Returns the key comparison object out of which the multimap was constructed.

**lower\_bound()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::lower_bound (
    const key_type & __x) [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

**lower\_bound()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::lower_bound (
    const key_type & __x) const [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

**Returns**

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful the iterator will point to the next greatest element or, if no such greater element exists, to end().

**max\_size()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
size_type std::multimap<_Key, _Tp, _Compare, _Alloc>::max_size () const [inline], [noexcept]
```

Returns the maximum size of the multimap.

**operator=()** [1/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
multimap & std::multimap<_Key, _Tp, _Compare, _Alloc>::operator= (
    const multimap<_Key, _Tp, _Compare, _Alloc> & ) [default]
```

Multimap assignment operator.

Whether the allocator is copied depends on the allocator traits.

**operator=()** [2/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
multimap & std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Multimap list assignment operator.

**Parameters**

|   |                      |
|---|----------------------|
| ↩ | An initializer_list. |
| ↩ |                      |
| ↩ |                      |
| ↩ |                      |
| / |                      |

This function fills a multimap with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the multimap and that the resulting multimap's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
multimap & std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
    multimap< _Key, _Tp, _Compare, _Alloc > && ) [default]
```

Move assignment operator.

**rbegin()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

**rbegin()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rbegin () [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

**rend()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rend () const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

**rend()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
reverse_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::rend() [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

**size()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
size_type std::multimap<_Key, _Tp, _Compare, _Alloc>::size() const [inline], [noexcept]
```

Returns the size of the multimap.

**swap()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
void std::multimap<_Key, _Tp, _Compare, _Alloc>::swap (
    multimap<_Key, _Tp, _Compare, _Alloc> &__x) [inline], [noexcept]
```

Swaps data with another multimap.

**Parameters**

|                  |                                                     |
|------------------|-----------------------------------------------------|
| <code>__x</code> | A multimap of the same element and allocator types. |
|------------------|-----------------------------------------------------|

This exchanges the elements between two multimaps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Referenced by [std::swap\(\)](#).

**upper\_bound()** [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::upper_bound (
    const key_type &__x) [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

**Returns**

Iterator pointing to the first element greater than key, or end().

**upper\_bound()** [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
    const key_type & __x) const [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__x</code> | Key of (key, value) pair to be located. |
|------------------|-----------------------------------------|

**Returns**

Read-only (constant) iterator pointing to first iterator greater than key, or end().

**value\_comp()**

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
value_compare std::multimap< _Key, _Tp, _Compare, _Alloc >::value_comp () const [inline]
```

Returns a value comparison object, built from the key comparison object out of which the multimap was constructed. The documentation for this class was generated from the following files:

- [stl\\_map.h](#)
- [stl\\_multimap.h](#)

### 6.710.1 Detailed Description

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
class std::multiset< _Key, _Compare, _Alloc >
```

A standard container made up of elements, which can be retrieved in logarithmic time.

Since

C++98

#### Template Parameters

|                       |                                                                              |
|-----------------------|------------------------------------------------------------------------------|
| <code>_Key</code>     | Type of key objects.                                                         |
| <code>_Compare</code> | Comparison function object type, defaults to <code>less&lt;_Key&gt;</code> . |
| <code>_Alloc</code>   | Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .             |

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using equivalent keys). For a `multiset<Key>` the `key_type` and `value_type` are `Key`.

Multisets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

### 6.710.2 Constructor & Destructor Documentation

#### `multiset()` [1/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset () [default]
```

Default constructor creates no elements.

#### `multiset()` [2/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
```

```
    const _Compare & __comp,
```

```
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a multiset with no elements.

#### Parameters

|                     |                      |
|---------------------|----------------------|
| <code>__comp</code> | Comparator to use.   |
| <code>__a</code>    | An allocator object. |

#### `multiset()` [3/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator>
```

```
std::multiset< _Key, _Compare, _Alloc >::multiset (
```

```

        __InputIterator __first,
        __InputIterator __last) [inline]

```

Builds a multiset from a range.

#### Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

Create a multiset consisting of copies of the elements from `[first,last)`. This is linear in  $N$  if the range is already sorted, and  $N\log N$  otherwise (where  $N$  is `distance(__first,__last)`).

#### **multiset()** [4/12]

```

template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
template<typename _InputIterator>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    __InputIterator __first,
    __InputIterator __last,
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline]

```

Builds a multiset from a range.

#### Parameters

|                      |                       |
|----------------------|-----------------------|
| <code>__first</code> | An input iterator.    |
| <code>__last</code>  | An input iterator.    |
| <code>__comp</code>  | A comparison functor. |
| <code>__a</code>     | An allocator object.  |

Create a multiset consisting of copies of the elements from `[__first,__last)`. This is linear in  $N$  if the range is already sorted, and  $N\log N$  otherwise (where  $N$  is `distance(__first,__last)`).

#### **multiset()** [5/12]

```

template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    const multiset< _Key, _Compare, _Alloc > & ) [default]

```

Multiset copy constructor.

Whether the allocator is copied depends on the allocator traits.

#### **multiset()** [6/12]

```

template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    multiset< _Key, _Compare, _Alloc > && ) [default]

```

Multiset move constructor.

The newly-created multiset contains the exact contents of the moved instance. The moved instance is a valid, but unspecified multiset.

### multiset() [7/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc>::multiset (
    initializer_list< value_type > __l,
    const _Compare & __comp = _Compare(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a multiset from an initializer\_list.

#### Parameters

|                     |                       |
|---------------------|-----------------------|
| <code>__l</code>    | An initializer_list.  |
| <code>__comp</code> | A comparison functor. |
| <code>__a</code>    | An allocator object.  |

Create a multiset consisting of copies of the elements from the list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is `__l.size()`).

### multiset() [8/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc>::multiset (
    const allocator_type & __a) [inline], [explicit]
```

Allocator-extended default constructor.

### multiset() [9/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc>::multiset (
    const multiset<_Key, _Compare, _Alloc> & __m,
    const __type_identity_t< allocator_type > & __a) [inline]
```

Allocator-extended copy constructor.

### multiset() [10/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc>::multiset (
    multiset<_Key, _Compare, _Alloc> && __m,
    const __type_identity_t< allocator_type > & __a) [inline], [noexcept]
```

Allocator-extended move constructor.

**multiset()** [11/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    initializer_list< value_type > __l,
    const allocator_type & __a) [inline]
```

Allocator-extended initializer-list constructor.

**multiset()** [12/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
template<typename _InputIterator>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a) [inline]
```

Allocator-extended range constructor.

**~multiset()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::multiset< _Key, _Compare, _Alloc >::~~multiset () [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**6.710.3 Member Function Documentation****begin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

**cbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

**cend()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

**clear()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
void std::multiset< _Key, _Compare, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
template<typename _Kt>
```

```
auto std::multiset< _Key, _Compare, _Alloc >::contains (
    const _Kt & __x) const -> decltype(_M_t._M_find_tr(__x), void()), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                  |                                |
|------------------|--------------------------------|
| <code>__x</code> | Key of elements to be located. |
|------------------|--------------------------------|

**Returns**

True if there is any element with the specified key.

**contains()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
bool std::multiset< _Key, _Compare, _Alloc >::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                  |                                |
|------------------|--------------------------------|
| <code>__x</code> | Key of elements to be located. |
|------------------|--------------------------------|

**Returns**

True if there is any element with the specified key.

**count()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
size_type std::multiset< _Key, _Compare, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements with given key.

**Parameters**

|                 |                                |
|-----------------|--------------------------------|
| <code>_↔</code> | Key of elements to be located. |
| <code>_X</code> |                                |

**Returns**

Number of elements with specified key.

**crbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔  
_Key>>
```

```
reverse_iterator std::multiset<_Key, _Compare, _Alloc >::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

**crend()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔  
_Key>>
```

```
reverse_iterator std::multiset<_Key, _Compare, _Alloc >::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

**emplace()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔  
_Key>>
```

```
template<typename... _Args>
```

```
iterator std::multiset<_Key, _Compare, _Alloc >::emplace (  
    _Args &&... __args) [inline]
```

Builds and inserts an element into the multiset.

**Parameters**

|                     |                                                                 |
|---------------------|-----------------------------------------------------------------|
| <code>__args</code> | Arguments used to generate the element instance to be inserted. |
|---------------------|-----------------------------------------------------------------|

**Returns**

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

**emplace\_hint()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔  
_Key>>
```

```
template<typename... _Args>
```

```
iterator std::multiset<_Key, _Compare, _Alloc >::emplace_hint (  
    const_iterator __pos,  
    _Args &&... __args) [inline]
```

Builds and inserts an element into the multiset.

#### Parameters

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__args</code> | Arguments used to generate the element instance to be inserted.               |

#### Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

#### `empty()`

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
bool std::multiset<_Key, _Compare, _Alloc>::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the set is empty.

#### `end()`

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
iterator std::multiset<_Key, _Compare, _Alloc>::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

#### `equal_range()` [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
std::pair< iterator, iterator > std::multiset<_Key, _Compare, _Alloc>::equal_range (
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

#### Parameters

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

#### Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

**equal\_range()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::pair< const_iterator, const_iterator > std::multiset< _Key, _Compare, _Alloc >::equal_range
(
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                                    |                    |
|------------------------------------|--------------------|
| <code>↵</code><br><code>__x</code> | Key to be located. |
|------------------------------------|--------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

**erase()** [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                                    |                              |
|------------------------------------|------------------------------|
| <code>↵</code><br><code>__x</code> | Key of element to be erased. |
|------------------------------------|------------------------------|

**Returns**

The number of elements erased.

This function erases all elements located by the given key from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [first,last) range of elements from a multiset.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator *last*.

This function erases a sequence of elements from a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset<_Key, _Compare, _Alloc>::erase (
    const_iterator __position) [inline]
```

Erases an element from a multiset.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset<_Key, _Compare, _Alloc>::find (
    const key_type & __x) [inline]
```

Tries to locate an element in a set.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__x</code> | Element to be located. |
|------------------|------------------------|

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

**find()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in a set.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__x</code> | Element to be located. |
|------------------|------------------------|

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**get\_allocator()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
allocator_type std::multiset< _Key, _Compare, _Alloc >::get_allocator () const [inline], [noexcept]
```

Returns the memory allocation object.

**insert()** [1/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator>
void std::multiset< _Key, _Compare, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that tries to insert a range of elements.

**Parameters**

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

**insert()** [2/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::insert (
    const value_type & __x) [inline]
```

Inserts an element into the multiset.

**Parameters**

|                 |                         |
|-----------------|-------------------------|
| <code>↔</code>  | Element to be inserted. |
| <code>_x</code> |                         |

**Returns**

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

Referenced by [std::multiset< \\_Key, \\_Cmp, polymorphic\\_allocator< \\_Key > >::insert\(\)](#).

**insert()** [3/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::insert (
    const_iterator __position,
    const value_type & __x) [inline]
```

Inserts an element into the multiset.

**Parameters**

|                         |                                                                               |
|-------------------------|-------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>        | Element to be inserted.                                                       |

**Returns**

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↔associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↔associative.insert_hints) for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

**insert()** [4/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
void std::multiset< _Key, _Compare, _Alloc >::insert (
    initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of elements into the multiset.

**Parameters**

|                |                                                                                    |
|----------------|------------------------------------------------------------------------------------|
| <code>↵</code> | A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted. |
| <code>↵</code> |                                                                                    |
| <code>↵</code> |                                                                                    |
| <code>↵</code> |                                                                                    |
| <code>/</code> |                                                                                    |

Complexity similar to that of the range constructor.

**key\_comp()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
key_compare std::multiset< _Key, _Compare, _Alloc >::key_comp () const [inline]
```

Returns the comparison object.

**lower\_bound()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound (
    const key_type & __x) [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>↵</code>  | Key to be located. |
| <code>_x</code> |                    |

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

**lower\_bound()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound (
    const key_type & __x) const [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>↵</code>  | Key to be located. |
| <code>_x</code> |                    |

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

**max\_size()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::multiset<_Key, _Compare, _Alloc>::max_size () const [inline], [noexcept]
```

Returns the maximum size of the set.

**operator=() [1/3]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
multiset & std::multiset<_Key, _Compare, _Alloc>::operator= (
    const multiset<_Key, _Compare, _Alloc> & ) [default]
```

Multiset assignment operator.

Whether the allocator is copied depends on the allocator traits.

**operator=() [2/3]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
multiset & std::multiset<_Key, _Compare, _Alloc>::operator= (
    initializer_list<value_type> & __l ) [inline]
```

Multiset list assignment operator.

**Parameters**

|   |                      |
|---|----------------------|
| ↵ | An initializer_list. |
| ↵ |                      |
| ↵ |                      |
| ↵ |                      |
| / |                      |

This function fills a multiset with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the multiset and that the resulting multiset's size is the same as the number of elements assigned.

**operator=() [3/3]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
multiset & std::multiset<_Key, _Compare, _Alloc>::operator= (
    multiset<_Key, _Compare, _Alloc> && ) [default]
```

Move assignment operator.

**rbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rbegin () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

### rend()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵_Key>>
```

```
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

### size()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵_Key>>
```

```
size_type std::multiset< _Key, _Compare, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the set.

### swap()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵_Key>>
```

```
void std::multiset< _Key, _Compare, _Alloc >::swap (
    multiset< _Key, _Compare, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another multiset.

#### Parameters

|                  |                                                     |
|------------------|-----------------------------------------------------|
| <code>↵_X</code> | A multiset of the same element and allocator types. |
|------------------|-----------------------------------------------------|

This exchanges the elements between two multisets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Referenced by [std::swap\(\)](#).

### upper\_bound() [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵_Key>>
```

```
iterator std::multiset< _Key, _Compare, _Alloc >::upper_bound (
    const key_type & __x) [inline]
```

Finds the end of a subsequence matching given key.

#### Parameters

|                  |                    |
|------------------|--------------------|
| <code>↵_X</code> | Key to be located. |
|------------------|--------------------|

**Returns**

Iterator pointing to the first element greater than key, or end().

**upper\_bound()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::upper_bound (
    const key_type & __x) const [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

**Returns**

Iterator pointing to the first element greater than key, or end().

**value\_comp()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
value_compare std::multiset< _Key, _Compare, _Alloc >::value_comp () const [inline]
```

Returns the comparison object.

## 6.717.1 Detailed Description

`template<typename _IntType = int>`  
**class** `std::negative_binomial_distribution< _IntType >`

A `negative_binomial_distribution` random number distribution.

The formula for the negative binomial probability mass function is  $p(i) = \binom{n}{i} p^i (1 - p)^{t-i}$  where  $t$  and  $p$  are the parameters of the distribution.

Since

C++11

## 6.717.2 Member Typedef Documentation

### result\_type

`template<typename _IntType = int>`  
`typedef _IntType std::negative_binomial_distribution< _IntType >::result_type`  
 The type of the range of the distribution.

## 6.717.3 Member Function Documentation

### k()

`template<typename _IntType = int>`  
`_IntType std::negative_binomial_distribution< _IntType >::k () const [inline]`  
 Return the  $k$  parameter of the distribution.

### max()

`template<typename _IntType = int>`  
`result_type std::negative_binomial_distribution< _IntType >::max () const [inline]`  
 Returns the least upper bound value of the distribution.

### min()

`template<typename _IntType = int>`  
`result_type std::negative_binomial_distribution< _IntType >::min () const [inline]`  
 Returns the greatest lower bound value of the distribution.

**operator()()**

```
template<typename _IntType>
template<typename _UniformRandomNumberGenerator>
negative_binomial_distribution< _IntType >::result_type std::negative_binomial_distribution< _↵
_IntType >::operator() (
    _UniformRandomNumberGenerator & __urng)
```

Generating functions.

**p()**

```
template<typename _IntType = int>
double std::negative_binomial_distribution< _IntType >::p () const [inline]
```

Return the  $p$  parameter of the distribution.

**param() [1/2]**

```
template<typename _IntType = int>
param_type std::negative_binomial_distribution< _IntType >::param () const [inline]
```

Returns the parameter set of the distribution.

**param() [2/2]**

```
template<typename _IntType = int>
void std::negative_binomial_distribution< _IntType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _IntType = int>
void std::negative_binomial_distribution< _IntType >::reset () [inline]
```

Resets the distribution state.

**6.717.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::negative_binomial_distribution< _IntType1 > & __x) [friend]
```

Inserts a negative\_binomial\_distribution random number distribution `__x` into the output stream `__os`.

**Parameters**

|                   |                   |
|-------------------|-------------------|
| <code>__os</code> | An output stream. |
|-------------------|-------------------|

|                  |                                                                           |
|------------------|---------------------------------------------------------------------------|
| <code>__x</code> | A <code>negative_binomial_distribution</code> random number distribution. |
|------------------|---------------------------------------------------------------------------|

### Returns

The output stream with the state of `__x` inserted or in an error state.

### `operator==`

```
template<typename _IntType = int>
bool operator== (
    const negative_binomial_distribution< _IntType > & __d1,
    const negative_binomial_distribution< _IntType > & __d2) [friend]
```

Return true if two negative binomial distributions have the same parameters and the sequences that would be generated are equal.

### `operator>>`

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::negative_binomial_distribution< _IntType1 > & __x) [friend]
```

Extracts a `negative_binomial_distribution` random number distribution `__x` from the input stream `__is`.

### Parameters

|                   |                                                                               |
|-------------------|-------------------------------------------------------------------------------|
| <code>__is</code> | An input stream.                                                              |
| <code>__x</code>  | A <code>negative_binomial_distribution</code> random number generator engine. |

### Returns

The input stream with `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

- void [rethrow\\_nested](#) () const

### 6.718.1 Detailed Description

Mixin class that stores the current exception.

This type can be used via `std::throw_with_nested` to store the current exception nested within another exception.

Since

C++11

See also

`std::throw_with_nested`

### 6.718.2 Constructor & Destructor Documentation

#### `nested_exception()`

```
std::nested_exception::nested_exception () [inline], [noexcept]
```

The default constructor stores the current exception (if any).

References [std::current\\_exception\(\)](#).

### 6.718.3 Member Function Documentation

#### `nested_ptr()`

```
exception_ptr std::nested_exception::nested_ptr () const [inline], [noexcept]
```

Access the stored exception.

#### `rethrow_nested()`

```
void std::nested_exception::rethrow_nested () const [inline]
```

Rethrow the stored exception, or terminate if none was stored.

References [std::rethrow\\_exception\(\)](#), [rethrow\\_nested\(\)](#), and [std::terminate\(\)](#).

Referenced by [rethrow\\_nested\(\)](#).

#### 6.721.1 Detailed Description

```
template<typename _Tp>
```

```
class __gnu_cxx::new_allocator<_Tp>
```

An allocator that uses global `new`, as per C++03 [20.4.1].

This is precisely the allocator defined in the C++ Standard.

- all allocation calls `operator new`
- all deallocation calls `operator delete`

This is a non-standard extension that can be used to guarantee allocation from `new` even if the library has been configured to use a different implementation for `std::allocator`.

#### Template Parameters

|                  |                           |
|------------------|---------------------------|
| <code>_Tp</code> | Type of allocated object. |

### 6.724.1 Detailed Description

**template<typename `_RealType` = double>**  
**class `std::normal_distribution`< `_RealType` >**

A normal continuous distribution for random numbers.  
 The formula for the normal probability density function is

$$p(x|\mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{x-\mu}{2\sigma^2}}$$

Since

C++11

### 6.724.2 Member Typedef Documentation

#### result\_type

```
template<typename _RealType = double>
typedef _RealType std::normal_distribution<_RealType>::result_type
```

The type of the range of the distribution.

### 6.724.3 Constructor & Destructor Documentation

#### normal\_distribution()

```
template<typename _RealType = double>
std::normal_distribution<_RealType>::normal_distribution (
    result_type __mean,
    result_type __stddev = result_type(1)) [inline], [explicit]
```

Constructs a normal distribution with parameters *mean* and standard deviation.

