _CharT, typename _InIter>
std::num_get<_CharT, _InIter>::num_get (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

**Parameters**

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

**~num\_get()**

```
template<typename _CharT, typename _InIter>
virtual std::num_get<_CharT, _InIter>::~num_get () [inline], [protected], [virtual]
```

Destructor.

#### 6.710.4 Member Function Documentation

##### **do\_get()** [1/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

##### See also

[get\(\)](#) for more details.

##### Parameters

|              |                             |
|--------------|-----------------------------|
| <i>__beg</i> | Start of input stream.      |
| <i>__end</i> | End of input stream.        |
| <i>__io</i>  | Source of locale and flags. |
| <i>__err</i> | Error flags to set.         |
| <i>__v</i>   | Value to format and insert. |

##### Returns

Iterator after reading.

##### **do\_get()** [2/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long long & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

##### See also

[get\(\)](#) for more details.

##### Parameters

|              |                             |
|--------------|-----------------------------|
| <i>__beg</i> | Start of input stream.      |
| <i>__end</i> | End of input stream.        |
| <i>__io</i>  | Source of locale and flags. |
| <i>__err</i> | Error flags to set.         |
| <i>__v</i>   | Value to format and insert. |

**Returns**

Iterator after reading.

**do\_get()** [3/11]

```
template<typename _CharT, typename _InIter>
virtual iter\_type std::num_get< _CharT, _InIter >::do_get (
    iter\_type __beg,
    iter\_type __end,
    ios\_base & __io,
    ios\_base::iostate & __err,
    unsigned int & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

**See also**

[get\(\)](#) for more details.

**Parameters**

|                       |                             |
|-----------------------|-----------------------------|
| <a href="#">__beg</a> | Start of input stream.      |
| <a href="#">__end</a> | End of input stream.        |
| <a href="#">__io</a>  | Source of locale and flags. |
| <a href="#">__err</a> | Error flags to set.         |
| <a href="#">__v</a>   | Value to format and insert. |

**Returns**

Iterator after reading.

**do\_get()** [4/11]

```
template<typename _CharT, typename _InIter>
virtual iter\_type std::num_get< _CharT, _InIter >::do_get (
    iter\_type __beg,
    iter\_type __end,
    ios\_base & __io,
    ios\_base::iostate & __err,
    unsigned long & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

**See also**

[get\(\)](#) for more details.

**Parameters**

|                       |                             |
|-----------------------|-----------------------------|
| <a href="#">__beg</a> | Start of input stream.      |
| <a href="#">__end</a> | End of input stream.        |
| <a href="#">__io</a>  | Source of locale and flags. |

|                    |                             |
|--------------------|-----------------------------|
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

#### **do\_get()** [5/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned long long & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

#### See also

`get()` for more details.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

#### **do\_get()** [6/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned short & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

#### See also

`get()` for more details.

## Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

## Returns

Iterator after reading.

**do\_get()** [7/11]

```
template<typename _CharT, typename _InIter>
_InIter std::num_get<_CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    bool & __v) const [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

## See also

`get()` for more details.

## Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

## Returns

Iterator after reading.

_InIter std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    double & __v) const [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

**See also**

[get\(\)](#) for more details.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

References [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::c\\_str\(\)](#), [std::ios\\_base::eofbit](#), and [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::r](#)

**do\_get()** [9/11]

```
template<typename _CharT, typename _InIter>
_InIter std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    float & __v) const [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

**See also**

[get\(\)](#) for more details.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

References [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc >::c\\_str\(\)](#), [std::ios\\_base::eofbit](#), and [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc >::r](#)

**do\_get()** [10/11]

```
template<typename _CharT, typename _InIter>
_InIter std::num_get<_CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long double & __v) const [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable v. This function is a hook for derived classes to change the value returned.

**See also**

[get\(\)](#) for more details.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

References [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc >::c\\_str\(\)](#), [std::ios\\_base::eofbit](#), and [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc >::r](#)

**do\_get()** [11/11]

```
template<typename _CharT, typename _InIter>
_InIter std::num_get<_CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    void *& __v) const [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable v. This function is a hook for derived classes to change the value returned.

**See also**

[get\(\)](#) for more details.

**Parameters**

|                    |                        |
|--------------------|------------------------|
| <code>__beg</code> | Start of input stream. |
|--------------------|------------------------|

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

References [std::ios\\_base::basefield](#), [std::ios\\_base::flags\(\)](#), [std::ios\\_base::fmtflags](#), and [std::ios\\_base::hex](#).

**get()** [1/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    bool & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the bool `v`. It does so by calling `num_get::do_get()`.

If `ios_base::boolalpha` is set, attempts to read `ctype<CharT>::truename()` or `ctype<CharT>::falsename()`. Sets `v` to true or false if successful. Sets `err` to `ios_base::failbit` if reading the string fails. Sets `err` to `ios_base::eofbit` if the stream is emptied.

If `ios_base::boolalpha` is not set, proceeds as with reading a long, except if the value is 1, sets `v` to true, if the value is 0, sets `v` to false, and otherwise set `err` to `ios_base::failbit`.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

Referenced by [std::basic\\_istream< \\_CharT, \\_Traits >::operator>>\(\)](#).

**get()** [2/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    double & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num\_get::do\_get().

The input characters are parsed like the scanf g specifier. The matching type length modifier is also used.

The decimal point character used is numpunct::decimal\_point(). Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands\_sep(). If the pattern of digit groups isn't consistent, sets err to ios\_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios\_base::failbit and leaves *v* unaltered. Sets err to ios\_base::eofbit if the stream is emptied.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

#### get() [3/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get<_CharT, _InIter>::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    float & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num\_get::do\_get().

The input characters are parsed like the scanf g specifier. The matching type length modifier is also used.

The decimal point character used is numpunct::decimal\_point(). Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands\_sep(). If the pattern of digit groups isn't consistent, sets err to ios\_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios\_base::failbit and leaves *v* unaltered. Sets err to ios\_base::eofbit if the stream is emptied.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

**get()** [4/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

**get()** [5/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long double & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf` `g` specifier. The matching type length modifier is also used.

The decimal point character used is `num_punct::decimal_point()`. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

|                    |                        |
|--------------------|------------------------|
| <code>__in</code>  | Start of input stream. |
| <code>__end</code> | End of input stream.   |

## Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

## Returns

Iterator after reading.

**get()** [6/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long long & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in `io`.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

## Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

## Returns

Iterator after reading.

**get()** [7/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned int & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

#### **get()** [8/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned long & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

**get()** [9/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned long long & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

**get()** [10/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned short & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets *err* to `ios_base::failbit` and leaves *v* unaltered. Sets *err* to `ios_base::eofbit` if the stream is emptied.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

#### **get()** [11/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    void *& __v) const [inline]
```

Numeric parsing.

Parses the input stream into the pointer variable *v*. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf p` specifier.

Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets *err* to `ios_base::failbit`.

Note that the digit grouping effect for pointers is a bit ambiguous in the standard and shouldn't be relied on. See DR 344.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets *err* to `ios_base::failbit` and leaves *v* unaltered. Sets *err* to `ios_base::eofbit` if the stream is emptied.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

### 6.710.5 Member Data Documentation

#### **id**

```
template<typename _CharT, typename _InIter>
locale::id std::num_get< _CharT, _InIter >::id [static]
```

Numpunct facet id.

The documentation for this class was generated from the following files:

- [locale\\_facets.h](#)
- [locale\\_facets.tcc](#)

## 6.711 std::num\_put< \_CharT, \_OutIter > Class Template Reference

```
#include <locale_facets.h>
```

Inheritance diagram for std::num\_put< \_CharT, \_OutIter >:

### Public Types

- typedef \_CharT [char\\_type](#)
- typedef \_OutIter [iter\\_type](#)

### 6.711.1 Detailed Description

```
template<typename _CharT, typename _OutIter>
class std::num_put< _CharT, _OutIter >
```

Primary class template `num_put`.

This facet encapsulates the code to convert a number to a string. It is used by the ostream numeric insertion operators. The `num_put` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `num_put` facet.

### 6.711.2 Member Typedef Documentation

#### `char_type`

```
template<typename _CharT, typename _OutIter>
typedef _CharT std::num_put< _CharT, _OutIter >::char_type
```

Public typedefs.

**iter\_type**

```
template<typename _CharT, typename _OutIter>
typedef _OutIter std::num_put< _CharT, _OutIter >::iter_type
Public typedefs.
```

**6.711.3 Constructor & Destructor Documentation****num\_put()**

```
template<typename _CharT, typename _OutIter>
std::num_put< _CharT, _OutIter >::num_put (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

**Parameters**

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

**~num\_put()**

```
template<typename _CharT, typename _OutIter>
virtual std::num_put< _CharT, _OutIter >::~~num_put () [inline], [protected], [virtual]
```

Destructor.

**6.711.4 Member Function Documentation****do\_put()** [1/8]

```
template<typename _CharT, typename _OutIter>
_OutIter std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    bool __v) const [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

**Returns**

Iterator after writing.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::adjustfield](#), [std::ios\\_base::boolalpha](#), [std::ios\\_base::flags\(\)](#), [std::ios\\_base::fmtflags](#), [std::ios\\_base::left](#), and [std::ios\\_base::width\(\)](#).

**do\_put()** [2/8]

```
template<typename _CharT, typename _OutIter>
virtual iter_type std::num_put<_CharT, _OutIter>::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long __v) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

|                                                                                                                            |                               |
|----------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| <a href="#"></a><br><code>__s</code>      | Stream to write to.           |
| <a href="#"></a><br><code>__io</code>   | Source of locale and flags.   |
| <a href="#"></a><br><code>__fill</code> | Char_type to use for filling. |
| <a href="#"></a><br><code>__v</code>    | Value to format and insert.   |

**Returns**

Iterator after writing.

**do\_put()** [3/8]

```
template<typename _CharT, typename _OutIter>
virtual iter_type std::num_put<_CharT, _OutIter>::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long long __v) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

|                                                                                                                         |                     |
|-------------------------------------------------------------------------------------------------------------------------|---------------------|
| <a href="#"></a><br><code>__s</code> | Stream to write to. |
|-------------------------------------------------------------------------------------------------------------------------|---------------------|

## Parameters

|                             |                               |
|-----------------------------|-------------------------------|
| $\leftrightarrow$<br>__io   | Source of locale and flags.   |
| $\leftrightarrow$<br>__fill | Char_type to use for filling. |
| $\leftrightarrow$<br>__v    | Value to format and insert.   |

## Returns

Iterator after writing.

**do\_put()** [4/8]

```
template<typename _CharT, typename _OutIter>
virtual iter\_type std::num_put<_CharT, _OutIter >::do_put (
    iter\_type __s,
    ios\_base & __io,
    char\_type __fill,
    unsigned long __v) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

## Parameters

|                             |                               |
|-----------------------------|-------------------------------|
| $\leftrightarrow$<br>__s    | Stream to write to.           |
| $\leftrightarrow$<br>__io   | Source of locale and flags.   |
| $\leftrightarrow$<br>__fill | Char_type to use for filling. |
| $\leftrightarrow$<br>__v    | Value to format and insert.   |

## Returns

Iterator after writing.

**do\_put()** [5/8]

```
template<typename _CharT, typename _OutIter>
virtual iter\_type std::num_put<_CharT, _OutIter >::do_put (
    iter\_type __s,
    ios\_base & __io,
    char\_type __fill,
    unsigned long long __v) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

|                                                                                                                                   |                               |
|-----------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| <a href="#"></a><br><a href="#"><u>_s</u></a>    | Stream to write to.           |
| <a href="#"></a><br><a href="#"><u>_io</u></a>   | Source of locale and flags.   |
| <a href="#"></a><br><a href="#"><u>_fill</u></a> | Char_type to use for filling. |
| <a href="#"></a><br><a href="#"><u>_v</u></a>    | Value to format and insert.   |

**Returns**

Iterator after writing.

**do\_put() [6/8]**

```
template<typename _CharT, typename _OutIter>
_OutIter std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const void * __v) const    [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

|                                                                                                                                     |                               |
|-------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| <a href="#"></a><br><a href="#"><u>_s</u></a>    | Stream to write to.           |
| <a href="#"></a><br><a href="#"><u>_io</u></a>   | Source of locale and flags.   |
| <a href="#"></a><br><a href="#"><u>_fill</u></a> | Char_type to use for filling. |
| <a href="#"></a><br><a href="#"><u>_v</u></a>    | Value to format and insert.   |

**Returns**

Iterator after writing.

References [std::ios\\_base::basefield](#), [std::ios\\_base::flags\(\)](#), [std::ios\\_base::fmtflags](#), [std::ios\\_base::hex](#), [std::ios\\_base::showbase](#), and [std::ios\\_base::uppercase](#).

**do\_put() [7/8]**

```
template<typename _CharT, typename _OutIter>
_OutIter std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    double __v) const    [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

#### Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

#### Returns

Iterator after writing.

#### do\_put() [8/8]

```
template<typename _CharT, typename _OutIter>
_OutIter std::num_put<_CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long double __v) const [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

#### Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

#### Returns

Iterator after writing.

#### put() [1/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put<_CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
```

```
char_type __fill,
bool __v) const [inline]
```

Numeric formatting.

Formats the boolean *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

If `ios_base::boolalpha` is set, writes `ctype<CharT>::truenamename()` or `ctype<CharT>::falsename()`. Otherwise formats *v* as an int.

#### Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

#### Returns

Iterator after writing.

Referenced by `std::basic_ostream<_CharT, _Traits>::operator<<()`.

#### put() [2/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put<_CharT, _OutIter>::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const void * __v) const [inline]
```

Numeric formatting.

Formats the pointer value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

This function formats *v* as an unsigned long with `ios_base::hex` and `ios_base::showbase` set.

#### Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

#### Returns

Iterator after writing.

**put()** [3/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    double __v) const [inline]
```

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling num\_put::do\_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios\_base::floatfield. If equal to ios\_base::fixed, formats like the printf f specifier. Else if equal to ios\_base::scientific, formats like e or E with ios\_base::uppercase unset or set respectively. Otherwise, formats like g or G depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like g or G.

The output precision is given by io.precision(). This precision is capped at numeric\_limits::digits10 + 2 (different for double and long double). The default precision is 6.

If ios\_base::showpos is set, '+' is output before positive values. If ios\_base::showpoint is set, a decimal point will always be output.

The decimal point character used is numpunct::decimal\_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands\_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios\_base::adjustfield) == ios\_base::left, result is padded at the end. If ios\_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

**Parameters**

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

**Returns**

Iterator after writing.

**put()** [4/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long __v) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling num\_put::do\_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios\_base::basefield. If equal to ios\_base::oct, formats like the printf o specifier. Else if equal to ios\_base::hex, formats like x or X with ios\_base::uppercase unset or set respectively.

Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, `'+'` is output before positive values. If `ios_base::showbase` is set, `'0'` precedes octal values (except 0) and `'0[xX]'` precedes hex values.

The decimal point character used is `numput::decimal_point()`. Thousands separators are inserted according to `numput::grouping()` and `numput::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a `'+'` or `'-'` or after `'0x'` or `'0X'`. Otherwise, padding occurs at the beginning.

#### Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

#### Returns

Iterator after writing.

#### put() [5/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long double __v) const [inline]
```

Numeric formatting.

Formats the floating point value `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in `io`.

The basic format is affected by the value of `io.flags() & ios_base::floatfield`. If equal to `ios_base::fixed`, formats like the `printf f` specifier. Else if equal to `ios_base::scientific`, formats like `e` or `E` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `g` or `G` depending on uppercase. Note that if both `fixed` and `scientific` are set, the effect will also be like `g` or `G`.

The output precision is given by `io.precision()`. This precision is capped at `numeric_limits::digits10 + 2` (different for double and long double). The default precision is 6.

If `ios_base::showpos` is set, `'+'` is output before positive values. If `ios_base::showpoint` is set, a decimal point will always be output.

The decimal point character used is `numput::decimal_point()`. Thousands separators are inserted according to `numput::grouping()` and `numput::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a `'+'` or `'-'` or after `'0x'` or `'0X'`. Otherwise, padding occurs at the beginning.

#### Parameters

|                  |                     |
|------------------|---------------------|
| <code>__s</code> | Stream to write to. |
|------------------|---------------------|

## Parameters

|          |                               |
|----------|-------------------------------|
| $\_io$   | Source of locale and flags.   |
| $\_fill$ | Char_type to use for filling. |
| $\_v$    | Value to format and insert.   |

## Returns

Iterator after writing.

**put()** [6/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long long __v) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling num\_put::do\_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios\_base::basefield. If equal to ios\_base::oct, formats like the printf o specifier. Else if equal to ios\_base::hex, formats like x or X with ios\_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.

If ios\_base::showpos is set, '+' is output before positive values. If ios\_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is numpunct::decimal\_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands\_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios\_base::adjustfield) == ios\_base::left, result is padded at the end. If ios\_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

## Parameters

|          |                               |
|----------|-------------------------------|
| $\_s$    | Stream to write to.           |
| $\_io$   | Source of locale and flags.   |
| $\_fill$ | Char_type to use for filling. |
| $\_v$    | Value to format and insert.   |

## Returns

Iterator after writing.

**put()** [7/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    unsigned long __v) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showbase` is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

**Parameters**

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

**Returns**

Iterator after writing.

**put()** [8/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    unsigned long long __v) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If ios\_base::showpos is set, '+' is output before positive values. If ios\_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is numpunct::decimal\_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands\_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios\_base::adjustfield) == ios\_base::left, result is padded at the end. If ios\_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

#### Parameters

|                          |                               |
|--------------------------|-------------------------------|
| <code>↵<br/>_s</code>    | Stream to write to.           |
| <code>↵<br/>_io</code>   | Source of locale and flags.   |
| <code>↵<br/>_fill</code> | Char_type to use for filling. |
| <code>↵<br/>_v</code>    | Value to format and insert.   |

#### Returns

Iterator after writing.

#### 6.712.1 Detailed Description

```
template<typename _Tp>
struct std::numeric_limits<_Tp>
```

Properties of fundamental types.

This class allows a program to obtain information about the representation of a fundamental type on a given platform. For non-fundamental types, the functions will return 0 and the data members will all be `false`.

#### 6.712.2 Member Function Documentation

##### **denorm\_min()**

```
template<typename _Tp>
constexpr _Tp std::numeric_limits<_Tp>::denorm_min () [inline], [static], [constexpr], [noexcept]
```

The minimum positive denormalized value. For types where `has_denorm` is false, this is the minimum positive normalized value.

**epsilon()**

```
template<typename _Tp>
```

```
constexpr _Tp std::numeric_limits< _Tp >::epsilon () [inline], [static], [constexpr], [noexcept]
```

The *machine epsilon*: the difference between 1 and the least value greater than 1 that is representable.

Referenced by [std::binomial\\_distribution< \\_IntType >::operator\(\)\(\)](#), [std::poisson\\_distribution< \\_IntType >::operator\(\)\(\)](#), and [std::operator<<\(\)](#).

**infinity()**

```
template<typename _Tp>
```

```
constexpr _Tp std::numeric_limits< _Tp >::infinity () [inline], [static], [constexpr], [noexcept]
```

The representation of positive infinity, if `has_infinity`.

**lowest()**

```
template<typename _Tp>
```

```
constexpr _Tp std::numeric_limits< _Tp >::lowest () [inline], [static], [constexpr], [noexcept]
```

A finite value `x` such that there is no other finite value `y` where `y < x`.

Referenced by [std::cauchy\\_distribution< \\_RealType >::min\(\)](#), [std::extreme\\_value\\_distribution< \\_RealType >::min\(\)](#), [std::normal\\_distribution< \\_RealType >::min\(\)](#), and [std::student\\_t\\_distribution< \\_RealType >::min\(\)](#).

**max()**

```
template<typename _Tp>
```

```
constexpr _Tp std::numeric_limits< _Tp >::max () [inline], [static], [constexpr], [noexcept]
```

The maximum finite value.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_parallel\\_random\\_shuffle\\_drs\(\)](#), [std::bernoulli\\_distribution::max\(\)](#), [std::cauchy\\_distribution< \\_RealType >::max\(\)](#), [std::chi\\_squared\\_distribution< \\_RealType >::max\(\)](#), [std::exponential\\_distribution< \\_RealType >::max\(\)](#), [std::extreme\\_value\\_distribution< \\_RealType >::max\(\)](#), [std::fisher\\_f\\_distribution< \\_RealType >::max\(\)](#), [std::gamma\\_distribution< \\_RealType >::max\(\)](#), [std::geometric\\_distribution< \\_IntType >::max\(\)](#), [std::lognormal\\_distribution< \\_RealType >::max\(\)](#), [std::negative\\_binomial\\_distribution< \\_IntType >::max\(\)](#), [std::normal\\_distribution< \\_RealType >::max\(\)](#), [std::poisson\\_distribution< \\_IntType >::max\(\)](#), [std::student\\_t\\_distribution< \\_RealType >::max\(\)](#), [std::weibull\\_distribution< \\_RealType >::max\(\)](#), [std::tr2::dynamic\\_bitset< \\_WordT, \\_Alloc >::max\\_size\(\)](#), [std::binomial\\_distribution< \\_IntType >::operator\(\)\(\)](#), [std::independent\\_bits\\_engine< \\_IntType >::operator\(\)\(\)](#), and [std::operator<<\(\)](#).

**min()**

```
template<typename _Tp>
```

```
constexpr _Tp std::numeric_limits< _Tp >::min () [inline], [static], [constexpr], [noexcept]
```

The minimum finite value, or for floating types with denormalization, the minimum positive normalized value.

Referenced by [std::bernoulli\\_distribution::min\(\)](#).

**quiet\_NaN()**

```
template<typename _Tp>
```

```
constexpr _Tp std::numeric_limits< _Tp >::quiet_NaN () [inline], [static], [constexpr], [noexcept]
```

The representation of a quiet Not a Number, if `has_quiet_NaN`.

**round\_error()**

```
template<typename _Tp>
```

```
constexpr _Tp std::numeric_limits< _Tp >::round_error () [inline], [static], [constexpr], [noexcept]
```

The maximum rounding error measurement (see LIA-1).

**signaling\_NaN()**

```
template<typename _Tp>
constexpr _Tp std::numeric_limits< _Tp >::signaling_NaN () [inline], [static], [constexpr],
[noexcept]
```

The representation of a signaling Not a Number, if `has_signaling_NaN`.

**6.712.3 Member Data Documentation****digits**

```
int std::__numeric_limits_base::digits [static], [constexpr], [inherited]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

Referenced by [std::generate\\_canonical\(\)](#), [std::independent\\_bits\\_engine<\\_RandomNumberEngine, \\_\\_w, \\_UIntType >::operator\(\)\(\)](#), and [std::linear\\_congruential\\_engine< uint\\_fast32\\_t, 16807UL, 0UL, 2147483647UL >::seed\(\)](#).

**digits10**

```
int std::__numeric_limits_base::digits10 [static], [constexpr], [inherited]
```

The number of base 10 digits that can be represented without change.

**has\_denorm**

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr], [inherited]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr], [inherited]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr], [inherited]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr], [inherited]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr], [inherited]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr], [inherited]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr], [inherited]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr], [inherited]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr], [inherited]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr], [inherited]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr], [inherited]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr], [inherited]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr], [inherited]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr], [inherited]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr], [inherited]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr], [inherited]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr], [inherited]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr], [inherited]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

Referenced by [std::generate\\_canonical\(\)](#).

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr], [inherited]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr], [inherited]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr], [inherited]
```

True if trapping is implemented for this type.

### 6.713.1 Detailed Description

numeric\_limits<bool> specialization.

### 6.713.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

#### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving `+`, `-`, or `*` on values of that type whose result would fall outside the range `[min(),max()]`, the value returned differs from the true value by an integer multiple of `max() - min() + 1`. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

#### 6.714.1 Detailed Description

`numeric_limits<char>` specialization.

#### 6.714.2 Member Data Documentation

##### **digits**

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

##### **digits10**

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

##### **has\_denorm**

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.715.1 Detailed Description

numeric\_limits<char16\_t> specialization.

### 6.715.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.716.1 Detailed Description

numeric\_limits<char32\_t> specialization.

### 6.716.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.717.1 Detailed Description

`numeric_limits<double>` specialization.

### 6.717.2 Member Data Documentation

#### **digits**

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### **digits10**

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### **has\_denorm**

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.718.1 Detailed Description

`numeric_limits<float>` specialization.

### 6.718.2 Member Data Documentation

#### **digits**

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### **digits10**

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### **has\_denorm**

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.719.1 Detailed Description

`numeric_limits<int>` specialization.

### 6.719.2 Member Data Documentation

#### **digits**

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### **digits10**

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### **has\_denorm**

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.721.1 Detailed Description

numeric\_limits<long double> specialization.

### 6.721.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.722.1 Detailed Description

numeric\_limits<long long> specialization.

### 6.722.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of [radix](#) digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of [radix](#) digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See [std::float\\_denorm\\_style](#) for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.723.1 Detailed Description

numeric\_limits<short> specialization.

### 6.723.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of [radix](#) digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of [radix](#) digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See [std::float\\_denorm\\_style](#) for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

The documentation for this struct was generated from the following file:

#### 6.724.1 Detailed Description

numeric\_limits<signed char> specialization.

#### 6.724.2 Member Data Documentation

##### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

##### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

##### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.725.1 Detailed Description

numeric\_limits<unsigned char> specialization.

### 6.725.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.726.1 Detailed Description

numeric\_limits<unsigned int> specialization.

### 6.726.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of [radix](#) digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of [radix](#) digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See [std::float\\_denorm\\_style](#) for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.727.1 Detailed Description

numeric\_limits<unsigned long> specialization.

### 6.727.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of [radix](#) digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of [radix](#) digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See [std::float\\_denorm\\_style](#) for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.728.1 Detailed Description

`numeric_limits<unsigned long long>` specialization.

### 6.728.2 Member Data Documentation

#### **digits**

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### **digits10**

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### **has\_denorm**

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.729.1 Detailed Description

numeric\_limits<unsigned short> specialization.

### 6.729.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of [radix](#) digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of [radix](#) digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See [std::float\\_denorm\\_style](#) for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.730.1 Detailed Description

numeric\_limits<wchar\_t> specialization.

### 6.730.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of [radix](#) digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of [radix](#) digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float\_denorm\_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See [std::float\\_denorm\\_style](#) for more information.

**has\_denorm\_loss**

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

**has\_infinity**

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

**has\_quiet\_NaN**

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

**has\_signaling\_NaN**

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

**is\_bounded**

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

**is\_exact**

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

**is\_iec559**

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

```
bool std::__numeric_limits_base::is_integer [static], [constexpr]
```

True if the type is integer.

**is\_modulo**

```
bool std::__numeric_limits_base::is_modulo [static], [constexpr]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

```
bool std::__numeric_limits_base::is_signed [static], [constexpr]
```

True if the type is signed.

**is\_specialized**

```
bool std::__numeric_limits_base::is_specialized [static], [constexpr]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

```
int std::__numeric_limits_base::max_digits10 [static], [constexpr]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

```
int std::__numeric_limits_base::max_exponent [static], [constexpr]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

```
int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

```
int std::__numeric_limits_base::min_exponent [static], [constexpr]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

```
int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

```
int std::__numeric_limits_base::radix [static], [constexpr]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

#### 6.731.1 Detailed Description

```
template<typename _CharT>
class std::numpunct< _CharT >
```

Primary class template numpunct.

This facet stores several pieces of information related to printing and scanning numbers, such as the decimal point character. It takes a template parameter specifying the char type. The numpunct facet is used by streams for many I/O operations involving numbers.

The numpunct template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from a numpunct facet.

#### 6.731.2 Member Typedef Documentation

##### char\_type

```
template<typename _CharT>
typedef _CharT std::numpunct< _CharT >::char_type
```

Public typedefs.

##### string\_type

```
template<typename _CharT>
typedef basic\_string<_CharT> std::numpunct< _CharT >::string_type
```

Public typedefs.

#### 6.731.3 Constructor & Destructor Documentation

##### numpunct() [1/3]

```
template<typename _CharT>
std::numpunct< _CharT >::numpunct (
    size_t __refs = 0) [inline], [explicit]
```

Numpunct constructor.

## Parameters

|                     |                                     |
|---------------------|-------------------------------------|
| <code>__refs</code> | RefCount to pass to the base class. |
|---------------------|-------------------------------------|

References [std::locale::facet::facet\(\)](#).

**numpunct()** [2/3]

```
template<typename _CharT>
std::numpunct<_CharT>::numpunct (
    __cache_type * __cache,
    size_t __refs = 0) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up the predefined locale facets.

## Parameters

|                      |                                       |
|----------------------|---------------------------------------|
| <code>__cache</code> | <code>__numpunct_cache</code> object. |
| <code>__refs</code>  | RefCount to pass to the base class.   |

References [std::locale::facet::facet\(\)](#).

**numpunct()** [3/3]

```
template<typename _CharT>
std::numpunct<_CharT>::numpunct (
    __c_locale __cloc,
    size_t __refs = 0) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

## Parameters

|                     |                                     |
|---------------------|-------------------------------------|
| <code>__cloc</code> | The C locale.                       |
| <code>__refs</code> | RefCount to pass to the base class. |

References [std::locale::facet::facet\(\)](#).

**~numpunct()**

```
template<typename _CharT>
virtual std::numpunct<_CharT>::~~numpunct () [protected], [virtual]
```

Destructor.

**6.731.4 Member Function Documentation****decimal\_point()**

```
template<typename _CharT>
char_type std::numpunct<_CharT>::decimal_point () const [inline]
```

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `returning numpunct<char_type>::do_decimal_point()`.

**Returns**

*char\_type* representing a decimal point.

References [do\\_decimal\\_point\(\)](#).

**do\_decimal\_point()**

```
template<typename _CharT>
virtual char\_type std::num\_punct< _CharT >::do_decimal_point () const [inline], [protected],
[virtual]
```

Return decimal point character.

Returns a *char\_type* to use as a decimal point. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a decimal point.

Referenced by [decimal\\_point\(\)](#).

**do\_falsename()**

```
template<typename _CharT>
virtual string\_type std::num\_punct< _CharT >::do_falsename () const [inline], [protected], [virtual]
```

Return string representation of bool false.