### 6.724.4 Member Function Documentation

#### max()

```
template<typename _RealType = double>
result_type std::normal_distribution<_RealType>::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### mean()

```
template<typename _RealType = double>
_RealType std::normal_distribution<_RealType>::mean () const [inline]
```

Returns the mean of the distribution.

#### min()

```
template<typename _RealType = double>
result_type std::normal_distribution<_RealType>::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

#### operator>() [1/2]

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::normal_distribution<_RealType>::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

#### operator>() [2/2]

```
template<typename _RealType>
template<typename _UniformRandomNumberGenerator>
normal_distribution<_RealType>::result_type std::normal_distribution<_RealType>::operator()
```

```
(  
    _UniformRandomNumberGenerator & __urng,  
    const param_type & __param)
```

Polar method due to Marsaglia.

Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. V, Sect. 4.4.

References [std::log\(\)](#), and [std::sqrt\(\)](#).

#### **param()** [1/2]

```
template<typename _RealType = double>  
param_type std::normal_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

#### **param()** [2/2]

```
template<typename _RealType = double>  
void std::normal_distribution< _RealType >::param (  
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

#### **Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

#### **reset()**

```
template<typename _RealType = double>  
void std::normal_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

#### **stddev()**

```
template<typename _RealType = double>  
_RealType std::normal_distribution< _RealType >::stddev () const [inline]
```

Returns the standard deviation of the distribution.

### **6.724.5 Friends And Related Symbol Documentation**

#### **operator<<**

```
template<typename _RealType = double>  
template<typename _RealType1, typename _CharT, typename _Traits>  
std::basic_ostream< _CharT, _Traits > & operator<< (  
    std::basic_ostream< _CharT, _Traits > & __os,  
    const std::normal_distribution< _RealType1 > & __x) [friend]
```

Inserts a normal\_distribution random number distribution `__x` into the output stream `__os`.

#### **Parameters**

|                   |                                                   |
|-------------------|---------------------------------------------------|
| <code>__os</code> | An output stream.                                 |
| <code>__x</code>  | A normal_distribution random number distribution. |

**Returns**

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _RealType = double>
template<typename _RealType1>
bool operator== (
    const std::normal_distribution< _RealType1 > & __d1,
    const std::normal_distribution< _RealType1 > & __d2) [friend]
```

Return true if two normal distributions have the same parameters and the sequences that would be generated are equal.

**operator>>**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::normal_distribution< _RealType1 > & __x) [friend]
```

Extracts a normal\_distribution random number distribution `__x` from the input stream `__is`.

**Parameters**

|                   |                                                       |
|-------------------|-------------------------------------------------------|
| <code>__is</code> | An input stream.                                      |
| <code>__x</code>  | A normal_distribution random number generator engine. |

**Returns**

The input stream with `__x` extracted or in an error state.

## 6.726 std::ranges::not\_equal\_to Struct Reference

```
#include <ranges_cmp.h>
```

### Public Types

- using `is_transparent`

### Static Public Member Functions

- `template<typename _Tp, typename _Up>`  
`static constexpr bool operator() (_Tp &&__t, _Up &&__u) noexcept(noexcept(std::declval<_Tp>()==std::declval<_Up>()))`

#### 6.726.1 Detailed Description

`ranges::not_equal_to` function object type.

The documentation for this struct was generated from the following file:

- [ranges\\_cmp.h](#)

## 6.727 std::not\_equal\_to< void > Struct Reference

```
#include <stl_function.h>
```

Inheritance diagram for `std::not_equal_to< void >`:

### Public Types

- `typedef void first_argument_type`
- `typedef __is_transparent is_transparent`
- `typedef bool result_type`
- `typedef void second_argument_type`

### Public Member Functions

- `template<typename _Tp, typename _Up>`  
`constexpr auto operator() (_Tp &&__t, _Up &&__u) const noexcept(noexcept(std::forward<_Tp>(__t) !=std::forward<_Up>(__u))) -> decltype(std::forward<_Tp>(__t) !=std::forward<_Up>(__u))`

### 6.727.1 Detailed Description

One of the [comparison functors](#).

### 6.727.2 Member Typedef Documentation

#### first\_argument\_type

```
typedef void std::binary\_function< void, void, bool >::first_argument_type
```

first\_argument\_type is the type of the first argument

#### result\_type

```
typedef bool std::binary\_function< void, void, bool >::result_type
```

result\_type is the return type

#### second\_argument\_type

```
typedef void std::binary\_function< void, void, bool >::second_argument_type
```

second\_argument\_type is the type of the second argument

## 6.728 \_\_gnu\_pbds::null\_node\_update< \_Tp1, \_Tp2, \_Tp3, \_Tp4 > Struct Template Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for \_\_gnu\_pbds::null\_node\_update< \_Tp1, \_Tp2, \_Tp3, \_Tp4 >:

### 6.728.1 Detailed Description

```
template<typename _Tp1, typename _Tp2, typename _Tp3, typename _Tp4>
struct __gnu_pbds::null_node_update< _Tp1, _Tp2, _Tp3, _Tp4 >
```

A null node updatator, indicating that no node updates are required.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.729 `__gnu_pbds::null_type` Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for `__gnu_pbds::null_type`:

### 6.729.1 Detailed Description

Represents no type, or absence of type, for template tricks.

In a mapped-policy, indicates that an associative container is a set.

In a list-update policy, indicates that each link does not need metadata.

In a hash policy, indicates that the combining hash function is actually a ranged hash function.

In a probe policy, indicates that the combining probe function is actually a ranged probe function.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.730 `std::experimental::fundamentals_v1::nullopt_t` Struct Reference

```
#include <optional>
```

## Public Types

- enum class `_Construct` { `_Token` }

## Public Member Functions

- constexpr `nullopt_t` (`_Construct`)

### 6.730.1 Detailed Description

Tag type to disengage optional objects.

The documentation for this struct was generated from the following file:

- [experimental/optional](#)

## 6.731 `std::num_get<_CharT, _InIter >` Class Template Reference

### 6.731.1 Detailed Description

```
template<typename _CharT, typename _InIter>
class std::num_get< _CharT, _InIter >
```

Primary class template `num_get`.

This facet encapsulates the code to parse and return a number from a string. It is used by the istream numeric extraction operators.

The `num_get` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `num_get` facet.

### 6.731.2 Member Typedef Documentation

#### `char_type`

```
template<typename _CharT, typename _InIter>
typedef _CharT std::num_get< _CharT, _InIter >::char_type
Public typedefs.
```

#### `iter_type`

```
template<typename _CharT, typename _InIter>
typedef _InIter std::num_get< _CharT, _InIter >::iter_type
Public typedefs.
```

### 6.731.3 Constructor & Destructor Documentation

#### `num_get()`

```
template<typename _CharT, typename _InIter>
std::num_get< _CharT, _InIter >::num_get (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

#### Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

#### `~num_get()`

```
template<typename _CharT, typename _InIter>
virtual std::num_get< _CharT, _InIter >::~num_get () [inline], [protected], [virtual]
Destructor.
```

### 6.731.4 Member Function Documentation

#### `do_get()` [1/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
```

```
ios_base::iostate & __err,
long & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

#### do\_get() [2/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get<_CharT, _InIter>::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long long & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

**do\_get()** [3/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned int & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

**See also**

get() for more details.

**Parameters**

|              |                             |
|--------------|-----------------------------|
| <i>__beg</i> | Start of input stream.      |
| <i>__end</i> | End of input stream.        |
| <i>__io</i>  | Source of locale and flags. |
| <i>__err</i> | Error flags to set.         |
| <i>__v</i>   | Value to format and insert. |

**Returns**

Iterator after reading.

**do\_get()** [4/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned long & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

#### do\_get() [5/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get<_CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned long long & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

**do\_get()** [6/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned short & __v) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

**See also**

[get\(\)](#) for more details.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

**do\_get()** [7/11]

```
template<typename _CharT, typename _InIter>
_InIter std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    bool & __v) const [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

**See also**

[get\(\)](#) for more details.

**Parameters**

|                    |                        |
|--------------------|------------------------|
| <code>__beg</code> | Start of input stream. |
| <code>__end</code> | End of input stream.   |

|                    |                             |
|--------------------|-----------------------------|
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long double & __v) const [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

**See also**

[get\(\)](#) for more details.

**Parameters**

|                    |                        |
|--------------------|------------------------|
| <code>__beg</code> | Start of input stream. |
| <code>__end</code> | End of input stream.   |

|                    |                             |
|--------------------|-----------------------------|
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

References [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::c\\_str\(\)](#), [std::ios\\_base::eofbit](#), and [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::r](#)

**do\_get()** [11/11]

```
template<typename _CharT, typename _InIter>
_InIter std::num_get<_CharT, _InIter>::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    void *& __v) const [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

**See also**

`get()` for more details.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__beg</code> | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

References [std::ios\\_base::basefield](#), [std::ios\\_base::flags\(\)](#), and [std::ios\\_base::hex](#).

**get()** [1/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get<_CharT, _InIter>::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
```

```

        ios_base::iostate & __err,
        bool & __v) const [inline]

```

Numeric parsing.

Parses the input stream into the bool *v*. It does so by calling `num_get::do_get()`.

If `ios_base::boolalpha` is set, attempts to read `ctype<CharT>::truenamename()` or `ctype<CharT>::falsename()`. Sets *v* to true or false if successful. Sets *err* to `ios_base::failbit` if reading the string fails. Sets *err* to `ios_base::eofbit` if the stream is emptied.

If `ios_base::boolalpha` is not set, proceeds as with reading a long, except if the value is 1, sets *v* to true, if the value is 0, sets *v* to false, and otherwise set *err* to `ios_base::failbit`.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

Referenced by `std::basic_istream< char_type, traits_type >::operator>>()`, and `std::basic_istream< _CharT, _Traits >::operator>>()`.

#### get() [2/11]

```

template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    double & __v) const [inline]

```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf g` specifier. The matching type length modifier is also used.

The decimal point character used is `num_punct::decimal_point()`. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets *err* to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets *err* to `ios_base::failbit` and leaves *v* unaltered. Sets *err* to `ios_base::eofbit` if the stream is emptied.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |

|                    |                             |
|--------------------|-----------------------------|
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

**get()** [3/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    float & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf g` specifier. The matching type length modifier is also used.

The decimal point character used is `num_punct::decimal_point()`. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered.

Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

**get()** [4/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

#### `get()` [5/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long double & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf` `g` specifier. The matching type length modifier is also used.

The decimal point character used is `num_punct::decimal_point()`. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |

|                  |                             |
|------------------|-----------------------------|
| <code>__v</code> | Value to format and insert. |
|------------------|-----------------------------|

**Returns**

Iterator after reading.

**get()** [6/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long long & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

**get()** [7/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
```

```
ios_base::iostate & __err,
unsigned int & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

#### `get()` [8/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned long & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

**get()** [9/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned long long & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in `io`.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

**get()** [10/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned short & __v) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

**Returns**

Iterator after reading.

**get()** [11/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    void *& __v) const [inline]
```

Numeric parsing.

Parses the input stream into the pointer variable *v*. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf` `p` specifier.

Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

Note that the digit grouping effect for pointers is a bit ambiguous in the standard and shouldn't be relied on. See DR 344.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets *err* to `ios_base::failbit` and leaves *v* unaltered. Sets *err* to `ios_base::eofbit` if the stream is emptied.

#### Parameters

|                    |                             |
|--------------------|-----------------------------|
| <code>__in</code>  | Start of input stream.      |
| <code>__end</code> | End of input stream.        |
| <code>__io</code>  | Source of locale and flags. |
| <code>__err</code> | Error flags to set.         |
| <code>__v</code>   | Value to format and insert. |

#### Returns

Iterator after reading.

#### 6.731.5 Member Data Documentation

##### id

```
template<typename _CharT, typename _InIter>
locale::id std::num_get<_CharT, _InIter >::id [static]
Numpunct facet id.

#### 6.732.1 Detailed Description

template<typename \_CharT, typename \_OutIter>  
class std::num\_put< \_CharT, \_OutIter >

Primary class template num\_put.

This facet encapsulates the code to convert a number to a string. It is used by the ostream numeric insertion operators. The num\_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the num\_put facet.

#### 6.732.2 Member Typedef Documentation

##### char\_type

```
template<typename _CharT, typename _OutIter>
typedef _CharT std::num_put< _CharT, _OutIter >::char_type
```

Public typedefs.

##### iter\_type

```
template<typename _CharT, typename _OutIter>
typedef _OutIter std::num_put< _CharT, _OutIter >::iter_type
```

Public typedefs.

#### 6.732.3 Constructor & Destructor Documentation

##### num\_put()

```
template<typename _CharT, typename _OutIter>
std::num_put< _CharT, _OutIter >::num_put (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

##### Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

##### ~num\_put()

```
template<typename _CharT, typename _OutIter>
virtual std::num_put< _CharT, _OutIter >::~num_put () [inline], [protected], [virtual]
```

Destructor.

## 6.732.4 Member Function Documentation

### do\_put() [1/8]

```
template<typename _CharT, typename _OutIter>
_OutIter std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    bool __v) const [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

#### Parameters

|                                                                                                                       |                               |
|-----------------------------------------------------------------------------------------------------------------------|-------------------------------|
| <a href="#"> <code>__s</code></a>    | Stream to write to.           |
| <a href="#"> <code>__io</code></a>   | Source of locale and flags.   |
| <a href="#"> <code>__fill</code></a> | Char_type to use for filling. |
| <a href="#"> <code>__v</code></a>    | Value to format and insert.   |

#### Returns

Iterator after writing.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::adjustfield](#), [std::ios\\_base::boolalpha](#), [std::ios\\_base::flags\(\)](#), [std::ios\\_base::left](#), and [std::ios\\_base::width\(\)](#).

### do\_put() [2/8]

```
template<typename _CharT, typename _OutIter>
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long __v) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

#### Parameters

|                                                                                                                      |                     |
|----------------------------------------------------------------------------------------------------------------------|---------------------|
| <a href="#"> <code>__s</code></a> | Stream to write to. |
|----------------------------------------------------------------------------------------------------------------------|---------------------|

|                                     |                               |
|-------------------------------------|-------------------------------|
| <a href="#"><code>__io</code></a>   | Source of locale and flags.   |
| <a href="#"><code>__fill</code></a> | Char_type to use for filling. |
| <a href="#"><code>__v</code></a>    | Value to format and insert.   |

**Returns**

Iterator after writing.

**do\_put() [3/8]**

```
template<typename _CharT, typename _OutIter>
virtual iter\_type std::num_put< _CharT, _OutIter >::do_put (
    iter\_type __s,
    ios\_base & __io,
    char\_type __fill,
    long long __v) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

|                                     |                               |
|-------------------------------------|-------------------------------|
| <a href="#"><code>__s</code></a>    | Stream to write to.           |
| <a href="#"><code>__io</code></a>   | Source of locale and flags.   |
| <a href="#"><code>__fill</code></a> | Char_type to use for filling. |
| <a href="#"><code>__v</code></a>    | Value to format and insert.   |

**Returns**

Iterator after writing.

**do\_put() [4/8]**

```
template<typename _CharT, typename _OutIter>
virtual iter\_type std::num_put< _CharT, _OutIter >::do_put (
    iter\_type __s,
    ios\_base & __io,
    char\_type __fill,
    unsigned long __v) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

|                            |                               |
|----------------------------|-------------------------------|
| $\leftrightarrow$<br>_s    | Stream to write to.           |
| $\leftrightarrow$<br>_io   | Source of locale and flags.   |
| $\leftrightarrow$<br>_fill | Char_type to use for filling. |
| $\leftrightarrow$<br>_v    | Value to format and insert.   |

**Returns**

Iterator after writing.

**do\_put()** [5/8]

```
template<typename _CharT, typename _OutIter>
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    unsigned long long __v) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

|                            |                               |
|----------------------------|-------------------------------|
| $\leftrightarrow$<br>_s    | Stream to write to.           |
| $\leftrightarrow$<br>_io   | Source of locale and flags.   |
| $\leftrightarrow$<br>_fill | Char_type to use for filling. |
| $\leftrightarrow$<br>_v    | Value to format and insert.   |

**Returns**

Iterator after writing.

**do\_put()** [6/8]

```
template<typename _CharT, typename _OutIter>
_OutIter std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const void * __v) const [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

#### Parameters

|                                     |                               |
|-------------------------------------|-------------------------------|
| <a href="#"><code>__s</code></a>    | Stream to write to.           |
| <a href="#"><code>__io</code></a>   | Source of locale and flags.   |
| <a href="#"><code>__fill</code></a> | Char_type to use for filling. |
| <a href="#"><code>__v</code></a>    | Value to format and insert.   |

#### Returns

Iterator after writing.

References [std::ios\\_base::basefield](#), [std::ios\\_base::flags\(\)](#), [std::ios\\_base::hex](#), [std::ios\\_base::showbase](#), and [std::ios\\_base::uppercase](#).

#### do\_put() [7/8]

```
template<typename _CharT, typename _OutIter>
_OutIter std::num_put<_CharT, _OutIter>::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    double __v) const [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

#### Parameters

|                                     |                               |
|-------------------------------------|-------------------------------|
| <a href="#"><code>__s</code></a>    | Stream to write to.           |
| <a href="#"><code>__io</code></a>   | Source of locale and flags.   |
| <a href="#"><code>__fill</code></a> | Char_type to use for filling. |
| <a href="#"><code>__v</code></a>    | Value to format and insert.   |

#### Returns

Iterator after writing.

**do\_put()** [8/8]

```
template<typename _CharT, typename _OutIter>
_OutIter std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long double __v) const [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

**Returns**

Iterator after writing.

**put()** [1/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    bool __v) const [inline]
```

Numeric formatting.

Formats the boolean `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

If `ios_base::boolalpha` is set, writes `ctype<CharT>::truenamename()` or `ctype<CharT>::falsename()`. Otherwise formats `v` as an int.

**Parameters**

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

**Returns**

Iterator after writing.

Referenced by [std::basic\\_ostream< \\_CharT, \\_Traits >::operator<<\(\)](#).

**put()** [2/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const void * __v) const [inline]
```

Numeric formatting.

Formats the pointer value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

This function formats *v* as an unsigned long with `ios_base::hex` and `ios_base::showbase` set.

**Parameters**

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

**Returns**

Iterator after writing.

**put()** [3/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    double __v) const [inline]
```

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::floatfield`. If equal to `ios_base::fixed`, formats like the `printf f` specifier. Else if equal to `ios_base::scientific`, formats like `e` or `E` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `g` or `G` depending on uppercase. Note that if both `fixed` and `scientific` are set, the effect will also be like `g` or `G`.

The output precision is given by `io.precision()`. This precision is capped at `numeric_limits::digits10 + 2` (different for double and long double). The default precision is 6.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showpoint` is set, a decimal point will always be output.

The decimal point character used is `numunct::decimal_point()`. Thousands separators are inserted according to `numunct::grouping()` and `numunct::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_↵base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

### Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>↵_s</code>    | Stream to write to.           |
| <code>↵_io</code>   | Source of locale and flags.   |
| <code>↵_fill</code> | Char_type to use for filling. |
| <code>↵_v</code>    | Value to format and insert.   |

### Returns

Iterator after writing.

### put() [4/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long __v) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags() & ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showbase` is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is `numunct::decimal_point()`. Thousands separators are inserted according to `numunct::grouping()` and `numunct::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_↵base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

### Parameters

|                   |                             |
|-------------------|-----------------------------|
| <code>↵_s</code>  | Stream to write to.         |
| <code>↵_io</code> | Source of locale and flags. |

|                     |                               |
|---------------------|-------------------------------|
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

**Returns**

Iterator after writing.

**put()** [5/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long double __v) const [inline]
```

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling num\_put::do\_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios\_base::floatfield. If equal to ios\_base::fixed, formats like the printf f specifier. Else if equal to ios\_base::scientific, formats like e or E with ios\_base::uppercase unset or set respectively. Otherwise, formats like g or G depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like g or G.