Returns a *string\_type* containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

**Returns**

*string\_type* representing printed form of false.

Referenced by [falsename\(\)](#).

**do\_grouping()**

```
template<typename _CharT>
virtual string std::num\_punct< _CharT >::do_grouping () const [inline], [protected], [virtual]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

**See also**

[grouping\(\)](#) for details.

**Returns**

String representing grouping specification.

Referenced by [grouping\(\)](#).

**do\_thousands\_sep()**

```
template<typename _CharT>
virtual char\_type std::num\_punct< _CharT >::do_thousands_sep () const [inline], [protected],
[virtual]
```

Return thousands separator character.

Returns a *char\_type* to use as a thousands separator. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a thousands separator.

Referenced by [thousands\\_sep\(\)](#).

**do\_truename()**

```
template<typename _CharT>
```

```
virtual string\_type std::num_punct<_CharT>::do_truename () const [inline], [protected], [virtual]
```

Return string representation of bool true.

Returns a *string\_type* containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

**Returns**

*string\_type* representing printed form of true.

Referenced by [truename\(\)](#).

**falsename()**

```
template<typename _CharT>
```

```
string\_type std::num_punct<_CharT>::false_name () const [inline]
```

Return string representation of bool false.

This function returns a *string\_type* containing the text representation for false bool variables. It does so by calling `num_punct<char_type>::do_false_name()`.

**Returns**

*string\_type* representing printed form of false.

References [do\\_false\\_name\(\)](#).

**grouping()**

```
template<typename _CharT>
```

```
string std::num_punct<_CharT>::grouping () const [inline]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the `grouping()` returns `"\003\002"` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `"32"`, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `num_punct<char_type>::do_grouping()`.

**Returns**

string representing grouping specification.

References [do\\_grouping\(\)](#).

**thousands\_sep()**

```
template<typename _CharT>
char_type std::numpunct<_CharT >::thousands_sep () const [inline]
```

Return thousands separator character.

This function returns a `char_type` to use as a thousands separator. It does so by returning `numpunct<char_type>::do_thousands_sep()`.

**Returns**

`char_type` representing a thousands separator.

References [do\\_thousands\\_sep\(\)](#).

**true\_name()**

```
template<typename _CharT>
string_type std::numpunct<_CharT >::true_name () const [inline]
```

Return string representation of bool true.

This function returns a `string_type` containing the text representation for true bool variables. It does so by calling `numpunct<char_type>::do_true_name()`.

**Returns**

`string_type` representing printed form of true.

References [do\\_true\\_name\(\)](#).

**6.731.5 Member Data Documentation****id**

```
template<typename _CharT>
locale::id std::numpunct<_CharT >::id [static]
```

Numpunct facet id.

#### 6.732.1 Detailed Description

```
template<typename _CharT>
class std::numpunct_byname< _CharT >
```

class numpunct\_byname [22.2.3.2].

#### 6.732.2 Member Function Documentation

##### decimal\_point()

```
template<typename _CharT>
char_type std::numpunct< _CharT >::decimal_point () const [inline], [inherited]
```

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `returning numpunct<char_type>::do_decimal_point()`.

##### Returns

*char\_type* representing a decimal point.

References [do\\_decimal\\_point\(\)](#).

##### do\_decimal\_point()

```
template<typename _CharT>
virtual char_type std::numpunct< _CharT >::do_decimal_point () const [inline], [protected],
[virtual], [inherited]
```

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

##### Returns

*char\_type* representing a decimal point.

Referenced by [decimal\\_point\(\)](#).

##### do\_falsename()

```
template<typename _CharT>
virtual string_type std::numpunct< _CharT >::do_falsename () const [inline], [protected], [virtual],
[inherited]
```

Return string representation of bool false.

Returns a `string_type` containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

**Returns**

string\_type representing printed form of false.

Referenced by [falsename\(\)](#).

**do\_grouping()**

```
template<typename _CharT>
virtual string std::num_punct<_CharT>::do_grouping () const [inline], [protected], [virtual],
[inherited]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

**See also**

grouping() for details.

**Returns**

String representing grouping specification.

Referenced by [grouping\(\)](#).

**do\_thousands\_sep()**

```
template<typename _CharT>
virtual char_type std::num_punct<_CharT>::do_thousands_sep () const [inline], [protected],
[virtual], [inherited]
```

Return thousands separator character.

Returns a char\_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

**Returns**

char\_type representing a thousands separator.

Referenced by [thousands\\_sep\(\)](#).

**do\_truename()**

```
template<typename _CharT>
virtual string_type std::num_punct<_CharT>::do_truename () const [inline], [protected], [virtual],
[inherited]
```

Return string representation of bool true.

Returns a string\_type containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

**Returns**

string\_type representing printed form of true.

Referenced by [truename\(\)](#).

**falsename()**

```
template<typename _CharT>
string_type std::num_punct<_CharT>::falsename () const [inline], [inherited]
```

Return string representation of bool false.

This function returns a string\_type containing the text representation for false bool variables. It does so by calling num\_punct<char\_type>::do\_falsename().

**Returns**

string\_type representing printed form of false.

References [do\\_falsename\(\)](#).

**grouping()**

```
template<typename _CharT>
string std::num_punct<_CharT>::grouping () const [inline], [inherited]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns "\003\002" and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was "32", this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling num\_punct<char\_type>::do\_grouping().

**Returns**

string representing grouping specification.

References [do\\_grouping\(\)](#).

**thousands\_sep()**

```
template<typename _CharT>
char_type std::num_punct<_CharT>::thousands_sep () const [inline], [inherited]
```

Return thousands separator character.

This function returns a char\_type to use as a thousands separator. It does so by returning num\_punct<char\_type>::do\_thousands\_sep().

**Returns**

char\_type representing a thousands separator.

References [do\\_thousands\\_sep\(\)](#).

**true\_name()**

```
template<typename _CharT>
string_type std::num_punct<_CharT>::true_name () const [inline], [inherited]
```

Return string representation of bool true.

This function returns a string\_type containing the text representation for true bool variables. It does so by calling num\_punct<char\_type>::do\_true\_name().

**Returns**

string\_type representing printed form of true.

References [do\\_true\\_name\(\)](#).

### 6.737.1 Detailed Description

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
class std::ostream_iterator< _Tp, _CharT, _Traits >
```

Provides output iterator semantics for streams.

This class provides an iterator to write to an ostream. The type `Tp` is the only type written by this iterator and there must be an `operator<<(Tp)` defined.

#### Template Parameters

|                      |                                        |
|----------------------|----------------------------------------|
| <code>_Tp</code>     | The type to write to the ostream.      |
| <code>_CharT</code>  | The ostream <code>char_type</code> .   |
| <code>_Traits</code> | The ostream <code>char_traits</code> . |

### 6.737.2 Member Typedef Documentation

#### `char_type`

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef _CharT std::ostream\_iterator< _Tp, _CharT, _Traits >::char_type
Public typedef.
```

#### `difference_type`

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
using std::ostream\_iterator< _Tp, _CharT, _Traits >::difference_type
Public typedef.
```

#### `iterator_category`

```
typedef output\_iterator\_tag std::iterator< output\_iterator\_tag, void, void, void, void >::iterator←
_category [inherited]
One of the tag types.
```

**ostream\_type**

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef basic_ostream<_CharT, _Traits> std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_↵
type
Public typedef.
```

**pointer**

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::pointer [inherited]
This type represents a pointer-to-value_type.
```

**reference**

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::reference [inherited]
This type represents a reference-to-value_type.
```

**traits\_type**

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef _Traits std::ostream_iterator< _Tp, _CharT, _Traits >::traits_type
Public typedef.
```

**value\_type**

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type [inherited]
The type "pointed to" by the iterator.
```

**6.737.3 Constructor & Destructor Documentation****ostream\_iterator() [1/3]**

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
    ostream_type & __s) [inline], [noexcept]
```

Construct from an ostream.

References [std::\\_\\_addressof\(\)](#).

Referenced by [ostream\\_iterator\(\)](#).

**ostream\_iterator() [2/3]**

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
    ostream_type & __s,
    const _CharT * __c) [inline], [noexcept]
```

Construct from an ostream.

The delimiter string *c* is written to the stream after every *Tp* written to the stream. The delimiter is not copied, and thus must not be destroyed while this iterator is in use.

**Parameters**

|                                          |                                   |
|------------------------------------------|-----------------------------------|
| <a href="#">_↵</a><br><a href="#">_s</a> | Underlying ostream to write to.   |
| <a href="#">_↵</a><br><a href="#">_c</a> | CharT delimiter string to insert. |

---

References [std::\\_\\_addressof\(\)](#).

### **ostream\_iterator()** [3/3]

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
    const ostream_iterator< _Tp, _CharT, _Traits > & __obj) [inline], [noexcept]
```

Copy constructor.

References [ostream\\_iterator\(\)](#).

## **6.737.4 Member Function Documentation**

### **operator=()**

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
ostream_iterator & std::ostream_iterator< _Tp, _CharT, _Traits >::operator= (
    const _Tp & __value) [inline]
```

Writes *value* to underlying ostream using operator<<. If constructed with delimiter string, writes delimiter to ostream. The documentation for this class was generated from the following file:

- [stream\\_iterator.h](#)

## **6.738 std::experimental::fundamentals\_v2::ostream\_joiner< \_DelimT, \_CharT, \_Traits > Class Template Reference**

```

## 6.739.1 Detailed Description

**template<typename \_CharT, typename \_Traits>  
class std::ostreambuf\_iterator< \_CharT, \_Traits >**

Provides output iterator semantics for streambufs.

## 6.739.2 Member Typedef Documentation

### char\_type

```
template<typename _CharT, typename _Traits>  
typedef _CharT std::ostreambuf\_iterator< _CharT, _Traits >::char_type  
Public typedefs.
```

### difference\_type

```
template<typename _CharT, typename _Traits>  
using std::ostreambuf\_iterator< _CharT, _Traits >::difference_type  
Public typedefs.
```

### iterator\_category

```
typedef output\_iterator\_tag std::iterator< output\_iterator\_tag, void, void, void, void >::iterator↔  
_category [inherited]  
One of the tag types.
```

### ostream\_type

```
template<typename _CharT, typename _Traits>  
typedef basic\_ostream<_CharT, _Traits> std::ostreambuf\_iterator< _CharT, _Traits >::ostream_type  
Public typedefs.
```

### pointer

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::pointer [inherited]  
This type represents a pointer-to-value_type.
```

### reference

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::reference [inherited]  
This type represents a reference-to-value_type.
```

**streambuf\_type**

```
template<typename _CharT, typename _Traits>
typedef basic_streambuf<_CharT, _Traits> std::ostreambuf_iterator< _CharT, _Traits >::streambuf←
_type
Public typedefs.
```

**traits\_type**

```
template<typename _CharT, typename _Traits>
typedef _Traits std::ostreambuf_iterator< _CharT, _Traits >::traits_type
Public typedefs.
```

**value\_type**

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type [inherited]
The type "pointed to" by the iterator.
```

**6.739.3 Constructor & Destructor Documentation****ostreambuf\_iterator() [1/2]**

```
template<typename _CharT, typename _Traits>
std::ostreambuf_iterator< _CharT, _Traits >::ostreambuf_iterator (
    ostream_type & __s) [inline], [noexcept]
```

Construct output iterator from ostream.

**ostreambuf\_iterator() [2/2]**

```
template<typename _CharT, typename _Traits>
std::ostreambuf_iterator< _CharT, _Traits >::ostreambuf_iterator (
    streambuf_type * __s) [inline], [noexcept]
```

Construct output iterator from streambuf.

**6.739.4 Member Function Documentation****failed()**

```
template<typename _CharT, typename _Traits>
bool std::ostreambuf_iterator< _CharT, _Traits >::failed () const [inline], [nodiscard], [noexcept]
```

Return true if previous operator=() failed.

Referenced by [std::basic\\_ostream<\\_CharT, \\_Traits>::operator<<\(\)](#).

**operator\*()**

```
template<typename _CharT, typename _Traits>
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator* () [inline], [nodiscard]
```

Return \*this.

**operator++() [1/2]**

```
template<typename _CharT, typename _Traits>
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator++ () [inline]
```

Return \*this.

**operator++()** [2/2]

```
template<typename _CharT, typename _Traits>
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator++ (
    int ) [inline]
```

Return \*this.

**operator=()**

```
template<typename _CharT, typename _Traits>
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator= (
    _CharT __c) [inline]
```

Write character to streambuf. Calls streambuf.sputc().

The documentation for this class was generated from the following files:

- [iosfwd](#)
- [streambuf\\_iterator.h](#)

**6.740 std::out\_of\_range Class Reference**

```
#include <stdexcept_except.h>
```

Inheritance diagram for std::out\_of\_range:

**Public Member Functions**

- **out\_of\_range** (const char \*)
- **out\_of\_range** (const [out\\_of\\_range](#) &)=default
- **out\_of\_range** (const [string](#) &\_\_arg)
- **out\_of\_range** ([out\\_of\\_range](#) &&)=default

- **out\_of\_range** & **operator=** ([out\\_of\\_range](#) &&)=default
- virtual const char \* **what** () const noexcept

### 6.740.1 Detailed Description

This represents an argument whose value is not within the expected range (e.g., boundary checks in `basic_string`).

### 6.740.2 Member Function Documentation

#### `what()`

```
virtual const char * std::logic_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this class was generated from the following file:

- [stdexcept\\_except.h](#)

## 6.741 `std::output_iterator_tag` Struct Reference

```
#include <stl_iterator_base_types.h>
```

### 6.741.1 Detailed Description

Marking output iterators.

The documentation for this struct was generated from the following file:

### 6.742.1 Detailed Description

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
class __gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >
```

Ordered-vector tree associative-container.

### 6.742.2 Member Function Documentation

#### node\_begin() [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::ov_tree_map<
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin () [inline]
Returns a node_iterator corresponding to the node at the root of the tree.
```

#### node\_begin() [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::ov_tree_map<
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin () const [inline]
Returns a const node_iterator corresponding to the node at the root of the tree.
```

#### node\_end() [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::ov_tree_map<
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end () [inline]
Returns a node_iterator corresponding to a node just after a leaf of the tree.
```

#### node\_end() [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::ov_tree_map<
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end () const [inline]
Returns a const node_iterator corresponding to a node just after a leaf of the tree.
```

The documentation for this class was generated from the following file:

class __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >
```

Node reference.

### 6.744.2 Member Function Documentation

#### `get_l_child()`

```
template<typename Value_Type, typename Metadata_Type, typename _Alloc>
ov_tree_node_it_ __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >::get↵
_l_child () const [inline]
```

Returns the node reference associated with the left node.

#### `get_r_child()`

```
template<typename Value_Type, typename Metadata_Type, typename _Alloc>
ov_tree_node_it_ __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >::get↵
_r_child () const [inline]
```

Returns the node reference associated with the right node.

#### `operator*()`

```
template<typename Value_Type, typename Metadata_Type, typename _Alloc>
reference __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >::operator* ()
const [inline]
```

Access.

## 6.745 \_\_gnu\_pbds::ov\_tree\_tag Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for \_\_gnu\_pbds::ov\_tree\_tag:

#### 6.745.1 Detailed Description

Ordered-vector tree.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.746 std::overflow\_error Class Reference

```
#include <stdexcept_except.h>
```

Inheritance diagram for `std::overflow_error`:

### Public Member Functions

- **overflow\_error** (const char \*)
- **overflow\_error** (const [overflow\\_error](#) &)=default
- **overflow\_error** (const [string](#) &\_\_arg)
- **overflow\_error** ([overflow\\_error](#) &&)=default
- [overflow\\_error](#) & **operator=** (const [overflow\\_error](#) &)=default
- [overflow\\_error](#) & **operator=** ([overflow\\_error](#) &&)=default
- virtual const char \* **what** () const noexcept

#### 6.746.1 Detailed Description

Thrown to indicate arithmetic overflow.

#### 6.746.2 Member Function Documentation

##### **what()**

`virtual const char * std::runtime_error::what () const [virtual], [noexcept], [inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#), and [std::filesystem::filesystem\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this class was generated from the following file:

- [stdexcept\\_except.h](#)

## 6.747 `std::owner_less<_Tp>` Struct Template Reference

### 6.747.1 Detailed Description

```
template<typename _Tp = void>
struct std::owner_less<_Tp>
```

Primary template `owner_less`.

The documentation for this struct was generated from the following file:

- [bits/shared\\_ptr.h](#)

## 6.748 `std::experimental::fundamentals_v2::owner_less<shared_ptr<_Tp>>` Struct Template Reference

```
#include <shared_ptr.h>
```

### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)
- typedef `bool` [result\\_type](#)
- typedef `_Tp` [second\\_argument\\_type](#)

### Public Member Functions

- `bool` **operator()** (`const _Tp &__lhs, const _Tp &__rhs`) `const noexcept`
- `bool` **operator()** (`const _Tp &__lhs, const _Tp1 &__rhs`) `const noexcept`
- `bool` **operator()** (`const _Tp1 &__lhs, const _Tp &__rhs`) `const noexcept`

### 6.748.1 Detailed Description

```
template<typename _Tp>
struct std::experimental::fundamentals_v2::owner_less<shared_ptr<_Tp>>
```

Partial specialization of `owner_less` for `shared_ptr`.

### 6.748.2 Member Typedef Documentation

#### `first_argument_type`

```
typedef _Tp std::binary_function<_Tp, _Tp, bool>::first_argument_type [inherited]
first_argument_type is the type of the first argument
```

#### `result_type`

```
typedef bool std::binary_function<_Tp, _Tp, bool>::result_type [inherited]
result_type is the return type
```

#### `second_argument_type`

```
typedef _Tp std::binary_function<_Tp, _Tp, bool>::second_argument_type [inherited]
second_argument_type is the type of the second argument
```

The documentation for this struct was generated from the following file:

- [experimental/bits/shared\\_ptr.h](#)

## 6.749 `std::owner_less< shared_ptr< _Tp > >` Struct Template Reference

```
#include <shared_ptr.h>
```

### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)
- typedef bool [result\\_type](#)
- typedef `_Tp` [second\\_argument\\_type](#)

### Public Member Functions

- bool **operator()** (const `_Tp` &\_\_lhs, const `_Tp` &\_\_rhs) const noexcept
- bool **operator()** (const `_Tp` &\_\_lhs, const `_Tp1` &\_\_rhs) const noexcept
- bool **operator()** (const `_Tp1` &\_\_lhs, const `_Tp` &\_\_rhs) const noexcept

#### 6.749.1 Detailed Description

```
template<typename _Tp>  
struct std::owner_less< shared_ptr< _Tp > >
```

Partial specialization of `owner_less` for `shared_ptr`.

#### 6.749.2 Member Typedef Documentation

##### `first_argument_type`

```
typedef _Tp std::binary_function< _Tp, _Tp, bool >::first_argument_type [inherited]  
first_argument_type is the type of the first argument
```

##### `result_type`

```
typedef bool std::binary_function< _Tp, _Tp, bool >::result_type [inherited]  
result_type is the return type
```

##### `second_argument_type`

```
typedef _Tp std::binary_function< _Tp, _Tp, bool >::second_argument_type [inherited]  
second_argument_type is the type of the second argument  
The documentation for this struct was generated from the following file:
```

- [bits/shared\\_ptr.h](#)

## 6.750 `std::owner_less< void >` Struct Reference

```
#include <shared_ptr.h>
```

### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)
- typedef bool [result\\_type](#)
- typedef `_Tp` [second\\_argument\\_type](#)

### Public Member Functions

- bool **operator()** (const `_Tp` &\_\_lhs, const `_Tp` &\_\_rhs) const noexcept
- bool **operator()** (const `_Tp` &\_\_lhs, const `_Tp1` &\_\_rhs) const noexcept
- bool **operator()** (const `_Tp1` &\_\_lhs, const `_Tp` &\_\_rhs) const noexcept

### 6.750.1 Detailed Description

Void specialization of `owner_less` compares either `shared_ptr` or `weak_ptr`.

### 6.750.2 Member Typedef Documentation

#### `first_argument_type`

`typedef _Tp std::binary_function< _Tp, _Tp, bool >::first_argument_type` [inherited]  
`first_argument_type` is the type of the first argument

#### `result_type`

`typedef bool std::binary_function< _Tp, _Tp, bool >::result_type` [inherited]  
`result_type` is the return type

#### `second_argument_type`

`typedef _Tp std::binary_function< _Tp, _Tp, bool >::second_argument_type` [inherited]  
`second_argument_type` is the type of the second argument

The documentation for this struct was generated from the following file:

- [bits/shared\\_ptr.h](#)

## 6.751 `std::experimental::fundamentals_v2::owner_less< weak_ptr< _Tp > >` Struct Template Reference

```
#include <shared_ptr.h>
```

### Public Types

- `typedef _Tp first_argument_type`
- `typedef bool result_type`
- `typedef _Tp second_argument_type`

### Public Member Functions

- `bool operator() (const _Tp &__lhs, const _Tp &__rhs) const noexcept`
- `bool operator() (const _Tp &__lhs, const _Tp1 &__rhs) const noexcept`
- `bool operator() (const _Tp1 &__lhs, const _Tp &__rhs) const noexcept`

### 6.751.1 Detailed Description

`template<typename _Tp>`

`struct std::experimental::fundamentals_v2::owner_less< weak_ptr< _Tp > >`

Partial specialization of `owner_less` for `weak_ptr`.

### 6.751.2 Member Typedef Documentation

#### `first_argument_type`

`typedef _Tp std::binary_function< _Tp, _Tp, bool >::first_argument_type` [inherited]  
`first_argument_type` is the type of the first argument

**result\_type**

typedef bool [std::binary\\_function](#)< \_Tp, \_Tp, bool >::result\_type [inherited]  
result\_type is the return type

**second\_argument\_type**

typedef \_Tp [std::binary\\_function](#)< \_Tp, \_Tp, bool >::second\_argument\_type [inherited]  
second\_argument\_type is the type of the second argument  
The documentation for this struct was generated from the following file:

- [experimental/bits/shared\\_ptr.h](#)

**6.752 std::owner\_less< weak\_ptr< \_Tp > > Struct Template Reference**

#### 6.754.1 Detailed Description

```
template<typename _T1, typename _T2>  
struct __gnu_cxx::pair<_T1, _T2 >
```

Struct holding two objects of arbitrary type.

## Template Parameters

|                  |                        |
|------------------|------------------------|
| <code>_T1</code> | Type of first object.  |
| <code>_T2</code> | Type of second object. |

<https://gcc.gnu.org/onlinedocs/libstdc++/manual/utilities.html>

### 6.754.2 Member Typedef Documentation

#### `first_type`

```
template<typename _T1, typename _T2>
typedef _T1 std::pair< _T1, _T2 >::first_type
The type of the first member.
```

#### `second_type`

```
template<typename _T1, typename _T2>
typedef _T2 std::pair< _T1, _T2 >::second_type
The type of the second member.
```

### 6.754.3 Constructor & Destructor Documentation

#### `pair()` [1/2]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::pair (
    const pair< _T1, _T2 > & ) [constexpr], [default]
Copy constructor.
```

#### `pair()` [2/2]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::pair (
    pair< _T1, _T2 > && ) [constexpr], [default]
Move constructor.
```

### 6.754.4 Member Function Documentation

#### `explicit()` [1/5]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_constructible<_U1, _U2>()) && (!_S_dangles<_U1, _U2>())
std::pair< _T1, _T2 >::explicit (
    !_S_convertible<_U1, _U2 > ()) && [constexpr]
Constructor accepting two values of arbitrary types.
```

#### `explicit()` [2/5]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_constructible<_U1, _U2>()) && (!_S_dangles<_U1, _U2>())
_U2 &constexpr std::pair< _T1, _T2 >::explicit (
    !_S_convertible<_U1, _U2 > ()) [constexpr]
Converting constructor from a non-const pair<_U1, _U2> rvalue.
```

**explicit()** [3/5]

```
template<typename _T1, typename _T2>
std::pair<_T1, _T2>::explicit (
    !_S_convertible< const _T1 &, const _T2 & > () const & [constexpr]
```

Constructor accepting lvalues of first\_type and second\_type

**explicit()** [4/5]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_constructible<const _U1&, const _U2&>()) && (!_S_dangles<_U1, _U2>())
_U2 &&constexpr std::pair<_T1, _T2>::explicit (
    !_S_convertible< const _U1 &, const _U2 & > () const [constexpr]
```

Converting constructor from a const pair<U1, U2> lvalue.

**explicit()** [5/5]

```
template<typename _T1, typename _T2>
std::pair<_T1, _T2>::explicit (
    __not_< __and_< __is_implicitly_default_constructible<_T1>, __is_implicitly_↵
default_constructible<_T2> > > > () [inline], [constexpr], [noexcept]
```

Default constructor.

**operator=()** [1/4]

```
template<typename _T1, typename _T2>
pair & std::pair<_T1, _T2>::operator= (
    const pair<_T1, _T2> & __p) [inline], [constexpr], [noexcept]
```

Copy assignment operator.

**operator=()** [2/4]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_assignable<const _U1&, const _U2&>())
pair & std::pair<_T1, _T2>::operator= (
    const pair<_U1, _U2> & __p) [inline], [constexpr], [noexcept]
```

Converting assignment from a const pair<U1, U2> lvalue.

**operator=()** [3/4]

```
template<typename _T1, typename _T2>
pair & std::pair<_T1, _T2>::operator= (
    pair<_T1, _T2> && __p) [inline], [constexpr], [noexcept]
```

Move assignment operator.

**operator=()** [4/4]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_assignable<_U1, _U2>())
pair & std::pair<_T1, _T2>::operator= (
    pair<_U1, _U2> && __p) [inline], [constexpr], [noexcept]
```

Converting assignment from a non-const pair<U1, U2> rvalue.

**swap()**

```
template<typename _T1, typename _T2>
void std::pair<_T1, _T2 >::swap (
    pair<_T1, _T2 > &__p) [inline], [constexpr], [noexcept]
```

Swap the first members and then the second members.

**6.754.5 Member Data Documentation****first**

```
template<typename _T1, typename _T2>
_T1 std::pair<_T1, _T2 >::first
The first member.
```

**second**

```
template<typename _T1, typename _T2>
_T2 std::pair<_T1, _T2 >::second
The second member.
```

The documentation for this struct was generated from the following files:

- [bits/stl\\_iterator.h](#)
- [stl\\_pair.h](#)
- [tuple](#)

### 6.755.1 Detailed Description

`template<typename _T1, typename _T2>`  
`struct std::pair< _T1, _T2 >`

Struct holding two objects of arbitrary type.

## Template Parameters

|                  |                        |
|------------------|------------------------|
| <code>_T1</code> | Type of first object.  |
| <code>_T2</code> | Type of second object. |

<https://gcc.gnu.org/onlinedocs/libstdc++/manual/utilities.html>

### 6.755.2 Member Typedef Documentation

#### `first_type`

```
template<typename _T1, typename _T2>
typedef _T1 std::pair< _T1, _T2 >::first_type
The type of the first member.
```

#### `second_type`

```
template<typename _T1, typename _T2>
typedef _T2 std::pair< _T1, _T2 >::second_type
The type of the second member.
```

### 6.755.3 Constructor & Destructor Documentation

#### `pair()` [1/2]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::pair (
    const pair< _T1, _T2 > & ) [constexpr], [default]
Copy constructor.
Referenced by pair().
```

#### `pair()` [2/2]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::pair (
    pair< _T1, _T2 > && ) [constexpr], [default]
Move constructor.
```

### 6.755.4 Member Function Documentation

#### `explicit()` [1/5]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_constructible<_U1, _U2>()) && (!_S_dangles<_U1, _U2>())
std::pair< _T1, _T2 >::explicit (
    !_S_convertible< _U1, _U2 > ()) && [constexpr]
Constructor accepting two values of arbitrary types.
```

#### `explicit()` [2/5]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_constructible<_U1, _U2>()) && (!_S_dangles<_U1, _U2>())
_U2 &constexpr std::pair< _T1, _T2 >::explicit (
    !_S_convertible< _U1, _U2 > ()) [constexpr]
```

Converting constructor from a non-const pair<U1, U2> rvalue.

#### explicit() [3/5]

```
template<typename _T1, typename _T2>
std::pair<_T1, _T2>::explicit (
    !_S_convertible< const _T1 &, const _T2 & > () const & [constexpr]
```

Constructor accepting lvalues of first\_type and second\_type

#### explicit() [4/5]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_constructible<const _U1&, const _U2&>()) && (!_S_dangles<_U1, _U2>())
_U2 &&constexpr std::pair<_T1, _T2>::explicit (
    !_S_convertible< const _U1 &, const _U2 & > () const [constexpr]
```

Converting constructor from a const pair<U1, U2> lvalue.

#### explicit() [5/5]

```
template<typename _T1, typename _T2>
std::pair<_T1, _T2>::explicit (
    __not< __and< __is_implicitly_default_constructible<_T1>, __is_implicitly_↵
default_constructible<_T2> > > () [inline], [constexpr], [noexcept]
```

Default constructor.

#### operator=() [1/4]

```
template<typename _T1, typename _T2>
pair & std::pair<_T1, _T2>::operator= (
    const pair<_T1, _T2> & __p) [inline], [constexpr], [noexcept]
```

Copy assignment operator.

#### operator=() [2/4]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_assignable<const _U1&, const _U2&>())
pair & std::pair<_T1, _T2>::operator= (
    const pair<_U1, _U2> & __p) [inline], [constexpr], [noexcept]
```

Converting assignment from a const pair<U1, U2> lvalue.

#### operator=() [3/4]

```
template<typename _T1, typename _T2>
pair & std::pair<_T1, _T2>::operator= (
    pair<_T1, _T2> && __p) [inline], [constexpr], [noexcept]
```

Move assignment operator.

#### operator=() [4/4]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_assignable<_U1, _U2>())
```

```
pair & std::pair< _T1, _T2 >::operator= (
    pair< _U1, _U2 > && __p) [inline], [constexpr], [noexcept]
```

Converting assignment from a non-const pair<U1, U2> rvalue.

### swap()

```
template<typename _T1, typename _T2>
void std::pair< _T1, _T2 >::swap (
    pair< _T1, _T2 > & __p) [inline], [constexpr], [noexcept]
```

Swap the first members and then the second members.

Referenced by [std::pair< const \\_\\_iter\\_key\\_t< \\_InputIterator >, \\_\\_iter\\_val\\_t< \\_InputIterator > >::swap\(\)](#), [std::sub\\_match< const char \\* >::swap\(\)](#), and [std::swap\(\)](#).

## 6.755.5 Member Data Documentation

### first

```
template<typename _T1, typename _T2>
_T1 std::pair< _T1, _T2 >::first
```

The first member.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_find\\_template\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_find\\_template\(\)](#), [std::\\_\\_sample\(\)](#), [std::set< \\_Key, \\_Cmp, polymorphic\\_allocator< \\_Key > >::insert\(\)](#), [std::pair< const \\_\\_iter\\_key\\_t< \\_InputIterator >, \\_\\_iter\\_val\\_t< \\_InputIterator > >::operator<=\(\)](#), [std::pair< const \\_\\_iter\\_key\\_t< \\_InputIterator >, \\_\\_iter\\_val\\_t< \\_InputIterator > >::operator==\(\)](#), and [std::shuffle\(\)](#).

### second

```
template<typename _T1, typename _T2>
_T2 std::pair< _T1, _T2 >::second
```

The second member.

Referenced by [std::\\_\\_sample\(\)](#), [std::set< \\_Key, \\_Cmp, polymorphic\\_allocator< \\_Key > >::insert\(\)](#), [std::pair< const \\_\\_iter\\_key\\_t< \\_InputIterator >, \\_\\_iter\\_val\\_t< \\_InputIterator > >::operator<=\(\)](#), [std::pair< const \\_\\_iter\\_key\\_t< \\_InputIterator >, \\_\\_iter\\_val\\_t< \\_InputIterator > >::operator==\(\)](#), and [std::shuffle\(\)](#).

### Protected Attributes

- node\_pointer **m\_p\_root**
- size\_type **m\_size**

#### 6.756.1 Detailed Description

```
template<typename Value_Type, typename Cmp_Fn, typename _Alloc>  
class __gnu_pbds::detail::pairing_heap< Value_Type, Cmp_Fn, _Alloc >
```

Pairing heap.

The documentation for this class was generated from the following file:

- [pairing\\_heap.hpp](#)

#### 6.757 \_\_gnu\_pbds::pairing\_heap\_tag Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for \_\_gnu\_pbds::pairing\_heap\_tag:

#### 6.757.1 Detailed Description

Pairing-heap.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

#### 6.758 \_\_gnu\_parallel::parallel\_tag Struct Reference

```
#include <tags.h>
```

Inheritance diagram for `__gnu_parallel::parallel_tag`:

#### Public Member Functions

- [parallel\\_tag](#) ()
- [parallel\\_tag](#) ([\\_ThreadIndex](#) \_\_num\_threads)
- [\\_ThreadIndex](#) [\\_\\_get\\_num\\_threads](#) ()

- void `set_num_threads` (`_ThreadIndex` `__num_threads`)

### 6.758.1 Detailed Description

Recommends parallel execution at compile time, optionally using a user-specified number of threads.

### 6.758.2 Constructor & Destructor Documentation

#### `parallel_tag()` [1/2]

```
__gnu_parallel::parallel_tag::parallel_tag () [inline]
```

Default constructor. Use default number of threads.

#### `parallel_tag()` [2/2]

```
__gnu_parallel::parallel_tag::parallel_tag (
    _ThreadIndex __num_threads) [inline]
```

Default constructor. Recommend number of threads to use.

#### Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

### 6.758.3 Member Function Documentation

#### `__get_num_threads()`

```
_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline]
```

Find out desired number of threads.

#### Returns

Desired number of threads.

Referenced by `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, and `__gnu_parallel::__parallel_sort()`.

#### `set_num_threads()`

```
void __gnu_parallel::parallel_tag::set_num_threads (
    _ThreadIndex __num_threads) [inline]
```

Set the desired number of threads.

#### Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

### 6.780.1 Detailed Description

template<typename Key, typename Mapped, typename Node\_And\_It\_Traits, typename \_Alloc>  
class `__gnu_pbds::detail::pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >`

PATRICIA trie.

This implementation loosely borrows ideas from: 1) Fast Mergeable Integer Maps, Okasaki, Gill 1998 2) Ptsset: Sets of integers implemented as Patricia trees, Jean-Christophe Filliatr, 2000

### 6.780.2 Member Enumeration Documentation

#### node\_type

enum `__gnu_pbds::detail::pat_trie_base::node_type` [inherited]

Three types of nodes.

i\_node is used by `_Inode`, leaf\_node by `_Leaf`, and head\_node by `_Head`.

### 6.780.3 Member Function Documentation

#### node\_begin() [1/2]

template<typename Key, typename Mapped, typename Node\_And\_It\_Traits, typename \_Alloc>  
`pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_iterator` `__gnu_pbds::detail::pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_begin()` [inline]

Returns a node\_iterator corresponding to the node at the root of the tree.

**node\_begin()** [2/2]

```
template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_begin () const [inline]
```

Returns a const node\_iterator corresponding to the node at the root of the tree.

**node\_end()** [1/2]

```
template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_end () [inline]
```

Returns a node\_iterator corresponding to a node just after a leaf of the tree.

**node\_end()** [2/2]

```
template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_end () const [inline]
```

Returns a const node\_iterator corresponding to a node just after a leaf of the tree.

### 6.784.1 Detailed Description

**template<typename \_RealType = double>**  
**class std::piecewise\_constant\_distribution< \_RealType >**

A `piecewise_constant_distribution` random number distribution.

This distribution produces random numbers  $x, b_0 \leq x < b_n$ , uniformly distributed over each subinterval  $[b_i, b_{i+1})$  according to the probability mass function

$$p(x|b_0, \dots, b_n, \rho_0, \dots, \rho_{n-1}) = \rho_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}$$

for  $b_i \leq x < b_{i+1}$ .

Since

C++11

### 6.784.2 Member Typedef Documentation

#### result\_type

```
template<typename _RealType = double>
```

```
typedef _RealType std::piecewise_constant_distribution< _RealType >::result_type
```

The type of the range of the distribution.

### 6.784.3 Member Function Documentation

#### densities()

```
template<typename _RealType = double>
```

```
std::vector< double > std::piecewise_constant_distribution< _RealType >::densities () const  
[inline]
```

Returns a vector of the probability densities.

#### intervals()

```
template<typename _RealType = double>
```

```
std::vector< _RealType > std::piecewise_constant_distribution< _RealType >::intervals () const  
[inline]
```

Returns a vector of the intervals.

#### max()

```
template<typename _RealType = double>
```

```
result_type std::piecewise_constant_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### min()

```
template<typename _RealType = double>
```

```
result_type std::piecewise_constant_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

#### operator>()

```
template<typename _RealType = double>
```

```
template<typename _UniformRandomNumberGenerator>
```

```
result_type std::piecewise_constant_distribution< _RealType >::operator() (  
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

#### param() [1/2]

```
template<typename _RealType = double>
```

```
param_type std::piecewise_constant_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

#### param() [2/2]

```
template<typename _RealType = double>
```

```
void std::piecewise_constant_distribution< _RealType >::param (  
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

## Parameters

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _RealType = double>
void std::piecewise_constant_distribution<_RealType>::reset () [inline]
Resets the distribution state.
```

**6.784.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream<_CharT, _Traits> & operator<< (
    std::basic_ostream<_CharT, _Traits> & __os,
    const std::piecewise_constant_distribution<_RealType1> & __x) [friend]
Inserts a piecewise_constant_distribution random number distribution __x into the output stream __os.
```

## Parameters

|                   |                                                               |
|-------------------|---------------------------------------------------------------|
| <code>__os</code> | An output stream.                                             |
| <code>__x</code>  | A piecewise_constant_distribution random number distribution. |

## Returns

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _RealType = double>
bool operator== (
    const piecewise_constant_distribution<_RealType> & __d1,
    const piecewise_constant_distribution<_RealType> & __d2) [friend]
Return true if two piecewise constant distributions have the same parameters.
```

**operator>>**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream<_CharT, _Traits> & operator>> (
    std::basic_istream<_CharT, _Traits> & __is,
    std::piecewise_constant_distribution<_RealType1> & __x) [friend]
Extracts a piecewise_constant_distribution random number distribution __x from the input stream __is.
```

## Parameters

|                   |                                                                   |
|-------------------|-------------------------------------------------------------------|
| <code>__is</code> | An input stream.                                                  |
| <code>__x</code>  | A piecewise_constant_distribution random number generator engine. |

### Returns

The input stream with \_\_\_x extracted or in an error state.

```
template<typename _RealType = double>
typedef _RealType std::piecewise_linear_distribution< _RealType >::result_type
```

The type of the range of the distribution.

## 6.786.3 Member Function Documentation

### densities()

```
template<typename _RealType = double>
std::vector< double > std::piecewise_linear_distribution< _RealType >::densities () const [inline]
```

Return a vector of the probability densities of the distribution.

### intervals()

```
template<typename _RealType = double>
std::vector< _RealType > std::piecewise_linear_distribution< _RealType >::intervals () const [inline]
```

Return the intervals of the distribution.

### max()

```
template<typename _RealType = double>
result_type std::piecewise_linear_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

**min()**

```
template<typename _RealType = double>
result_type std::piecewise_linear_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

**operator>()()**

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::piecewise_linear_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator>\(\)\(\)](#).

**param() [1/2]**

```
template<typename _RealType = double>
param_type std::piecewise_linear_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

**param() [2/2]**

```
template<typename _RealType = double>
void std::piecewise_linear_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _RealType = double>
void std::piecewise_linear_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

**6.786.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::piecewise_linear_distribution< _RealType1 > & __x) [friend]
```

Inserts a `piecewise_linear_distribution` random number distribution `__x` into the output stream `__os`.

**Parameters**

|                   |                                                                          |
|-------------------|--------------------------------------------------------------------------|
| <code>__os</code> | An output stream.                                                        |
| <code>__x</code>  | A <code>piecewise_linear_distribution</code> random number distribution. |

**Returns**

The output stream with the state of \_\_\_x inserted or in an error state.

**operator==**

```
template<typename _RealType = double>
bool operator== (
    const piecewise\_linear\_distribution< _RealType > & __d1,
    const piecewise\_linear\_distribution< _RealType > & __d2) [friend]
```

Return true if two piecewise linear distributions have the same parameters.

**operator>>**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::piecewise_linear_distribution< _RealType1 > & __x) [friend]
```

Extracts a `piecewise_linear_distribution` random number distribution \_\_\_x from the input stream \_\_is.

**Parameters**

|                   |                                                                              |
|-------------------|------------------------------------------------------------------------------|
| <code>__is</code> | An input stream.                                                             |
| <code>__x</code>  | A <code>piecewise_linear_distribution</code> random number generator engine. |

**Returns**

The input stream with \_\_\_x extracted or in an error state.

template<typename _Ptr, typename _Elt, bool = is_void<_Elt>::value>
pointer std::__ptr_traits_ptr_to<_Ptr, _Elt, bool>::pointer_to (
    element_type & __r) [inline], [static], [inherited]
```

Obtain a pointer to an object.

**Parameters**

|          |                                                            |
|----------|------------------------------------------------------------|
| ↩        | A reference to an object of type <code>element_type</code> |
| ↩        |                                                            |
| ↩        |                                                            |
| ↩        |                                                            |
| <i>r</i> |                                                            |

**Returns**

```
pointer::pointer_to(__r)
```

**Precondition**

`pointer::pointer_to(__r)` is a valid expression.

The documentation for this struct was generated from the following file:

#### 6.792.1 Detailed Description

```
template<typename _Tp>
struct std::pointer_traits<_Tp * >
```

Partial specialization for built-in pointers.

Since

C++11

#### 6.792.2 Member Typedef Documentation

##### **difference\_type** [1/2]

```
using std::__ptr_traits_impl<_Tp *, _Elt >::difference_type
```

The type used to represent the difference between two pointers.

##### **difference\_type** [2/2]

```
template<typename _Tp>
typedef ptrdiff_t std::pointer\_traits<_Tp * >::difference_type
```

Type used to represent the difference between two pointers.

##### **element\_type** [1/2]

```
using std::__ptr_traits_impl<_Tp *, _Elt >::element_type
```

The type pointed to.

##### **element\_type** [2/2]

```
template<typename _Tp>
typedef _Tp std::pointer\_traits<_Tp * >::element_type
```

The type pointed to.

##### **pointer** [1/2]

```
using std::__ptr_traits_impl<_Tp *, _Elt >::pointer
```

The pointer type.

##### **pointer** [2/2]

```
template<typename _Tp>
typedef _Tp* std::pointer\_traits<_Tp * >::pointer
```

The pointer type.

##### **rebind** [1/2]

```
using std::__ptr_traits_impl<_Tp *, _Elt >::rebind
```

A pointer to a different type.

**rebind** [2/2]

```
template<typename _Tp>
template<typename _Up>
using std::pointer_traits<_Tp * >::rebind
A pointer to a different type.
```

**6.792.3 Member Function Documentation****pointer\_to()** [1/3]

```
template<typename _Ptr, typename _Elt, bool = is_void<_Elt>::value>
pointer std::__ptr_traits_ptr_to<_Ptr, _Elt, bool >::pointer_to (
    element_type & __r) [inline], [static], [inherited]
```

Obtain a pointer to an object.

**Parameters**

|          |                                               |
|----------|-----------------------------------------------|
| ↩        | A reference to an object of type element_type |
| ↩        |                                               |
| ↩        |                                               |
| ↩        |                                               |
| <i>r</i> |                                               |

**Returns**

pointer::pointer\_to(\_\_r)

**Precondition**

pointer::pointer\_to(\_\_r) is a valid expression.

**pointer\_to()** [2/3]

```
template<typename _Ptr, typename _Elt, bool = is_void<_Elt>::value>
pointer std::__ptr_traits_ptr_to<_Ptr, _Elt, bool >::pointer_to (
    element_type & __r) [inline], [static], [inherited]
```

Obtain a pointer to an object.

**Parameters**

|          |                                               |
|----------|-----------------------------------------------|
| ↩        | A reference to an object of type element_type |
| ↩        |                                               |
| ↩        |                                               |
| ↩        |                                               |
| <i>r</i> |                                               |

**Returns**

pointer::pointer\_to(\_\_r)

**Precondition**

pointer::pointer\_to(\_\_r) is a valid expression.

**pointer\_to()** [3/3]

```
pointer std::__ptr_traits_ptr_to< _Tp *, _Elt, bool >::pointer_to (
    element_type & __r) [inline], [static]
```

Obtain a pointer to an object.

**Parameters**

|          |                                                            |
|----------|------------------------------------------------------------|
| ↔        | A reference to an object of type <code>element_type</code> |
| ↔        |                                                            |
| ↔        |                                                            |
| ↔        |                                                            |
| <i>r</i> |                                                            |

**Returns**

```
pointer::pointer_to(__r)
```

**Precondition**

`pointer::pointer_to(__r)` is a valid expression.

## 6.793.1 Detailed Description

template<typename \_IntType = int>  
class std::poisson\_distribution< \_IntType >

A discrete Poisson random number distribution.

The formula for the Poisson probability density function is  $p(i|\mu) = \frac{\mu^i}{i!} e^{-\mu}$  where  $\mu$  is the parameter of the distribution.

Since

C++11

## 6.793.2 Member Typedef Documentation

### result\_type

```
template<typename _IntType = int>
typedef _IntType std::poisson_distribution< _IntType >::result_type
```

The type of the range of the distribution.

## 6.793.3 Member Function Documentation

### max()

```
template<typename _IntType = int>
result_type std::poisson_distribution< _IntType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

### mean()

```
template<typename _IntType = int>
double std::poisson_distribution< _IntType >::mean () const [inline]
```

Returns the distribution parameter mean.

### min()

```
template<typename _IntType = int>
result_type std::poisson_distribution< _IntType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

**operator>() [1/2]**

```
template<typename _IntType = int>
template<typename _UniformRandomNumberGenerator>
result_type std::poisson_distribution< _IntType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator>\(\)](#).

**operator>() [2/2]**

```
template<typename _IntType>
template<typename _UniformRandomNumberGenerator>
poisson_distribution< _IntType >::result_type std::poisson_distribution< _IntType >::operator()
(
    _UniformRandomNumberGenerator & __urng,
    const param_type & __param)
```

A rejection algorithm when mean  $\geq 12$  and a simple method based upon the multiplication of uniform random variates otherwise. NB: The former is available only if `_GLIBCXX_USE_C99_MATH_FUNCS` is defined.

Reference: Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. X, Sects. 3.3 & 3.4 (+ Errata!).

References [std::abs\(\)](#), [std::numeric\\_limits< \\_Tp >::epsilon\(\)](#), [std::log\(\)](#), and [std::numeric\\_limits< \\_Tp >::max\(\)](#).

**param() [1/2]**

```
template<typename _IntType = int>
param_type std::poisson_distribution< _IntType >::param () const [inline]
```

Returns the parameter set of the distribution.

**param() [2/2]**

```
template<typename _IntType = int>
void std::poisson_distribution< _IntType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _IntType = int>
void std::poisson_distribution< _IntType >::reset () [inline]
```

Resets the distribution state.

**6.793.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::poisson_distribution< _IntType1 > & __x) [friend]
```

Inserts a poisson\_distribution random number distribution `___x` into the output stream `___os`.

#### Parameters

|                    |                                                    |
|--------------------|----------------------------------------------------|
| <code>___os</code> | An output stream.                                  |
| <code>___x</code>  | A poisson_distribution random number distribution. |

#### Returns

The output stream with the state of `___x` inserted or in an error state.

#### operator==

```
template<typename _IntType = int>
bool operator== (
    const poisson_distribution< _IntType > & __d1,
    const poisson_distribution< _IntType > & __d2) [friend]
```

Return true if two Poisson distributions have the same parameters and the sequences that would be generated are equal.

#### operator>>

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::poisson_distribution< _IntType1 > & __x) [friend]
```

Extracts a poisson\_distribution random number distribution `___x` from the input stream `___is`.

#### Parameters

|                    |                                                        |
|--------------------|--------------------------------------------------------|
| <code>___is</code> | An input stream.                                       |
| <code>___x</code>  | A poisson_distribution random number generator engine. |

#### Returns

The input stream with `___x` extracted or in an error state.

### 6.794.1 Detailed Description

```
template<typename _Tp>
class std::pmr::polymorphic_allocator< _Tp >
```

Class template polymorphic\_allocator.

Since

C++17

The documentation for this class was generated from the following file:

- [memory\\_resource.h](#)

## 6.795 std::pmr::pool\_options Struct Reference

```
#include <memory_resource>
```

### Public Attributes

- size\_t **largest\_required\_pool\_block**
- size\_t [max\\_blocks\\_per\\_chunk](#)

### 6.795.1 Detailed Description

Parameters for tuning a pool resource's behaviour.

Since

C++17

## 6.795.2 Member Data Documentation

### `max_blocks_per_chunk`

`size_t std::pmr::pool_options::max_blocks_per_chunk`

Upper limit on number of blocks in a chunk.

A lower value prevents allocating huge chunks that could remain mostly unused, but means pools will need to replenished more frequently.

The documentation for this struct was generated from the following file:

- [memory\\_resource](#)

## 6.796 `__gnu_pbds::priority_queue<_Tv, Cmp_Fn, Tag, _Alloc>` Class Template Reference

### 6.796.1 Detailed Description

```
template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>
```

```
class __gnu_pbds::priority_queue<_Tv, Cmp_Fn, Tag, _Alloc>
```

A priority queue composed of one specific heap policy.

### Template Parameters

|                     |                                                                     |
|---------------------|---------------------------------------------------------------------|
| <code>_Tv</code>    | Value type.                                                         |
| <code>Cmp_Fn</code> | Comparison functor.                                                 |
| <code>Tag</code>    | Instantiating data structure type, see <code>container_tag</code> . |
| <code>_Alloc</code> | Allocator type.                                                     |

Base is dispatched at compile time via `Tag`, from the following choices: `binary_heap_tag`, `binomial_heap_tag`, `pairing_↵_heap_tag`, `rc_binomial_heap_tag`, `thin_heap_tag`

Base choices are: `detail::binary_heap`, `detail::binomial_heap`, `detail::pairing_heap`, `detail::rc_binomial_heap`, `detail::↵thin_heap`.

## 6.796.2 Constructor & Destructor Documentation

### `priority_queue()` [1/3]

```
template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>>
__gnu_pbds::priority_queue<_Tv, Cmp_Fn, Tag, _Alloc >::priority_queue (
    const cmp_fn & r_cmp_fn) [inline]
```

Constructor taking some policy objects. `r_cmp_fn` will be copied by the `Cmp_Fn` object of the container object.

### `priority_queue()` [2/3]

```
template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>>
template<typename It>
__gnu_pbds::priority_queue<_Tv, Cmp_Fn, Tag, _Alloc >::priority_queue (
    It first_it,
    It last_it) [inline]
```

Constructor taking `__iterators` to a range of `value_types`. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

### `priority_queue()` [3/3]

```
template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>>
template<typename It>
__gnu_pbds::priority_queue<_Tv, Cmp_Fn, Tag, _Alloc >::priority_queue (
    It first_it,
    It last_it,
    const cmp_fn & r_cmp_fn) [inline]
```

Constructor taking `__iterators` to a range of `value_types` and some policy objects The `value_types` between `first_it` and `last_it` will be inserted into the container object. `r_cmp_fn` will be copied by the `cmp_fn` object of the container object.

The documentation for this class was generated from the following file:

- [priority\\_queue.hpp](#)

- void `swap(priority_queue &__pq)` noexcept(`__and_<__c++1z or gnu++11 __is_nothrow_swappable<_Sequence>, __is_nothrow_swappable<_Compare>>::value`)
- const\_reference `top()` const

### Protected Attributes

- `_Sequence c`
- `_Compare comp`

### 6.797.1 Detailed Description

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>
class std::priority_queue<_Tp, _Sequence, _Compare>
```

A standard container automatically sorting its contents.

#### Template Parameters

|                        |                                                                                               |
|------------------------|-----------------------------------------------------------------------------------------------|
| <code>_Tp</code>       | Type of element.                                                                              |
| <code>_Sequence</code> | Type of underlying sequence, defaults to <code>vector&lt;_Tp&gt;</code> .                     |
| <code>_Compare</code>  | Comparison function object type, defaults to <code>less&lt;_Sequence::value_type&gt;</code> . |

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces priority-based sorting and queue behavior. Very few of the standard container/sequence interface requirements are met (e.g., iterators).

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::vector`, but it can be any type that supports `front()`, `push_back`, `pop_back`, and random-access iterators, such as `std::deque` or an appropriate user-defined type.

The third template parameter supplies the means of making priority comparisons. It defaults to `less<value_type>` but can be anything defining a strict weak ordering.

Members not found in *normal* containers are `container_type`, which is a typedef for the second `Sequence` parameter, and `push`, `pop`, and `top`, which are standard queue operations.

#### Note

No equality/comparison operators are provided for `priority_queue`.

Sorting of the elements takes place as they are added to, and removed from, the `priority_queue` using the `priority_queue`'s member functions. If you access the elements by other means, and change their data such that the sorting order would be different, the `priority_queue` will not re-sort the elements for you. (How could it know to do so?)

### 6.797.2 Constructor & Destructor Documentation

#### `priority_queue()` [1/2]

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<__and_<is_default_constructible<_Compare>, is_default_constructible<_Seq>>::value>::type>
std::priority_queue<_Tp, _Sequence, _Compare>::priority_queue() [inline]
Default constructor creates no elements.
```

**priority\_queue()** [2/2]

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Tp,
Sequence::value_type>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>>
std::priority_queue< _Tp, _Sequence, _Compare >::priority_queue (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __x = _Compare()) [inline]
```

Builds a queue from a range.

**Parameters**

|                      |                                                         |
|----------------------|---------------------------------------------------------|
| <code>__first</code> | An input iterator.                                      |
| <code>__last</code>  | An input iterator.                                      |
| <code>__x</code>     | A comparison functor describing a strict weak ordering. |
| <code>__s</code>     | An initial sequence with which to start.                |

Begins by copying `__s`, inserting a copy of the elements from `[first,last)` into the copy of `__s`, then ordering the copy according to `__x`.

For more information on function objects, see the documentation on [functor base classes](#).

**6.797.3 Member Function Documentation****empty()**

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Tp,
Sequence::value_type>>
bool std::priority_queue< _Tp, _Sequence, _Compare >::empty () const [inline], [nodiscard]
```

Returns true if the queue is empty.

Referenced by [\\_\\_gnu\\_parallel::multiseq\\_partition\(\)](#), and [\\_\\_gnu\\_parallel::multiseq\\_selection\(\)](#).

**pop()**

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Tp,
Sequence::value_type>>
void std::priority_queue< _Tp, _Sequence, _Compare >::pop () [inline]
```

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

Referenced by [\\_\\_gnu\\_parallel::multiseq\\_partition\(\)](#), and [\\_\\_gnu\\_parallel::multiseq\\_selection\(\)](#).

**push()**

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Tp,
Sequence::value_type>>
void std::priority_queue< _Tp, _Sequence, _Compare >::push (
    const value_type & __x) [inline]
```

Add data to the queue.

**Parameters**

|                  |                   |
|------------------|-------------------|
| <code>__x</code> | Data to be added. |
|------------------|-------------------|

This is a typical queue operation. The time complexity of the operation depends on the underlying sequence. Referenced by [\\_\\_gnu\\_parallel::multiseq\\_partition\(\)](#), and [\\_\\_gnu\\_parallel::multiseq\\_selection\(\)](#).

### size()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↵
Sequence::value_type>>
size_type std::priority\_queue< _Tp, _Sequence, _Compare >::size () const [inline], [nodiscard]
Returns the number of elements in the queue.
```

### top()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↵
Sequence::value_type>>
const_reference std::priority\_queue< _Tp, _Sequence, _Compare >::top () const [inline], [nodiscard]
Returns a read-only (constant) reference to the data at the first element of the queue.
Referenced by \_\_gnu\_parallel::multiseq\_partition\(\), and \_\_gnu\_parallel::multiseq\_selection\(\).

#### 6.807.1 Detailed Description

template<typename \_Tp, typename \_Sequence = deque<\_Tp>>  
class std::queue< \_Tp, \_Sequence >

A standard container giving FIFO behavior.

#### Template Parameters

|                        |                                                      |
|------------------------|------------------------------------------------------|
| <code>_Tp</code>       | Type of element.                                     |
| <code>_Sequence</code> | Type of underlying sequence, defaults to deque<_Tp>. |

Meets many of the requirements of a `container`, but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-first-out queue behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to std::deque, but it can be any type that supports `front`, `back`, `push_back`, and `pop_front`, such as std::list or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push` and `pop`, which are standard queue/FIFO operations.

#### 6.807.2 Constructor & Destructor Documentation

##### queue()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<is_default_constructible<_Seq>::value>::type>
std::queue< _Tp, _Sequence >::queue () [inline]
```

Default constructor creates no elements.

References `c`.

### 6.807.3 Member Function Documentation

#### **back()** [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::queue< _Tp, _Sequence >::back () [inline], [nodiscard]
```

Returns a read/write reference to the data at the last element of the queue.

References [c](#).

#### **back()** [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::queue< _Tp, _Sequence >::back () const [inline], [nodiscard]
```

Returns a read-only (constant) reference to the data at the last element of the queue.

References [c](#).

#### **empty()**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
bool std::queue< _Tp, _Sequence >::empty () const [inline], [nodiscard]
```

Returns true if the queue is empty.

References [c](#).

#### **front()** [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::queue< _Tp, _Sequence >::front () [inline], [nodiscard]
```

Returns a read/write reference to the data at the first element of the queue.

References [c](#).

#### **front()** [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::queue< _Tp, _Sequence >::front () const [inline], [nodiscard]
```

Returns a read-only (constant) reference to the data at the first element of the queue.

References [c](#).

#### **pop()**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::queue< _Tp, _Sequence >::pop () [inline]
```

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.

References [c](#).

#### **push()**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::queue< _Tp, _Sequence >::push (
    const value_type & __x) [inline]
```

Add data to the end of the queue.

## Parameters

|                    |                   |
|--------------------|-------------------|
| <a href="#">_↔</a> | Data to be added. |
| <a href="#">_X</a> |                   |

This is a typical queue operation. The function creates an element at the end of the queue and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

References [c](#).

**size()**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
size_type std::queue< _Tp, _Sequence >::size () const [inline], [nodiscard]
```

Returns the number of elements in the queue.

References [c](#).