The output precision is given by io.precision(). This precision is capped at numeric\_limits::digits10 + 2 (different for double and long double). The default precision is 6.

If ios\_base::showpos is set, '+' is output before positive values. If ios\_base::showpoint is set, a decimal point will always be output.

The decimal point character used is numpunct::decimal\_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands\_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios\_base::adjustfield) == ios\_base::left, result is padded at the end. If ios\_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

**Parameters**

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

**Returns**

Iterator after writing.

**put()** [6/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long long __v) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showbase` is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

**Parameters**

|                          |                               |
|--------------------------|-------------------------------|
| <code>↔<br/>_s</code>    | Stream to write to.           |
| <code>↔<br/>_io</code>   | Source of locale and flags.   |
| <code>↔<br/>_fill</code> | Char_type to use for filling. |
| <code>↔<br/>_v</code>    | Value to format and insert.   |

**Returns**

Iterator after writing.

**put()** [7/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    unsigned long __v) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showbase` is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is `numput::decimal_point()`. Thousands separators are inserted according to `numput::grouping()` and `numput::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

### Parameters

|                     |                               |
|---------------------|-------------------------------|
| <code>__s</code>    | Stream to write to.           |
| <code>__io</code>   | Source of locale and flags.   |
| <code>__fill</code> | Char_type to use for filling. |
| <code>__v</code>    | Value to format and insert.   |

### Returns

Iterator after writing.

### put() [8/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    unsigned long long __v) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showbase` is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is `numput::decimal_point()`. Thousands separators are inserted according to `numput::grouping()` and `numput::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

### Parameters

|                  |                     |
|------------------|---------------------|
| <code>__s</code> | Stream to write to. |
|------------------|---------------------|

|                           |                               |
|---------------------------|-------------------------------|
| <code>_↔<br/>_io</code>   | Source of locale and flags.   |
| <code>_↔<br/>_fill</code> | Char_type to use for filling. |
| <code>_↔<br/>_v</code>    | Value to format and insert.   |

**Returns**

Iterator after writing.

### 6.733.1 Detailed Description

```
template<typename _Tp>
struct std::numeric_limits< _Tp >
```

Properties of fundamental types.

This class allows a program to obtain information about the representation of a fundamental type on a given platform. For non-fundamental types, the functions will return 0 and the data members will all be `false`.

### 6.733.2 Member Function Documentation

#### denorm\_min()

```
template<typename _Tp>
constexpr _Tp std::numeric_limits< _Tp >::denorm_min () [inline], [static], [constexpr], [noexcept]
```

The minimum positive denormalized value. For types where `has_denorm` is `false`, this is the minimum positive normalized value.

#### epsilon()

```
template<typename _Tp>
constexpr _Tp std::numeric_limits< _Tp >::epsilon () [inline], [static], [constexpr], [noexcept]
```

The *machine epsilon*: the difference between 1 and the least value greater than 1 that is representable. Referenced by `std::binomial_distribution< _IntType >::operator()()`, `std::poisson_distribution< _IntType >::operator()()`, and `std::operator<<()`.

**infinity()**

```
template<typename _Tp>
constexpr _Tp std::numeric_limits<_Tp>::infinity () [inline], [static], [constexpr], [noexcept]
```

The representation of positive infinity, if has\_infinity.

**lowest()**

```
template<typename _Tp>
constexpr _Tp std::numeric_limits<_Tp>::lowest () [inline], [static], [constexpr], [noexcept]
```

A finite value x such that there is no other finite value y where y < x.

Referenced by [std::cauchy\\_distribution<\\_RealType>::min\(\)](#), [std::extreme\\_value\\_distribution<\\_RealType>::min\(\)](#), [std::normal\\_distribution<\\_RealType>::min\(\)](#), and [std::student\\_t\\_distribution<\\_RealType>::min\(\)](#).

**max()**

```
template<typename _Tp>
constexpr _Tp std::numeric_limits<_Tp>::max () [inline], [static], [constexpr], [noexcept]
```

The maximum finite value.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_parallel\\_random\\_shuffle\\_drs\(\)](#), [std::bernoulli\\_distribution::max\(\)](#), [std::cauchy\\_distribution<\\_RealType>::max\(\)](#), [std::chi\\_squared\\_distribution<\\_RealType>::max\(\)](#), [std::exponential\\_distribution<\\_RealType>::max\(\)](#), [std::extreme\\_value\\_distribution<\\_RealType>::max\(\)](#), [std::fisher\\_f\\_distribution<\\_RealType>::max\(\)](#), [std::gamma\\_distribution<\\_RealType>::max\(\)](#), [std::geometric\\_distribution<\\_IntType>::max\(\)](#), [std::lognormal\\_distribution<\\_RealType>::max\(\)](#), [std::negative\\_binomial\\_distribution<\\_IntType>::max\(\)](#), [std::normal\\_distribution<\\_RealType>::max\(\)](#), [std::poisson\\_distribution<\\_IntType>::max\(\)](#), [std::student\\_t\\_distribution<\\_RealType>::max\(\)](#), [std::weibull\\_distribution<\\_RealType>::max\(\)](#), [std::tr2::dynamic\\_bitset<\\_WordT, \\_Alloc>::max\\_size\(\)](#), [std::binomial\\_distribution<\\_IntType>::operator\(\)\(\)](#), [std::independent\\_bits\\_engine<\\_WordT, \\_Alloc>::max\\_size\(\)](#), and [std::operator<<\(\)](#).

**min()**

```
template<typename _Tp>
constexpr _Tp std::numeric_limits<_Tp>::min () [inline], [static], [constexpr], [noexcept]
```

The minimum finite value, or for floating types with denormalization, the minimum positive normalized value.

Referenced by [std::bernoulli\\_distribution::min\(\)](#).

**quiet\_NaN()**

```
template<typename _Tp>
constexpr _Tp std::numeric_limits<_Tp>::quiet_NaN () [inline], [static], [constexpr], [noexcept]
```

The representation of a quiet Not a Number, if has\_quiet\_NaN.

**round\_error()**

```
template<typename _Tp>
constexpr _Tp std::numeric_limits<_Tp>::round_error () [inline], [static], [constexpr], [noexcept]
```

The maximum rounding error measurement (see LIA-1).

**signaling\_NaN()**

```
template<typename _Tp>
constexpr _Tp std::numeric_limits<_Tp>::signaling_NaN () [inline], [static], [constexpr], [noexcept]
```

The representation of a signaling Not a Number, if has\_signaling\_NaN.

### 6.733.3 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr], [inherited]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

Referenced by [std::generate\\_canonical\(\)](#), [std::independent\\_bits\\_engine<\\_RandomNumberEngine, \\_\\_w, \\_UIntType>::operator\(\)](#), and [std::linear\\_congruential\\_engine<\\_UIntType, \\_\\_a, \\_\\_c, \\_\\_m>::seed\(\)](#).

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr], [inherited]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr], [inherited]
```

See [std::float\\_denorm\\_style](#) for more information.

#### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr], [inherited]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

#### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr], [inherited]
```

True if the type has a representation for positive infinity.

#### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr], [inherited]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

#### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr], [inherited]
```

True if the type has a representation for a signaling Not a Number.

#### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr], [inherited]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

#### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr], [inherited]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

#### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr], [inherited]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr], [inherited]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr], [inherited]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range `[min(),max()]`, the value returned differs from the true value by an integer multiple of `max() - min() + 1`. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr], [inherited]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr], [inherited]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr], [inherited]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr], [inherited]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr], [inherited]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr], [inherited]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr], [inherited]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr], [inherited]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

Referenced by [std::generate\\_canonical\(\)](#).

### round\_style

`float_round_style` `std::__numeric_limits_base::round_style` [static], [constexpr], [inherited]

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

### tinyness\_before

`bool` `std::__numeric_limits_base::tinyness_before` [static], [constexpr], [inherited]

True if tininess is detected before rounding. (see IEC 559)

### traps

`bool` `std::__numeric_limits_base::traps` [static], [constexpr], [inherited]

True if trapping is implemented for this type.

The documentation for this struct was generated from the following file:

### 6.734.1 Detailed Description

numeric\_limits<bool> specialization.

### 6.734.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

#### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

#### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

#### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

#### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

#### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

#### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

#### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See std::float\_round\_style for more information. This is only meaningful for floating types; integer types will all be round\_toward\_zero.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.735.1 Detailed Description

numeric\_limits<char> specialization.

### 6.735.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

#### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

#### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

#### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

#### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

#### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

#### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

#### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See std::float\_round\_style for more information. This is only meaningful for floating types; integer types will all be round\_toward\_zero.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

#### 6.736.1 Detailed Description

numeric\_limits<char16\_t> specialization.

## 6.736.2 Member Data Documentation

### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See std::float\_round\_style for more information. This is only meaningful for floating types; integer types will all be round\_toward\_zero.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.737.1 Detailed Description

numeric\_limits<char32\_t> specialization.

### 6.737.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

#### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

#### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

#### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

#### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

#### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

#### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

#### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See std::float\_round\_style for more information. This is only meaningful for floating types; integer types will all be round\_toward\_zero.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See std::float\_round\_style for more information. This is only meaningful for floating types; integer types will all be round\_toward\_zero.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.739.1 Detailed Description

numeric\_limits<float> specialization.

### 6.739.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

#### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

#### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

#### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

#### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

#### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

#### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

#### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.740.1 Detailed Description

numeric\_limits<int> specialization.

### 6.740.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

#### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

#### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

#### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

#### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

#### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

#### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

#### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See std::float\_round\_style for more information. This is only meaningful for floating types; integer types will all be round\_toward\_zero.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.741.1 Detailed Description

numeric\_limits<long> specialization.

### 6.741.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

#### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

#### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

#### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

#### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

#### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

#### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

#### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See std::float\_round\_style for more information. This is only meaningful for floating types; integer types will all be round\_toward\_zero.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

The documentation for this struct was generated from the following file:

### 6.742.1 Detailed Description

numeric\_limits<long double> specialization.

### 6.742.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

#### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

#### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

#### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

#### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

#### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

#### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

#### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See std::float\_round\_style for more information. This is only meaningful for floating types; integer types will all be round\_toward\_zero.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.743.1 Detailed Description

numeric\_limits<long long> specialization.

### 6.743.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

#### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

#### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

#### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

#### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

#### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

#### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

#### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See std::float\_round\_style for more information. This is only meaningful for floating types; integer types will all be round\_toward\_zero.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.744.1 Detailed Description

numeric\_limits<short> specialization.

### 6.744.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

#### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

#### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

#### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

#### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

#### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

#### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

#### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]

### 6.745.1 Detailed Description

numeric\_limits<signed char> specialization.

## 6.745.2 Member Data Documentation

### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See std::float\_round\_style for more information. This is only meaningful for floating types; integer types will all be round\_toward\_zero.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

#### 6.746.1 Detailed Description

numeric\_limits<unsigned char> specialization.

## 6.746.2 Member Data Documentation

### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See std::float\_round\_style for more information. This is only meaningful for floating types; integer types will all be round\_toward\_zero.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.747.1 Detailed Description

numeric\_limits<unsigned int> specialization.

### 6.747.2 Member Data Documentation

#### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

#### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

#### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

#### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

#### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

#### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

#### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

#### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

#### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

#### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See std::float\_round\_style for more information. This is only meaningful for floating types; integer types will all be round\_toward\_zero.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.748.1 Detailed Description

numeric\_limits<unsigned long> specialization.

## 6.748.2 Member Data Documentation

### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See std::float\_round\_style for more information. This is only meaningful for floating types; integer types will all be round\_toward\_zero.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.749.1 Detailed Description

numeric\_limits<unsigned long long> specialization.

## 6.749.2 Member Data Documentation

### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See std::float\_round\_style for more information. This is only meaningful for floating types; integer types will all be round\_toward\_zero.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.750.1 Detailed Description

numeric\_limits<unsigned short> specialization.

## 6.750.2 Member Data Documentation

### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```

See std::float\_round\_style for more information. This is only meaningful for floating types; integer types will all be round\_toward\_zero.

**tinyness\_before**

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```

True if tininess is detected before rounding. (see IEC 559)

**traps**

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```

True if trapping is implemented for this type.

### 6.751.1 Detailed Description

numeric\_limits<wchar\_t> specialization.

## 6.751.2 Member Data Documentation

### digits

```
int std::__numeric_limits_base::digits [static], [constexpr]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

### digits10

```
int std::__numeric_limits_base::digits10 [static], [constexpr]
```

The number of base 10 digits that can be represented without change.

### has\_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
```

See `std::float_denorm_style` for more information.

### has\_denorm\_loss

```
bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

### has\_infinity

```
bool std::__numeric_limits_base::has_infinity [static], [constexpr]
```

True if the type has a representation for positive infinity.

### has\_quiet\_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

### has\_signaling\_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
```

True if the type has a representation for a signaling Not a Number.

### is\_bounded

```
bool std::__numeric_limits_base::is_bounded [static], [constexpr]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

### is\_exact

```
bool std::__numeric_limits_base::is_exact [static], [constexpr]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

### is\_iec559

```
bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

**is\_integer**

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`  
True if the type is integer.

**is\_modulo**

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`  
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or \* on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

**is\_signed**

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`  
True if the type is signed.

**is\_specialized**

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`  
This will be true for all fundamental types (which have specializations), and false for everything else.

**max\_digits10**

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`  
The number of base 10 digits required to ensure that values which differ are always differentiated.

**max\_exponent**

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`  
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

**max\_exponent10**

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`  
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

**min\_exponent**

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`  
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

**min\_exponent10**

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`  
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

**radix**

`int std::__numeric_limits_base::radix [static], [constexpr]`  
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

**round\_style**

`float_round_style` `std::__numeric_limits_base::round_style` [static], [constexpr]

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

**tinyness\_before**

`bool` `std::__numeric_limits_base::tinyness_before` [static], [constexpr]

True if tininess is detected before rounding. (see IEC 559)

**traps**

`bool` `std::__numeric_limits_base::traps` [static], [constexpr]

True if trapping is implemented for this type.

#### 6.752.1 Detailed Description

```
template<typename _CharT>
class std::numpunct<_CharT >
```

Primary class template numpunct.

This facet stores several pieces of information related to printing and scanning numbers, such as the decimal point character. It takes a template parameter specifying the char type. The numpunct facet is used by streams for many I/O operations involving numbers.

The numpunct template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from a numpunct facet.

## 6.752.2 Member Typedef Documentation

### char\_type

```
template<typename _CharT>
typedef _CharT std::numpunct<_CharT>::char_type
```

Public typedefs.

### string\_type

```
template<typename _CharT>
typedef basic_string<_CharT> std::numpunct<_CharT>::string_type
```

Public typedefs.

## 6.752.3 Constructor & Destructor Documentation

### numpunct() [1/3]

```
template<typename _CharT>
std::numpunct<_CharT>::numpunct (
    size_t __refs = 0) [inline], [explicit]
```

Numpunct constructor.

#### Parameters

|                     |                                     |
|---------------------|-------------------------------------|
| <code>__refs</code> | Refcount to pass to the base class. |
|---------------------|-------------------------------------|

References [std::locale::facet::facet\(\)](#).

### numpunct() [2/3]

```
template<typename _CharT>
std::numpunct<_CharT>::numpunct (
    __cache_type * __cache,
    size_t __refs = 0) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up the predefined locale facets.

#### Parameters

|                      |                                       |
|----------------------|---------------------------------------|
| <code>__cache</code> | <code>__numpunct_cache</code> object. |
| <code>__refs</code>  | Refcount to pass to the base class.   |

References [std::locale::facet::facet\(\)](#).

### numpunct() [3/3]

```
template<typename _CharT>
std::numpunct<_CharT>::numpunct (
    __c_locale __cloc,
    size_t __refs = 0) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

**Parameters**

|                     |                                     |
|---------------------|-------------------------------------|
| <code>__cloc</code> | The C locale.                       |
| <code>__refs</code> | RefCount to pass to the base class. |

References [std::locale::facet::facet\(\)](#).

**~numpunct()**

```
template<typename _CharT>
virtual std::numpunct< _CharT >::~~numpunct () [protected], [virtual]
Destructor.
```

**6.752.4 Member Function Documentation****decimal\_point()**

```
template<typename _CharT>
char\_type std::numpunct< _CharT >::decimal_point () const [inline]
Return decimal point character.
This function returns a char\_type to use as a decimal point. It does so by returning numpunct<char\_type>::do_decimal_point().
```

**Returns**

*[char\\_type](#)* representing a decimal point.

References [do\\_decimal\\_point\(\)](#).

**do\_decimal\_point()**

```
template<typename _CharT>
virtual char\_type std::numpunct< _CharT >::do_decimal_point () const [inline], [protected],
[virtual]
Return decimal point character.
Returns a char\_type to use as a decimal point. This function is a hook for derived classes to change the value returned.
```

**Returns**

*[char\\_type](#)* representing a decimal point.

Referenced by [decimal\\_point\(\)](#).

**do\_falsename()**

```
template<typename _CharT>
virtual string\_type std::numpunct< _CharT >::do_falsename () const [inline], [protected], [virtual]
Return string representation of bool false.
Returns a string\_type containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.
```

**Returns**

*[string\\_type](#)* representing printed form of false.

Referenced by [falsename\(\)](#).

### do\_grouping()

```
template<typename _CharT>
virtual string std::num_punct<_CharT>::do_grouping () const [inline], [protected], [virtual]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

#### See also

grouping() for details.

#### Returns

String representing grouping specification.

Referenced by [grouping\(\)](#).

### do\_thousands\_sep()

```
template<typename _CharT>
virtual char_type std::num_punct<_CharT>::do_thousands_sep () const [inline], [protected],
[virtual]
```

Return thousands separator character.

Returns a char\_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

#### Returns

*char\_type* representing a thousands separator.

Referenced by [thousands\\_sep\(\)](#).

### do\_truename()

```
template<typename _CharT>
virtual string_type std::num_punct<_CharT>::do_truename () const [inline], [protected], [virtual]
```

Return string representation of bool true.

Returns a string\_type containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

#### Returns

string\_type representing printed form of true.

Referenced by [truename\(\)](#).

### falsename()

```
template<typename _CharT>
string_type std::num_punct<_CharT>::false_name () const [inline]
```

Return string representation of bool false.

This function returns a string\_type containing the text representation for false bool variables. It does so by calling num\_punct<char\_type>::do\_false\_name().

#### Returns

string\_type representing printed form of false.

References [do\\_false\\_name\(\)](#).

**grouping()**

```
template<typename _CharT>
string std::num_punct<_CharT>::grouping () const [inline]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the `grouping()` returns `"\003\002"` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `"32"`, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `num_punct<char_type>::do_grouping()`.

**Returns**

string representing grouping specification.

References [do\\_grouping\(\)](#).

**thousands\_sep()**

```
template<typename _CharT>
char_type std::num_punct<_CharT>::thousands_sep () const [inline]
```

Return thousands separator character.

This function returns a `char_type` to use as a thousands separator. It does so by returning `num_punct<char_type>::do_thousands_sep()`.

**Returns**

`char_type` representing a thousands separator.

References [do\\_thousands\\_sep\(\)](#).

**true\_name()**

```
template<typename _CharT>
string_type std::num_punct<_CharT>::true_name () const [inline]
```

Return string representation of bool true.

This function returns a `string_type` containing the text representation for true bool variables. It does so by calling `num_punct<char_type>::do_true_name()`.

**Returns**

`string_type` representing printed form of true.

References [do\\_true\\_name\(\)](#).

**template<typename \_CharT>**  
**class std::numpunct\_byname< \_CharT >**

class numpunct\_byname [22.2.3.2].

### 6.753.2 Member Function Documentation

#### decimal\_point()

```
template<typename _CharT>
char_type std::numpunct< _CharT >::decimal_point () const [inline], [inherited]
```

Return decimal point character.

This function returns a char\_type to use as a decimal point. It does so by returning returning [numpunct<char\\_type>::do\\_decimal\\_point\(\)](#).

#### Returns

*char\_type* representing a decimal point.

References [do\\_decimal\\_point\(\)](#).