**6.807.4 Member Data Documentation****c**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
_Sequence std::queue< _Tp, _Sequence >::c [protected]
```

c is the underlying container.

**6.808 \_\_gnu\_parallel::quicksort\_tag Struct Reference**

```
#include <tags.h>
```

Inheritance diagram for \_\_gnu\_parallel::quicksort\_tag:

**Public Member Functions**

- [quicksort\\_tag](#) ([\\_ThreadIndex](#) \_\_num\_threads)
- [\\_ThreadIndex](#) [\\_\\_get\\_num\\_threads](#) ()
- void [set\\_num\\_threads](#) ([\\_ThreadIndex](#) \_\_num\_threads)

### 6.808.1 Detailed Description

Forces parallel sorting using unbalanced quicksort at compile time.

### 6.808.2 Member Function Documentation

#### `__get_num_threads()`

`_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline], [inherited]`

Find out desired number of threads.

#### Returns

Desired number of threads.

Referenced by `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, and `__gnu_parallel::__parallel_sort()`.

#### `set_num_threads()`

`void __gnu_parallel::parallel_tag::set_num_threads (`  
`_ThreadIndex __num_threads) [inline], [inherited]`

Set the desired number of threads.

#### Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

The documentation for this struct was generated from the following file:

## 6.809 `std::random_access_iterator_tag` Struct Reference

```
#include <stl_iterator_base_types.h>
```

Inheritance diagram for `std::random_access_iterator_tag`:

### 6.809.1 Detailed Description

Random-access iterators support a superset of bidirectional iterator operations. The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

### 6.810 `__gnu_cxx::random_condition` Struct Reference

```
#include <throw_allocator.h>
```

Inheritance diagram for `__gnu_cxx::random_condition`:

## Classes

- struct [always\\_adjustor](#)
- struct [group\\_adjustor](#)
- struct [never\\_adjustor](#)

## Public Member Functions

- void **seed** (unsigned long \_\_s)

## Static Public Member Functions

- static void **set\_probability** (double \_\_p)
- static void **throw\_conditionally** ()

### 6.810.1 Detailed Description

Base class for random probability control and throw.

The documentation for this struct was generated from the following file:

- [throw\\_allocator.h](#)

## 6.811 std::random\_device Class Reference

```
#include <random>
```

## Public Types

- typedef unsigned int [result\\_type](#)

## Public Member Functions

- **random\_device** (const [random\\_device](#) &)=delete
- **random\_device** (const [std::string](#) &\_\_token)
- double **entropy** () const noexcept
- [result\\_type](#) **operator()** ()
- void **operator=** (const [random\\_device](#) &)=delete

## Static Public Member Functions

- static constexpr [result\\_type](#) **max** ()
- static constexpr [result\\_type](#) **min** ()

### 6.811.1 Detailed Description

A standard interface to a platform-specific non-deterministic random number generator (if any are available).

Since

C++11

### 6.811.2 Member Typedef Documentation

#### result\_type

typedef unsigned int [std::random\\_device::result\\_type](#)

The type of the generated random value.

The documentation for this class was generated from the following file:

- [random.h](#)

## 6.812 std::range\_error Class Reference

```
#include <stdexcept>
```

Inheritance diagram for std::range\_error:

### Public Member Functions

- **range\_error** (const char \*)
- **range\_error** (const [range\\_error](#) &)=default
- **range\_error** (const [string](#) &\_\_arg)
- **range\_error** ([range\\_error](#) &&)=default
- [range\\_error](#) & **operator=** (const [range\\_error](#) &)=default
- [range\\_error](#) & **operator=** ([range\\_error](#) &&)=default
- virtual const char \* **what** () const noexcept

### 6.812.1 Detailed Description

Thrown to indicate range errors in internal computations.

### 6.812.2 Member Function Documentation

#### what()

```
virtual const char * std::runtime_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#), and [std::filesystem::filesystem\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

### 6.813 \_\_gnu\_pbds::range\_invalidation\_guarantee Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for \_\_gnu\_pbds::range\_invalidation\_guarantee:

#### 6.813.1 Detailed Description

Signifies an invalidation guarantee that includes all those of its base, and additionally, that any range-type iterator (including the returns of `begin()` and `end()`) is in the correct relative positions to other range-type iterators as long as its corresponding entry has not be erased, regardless of modifications to the container object.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.814 `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >` Class Template Reference

Inheritance diagram for `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >`:

### 6.814.1 Detailed Description

**template**<typename Key, typename Hash\_Fn, typename \_Alloc, typename Comb\_Hash\_Fn, bool Store\_Hash>  
**class** `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >`

Primary template.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

## 6.815 `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, false >` Class Template Reference

```
#include <ranged_hash_fn.hpp>
```

### Protected Types

- typedef Comb\_Hash\_Fn **comb\_hash\_fn\_base**
- typedef Hash\_Fn **hash\_fn\_base**
- typedef [rebind\\_traits](#)< \_Alloc, Key >::const\_reference **key\_const\_reference**
- typedef \_Alloc::size\_type **size\_type**

### Protected Member Functions

- **ranged\_hash\_fn** (size\_type)
- **ranged\_hash\_fn** (size\_type, const Hash\_Fn &)
- **ranged\_hash\_fn** (size\_type, const Hash\_Fn &, const Comb\_Hash\_Fn &)
- void **notify\_resized** (size\_type)
- size\_type **operator()** (key\_const\_reference) const
- void **swap** ([ranged\\_hash\\_fn](#)< Key, Hash\_Fn, \_Alloc, Comb\_Hash\_Fn, false > &)

### 6.815.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Hash_Fn>
class __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, false >
```

Specialization 1 The client supplies a hash function and a ranged hash function, and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

### 6.816 \_\_gnu\_pbds::detail::ranged\_hash\_fn< Key, Hash\_Fn, \_Alloc, Comb\_Hash\_Fn, true > Class Template Reference

```
#include <ranged_hash_fn.hpp>
```

#### Protected Types

- typedef Comb\_Hash\_Fn **comb\_hash\_fn\_base**
- typedef [std::pair](#)< size\_type, size\_type > **comp\_hash**
- typedef Hash\_Fn **hash\_fn\_base**
- typedef [rebind\\_traits](#)< \_Alloc, Key >::const\_reference **key\_const\_reference**
- typedef \_Alloc::size\_type **size\_type**

#### Protected Member Functions

- **ranged\_hash\_fn** (size\_type)
- **ranged\_hash\_fn** (size\_type, const Hash\_Fn &)
- **ranged\_hash\_fn** (size\_type, const Hash\_Fn &, const Comb\_Hash\_Fn &)
- void **notify\_resized** (size\_type)
- [comp\\_hash operator](#)() (key\_const\_reference) const
- [comp\\_hash operator](#)() (key\_const\_reference, size\_type) const
- void **swap** ([ranged\\_hash\\_fn](#)< Key, Hash\_Fn, \_Alloc, Comb\_Hash\_Fn, true > &)

### 6.816.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Hash_Fn>
class __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, true >
```

Specialization 2 The client supplies a hash function and a ranged hash function, and requests that hash values be stored.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

### 6.817 \_\_gnu\_pbds::detail::ranged\_hash\_fn< Key, null\_type, \_Alloc, Comb\_Hash\_Fn, false > Class Template Reference

```
#include <ranged_hash_fn.hpp>
```

#### Protected Types

- typedef Comb\_Hash\_Fn **comb\_hash\_fn\_base**
- typedef \_Alloc::size\_type **size\_type**

### Protected Member Functions

- `ranged_hash_fn` (size\_type)
- `ranged_hash_fn` (size\_type, const Comb\_Hash\_Fn &)
- `ranged_hash_fn` (size\_type, const [null\\_type](#) &, const Comb\_Hash\_Fn &)
- void `swap` ([ranged\\_hash\\_fn](#)< Key, [null\\_type](#), \_Alloc, Comb\_Hash\_Fn, false > &)

#### 6.817.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Comb_Hash_Fn>
class __gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, false >
```

Specialization 3 The client does not supply a hash function (by specifying `null_type` as the `Hash_Fn` parameter), and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

### 6.818 `__gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, true >` Class Template Reference

```
#include <ranged_hash_fn.hpp>
```

### Protected Types

- typedef Comb\_Hash\_Fn `comb_hash_fn_base`
- typedef \_Alloc::size\_type `size_type`

### Protected Member Functions

- `ranged_hash_fn` (size\_type)
- `ranged_hash_fn` (size\_type, const Comb\_Hash\_Fn &)
- `ranged_hash_fn` (size\_type, const [null\\_type](#) &, const Comb\_Hash\_Fn &)
- void `swap` ([ranged\\_hash\\_fn](#)< Key, [null\\_type](#), \_Alloc, Comb\_Hash\_Fn, true > &)

#### 6.818.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Comb_Hash_Fn>
class __gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, true >
```

Specialization 4 The client does not supply a hash function (by specifying `null_type` as the `Hash_Fn` parameter), and requests that hash values be stored.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

### 6.819 `__gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, Store_Hash >` Class Template Reference

Inheritance diagram for `__gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, Store_Hash >`:

#### 6.819.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Probe_Fn, typename Probe_Fn, bool Store_Hash>
class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, Store_Hash >
```

Primary template.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

### 6.820 `__gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, false >` Class Template Reference

```
#include <ranged_probe_fn.hpp>
```

#### Protected Types

- typedef `Comb_Probe_Fn` **comb\_probe\_fn\_base**
- typedef `Hash_Fn` **hash\_fn\_base**
- typedef `rebind_traits< _Alloc, Key >::const_reference` **key\_const\_reference**
- typedef `Probe_Fn` **probe\_fn\_base**
- typedef `_Alloc::size_type` **size\_type**

#### Protected Member Functions

- **ranged\_probe\_fn** (`size_type`)
- **ranged\_probe\_fn** (`size_type, const Hash_Fn &`)
- **ranged\_probe\_fn** (`size_type, const Hash_Fn &, const Comb_Probe_Fn &`)
- **ranged\_probe\_fn** (`size_type, const Hash_Fn &, const Comb_Probe_Fn &, const Probe_Fn &`)

- void **notify\_resized** (size\_type)
- size\_type **operator()** (key\_const\_reference) const
- size\_type **operator()** (key\_const\_reference, size\_type, size\_type) const
- void **swap** (ranged\_probe\_fn< Key, Hash\_Fn, \_Alloc, Comb\_Probe\_Fn, Probe\_Fn, false > &)

### 6.820.1 Detailed Description

`template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Probe_Fn, typename Probe_Fn>`  
`class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, false >`

Specialization 1

The client supplies a probe function and a ranged probe function, and requests that hash values not be stored.  
 The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

## 6.821 `__gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, true >` Class Template Reference

```
#include <ranged_probe_fn.hpp>
```

### Protected Types

- typedef Comb\_Probe\_Fn **comb\_probe\_fn\_base**
- typedef `std::pair< size_type, size_type >` **comp\_hash**
- typedef Hash\_Fn **hash\_fn\_base**
- typedef `rebind_traits< _Alloc, Key >::const_reference` **key\_const\_reference**
- typedef Probe\_Fn **probe\_fn\_base**
- typedef `_Alloc::size_type` **size\_type**

### Protected Member Functions

- **ranged\_probe\_fn** (size\_type)
- **ranged\_probe\_fn** (size\_type, const Hash\_Fn &)
- **ranged\_probe\_fn** (size\_type, const Hash\_Fn &, const Comb\_Probe\_Fn &)
- **ranged\_probe\_fn** (size\_type, const Hash\_Fn &, const Comb\_Probe\_Fn &, const Probe\_Fn &)
- void **notify\_resized** (size\_type)
- **comp\_hash operator()** (key\_const\_reference) const
- size\_type **operator()** (key\_const\_reference, size\_type) const
- size\_type **operator()** (key\_const\_reference, size\_type, size\_type) const
- void **swap** (ranged\_probe\_fn< Key, Hash\_Fn, \_Alloc, Comb\_Probe\_Fn, Probe\_Fn, true > &)

### 6.821.1 Detailed Description

`template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Probe_Fn, typename Probe_Fn>`  
`class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, true >`

Specialization 2- The client supplies a probe function and a ranged probe function, and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

## 6.822 `__gnu_pbds::detail::ranged_probe_fn< Key, null_type, _Alloc, Comb_Probe_Fn, null_type, false >` Class Template Reference

```
#include <ranged_probe_fn.hpp>
```

### Protected Types

- typedef `Comb_Probe_Fn` **`comb_probe_fn_base`**
- typedef `rebind_traits< _Alloc, Key >::const_reference` **`key_const_reference`**
- typedef `_Alloc::size_type` **`size_type`**

### Protected Member Functions

- **`ranged_probe_fn`** (`size_type` size)
- **`ranged_probe_fn`** (`size_type`, const `Comb_Probe_Fn` &r\_comb\_probe\_fn)
- **`ranged_probe_fn`** (`size_type`, const `null_type` &, const `Comb_Probe_Fn` &r\_comb\_probe\_fn, const `null_type` &)
- void **`swap`** (`ranged_probe_fn` &other)

#### 6.822.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Comb_Probe_Fn>
class __gnu_pbds::detail::ranged_probe_fn< Key, null_type, _Alloc, Comb_Probe_Fn, null_type, false >
```

Specialization 3 and 4 The client does not supply a hash function or probe function, and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

## 6.823 `std::rank< _Tp >` Struct Template Reference

```
#include <type_traits>
```

Inheritance diagram for `std::rank< _Tp >`:

### Public Types

- using **`type`**
- using **`value_type`**

**Public Member Functions**

- constexpr **operator value\_type** () const noexcept

**Static Public Attributes**

- static constexpr std::size\_t **value**

**6.823.1 Detailed Description**

```
template<typename _Tp>
struct std::rank<_Tp >
```

rank

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

**6.824 `std::ratio<_Num, _Den >` Struct Template Reference**

```
#include <ratio>
```

**Public Types**

- typedef [ratio](#)< num, den > **type**

**Static Public Attributes**

- static constexpr intmax\_t **den**
- static constexpr intmax\_t **num**

**6.824.1 Detailed Description**

```
template<intmax_t _Num, intmax_t _Den = 1>
struct std::ratio<_Num, _Den >
```

Provides compile-time rational arithmetic.

This class template represents any finite rational number with a numerator and denominator representable by compile-time constants of type `intmax_t`. The ratio is simplified when instantiated.

For example:

```
std::ratio<7,-21>::num == -1;
std::ratio<7,-21>::den == 3;
```

The documentation for this struct was generated from the following file:

- [ratio](#)

**6.825 `std::ratio_equal<_R1, _R2 >` Struct Template Reference**

```
#include <ratio>
```

Inheritance diagram for `std::ratio_equal<_R1, _R2>`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 6.825.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_equal<_R1, _R2>
```

ratio\_equal

The documentation for this struct was generated from the following file:

- [ratio](#)

#### 6.826 std::ratio\_greater<\_R1, \_R2> Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_greater<_R1, _R2>`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 6.826.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_greater<_R1, _R2>
```

`ratio_greater`

The documentation for this struct was generated from the following file:

- [ratio](#)

## 6.827 `std::ratio_greater_equal<_R1, _R2>` Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_greater_equal< _R1, _R2 >`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 6.827.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_greater_equal< _R1, _R2 >
```

`ratio_greater_equal`

The documentation for this struct was generated from the following file:

- [ratio](#)

### 6.828 std::ratio\_less< \_R1, \_R2 > Struct Template Reference

```
#include <ratio>
```

#### 6.828.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_less< _R1, _R2 >
```

`ratio_less`

The documentation for this struct was generated from the following file:

- [ratio](#)

**6.829 `std::ratio_less_equal<_R1, _R2>` Struct Template Reference**

```
#include <ratio>
```

Inheritance diagram for `std::ratio_less_equal<_R1, _R2>`:

**Public Types**

- using **type**
- using **value\_type**

**Public Member Functions**

- constexpr **operator value\_type** () const noexcept

**Static Public Attributes**

- static constexpr bool **value**

**6.829.1 Detailed Description**

```
template<typename _R1, typename _R2>
struct std::ratio_less_equal<_R1, _R2>
```

`ratio_less_equal`

The documentation for this struct was generated from the following file:

- [ratio](#)

**6.830 `std::ratio_not_equal<_R1, _R2>` Struct Template Reference**

```
#include <ratio>
```

Inheritance diagram for `std::ratio_not_equal<_R1, _R2>`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 6.830.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_not_equal<_R1, _R2>
```

ratio\_not\_equal

The documentation for this struct was generated from the following file:

- [ratio](#)

#### 6.831 `std::raw_storage_iterator<_OutputIterator, _Tp>` Class Template Reference

```
#include <stl_raw_storage_iter.h>
```

Inheritance diagram for std::raw\_storage\_iterator< \_OutputIterator, \_Tp >:

### Public Types

- typedef void [difference\\_type](#)
- typedef [output\\_iterator\\_tag](#) [iterator\\_category](#)
- typedef void [pointer](#)
- typedef void [reference](#)
- typedef void [value\\_type](#)

### Public Member Functions

- **raw\_storage\_iterator** ([\\_OutputIterator](#) \_\_x)
- [\\_OutputIterator](#) **base** () const
- [raw\\_storage\\_iterator](#) & **operator\*** ()
- [raw\\_storage\\_iterator](#) & **operator++** ()
- [raw\\_storage\\_iterator](#) **operator++** (int)
- [raw\\_storage\\_iterator](#) & **operator=** ([\\_Tp](#) &&\_\_element)
- [raw\\_storage\\_iterator](#) & **operator=** (const [\\_Tp](#) &\_\_element)

### Protected Attributes

- [\\_OutputIterator](#) **\_M\_iter**

#### 6.831.1 Detailed Description

```
template<class _OutputIterator, class _Tp>
class std::raw_storage_iterator< _OutputIterator, _Tp >
```

This iterator class lets algorithms store their results into uninitialized memory.

#### 6.831.2 Member Typedef Documentation

##### difference\_type

typedef void [std::iterator](#)< [output\\_iterator\\_tag](#), void, void, void, void >::difference\_type [inherited]  
Distance between iterators is represented as this type.

### iterator\_category

```
typedef output_iterator_tag std::iterator< output_iterator_tag, void, void, void, void >::iterator_category [inherited]
```

One of the [tag types](#).

### pointer

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::pointer [inherited]
```

This type represents a pointer-to-value\_type.

### reference

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::reference [inherited]
```

This type represents a reference-to-value\_type.

### value\_type

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type [inherited]
```

The type "pointed to" by the iterator.

The documentation for this class was generated from the following file:

- [stl\\_raw\\_storage\\_iter.h](#)

## 6.832 \_\_gnu\_cxx::rb\_tree< \_Key, \_Value, \_KeyOfValue, \_Compare, \_Alloc > Struct Template Reference

```
#include <rb_tree>
```

### Public Types

- `template<typename _Iter>`  
  using **\_\_same\_value\_type**
- `typedef std::_Rb_tree< _Key, _Value, _KeyOfValue, _Compare, _Alloc > _Base`
- `typedef _Base::allocator_type allocator_type`
- `typedef _Node_traits::_Const_iterator const_iterator`
- `typedef const value_type * const_pointer`
- `typedef const value_type & const_reference`
- `typedef std::reverse\_iterator< const_iterator > const_reverse_iterator`
- `typedef ptrdiff_t difference_type`
- `typedef _Node_traits::_Iterator iterator`
- `typedef _Key key_type`
- `typedef value_type * pointer`
- `typedef value_type & reference`
- `typedef std::reverse\_iterator< iterator > reverse_iterator`
- `typedef size_t size_type`
- `typedef _Val value_type`

### Public Member Functions

#### 6.833.1 Detailed Description

template<typename Key, typename Mapped, typename Cmp\_Fn, typename Node\_And\_It\_Traits, typename \_↵ Alloc>

class **\_\_gnu\_pbds::detail::rb\_tree\_map**< Key, Mapped, Cmp\_Fn, Node\_And\_It\_Traits, \_Alloc >

Red-Black tree.

This implementation uses an idea from the SGI STL (using a *header* node which is needed for efficient iteration).

#### 6.833.2 Member Function Documentation

##### **node\_begin()** [1/2]

template<typename Key, typename Mapped, typename Cmp\_Fn, typename Node\_And\_It\_Traits, typename \_↵ Alloc>

bin\_search\_tree\_map< Key, Mapped, Cmp\_Fn, Node\_And\_It\_Traits, \_Alloc >::node\_iterator \_\_gnu\_↵  
pbds::detail::bin\_search\_tree\_map< Key, Mapped, Cmp\_Fn, Node\_And\_It\_Traits, \_Alloc >::node\_begin  
( ) [inline], [inherited]

Returns a node\_iterator corresponding to the node at the root of the tree.

##### **node\_begin()** [2/2]

template<typename Key, typename Mapped, typename Cmp\_Fn, typename Node\_And\_It\_Traits, typename \_↵ Alloc>

bin\_search\_tree\_map< Key, Mapped, Cmp\_Fn, Node\_And\_It\_Traits, \_Alloc >::node\_const\_iterator \_\_↵  
gnu\_pbds::detail::bin\_search\_tree\_map< Key, Mapped, Cmp\_Fn, Node\_And\_It\_Traits, \_Alloc >::node\_↵  
begin ( ) const [inline], [inherited]

Returns a const node\_iterator corresponding to the node at the root of the tree.

**node\_end()** [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
```

```
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end ()
```

[inline], [inherited]

Returns a `node_iterator` corresponding to a node just after a leaf of the tree.

**node\_end()** [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
```

```
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end () const
```

[inline], [inherited]

Returns a const `node_iterator` corresponding to a node just after a leaf of the tree.

The documentation for this class was generated from the following file:

- [rb\\_tree\\_.hpp](#)

## 6.834 `__gnu_pbds::detail::rb_tree_node_< Value_Type, Metadata, _Alloc >` Struct Template Reference

```
#include <node.hpp>
```

**Public Types**

- `bool operator==` (const [recursive\\_directory\\_iterator](#) &\_\_lhs, const [recursive\\_directory\\_iterator](#) &\_\_rhs) noexcept

### 6.840.1 Detailed Description

Iterator type for recursively traversing a directory hierarchy.

Since

C++17

The documentation for this class was generated from the following file:

- [bits/fs\\_dir.h](#)

## 6.841 \_\_gnu\_cxx::recursive\_init\_error Class Reference

```
#include <cxxabi.h>
```

Inheritance diagram for `__gnu_cxx::recursive_init_error`:

## Public Member Functions

- virtual const char \* [what](#) () const noexcept

### 6.841.1 Detailed Description

Exception thrown by `__cxa_guard_acquire`.

C++ 2011 6.7 [stmt.dcl]/4: If control re-enters the declaration recursively while the variable is being initialized, the behavior is undefined.

Since we already have a library function to handle locking, we might as well check for this situation and throw an exception. We use the second byte of the guard variable to remember that we're in the middle of an initialization.

### 6.841.2 Member Function Documentation

#### `what()`

```
virtual const char * std::exception::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error.

Reimplemented in [std::bad\\_alloc](#), [std::bad\\_cast](#), [std::bad\\_exception](#), [std::bad\\_function\\_call](#), [std::bad\\_typeid](#), [std::bad\\_weak\\_ptr](#), [std::experimental::filesystem::v1::filesystem\\_error](#), [std::experimental::fundamentals\\_v1::bad\\_any\\_cast](#), [std::filesystem::filesystem\\_error](#), [std::future\\_error](#), [std::logic\\_error](#), and [std::runtime\\_error](#).

The documentation for this class was generated from the following file:

## 6.842 std::recursive\_mutex Class Reference

```
#include <mutex>
```

### Public Types

- typedef \_\_native\_type \* **native\_handle\_type**

### Public Member Functions

- **recursive\_mutex** (const [recursive\\_mutex](#) &)=delete
- void **lock** ()
- native\_handle\_type **native\_handle** () noexcept
- [recursive\\_mutex](#) & **operator=** (const [recursive\\_mutex](#) &)=delete
- bool **try\_lock** () noexcept
- void **unlock** ()

#### 6.842.1 Detailed Description

The standard recursive mutex type.

A recursive mutex can be locked more than once by the same thread. Other threads cannot lock the mutex until the owning thread unlocks it as many times as it was locked.

Since

C++11

The documentation for this class was generated from the following file:

- [mutex](#)

## 6.843 std::recursive\_timed\_mutex Class Reference

```
#include <mutex>
```

### Public Types

- typedef \_\_native\_type \* **native\_handle\_type**

### Public Member Functions

- **recursive\_timed\_mutex** (const [recursive\\_timed\\_mutex](#) &)=delete
- void **lock** ()
- native\_handle\_type **native\_handle** () noexcept
- [recursive\\_timed\\_mutex](#) & **operator=** (const [recursive\\_timed\\_mutex](#) &)=delete

`bool try_lock_until (const chrono::time_point< _Clock, _Duration > &__atime)`
- `void unlock ()`

### Friends

- `class __timed_mutex_impl< recursive_timed_mutex >`

#### 6.843.1 Detailed Description

The standard recursive timed mutex type.

A recursive mutex that supports a timeout when trying to acquire the lock. A recursive mutex can be locked more than once by the same thread. Other threads cannot lock the mutex until the owning thread unlocks it as many times as it was locked.

Since

C++11

The documentation for this class was generated from the following file:

- [mutex](#)

## 6.844 `std::bitset<_Nb>::reference` Class Reference

```
#include <bitset>
```

### Public Member Functions

- **reference** (const [reference](#) &)=default
- `constexpr reference & flip ()` noexcept
- `constexpr operator bool ()` const noexcept
- `constexpr reference & operator= (bool __x)` noexcept
- `constexpr reference & operator= (const reference &__j)` noexcept
- `constexpr bool operator~ ()` const noexcept

### Friends

- `class bitset`

#### 6.844.1 Detailed Description

```
template<size_t _Nb>
```

```
class std::bitset<_Nb>::reference
```

This encapsulates the concept of a single bit. An instance of this class is a proxy for an actual bit; this way the individual bit operations are done as faster word-size bitwise instructions.

Most users will never need to use this class directly; conversions to and from `bool` are automatic and should be transparent. Overloaded operators help to preserve the illusion.

(On a typical system, this *bit reference* is 64 times the size of an actual bit. Ha.)

The documentation for this class was generated from the following file:

- [bitset](#)

## 6.845 `std::tr2::dynamic_bitset<_WordT, _Alloc>::reference` Class Reference

```
#include <dynamic_bitset>
```

## Public Member Functions

- **reference** ([dynamic\\_bitset](#) &\_\_b, size\_type \_\_pos) noexcept
- **reference** & **flip** () noexcept
- **operator bool** () const noexcept
- **reference** & **operator=** (bool \_\_x) noexcept
- **reference** & **operator=** (const [reference](#) &\_\_j) noexcept
- bool **operator~** () const noexcept

## Friends

- class **dynamic\_bitset**

### 6.845.1 Detailed Description

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
class std::tr2::dynamic_bitset< _WordT, _Alloc >::reference
```

This encapsulates the concept of a single bit. An instance of this class is a proxy for an actual bit; this way the individual bit operations are done as faster word-size bitwise instructions.

Most users will never need to use this class directly; conversions to and from bool are automatic and should be transparent. Overloaded operators help to preserve the illusion.

(On a typical system, this "bit %reference" is 64 times the size of an actual bit. Ha.)

The documentation for this class was generated from the following file:

- [dynamic\\_bitset](#)

### 6.846 std::reference\_wrapper< \_Tp > Class Template Reference

```
#include <refwrap.h>
```

## Public Types

## Related Symbols

(Note that these are not member symbols.)

- template<typename \_Tp> constexpr [reference\\_wrapper](#)< \_Tp > [ref](#) (\_Tp &\_\_t) noexcept
- template<typename \_Tp> constexpr [reference\\_wrapper](#)< const \_Tp > [cref](#) (const \_Tp &\_\_t) noexcept

- `template<typename _Tp>`  
`constexpr reference\_wrapper< _Tp > ref (reference\_wrapper< _Tp > __t) noexcept`
- `template<typename _Tp>`  
`constexpr reference\_wrapper< const _Tp > cref (reference\_wrapper< _Tp > __t) noexcept`

### 6.846.1 Detailed Description

`template<typename _Tp>`  
**class** `std::reference_wrapper< _Tp >`

Primary class template for `reference_wrapper`.

### 6.846.2 Friends And Related Symbol Documentation

**cref()** [1/2]

```
template<typename _Tp>
reference\_wrapper< const _Tp > cref (
    const _Tp & __t) [related]
```

Denotes a const reference should be taken to a variable.

**cref()** [2/2]

```
template<typename _Tp>
reference\_wrapper< const _Tp > cref (
    reference\_wrapper< _Tp > __t) [related]
```

`std::cref` overload to prevent wrapping a `reference_wrapper`

**ref()** [1/2]

```
template<typename _Tp>
reference\_wrapper< _Tp > ref (
    _Tp & __t) [related]
```

Denotes a reference should be taken to a variable.

**ref()** [2/2]

```
template<typename _Tp>
reference\_wrapper< _Tp > ref (
    reference\_wrapper< _Tp > __t) [related]
```

`std::ref` overload to prevent wrapping a `reference_wrapper`

The documentation for this class was generated from the following files:

- [type\\_traits](#)
- [refwrap.h](#)

## 6.847 std::regex\_error Class Reference

```
#include <regex>
```

Inheritance diagram for `std::regex_error`:

### Public Member Functions

- [regex\\_error](#) ([error\\_type](#) \_\_ecode)
- [regex\\_constants::error\\_type](#) code () const noexcept
- virtual const char \* [what](#) () const noexcept

### 6.847.1 Detailed Description

A regular expression exception class.  
The regular expression library throws objects of this class on error.

Since

C++11

### 6.847.2 Constructor & Destructor Documentation

#### **regex\_error()**

```
std::regex_error::regex_error (  
    error\_type __ecode) [explicit]
```

Constructs a `regex_error` object.

#### Parameters

|                      |                       |
|----------------------|-----------------------|
| <code>__ecode</code> | the regex error code. |
|----------------------|-----------------------|

References [regex\\_error\(\)](#).

Referenced by [regex\\_error\(\)](#).

### 6.847.3 Member Function Documentation

#### `code()`

`regex_constants::error_type` `std::regex_error::code () const [inline], [noexcept]`

Gets the regex error code.

#### Returns

the regex error code.

References [code\(\)](#).

Referenced by [code\(\)](#).

#### `what()`

`virtual const char * std::runtime_error::what () const [virtual], [noexcept], [inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#), and [std::filesystem::filesystem\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this class was generated from the following file:

- [regex\\_error.h](#)

## 6.848 `std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>` Class Template Reference

```
#include <regex>
```

### Public Types

- `typedef std::ptrdiff_t difference_type`
- `typedef std::forward\_iterator\_tag iterator_category`
- `typedef std::input\_iterator\_tag iterator_concept`
- `typedef const value_type * pointer`
- `typedef const value_type & reference`
- `typedef basic\_regex<\_Ch\_type, \_Rx\_traits> regex_type`
- `typedef match\_results<\_Bi\_iter> value_type`

### Public Member Functions

- `bool operator== (const regex\_iterator &) const noexcept`
- `bool operator== (default\_sentinel\_t) const noexcept`

### 6.848.1 Detailed Description

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>>
class std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >
```

An iterator adaptor that will provide repeated calls of `regex_search` over a range until no more matches remain.

Since

C++11

### 6.848.2 Constructor & Destructor Documentation

#### `regex_iterator()` [1/3]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator () [default]
```

Provides a singular iterator, useful for indicating one-past-the-end of a range.

Referenced by `std::regex_iterator< const char * >::regex_iterator()`, and `operator==(())`.

#### `regex_iterator()` [2/3]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a `regex_iterator`...

#### Parameters

|                   |                                                    |
|-------------------|----------------------------------------------------|
| <code>__a</code>  | [IN] The start of a text range to search.          |
| <code>__b</code>  | [IN] One-past-the-end of the text range to search. |
| <code>__re</code> | [IN] The regular expression to match.              |
| <code>__m</code>  | [IN] Policy flags for match rules.                 |

#### `regex_iterator()` [3/3]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator (
    const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & ) [default]
```

Copy constructs a `regex_iterator`.

### 6.848.3 Member Function Documentation

#### `operator*()`

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type & std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator* () const
[inline], [noexcept]
```

Dereferences a `regex_iterator`.

#### `operator++()` [1/2]

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
regex_iterator<_Bi_iter, _Ch_type, _Rx_traits> & std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator++ ()
```

Increments a `regex_iterator`.

References `std::regex_constants::match_continuous`, `std::regex_constants::match_not_null`, `std::regex_constants::match_prev_avail`, and `std::regex_search()`.

#### `operator++()` [2/2]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator++ (
    int ) [inline]
```

Postincrements a `regex_iterator`.

#### `operator->()`

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type * std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator-> () const
[inline], [noexcept]
```

Selects a `regex_iterator` member.

#### `operator=()`

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator & std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator= (
    const regex_iterator<_Bi_iter, _Ch_type, _Rx_traits> & ) [default]
```

Copy assigns one `regex_iterator` to another.

#### `operator==()`

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
bool std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator== (
    const regex_iterator<_Bi_iter, _Ch_type, _Rx_traits> & __rhs) const [noexcept]
```

Tests the equivalence of two `regex iterators`.

References `regex_iterator()`.

The documentation for this class was generated from the following files:

- `regex.h`
- `regex.tcc`

## 6.849 `std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>` Class Template Reference

```
#include <regex>
```

### Public Types

### 6.849.1 Detailed Description

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>>
class std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>
```

Iterates over submatches in a range (or *splits* a text string).

The purpose of this iterator is to enumerate all, or all specified, matches of a regular expression within a text range. The dereferenced value of an iterator of this class is a `std::sub_match` object.

Since

C++11

## 6.849.2 Constructor & Destructor Documentation

### regex\_token\_iterator() [1/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator () [inline]
```

Default constructs a `regex_token_iterator`.

A default-constructed `regex_token_iterator` is a singular iterator that will compare equal to the one-past-the-end value for any iterator of the same type.

Referenced by `operator++()`, `operator=()`, and `operator==()`.

### regex\_token\_iterator() [2/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    int __submatch = 0,
    regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a `regex_token_iterator`...

#### Parameters

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__a</code>        | [IN] The start of the text to search.                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>__b</code>        | [IN] One-past-the-end of the text to search.                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>__re</code>       | [IN] The regular expression to search for.                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>__submatch</code> | [IN] Which submatch to return. There are some special values for this parameter: <ul style="list-style-type: none"> <li>• -1 each enumerated subexpression does NOT match the regular expression (aka field splitting)</li> <li>• 0 the entire string matching the subexpression is returned for each match within the text.</li> <li>• &gt;0 enumerates only the indicated subexpression from a match within the text.</li> </ul> |
| <code>__m</code>        | [IN] Policy flags for match rules.                                                                                                                                                                                                                                                                                                                                                                                                 |

### regex\_token\_iterator() [3/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    const std::vector< int > & __submatches,
    regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a `regex_token_iterator`...

#### Parameters

|                  |                                              |
|------------------|----------------------------------------------|
| <code>__a</code> | [IN] The start of the text to search.        |
| <code>__b</code> | [IN] One-past-the-end of the text to search. |

## Parameters

|                           |                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------|
| <code>__re</code>         | [IN] The regular expression to search for.                                                 |
| <code>__submatches</code> | [IN] A list of subexpressions to return for each regular expression match within the text. |
| <code>__m</code>          | [IN] Policy flags for match rules.                                                         |

**regex\_token\_iterator()** [4/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    initializer_list< int > __submatches,
    regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a `regex_token_iterator`...

## Parameters

|                           |                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------|
| <code>__a</code>          | [IN] The start of the text to search.                                                      |
| <code>__b</code>          | [IN] One-past-the-end of the text to search.                                               |
| <code>__re</code>         | [IN] The regular expression to search for.                                                 |
| <code>__submatches</code> | [IN] A list of subexpressions to return for each regular expression match within the text. |
| <code>__m</code>          | [IN] Policy flags for match rules.                                                         |

**regex\_token\_iterator()** [5/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
template<std::size_t _Nm>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    const int (&) __submatches[_Nm],
    regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a `regex_token_iterator`...

## Parameters

|                           |                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------|
| <code>__a</code>          | [IN] The start of the text to search.                                                      |
| <code>__b</code>          | [IN] One-past-the-end of the text to search.                                               |
| <code>__re</code>         | [IN] The regular expression to search for.                                                 |
| <code>__submatches</code> | [IN] A list of subexpressions to return for each regular expression match within the text. |
| <code>__m</code>          | [IN] Policy flags for match rules.                                                         |

**regex\_token\_iterator()** [6/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs) [inline]
```

Copy constructs a regex\_token\_iterator.

**Parameters**

|                    |                                      |
|--------------------|--------------------------------------|
| <code>__rhs</code> | [IN] A regex_token_iterator to copy. |
|--------------------|--------------------------------------|

**6.849.3 Member Function Documentation****operator\*()**

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type & std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator* ()
const [inline]
```

Dereferences a regex\_token\_iterator.

**operator++()** [1/2]

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ ()
[inline]
```

Increments a regex\_token\_iterator.

References regex\_token\_iterator().

**operator++()** [2/2]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_token_iterator std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ (
    int ) [inline]
```

Postincrements a regex\_token\_iterator.

**operator->()**

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type * std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator-> ()
const [inline]
```

Selects a regex\_token\_iterator member.

**operator=()**

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator= (
    const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs)
```

Assigns a regex\_token\_iterator to another.

#### Parameters

|                    |                                                   |
|--------------------|---------------------------------------------------|
| <code>__rhs</code> | [IN] A <code>regex_token_iterator</code> to copy. |
|--------------------|---------------------------------------------------|

References [regex\\_token\\_iterator\(\)](#).

#### `operator==()`

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
bool std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator== (
    const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs) const
```

Compares a `regex_token_iterator` to another for equality.

References [regex\\_token\\_iterator\(\)](#).

### 6.850.1 Detailed Description

```
template<typename _Ch_type>
class std::regex_traits< _Ch_type >
```

Describes aspects of a regular expression.

A regular expression traits class that satisfies the requirements of section [28.7].

The class `regex` is parameterized around a set of related types and functions used to complete the definition of its semantics. This class satisfies the requirements of such a traits class.

Since

C++11

### 6.850.2 Constructor & Destructor Documentation

#### regex\_traits()

```
template<typename _Ch_type>
std::regex_traits< _Ch_type >::regex_traits () [inline]
```

Constructs a default traits object.

Referenced by [value\(\)](#).

### 6.850.3 Member Function Documentation

#### getloc()

```
template<typename _Ch_type>
locale_type std::regex_traits< _Ch_type >::getloc () const [inline]
```

Gets a copy of the current locale in use by the `regex_traits` object.

#### imbue()

```
template<typename _Ch_type>
locale_type std::regex_traits< _Ch_type >::imbue (
    locale_type __loc) [inline]
```

Imbues the `regex_traits` object with a copy of a new locale.

#### Parameters

|                    |           |
|--------------------|-----------|
| <code>__loc</code> | A locale. |
|--------------------|-----------|

#### Returns

a copy of the previous locale in use by the `regex_traits` object.

#### Note

Calling `imbue` with a different locale than the one currently in use invalidates all cached data held by `*this`.

#### istype()

```
template<typename _Ch_type>
bool std::regex_traits< _Ch_type >::istype (
    _Ch_type __c,
    char_class_type __f) const
```

Determines if `c` is a member of an identified class.

**Parameters**

|                  |                                                                 |
|------------------|-----------------------------------------------------------------|
| <code>__c</code> | a character.                                                    |
| <code>__f</code> | a class type (as returned from <code>lookup_classname</code> ). |

**Returns**

true if the character `__c` is a member of the classification represented by `__f`, false otherwise.

**Exceptions**

|                            |                                                    |
|----------------------------|----------------------------------------------------|
| <code>std::bad_cast</code> | if the current locale does not have a ctype facet. |
|----------------------------|----------------------------------------------------|

References [std::use\\_facet\(\)](#).

**length()**

```
template<typename _Ch_type>
std::size_t std::regex_traits<_Ch_type>::length (
    const char_type * __p) [inline], [static]
```

Gives the length of a C-style string starting at `__p`.

**Parameters**

|                  |                                                 |
|------------------|-------------------------------------------------|
| <code>__p</code> | a pointer to the start of a character sequence. |
|------------------|-------------------------------------------------|

**Returns**

the number of characters between `*__p` and the first default-initialized value of type `char_type`. In other words, uses the C-string algorithm for determining the length of a sequence of characters.

**lookup\_classname()**

```
template<typename _Ch_type>
template<typename _Fwd_iter>
regex_traits<_Ch_type>::char_class_type std::regex_traits<_Ch_type>::lookup_classname (
    _Fwd_iter __first,
    _Fwd_iter __last,
    bool __icase = false) const
```

Maps one or more characters to a named character classification.

**Parameters**

|                      |                                              |
|----------------------|----------------------------------------------|
| <code>__first</code> | beginning of the character sequence.         |
| <code>__last</code>  | one-past-the-end of the character sequence.  |
| <code>__icase</code> | ignores the case of the classification name. |

**Returns**

an unspecified value that represents the character classification named by the character sequence designated by the iterator range `[__first, __last)`. If `icase` is true, the returned mask identifies the classification regardless of the case of the characters to be matched (for example, `[:lower:]` is the same as `[:alpha:]`), otherwise a case-dependent classification is returned. The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns a value that compares equal to 0.

At least the following names (or their wide-character equivalent) are supported.

- d
- w
- s
- alnum
- alpha
- blank
- cntrl
- digit
- graph
- lower
- print
- punct
- space
- upper
- xdigit

References [std::use\\_facet\(\)](#).

**lookup\_collatename()**

```
template<typename _Ch_type>
template<typename _Fwd_iter>
regex_traits<_Ch_type>::string_type std::regex_traits<_Ch_type>::lookup_collatename (
    _Fwd_iter __first,
    _Fwd_iter __last) const
```

Gets a collation element by name.

**Parameters**

|                      |                                                 |
|----------------------|-------------------------------------------------|
| <code>__first</code> | beginning of the collation element name.        |
| <code>__last</code>  | one-past-the-end of the collation element name. |

**Returns**

a sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range `[__first, __last)`. Returns an empty string if the character sequence is not a valid collating element.

References [std::use\\_facet\(\)](#).

**transform()**

```
template<typename _Ch_type>
template<typename _Fwd_iter>
string_type std::regex_traits< _Ch_type >::transform (
    _Fwd_iter __first,
    _Fwd_iter __last) const [inline]
```

Gets a sort key for a character sequence.

**Parameters**

|                      |                                             |
|----------------------|---------------------------------------------|
| <code>__first</code> | beginning of the character sequence.        |
| <code>__last</code>  | one-past-the-end of the character sequence. |

Returns a sort key for the character sequence designated by the iterator range [F1, F2) such that if the character sequence [G1, G2) sorts before the character sequence [H1, H2) then `v.transform(G1, G2) < v.transform(H1, H2)`. What this really does is provide a more efficient way to compare a string to multiple other strings in locales with fancy collation rules and equivalence classes.

**Returns**

a locale-specific sort key equivalent to the input range.

**Exceptions**

|                            |                                                      |
|----------------------------|------------------------------------------------------|
| <code>std::bad_cast</code> | if the current locale does not have a collate facet. |
|----------------------------|------------------------------------------------------|

**transform\_primary()**

```
template<typename _Ch_type>
template<typename _Fwd_iter>
string_type std::regex_traits< _Ch_type >::transform_primary (
    _Fwd_iter __first,
    _Fwd_iter __last) const [inline]
```

Gets a sort key for a character sequence, independent of case.

**Parameters**

|                      |                                             |
|----------------------|---------------------------------------------|
| <code>__first</code> | beginning of the character sequence.        |
| <code>__last</code>  | one-past-the-end of the character sequence. |

**Effects:** if `typeid(use_facet<collate<_Ch_type>>(getloc())) == typeid(collate_byname<_Ch_type>)` and the form of the sort key returned by `collate_byname<_Ch_type>::transform(__first, __last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

**Todo** Implement this function correctly.

**translate()**

```
template<typename _Ch_type>
char_type std::regex_traits< _Ch_type >::translate (
    char_type __c) const [inline]
```

Performs the identity translation.

## Parameters

|                  |                                                   |
|------------------|---------------------------------------------------|
| <code>__c</code> | A character to the locale-specific character set. |
|------------------|---------------------------------------------------|

## Returns

`__c`.

**translate\_nocase()**

```
template<typename _Ch_type>
char_type std::regex_traits<_Ch_type>::translate_nocase (
    char_type __c) const [inline]
```

Translates a character into a case-insensitive equivalent.

## Parameters

|                  |                                                   |
|------------------|---------------------------------------------------|
| <code>__c</code> | A character to the locale-specific character set. |
|------------------|---------------------------------------------------|

## Returns

the locale-specific lower-case equivalent of `__c`.

## Exceptions

|                            |                                                        |
|----------------------------|--------------------------------------------------------|
| <code>std::bad_cast</code> | if the imbued locale does not support the ctype facet. |
|----------------------------|--------------------------------------------------------|

**value()**

```
template<typename _Ch_type>
int std::regex_traits<_Ch_type>::value (
    _Ch_type __ch,
    int __radix) const
```

Converts a digit to an int.

## Parameters

|                      |                                                                |
|----------------------|----------------------------------------------------------------|
| <code>__ch</code>    | a character representing a digit.                              |
| <code>__radix</code> | the radix if the numeric conversion (limited to 8, 10, or 16). |

## Returns

the value represented by the digit `__ch` in base `radix` if the character `__ch` is a valid digit in base `radix`; otherwise returns -1.

### 6.861.1 Detailed Description

template<typename [\\_Iterator](#)>

class std::reverse\_iterator<\_Iterator>

Bidirectional and random access iterators have corresponding reverse iterator adaptors that iterate through the data structure in the opposite direction. They have the same signatures as the corresponding iterators. The fundamental relation between a reverse iterator and its corresponding iterator *i* is established by the identity:

```
*(reverse_iterator(i)) == *(i - 1)
```

*This mapping is dictated by the fact that while there is always a pointer past the end of an array, there might not be a valid pointer before the beginning of an array.* [24.4.1]/1,2

Reverse iterators can be tricky and surprising at first. Their semantics make sense, however, and the trickiness is a side effect of the requirement that the iterators must be safe.

### 6.861.2 Constructor & Destructor Documentation

#### reverse\_iterator() [1/4]

```
template<typename \_Iterator>
```

```
std::reverse_iterator<_Iterator>::reverse_iterator() [inline], [constexpr], [noexcept]
```

The default constructor value-initializes member `current`. If it is a pointer, that means it is zero-initialized.

Referenced by [std::reverse\\_iterator<iterator>::operator+\(\)](#), and [std::reverse\\_iterator<iterator>::operator-\(\)](#).

#### reverse\_iterator() [2/4]

```
template<typename \_Iterator>
```

```
std::reverse_iterator<_Iterator>::reverse_iterator(  
    iterator_type __x) [inline], [explicit], [constexpr], [noexcept]
```

This iterator will move in the opposite direction that `x` does.

#### reverse\_iterator() [3/4]

```
template<typename \_Iterator>
```

```
std::reverse_iterator<_Iterator>::reverse_iterator(  
    const reverse\_iterator<_Iterator> &__x) [inline], [constexpr], [noexcept]
```

The copy constructor is normal.

**reverse\_iterator()** [4/4]

```
template<typename _Iterator>
template<typename _Iter>
requires __convertible<_Iter>
std::reverse_iterator< _Iterator >::reverse_iterator (
    const reverse_iterator< _Iter > & __x) [inline], [constexpr], [noexcept]
```

A reverse\_iterator across other types can be copied if the underlying iterator can be converted to the type of current.

**6.861.3 Member Function Documentation****base()**

```
template<typename _Iterator>
iterator_type std::reverse_iterator< _Iterator >::base () const [inline], [nodiscard], [constexpr],
[noexcept]
```

**Returns**

current, the iterator used for underlying work.

Referenced by `std::operator==()`.

**operator\*()**

```
template<typename _Iterator>
reference std::reverse_iterator< _Iterator >::operator* () const [inline], [nodiscard], [constexpr]
```

**Returns**

A reference to the value at `--current`

This requires that `--current` is dereferenceable.

**Warning**

This implementation requires that for an iterator of the underlying iterator type, `x`, a reference obtained by `*x` remains valid after `x` has been modified or destroyed. This is a bug: <http://gcc.gnu.org/PR51823>

**operator+()**

```
template<typename _Iterator>
reverse_iterator std::reverse_iterator< _Iterator >::operator+ (
    difference_type __n) const [inline], [nodiscard], [constexpr]
```

**Returns**

A reverse\_iterator that refers to `current - __n`

The underlying iterator must be a Random Access Iterator.

**operator++()** [1/2]

```
template<typename _Iterator>
reverse_iterator & std::reverse_iterator< _Iterator >::operator++ () [inline], [constexpr]
```

**Returns**

`*this`

Decrements the underlying iterator.

**operator++()** [2/2]

```
template<typename _Iterator>
reverse_iterator std::reverse_iterator< _Iterator >::operator++ (
    int ) [inline], [constexpr]
```

**Returns**

The original value of `*this`

Decrements the underlying iterator.

**operator+=()**

```
template<typename _Iterator>
reverse_iterator & std::reverse_iterator< _Iterator >::operator+= (
    difference_type __n) [inline], [constexpr]
```

**Returns**

`*this`

Moves the underlying iterator backwards `__n` steps. The underlying iterator must be a Random Access Iterator.

**operator-()**

```
template<typename _Iterator>
reverse_iterator std::reverse_iterator< _Iterator >::operator- (
    difference_type __n) const [inline], [nodiscard], [constexpr]
```

**Returns**

A `reverse_iterator` that refers to `current - __n`

The underlying iterator must be a Random Access Iterator.

**operator--()** [1/2]

```
template<typename _Iterator>
reverse_iterator & std::reverse_iterator< _Iterator >::operator-- () [inline], [constexpr]
```

**Returns**

`*this`

Increments the underlying iterator.

**operator--()** [2/2]

```
template<typename _Iterator>
reverse_iterator std::reverse_iterator< _Iterator >::operator-- (
    int ) [inline], [constexpr]
```

**Returns**

A `reverse_iterator` with the previous value of `*this`

Increments the underlying iterator.

**operator-=( )**

```
template<typename _Iterator>
reverse_iterator & std::reverse_iterator< _Iterator >::operator-= (
    difference_type __n) [inline], [constexpr]
```

**Returns**

\*this

Moves the underlying iterator forwards `__n` steps. The underlying iterator must be a Random Access Iterator.

**operator->()**

```
template<typename _Iterator>
pointer std::reverse_iterator< _Iterator >::operator-> () const [inline], [nodiscard], [constexpr]
```

**Returns**

A pointer to the value at `--current`

This requires that `--current` is dereferenceable.

**operator[]()**

```
template<typename _Iterator>
reference std::reverse_iterator< _Iterator >::operator[] (
    difference_type __n) const [inline], [nodiscard], [constexpr]
```

**Returns**

The value at `current - __n - 1`

The underlying iterator must be a Random Access Iterator.

### 6.862.1 Detailed Description

```
template<class _CharT, class _Alloc>
class __gnu_cxx::rope<_CharT, _Alloc>
```

This is an SGI extension.

**Todo** Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html)

The documentation for this class was generated from the following files:

- `rope`
- `ropeimpl.h`

## 6.863 std::runtime\_error Class Reference

```
#include <stdexcept_except.h>
```

Inheritance diagram for `std::runtime_error`:

## Public Member Functions

- `runtime_error (const char *)`
- `runtime_error (const runtime\_error &) noexcept`

- [runtime\\_error](#) (const [string](#) &\_\_arg)
- [runtime\\_error](#) ([runtime\\_error](#) &&) noexcept
- [runtime\\_error](#) & **operator=** (const [runtime\\_error](#) &) noexcept
- [runtime\\_error](#) & **operator=** ([runtime\\_error](#) &&) noexcept
- virtual const char \* [what](#) () const noexcept

### 6.863.1 Detailed Description

One of two subclasses of exception.

Runtime errors represent problems outside the scope of a program; they cannot be easily predicted and can generally only be caught as the program executes.

### 6.863.2 Constructor & Destructor Documentation

#### [runtime\\_error\(\)](#)

```
std::runtime_error::runtime_error (  
    const string & __arg) [explicit]
```

Takes a character string describing the error.

References [runtime\\_error\(\)](#).

Referenced by [runtime\\_error\(\)](#).

### 6.863.3 Member Function Documentation

#### [what\(\)](#)

```
virtual const char * std::runtime_error::what () const [virtual], [noexcept]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#), and [std::filesystem::filesystem\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this class was generated from the following file:

- [stdexcept\\_except.h](#)

## 6.864 [\\_\\_gnu\\_pbds::sample\\_probe\\_fn](#) Class Reference

```
#include <sample_probe_fn.hpp>
```

### Public Types

- typedef std::size\_t **size\_type**

### Public Member Functions

- [sample\\_probe\\_fn](#) ()
- [sample\\_probe\\_fn](#) (const [sample\\_probe\\_fn](#) &)
- void [swap](#) ([sample\\_probe\\_fn](#) &)

### Protected Member Functions

- size\_type [operator\(\)](#) (key\_const\_reference r\_key, size\_type i) const

### 6.864.1 Detailed Description

A sample probe policy.

### 6.864.2 Constructor & Destructor Documentation

#### sample\_probe\_fn() [1/2]

```
__gnu_pbds::sample_probe_fn::sample_probe_fn ()
```

Default constructor.

Referenced by [sample\\_probe\\_fn\(\)](#), and [swap\(\)](#).

#### sample\_probe\_fn() [2/2]

```
__gnu_pbds::sample_probe_fn::sample_probe_fn (
    const sample\_probe\_fn & )
```

Copy constructor.

References [sample\\_probe\\_fn\(\)](#).

### 6.864.3 Member Function Documentation

#### operator>()

```
size_type __gnu_pbds::sample_probe_fn::operator() (
    key_const_reference r_key,
    size_type i) const [inline], [protected]
```

Returns the i-th offset from the hash value of some key r\_key.

#### swap()

```
void __gnu_pbds::sample_probe_fn::swap (
    sample\_probe\_fn & ) [inline]
```

Swaps content.

References [sample\\_probe\\_fn\(\)](#).

The documentation for this class was generated from the following file:

- [sample\\_probe\\_fn.hpp](#)

## 6.865 \_\_gnu\_pbds::sample\_range\_hashing Class Reference

```
#include <sample_range_hashing.hpp>
```

### Public Types

- typedef std::size\_t [size\\_type](#)

### Public Member Functions

- [sample\\_range\\_hashing](#) ()
- [sample\\_range\\_hashing](#) (const [sample\\_range\\_hashing](#) &other)
- void [swap](#) ([sample\\_range\\_hashing](#) &other)

### Protected Member Functions

- void [notify\\_resized](#) ([size\\_type](#))
- [size\\_type](#) [operator\(\)](#) ([size\\_type](#)) const

### 6.865.1 Detailed Description

A sample range-hashing functor.

### 6.865.2 Member Typedef Documentation

#### size\_type

`typedef std::size_t __gnu_pbds::sample_range_hashing::size_type`  
Size type.

### 6.865.3 Constructor & Destructor Documentation

#### sample\_range\_hashing() [1/2]

`__gnu_pbds::sample_range_hashing::sample_range_hashing ()`  
Default constructor.  
Referenced by [sample\\_range\\_hashing\(\)](#), and [swap\(\)](#).

#### sample\_range\_hashing() [2/2]

`__gnu_pbds::sample_range_hashing::sample_range_hashing (  
    const sample\_range\_hashing & other)`  
Copy constructor.  
References [sample\\_range\\_hashing\(\)](#).

### 6.865.4 Member Function Documentation

#### notify\_resized()

`void __gnu_pbds::sample_range_hashing::notify_resized (  
    size\_type ) [protected]`  
Notifies the policy object that the container's size has changed to argument's size.

#### operator>()

`size\_type __gnu_pbds::sample_range_hashing::operator() (  
    size\_type ) const [inline], [protected]`  
Transforms the `__hash` value hash into a ranged-hash value.

#### swap()

`void __gnu_pbds::sample_range_hashing::swap (  
    sample\_range\_hashing & other) [inline]`  
Swaps content.  
References [sample\\_range\\_hashing\(\)](#).  
The documentation for this class was generated from the following file:

- [sample\\_range\\_hashing.hpp](#)

### 6.866 \_\_gnu\_pbds::sample\_ranged\_hash\_fn Class Reference

`#include <sample_ranged_hash_fn.hpp>`

#### Public Types

- `typedef std::size_t size\_type`

**Public Member Functions**

- [sample\\_ranged\\_hash\\_fn](#) ()
- [sample\\_ranged\\_hash\\_fn](#) (const [sample\\_ranged\\_hash\\_fn](#) &)
- void [swap](#) ([sample\\_ranged\\_hash\\_fn](#) &)

**Protected Member Functions**

- void [notify\\_resized](#) (size\_type)
- size\_type [operator\(\)](#) (key\_const\_reference) const

**6.866.1 Detailed Description**

A sample ranged-hash functor.

**6.866.2 Constructor & Destructor Documentation****sample\_ranged\_hash\_fn() [1/2]**

```
__gnu_pbds::sample_ranged_hash_fn::sample_ranged_hash_fn ()
```

Default constructor.

Referenced by [sample\\_ranged\\_hash\\_fn\(\)](#), and [swap\(\)](#).

**sample\_ranged\_hash\_fn() [2/2]**

```
__gnu_pbds::sample_ranged_hash_fn::sample_ranged_hash_fn (
    const sample\_ranged\_hash\_fn & )
```

Copy constructor.

References [sample\\_ranged\\_hash\\_fn\(\)](#).

**6.866.3 Member Function Documentation****notify\_resized()**

```
void __gnu_pbds::sample_ranged_hash_fn::notify_resized (
    size_type ) [protected]
```

Notifies the policy object that the container's `__size` has changed to `size`.

**operator>()()**

```
size_type __gnu_pbds::sample_ranged_hash_fn::operator() (
    key_const_reference ) const [inline], [protected]
```

Transforms `key_const_reference` into a position within the table.

**swap()**

```
void __gnu_pbds::sample_ranged_hash_fn::swap (
    sample\_ranged\_hash\_fn & ) [inline]
```

Swaps content.

References [sample\\_ranged\\_hash\\_fn\(\)](#).

The documentation for this class was generated from the following file:

- bool **is\_resize\_needed** () const
- void **notify\_cleared** ()
- void **notify\_erase\_search\_collision** ()
- void **notify\_erase\_search\_end** ()
- void **notify\_erase\_search\_start** ()
- void **notify\_erased** ([size\\_type](#) num\_e)
- void **notify\_find\_search\_collision** ()
- void **notify\_find\_search\_end** ()
- void **notify\_find\_search\_start** ()
- void **notify\_insert\_search\_collision** ()
- void **notify\_insert\_search\_end** ()
- void **notify\_insert\_search\_start** ()
- void **notify\_inserted** ([size\\_type](#) num\_e)
- void **notify\_resized** ([size\\_type](#) new\_size)

### 6.868.1 Detailed Description

A sample resize policy.

### 6.868.2 Member Typedef Documentation

#### `size_type`

```
typedef std::size_t __gnu_pbds::sample_resize_policy::size_type
```

Size type.

### 6.868.3 Constructor & Destructor Documentation

#### `sample_resize_policy()`

```
__gnu_pbds::sample_resize_policy::sample_resize_policy ()
```

Default constructor.  
Referenced by [sample\\_range\\_hashing\(\)](#), and [swap\(\)](#).

### 6.868.4 Member Function Documentation

#### `get_new_size()`

```
size_type __gnu_pbds::sample_resize_policy::get_new_size (  
    size_type size,  
    size_type num_used_e) const [protected]
```

Queries what the new size should be.

#### `is_resize_needed()`

```
bool __gnu_pbds::sample_resize_policy::is_resize_needed () const [inline], [protected]
```

Queries whether a resize is needed.

#### `notify_cleared()`

```
void __gnu_pbds::sample_resize_policy::notify_cleared () [protected]
```

Notifies the table was cleared.

#### `notify_erase_search_collision()`

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

#### `notify_erase_search_end()`

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_end () [inline], [protected]
```

Notifies a search ended.

#### `notify_erase_search_start()`

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_start () [inline], [protected]
```

Notifies a search started.

#### `notify_erased()`

```
void __gnu_pbds::sample_resize_policy::notify_erased (  
    size_type num_e) [inline], [protected]
```

Notifies an element was erased.

**notify\_find\_search\_collision()**

```
void __gnu_pbds::sample_resize_policy::notify_find_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

**notify\_find\_search\_end()**

```
void __gnu_pbds::sample_resize_policy::notify_find_search_end () [inline], [protected]
```

Notifies a search ended.

**notify\_find\_search\_start()**

```
void __gnu_pbds::sample_resize_policy::notify_find_search_start () [inline], [protected]
```

Notifies a search started.

**notify\_insert\_search\_collision()**

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

**notify\_insert\_search\_end()**

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_end () [inline], [protected]
```

Notifies a search ended.

**notify\_insert\_search\_start()**

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_start () [inline], [protected]
```

Notifies a search started.

**notify\_inserted()**

```
void __gnu_pbds::sample_resize_policy::notify_inserted (  
    size_type num_e) [inline], [protected]
```

Notifies an element was inserted.

**notify\_resized()**

```
void __gnu_pbds::sample_resize_policy::notify_resized (  
    size_type new_size) [protected]
```

Notifies the table was resized to new\_size.