#### do\_decimal\_point()

```
template<typename _CharT>
virtual char_type std::numpunct< _CharT >::do_decimal_point () const [inline], [protected],
[virtual], [inherited]
```

Return decimal point character.

Returns a char\_type to use as a decimal point. This function is a hook for derived classes to change the value returned.

#### Returns

*char\_type* representing a decimal point.

Referenced by [decimal\\_point\(\)](#).

**do\_falsename()**

```
template<typename _CharT>
virtual string_type std::num_punct<_CharT>::do_falsename () const [inline], [protected], [virtual],
[inherited]
```

Return string representation of bool false.

Returns a string\_type containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

**Returns**

string\_type representing printed form of false.

Referenced by [falsename\(\)](#).

**do\_grouping()**

```
template<typename _CharT>
virtual string std::num_punct<_CharT>::do_grouping () const [inline], [protected], [virtual],
[inherited]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

**See also**

[grouping\(\)](#) for details.

**Returns**

String representing grouping specification.

Referenced by [grouping\(\)](#).

**do\_thousands\_sep()**

```
template<typename _CharT>
virtual char_type std::num_punct<_CharT>::do_thousands_sep () const [inline], [protected],
[virtual], [inherited]
```

Return thousands separator character.

Returns a char\_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

**Returns**

char\_type representing a thousands separator.

Referenced by [thousands\\_sep\(\)](#).

**do\_truename()**

```
template<typename _CharT>
virtual string_type std::num_punct<_CharT>::do_truename () const [inline], [protected], [virtual],
[inherited]
```

Return string representation of bool true.

Returns a string\_type containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

**Returns**

string\_type representing printed form of true.

Referenced by [truename\(\)](#).

**falsename()**

```
template<typename _CharT>
```

```
string_type std::num_punct< _CharT >::false_name () const [inline], [inherited]
```

Return string representation of bool false.

This function returns a string\_type containing the text representation for false bool variables. It does so by calling num\_punct<char\_type>::do\_false\_name().

**Returns**

string\_type representing printed form of false.

References [do\\_false\\_name\(\)](#).

**grouping()**

```
template<typename _CharT>
```

```
string std::num_punct< _CharT >::grouping () const [inline], [inherited]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns "\003\002" and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was "32", this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling num\_punct<char\_type>::do\_grouping().

**Returns**

string representing grouping specification.

References [do\\_grouping\(\)](#).

**thousands\_sep()**

```
template<typename _CharT>
```

```
char_type std::num_punct< _CharT >::thousands_sep () const [inline], [inherited]
```

Return thousands separator character.

This function returns a char\_type to use as a thousands separator. It does so by returning num\_punct<char\_type>::do\_thousands\_sep().

**Returns**

char\_type representing a thousands separator.

References [do\\_thousands\\_sep\(\)](#).

**true\_name()**

```
template<typename _CharT>
```

```
string_type std::num_punct< _CharT >::true_name () const [inline], [inherited]
```

Return string representation of bool true.

This function returns a string\_type containing the text representation for true bool variables. It does so by calling num\_punct<char\_type>::do\_true\_name().

**Returns**

string\_type representing printed form of true.

References [do\\_true\\_name\(\)](#).

### 6.758.1 Detailed Description

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
class std::ostream_iterator< _Tp, _CharT, _Traits >
```

Provides output iterator semantics for streams.

This class provides an iterator to write to an ostream. The type `Tp` is the only type written by this iterator and there must be an `operator<<(Tp)` defined.

### Template Parameters

|                      |                                        |
|----------------------|----------------------------------------|
| <code>_Tp</code>     | The type to write to the ostream.      |
| <code>_CharT</code>  | The ostream <code>char_type</code> .   |
| <code>_Traits</code> | The ostream <code>char_traits</code> . |

### 6.758.2 Member Typedef Documentation

#### `char_type`

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef _CharT std::ostream\_iterator< _Tp, _CharT, _Traits >::char_type
Public typedef.
```

#### `difference_type`

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
using std::ostream\_iterator< _Tp, _CharT, _Traits >::difference_type
Public typedef.
```

#### `iterator_category`

```
typedef output\_iterator\_tag std::iterator< output\_iterator\_tag, void, void, void, void >::↵
iterator_category [inherited]
One of the tag types.
```

**ostream\_type**

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef basic_ostream<_CharT, _Traits> std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_↵
type
Public typedef.
```

**pointer**

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::pointer [inherited]
This type represents a pointer-to-value_type.
```

**reference**

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::reference [inherited]
This type represents a reference-to-value_type.
```

**traits\_type**

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef _Traits std::ostream_iterator< _Tp, _CharT, _Traits >::traits_type
Public typedef.
```

**value\_type**

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type [inherited]
The type "pointed to" by the iterator.
```

**6.758.3 Constructor & Destructor Documentation****ostream\_iterator() [1/3]**

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
    ostream_type & __s) [inline], [noexcept]
```

Construct from an ostream.

References [std::\\_\\_addressof\(\)](#).

Referenced by [ostream\\_iterator\(\)](#).

**ostream\_iterator() [2/3]**

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
    ostream_type & __s,
    const _CharT * __c) [inline], [noexcept]
```

Construct from an ostream.

The delimiter string *c* is written to the stream after every *Tp* written to the stream. The delimiter is not copied, and thus must not be destroyed while this iterator is in use.

**Parameters**

|                                          |                                   |
|------------------------------------------|-----------------------------------|
| <a href="#">_↵</a><br><a href="#">_s</a> | Underlying ostream to write to.   |
| <a href="#">_↵</a><br><a href="#">_c</a> | CharT delimiter string to insert. |

References [std::\\_\\_addressof\(\)](#).

### ostream\_iterator() [3/3]

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
    const ostream_iterator< _Tp, _CharT, _Traits > & __obj) [inline], [noexcept]
```

Copy constructor.

References [ostream\\_iterator\(\)](#).

## 6.758.4 Member Function Documentation

### operator=()

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
ostream_iterator & std::ostream_iterator< _Tp, _CharT, _Traits >::operator= (
    const _Tp & __value) [inline]
```

Writes *value* to underlying ostream using operator<<. If constructed with delimiter string, writes delimiter to ostream.

The documentation for this class was generated from the following file:

- [stream\\_iterator.h](#)

## 6.759 std::experimental::fundamentals\_v2::ostream\_joiner<\_DelimT, \_CharT, \_Traits > Class Template Reference

## 6.760.1 Detailed Description

**template<typename \_CharT, typename \_Traits>**  
**class std::ostreambuf\_iterator< \_CharT, \_Traits >**

Provides output iterator semantics for streambufs.

## 6.760.2 Member Typedef Documentation

### char\_type

```
template<typename _CharT, typename _Traits>  
typedef _CharT std::ostreambuf\_iterator< _CharT, _Traits >::char_type  
Public typedefs.
```

### difference\_type

```
template<typename _CharT, typename _Traits>  
using std::ostreambuf\_iterator< _CharT, _Traits >::difference_type  
Public typedefs.
```

### iterator\_category

```
typedef output\_iterator\_tag std::iterator< output\_iterator\_tag, void, void, void, void >::↵  
iterator_category [inherited]  
One of the tag types.
```

### ostream\_type

```
template<typename _CharT, typename _Traits>  
typedef basic\_ostream<_CharT, _Traits> std::ostreambuf\_iterator< _CharT, _Traits >::ostream_type  
Public typedefs.
```

### pointer

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::pointer [inherited]  
This type represents a pointer-to-value_type.
```

### reference

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::reference [inherited]  
This type represents a reference-to-value_type.
```

**streambuf\_type**

```
template<typename _CharT, typename _Traits>
typedef basic_streambuf<_CharT, _Traits> std::ostreambuf_iterator< _CharT, _Traits >::streambuf←
_type
Public typedefs.
```

**traits\_type**

```
template<typename _CharT, typename _Traits>
typedef _Traits std::ostreambuf_iterator< _CharT, _Traits >::traits_type
Public typedefs.
```

**value\_type**

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type [inherited]
The type "pointed to" by the iterator.
```

**6.760.3 Constructor & Destructor Documentation****ostreambuf\_iterator() [1/2]**

```
template<typename _CharT, typename _Traits>
std::ostreambuf_iterator< _CharT, _Traits >::ostreambuf_iterator (
    ostream_type & __s) [inline], [noexcept]
```

Construct output iterator from ostream.

**ostreambuf\_iterator() [2/2]**

```
template<typename _CharT, typename _Traits>
std::ostreambuf_iterator< _CharT, _Traits >::ostreambuf_iterator (
    streambuf_type * __s) [inline], [noexcept]
```

Construct output iterator from streambuf.

**6.760.4 Member Function Documentation****failed()**

```
template<typename _CharT, typename _Traits>
bool std::ostreambuf_iterator< _CharT, _Traits >::failed () const [inline], [nodiscard], [noexcept]
```

Return true if previous operator=() failed.

Referenced by [std::basic\\_ostream<\\_CharT, \\_Traits>::operator<<\(\)](#).

**operator\*()**

```
template<typename _CharT, typename _Traits>
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator* () [inline], [nodiscard]
```

Return \*this.

**operator++() [1/2]**

```
template<typename _CharT, typename _Traits>
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator++ () [inline]
```

Return \*this.

**operator++()** [2/2]

```
template<typename _CharT, typename _Traits>
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator++ (
    int ) [inline]
```

Return \*this.

**operator=()**

```
template<typename _CharT, typename _Traits>
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator= (
    _CharT __c) [inline]
```

Write character to streambuf. Calls streambuf.sputc().

The documentation for this class was generated from the following files:

- iosfwd.h
- [streambuf\\_iterator.h](#)

**6.761 std::out\_of\_range Class Reference**

```
#include <stdexcept_except.h>
```

Inheritance diagram for std::out\_of\_range:

**Public Member Functions**

- **out\_of\_range** (const char \*)
- **out\_of\_range** (const out\_of\_range &)=default
- **out\_of\_range** (const [string](#) &\_\_arg)
- **out\_of\_range** (out\_of\_range &&)=default
- out\_of\_range & **operator=** (const out\_of\_range &)=default
- out\_of\_range & **operator=** (out\_of\_range &&)=default
- virtual const char \* **what** () const noexcept

### 6.761.1 Detailed Description

This represents an argument whose value is not within the expected range (e.g., boundary checks in `basic_string`).

### 6.761.2 Member Function Documentation

#### what()

```
virtual const char * std::logic_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future\\_error](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this class was generated from the following file:

- [stdexcept\\_except.h](#)

## 6.762 std::out\_ptr\_t< \_Smart, \_Pointer, \_Args > Class Template Reference

```
#include <>>
```

### Public Member Functions

- **out\_ptr\_t** (`_Smart &__smart, _Args... __args`)
- **out\_ptr\_t** (`const out_ptr_t &)=delete`
- **operator \_Pointer \*** (`() const noexcept`)
- **operator void \*\*** (`() const noexcept`)

### Friends

- `template<typename, typename, typename...>`  
`class inout_ptr_t`

### 6.762.1 Detailed Description

```
template<typename _Smart, typename _Pointer, typename... _Args>
```

```
class std::out_ptr_t< _Smart, _Pointer, _Args >
```

Smart pointer adaptor for functions taking an output pointer parameter.

### Template Parameters

|                       |                                                       |
|-----------------------|-------------------------------------------------------|
| <code>_Smart</code>   | The type of pointer to adapt.                         |
| <code>_Pointer</code> | The type of pointer to convert to.                    |
| <code>_Args...</code> | Argument types used when resetting the smart pointer. |

Since

C++23

The documentation for this class was generated from the following file:

### 6.764.1 Detailed Description

**template<typename Key, typename Mapped, typename Cmp\_Fn, typename Node\_And\_It\_Traits, typename \_↵ Alloc>**

**class \_\_gnu\_pbds::detail::ov\_tree\_map< Key, Mapped, Cmp\_Fn, Node\_And\_It\_Traits, \_Alloc >**

Ordered-vector tree associative-container.

### 6.764.2 Member Function Documentation

#### **node\_begin()** [1/2]

**template<typename Key, typename Mapped, typename Cmp\_Fn, typename Node\_And\_It\_Traits, typename \_↵ Alloc>**

ov\_tree\_map< Key, Mapped, Cmp\_Fn, Node\_And\_It\_Traits, \_Alloc >::node\_iterator **\_\_gnu\_pbds::detail::ov\_tree\_map< Key, Mapped, Cmp\_Fn, Node\_And\_It\_Traits, \_Alloc >::node\_begin ()** [inline]

Returns a node\_iterator corresponding to the node at the root of the tree.

#### **node\_begin()** [2/2]

**template<typename Key, typename Mapped, typename Cmp\_Fn, typename Node\_And\_It\_Traits, typename \_↵ Alloc>**

ov\_tree\_map< Key, Mapped, Cmp\_Fn, Node\_And\_It\_Traits, \_Alloc >::node\_const\_iterator **\_\_gnu\_pbds::detail::ov\_tree\_map< Key, Mapped, Cmp\_Fn, Node\_And\_It\_Traits, \_Alloc >::node\_begin () const** [inline]

Returns a const node\_iterator corresponding to the node at the root of the tree.

#### **node\_end()** [1/2]

**template<typename Key, typename Mapped, typename Cmp\_Fn, typename Node\_And\_It\_Traits, typename \_↵ Alloc>**

ov\_tree\_map< Key, Mapped, Cmp\_Fn, Node\_And\_It\_Traits, \_Alloc >::node\_iterator **\_\_gnu\_pbds::detail::ov\_tree\_map< Key, Mapped, Cmp\_Fn, Node\_And\_It\_Traits, \_Alloc >::node\_end ()** [inline]

Returns a node\_iterator corresponding to a node just after a leaf of the tree.

## node\_end() [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
```

```
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::ov_tree_r
```

```
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end () const [inline]
```

Returns a const node\_iterator corresponding to a node just after a leaf of the tree.

The documentation for this class was generated from the following file:

- [ov\\_tree\\_map\\_.hpp](#)

## 6.765 `__gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc >` Class Template Reference

static Ptr **mid\_pointer** (Ptr p\_begin, Ptr p\_end)

#### 6.765.1 Detailed Description

```
template<typename Value_Type, typename Metadata_Type, typename _Alloc>
class __gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc >
```

Const node reference.

#### 6.765.2 Member Function Documentation

##### **get\_l\_child()**

```
template<typename Value_Type, typename Metadata_Type, typename _Alloc>
this_type __gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc >::get_l_↵
l_child () const [inline]
```

Returns the node iterator associated with the left node.

##### **get\_r\_child()**

```
template<typename Value_Type, typename Metadata_Type, typename _Alloc>
this_type __gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc >::get_↵
r_child () const [inline]
```

Returns the node iterator associated with the right node.

The documentation for this class was generated from the following file:

- [ov\\_tree\\_map\\_/node\\_iterators.hpp](#)

## 6.766 `__gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >` Class Template Reference

- `bool` **operator()** (`const _Tp1 &__lhs`, `const _Tp &__rhs`) `const` `noexcept`

### 6.770.1 Detailed Description

```
template<typename _Tp>
struct std::experimental::fundamentals_v2::owner_less<shared_ptr<_Tp>>
```

Partial specialization of `owner_less` for `shared_ptr`.

### 6.770.2 Member Typedef Documentation

#### `first_argument_type`

```
typedef _Tp std::binary\_function<_Tp, _Tp, bool>::first_argument_type [inherited]
first_argument_type is the type of the first argument
```

#### `result_type`

```
typedef bool std::binary\_function<_Tp, _Tp, bool>::result_type [inherited]
result_type is the return type
```

#### `second_argument_type`

```
typedef _Tp std::binary\_function<_Tp, _Tp, bool>::second_argument_type [inherited]
second_argument_type is the type of the second argument
```

The documentation for this struct was generated from the following file:

### 6.776.1 Detailed Description

```
template<typename _T1, typename _T2>
struct __gnu_cxx::pair<_T1, _T2>
```

Struct holding two objects (or references) of arbitrary type.

## Template Parameters

|                  |                                         |
|------------------|-----------------------------------------|
| <code>_T1</code> | Type of the <code>first</code> member.  |
| <code>_T2</code> | Type of the <code>second</code> member. |

<https://gcc.gnu.org/onlinedocs/libstdc++/manual/utilities.html>

### 6.776.2 Member Typedef Documentation

#### `first_type`

```
template<typename _T1, typename _T2>
typedef _T1 std::pair<_T1, _T2>::first_type
```

The type of the `first` member.

#### `second_type`

```
template<typename _T1, typename _T2>
typedef _T2 std::pair<_T1, _T2>::second_type
```

The type of the `second` member.

### 6.776.3 Constructor & Destructor Documentation

#### `pair()` [1/2]

```
template<typename _T1, typename _T2>
std::pair<_T1, _T2>::pair (
    const pair<_T1, _T2> & ) [constexpr], [default]
```

Copy constructor.

**pair()** [2/2]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::pair (
    pair< _T1, _T2 > && ) [constexpr], [default]
```

Move constructor.

**6.776.4 Member Function Documentation****explicit()** [1/7]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
_U2 &&constexpr std::pair< _T1, _T2 >::explicit (
    !_S_convertible< _U1 &, _U2 & > ()) [constexpr]
```

Converting constructor from a non-const pair<U1, U2> lvalue.

**explicit()** [2/7]

```
template<typename _T1, typename _T2>
template<typename _U1 = _T1, typename _U2 = _T2>
std::pair< _T1, _T2 >::explicit (
    !_S_convertible< _U1, _U2 > ()) && [constexpr]
```

Constructor accepting two values of arbitrary types.

**explicit()** [3/7]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
_U2 &constexpr std::pair< _T1, _T2 >::explicit (
    !_S_convertible< _U1, _U2 > ()) [constexpr]
```

Converting constructor from a non-const pair<U1, U2> rvalue.

**explicit()** [4/7]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::explicit (
    !_S_convertible< const _T1 &, const _T2 & > ()) const & [constexpr]
```

Constructor accepting lvalues of first\_type and second\_type.

**explicit()** [5/7]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
_U2 &&constexpr std::pair< _T1, _T2 >::explicit (
    !_S_convertible< const _U1 &, const _U2 & > ()) const [constexpr]
```

Converting constructor from a const pair<U1, U2> lvalue.

**explicit()** [6/7]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
_U2 &constexpr std::pair< _T1, _T2 >::explicit (
    !_S_convertible< const _U1, const _U2 > ()) const [constexpr]
```

Converting constructor from a const pair<U1, U2> rvalue.

**explicit()** [7/7]

```
template<typename _T1, typename _T2>
std::pair<_T1, _T2>::explicit (
    __not_< __and_< __is_implicitly_default_constructible<_T1>, __is_implicitly_↵
default_constructible<_T2> > > ()) [inline], [constexpr], [noexcept]
Default constructor.
```

**operator=()** [1/8]

```
template<typename _T1, typename _T2>
const pair & std::pair<_T1, _T2>::operator= (
    const pair<_T1, _T2> & __p) const [inline], [constexpr]
Copy assignment operator (const).
```

**operator=()** [2/8]

```
template<typename _T1, typename _T2>
pair & std::pair<_T1, _T2>::operator= (
    const pair<_T1, _T2> & __p) [inline], [constexpr], [noexcept]
Copy assignment operator.
```

**operator=()** [3/8]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_const_assignable<const _U1&, const _U2&>())
const pair & std::pair<_T1, _T2>::operator= (
    const pair<_U1, _U2> & __p) const [inline], [constexpr]
Converting assignment from a const pair<U1, U2> lvalue.
```

**operator=()** [4/8]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_assignable<const _U1&, const _U2&>())
pair & std::pair<_T1, _T2>::operator= (
    const pair<_U1, _U2> & __p) [inline], [constexpr], [noexcept]
Converting assignment from a const pair<U1, U2> lvalue.
```

**operator=()** [5/8]

```
template<typename _T1, typename _T2>
const pair & std::pair<_T1, _T2>::operator= (
    pair<_T1, _T2> && __p) const [inline], [constexpr]
Move assignment operator (const).
```

**operator=()** [6/8]

```
template<typename _T1, typename _T2>
pair & std::pair<_T1, _T2>::operator= (
    pair<_T1, _T2> && __p) [inline], [constexpr], [noexcept]
Move assignment operator.
```

**operator=()** [7/8]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_const_assignable<_U1, _U2>())
const pair & std::pair< _T1, _T2 >::operator= (
    pair< _U1, _U2 > && __p) const [inline], [constexpr]
```

Converting assignment from a non-const pair<U1, U2> rvalue.