**sample\_range\_hashing()**

```
__gnu_pbds::sample_resize_policy::sample_range_hashing (  
    const sample_resize_policy & other)
```

Copy constructor.

References [sample\\_resize\\_policy\(\)](#).

**swap()**

```
void __gnu_pbds::sample_resize_policy::swap (  
    sample_resize_policy & other) [inline]
```

Swaps content.

References [sample\\_resize\\_policy\(\)](#).

The documentation for this class was generated from the following file:

- [sample\\_resize\\_policy.hpp](#)

## 6.869 `__gnu_pbds::sample_resize_trigger` Class Reference

```
#include <sample_resize_trigger.hpp>
```

### Public Types

- void [notify\\_inserted](#) ([size\\_type](#) num\_entries)
- void [notify\\_resized](#) ([size\\_type](#) new\_size)

#### 6.869.1 Detailed Description

A sample resize trigger policy.

#### 6.869.2 Member Typedef Documentation

##### `size_type`

```
typedef std::size_t __gnu_pbds::sample_resize_trigger::size_type
```

Size type.

#### 6.869.3 Constructor & Destructor Documentation

##### `sample_resize_trigger()`

```
__gnu_pbds::sample_resize_trigger::sample_resize_trigger ()
```

Default constructor.

Referenced by [sample\\_range\\_hashing\(\)](#), and [swap\(\)](#).

#### 6.869.4 Member Function Documentation

##### **is\_grow\_needed()**

```
bool __gnu_pbds::sample_resize_trigger::is_grow_needed (
    size_type size,
    size_type num_entries) const [inline], [protected]
```

Queries whether a grow is needed.

##### **is\_resize\_needed()**

```
bool __gnu_pbds::sample_resize_trigger::is_resize_needed () const [inline], [protected]
```

Queries whether a resize is needed.

##### **notify\_cleared()**

```
void __gnu_pbds::sample_resize_trigger::notify_cleared () [protected]
```

Notifies the table was cleared.

##### **notify\_erase\_search\_collision()**

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

##### **notify\_erase\_search\_end()**

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_end () [inline], [protected]
```

Notifies a search ended.

##### **notify\_erase\_search\_start()**

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_start () [inline], [protected]
```

Notifies a search started.

##### **notify\_erased()**

```
void __gnu_pbds::sample_resize_trigger::notify_erased (
    size_type num_entries) [inline], [protected]
```

Notifies an element was erased.

##### **notify\_externally\_resized()**

```
void __gnu_pbds::sample_resize_trigger::notify_externally_resized (
    size_type new_size) [protected]
```

Notifies the table was resized externally.

##### **notify\_find\_search\_collision()**

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

##### **notify\_find\_search\_end()**

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_end () [inline], [protected]
```

Notifies a search ended.

**notify\_find\_search\_start()**

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_start () [inline], [protected]
```

Notifies a search started.

**notify\_insert\_search\_collision()**

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

**notify\_insert\_search\_end()**

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_end () [inline], [protected]
```

Notifies a search ended.

**notify\_insert\_search\_start()**

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_start () [inline], [protected]
```

Notifies a search started.

**notify\_inserted()**

```
void __gnu_pbds::sample_resize_trigger::notify_inserted (
    size_type num_entries) [inline], [protected]
```

Notifies an element was inserted. the total number of entries in the table is num\_entries.

**notify\_resized()**

```
void __gnu_pbds::sample_resize_trigger::notify_resized (
    size_type new_size) [protected]
```

Notifies the table was resized as a result of this object's signifying that a resize is needed.

**sample\_range\_hashing()**

```
__gnu_pbds::sample_resize_trigger::sample_range_hashing (
    const sample_resize_trigger & )
```

Copy constructor.

References [sample\\_resize\\_trigger\(\)](#).

**swap()**

```
void __gnu_pbds::sample_resize_trigger::swap (
    sample_resize_trigger & ) [inline]
```

Swaps content.

References [sample\\_resize\\_trigger\(\)](#).

The documentation for this class was generated from the following file:

- [size\\_type](#) [get\\_nearest\\_smaller\\_size](#) ([size\\_type](#) size) const

### 6.870.1 Detailed Description

A sample size policy.

### 6.870.2 Member Typedef Documentation

#### **size\_type**

typedef std::size\_t [\\_\\_gnu\\_pbds::sample\\_size\\_policy::size\\_type](#)  
Size type.

### 6.870.3 Constructor & Destructor Documentation

#### **sample\_size\_policy()**

[\\_\\_gnu\\_pbds::sample\\_size\\_policy::sample\\_size\\_policy](#) ()  
Default constructor.  
Referenced by [sample\\_range\\_hashing\(\)](#), and [swap\(\)](#).

### 6.870.4 Member Function Documentation

#### **get\_nearest\_larger\_size()**

[size\\_type](#) [\\_\\_gnu\\_pbds::sample\\_size\\_policy::get\\_nearest\\_larger\\_size](#) (  
    [size\\_type](#) size) const [inline], [protected]  
Given a [\\_\\_size](#) size, returns a [\\_\\_size](#) that is larger.

#### **get\_nearest\_smaller\_size()**

[size\\_type](#) [\\_\\_gnu\\_pbds::sample\\_size\\_policy::get\\_nearest\\_smaller\\_size](#) (  
    [size\\_type](#) size) const [inline], [protected]  
Given a [\\_\\_size](#) size, returns a [\\_\\_size](#) that is smaller.

#### **sample\_range\_hashing()**

[\\_\\_gnu\\_pbds::sample\\_size\\_policy::sample\\_range\\_hashing](#) (  
    const [sample\\_size\\_policy](#) & )  
Copy constructor.  
References [sample\\_size\\_policy\(\)](#).

#### **swap()**

void [\\_\\_gnu\\_pbds::sample\\_size\\_policy::swap](#) (  
    [sample\\_size\\_policy](#) & other) [inline]  
Swaps content.  
References [sample\\_size\\_policy\(\)](#).

The documentation for this class was generated from the following file:

## 6.871 `__gnu_pbds::sample_tree_node_update< Const_Node_Iter, Node_Iter, Cmp_Fn, _Alloc >` Class Template Reference

```
#include <sample_tree_node_update.hpp>
```

### 6.871.1 Detailed Description

```
template<typename Const_Node_Iter, typename Node_Iter, typename Cmp_Fn, typename _Alloc>
class __gnu_pbds::sample_tree_node_update< Const_Node_Iter, Node_Iter, Cmp_Fn, _Alloc >
```

A sample node updator.

The documentation for this class was generated from the following file:

- [sample\\_tree\\_node\\_update.hpp](#)

## 6.872 `__gnu_pbds::sample_trie_access_traits` Struct Reference

```
#include <sample_trie_access_traits.hpp>
```

### Public Types

- enum { `max_size` }
- typedef `std::string::const_iterator` `const_iterator`
- typedef char `e_type`
- typedef `rebind_traits< _Alloc, key_type >::const_reference` `key_const_reference`
- typedef `std::string` `key_type`
- typedef `std::size_t` `size_type`

### Static Public Member Functions

- static `const_iterator` `begin` (`key_const_reference`)
- static `size_type` `e_pos` (`e_type`)
- static `const_iterator` `end` (`key_const_reference`)

### 6.872.1 Detailed Description

A sample trie element access traits.

### 6.872.2 Member Typedef Documentation

#### `e_type`

```
typedef char __gnu_pbds::sample_trie_access_traits::e_type
```

Element type.

### 6.872.3 Member Function Documentation

#### `begin()`

```
const_iterator __gnu_pbds::sample_trie_access_traits::begin (
    key_const_reference ) [inline], [static]
```

Returns a `const_iterator` to the first element of `r_key`.

**e\_pos()**

```
size_type __gnu_pbds::sample_trie_access_traits::e_pos (
    e_type ) [inline], [static]
```

Maps an element to a position.

**end()**

```
const_iterator __gnu_pbds::sample_trie_access_traits::end (
    key_const_reference ) [inline], [static]
```

Returns a const\_iterator to the after-last element of r\_key.

The documentation for this struct was generated from the following file:

- [sample\\_trie\\_access\\_traits.hpp](#)

## 6.873 `__gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >` Class Template Reference

```
#include <sample_trie_node_update.hpp>
```

**Public Types**

- typedef std::size\_t **metadata\_type**

**Protected Member Functions**

- [sample\\_trie\\_node\\_update](#) ()
- void [operator](#)() (node\_iterator, node\_const\_iterator) const

### 6.873.1 Detailed Description

```
template<typename Node_Cltr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >
```

A sample node updator.

### 6.873.2 Constructor & Destructor Documentation

**sample\_trie\_node\_update()**

```
template<typename Node_Cltr, typename Node_Itr, typename _ATraits, typename _Alloc>
__gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >::sample_trie_node_↵
update () [protected]
```

Default constructor.

### 6.873.3 Member Function Documentation

**operator>()()**

```
template<typename Node_Cltr, typename Node_Itr, typename _ATraits, typename _Alloc>
void __gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >::operator() (
    node_iterator ,
    node_const_iterator ) const [inline], [protected]
```

Updates the rank of a node through a node\_iterator node\_it; end\_nd\_it is the end node iterator.

The documentation for this class was generated from the following file:

- [sample\\_trie\\_node\\_update.hpp](#)

## 6.874 `__gnu_pbds::sample_update_policy` Struct Reference

```
#include <sample_update_policy.hpp>
```

### Public Member Functions

- [sample\\_update\\_policy](#) ()
- [sample\\_update\\_policy](#) (const [sample\\_update\\_policy](#) &)
- void [swap](#) ([sample\\_update\\_policy](#) &other)

### Protected Types

- typedef some\_metadata\_type [metadata\\_type](#)

### Protected Member Functions

- [metadata\\_type operator\(\)](#) () const
- bool [operator\(\)](#) (metadata\_reference) const

#### 6.874.1 Detailed Description

A sample list-update policy.

#### 6.874.2 Member Typedef Documentation

##### `metadata_type`

```
typedef some_metadata_type __gnu_pbds::sample_update_policy::metadata_type [protected]
```

Metadata on which this functor operates.

#### 6.874.3 Constructor & Destructor Documentation

##### `sample_update_policy()` [1/2]

```
__gnu_pbds::sample_update_policy::sample_update_policy ()
```

Default constructor.

Referenced by [sample\\_update\\_policy\(\)](#), and [swap\(\)](#).

##### `sample_update_policy()` [2/2]

```
__gnu_pbds::sample_update_policy::sample_update_policy (  
    const sample\_update\_policy & )
```

Copy constructor.

References [sample\\_update\\_policy\(\)](#).

#### 6.874.4 Member Function Documentation

##### `operator>()` [1/2]

```
metadata\_type __gnu_pbds::sample_update_policy::operator() () const [protected]
```

Creates a metadata object.

**operator>() [2/2]**

```
bool __gnu_pbds::sample_update_policy::operator() (
    metadata_reference ) const [protected]
```

Decides whether a metadata object should be moved to the front of the list. A list-update based containers object will call this method to decide whether to move a node to the front of the list. The method should return true if the node should be moved to the front of the list.

**swap()**

```
void __gnu_pbds::sample_update_policy::swap (
    sample_update_policy & other) [inline]
```

Swaps content.

References [sample\\_update\\_policy\(\)](#).

The documentation for this struct was generated from the following file:

- [sample\\_update\\_policy.hpp](#)

**6.875 \_\_gnu\_parallel::sampling\_tag Struct Reference**

```
#include <tags.h>
```

Inheritance diagram for `__gnu_parallel::sampling_tag`:

**Public Member Functions**

- [sampling\\_tag](#) ([\\_ThreadIndex](#) \_\_num\_threads)
- [\\_ThreadIndex](#) [\\_\\_get\\_num\\_threads](#) ()
- void [set\\_num\\_threads](#) ([\\_ThreadIndex](#) \_\_num\_threads)

**6.875.1 Detailed Description**

Forces parallel merging with exact splitting, at compile time.

**6.875.2 Member Function Documentation****`__get_num_threads()`**

```
\_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline], [inherited]
```

Find out desired number of threads.

### Returns

Desired number of threads.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), and [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#).

### set\_num\_threads()

```
void __gnu_parallel::parallel_tag::set_num_threads (
    __ThreadIndex __num_threads) [inline], [inherited]
```

Set the desired number of threads.

### Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

The documentation for this struct was generated from the following file:

### 6.876.1 Detailed Description

```
template<typename _OuterAlloc, typename... _InnerAllocs>
class std::scoped_allocator_adaptor< _OuterAlloc, _InnerAllocs >
```

An adaptor to recursively pass an allocator to the objects it constructs.  
The documentation for this class was generated from the following file:

- [scoped\\_allocator](#)

### 6.877 std::seed\_seq Class Reference

```
#include <random>
```

#### Public Types

- typedef uint\_least32\_t [result\\_type](#)

## Public Member Functions

- `seed_seq` () noexcept
- `template<typename _InputIterator>`  
`seed_seq` (\_InputIterator \_\_begin, \_InputIterator \_\_end)
- `seed_seq` (const `seed_seq` &)=delete
- `template<typename _IntType, typename = _Require<is_integral<_IntType>>>`  
`seed_seq` (std::initializer\_list<\_IntType> \_\_il)
- `template<typename _RandomAccessIterator>`  
void `generate` (\_RandomAccessIterator \_\_begin, \_RandomAccessIterator \_\_end)
- `seed_seq` & `operator=` (const `seed_seq` &)=delete
- `template<typename _OutputIterator>`  
void `param` (\_OutputIterator \_\_dest) const
- `size_t size` () const noexcept

### 6.877.1 Detailed Description

The `seed_seq` class generates sequences of seeds for random number generators.

Since

C++11

### 6.877.2 Member Typedef Documentation

#### `result_type`

```
typedef uint_least32_t std::seed_seq::result_type
```

The type of the seed vales.

### 6.877.3 Constructor & Destructor Documentation

#### `seed_seq()`

```
std::seed_seq::seed_seq () [inline], [noexcept]
```

Default constructor.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

## 6.878 `__gnu_cxx::select1st<_Pair>` Struct Template Reference

```

## 6.880 `__gnu_pbds::detail::select_value_type< Key, Mapped >` Struct Template Reference

```
#include <types_traits.hpp>
```

### Public Types

- typedef `std::pair< const Key, Mapped >` `type`

#### 6.880.1 Detailed Description

```
template<typename Key, typename Mapped>
struct __gnu_pbds::detail::select_value_type< Key, Mapped >
```

Choose `value_type` to be a key/value pair or just a key.

The documentation for this struct was generated from the following file:

- [types\\_traits.hpp](#)

## 6.881 `__gnu_pbds::detail::select_value_type< Key, null_type >` Struct Template Reference

```
#include <types_traits.hpp>
```

### Public Types

- typedef `Key` `type`

#### 6.881.1 Detailed Description

```
template<typename Key>
struct __gnu_pbds::detail::select_value_type< Key, null_type >
```

Specialization for sets where the key is the `value_type`.

The documentation for this struct was generated from the following file:

- [types\\_traits.hpp](#)

## 6.882 `std::basic_istream< _CharT, _Traits >::sentry` Class Reference

```
#include <istream>
```

### Public Types

- typedef `__istream_type::__ctype_type` `__ctype_type`
- typedef `_Traits::int_type` `__int_type`
- typedef `basic_istream< _CharT, _Traits >` `__istream_type`
- typedef `basic_streambuf< _CharT, _Traits >` `__streambuf_type`
- typedef `_Traits traits_type`

### Public Member Functions

- `sentry` (`basic_istream< _CharT, _Traits > &__is`, `bool __noskipws=false`)
- `operator bool` () `const`

### 6.882.1 Detailed Description

```
template<typename _CharT, typename _Traits>
class std::basic_istream< _CharT, _Traits >::sentry
```

Performs setup work for input streams.

Objects of this class are created before all of the standard extractors are run. It is responsible for *exception-safe prefix and suffix operations*, although only prefix actions are currently required by the standard.

### 6.882.2 Member Typedef Documentation

#### traits\_type

```
template<typename _CharT, typename _Traits>
typedef _Traits std::basic_istream< _CharT, _Traits >::sentry::traits_type
Easy access to dependent types.
```

### 6.882.3 Constructor & Destructor Documentation

#### sentry()

```
template<typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits >::sentry::sentry (
    basic_istream< _CharT, _Traits > & __is,
    bool __noskipws = false) [explicit]
```

The constructor performs all the work.

#### Parameters

|                         |                                       |
|-------------------------|---------------------------------------|
| <code>__is</code>       | The input stream to guard.            |
| <code>__noskipws</code> | Whether to consume whitespace or not. |

If the stream state is good (`__is.good()` is true), then the following actions are performed, otherwise the sentry state is false (*not okay*) and failbit is set in the stream state.

The sentry's preparatory actions are:

1. if the stream is tied to an output stream, `is.tie()->flush()` is called to synchronize the output sequence
2. if `__noskipws` is false, and `ios_base::skipws` is set in `is.flags()`, the sentry extracts and discards whitespace characters from the stream. The currently imbued locale is used to determine whether each character is whitespace.

If the stream state is still good, then the sentry state becomes true (*okay*).

References `std::basic_istream< _CharT, _Traits >::basic_istream()`, `std::ios_base::badbit`, `std::basic_ios< _CharT, _Traits >::good()`, and `std::ios_base::goodbit`.

### 6.882.4 Member Function Documentation

#### operator bool()

```
template<typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits >::sentry::operator bool () const [inline], [explicit]
```

Quick status checking.

## Returns

The sentry state.

For ease of use, sentries may be converted to booleans. The return value is that of the sentry state (`true == okay`). The documentation for this class was generated from the following files:

- [istream](#)
- [istream.tcc](#)

**6.883 `std::basic_ostream<_CharT, _Traits>::sentry` Class Reference**

```
#include <ostream.h>
```

**Public Member Functions**

- [sentry](#) ([basic\\_ostream](#)<\_CharT, \_Traits> &\_\_os)
- [~sentry](#) ()
- [operator bool](#) () const

**6.883.1 Detailed Description**

```
template<typename _CharT, typename _Traits>
class std::basic_ostream<_CharT, _Traits>::sentry
```

Performs setup work for output streams.

Objects of this class are created before all of the standard inserters are run. It is responsible for *exception-safe prefix and suffix operations*.

**6.883.2 Constructor & Destructor Documentation****sentry()**

```
template<typename _CharT, typename _Traits>
std::basic_ostream<_CharT, _Traits>::sentry::sentry (
    basic_ostream<_CharT, _Traits> &__os) [explicit]
```

The constructor performs preparatory work.

**Parameters**

|                   |                             |
|-------------------|-----------------------------|
| <code>__os</code> | The output stream to guard. |
|-------------------|-----------------------------|

If the stream state is good (`__os.good()` is true), then if the stream is tied to another output stream, `is->tie()->flush()` is called to synchronize the output sequences.

If the stream state is still good, then the sentry state becomes true (*okay*).

References [std::basic\\_ostream<\\_CharT, \\_Traits>::basic\\_ostream\(\)](#), [std::basic\\_ios<\\_CharT, \\_Traits>::bad\(\)](#), [std::ios\\_base::failbit](#), [std::basic\\_ios<\\_CharT, \\_Traits>::good\(\)](#), [std::basic\\_ios<\\_CharT, \\_Traits>::setstate\(\)](#), and [std::basic\\_ios<\\_CharT, \\_Traits>::tie\(\)](#).

**~sentry()**

```
template<typename _CharT, typename _Traits>
std::basic_ostream<_CharT, _Traits>::sentry::~sentry () [inline]
Possibly flushes the stream.
```

If `ios_base::unitbuf` is set in `os.flags()`, and `std::uncaught_exception()` is true, the sentry destructor flushes the output stream.

References [std::ios\\_base::badbit](#), [std::uncaught\\_exception\(\)](#), and [std::ios\\_base::unitbuf](#).

### 6.883.3 Member Function Documentation

#### operator bool()

```
template<typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits >::sentry::operator bool () const [inline], [explicit]
Quick status checking.
```

#### Returns

The sentry state.

For ease of use, sentries may be converted to booleans. The return value is that of the sentry state (true == okay).

### 6.887.1 Detailed Description

**template**<typename **\_Key**, typename **\_Compare** = `std::less`<**\_Key**>, typename **\_Alloc** = `std::allocator`<**\_Key**>>  
**class** `std::set`< **\_Key**, **\_Compare**, **\_Alloc** >

A standard container made up of unique keys, which can be retrieved in logarithmic time.

Since

C++98

#### Template Parameters

|                 |                                                                                 |
|-----------------|---------------------------------------------------------------------------------|
| <b>_Key</b>     | Type of key objects.                                                            |
| <b>_Compare</b> | Comparison function object type, defaults to <code>less</code> < <b>_Key</b> >. |
| <b>_Alloc</b>   | Allocator type, defaults to <code>allocator</code> < <b>_Key</b> >.             |

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys).

Sets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (\*\_unique versus \*\_equal, same as the standard).

## 6.887.2 Member Typedef Documentation

### allocator\_type

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
typedef _Alloc std::set< _Key, _Compare, _Alloc >::allocator_type
Public typedefs.
```

Public typedefs.
```

### value\_type

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>  
typedef _Key std::set< _Key, _Compare, _Alloc >::value_type  
Public typedefs.
```

### 6.887.3 Constructor & Destructor Documentation

#### set() [1/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
std::set<_Key, _Compare, _Alloc>::set () [default]
```

Default constructor creates no elements.

#### set() [2/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
std::set<_Key, _Compare, _Alloc>::set (  
    const _Compare & __comp,  
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a set with no elements.

##### Parameters

|                     |                      |
|---------------------|----------------------|
| <code>__comp</code> | Comparator to use.   |
| <code>__a</code>    | An allocator object. |

#### set() [3/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
template<typename _InputIterator>
```

```
std::set<_Key, _Compare, _Alloc>::set (  
    _InputIterator __first,  
    _InputIterator __last) [inline]
```

Builds a set from a range.

##### Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

Create a set consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

#### set() [4/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
template<typename _InputIterator>
```

```
std::set<_Key, _Compare, _Alloc>::set (  
    _InputIterator __first,  
    _InputIterator __last,  
    const _Compare & __comp,  
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a set from a range.

## Parameters

|                      |                       |
|----------------------|-----------------------|
| <code>__first</code> | An input iterator.    |
| <code>__last</code>  | An input iterator.    |
| <code>__comp</code>  | A comparison functor. |
| <code>__a</code>     | An allocator object.  |

Create a set consisting of copies of the elements from `[__first,__last)`. This is linear in  $N$  if the range is already sorted, and  $N\log N$  otherwise (where  $N$  is `distance(__first,__last)`).

**set()** [5/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc >::set (
    const set<_Key, _Compare, _Alloc > & ) [default]
```

Set copy constructor.

Whether the allocator is copied depends on the allocator traits.

**set()** [6/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc >::set (
    set<_Key, _Compare, _Alloc > && ) [default]
```

Set move constructor

The newly-created set contains the exact contents of the moved instance. The moved instance is a valid, but unspecified, set.

**set()** [7/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc >::set (
    initializer_list<value_type> & __l,
    const _Compare & __comp = _Compare(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a set from an `initializer_list`.

## Parameters

|                     |                                    |
|---------------------|------------------------------------|
| <code>__l</code>    | An <code>initializer_list</code> . |
| <code>__comp</code> | A comparison functor.              |
| <code>__a</code>    | An allocator object.               |

Create a set consisting of copies of the elements in the list. This is linear in  $N$  if the list is already sorted, and  $N\log N$  otherwise (where  $N$  is `__l.size()`).

**set()** [8/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc >::set (
    const allocator_type & __a) [inline], [explicit]
```

Allocator-extended default constructor.

#### set() [9/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
    const set< _Key, _Compare, _Alloc > & __x,
    const __type_identity_t< allocator_type > & __a) [inline]
```

Allocator-extended copy constructor.

#### set() [10/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
    set< _Key, _Compare, _Alloc > && __x,
    const __type_identity_t< allocator_type > & __a) [inline], [noexcept]
```

Allocator-extended move constructor.

#### set() [11/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
    initializer_list< value_type > __l,
    const allocator_type & __a) [inline]
```

Allocator-extended initializer-list constructor.

#### set() [12/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator>
std::set< _Key, _Compare, _Alloc >::set (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a) [inline]
```

Allocator-extended range constructor.

#### ~set()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::~~set () [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

### 6.887.4 Member Function Documentation

#### begin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set< _Key, _Compare, _Alloc >::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

### cbegin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
iterator std::set<_Key, _Compare, _Alloc >::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

### cend()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
iterator std::set<_Key, _Compare, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

### clear()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
void std::set<_Key, _Compare, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in a set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

### contains() [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
template<typename _Kt>
```

```
auto std::set<_Key, _Compare, _Alloc >::contains (
    const _Kt & __x) const -> decltype(_M_t._M_find_tr(__x), void()), true) [inline]
```

Finds whether an element with the given key exists.

#### Parameters

|                  |                                |
|------------------|--------------------------------|
| <code>__x</code> | Key of elements to be located. |
|------------------|--------------------------------|

#### Returns

True if there is an element with the specified key.

### contains() [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
bool std::set<_Key, _Compare, _Alloc >::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                   |                                |
|-------------------|--------------------------------|
| <code>_Key</code> | Key of elements to be located. |
| <code>__x</code>  |                                |

**Returns**

True if there is an element with the specified key.

**count()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::set< _Key, _Compare, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

|                   |                     |
|-------------------|---------------------|
| <code>_Key</code> | Element to located. |
| <code>__x</code>  |                     |

**Returns**

Number of elements with specified key.

This function only makes sense for multisets; for set the result will either be 0 (not present) or 1 (present).

**crbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::set< _Key, _Compare, _Alloc >::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

**crend()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::set< _Key, _Compare, _Alloc >::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

**emplace()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args>
```

```
std::pair< iterator, bool > std::set< _Key, _Compare, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Attempts to build and insert an element into the set.

**Parameters**

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__args</code> | Arguments used to generate an element. |
|---------------------|----------------------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a `bool` that is true if the element was actually inserted.

This function attempts to build and insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

**emplace\_hint()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args>
iterator std::set< _Key, _Compare, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Attempts to insert an element into the set.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__args</code> | Arguments used to generate the element to be inserted.                        |

**Returns**

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

**empty()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
bool std::set< _Key, _Compare, _Alloc >::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the set is empty.

**end()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set< _Key, _Compare, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

**equal\_range()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::pair< iterator, iterator > std::set< _Key, _Compare, _Alloc >::equal_range (
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                                       |                    |
|---------------------------------------|--------------------|
| <div><div>↵</div><div>__x</div></div> | Key to be located. |
|---------------------------------------|--------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

**equal\_range()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::pair< const_iterator, const_iterator > std::set< _Key, _Compare, _Alloc >::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                                       |                    |
|---------------------------------------|--------------------|
| <div><div>↵</div><div>__x</div></div> | Key to be located. |
|---------------------------------------|--------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

**erase()** [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
size_type std::set< _Key, _Compare, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                 |                              |
|-----------------|------------------------------|
| <code>_↔</code> | Key of element to be erased. |
| <code>_X</code> |                              |

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase() [2/3]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::set< _Key, _Compare, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from a set.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase() [3/3]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::set< _Key, _Compare, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from a set.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::find (
    const key_type & __x) [inline]
```

Tries to locate an element in a set.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>↵</code>   | Element to be located. |
| <code>__x</code> |                        |

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

**find()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
const_iterator std::set< _Key, _Compare, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in a set.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>↵</code>   | Element to be located. |
| <code>__x</code> |                        |

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

**get\_allocator()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
allocator_type std::set< _Key, _Compare, _Alloc >::get_allocator () const [inline], [noexcept]
```

Returns the allocator object with which the set was constructed.

**insert()** [1/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
template<typename _InputIterator>
void std::set< _Key, _Compare, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

## Parameters

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

**insert()** [2/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair< iterator, bool > std::set< _Key, _Compare, _Alloc >::insert (
    const value_type & __x) [inline]
```

Attempts to insert an element into the set.

## Parameters

|                  |                         |
|------------------|-------------------------|
| <code>__x</code> | Element to be inserted. |
|------------------|-------------------------|

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

Referenced by `std::set< _Key, _Cmp, polymorphic_allocator< _Key > >::insert()`.

**insert()** [3/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set< _Key, _Compare, _Alloc >::insert (
    const_iterator __position,
    const value_type & __x) [inline]
```

Attempts to insert an element into the set.

## Parameters

|                         |                                                                               |
|-------------------------|-------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>        | Element to be inserted.                                                       |

## Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

**insert()** [4/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
void std::set<_Key, _Compare, _Alloc>::insert (
    initializer_list<value_type> & __l) [inline]
```

Attempts to insert a list of elements into the set.

**Parameters**

|   |                                                                 |
|---|-----------------------------------------------------------------|
| ↔ | A std::initializer_list<value_type> of elements to be inserted. |
| ↔ |                                                                 |
| ↔ |                                                                 |
| ↔ |                                                                 |
| / |                                                                 |

Complexity similar to that of the range constructor.

**key\_comp()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
key_compare std::set<_Key, _Compare, _Alloc>::key_comp () const [inline]
```

Returns the comparison object with which the set was constructed.

**lower\_bound()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc>::lower_bound (
    const key_type & __x) [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|    |                    |
|----|--------------------|
| ↔  | Key to be located. |
| _X |                    |

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

**lower\_bound()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::set<_Key, _Compare, _Alloc>::lower_bound (
    const key_type & __x) const [inline]
```

Finds the beginning of a subsequence matching given key.

## Parameters

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

## Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

**max\_size()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
size_type std::set<_Key, _Compare, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the maximum size of the set.

**operator=()** [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
set & std::set<_Key, _Compare, _Alloc >::operator= (
    const set<_Key, _Compare, _Alloc > & ) [default]
```

Set assignment operator.

Whether the allocator is copied depends on the allocator traits.

**operator=()** [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
set & std::set<_Key, _Compare, _Alloc >::operator= (
    initializer_list<value_type > __l) [inline]
```

Set list assignment operator.

## Parameters

|                 |                      |
|-----------------|----------------------|
| <code>↵</code>  | An initializer_list. |
| <code>_↵</code> |                      |
| <code>↵</code>  |                      |
| <code>_↵</code> |                      |
| <code>/</code>  |                      |

This function fills a set with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the set and that the resulting set's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
set & std::set<_Key, _Compare, _Alloc >::operator= (
    set<_Key, _Compare, _Alloc > && ) [default]
```

Move assignment operator.

**rbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
reverse_iterator std::set< _Key, _Compare, _Alloc >::rbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

**rend()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
reverse_iterator std::set< _Key, _Compare, _Alloc >::rend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

**size()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
size_type std::set< _Key, _Compare, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the set.

**swap()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
void std::set< _Key, _Compare, _Alloc >::swap (
    set< _Key, _Compare, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another set.

**Parameters**

|                  |                                                |
|------------------|------------------------------------------------|
| <code>↵</code>   | A set of the same element and allocator types. |
| <code>__x</code> |                                                |

This exchanges the elements between two sets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Referenced by [std::swap\(\)](#).

**upper\_bound() [1/2]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
iterator std::set< _Key, _Compare, _Alloc >::upper_bound (
    const key_type & __x) [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>↵</code>   | Key to be located. |
| <code>__x</code> |                    |

**Returns**

Iterator pointing to the first element greater than key, or end().

**upper\_bound()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::set<_Key, _Compare, _Alloc>::upper_bound (
    const key_type & __x) const [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

**Returns**

Iterator pointing to the first element greater than key, or end().

**value\_comp()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
value_compare std::set<_Key, _Compare, _Alloc>::value_comp () const [inline]
```

Returns the comparison object with which the set was constructed.

The documentation for this class was generated from the following files:

### 6.888.1 Detailed Description

```
template<typename _Res>
class std::shared_future< _Res >
```

Primary template for shared\_future.

### 6.888.2 Constructor & Destructor Documentation

#### shared\_future() [1/3]

```
template<typename _Res>
std::shared_future< _Res >::shared_future (
    const shared_future< _Res > & __sf) [inline], [noexcept]
```

Copy constructor.

#### shared\_future() [2/3]

```
template<typename _Res>
std::shared_future< _Res >::shared_future (
    future< _Res > && __uf) [inline], [noexcept]
```

Construct from a future rvalue.

References `std::move()`.

#### shared\_future() [3/3]

```
template<typename _Res>
std::shared_future< _Res >::shared_future (
    shared_future< _Res > && __sf) [inline], [noexcept]
```

Construct from a shared\_future rvalue.

References `std::move()`.

### 6.888.3 Member Function Documentation

#### **\_M\_get\_result()**

```
template<typename _Res>
```

```
__result_type std::__basic_future< _Res >::_M_get_result () const [inline], [protected], [inherited]
```

Wait for the state to be ready and rethrow any stored exception.

Referenced by [std::future< \\_Res >::get\(\)](#), and [std::shared\\_future< \\_Res >::get\(\)](#).

#### **get()**

```
template<typename _Res>
```

```
const _Res & std::shared_future< _Res >::get () const [inline]
```

Retrieving the value.

References [std::\\_\\_basic\\_future< \\_Res >::\\_M\\_get\\_result\(\)](#).

### 6.892.1 Detailed Description

**template<typename \_Tp>**  
**class std::shared\_ptr< \_Tp >**

A smart pointer with reference-counted copy semantics.

Since

C++11

A `shared_ptr` object is either empty or *owns* a pointer passed to the constructor. Copies of a `shared_ptr` share ownership of the same pointer. When the last `shared_ptr` that owns the pointer is destroyed or reset, the owned pointer is freed (either by `delete` or by invoking a custom deleter that was passed to the constructor).

A `shared_ptr` also stores another pointer, which is usually (but not always) the same pointer as it owns. The stored pointer can be retrieved by calling the `get()` member function.

The equality and relational operators for `shared_ptr` only compare the stored pointer returned by `get()`, not the owned pointer. To test whether two `shared_ptr` objects share ownership of the same pointer see `std::shared_ptr::owner_before` and `std::owner_less`.

## 6.892.2 Member Typedef Documentation

### element\_type

```
template<typename _Tp>
using std::shared\_ptr< _Tp >::element_type
```

The type pointed to by the stored pointer, `remove_extent_t<_Tp>`

## 6.892.3 Constructor & Destructor Documentation

### shared\_ptr() [1/14]

```
template<typename _Tp>
std::shared\_ptr< _Tp >::shared_ptr () [inline], [constexpr], [noexcept]
```

Construct an empty `shared_ptr`.

#### Postcondition

```
use_count()==0 && get()==0
```

### shared\_ptr() [2/14]

```
template<typename _Tp>
std::shared\_ptr< _Tp >::shared_ptr (
    const shared\_ptr< _Tp > & ) [default], [noexcept]
```

Copy constructor.

### shared\_ptr() [3/14]

```
template<typename _Tp>
template<typename _Yp, typename = _Constructible<_Yp*>>
std::shared\_ptr< _Tp >::shared_ptr (
    _Yp * __p) [inline], [explicit]
```

Construct a `shared_ptr` that owns the pointer `__p`.

#### Parameters

|                  |                                                               |
|------------------|---------------------------------------------------------------|
| <code>__p</code> | A pointer that is convertible to <code>element_type*</code> . |
|------------------|---------------------------------------------------------------|

#### Postcondition

```
use_count() == 1 && get() == __p
```

#### Exceptions

|                                  |                                               |
|----------------------------------|-----------------------------------------------|
| <code>std::bad_alloc</code> , in | which case <code>delete __p</code> is called. |
|----------------------------------|-----------------------------------------------|

### shared\_ptr() [4/14]

```
template<typename _Tp>
template<typename _Yp, typename _Deleter, typename = _Constructible<_Yp*, _Deleter>>
std::shared\_ptr< _Tp >::shared_ptr (
    _Yp * __p,
    _Deleter __d) [inline]
```

Construct a `shared_ptr` that owns the pointer `__p` and the deleter `__d`.

## Parameters

|                          |            |
|--------------------------|------------|
| $\leftrightarrow$<br>__p | A pointer. |
| $\leftrightarrow$<br>__d | A deleter. |

## Postcondition

use\_count() == 1 && get() == \_\_p

## Exceptions

|                            |                                |
|----------------------------|--------------------------------|
| <i>std::bad_alloc</i> , in | which case __d(__p) is called. |
|----------------------------|--------------------------------|

Requirements: \_Deleter's copy constructor and destructor must not throw  
\_\_shared\_ptr will release \_\_p by calling \_\_d(\_\_p)

**shared\_ptr()** [5/14]

```
template<typename _Tp>
template<typename _Deleter>
std::shared_ptr< _Tp >::shared_ptr (
    nullptr_t __p,
    _Deleter __d) [inline]
```

Construct a shared\_ptr that owns a null pointer and the deleter \_\_d.

## Parameters

|                          |                          |
|--------------------------|--------------------------|
| $\leftrightarrow$<br>__p | A null pointer constant. |
| $\leftrightarrow$<br>__d | A deleter.               |

## Postcondition

use\_count() == 1 && get() == \_\_p

## Exceptions

|                            |                                |
|----------------------------|--------------------------------|
| <i>std::bad_alloc</i> , in | which case __d(__p) is called. |
|----------------------------|--------------------------------|

Requirements: \_Deleter's copy constructor and destructor must not throw  
The last owner will call \_\_d(\_\_p)

**shared\_ptr()** [6/14]

```
template<typename _Tp>
template<typename _Yp, typename _Deleter, typename _Alloc, typename = _Constructible<_Yp*,  $\leftrightarrow$ 
Deleter, _Alloc>>
std::shared_ptr< _Tp >::shared_ptr (
```

```
__Yp * __p,  
__Deleter __d,  
__Alloc __a) [inline]
```

Construct a `shared_ptr` that owns the pointer `__p` and the deleter `__d`.

## Parameters

|                          |               |
|--------------------------|---------------|
| $\leftrightarrow$<br>__p | A pointer.    |
| $\leftrightarrow$<br>__d | A deleter.    |
| $\leftrightarrow$<br>__a | An allocator. |

## Postcondition

use\_count() == 1 && get() == \_\_p

## Exceptions

|                            |                                |
|----------------------------|--------------------------------|
| <i>std::bad_alloc</i> , in | which case __d(__p) is called. |
|----------------------------|--------------------------------|

Requirements: \_Deleter's copy constructor and destructor must not throw \_Alloc's copy constructor and destructor must not throw.

\_\_shared\_ptr will release \_\_p by calling \_\_d(\_\_p)

**shared\_ptr()** [7/14]

```
template<typename _Tp>
template<typename _Deleter, typename _Alloc>
std::shared_ptr< _Tp >::shared_ptr (
    nullptr_t __p,
    _Deleter __d,
    _Alloc __a) [inline]
```

Construct a shared\_ptr that owns a null pointer and the deleter \_\_d.

## Parameters

|                          |                          |
|--------------------------|--------------------------|
| $\leftrightarrow$<br>__p | A null pointer constant. |
| $\leftrightarrow$<br>__d | A deleter.               |
| $\leftrightarrow$<br>__a | An allocator.            |

## Postcondition

use\_count() == 1 && get() == \_\_p

## Exceptions

|                            |                                |
|----------------------------|--------------------------------|
| <i>std::bad_alloc</i> , in | which case __d(__p) is called. |
|----------------------------|--------------------------------|

Requirements: \_Deleter's copy constructor and destructor must not throw \_Alloc's copy constructor and destructor must not throw.

The last owner will call \_\_d(\_\_p)

**shared\_ptr()** [8/14]

```
template<typename _Tp>
template<typename _Yp>
std::shared_ptr< _Tp >::shared_ptr (
    const shared_ptr< _Yp > & __r,
    element_type * __p) [inline], [noexcept]
```

Constructs a shared\_ptr instance that stores \_\_p and shares ownership with \_\_r.

**Parameters**

|                                                                                              |                                                       |
|----------------------------------------------------------------------------------------------|-------------------------------------------------------|
|  <b>__r</b> | A shared_ptr.                                         |
|  <b>__p</b> | A pointer that will remain valid while *__r is valid. |

**Postcondition**

```
get() == __p && use_count() == __r.use_count()
```

This can be used to construct a shared\_ptr to a sub-object of an object managed by an existing shared\_ptr. The complete object will remain valid while any shared\_ptr owns it, even if they don't store a pointer to the complete object.

```
shared_ptr<pair<int,int>> pii(new pair<int,int>());
shared_ptr<int> pi(pii, &pii->first);
assert(pii.use_count() == 2);
```

**shared\_ptr()** [9/14]

```
template<typename _Tp>
template<typename _Yp>
std::shared_ptr< _Tp >::shared_ptr (
    shared_ptr< _Yp > && __r,
    element_type * __p) [inline], [noexcept]
```

Constructs a shared\_ptr instance that stores \_\_p and shares ownership with \_\_r.

**Parameters**

|                                                                                                |                                                       |
|------------------------------------------------------------------------------------------------|-------------------------------------------------------|
|  <b>__r</b> | A shared_ptr.                                         |
|  <b>__p</b> | A pointer that will remain valid while *__r is valid. |

**Postcondition**

```
get() == __p && !__r.use_count() && !__r.get()
```

**Since**

C++17

This can be used to construct a shared\_ptr to a sub-object of an object managed by an existing shared\_ptr. The complete object will remain valid while any shared\_ptr owns it, even if they don't store a pointer to the complete object.

```
shared_ptr<pair<int,int>> pii(new pair<int,int>());
shared_ptr<int> pi1(pii, &pii->first);
assert(pii.use_count() == 2);
shared_ptr<int> pi2(std::move(pii), &pii->second);
assert(pii.use_count() == 0);
```

**shared\_ptr()** [10/14]

```
template<typename _Tp>
template<typename _Yp, typename = _Constructible<const shared_ptr<_Yp>&>>
std::shared_ptr<_Tp>::shared_ptr (
    const shared_ptr<_Yp> & __r) [inline], [noexcept]
```

If `__r` is empty, constructs an empty `shared_ptr`; otherwise construct a `shared_ptr` that shares ownership with `__r`.

**Parameters**

|          |               |
|----------|---------------|
| ↩        | A shared_ptr. |
| ↩        |               |
| ↩        |               |
| ↩        |               |
| <i>r</i> |               |

**Postcondition**

`get() == __r.get() && use_count() == __r.use_count()`

**shared\_ptr()** [11/14]

```
template<typename _Tp>
std::shared_ptr<_Tp>::shared_ptr (
    shared_ptr<_Tp> && __r) [inline], [noexcept]
```

Move-constructs a `shared_ptr` instance from `__r`.

**Parameters**

|          |                      |
|----------|----------------------|
| ↩        | A shared_ptr rvalue. |
| ↩        |                      |
| ↩        |                      |
| ↩        |                      |
| <i>r</i> |                      |

**Postcondition**

\*this contains the old value of `__r`, `__r` is empty.

**shared\_ptr()** [12/14]

```
template<typename _Tp>
template<typename _Yp, typename = _Constructible<shared_ptr<_Yp>>>
std::shared_ptr<_Tp>::shared_ptr (
    shared_ptr<_Yp> && __r) [inline], [noexcept]
```

Move-constructs a `shared_ptr` instance from `__r`.

**Parameters**

|          |                      |
|----------|----------------------|
| ↩        | A shared_ptr rvalue. |
| ↩        |                      |
| ↩        |                      |
| ↩        |                      |
| <i>r</i> |                      |

**Postcondition**

\*this contains the old value of `__r`, `__r` is empty.

**shared\_ptr()** [13/14]

```
template<typename _Tp>
template<typename _Yp, typename = _Constructible<const weak_ptr<_Yp>&>>
std::shared_ptr< _Tp >::shared_ptr (
    const weak_ptr< _Yp > & __r) [inline], [explicit]
```

Constructs a `shared_ptr` that shares ownership with `__r` and stores a copy of the pointer stored in `__r`.

**Parameters**

|          |             |
|----------|-------------|
| ↩        | A weak_ptr. |
| __↩      |             |
| ↩        |             |
| __↩      |             |
| <i>r</i> |             |

**Postcondition**

`use_count() == __r.use_count()`

**Exceptions**

|                     |                                                                                |
|---------------------|--------------------------------------------------------------------------------|
| <i>bad_weak_ptr</i> | when <code>__r.expired()</code> , in which case the constructor has no effect. |
|---------------------|--------------------------------------------------------------------------------|

**shared\_ptr()** [14/14]

```
template<typename _Tp>
std::shared_ptr< _Tp >::shared_ptr (
    nullptr_t ) [inline], [constexpr], [noexcept]
```

Construct an empty `shared_ptr`.

**Postcondition**

`use_count() == 0 && get() == nullptr`

**6.892.4 Member Function Documentation****get()**

```
template<typename _Tp, _Lock_policy _Lp>
element_type * std::__shared_ptr< _Tp, _Lp >::get () const [inline], [noexcept], [inherited]
```

Return the stored pointer.

**operator bool()**

```
template<typename _Tp, _Lock_policy _Lp>
std::__shared_ptr< _Tp, _Lp >::operator bool () const [inline], [explicit], [noexcept], [inherited]
```

Return true if the stored pointer is not null.

**owner\_before()** [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
template<typename _Tp1>
bool std::__shared_ptr< _Tp, _Lp >::owner_before (
    __shared_ptr< _Tp1, _Lp > const & __rhs) const [inline], [noexcept], [inherited]
```

Define an ordering based on ownership.

This function defines a strict weak ordering between two `shared_ptr` or `weak_ptr` objects, such that one object is less than the other unless they share ownership of the same pointer, or are both empty.

**owner\_before()** [2/2]

```
template<typename _Tp, _Lock_policy _Lp>
template<typename _Tp1>
bool std::__shared_ptr< _Tp, _Lp >::owner_before (
    __weak_ptr< _Tp1, _Lp > const & __rhs) const [inline], [noexcept], [inherited]
```

Define an ordering based on ownership.

This function defines a strict weak ordering between two `shared_ptr` or `weak_ptr` objects, such that one object is less than the other unless they share ownership of the same pointer, or are both empty.

**swap()**

```
template<typename _Tp, _Lock_policy _Lp>
void std::__shared_ptr< _Tp, _Lp >::swap (
    __shared_ptr< _Tp, _Lp > & __other) [inline], [noexcept], [inherited]
```

Exchange both the owned pointer and the stored pointer.

**unique()**

```
template<typename _Tp, _Lock_policy _Lp>
bool std::__shared_ptr< _Tp, _Lp >::unique () const [inline], [noexcept], [inherited]
```

Return true if `use_count() == 1`.

**use\_count()**

```
template<typename _Tp, _Lock_policy _Lp>
long std::__shared_ptr< _Tp, _Lp >::use_count () const [inline], [noexcept], [inherited]
```

If `*this` owns a pointer, return the number of owners, otherwise zero.

### 6.894.1 Detailed Description

```
template<typename _RandomNumberEngine, size_t __k>
class std::shuffle_order_engine< _RandomNumberEngine, __k >
```

Produces random numbers by reordering random numbers from some base engine.

The values from the base engine are stored in a sequence of size \_\_k and shuffled by an algorithm that depends on those values.

Since

C++11

### 6.894.2 Member Typedef Documentation

#### result\_type

```
template<typename _RandomNumberEngine, size_t __k>
typedef _RandomNumberEngine::result_type std::shuffle_order_engine< _RandomNumberEngine, __k >↔
::result_type
```

The type of the generated random value.

### 6.894.3 Constructor & Destructor Documentation

#### shuffle\_order\_engine() [1/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine () [inline]
```

Constructs a default shuffle\_order\_engine engine.

The underlying engine is default constructed as well.

#### shuffle\_order\_engine() [2/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
    const _RandomNumberEngine & __rng) [inline], [explicit]
```

Copy constructs a shuffle\_order\_engine engine.

Copies an existing base class random number generator.

#### Parameters

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__rng</code> | An existing (base class) engine object. |
|--------------------|-----------------------------------------|

**shuffle\_order\_engine()** [3/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
    _RandomNumberEngine && __rng) [inline], [explicit]
```

Move constructs a shuffle\_order\_engine engine.

Copies an existing base class random number generator.

**Parameters**

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__rng</code> | An existing (base class) engine object. |
|--------------------|-----------------------------------------|

**shuffle\_order\_engine()** [4/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
    result_type __s) [inline], [explicit]
```

Seed constructs a shuffle\_order\_engine engine.

Constructs the underlying generator engine seeded with \_\_s.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A seed value for the base class engine. |
|------------------|-----------------------------------------|

**shuffle\_order\_engine()** [5/5]

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
    _Sseq & __q) [inline], [explicit]
```

Generator construct a shuffle\_order\_engine engine.

**Parameters**

|                  |                  |
|------------------|------------------|
| <code>__q</code> | A seed sequence. |
|------------------|------------------|

**6.894.4 Member Function Documentation****base()**

```
template<typename _RandomNumberEngine, size_t __k>
const _RandomNumberEngine & std::shuffle_order_engine< _RandomNumberEngine, __k >::base () const
[inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

**discard()**

```
template<typename _RandomNumberEngine, size_t __k>
void std::shuffle_order_engine< _RandomNumberEngine, __k >::discard (
    unsigned long long __z) [inline]
```

Discard a sequence of random numbers.

**max()**

```
template<typename _RandomNumberEngine, size_t __k>
constexpr result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::max () [inline],
[static], [constexpr]
```

Gets the maximum value in the generated random number range.

**min()**

```
template<typename _RandomNumberEngine, size_t __k>
constexpr result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::min () [inline],
[static], [constexpr]
```

Gets the minimum value in the generated random number range.

**operator>()()**

```
template<typename _RandomNumberEngine, size_t __k>
shuffle_order_engine< _RandomNumberEngine, __k >::result_type std::shuffle_order_engine< _↵
RandomNumberEngine, __k >::operator() ()
```

Gets the next value in the generated random number sequence.

References [std::max\(\)](#), and [std::min\(\)](#).

**seed()** [1/3]

```
template<typename _RandomNumberEngine, size_t __k>
void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed () [inline]
```

Reseeds the shuffle\_order\_engine object with the default seed for the underlying base class generator engine.

**seed()** [2/3]

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _Sseq>
_If_seed_seq< _Sseq > std::shuffle_order_engine< _RandomNumberEngine, __k >::seed (
    _Sseq & __q) [inline]
```

Reseeds the shuffle\_order\_engine object with the given seed sequence.

**Parameters**

|                    |                            |
|--------------------|----------------------------|
| <a href="#">_↵</a> | A seed generator function. |
| <a href="#">_q</a> |                            |

**seed()** [3/3]

```
template<typename _RandomNumberEngine, size_t __k>
void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed (
    result_type __s) [inline]
```

Reseeds the shuffle\_order\_engine object with the default seed for the underlying base class generator engine.

**6.894.5 Friends And Related Symbol Documentation****operator<<**

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _RandomNumberEngine1, size_t __k1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
```

```
std::basic_ostream< _CharT, _Traits > & __os,
const std::shuffle_order_engine< _RandomNumberEngine1, __k1 > & __x) [friend]
```

Inserts the current state of a shuffle\_order\_engine random number generator engine \_\_x into the output stream \_\_os.

#### Parameters

|                   |                                                        |
|-------------------|--------------------------------------------------------|
| <code>__os</code> | An output stream.                                      |
| <code>__x</code>  | A shuffle_order_engine random number generator engine. |

#### Returns

The output stream with the state of \_\_x inserted or in an error state.

#### operator==

```
template<typename _RandomNumberEngine, size_t __k>
bool operator== (
    const std::shuffle_order_engine< _RandomNumberEngine, __k > & __lhs,
    const std::shuffle_order_engine< _RandomNumberEngine, __k > & __rhs) [friend]
```

Compares two shuffle\_order\_engine random number generator objects of the same type for equality.

#### Parameters

|                    |                                                              |
|--------------------|--------------------------------------------------------------|
| <code>__lhs</code> | A shuffle_order_engine random number generator object.       |
| <code>__rhs</code> | Another shuffle_order_engine random number generator object. |

#### Returns

true if the infinite sequences of generated values would be equal, false otherwise.

#### operator>>

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _RandomNumberEngine1, size_t __k1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::shuffle_order_engine< _RandomNumberEngine1, __k1 > & __x) [friend]
```

Extracts the current state of a % subtract\_with\_carry\_engine random number generator engine \_\_x from the input stream \_\_is.

#### Parameters

|                   |                                                        |
|-------------------|--------------------------------------------------------|
| <code>__is</code> | An input stream.                                       |
| <code>__x</code>  | A shuffle_order_engine random number generator engine. |

#### Returns

The input stream with the state of \_\_x extracted or in an error state.

#### 6.896.1 Detailed Description

Class defining one-dimensional subset of an array.

The slice class represents a one-dimensional subset of an array, specified by three parameters: start offset, size, and stride. The start offset is the index of the first element of the array that is part of the subset. The size is the total number of elements in the subset. Stride is the distance between each successive array element to include in the subset.

For example, with an array of size 10, and a slice with offset 1, size 3 and stride 2, the subset consists of array elements 1, 3, and 5.

### 6.897.1 Detailed Description

template<typename \_Tp>  
class std::slice\_array< \_Tp >

Reference to one-dimensional subset of an array.

A slice\_array is a reference to the actual elements of an array specified by a slice. The way to get a slice\_array is to call operator[](slice) on a valarray. The returned slice\_array then permits carrying operations out on the referenced subset of elements in the original valarray. For example, operator+=(valarray) will add values to the subset of elements in the underlying valarray this slice\_array refers to.

#### Parameters

|           |               |
|-----------|---------------|
| <i>Tp</i> | Element type. |
|-----------|---------------|

## 6.897.2 Member Function Documentation

### **operator%=( )**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator%= (
    const valarray< _Tp > & ) const
```

Modulo slice elements by corresponding elements of *v*.

### **operator&=( )**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator&= (
    const valarray< _Tp > & ) const
```

Logical and slice elements with corresponding elements of *v*.

### **operator\*=( )**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator*= (
    const valarray< _Tp > & ) const
```

Multiply slice elements by corresponding elements of *v*.

### **operator+=( )**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator+= (
    const valarray< _Tp > & ) const
```

Add corresponding elements of *v* to slice elements.

### **operator-=( )**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator-= (
    const valarray< _Tp > & ) const
```

Subtract corresponding elements of *v* from slice elements.

### **operator/=( )**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator/= (
    const valarray< _Tp > & ) const
```

Divide slice elements by corresponding elements of *v*.

### **operator<<=( )**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator<<= (
    const valarray< _Tp > & ) const
```

Left shift slice elements by corresponding elements of *v*.

### **operator>>=( )**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator>>= (
    const valarray< _Tp > & ) const
```

Right shift slice elements by corresponding elements of *v*.

### `operator^=()`

```
template<typename _Tp>
void std::slice_array<_Tp>::operator^= (
    const valarray<_Tp> & ) const
```

Logical xor slice elements with corresponding elements of *v*.

### `operator" |=()`

```
template<typename _Tp>
void std::slice_array<_Tp>::operator|= (
    const valarray<_Tp> & ) const
```

Logical or slice elements with corresponding elements of *v*.

The documentation for this class was generated from the following files:

#### 6.901.1 Detailed Description

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
class __gnu_pbds::detail::splay_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >
```

Splay tree.

### 6.901.2 Member Function Documentation

#### `node_begin()` [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
```

```
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin () [inline], [inherited]
```

Returns a `node_iterator` corresponding to the node at the root of the tree.

#### `node_begin()` [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
```

```
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin () const [inline], [inherited]
```

Returns a const `node_iterator` corresponding to the node at the root of the tree.

#### `node_end()` [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
```

```
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end () [inline], [inherited]
```

Returns a `node_iterator` corresponding to a node just after a leaf of the tree.

#### `node_end()` [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
```

```
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end () const [inline], [inherited]
```

Returns a const `node_iterator` corresponding to a node just after a leaf of the tree.

The documentation for this class was generated from the following file:

- [splay\\_tree.hpp](#)

## 6.902 `__gnu_pbds::detail::splay_tree_node_< Value_Type, Metadata, _Alloc >` Struct Template Reference

### 6.904.1 Detailed Description

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
class std::stack< _Tp, _Sequence >
```

A standard container giving FILO behavior.

#### Template Parameters

|                        |                                                                          |
|------------------------|--------------------------------------------------------------------------|
| <code>_Tp</code>       | Type of element.                                                         |
| <code>_Sequence</code> | Type of underlying sequence, defaults to <code>deque&lt;_Tp&gt;</code> . |

Meets many of the requirements of a [container](#), but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-last-out stack behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `back`, `push_back`, and `pop_back`, such as `std::list`, `std::vector`, or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push`, `pop`, and `top`, which are standard stack/FILO operations.

### 6.904.2 Constructor & Destructor Documentation

#### stack()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<is_default_constructible<_Seq>::value>::type>
```

```
std::stack< _Tp, _Sequence >::stack () [inline]
```

Default constructor creates no elements.

### 6.904.3 Member Function Documentation

#### empty()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
bool std::stack< _Tp, _Sequence >::empty () const [inline], [nodiscard]
```

Returns true if the stack is empty.

#### pop()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::stack< _Tp, _Sequence >::pop () [inline]
```

Removes first element.

This is a typical stack operation. It shrinks the stack by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

#### push()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::stack< _Tp, _Sequence >::push (
    const value_type & __x) [inline]
```

Add data to the top of the stack.

#### Parameters

|                  |                   |
|------------------|-------------------|
| <code>__x</code> | Data to be added. |
|------------------|-------------------|

This is a typical stack operation. The function creates an element at the top of the stack and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

#### size()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
size_type std::stack< _Tp, _Sequence >::size () const [inline], [nodiscard]
```

Returns the number of elements in the stack.

**top()** [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::stack<_Tp, _Sequence>::top () [inline], [nodiscard]
```

Returns a read/write reference to the data at the first element of the stack.

**top()** [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::stack<_Tp, _Sequence>::top () const [inline], [nodiscard]
```

Returns a read-only (constant) reference to the data at the first element of the stack.

The documentation for this class was generated from the following file:

- [stl\\_stack.h](#)

**6.905 \_\_gnu\_cxx::stdio\_filebuf<\_CharT, \_Traits> Class Template Reference**

### 6.905.1 Detailed Description

**template**<typename `_CharT`, typename `_Traits` = `std::char_traits<_CharT>`>  
**class** `__gnu_cxx::stdio_filebuf<_CharT, _Traits>`

Provides a layer of compatibility for C/POSIX.

This GNU extension provides extensions for working with standard C FILE\*'s and POSIX file descriptors. It must be instantiated by the user with the type of character used in the file stream, e.g., `stdio_filebuf<char>`.