**operator=()** [8/8]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_assignable<_U1, _U2>())
pair & std::pair< _T1, _T2 >::operator= (
    pair< _U1, _U2 > && __p) [inline], [constexpr], [noexcept]
```

Converting assignment from a non-const pair<U1, U2> rvalue.

**swap()**

```
template<typename _T1, typename _T2>
void std::pair< _T1, _T2 >::swap (
    pair< _T1, _T2 > & __p) [inline], [constexpr], [noexcept]
```

Swap the first members and then the second members.

**6.776.5 Member Data Documentation****first**

```
template<typename _T1, typename _T2>
_T1 std::pair< _T1, _T2 >::first
The first member.
```

**second**

```
template<typename _T1, typename _T2>
_T2 std::pair< _T1, _T2 >::second
The second member.
```

The documentation for this struct was generated from the following files:

- [bits/stl\\_iterator.h](#)
- [stl\\_pair.h](#)
- [tuple](#)

**6.777 std::pair< \_T1, \_T2 > Struct Template Reference**

### 6.777.1 Detailed Description

`template<typename _T1, typename _T2>`

`struct std::pair< _T1, _T2 >`

Struct holding two objects (or references) of arbitrary type.

### Template Parameters

|                  |                                   |
|------------------|-----------------------------------|
| <code>_T1</code> | Type of the <i>first</i> member.  |
| <code>_T2</code> | Type of the <i>second</i> member. |

<https://gcc.gnu.org/onlinedocs/libstdc++/manual/utilities.html>

### 6.777.2 Member Typedef Documentation

#### first\_type

```
template<typename _T1, typename _T2>
typedef _T1 std::pair< _T1, _T2 >::first_type
```

The type of the first member.

#### second\_type

```
template<typename _T1, typename _T2>
typedef _T2 std::pair< _T1, _T2 >::second_type
```

The type of the second member.

### 6.777.3 Constructor & Destructor Documentation

#### pair() [1/2]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::pair (
    const pair< _T1, _T2 > & ) [constexpr], [default]
```

Copy constructor.

Referenced by [pair\(\)](#).

#### pair() [2/2]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::pair (
    pair< _T1, _T2 > && ) [constexpr], [default]
```

Move constructor.

### 6.777.4 Member Function Documentation

#### explicit() [1/7]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
_U2 &&constexpr std::pair< _T1, _T2 >::explicit (
    !_S_convertible< _U1 &, _U2 & > ()) [constexpr]
```

Converting constructor from a non-const pair<U1, U2> lvalue.

#### explicit() [2/7]

```
template<typename _T1, typename _T2>
template<typename _U1 = _T1, typename _U2 = _T2>
std::pair< _T1, _T2 >::explicit (
    !_S_convertible< _U1, _U2 > ()) && [constexpr]
```

Constructor accepting two values of arbitrary types.

#### explicit() [3/7]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
_U2 &constexpr std::pair< _T1, _T2 >::explicit (
    !_S_convertible< _U1, _U2 > ()) [constexpr]
```

Converting constructor from a non-const pair<U1, U2> rvalue.

**explicit()** [4/7]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::explicit (
    !_S_convertible< const _T1 &, const _T2 & > ()) const & [constexpr]
```

Constructor accepting lvalues of first\_type and second\_type.

**explicit()** [5/7]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
_U2 &&constexpr std::pair< _T1, _T2 >::explicit (
    !_S_convertible< const _U1 &, const _U2 & > ()) const [constexpr]
```

Converting constructor from a const pair<U1, U2> lvalue.

**explicit()** [6/7]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
_U2 &constexpr std::pair< _T1, _T2 >::explicit (
    !_S_convertible< const _U1, const _U2 > ()) const [constexpr]
```

Converting constructor from a const pair<U1, U2> rvalue.

**explicit()** [7/7]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::explicit (
    __not_< __and_< __is_implicitly_default_constructible< _T1 >, __is_implicitly_↵
default_constructible< _T2 > > > ()) [inline], [constexpr], [noexcept]
```

Default constructor.

**operator=()** [1/8]

```
template<typename _T1, typename _T2>
const pair & std::pair< _T1, _T2 >::operator= (
    const pair< _T1, _T2 > & __p) const [inline], [constexpr]
```

Copy assignment operator (const).

**operator=()** [2/8]

```
template<typename _T1, typename _T2>
pair & std::pair< _T1, _T2 >::operator= (
    const pair< _T1, _T2 > & __p) [inline], [constexpr], [noexcept]
```

Copy assignment operator.

**operator=()** [3/8]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_const_assignable<const _U1&, const _U2&>())
const pair & std::pair< _T1, _T2 >::operator= (
    const pair< _U1, _U2 > & __p) const [inline], [constexpr]
```

Converting assignment from a const pair<U1, U2> lvalue.

**operator=()** [4/8]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_assignable<const _U1&, const _U2&>())
pair & std::pair<_T1, _T2>::operator= (
    const pair<_U1, _U2> & __p) [inline], [constexpr], [noexcept]
```

Converting assignment from a const pair<U1, U2> lvalue.

**operator=()** [5/8]

```
template<typename _T1, typename _T2>
const pair & std::pair<_T1, _T2>::operator= (
    pair<_T1, _T2> && __p) const [inline], [constexpr]
```

Move assignment operator (const).

**operator=()** [6/8]

```
template<typename _T1, typename _T2>
pair & std::pair<_T1, _T2>::operator= (
    pair<_T1, _T2> && __p) [inline], [constexpr], [noexcept]
```

Move assignment operator.

**operator=()** [7/8]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_const_assignable<_U1, _U2>())
const pair & std::pair<_T1, _T2>::operator= (
    pair<_U1, _U2> && __p) const [inline], [constexpr]
```

Converting assignment from a non-const pair<U1, U2> rvalue.

**operator=()** [8/8]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_assignable<_U1, _U2>())
pair & std::pair<_T1, _T2>::operator= (
    pair<_U1, _U2> && __p) [inline], [constexpr], [noexcept]
```

Converting assignment from a non-const pair<U1, U2> rvalue.

**swap()**

```
template<typename _T1, typename _T2>
void std::pair<_T1, _T2>::swap (
    pair<_T1, _T2> & __p) [inline], [constexpr], [noexcept]
```

Swap the first members and then the second members.

Referenced by `std::pair<const __iter_key_t<_InputIterator>, __iter_val_t<_InputIterator>>::swap()`, `std::sub_match<const char*>` and `std::swap()`.

**6.777.5 Member Data Documentation****first**

```
template<typename _T1, typename _T2>
_T1 std::pair<_T1, _T2>::first
```

The first member.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_find\\_template\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_find\\_template\(\)](#), [std::set< \\_Key, \\_Cmp, polymorphic\\_allocator< \\_Key > >::operator<=>\(\)](#), [std::pair< const \\_\\_iter\\_key\\_t< \\_InputIterator >, \\_\\_iter\\_val\\_t< \\_InputIterator > >::operator<=>\(\)](#), [std::pair< const \\_\\_iter\\_key\\_t< \\_InputIterator >, \\_\\_iter\\_val\\_t< \\_InputIterator > >::operator==\(\)](#), and [std::shuffle\(\)](#).

## second

```
template<typename _T1, typename _T2>
_T2 std::pair< \_T1, \_T2 >::second
```

The second member.

Referenced by [std::set< \\_Key, \\_Cmp, polymorphic\\_allocator< \\_Key > >::insert\(\)](#), [std::pair< const \\_\\_iter\\_key\\_t< \\_InputIterator >, \\_\\_iter\\_val\\_t< \\_InputIterator > >::operator<=>\(\)](#), [std::pair< const \\_\\_iter\\_key\\_t< \\_InputIterator >, \\_\\_iter\\_val\\_t< \\_InputIterator > >::operator==\(\)](#), and [std::shuffle\(\)](#).

#### 6.778.1 Detailed Description

```
template<typename Value_Type, typename Cmp_Fn, typename _Alloc>
class __gnu_pbds::detail::pairing_heap< Value_Type, Cmp_Fn, _Alloc >
```

Pairing heap.

The documentation for this class was generated from the following file:

- [pairing\\_heap.hpp](#)

#### 6.779 \_\_gnu\_pbds::pairing\_heap\_tag Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for \_\_gnu\_pbds::pairing\_heap\_tag:

#### 6.779.1 Detailed Description

Pairing-heap.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

#### 6.780 \_\_gnu\_parallel::parallel\_tag Struct Reference

```
#include <tags.h>
```

Inheritance diagram for \_\_gnu\_parallel::parallel\_tag:

### Public Member Functions

- [parallel\\_tag](#) ()
- [parallel\\_tag](#) ([\\_ThreadIndex](#) \_\_num\_threads)
- [\\_ThreadIndex](#) [\\_\\_get\\_num\\_threads](#) ()

- void [set\\_num\\_threads](#) ([\\_ThreadIndex](#) \_\_num\_threads)

### 6.780.1 Detailed Description

Recommends parallel execution at compile time, optionally using a user-specified number of threads.

### 6.780.2 Constructor & Destructor Documentation

#### **parallel\_tag()** [1/2]

```
__gnu_parallel::parallel_tag::parallel_tag () [inline]
```

Default constructor. Use default number of threads.

#### **parallel\_tag()** [2/2]

```
__gnu_parallel::parallel_tag::parallel_tag (  
    \_ThreadIndex __num_threads) [inline]
```

Default constructor. Recommend number of threads to use.

#### Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

### 6.780.3 Member Function Documentation

#### **\_\_get\_num\_threads()**

```
\_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline]
```

Find out desired number of threads.

#### Returns

Desired number of threads.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), and [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#)

#### **set\_num\_threads()**

```
void __gnu_parallel::parallel_tag::set_num_threads (  
    \_ThreadIndex __num_threads) [inline]
```

Set the desired number of threads.

#### Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

- void **value\_swap** (pat\_trie\_map< Key, Mapped, Node\_And\_It\_Traits, \_Alloc > &)

### 6.802.1 Detailed Description

template<typename Key, typename Mapped, typename Node\_And\_It\_Traits, typename \_Alloc>  
class **\_\_gnu\_pbds::detail::pat\_trie\_map**< Key, Mapped, Node\_And\_It\_Traits, \_Alloc >

PATRICIA trie.

This implementation loosely borrows ideas from: 1) Fast Mergeable Integer Maps, Okasaki, Gill 1998 2) Ptsset: Sets of integers implemented as Patricia trees, Jean-Christophe Filliatr, 2000

### 6.802.2 Member Enumeration Documentation

#### node\_type

enum **\_\_gnu\_pbds::detail::pat\_trie\_base::node\_type** [inherited]

Three types of nodes.

i\_node is used by \_Inode, leaf\_node by \_Leaf, and head\_node by \_Head.

### 6.802.3 Member Function Documentation

#### node\_begin() [1/2]

template<typename Key, typename Mapped, typename Node\_And\_It\_Traits, typename \_Alloc>  
pat\_trie\_map< Key, Mapped, Node\_And\_It\_Traits, \_Alloc >::node\_iterator **\_\_gnu\_pbds::detail::pat\_trie\_map**<  
Key, Mapped, Node\_And\_It\_Traits, \_Alloc >::node\_begin () [inline]

Returns a node\_iterator corresponding to the node at the root of the tree.

**node\_begin()** [2/2]

```
template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_begin () const [inline]
```

Returns a const node\_iterator corresponding to the node at the root of the tree.

**node\_end()** [1/2]

```
template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_end () [inline]
```

Returns a node\_iterator corresponding to a node just after a leaf of the tree.

**node\_end()** [2/2]

```
template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_end () const [inline]
```

Returns a const node\_iterator corresponding to a node just after a leaf of the tree.

The documentation for this class was generated from the following file:

- [pat\\_trie\\_.hpp](#)

**6.803 \_\_gnu\_pbds::pat\_trie\_tag Struct Reference**

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for `__gnu_pbds::pat_trie_tag`:

### 6.803.1 Detailed Description

PATRICIA trie.

The documentation for this struct was generated from the following file:

#### 6.805.1 Detailed Description

A filesystem path.

Since

C++17

#### 6.805.2 Member Enumeration Documentation

##### format

enum **std::filesystem::path::format** : unsigned char  
path::format is ignored in this implementation

### 6.805.3 Friends And Related Symbol Documentation

#### **operator/**

```
path operator/ (
    const path & __lhs,
    const path & __rhs) [friend]
```

Append one path to another.

#### **operator<<**

```
template<typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const path & __p) [friend]
```

Write a path to a stream.

#### **operator<=>**

```
strong_ordering operator<=> (
    const path & __lhs,
    const path & __rhs) [friend]
```

Compare paths.

#### **operator==**

```
bool operator== (
    const path & __lhs,
    const path & __rhs) [friend]
```

Compare paths.

#### **operator>>**

```
template<typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    path & __p) [friend]
```

Read a path from a stream.

#### 6.806.1 Detailed Description

**template<typename \_UIntType, size\_t \_\_w, size\_t \_\_n, size\_t \_\_r, \_UIntType... \_\_consts>**  
**class std::philox\_engine< \_UIntType, \_\_w, \_\_n, \_\_r, \_\_consts >**

A discrete pseudorandom number generator with weak cryptographic properties.

This algorithm was designed to be used for highly parallel random number generation, and is capable of immensely long periods. It provides "Crush-resistance", denoting an ability to pass the TestU01 Suite's "Big Crush" test, demonstrating significant apparent entropy.

It is not intended for cryptographic use and should not be used for such, despite being based on cryptographic primitives. The typedefs `philox4x32` and `philox4x64` are provided as suitable defaults for most use cases, providing high-quality random numbers with reasonable performance.

This algorithm was created by John Salmon, Mark Moraes, Ron Dror, and David Shaw as a product of D.E. Shaw Research.

### Template Parameters

|                  |             |
|------------------|-------------|
| <code>__w</code> | Word size   |
| <code>__n</code> | Buffer size |

|                       |                                                                                                                                      |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <code>__r</code>      | Rounds                                                                                                                               |
| <code>__consts</code> | Multiplication and round constant pack, ordered as $M_{\{0\}}, C_{\{0\}}, M_{\{1\}}, C_{\{1\}}, \dots, M_{\{N/2-1\}}, C_{\{N/2-1\}}$ |

Since

C++26

## 6.806.2 Constructor & Destructor Documentation

### `philox_engine()`

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType... __consts>
template<typename _Sseq>
std::philox_engine< _UIntType, __w, __n, __r, __consts >::philox_engine (
    _Sseq & __q) [inline], [explicit]
seed sequence constructor for philox_engine
```

#### Parameters

|                  |                   |
|------------------|-------------------|
| <code>__q</code> | the seed sequence |
|------------------|-------------------|

## 6.806.3 Member Function Documentation

### `discard()`

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType... __consts>
void std::philox_engine< _UIntType, __w, __n, __r, __consts >::discard (
    unsigned long long __z) [inline]
discards __z numbers
```

#### Parameters

|                  |                                 |
|------------------|---------------------------------|
| <code>__z</code> | number of iterations to discard |
|------------------|---------------------------------|

### `max()`

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType... __consts>
constexpr result_type std::philox_engine< _UIntType, __w, __n, __r, __consts >::max () [inline],
[static], [constexpr]
```

The maximum value that this engine can return.

Referenced by `std::philox_engine< uint_fast32_t, 32, 4, 10, 0xCD9E8D57, 0x9E3779B9, 0xD2511F53, 0xBB67AE85 >::operator>>`, and `std::philox_engine< uint_fast32_t, 32, 4, 10, 0xCD9E8D57, 0x9E3779B9, 0xD2511F53, 0xBB67AE85 >::set__counter()`.

**min()**

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType... __consts>
constexpr result_type std::philox_engine< _UIntType, __w, __n, __r, __consts >::min () [inline],
[static], [constexpr]
```

The minimum value that this engine can return.

**operator>()()**

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType... __consts>
result_type std::philox_engine< _UIntType, __w, __n, __r, __consts >::operator() () [inline]
```

outputs a single w-bit number and handles state advancement

**Returns**

return\_type

**seed()**

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType... __consts>
requires __is_seed_seq<_Sseq>
template<typename _Sseq>
requires __is_seed_seq<_Sseq>
void std::philox_engine< _UIntType, __w, __n, __r, __consts >::seed (
    _Sseq & __q)
```

seeds philox\_engine by seed sequence

**Parameters**

|                  |                   |
|------------------|-------------------|
| <code>__q</code> | the seed sequence |
|------------------|-------------------|

References [std::max\(\)](#).

**set\_counter()**

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType... __consts>
void std::philox_engine< _UIntType, __w, __n, __r, __consts >::set_counter (
    const array< result_type, __n > & __counter) [inline]
```

sets the internal counter "cleartext"

**Parameters**

|                        |                     |
|------------------------|---------------------|
| <code>__counter</code> | std::array of len N |
|------------------------|---------------------|

**6.806.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType... __consts>
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & operator<< (
    basic_ostream< _CharT, _Traits > & __os,
    const philox_engine< _UIntType, __w, __n, __r, __consts > & __x) [friend]
```

outputs the state of the generator

#### Parameters

|                   |                                               |
|-------------------|-----------------------------------------------|
| <code>__os</code> | An output stream.                             |
| <code>__x</code>  | A <code>philox_engine</code> object reference |

#### Returns

the state of the Philox Engine in `__os`

#### `operator==`

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType... __consts>
bool operator== (
    const philox_engine< _UIntType, __w, __n, __r, __consts > & ,
    const philox_engine< _UIntType, __w, __n, __r, __consts > & ) [friend]
```

compares two `philox_engine` objects

#### Returns

true if the objects will produce an identical stream, false otherwise

#### `operator>>`

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType... __consts>
template<typename _CharT, typename _Traits>
basic_istream< _CharT, _Traits > & operator>> (
    basic_istream< _CharT, _Traits > & __is,
    philox_engine< _UIntType, __w, __n, __r, __consts > & __x) [friend]
```

takes input to set the state of the `philox_engine` object

#### Parameters

|                   |                                               |
|-------------------|-----------------------------------------------|
| <code>__is</code> | An input stream.                              |
| <code>__x</code>  | A <code>philox_engine</code> object reference |

#### Returns

`philox_engine` object is set with values from instream

### 6.807.1 Detailed Description

**template<typename \_RealType = double>**  
**class** [std::piecewise\\_constant\\_distribution](#)<\_RealType>

A [piecewise\\_constant\\_distribution](#) random number distribution.

This distribution produces random numbers  $x, b_0 \leq x < b_n$ , uniformly distributed over each subinterval  $[b_i, b_{i+1})$  according to the probability mass function

$$p(x|b_0, \dots, b_n, \rho_0, \dots, \rho_{n-1}) = \rho_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}$$

for  $b_i \leq x < b_{i+1}$ .

Since

C++11

### 6.807.2 Member Typedef Documentation

#### result\_type

```
template<typename _RealType = double>
typedef _RealType std::piecewise\_constant\_distribution< _RealType >::result_type
```

The type of the range of the distribution.

### 6.807.3 Member Function Documentation

#### densities()

```
template<typename _RealType = double>
std::vector< result\_type > std::piecewise\_constant\_distribution< _RealType >::densities () const
[inline]
```

Returns a vector of the probability densities.

#### intervals()

```
template<typename _RealType = double>
std::vector< result\_type > std::piecewise\_constant\_distribution< _RealType >::intervals () const
[inline]
```

Returns a vector of the intervals.

#### max()

```
template<typename _RealType = double>
result\_type std::piecewise\_constant\_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### min()

```
template<typename _RealType = double>
result\_type std::piecewise\_constant\_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

#### operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result\_type std::piecewise\_constant\_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

**param()** [1/2]

```
template<typename _RealType = double>
param_type std::piecewise_constant_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

**param()** [2/2]

```
template<typename _RealType = double>
void std::piecewise_constant_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _RealType = double>
void std::piecewise_constant_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

**6.807.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::piecewise_constant_distribution< _RealType1 > & __x) [friend]
```

Inserts a piecewise\_constant\_distribution random number distribution `__x` into the output stream `__os`.

**Parameters**

|                   |                                                               |
|-------------------|---------------------------------------------------------------|
| <code>__os</code> | An output stream.                                             |
| <code>__x</code>  | A piecewise_constant_distribution random number distribution. |

**Returns**

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _RealType = double>
bool operator== (
    const piecewise_constant_distribution< _RealType > & __d1,
    const piecewise_constant_distribution< _RealType > & __d2) [friend]
```

Return true if two piecewise constant distributions have the same parameters.

**operator>>**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::piecewise_constant_distribution< _RealType1 > & __x) [friend]
```

Extracts a `piecewise_constant_distribution` random number distribution `__x` from the input stream `__is`.

**Parameters**

|                   |                                                                                |
|-------------------|--------------------------------------------------------------------------------|
| <code>__is</code> | An input stream.                                                               |
| <code>__x</code>  | A <code>piecewise_constant_distribution</code> random number generator engine. |

**Returns**

The input stream with `__x` extracted or in an error state.

## 6.809.1 Detailed Description

**template<typename \_RealType = double>**  
**class std::piecewise\_linear\_distribution<\_RealType>**

A [piecewise\\_linear\\_distribution](#) random number distribution.

This distribution produces random numbers  $x$ ,  $b_0 \leq x < b_n$ , distributed over each subinterval  $[b_i, b_{i+1})$  according to the probability mass function  $p(x|b_0, \dots, b_n, \rho_0, \dots, \rho_n) = \rho_i$ , for  $b_i \leq x < b_{i+1}$ .

Since

C++11

## 6.809.2 Member Typedef Documentation

### result\_type

template<typename \_RealType = double>  
typedef \_RealType [std::piecewise\\_linear\\_distribution< \\_RealType >::result\\_type](#)  
The type of the range of the distribution.

### 6.809.3 Member Function Documentation

#### **densities()**

```
template<typename _RealType = double>
std::vector< result_type > std::piecewise_linear_distribution< _RealType >::densities () const
[inline]
```

Return a vector of the probability densities of the distribution.

#### **intervals()**

```
template<typename _RealType = double>
std::vector< result_type > std::piecewise_linear_distribution< _RealType >::intervals () const
[inline]
```

Return the intervals of the distribution.

#### **max()**

```
template<typename _RealType = double>
result_type std::piecewise_linear_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### **min()**

```
template<typename _RealType = double>
result_type std::piecewise_linear_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

#### **operator()()**

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::piecewise_linear_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)\(\)](#).

#### **param()** [1/2]

```
template<typename _RealType = double>
param_type std::piecewise_linear_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

#### **param()** [2/2]

```
template<typename _RealType = double>
void std::piecewise_linear_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

#### **Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _RealType = double>
void std::piecewise_linear_distribution<_RealType>::reset () [inline]
```

Resets the distribution state.

**6.809.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream<_CharT, _Traits> & operator<< (
    std::basic_ostream<_CharT, _Traits> & __os,
    const std::piecewise_linear_distribution<_RealType1> & __x) [friend]
```

Inserts a piecewise\_linear\_distribution random number distribution \_\_x into the output stream \_\_os.

**Parameters**

|                   |                                                             |
|-------------------|-------------------------------------------------------------|
| <code>__os</code> | An output stream.                                           |
| <code>__x</code>  | A piecewise_linear_distribution random number distribution. |

**Returns**

The output stream with the state of \_\_x inserted or in an error state.

**operator==**

```
template<typename _RealType = double>
bool operator== (
    const piecewise_linear_distribution<_RealType> & __d1,
    const piecewise_linear_distribution<_RealType> & __d2) [friend]
```

Return true if two piecewise linear distributions have the same parameters.

**operator>>**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream<_CharT, _Traits> & operator>> (
    std::basic_istream<_CharT, _Traits> & __is,
    std::piecewise_linear_distribution<_RealType1> & __x) [friend]
```

Extracts a piecewise\_linear\_distribution random number distribution \_\_x from the input stream \_\_is.

**Parameters**

|                   |                                                                 |
|-------------------|-----------------------------------------------------------------|
| <code>__is</code> | An input stream.                                                |
| <code>__x</code>  | A piecewise_linear_distribution random number generator engine. |

**Returns**

The input stream with `___x` extracted or in an error state.

### 6.814.1 Detailed Description

```
template<typename _Ptr>
struct std::pointer_traits<_Ptr >
```

Uniform interface to all pointer-like types.

Since

C++11

### 6.814.2 Member Typedef Documentation

#### difference\_type

```
template<typename _Ptr, typename _Elt>
using std::__ptr_traits_impl< _Ptr, _Elt >::difference_type [inherited]
```

The type used to represent the difference between two pointers.

#### element\_type

```
template<typename _Ptr, typename _Elt>
using std::__ptr_traits_impl< _Ptr, _Elt >::element_type [inherited]
```

The type pointed to.

#### pointer

```
template<typename _Ptr, typename _Elt>
using std::__ptr_traits_impl< _Ptr, _Elt >::pointer [inherited]
```

The pointer type.

#### rebind

```
template<typename _Ptr, typename _Elt>
template<typename _Up>
using std::__ptr_traits_impl< _Ptr, _Elt >::rebind [inherited]
```

A pointer to a different type.

### 6.814.3 Member Function Documentation

#### pointer\_to()

```
template<typename _Ptr, typename _Elt, bool = is_void<_Elt>::value>
constexpr pointer std::__ptr_traits_ptr_to< _Ptr, _Elt, bool >::pointer_to (
    element_type & __r) [inline], [static], [constexpr], [inherited]
```

Obtain a pointer to an object.

#### Parameters

|          |                                               |
|----------|-----------------------------------------------|
| ↩        | A reference to an object of type element_type |
| ↩        |                                               |
| ↩        |                                               |
| ↩        |                                               |
| <i>r</i> |                                               |

#### Returns

```
pointer::pointer_to(__r)
```

#### Precondition

pointer::pointer\_to(\_\_r) is a valid expression.

The documentation for this struct was generated from the following file:

### 6.816.1 Detailed Description

template<typename \_IntType = int>  
class [std::poisson\\_distribution](#)< \_IntType >

A discrete Poisson random number distribution.

The formula for the Poisson probability density function is  $p(i|\mu) = \frac{\mu^i}{i!} e^{-\mu}$  where  $\mu$  is the parameter of the distribution.

Since

C++11

### 6.816.2 Member Typedef Documentation

#### result\_type

template<typename \_IntType = int>  
typedef \_IntType [std::poisson\\_distribution](#)< \_IntType >::result\_type

The type of the range of the distribution.

### 6.816.3 Member Function Documentation

#### max()

```
template<typename _IntType = int>
result_type std::poisson_distribution< _IntType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### mean()

```
template<typename _IntType = int>
double std::poisson_distribution< _IntType >::mean () const [inline]
```

Returns the distribution parameter mean.

#### min()

```
template<typename _IntType = int>
result_type std::poisson_distribution< _IntType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

#### operator>() [1/2]

```
template<typename _IntType = int>
template<typename _UniformRandomNumberGenerator>
result_type std::poisson_distribution< _IntType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)](#).

#### operator>() [2/2]

template<typename _IntType>
template<typename _UniformRandomNumberGenerator>
poisson_distribution< _IntType >::result_type std::poisson_distribution< _IntType >::operator()
(
    _UniformRandomNumberGenerator & __urng,
    const param_type & __param)
```

A rejection algorithm when mean  $\geq 12$  and a simple method based upon the multiplication of uniform random variates otherwise. NB: The former is available only if `_GLIBCXX_USE_C99_MATH_FUNCS` is defined.

Reference: Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. X, Sects. 3.3 & 3.4 (+ Errata!).

References [std::abs\(\)](#), [std::numeric\\_limits< \\_Tp >::epsilon\(\)](#), [std::log\(\)](#), and [std::numeric\\_limits< \\_Tp >::max\(\)](#).

#### param() [1/2]

```
template<typename _IntType = int>
param_type std::poisson_distribution< _IntType >::param () const [inline]
```

Returns the parameter set of the distribution.

#### param() [2/2]

```
template<typename _IntType = int>
void std::poisson_distribution< _IntType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _IntType = int>
void std::poisson_distribution< _IntType >::reset () [inline]
Resets the distribution state.
```

**6.816.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::poisson_distribution< _IntType1 > & __x) [friend]
Inserts a poisson_distribution random number distribution __x into the output stream __os.
```

**Parameters**

|                   |                                                    |
|-------------------|----------------------------------------------------|
| <code>__os</code> | An output stream.                                  |
| <code>__x</code>  | A poisson_distribution random number distribution. |

**Returns**

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _IntType = int>
bool operator== (
    const poisson_distribution< _IntType > & __d1,
    const poisson_distribution< _IntType > & __d2) [friend]
```

Return true if two Poisson distributions have the same parameters and the sequences that would be generated are equal.

**operator>>**

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::poisson_distribution< _IntType1 > & __x) [friend]
```

Extracts a poisson\_distribution random number distribution `__x` from the input stream `__is`.

**Parameters**

|                                                                                                                        |                                                        |
|------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| <a href="#"></a><br><code>__is</code> | An input stream.                                       |
| <a href="#"></a><br><code>__x</code>  | A poisson_distribution random number generator engine. |

**Returns**

The input stream with `__x` extracted or in an error state.

```
#include <memory_resource>
```

### Public Attributes

- `size_t` **largest\_required\_pool\_block**
- `size_t` [max\\_blocks\\_per\\_chunk](#)

### 6.818.1 Detailed Description

Parameters for tuning a pool resource's behaviour.

Since

C++17

### 6.818.2 Member Data Documentation

#### **max\_blocks\_per\_chunk**

`size_t` `std::pmr::pool_options::max_blocks_per_chunk`

Upper limit on number of blocks in a chunk.

A lower value prevents allocating huge chunks that could remain mostly unused, but means pools will need to replenished more frequently.

The documentation for this struct was generated from the following file:

- [memory\\_resource](#)

### 6.819.1 Detailed Description

`template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename _Alloc = std::allocator<char>>`

`class __gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >`

A priority queue composed of one specific heap policy.

#### Template Parameters

|               |                                                       |
|---------------|-------------------------------------------------------|
| <i>_Tv</i>    | Value type.                                           |
| <i>Cmp_Fn</i> | Comparison functor.                                   |
| <i>Tag</i>    | Instantiating data structure type, see container_tag. |
| <i>_Alloc</i> | Allocator type.                                       |

Base is dispatched at compile time via Tag, from the following choices: `binary_heap_tag`, `binomial_heap_tag`, `pairing_heap_tag`, `rc_binomial_heap_tag`, `thin_heap_tag`

Base choices are: `detail::binary_heap`, `detail::binomial_heap`, `detail::pairing_heap`, `detail::rc_binomial_heap`, `detail::thin_heap`.

### 6.819.2 Constructor & Destructor Documentation

#### [priority\\_queue\(\)](#) [1/3]

```
template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>
__gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >::priority_queue (
    const cmp_fn & r_cmp_fn) [inline]
```

Constructor taking some policy objects. `r_cmp_fn` will be copied by the `Cmp_Fn` object of the container object.

#### [priority\\_queue\(\)](#) [2/3]

```
template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >::priority_queue (
    It first_it,
    It last_it) [inline]
```

Constructor taking `__iterators` to a range of `value_types`. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

**priority\_queue()** [3/3]

```
template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >::priority_queue (
    It first_it,
    It last_it,
    const cmp_fn & r_cmp_fn) [inline]
```

Constructor taking \_\_iterators to a range of value\_types and some policy objects The value\_types between first\_it and last\_it will be inserted into the container object. r\_cmp\_fn will be copied by the cmp\_fn object of the container object. The documentation for this class was generated from the following file:

## Protected Attributes

- `_Sequence` `c`
- `_Compare` `comp`

## 6.820.1 Detailed Description

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename __↵
Sequence::value_type>>
class std::priority_queue< _Tp, _Sequence, _Compare >
```

A standard container automatically sorting its contents.

## Template Parameters

|                        |                                                                                               |
|------------------------|-----------------------------------------------------------------------------------------------|
| <code>_Tp</code>       | Type of element.                                                                              |
| <code>_Sequence</code> | Type of underlying sequence, defaults to <code>vector&lt;_Tp&gt;</code> .                     |
| <code>_Compare</code>  | Comparison function object type, defaults to <code>less&lt;_Sequence::value_type&gt;</code> . |

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces priority-based sorting and queue behavior. Very few of the standard container/sequence interface requirements are met (e.g., iterators).

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::vector`, but it can be any type that supports `front()`, `push_back`, `pop_back`, and random-access iterators, such as `std::deque` or an appropriate user-defined type.

The third template parameter supplies the means of making priority comparisons. It defaults to `less<value_type>` but can be anything defining a strict weak ordering.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push`, `pop`, and `top`, which are standard queue operations.

#### Note

No equality/comparison operators are provided for `priority_queue`.

Sorting of the elements takes place as they are added to, and removed from, the `priority_queue` using the `priority_queue`'s member functions. If you access the elements by other means, and change their data such that the sorting order would be different, the `priority_queue` will not re-sort the elements for you. (How could it know to do so?)

### 6.820.2 Constructor & Destructor Documentation

#### `priority_queue()` [1/4]

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<__and<is_default_constructible<_Compare>, is_default_constructible<_Seq>>::value>::type>
std::priority_queue<_Tp, _Sequence, _Compare >::priority_queue () [inline], [constexpr]
Default constructor creates no elements.
```

#### `priority_queue()` [2/4]

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
std::priority_queue<_Tp, _Sequence, _Compare >::priority_queue (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __x = _Compare()) [inline], [constexpr]
Builds a queue from a range.
```

#### Parameters

|                      |                                                         |
|----------------------|---------------------------------------------------------|
| <code>__first</code> | An input iterator.                                      |
| <code>__last</code>  | An input iterator.                                      |
| <code>__x</code>     | A comparison functor describing a strict weak ordering. |
| <code>__s</code>     | An initial sequence with which to start.                |

Begins by copying `__s`, inserting a copy of the elements from `[first,last)` into the copy of `__s`, then ordering the copy according to `__x`.

For more information on function objects, see the documentation on [functor base classes](#).

**priority\_queue()** [3/4]

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>>
std::priority_queue< _Tp, _Sequence, _Compare >::priority_queue (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __x,
    const _Sequence & __s) [inline], [constexpr]
```

Builds a queue from a range.

**Parameters**

|                      |                                                         |
|----------------------|---------------------------------------------------------|
| <code>__first</code> | An input iterator.                                      |
| <code>__last</code>  | An input iterator.                                      |
| <code>__x</code>     | A comparison functor describing a strict weak ordering. |
| <code>__s</code>     | An initial sequence with which to start.                |

Begins by copying `__s`, inserting a copy of the elements from `[first,last)` into the copy of `__s`, then ordering the copy according to `__x`.

For more information on function objects, see the documentation on [functor base classes](#).

**priority\_queue()** [4/4]

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>>
std::priority_queue< _Tp, _Sequence, _Compare >::priority_queue (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __x,
    _Sequence && __s) [inline], [constexpr]
```

Builds a queue from a range.

**Parameters**

|                      |                                                         |
|----------------------|---------------------------------------------------------|
| <code>__first</code> | An input iterator.                                      |
| <code>__last</code>  | An input iterator.                                      |
| <code>__x</code>     | A comparison functor describing a strict weak ordering. |
| <code>__s</code>     | An initial sequence with which to start.                |

Begins by copying `__s`, inserting a copy of the elements from `[first,last)` into the copy of `__s`, then ordering the copy according to `__x`.

For more information on function objects, see the documentation on [functor base classes](#).

References [std::move\(\)](#).

### 6.820.3 Member Function Documentation

#### empty()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↵
Sequence::value_type>>
```

```
bool std::priority_queue< _Tp, _Sequence, _Compare >::empty () const [inline], [nodiscard],
[constexpr]
```

Returns true if the queue is empty.

Referenced by [\\_\\_gnu\\_parallel::multiseq\\_partition\(\)](#), and [\\_\\_gnu\\_parallel::multiseq\\_selection\(\)](#).

#### pop()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↵
Sequence::value_type>>
```

```
void std::priority_queue< _Tp, _Sequence, _Compare >::pop () [inline], [constexpr]
```

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.

Referenced by [\\_\\_gnu\\_parallel::multiseq\\_partition\(\)](#), and [\\_\\_gnu\\_parallel::multiseq\\_selection\(\)](#).

#### push()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↵
Sequence::value_type>>
```

```
void std::priority_queue< _Tp, _Sequence, _Compare >::push (
    const value_type & __x) [inline], [constexpr]
```

Add data to the queue.

#### Parameters

|                    |                   |
|--------------------|-------------------|
| <a href="#">_↵</a> | Data to be added. |
| <a href="#">_x</a> |                   |

This is a typical queue operation. The time complexity of the operation depends on the underlying sequence.

Referenced by [\\_\\_gnu\\_parallel::multiseq\\_partition\(\)](#), and [\\_\\_gnu\\_parallel::multiseq\\_selection\(\)](#).

#### size()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↵
Sequence::value_type>>
```

```
size_type std::priority_queue< _Tp, _Sequence, _Compare >::size () const [inline], [nodiscard],
[constexpr]
```

Returns the number of elements in the queue.

#### top()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↵
Sequence::value_type>>
```

```
const_reference std::priority_queue< _Tp, _Sequence, _Compare >::top () const [inline], [nodiscard],
[constexpr]
```

Returns a read-only (constant) reference to the data at the first element of the queue.

Referenced by [\\_\\_gnu\\_parallel::multiseq\\_partition\(\)](#), and [\\_\\_gnu\\_parallel::multiseq\\_selection\(\)](#).

- `template<typename _Up>`  
`constexpr _Up & get_underlying (propagate_const< _Up > &__pt) noexcept`

### 6.828.1 Detailed Description

```
template<typename _Tp>
class std::experimental::fundamentals_v2::propagate_const< _Tp >
```

Const-propagating wrapper.

The documentation for this class was generated from the following file:

- [propagate\\_const](#)

## 6.829 `__gnu_pbds::quadratic_probe_fn< Size_Type >` Class Template Reference

```
#include <hash_policy.hpp>
```

### Public Types

- typedef `Size_Type` **size\_type**

### Public Member Functions

- void **swap** ([quadratic\\_probe\\_fn< Size\\_Type >](#) &other)

### Protected Member Functions

- `size_type` [operator\(\)](#) (`size_type` i) const

### 6.829.1 Detailed Description

```
template<typename Size_Type = std::size_t>
class __gnu_pbds::quadratic_probe_fn< Size_Type >
```

A probe sequence policy using square increments.

### 6.829.2 Member Function Documentation

#### **operator()**

```
template<typename Size_Type>
quadratic\_probe\_fn< Size\_Type >::size\_type __gnu_pbds::quadratic_probe_fn< Size_Type >::operator()
(
    size_type i) const [inline], [protected]
```

Returns the i-th offset from the hash value.