### 6.905.2 Constructor & Destructor Documentation

#### `stdio_filebuf()` [1/3]

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
__gnu_cxx::stdio_filebuf<_CharT, _Traits>::stdio_filebuf () [inline]
deferred initialization
References std::basic\_filebuf<\_CharT, \_Traits>::basic\_filebuf\(\).
```

#### `stdio_filebuf()` [2/3]

```
template<typename _CharT, typename _Traits>
__gnu_cxx::stdio_filebuf<_CharT, _Traits>::stdio_filebuf (
    int __fd,
    std::ios_base::openmode __mode,
    size_t __size = static_cast<size_t>( BUFSIZ ))
```

#### Parameters

|                     |                                                         |
|---------------------|---------------------------------------------------------|
| <code>__fd</code>   | An open file descriptor.                                |
| <code>__mode</code> | Same meaning as in a standard filebuf.                  |
| <code>__size</code> | Optimal or preferred size of internal buffer, in chars. |

This constructor associates a file stream buffer with an open POSIX file descriptor. The file descriptor will be automatically closed when the `stdio_filebuf` is closed/destroyed.

References [std::basic\\_filebuf<\\_CharT, \\_Traits>::M\\_buf\\_size](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::M\\_mode](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::M\\_reading](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::M\\_set\\_buffer\(\)](#), and [std::basic\\_filebuf<\\_CharT, \\_Traits>::is\\_open\(\)](#).

#### `stdio_filebuf()` [3/3]

```
template<typename _CharT, typename _Traits>
__gnu_cxx::stdio_filebuf<_CharT, _Traits>::stdio_filebuf (
    std::__c_file * __f,
    std::ios_base::openmode __mode,
    size_t __size = static_cast<size_t>( BUFSIZ ))
```

## Parameters

|                     |                                                                                                    |
|---------------------|----------------------------------------------------------------------------------------------------|
| <code>__f</code>    | An open <code>FILE*</code> .                                                                       |
| <code>__mode</code> | Same meaning as in a standard filebuf.                                                             |
| <code>__size</code> | Optimal or preferred size of internal buffer, in chars. Defaults to system's <code>BUFSIZ</code> . |

This constructor associates a file stream buffer with an open C `FILE*`. The `FILE*` will not be automatically closed when the `stdio_filebuf` is closed/destroyed.

References [std::basic\\_filebuf<\\_CharT, \\_Traits>::\\_M\\_buf\\_size](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::\\_M\\_mode](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::\\_M\\_reading](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::\\_M\\_set\\_buffer\(\)](#), and [std::basic\\_filebuf<\\_CharT, \\_Traits>::is\\_open\(\)](#).

**~stdio\_filebuf()**

```
template<typename _CharT, typename _Traits>
__gnu_cxx::stdio_filebuf<_CharT, _Traits>::~~stdio_filebuf () [virtual]
```

Closes the external data stream if the file descriptor constructor was used.

**6.905.3 Member Function Documentation****\_M\_create\_pback()**

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf<_CharT, _Traits>::_M_create_pback () [inline], [protected], [inherited]
```

Initializes pback buffers, and moves normal buffers to safety. Assumptions: `_M_in_cur` has already been moved back

Referenced by [pbackfail\(\)](#).

**\_M\_destroy\_pback()**

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf<_CharT, _Traits>::_M_destroy_pback () throw () [inline], [protected], [inherited]
```

Deactivates pback buffer contents, and restores normal buffer. Assumptions: The pback buffer has only moved forward.

Referenced by [overflow\(\)](#), [seekoff\(\)](#), [seekpos\(\)](#), [underflow\(\)](#), and [xsgetn\(\)](#).

**\_M\_set\_buffer()**

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf<_CharT, _Traits>::_M_set_buffer (
    streamsize __off) [inline], [protected], [inherited]
```

This function sets the pointers of the internal buffer, both get and put areas. Typically:

`__off == egptr() - eback()` upon underflow/uflow (**read** mode); `__off == 0` upon overflow (**write** mode); `__off == -1` upon open, setbuf, seekoff/pos (**uncommitted** mode).

NB: `egptr() - pbase() == _M_buf_size - 1`, since `_M_buf_size` reflects the actual allocated memory and the last cell is reserved for the overflow char of a full put area.

Referenced by [\\_\\_gnu\\_cxx::stdio\\_filebuf<\\_CharT, \\_Traits>::stdio\\_filebuf\(\)](#), [\\_\\_gnu\\_cxx::stdio\\_filebuf<\\_CharT, \\_Traits>::stdio\\_filebuf\(\)](#), [close\(\)](#), [imbue\(\)](#), [open\(\)](#), [overflow\(\)](#), [pbackfail\(\)](#), [underflow\(\)](#), [xsgetn\(\)](#), and [xsputn\(\)](#).

**close()**

```
template<typename _CharT, typename _Traits>
basic_filebuf<_CharT, _Traits>::~__filebuf_type * std::basic_filebuf<_CharT, _Traits>::close
() [inherited]
```

Closes the currently associated file.

**Returns**

`this` on success, `NULL` on failure

If no file is currently open, this function immediately fails.

If a *put buffer area* exists, `overflow(eof)` is called to flush all the characters. The file is then closed.

If any operations fail, this function also fails.

References `basic_filebuf()`, `_M_mode`, `_M_pback_init`, `_M_reading`, `_M_set_buffer()`, and `is_open()`.

Referenced by `std::basic_filebuf<char_type, traits_type>::~~basic_filebuf()`, and `open()`.

**eback()**

```
template<typename _CharT, typename _Traits>
```

```
char_type * std::basic_streambuf<_CharT, _Traits>::eback () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::basic_filebuf<char_type, traits_type>::_M_destroy_pback()`, `std::basic_filebuf<_CharT, _Traits>::imbue()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, `std::basic_filebuf<_CharT, _Traits>::pbackfail()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekpos()`, `std::basic_streambuf<char_type, traits_type>::sputbackc()`, `std::basic_streambuf<char_type, traits_type>::sungetc()`, `std::basic_filebuf<_CharT, _Traits>::underflow()`, and `std::basic_filebuf<_CharT, _Traits>::xsgetn()`.

**egptr()**

```
template<typename _CharT, typename _Traits>
```

```
char_type * std::basic_streambuf<_CharT, _Traits>::egptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::basic_filebuf<char_type, traits_type>::_M_create_pback()`, `std::basic_streambuf<char_type, traits_type>::in_avail()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, `std::basic_streambuf<char_type, traits_type>::sbumpc()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekpos()`, `std::basic_streambuf<char_type, traits_type>::sgetc()`, `std::basic_filebuf<_CharT, _Traits>::showmanyc()`, `std::basic_stringbuf<char_type, traits_type, _Alloc>::underflow()`, `std::basic_filebuf<_CharT, _Traits>::underflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::underflow()`, `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::underflow()`, `std::basic_filebuf<_CharT, _Traits>::xsgetn()`, and `xsgetn()`.

**epptr()**

```
template<typename _CharT, typename _Traits>
```

```
char_type * std::basic_streambuf<_CharT, _Traits>::epptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence

- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

Referenced by `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekpos()`, `std::basic_streambuf<char_type, traits_type>::sputc()`, `std::basic_filebuf<_CharT, _Traits>::xsputn()`, and `xsputn()`.

## **fd()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
int __gnu_cxx::stdio_filebuf<_CharT, _Traits>::fd () [inline]
```

### **Returns**

The underlying file descriptor.

Once associated with an external data stream, this function can be used to access the underlying POSIX file descriptor. Note that there is no way for the library to track what you do with the descriptor, so be careful.

## **file()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
std::__c_file * __gnu_cxx::stdio_filebuf<_CharT, _Traits>::file () [inline]
```

### **Returns**

The underlying FILE\*.

This function can be used to access the underlying "C" file pointer. Note that there is no way for the library to track what you do with the file, so be careful.

## **gbump()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::gbump (
    int __n) [inline], [protected], [inherited]
```

Moving the read position.

### **Parameters**

|                  |                             |
|------------------|-----------------------------|
| <code>__n</code> | The delta by which to move. |
|------------------|-----------------------------|

This just advances the read position without returning any data.

Referenced by `std::basic_filebuf<_CharT, _Traits>::pbackfail()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::pbackfail()`, `std::basic_streambuf<char_type, traits_type>::sbumpc()`, `std::basic_streambuf<char_type, traits_type>::sputbackc()`, `std::basic_streambuf<char_type, traits_type>::sungetc()`, `std::basic_streambuf<char_type, traits_type>::uflow()`, and `std::basic_filebuf<_CharT, _Traits>::xsgetn()`.

## **getloc()**

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf<_CharT, _Traits>::getloc () const [inline], [inherited]
```

Locale access.

## Returns

The current locale in effect.

If `pubimbue(loc)` has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.

Referenced by `std::basic_streambuf<char_type, traits_type>::pubimbue()`.

## gptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf<_CharT, _Traits>::gptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::basic_filebuf<char_type, traits_type>::_M_create_pback()`, `std::basic_filebuf<char_type, traits_type>::_M_destroy`, `std::basic_filebuf<_CharT, _Traits>::imbue()`, `std::basic_streambuf<char_type, traits_type>::in_avail()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::pbackfail()`, `std::basic_streambuf<char_type, traits_type>::pbackfail()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`, `std::basic_streambuf<char_type, traits_type>::sgetc()`, `std::basic_filebuf<_CharT, _Traits>::showmanyc()`, `std::basic_stringbuf<char>::showmanyc()`, `std::basic_streambuf<char_type, traits_type>::sungetc()`, `std::basic_streambuf<char_type, traits_type>::uflow()`, `std::basic_filebuf<_CharT, _Traits>::underflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::underflow()`, `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::underflow()`, `std::basic_filebuf<_CharT, _Traits>::xsgetn()`, and `xsgetn()`.

## imbue()

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf<_CharT, _Traits>::imbue (
    const locale & __loc) [protected], [virtual], [inherited]
```

Changes translations.

## Parameters

|                    |               |
|--------------------|---------------|
| <code>__loc</code> | A new locale. |
|--------------------|---------------|

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

## Note

Base class version does nothing.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `_M_ext_buf`, `_M_ext_next`, `_M_mode`, `_M_reading`, `_M_set_buffer()`, `std::ios_base::cur`, `std::basic_streambuf<_CharT, _Traits>::gptr()`, `is_open()`, and `seekoff()`.

## in\_avail()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::in_avail () [inline], [inherited]
```

Looking ahead into the stream.

**Returns**

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

**is\_open()**

```
template<typename _CharT, typename _Traits>
bool std::basic_filebuf< _CharT, _Traits >::is_open () const throw ( )    [inline], [nodiscard],
[inherited]
```

Returns true if the external file is open.

Referenced by `__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf()`, `__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf()`, `close()`, `imbue()`, `open()`, `seekoff()`, `seekpos()`, `setbuf()`, and `showmanyc()`.

**open() [1/3]**

```
template<typename _CharT, typename _Traits>
template<typename _Path>
_If_fs_path< _Path, __filebuf_type * > std::basic_filebuf< _CharT, _Traits >::open (
    const _Path & __s,
    ios_base::openmode __mode)    [inline], [inherited]
```

Opens an external file.

**Parameters**

|                     |                                                            |
|---------------------|------------------------------------------------------------|
| <code>__s</code>    | The name of the file, as a <code>filesystem::path</code> . |
| <code>__mode</code> | The open mode flags.                                       |

**Returns**

`this` on success, NULL on failure

**open() [2/3]**

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::__filebuf_type * std::basic_filebuf< _CharT, _Traits >::open (
    const char * __s,
    ios_base::openmode __mode)    [inherited]
```

Opens an external file.

**Parameters**

|                     |                       |
|---------------------|-----------------------|
| <code>__s</code>    | The name of the file. |
| <code>__mode</code> | The open mode flags.  |

**Returns**

`this` on success, NULL on failure

If a file is already open, this function immediately fails. Otherwise it tries to open the file named `__s` using the flags given in `__mode`.

Table 92, adapted here, gives the relation between openmode combinations and the equivalent `fopen()` flags. (NB: lines `app`, `in|out|app`, `in|app`, `binary|app`, `binary|in|out|app`, and `binary|in|app` per DR 596)

| ios_base Flag combination |    |     |       |     | stdio equivalent |
|---------------------------|----|-----|-------|-----|------------------|
| binary                    | in | out | trunc | app |                  |
|                           |    | +   |       |     | w                |
|                           |    | +   |       | +   | a                |
|                           |    |     |       | +   | a                |
|                           |    | +   | +     |     | w                |
|                           | +  |     |       |     | r                |
|                           | +  | +   |       |     | r+               |
|                           | +  | +   | +     |     | w+               |
|                           | +  | +   |       | +   | a+               |
|                           | +  |     |       | +   | a+               |
| +                         |    |     |       |     | wb               |
| +                         |    | +   |       | +   | ab               |
| +                         |    |     |       | +   | ab               |
| +                         |    | +   | +     |     | wb               |
| +                         | +  |     |       |     | rb               |
| +                         | +  | +   |       |     | r+b              |
| +                         | +  | +   | +     |     | w+b              |
| +                         | +  | +   |       | +   | a+b              |
| +                         | +  |     |       | +   | a+b              |

References [\\_M\\_mode](#), [\\_M\\_reading](#), [\\_M\\_set\\_buffer\(\)](#), [std::ios\\_base::ate](#), [close\(\)](#), [std::ios\\_base::end](#), [is\\_open\(\)](#), and [seekoff\(\)](#).

Referenced by [std::basic\\_filebuf<char\\_type, traits\\_type>::open\(\)](#), and [std::basic\\_filebuf<char\\_type, traits\\_type>::open\(\)](#).

### open() [3/3]

```
template<typename _CharT, typename _Traits>
__filebuf_type * std::basic_filebuf< _CharT, _Traits >::open (
    const std::string & __s,
    ios_base::openmode __mode) [inline], [inherited]
```

Opens an external file.

#### Parameters

|                     |                       |
|---------------------|-----------------------|
| <code>__s</code>    | The name of the file. |
| <code>__mode</code> | The open mode flags.  |

#### Returns

`this` on success, NULL on failure

### overflow()

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::int_type std::basic_filebuf< _CharT, _Traits >::overflow (
    int_type __c = _Traits::eof()) [protected], [virtual], [inherited]
```

Consumes data from the buffer; writes to the controlled sequence.

**Parameters**

|                 |                                     |
|-----------------|-------------------------------------|
| <code>_↔</code> | An additional character to consume. |
| <code>_c</code> |                                     |

**Returns**

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

References [\\_M\\_buf\\_size](#), [\\_M\\_destroy\\_pback\(\)](#), [\\_M\\_mode](#), [\\_M\\_reading](#), [\\_M\\_set\\_buffer\(\)](#), [std::ios\\_base::app](#), [std::ios\\_base::cur](#), [std::ios\\_base::out](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::pbase\(\)](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::pbum](#) and [std::basic\\_streambuf<\\_CharT, \\_Traits>::pptr\(\)](#).

Referenced by [pbackfail\(\)](#), [sync\(\)](#), [underflow\(\)](#), and [xsgetn\(\)](#).

**pbackfail()**

```
template<typename _CharT, typename _Traits>
basic_filebuf<_CharT, _Traits>::int_type std::basic_filebuf<_CharT, _Traits>::pbackfail (
    int_type __c = _Traits::eof()) [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

**Parameters**

|                 |                                                      |
|-----------------|------------------------------------------------------|
| <code>_↔</code> | The character to be inserted back into the sequence. |
| <code>_c</code> |                                                      |

**Returns**

`eof()` on failure, *some other value* on success

**Postcondition**

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

References [\\_M\\_create\\_pback\(\)](#), [\\_M\\_mode](#), [\\_M\\_pback\\_init](#), [\\_M\\_reading](#), [\\_M\\_set\\_buffer\(\)](#), [std::ios\\_base::cur](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::eback\(\)](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::gbump\(\)](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::in](#), [std::ios\\_base::in](#), [overflow\(\)](#), [seekoff\(\)](#), and [underflow\(\)](#).

**pbase()**

```
template<typename _CharT, typename _Traits>
```

```
char_type * std::basic\_streambuf<\_CharT, \_Traits>::pbase () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

Referenced by [std::basic\\_filebuf<\\_CharT, \\_Traits>::overflow\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::overflow\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::seekoff\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::seekoff\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::str\(\)](#), [std::basic\\_stringbuf<char>::str\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::sync\(\)](#), and [std::basic\\_filebuf<\\_CharT, \\_Traits>::xsputn\(\)](#).

**pbump()**

```
template<typename _CharT, typename _Traits>
```

```
void std::basic\_streambuf<\_CharT, \_Traits>::pbump (  
    int __n) [inline], [protected], [inherited]
```

Moving the write position.

**Parameters**

|                  |                             |
|------------------|-----------------------------|
| <code>__n</code> | The delta by which to move. |
|------------------|-----------------------------|

This just advances the write position without returning any data.

Referenced by [std::basic\\_filebuf<\\_CharT, \\_Traits>::overflow\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::overflow\(\)](#), and [std::basic\\_streambuf<char\\_type, traits\\_type>::sputc\(\)](#).

**pptr()**

```
template<typename _CharT, typename _Traits>
```

```
char_type * std::basic\_streambuf<\_CharT, \_Traits>::pptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

Referenced by [std::basic\\_filebuf<\\_CharT, \\_Traits>::overflow\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::overflow\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::seekoff\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::seekoff\(\)](#), [std::basic\\_streambuf<char\\_type, traits\\_type>::sputc\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::sync\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::xsputn\(\)](#), and [xsputn\(\)](#).

**pubimbue()**

```
template<typename _CharT, typename _Traits>
```

```
locale std::basic\_streambuf<\_CharT, \_Traits>::pubimbue (  
    const locale & __loc) [inline], [inherited]
```

Entry point for imbue().

**Parameters**

|                    |                 |
|--------------------|-----------------|
| <code>__loc</code> | The new locale. |
|--------------------|-----------------|

**Returns**

The previous locale.

Calls the derived `imbue(__loc)`.

**pubseekoff()**

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
    off_type __off,
    ios_base::seekdir __way,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

**Parameters**

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__off</code>  | Offset.                                     |
| <code>__way</code>  | Value for <code>ios_base::seekdir</code> .  |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual `seekoff` function.

**pubseekpos()**

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
    pos_type __sp,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

**Parameters**

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__sp</code>   | Position                                    |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual `seekpos` function.

**pubsetbuf()**

```
template<typename _CharT, typename _Traits>
basic_streambuf * std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

**pubsync()**

```
template<typename _CharT, typename _Traits>
int std::basic_streambuf< _CharT, _Traits >::pubsync () [inline], [inherited]
```

Calls virtual sync function.

Referenced by `std::basic_istream<_CharT, _Traits>::sync()`.

**sbumpc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sbumpc () [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.

Referenced by `std::basic_istream<_CharT, _Traits>::ignore()`, `std::basic_streambuf<char_type, traits_type>::snextc()`, and `std::basic_istream<_CharT, char_traits<_CharT>>::unget()`.

**seekoff()**

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::pos_type std::basic_filebuf< _CharT, _Traits >::seekoff (
    off_type ,
    ios_base::seekdir ,
    ios_base::openmode = ios_base::in | ios_base::out) [protected], [virtual], [inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `_M_destroy_pback()`, `_M_reading`, `std::ios_base::cur`, `is_open()`, `std::basic_streambuf<_CharT, _Traits>::pbase()`, and `std::basic_streambuf<_CharT, _Traits>::pptr()`.

Referenced by `imbue()`, `open()`, and `pbackfail()`.

**seekpos()**

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::pos_type std::basic_filebuf< _CharT, _Traits >::seekpos (
    pos_type ,
    ios_base::openmode = ios_base::in | ios_base::out) [protected], [virtual], [inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `_M_destroy_pback()`, `std::ios_base::beg`, and `is_open()`.

**setbuf()**

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::__streambuf_type * std::basic_filebuf< _CharT, _Traits >↵
::setbuf (
    char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Manipulates the buffer.

**Parameters**

|                          |                           |
|--------------------------|---------------------------|
| <code>__↵<br/>__s</code> | Pointer to a buffer area. |
| <code>__↵<br/>__n</code> | Size of __s.              |

**Returns**

`this`

If no file has been opened, and both `__s` and `__n` are zero, then the stream becomes unbuffered. Otherwise, `__↵  
s` is used as a buffer; see [https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.↵  
html#io.streambuf.buffering](https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.↵<br/>html#io.streambuf.buffering) for more.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

References `_M_buf`, `_M_buf_size`, and `is_open()`.

**setg()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setg (
    char_type * __gbeg,
    char_type * __gnext,
    char_type * __gend) [inline], [protected], [inherited]
```

Setting the three read area pointers.

**Parameters**

|                      |            |
|----------------------|------------|
| <code>__gbeg</code>  | A pointer. |
| <code>__gnext</code> | A pointer. |
| <code>__gend</code>  | A pointer. |

**Postcondition**

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

Referenced by `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert()`, `std::basic_filebuf< char_type, traits_type >::_M_create`, `std::basic_filebuf< char_type, traits_type >::_M_destroy_pback()`, `std::basic_filebuf< char_type, traits_type >::_M_set_buffer()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos()`, and `std::basic_filebuf< _CharT, _Traits >::xsgetn()`.

**setp()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setp (
```

```
char_type * __pbeg,  
char_type * __pend) [inline], [protected], [inherited]
```

Setting the three write area pointers.

**Parameters**

|                     |            |
|---------------------|------------|
| <code>__pbeg</code> | A pointer. |
| <code>__pend</code> | A pointer. |

**Postcondition**

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == epptr()`

Referenced by [std::wbuffer\\_convert<\\_Codecvt, \\_Elem, \\_Tr>::wbuffer\\_convert\(\)](#), and [std::basic\\_filebuf<char\\_type, traits\\_type>::\\_M\\_s](#)

**sgetc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sgetc () [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

Referenced by [std::basic\\_istream<\\_CharT, \\_Traits>::get\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::get\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::get\(\)](#), [std::basic\\_istream<\\_CharT, char\\_traits<\\_CharT>>::readsome\(\)](#), and [std::basic\\_streambuf<char\\_type, traits\\_type>::snextc\(\)](#).

**sgetn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sgetn (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for `xsggetn`.

**Parameters**

|                  |                |
|------------------|----------------|
| <code>__s</code> | A buffer area. |
| <code>__n</code> | A count.       |

Returns `xsggetn(__s, __n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

**showmanyc()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_filebuf<_CharT, _Traits>::showmanyc () [protected], [virtual], [inherited]
```

Investigating the data available.

**Returns**

An estimate of the number of characters available in the input sequence, or -1.

*If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail.* [27.5.2.4.3]/1

**Note**

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to underflow or uflow] will not return `eof()` but that they will return immediately.*

The standard adds that *the morphemes of `showmanyc` are **es-how-many-see**, not **show-manic**.*

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `_M_mode`, `std::ios_base::binary`, `std::basic_streambuf<_CharT, _Traits>::egptr()`, `std::basic_streambuf<_CharT, _Traits>::std::ios_base::in`, and `is_open()`.

**snextc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::snextc () [inline], [inherited]
Getting the next character.
```

**Returns**

The next character, or `eof`.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

Referenced by `std::basic_istream<_CharT, char_traits<_CharT>>::get()`, `std::basic_istream<char_type, traits_type>::ignore()`, and `std::basic_istream<_CharT, char_traits<_CharT>>::readsome()`.

**sputbackc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputbackc (
    char_type __c) [inline], [inherited]
```

Pushing characters back into the input stream.

**Parameters**

|                  |                             |
|------------------|-----------------------------|
| <code>__c</code> | The character to push back. |
|------------------|-----------------------------|

**Returns**

The previous character, if possible.

Similar to `sungetc()`, but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

Referenced by `std::basic_istream<_CharT, _Traits>::putback()`.

**sputc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputc (
    char_type __c) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__c</code> | A character to output. |
|------------------|------------------------|

**Returns**

\_\_c, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores \_\_c in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(↵ __c)`.

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::overflow()`.

**sputn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::sputn (
    const char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|                        |                     |
|------------------------|---------------------|
| <code>↵<br/>__s</code> | A buffer read area. |
| <code>↵<br/>__n</code> | A count.            |

One of two public output functions.

Returns `xsgputn(__s,__n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

**sungetc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sungetc () [inline], [inherited]
```

Moving backwards in the input stream.

**Returns**

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbackfail()`. The effect is to *unget* the last character *gotten*.

Referenced by `std::basic_istream<_CharT, _Traits>::ungetc()`.

**sync()**

```
template<typename _CharT, typename _Traits>
int std::basic_filebuf< _CharT, _Traits >::sync () [protected], [virtual], [inherited]
```

Synchronizes the buffer arrays with the controlled sequences.

**Returns**

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

**Note**

Base class version does nothing, returns zero.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `overflow()`, `std::basic_streambuf<_CharT, _Traits>::pbase()`, and `std::basic_streambuf<_CharT, _Traits>::pptr()`.

**uflow()**

```
template<typename _CharT, typename _Traits>
virtual int_type std::basic_streambuf< _CharT, _Traits >::uflow () [inline], [protected], [virtual],
[inherited]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Reimplemented in `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>`.

Referenced by `std::basic_streambuf< char_type, traits_type >::sbumpc()`, and `xsgetn()`.

**underflow()**

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::int_type std::basic_filebuf< _CharT, _Traits >::underflow ()
[protected], [virtual], [inherited]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `_M_buf_size`, `_M_destroy_pback()`, `_M_mode`, `_M_set_buffer()`, `std::basic_streambuf<_CharT, _Traits>::eback()`, `std::basic_streambuf<_CharT, _Traits>::egptr()`, `std::basic_streambuf<_CharT, _Traits>::gptr()`, `std::ios_base::in`, and `overflow()`.

Referenced by `pbackfail()`.

**xsgetn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_filebuf< _CharT, _Traits >::xsgetn (
    char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character extraction.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A buffer area.                          |
| <code>__n</code> | Maximum number of characters to assign. |

## Returns

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

References [\\_M\\_buf\\_size](#), [\\_M\\_destroy\\_pback\(\)](#), [\\_M\\_mode](#), [\\_M\\_pback\\_init](#), [\\_M\\_reading](#), [\\_M\\_set\\_buffer\(\)](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::egptr\(\)](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::gbump\(\)](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::in](#), [std::ios\\_base::in](#), [overflow\(\)](#), [std::basic\\_streambuf<\\_CharT, \\_Traits>::setg\(\)](#), and [std::basic\\_streambuf<char\\_type, traits\\_type>::xsgetn\(\)](#).

## xspn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_filebuf<_CharT, _Traits>::xspn (
    const char_type * __s,
    streamsize __n)    [protected], [virtual], [inherited]
```

Multiple character insertion.

## Parameters

|                  |                                        |
|------------------|----------------------------------------|
| <code>__s</code> | A buffer area.                         |
| <code>__n</code> | Maximum number of characters to write. |

## Returns

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits>](#).

## 6.905.4 Member Data Documentation

### \_M\_buf

```
template<typename _CharT, typename _Traits>
char_type* std::basic_filebuf<_CharT, _Traits>::_M_buf    [protected], [inherited]
```

Pointer to the beginning of internal buffer.

Referenced by [basic\\_filebuf\(\)](#), and [setbuf\(\)](#).

### \_M\_buf\_locale

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf<_CharT, _Traits>::_M_buf_locale    [protected], [inherited]
```

Current locale setting.

Referenced by [std::basic\\_filebuf<\\_CharT, \\_Traits>::basic\\_filebuf\(\)](#).

### `_M_buf_size`

```
template<typename _CharT, typename _Traits>
```

```
size_t std::basic_filebuf<_CharT, _Traits>::_M_buf_size [protected], [inherited]
```

Actual size of internal buffer. This number is equal to the size of the put area + 1 position, reserved for the overflow char of a full area.

Referenced by `basic_filebuf()`, `__gnu_cxx::stdio_filebuf<_CharT, _Traits>::stdio_filebuf()`, `__gnu_cxx::stdio_filebuf<_CharT, _Traits>::overflow()`, `setbuf()`, `underflow()`, `xsgetn()`, and `xspn()`.

### `_M_ext_buf`

```
template<typename _CharT, typename _Traits>
```

```
char* std::basic_filebuf<_CharT, _Traits>::_M_ext_buf [protected], [inherited]
```

Buffer for external characters. Used for input when `codecvt::always_noconv() == false`. When valid, this corresponds to `eback()`.

Referenced by `basic_filebuf()`, and `imbue()`.

### `_M_ext_buf_size`

```
template<typename _CharT, typename _Traits>
```

```
streamsize std::basic_filebuf<_CharT, _Traits>::_M_ext_buf_size [protected], [inherited]
```

Size of buffer held by `_M_ext_buf`.

Referenced by `basic_filebuf()`.

### `_M_ext_next`

```
template<typename _CharT, typename _Traits>
```

```
const char* std::basic_filebuf<_CharT, _Traits>::_M_ext_next [protected], [inherited]
```

Pointers into the buffer held by `_M_ext_buf` that delimit a subsequence of bytes that have been read but not yet converted. When valid, `_M_ext_next` corresponds to `egptr()`.

Referenced by `basic_filebuf()`, and `imbue()`.

### `_M_in_beg`

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic_streambuf<_CharT, _Traits>::_M_in_beg [protected], [inherited]
```

Start of get area.

### `_M_in_cur`

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic_streambuf<_CharT, _Traits>::_M_in_cur [protected], [inherited]
```

Current read area.

### `_M_in_end`

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic_streambuf<_CharT, _Traits>::_M_in_end [protected], [inherited]
```

End of get area.

### `_M_mode`

```
template<typename _CharT, typename _Traits>
```

```
ios_base::openmode std::basic_filebuf<_CharT, _Traits>::_M_mode [protected], [inherited]
```

Place to stash in || out || in | out settings for current filebuf.

Referenced by [basic\\_filebuf\(\)](#), [\\_\\_gnu\\_cxx::stdio\\_filebuf<\\_CharT, \\_Traits>::stdio\\_filebuf\(\)](#), [\\_\\_gnu\\_cxx::stdio\\_filebuf<\\_CharT, \\_Traits>::close\(\)](#), [imbue\(\)](#), [open\(\)](#), [overflow\(\)](#), [pbackfail\(\)](#), [showmanyc\(\)](#), [underflow\(\)](#), [xsgetn\(\)](#), and [xsputn\(\)](#).

### **\_M\_out\_beg**

```
template<typename _CharT, typename _Traits>
char_type* std::basic\_streambuf< _CharT, _Traits >::_M_out_beg [protected], [inherited]
Start of put area.
```

### **\_M\_out\_cur**

```
template<typename _CharT, typename _Traits>
char_type* std::basic\_streambuf< _CharT, _Traits >::_M_out_cur [protected], [inherited]
Current put area.
```

### **\_M\_out\_end**

```
template<typename _CharT, typename _Traits>
char_type* std::basic\_streambuf< _CharT, _Traits >::_M_out_end [protected], [inherited]
End of put area.
```

### **\_M\_pback**

```
template<typename _CharT, typename _Traits>
char_type std::basic\_filebuf< _CharT, _Traits >::_M_pback [protected], [inherited]
Necessary bits for putback buffer management.
```

#### **Note**

pbacks of over one character are not currently supported.

Referenced by [basic\\_filebuf\(\)](#).

### **\_M\_pback\_cur\_save**

```
template<typename _CharT, typename _Traits>
char_type* std::basic\_filebuf< _CharT, _Traits >::_M_pback_cur_save [protected], [inherited]
Necessary bits for putback buffer management.
```

#### **Note**