The documentation for this class was generated from the following file:

- [hash\\_policy.hpp](#)

## 6.830 `std::queue< _Tp, _Sequence >` Class Template Reference

```

- `void swap (queue & __q) noexcept(__is_nothrow_swappable<_Sequence>::value)`

## Protected Attributes

- `_Sequence c`

## Friends

- `template<typename _Tp1, typename _Seq1> bool operator< (const queue<_Tp1, _Seq1> &, const queue<_Tp1, _Seq1> &)`
- `template<typename _Tp1, three_way_comparable _Seq1> compare_three_way_result_t<_Seq1> operator<=> (const queue<_Tp1, _Seq1> &, const queue<_Tp1, _Seq1> &)`
- `template<typename _Tp1, typename _Seq1> bool operator== (const queue<_Tp1, _Seq1> &, const queue<_Tp1, _Seq1> &)`

### 6.830.1 Detailed Description

`template<typename _Tp, typename _Sequence = deque<_Tp>>`  
`class std::queue<_Tp, _Sequence>`

A standard container giving FIFO behavior.

## Template Parameters

|                  |                  |
|------------------|------------------|
| <code>_Tp</code> | Type of element. |
|------------------|------------------|

|                        |                                                                          |
|------------------------|--------------------------------------------------------------------------|
| <code>_Sequence</code> | Type of underlying sequence, defaults to <code>deque&lt;_Tp&gt;</code> . |
|------------------------|--------------------------------------------------------------------------|

Meets many of the requirements of a `container`, but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-first-out queue behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `front`, `back`, `push_back`, and `pop_front`, such as `std::list` or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push` and `pop`, which are standard queue/FIFO operations.

## 6.830.2 Constructor & Destructor Documentation

### `queue()`

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<is_default_constructible<↵
_Seq>::value>::type>
std::queue<_Tp, _Sequence>::queue () [inline]
```

Default constructor creates no elements.

References [c](#).

## 6.830.3 Member Function Documentation

### `back()` [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::queue<_Tp, _Sequence>::back () [inline], [nodiscard]
```

Returns a read/write reference to the data at the last element of the queue.

References [c](#).

### `back()` [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::queue<_Tp, _Sequence>::back () const [inline], [nodiscard]
```

Returns a read-only (constant) reference to the data at the last element of the queue.

References [c](#).

### `empty()`

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
bool std::queue<_Tp, _Sequence>::empty () const [inline], [nodiscard]
```

Returns true if the queue is empty.

References [c](#).

### `front()` [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::queue<_Tp, _Sequence>::front () [inline], [nodiscard]
```

Returns a read/write reference to the data at the first element of the queue.

References [c](#).

**front()** [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::queue< _Tp, _Sequence >::front () const [inline], [nodiscard]
```

Returns a read-only (constant) reference to the data at the first element of the queue.

References [c](#).

**pop()**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::queue< _Tp, _Sequence >::pop () [inline]
```

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

References [c](#).

**push()**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::queue< _Tp, _Sequence >::push (
    const value_type & __x) [inline]
```

Add data to the end of the queue.

**Parameters**

|                  |                   |
|------------------|-------------------|
| <code>__x</code> | Data to be added. |
|------------------|-------------------|

This is a typical queue operation. The function creates an element at the end of the queue and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

References [c](#).

**size()**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
size_type std::queue< _Tp, _Sequence >::size () const [inline], [nodiscard]
```

Returns the number of elements in the queue.

References [c](#).

**6.830.4 Member Data Documentation****c**

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
_Sequene std::queue< _Tp, _Sequence >::c [protected]
```

`c` is the underlying container.

Referenced by [queue\(\)](#), [back\(\)](#), [back\(\)](#), [empty\(\)](#), [front\(\)](#), [front\(\)](#), [std::operator<\(\)](#), [std::operator==\(\)](#), [pop\(\)](#), [push\(\)](#), and [size\(\)](#).

**6.831 \_\_gnu\_parallel::quicksort\_tag Struct Reference**

```
#include <tags.h>
```

Inheritance diagram for `__gnu_parallel::quicksort_tag`:

### Public Member Functions

- `quicksort_tag` (`_ThreadIndex` \_\_num\_threads)
- `_ThreadIndex` `__get_num_threads` ()
- void `set_num_threads` (`_ThreadIndex` \_\_num\_threads)

#### 6.831.1 Detailed Description

Forces parallel sorting using unbalanced quicksort at compile time.

#### 6.831.2 Member Function Documentation

##### `__get_num_threads()`

`_ThreadIndex` `__gnu_parallel::parallel_tag::__get_num_threads` () [inline], [inherited]

Find out desired number of threads.

##### Returns

Desired number of threads.

Referenced by `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, and `__gnu_parallel::__parallel_sort()`.

##### `set_num_threads()`

void `__gnu_parallel::parallel_tag::set_num_threads` (  
     `_ThreadIndex` \_\_num\_threads) [inline], [inherited]

Set the desired number of threads.

### Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

The documentation for this struct was generated from the following file:

### 6.832 `std::random_access_iterator_tag` Struct Reference

```
#include <stl_iterator_base_types.h>
```

Inheritance diagram for `std::random_access_iterator_tag`:

#### 6.832.1 Detailed Description

Random-access iterators support a superset of bidirectional iterator operations. The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

### 6.833 `__gnu_cxx::random_condition` Struct Reference

```
#include <throw_allocator.h>
```

Inheritance diagram for `__gnu_cxx::random_condition`:

## Classes

- struct [always\\_adjustor](#)
- struct [group\\_adjustor](#)
- struct [never\\_adjustor](#)

## Public Member Functions

- void **seed** (unsigned long \_\_s)

## Static Public Member Functions

- static void **set\_probability** (double \_\_p)
- static void **throw\_conditionally** ()

### 6.833.1 Detailed Description

Base class for random probability control and throw.

The documentation for this struct was generated from the following file:

- [throw\\_allocator.h](#)

## 6.834 std::random\_device Class Reference

```
#include <random>
```

## Public Types

- typedef unsigned int [result\\_type](#)

## Public Member Functions

- **random\_device** (const random\_device &)=delete
- **random\_device** (const [std::string](#) &\_\_token)
- double **entropy** () const noexcept
- [result\\_type](#) **operator()** ()
- void **operator=** (const random\_device &)=delete

## Static Public Member Functions

- static constexpr [result\\_type](#) **max** ()
- static constexpr [result\\_type](#) **min** ()

### 6.834.1 Detailed Description

A standard interface to a platform-specific non-deterministic random number generator (if any are available).

Since

C++11

### 6.834.2 Member Typedef Documentation

#### result\_type

typedef unsigned int [std::random\\_device::result\\_type](#)

The type of the generated random value.

The documentation for this class was generated from the following file:

- [random.h](#)

## 6.835 std::range\_error Class Reference

```
#include <stdexcept>
```

Inheritance diagram for `std::range_error`:

### Public Member Functions

- **range\_error** (const char \*)
- **range\_error** (const range\_error &)=default
- **range\_error** (const [string](#) &\_\_arg)
- **range\_error** (range\_error &&)=default
- range\_error & **operator=** (const range\_error &)=default
- range\_error & **operator=** (range\_error &&)=default
- virtual const char \* [what](#) () const noexcept

### 6.835.1 Detailed Description

Thrown to indicate range errors in internal computations.

### 6.835.2 Member Function Documentation

#### `what()`

```
virtual const char * std::runtime_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#), [std::filesystem::filesystem\\_error](#), and [std::ios\\_base::failure](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

The documentation for this class was generated from the following file:

### 6.836 `__gnu_pbds::range_invalidation_guarantee` Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for `__gnu_pbds::range_invalidation_guarantee`:

#### 6.836.1 Detailed Description

Signifies an invalidation guarantee that includes all those of its base, and additionally, that any range-type iterator (including the returns of `begin()` and `end()`) is in the correct relative positions to other range-type iterators as long as its corresponding entry has not be erased, regardless of modifications to the container object.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

### 6.837 `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >` Class Template Reference

Inheritance diagram for `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >`:

#### 6.837.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Hash_Fn, bool Store_Hash>
class __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >
```

Primary template.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

### 6.838 `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, false >` Class Template Reference

```

- **ranged\_hash\_fn** (size\_type, const Comb\_Hash\_Fn &)
- **ranged\_hash\_fn** (size\_type, const [null\\_type](#) &, const Comb\_Hash\_Fn &)
- void **swap** (ranged\_hash\_fn< Key, [null\\_type](#), \_Alloc, Comb\_Hash\_Fn, false > &)

#### 6.840.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Comb_Hash_Fn>
class __gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, false >
```

Specialization 3 The client does not supply a hash function (by specifying `null_type` as the `Hash_Fn` parameter), and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

#### 6.841 `__gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, true >` Class Template Reference

```
#include <ranged_hash_fn.hpp>
```

### Protected Types

- typedef Comb\_Hash\_Fn **comb\_hash\_fn\_base**
- typedef \_Alloc::size\_type **size\_type**

### Protected Member Functions

- **ranged\_hash\_fn** (size\_type)
- **ranged\_hash\_fn** (size\_type, const Comb\_Hash\_Fn &)
- **ranged\_hash\_fn** (size\_type, const [null\\_type](#) &, const Comb\_Hash\_Fn &)
- void **swap** (ranged\_hash\_fn< Key, [null\\_type](#), \_Alloc, Comb\_Hash\_Fn, true > &)

#### 6.841.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Comb_Hash_Fn>
class __gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, true >
```

Specialization 4 The client does not supply a hash function (by specifying `null_type` as the `Hash_Fn` parameter), and requests that hash values be stored.

The documentation for this class was generated from the following file:

- [ranged\\_hash\\_fn.hpp](#)

## 6.842 `__gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, Store_Hash >` Class Template Reference

Inheritance diagram for `__gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, Store_Hash >`:

### 6.842.1 Detailed Description

`template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Probe_Fn, typename Probe_Fn, bool Store_Hash>`

`class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, Store_Hash >`

Primary template.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

## 6.843 `__gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, false >` Class Template Reference

```
#include <ranged_probe_fn.hpp>
```

### Protected Types

- typedef Comb\_Probe\_Fn **comb\_probe\_fn\_base**

#### 6.844.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Probe_Fn, typename Probe_Fn>
class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, true >
```

Specialization 2- The client supplies a probe function and a ranged probe function, and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

## 6.845 `__gnu_pbds::detail::ranged_probe_fn< Key, null_type, _Alloc, Comb_Probe_Fn, null_type, false >` Class Template Reference

```
#include <ranged_probe_fn.hpp>
```

### Protected Types

- typedef `Comb_Probe_Fn` **comb\_probe\_fn\_base**
- typedef `rebind_traits< _Alloc, Key >::const_reference` **key\_const\_reference**
- typedef `_Alloc::size_type` **size\_type**

### Protected Member Functions

- **ranged\_probe\_fn** (`size_type` size)
- **ranged\_probe\_fn** (`size_type`, const `Comb_Probe_Fn` &r\_comb\_probe\_fn)
- **ranged\_probe\_fn** (`size_type`, const `null_type` &, const `Comb_Probe_Fn` &r\_comb\_probe\_fn, const `null_type` &)
- void **swap** (`ranged_probe_fn` &other)

#### 6.845.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Comb_Probe_Fn>
class __gnu_pbds::detail::ranged_probe_fn< Key, null_type, _Alloc, Comb_Probe_Fn, null_type, false >
```

Specialization 3 and 4 The client does not supply a hash function or probe function, and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged\\_probe\\_fn.hpp](#)

## 6.846 `std::rank< _Tp >` Struct Template Reference

```
#include <type_traits>
```

Inheritance diagram for `std::rank< _Tp >`:

### Public Types

- using **type**
- using **value\_type**

### Public Member Functions

- constexpr **operator value\_type** () const noexcept

### Static Public Attributes

- static constexpr std::size\_t **value**

#### 6.846.1 Detailed Description

```
template<typename _Tp>
struct std::rank<_Tp>
```

rank

The documentation for this struct was generated from the following file:

- [type\\_traits](#)

### 6.847 std::ratio<\_Num, \_Den > Struct Template Reference

```
#include <ratio>
```

#### Public Types

- typedef [ratio](#)< num, den > **type**

#### Static Public Attributes

- static constexpr intmax\_t **den**
- static constexpr intmax\_t **num**

#### 6.847.1 Detailed Description

```
template<intmax_t _Num, intmax_t _Den = 1>
struct std::ratio<_Num, _Den>
```

Provides compile-time rational arithmetic.

This class template represents any finite rational number with a numerator and denominator representable by compile-time constants of type intmax\_t. The ratio is simplified when instantiated.

For example:

```
std::ratio<7,-21>::num == -1;
std::ratio<7,-21>::den == 3;
```

The documentation for this struct was generated from the following file:

- [ratio](#)

### 6.848 std::ratio\_equal<\_R1, \_R2 > Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_equal<_R1, _R2>`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 6.848.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_equal<_R1, _R2>
```

`ratio_equal`

The documentation for this struct was generated from the following file:

- [ratio](#)

#### 6.849 `std::ratio_greater<_R1, _R2>` Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_greater< _R1, _R2 >`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 6.849.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_greater< _R1, _R2 >
```

ratio\_greater

The documentation for this struct was generated from the following file:

- [ratio](#)

#### 6.850 std::ratio\_greater\_equal< \_R1, \_R2 > Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_greater_equal<_R1, _R2>`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 6.850.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_greater_equal<_R1, _R2>
```

`ratio_greater_equal`

The documentation for this struct was generated from the following file:

- [ratio](#)

### 6.851 `std::ratio_less<_R1, _R2>` Struct Template Reference

```
#include <ratio>
```

#### 6.851.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_less<_R1, _R2>
```

`ratio_less`

The documentation for this struct was generated from the following file:

- [ratio](#)

## 6.852 `std::ratio_less_equal<_R1, _R2>` Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_less_equal<_R1, _R2>`:

### Public Types

- using **type**
- using **value\_type**

### Public Member Functions

- constexpr **operator value\_type** () const noexcept

### Static Public Attributes

- static constexpr bool **value**

#### 6.852.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_less_equal<_R1, _R2>
```

`ratio_less_equal`

The documentation for this struct was generated from the following file:

- [ratio](#)

## 6.853 `std::ratio_not_equal<_R1, _R2>` Struct Template Reference

```
#include <ratio>
```

Inheritance diagram for `std::ratio_not_equal<_R1, _R2>`:

#### Public Types

- using **type**
- using **value\_type**

#### Public Member Functions

- constexpr **operator value\_type** () const noexcept

#### Static Public Attributes

- static constexpr bool **value**

#### 6.853.1 Detailed Description

```
template<typename _R1, typename _R2>
struct std::ratio_not_equal<_R1, _R2>
```

`ratio_not_equal`

The documentation for this struct was generated from the following file:

- [ratio](#)

## 6.854 `std::raw_storage_iterator<_OutputIterator, _Tp>` Class Template Reference

```
#include <stl_raw_storage_iter.h>
```

Inheritance diagram for `std::raw_storage_iterator<_OutputIterator, _Tp>`:

### Public Types

- typedef void [difference\\_type](#)
- typedef [output\\_iterator\\_tag](#) [iterator\\_category](#)
- typedef void [pointer](#)
- typedef void [reference](#)
- typedef void [value\\_type](#)

### Public Member Functions

- **raw\_storage\_iterator** ([\\_OutputIterator](#) \_\_x)
- [\\_OutputIterator](#) **base** () const
- [raw\\_storage\\_iterator](#) & **operator\*** ()
- [raw\\_storage\\_iterator](#) & **operator++** ()
- [raw\\_storage\\_iterator](#) **operator++** (int)
- [raw\\_storage\\_iterator](#) & **operator=** ([\\_Tp](#) &&\_\_element)
- [raw\\_storage\\_iterator](#) & **operator=** (const [\\_Tp](#) &\_\_element)

### Protected Attributes

- [\\_OutputIterator](#) **\_M\_iter**

#### 6.854.1 Detailed Description

```
template<class _OutputIterator, class _Tp>
class std::raw_storage_iterator<_OutputIterator, _Tp>
```

This iterator class lets algorithms store their results into uninitialized memory.

#### 6.854.2 Member Typedef Documentation

##### **difference\_type**

typedef void `std::iterator< output\_iterator\_tag, void, void, void, void >::difference_type` [inherited]  
 Distance between iterators is represented as this type.

**iterator\_category**

```
typedef output\_iterator\_tag std::iterator< output\_iterator\_tag, void, void, void, void >::↵
iterator_category [inherited]
```

One of the [tag types](#).

**pointer**

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::pointer [inherited]
```

This type represents a pointer-to-value\_type.

**reference**

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::reference [inherited]
```

This type represents a reference-to-value\_type.

**value\_type**

```
typedef void std::iterator< output\_iterator\_tag, void, void, void, void >::value_type [inherited]
```

The type "pointed to" by the iterator.

The documentation for this class was generated from the following file:

- [stl\\_raw\\_storage\\_iter.h](#)

## 6.855 `__gnu_cxx::rb_tree< _Key, _Value, _KeyOfValue, _Compare, _Alloc >` Struct Template Reference

```
#include <rb_tree>
```

**Public Types**

#### 6.856.1 Detailed Description

`template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>`

`class __gnu_pbds::detail::rb_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >`

Red-Black tree.

This implementation uses an idea from the SGI STL (using a *header* node which is needed for efficient iteration).

#### 6.856.2 Member Function Documentation

##### `node_begin()` [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
```

```
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin()  
() [inline], [inherited]
```

Returns a `node_iterator` corresponding to the node at the root of the tree.

##### `node_begin()` [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
```

```
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin() const  
[inline], [inherited]
```

Returns a const `node_iterator` corresponding to the node at the root of the tree.

##### `node_end()` [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
```

```
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end()  
[inline], [inherited]
```

Returns a `node_iterator` corresponding to a node just after a leaf of the tree.

##### `node_end()` [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
```

```
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __↵  
gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_↵  
end () const [inline], [inherited]
```

Returns a const node\_iterator corresponding to a node just after a leaf of the tree.

The documentation for this class was generated from the following file:

- [rb\\_tree\\_.hpp](#)

## 6.857 `__gnu_pbds::detail::rb_tree_node_< Value_Type, Metadata, _Alloc >` Struct Template Reference

```
#include <node.hpp>
```

### Public Types

### 6.860.1 Detailed Description

```
template<typename Value_Type, typename Cmp_Fn, typename _Alloc>
class __gnu_pbds::detail::rc_binomial_heap< Value_Type, Cmp_Fn, _Alloc >
```

Redundant-counter binomial heap.

The documentation for this class was generated from the following file:

- [rc\\_binomial\\_heap.hpp](#)

### 6.861 \_\_gnu\_pbds::rc\_binomial\_heap\_tag Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for \_\_gnu\_pbds::rc\_binomial\_heap\_tag:

#### 6.861.1 Detailed Description

Redundant-counter binomial-heap.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

### 6.862 std::simd::rebind<\_Tp, \_Mp, \_Traits> Struct Template Reference

```
#include <simd_mask.h>
```

#### Public Types

- `using type`

#### 6.862.1 Detailed Description

```
template<__vectorizable _Tp, __simd_mask_type _Mp, _ArchTraits _Traits>
struct std::simd::rebind<_Tp, _Mp, _Traits>
```

As above, except for `basic_mask`.

The documentation for this struct was generated from the following file:

- `simd_mask.h`

### 6.863 `std::simd::rebind<_Tp, _Vp, _Traits>` Struct Template Reference

```
#include <simd_mask.h>
```

#### Public Types

- using `type`

#### 6.863.1 Detailed Description

```
template<__vectorizable _Tp, __simd_vec_type _Vp, _ArchTraits _Traits>
struct std::simd::rebind<_Tp, _Vp, _Traits>
```

Computes a member type `basic_vec<_Tp, Abi>`, where `Abi` is chosen such that the number of elements is equal to `_Vp::size()` and features of the ABI tag (such as the internal representation of masks, or storage order of complex components) are preserved.

The documentation for this struct was generated from the following file:

- `simd_mask.h`

### 6.864 `__gnu_pbds::detail::rebind_traits<_Alloc, T>` Struct Template Reference

```
#include <types_traits.hpp>
```

#### Public Types

- using `const_reference`
- using `reference`

#### 6.864.1 Detailed Description

```
template<typename _Alloc, typename T>
struct __gnu_pbds::detail::rebind_traits<_Alloc, T>
```

Consistent API for accessing allocator-related types.

The documentation for this struct was generated from the following file:

- [types\\_traits.hpp](#)

### 6.865 `std::filesystem::recursive_directory_iterator` Class Reference

```
#include <filesystem>
```

## Public Types

- uintmax\_t **filesystem::remove\_all** (const [path](#) &, [error\\_code](#) &)
- bool **operator==** (const recursive\_directory\_iterator &\_\_lhs, const recursive\_directory\_iterator &\_\_rhs) noexcept

### 6.865.1 Detailed Description

Iterator type for recursively traversing a directory hierarchy.

Since

C++17

The documentation for this class was generated from the following file:

- [bits/fs\\_dir.h](#)

## 6.866 `__gnu_cxx::recursive_init_error` Class Reference

```
#include <cxxabi.h>
```

Inheritance diagram for `__gnu_cxx::recursive_init_error`:

### Public Member Functions

- virtual constexpr const char \* [what](#) () const noexcept

#### 6.866.1 Detailed Description

Exception thrown by `__cxa_guard_acquire`.

C++ 2011 6.7 [stmt.dcl]/4: If control re-enters the declaration recursively while the variable is being initialized, the behavior is undefined.

Since we already have a library function to handle locking, we might as well check for this situation and throw an exception. We use the second byte of the guard variable to remember that we're in the middle of an initialization.

#### 6.866.2 Member Function Documentation

##### `what()`

```
virtual constexpr const char * std::exception::what () const [inline], [constexpr], [virtual],
[noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error.

Reimplemented in [std::bad\\_alloc](#), [std::bad\\_cast](#), [std::bad\\_exception](#), [std::bad\\_function\\_call](#), [std::bad\\_typeid](#), [std::bad\\_weak\\_ptr](#), [std::experimental::filesystem::v1::filesystem\\_error](#), [std::experimental::fundamentals\\_v1::bad\\_any\\_cast](#), [std::filesystem::filesystem\\_error](#), [std::future\\_error](#), [std::ios\\_base::failure](#), [std::logic\\_error](#), and [std::runtime\\_error](#).

The documentation for this class was generated from the following file:

- [cxxabi.h](#)

## 6.867 `std::recursive_mutex` Class Reference

```
#include <mutex>
```

### Public Types

- typedef `__native_type` \* **native\_handle\_type**

### Public Member Functions

- **recursive\_mutex** (const recursive\_mutex &)=delete
- void **lock** ()
- native\_handle\_type **native\_handle** () noexcept
- recursive\_mutex & **operator=** (const recursive\_mutex &)=delete
- bool **try\_lock** () noexcept
- void **unlock** ()

#### 6.867.1 Detailed Description

The standard recursive mutex type.

A recursive mutex can be locked more than once by the same thread. Other threads cannot lock the mutex until the owning thread unlocks it as many times as it was locked.

Since

C++11

The documentation for this class was generated from the following file:

- [mutex](#)

## 6.868 std::recursive\_timed\_mutex Class Reference

```
#include <mutex>
```

### Public Types

- typedef \_\_native\_type \* **native\_handle\_type**

### Public Member Functions

- **recursive\_timed\_mutex** (const recursive\_timed\_mutex &)=delete
- void **lock** ()
- native\_handle\_type **native\_handle** () noexcept
- recursive\_timed\_mutex & **operator=** (const recursive\_timed\_mutex &)=delete
- bool **try\_lock** () noexcept
- template<class \_Rep, class \_Period>  
bool **try\_lock\_for** (const [chrono::duration](#)< \_Rep, \_Period > &\_\_rtime)
- template<class \_Clock, class \_Duration>  
bool **try\_lock\_until** (const [chrono::time\\_point](#)< \_Clock, \_Duration > &\_\_atime)
- void **unlock** ()

### Friends

- class **\_\_timed\_mutex\_impl**< recursive\_timed\_mutex >

#### 6.868.1 Detailed Description

The standard recursive timed mutex type.

A recursive mutex that supports a timeout when trying to acquire the lock. A recursive mutex can be locked more than once by the same thread. Other threads cannot lock the mutex until the owning thread unlocks it as many times as it was locked.

Since

C++11

The documentation for this class was generated from the following file:

- [mutex](#)

## 6.869 `std::bitset<_Nb>::reference` Class Reference

```
#include <bitset>
```

### Public Member Functions

- **reference** (const reference &)=default
- constexpr reference & **flip** () noexcept
- constexpr **operator bool** () const noexcept
- constexpr const reference & **operator=** (bool \_\_x) const noexcept
- constexpr reference & **operator=** (bool \_\_x) noexcept
- constexpr reference & **operator=** (const reference &\_\_j) noexcept
- constexpr bool **operator~** () const noexcept

### Friends

- class **bitset**
- constexpr friend void **swap** (bool &\_\_x, reference \_\_y) noexcept
- constexpr friend void **swap** (reference \_\_x, bool &\_\_y) noexcept
- constexpr friend void **swap** (reference \_\_x, reference \_\_y) noexcept

#### 6.869.1 Detailed Description

```
template<size_t _Nb>
```

```
class std::bitset<_Nb>::reference
```

This encapsulates the concept of a single bit. An instance of this class is a proxy for an actual bit; this way the individual bit operations are done as faster word-size bitwise instructions.

Most users will never need to use this class directly; conversions to and from bool are automatic and should be transparent. Overloaded operators help to preserve the illusion.

(On a typical system, this *bit reference* is 64 times the size of an actual bit. Ha.)

The documentation for this class was generated from the following file:

- [bitset](#)

## 6.870 `std::tr2::dynamic_bitset<_WordT, _Alloc>::reference` Class Reference

```
#include <dynamic_bitset>
```

### Public Member Functions

- **reference** (dynamic\_bitset &\_\_b, size\_type \_\_pos) noexcept
- reference & **flip** () noexcept
- **operator bool** () const noexcept
- reference & **operator=** (bool \_\_x) noexcept
- reference & **operator=** (const reference &\_\_j) noexcept
- bool **operator~** () const noexcept

## Friends

- class `dynamic_bitset`

### 6.870.1 Detailed Description

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
class std::tr2::dynamic_bitset<_WordT, _Alloc >::reference
```

This encapsulates the concept of a single bit. An instance of this class is a proxy for an actual bit; this way the individual bit operations are done as faster word-size bitwise instructions.

Most users will never need to use this class directly; conversions to and from `bool` are automatic and should be transparent. Overloaded operators help to preserve the illusion.

(On a typical system, this "bit %reference" is 64 times the size of an actual bit. Ha.)

The documentation for this class was generated from the following file:

- [dynamic\\_bitset](#)

### 6.871 `std::reference_wrapper<_Tp>` Class Template Reference

```
#include <refwrap.h>
```

## Public Types

- typedef `_Tp type`

## Public Member Functions

- template<typename `_Up`, typename = `__not_same<_Up>`, typename = `decltype(reference_wrapper::_S_fun(std::declval<_Up>()))`> constexpr **reference\_wrapper** (`_Up &&__uref`) noexcept(noexcept(reference\_wrapper::\_S\_fun(`std::declval<_Up>`) < `_Up >()`)))
- **reference\_wrapper** (const `reference_wrapper &`)=default

- `reference_wrapper & operator=` (const `reference_wrapper &`)=default

## Friends

- constexpr auto **operator<=>** (`reference_wrapper __x`, const `_Tp &__y`)
- constexpr auto **operator<=>** (`reference_wrapper __x`, `reference_wrapper __y`)
- constexpr auto **operator<=>** (`reference_wrapper __x`, `reference_wrapper< const _Tp > __y`)
- constexpr bool **operator==** (`reference_wrapper __x`, const `_Tp &__y`)
- constexpr bool **operator==** (`reference_wrapper __x`, `reference_wrapper __y`)
- constexpr bool **operator==** (`reference_wrapper __x`, `reference_wrapper< const _Tp > __y`)

## Related Symbols

(Note that these are not member symbols.)

- template<typename `_Tp`> constexpr `reference_wrapper<_Tp>` [ref](#) (`_Tp &__t`) noexcept
- template<typename `_Tp`> constexpr `reference_wrapper< const _Tp >` [cref](#) (const `_Tp &__t`) noexcept

- `template<typename _Tp>`  
`constexpr reference_wrapper< _Tp > ref (reference_wrapper< _Tp > __t) noexcept`
- `template<typename _Tp>`  
`constexpr reference_wrapper< const _Tp > cref (reference_wrapper< _Tp > __t) noexcept`

### 6.871.1 Detailed Description

`template<typename _Tp>`  
**class** `std::reference_wrapper< _Tp >`

Primary class template for `reference_wrapper`.

### 6.871.2 Friends And Related Symbol Documentation

#### **cref()** [1/2]

```
template<typename _Tp>
reference_wrapper< const _Tp > cref (
    const _Tp & __t) [related]
```

Denotes a const reference should be taken to a variable.

#### **cref()** [2/2]

```
template<typename _Tp>
reference_wrapper< const _Tp > cref (
    reference_wrapper< _Tp > __t) [related]
```

`std::cref` overload to prevent wrapping a `reference_wrapper`

#### **ref()** [1/2]

```
template<typename _Tp>
reference_wrapper< _Tp > ref (
    _Tp & __t) [related]
```

Denotes a reference should be taken to a variable.

#### **ref()** [2/2]

```
template<typename _Tp>
reference_wrapper< _Tp > ref (
    reference_wrapper< _Tp > __t) [related]
```

`std::ref` overload to prevent wrapping a `reference_wrapper`

## 6.872 std::regex\_error Class Reference

```
#include <regex>
```

Inheritance diagram for `std::regex_error`:

#### Public Member Functions

- [regex\\_error](#) ([error\\_type](#) \_\_ecode)
- [regex\\_constants::error\\_type](#) code () const noexcept
- virtual const char \* [what](#) () const noexcept

#### 6.872.1 Detailed Description

A regular expression exception class.

The regular expression library throws objects of this class on error.

Since

C++11

#### 6.872.2 Constructor & Destructor Documentation

##### **regex\_error()**

```
std::regex_error::regex_error (  
    error\_type __ecode) [explicit]
```

Constructs a `regex_error` object.

##### Parameters

|                      |                       |
|----------------------|-----------------------|
| <code>__ecode</code> | the regex error code. |
|----------------------|-----------------------|

References [regex\\_error\(\)](#).

Referenced by [regex\\_error\(\)](#).

### 6.872.3 Member Function Documentation

#### `code()`

`regex_constants::error_type` `std::regex_error::code () const [inline], [noexcept]`

Gets the regex error code.

#### Returns

the regex error code.

References [code\(\)](#).

Referenced by [code\(\)](#).

#### `what()`

`virtual const char * std::runtime_error::what () const [virtual], [noexcept], [inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#), [std::filesystem::filesystem\\_error](#), and [std::ios\\_base::failure](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

## 6.873 `std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >` Class Template Reference

`#include <regex>`

### Public Types

- `typedef std::ptrdiff_t difference_type`
- `typedef std::forward\_iterator\_tag iterator_category`
- `typedef std::input\_iterator\_tag iterator_concept`
- `typedef const value_type * pointer`
- `typedef const value_type & reference`
- `typedef basic\_regex< \_Ch\_type, \_Rx\_traits > regex_type`
- `typedef match\_results< \_Bi\_iter > value_type`

### Public Member Functions

- `regex\_iterator ()=default`
- `regex\_iterator (_Bi_iter __a, _Bi_iter __b, const regex_type &__re, regex\_constants::match\_flag\_type __m=regex\_constants::match\_default)`
- `regex_iterator (_Bi_iter, _Bi_iter, const regex_type &&, regex\_constants::match\_flag\_type=regex\_constants::match\_default)=default`
- `regex\_iterator (const regex\_iterator &)=default`
- `const value_type & operator\* () const noexcept`
- `regex\_iterator & operator++ ()`
- `regex\_iterator operator++ (int)`
- `const value_type * operator-> () const noexcept`
- `regex\_iterator & operator= (const regex\_iterator &)=default`
- `bool operator== (const regex\_iterator &) const noexcept`
- `bool operator== (default\_sentinel\_t) const noexcept`

### 6.873.1 Detailed Description

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>>
class std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >
```

An iterator adaptor that will provide repeated calls of `regex_search` over a range until no more matches remain.

Since

C++11

### 6.873.2 Constructor & Destructor Documentation

#### `regex_iterator()` [1/3]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator () [default]
```

Provides a singular iterator, useful for indicating one-past-the-end of a range.

Referenced by `std::regex_iterator< const char * >::regex_iterator()`, and `operator==()`.

#### `regex_iterator()` [2/3]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a `regex_iterator`...

#### Parameters

|                   |                                                    |
|-------------------|----------------------------------------------------|
| <code>__a</code>  | [IN] The start of a text range to search.          |
| <code>__b</code>  | [IN] One-past-the-end of the text range to search. |
| <code>__re</code> | [IN] The regular expression to match.              |
| <code>__m</code>  | [IN] Policy flags for match rules.                 |

#### `regex_iterator()` [3/3]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator (
    const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & ) [default]
```

Copy constructs a `regex_iterator`.

### 6.873.3 Member Function Documentation

#### `operator*()`

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type & std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator* () const
[inline], [noexcept]
```

Dereferences a `regex_iterator`.

#### `operator++()` [1/2]

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ ()
```

Increments a `regex_iterator`.

References `std::regex_constants::match_continuous`, `std::regex_constants::match_not_null`, `std::regex_constants::match_prev_avail`, and `std::regex_search()`.

#### `operator++()` [2/2]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ (
    int ) [inline]
```

Postincrements a `regex_iterator`.

#### `operator->()`

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type * std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator-> () const
[inline], [noexcept]
```

Selects a `regex_iterator` member.

#### `operator=()`

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator & std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator= (
    const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & ) [default]
```

Copy assigns one `regex_iterator` to another.

#### `operator==()`

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
bool std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator== (
    const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs) const [noexcept]
```

Tests the equivalence of two `regex iterators`.

References `regex_iterator()`.

The documentation for this class was generated from the following files:

- [regex.h](#)
- [regex.tcc](#)

## 6.874 `std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>` Class Template Reference

```
#include <regex>
```

### Public Types

- typedef `std::ptrdiff_t` **difference\_type**
- typedef `std::forward_iterator_tag` **iterator\_category**
- typedef `std::input_iterator_tag` **iterator\_concept**

- `bool operator== (const regex_token_iterator &__rhs) const`
- `bool operator== (default_sentinel_t) const noexcept`

### 6.874.1 Detailed Description

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>>
class std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>
```

Iterates over submatches in a range (or *splits* a text string).

The purpose of this iterator is to enumerate all, or all specified, matches of a regular expression within a text range. The dereferenced value of an iterator of this class is a `std::sub_match` object.

Since

C++11

### 6.874.2 Constructor & Destructor Documentation

#### regex\_token\_iterator() [1/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator () [inline]
```

Default constructs a regex\_token\_iterator.

A default-constructed regex\_token\_iterator is a singular iterator that will compare equal to the one-past-the-end value for any iterator of the same type.

Referenced by [operator++\(\)](#), [operator=\(\)](#), and [operator==\(\)](#).

#### regex\_token\_iterator() [2/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    int __submatch = 0,
    regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a regex\_token\_iterator...

#### Parameters

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__a</code>        | [IN] The start of the text to search.                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>__b</code>        | [IN] One-past-the-end of the text to search.                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>__re</code>       | [IN] The regular expression to search for.                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>__submatch</code> | [IN] Which submatch to return. There are some special values for this parameter: <ul style="list-style-type: none"> <li>• -1 each enumerated subexpression does NOT match the regular expression (aka field splitting)</li> <li>• 0 the entire string matching the subexpression is returned for each match within the text.</li> <li>• &gt;0 enumerates only the indicated subexpression from a match within the text.</li> </ul> |
| <code>__m</code>        | [IN] Policy flags for match rules.                                                                                                                                                                                                                                                                                                                                                                                                 |

#### regex\_token\_iterator() [3/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    const std::vector< int > & __submatches,
    regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a regex\_token\_iterator...

**Parameters**

|                           |                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------|
| <code>__a</code>          | [IN] The start of the text to search.                                                      |
| <code>__b</code>          | [IN] One-past-the-end of the text to search.                                               |
| <code>__re</code>         | [IN] The regular expression to search for.                                                 |
| <code>__submatches</code> | [IN] A list of subexpressions to return for each regular expression match within the text. |
| <code>__m</code>          | [IN] Policy flags for match rules.                                                         |

**regex\_token\_iterator() [4/6]**

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    initializer_list< int > __submatches,
    regex_constants::match_flag_type __m = regex_constants::match_default) [inline]
```

Constructs a `regex_token_iterator`...

**Parameters**

|                           |                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------|
| <code>__a</code>          | [IN] The start of the text to search.                                                      |
| <code>__b</code>          | [IN] One-past-the-end of the text to search.                                               |

| <code>__re</code>         | [IN] The regular expression to search for.                                                 |
| <code>__submatches</code> | [IN] A list of subexpressions to return for each regular expression match within the text. |
| <code>__m</code>          | [IN] Policy flags for match rules.                                                         |

**regex\_token\_iterator() [6/6]**

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs) [inline]
```

Copy constructs a `regex_token_iterator`.

**Parameters**

|                    |                                                   |
|--------------------|---------------------------------------------------|
| <code>__rhs</code> | [IN] A <code>regex_token_iterator</code> to copy. |
|--------------------|---------------------------------------------------|

**6.874.3 Member Function Documentation****operator\*()**

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
const value_type & std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator* ()
const [inline]
```

Dereferences a `regex_token_iterator`.

**operator++() [1/2]**

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ ()
```

Increments a `regex_token_iterator`.

References `regex_token_iterator()`.

**operator++() [2/2]**

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
```

```
regex_token_iterator std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ (
    int ) [inline]
```

Postincrements a `regex_token_iterator`.

**operator->()**

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type * std::regex\_token\_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator-> ()
const [inline]
```

Selects a `regex_token_iterator` member.

**operator=()**

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
regex\_token\_iterator< _Bi_iter, _Ch_type, _Rx_traits > & std::regex\_token\_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator= (
    const regex\_token\_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs)
```

Assigns a `regex_token_iterator` to another.

**Parameters**

|                    |                                                   |
|--------------------|---------------------------------------------------|
| <code>__rhs</code> | [IN] A <code>regex_token_iterator</code> to copy. |
|--------------------|---------------------------------------------------|

References [regex\\_token\\_iterator\(\)](#).

**operator==()**

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
bool std::regex\_token\_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator== (
    const regex\_token\_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs) const
```

Compares a `regex_token_iterator` to another for equality.

References [regex\\_token\\_iterator\(\)](#).

### 6.875.1 Detailed Description

**template<typename \_Ch\_type>**  
**class std::regex\_traits<\_Ch\_type>**

Describes aspects of a regular expression.

A regular expression traits class that satisfies the requirements of section [28.7].

The class regex is parameterized around a set of related types and functions used to complete the definition of its semantics. This class satisfies the requirements of such a traits class.

Since

C++11

### 6.875.2 Constructor & Destructor Documentation

#### regex\_traits()

```
template<typename _Ch_type>
std::regex_traits<_Ch_type>::regex_traits () [inline]
```

Constructs a default traits object.

Referenced by [value\(\)](#).

### 6.875.3 Member Function Documentation

#### getloc()

```
template<typename _Ch_type>
locale_type std::regex_traits<_Ch_type>::getloc () const [inline]
```

Gets a copy of the current locale in use by the regex\_traits object.

#### imbue()

```
template<typename _Ch_type>
locale_type std::regex_traits<_Ch_type>::imbue (
    locale_type __loc) [inline]
```

Imbues the regex\_traits object with a copy of a new locale.

**Parameters**

|                    |           |
|--------------------|-----------|
| <code>__loc</code> | A locale. |
|--------------------|-----------|

**Returns**

a copy of the previous locale in use by the `regex_traits` object.

**Note**

Calling `imbue` with a different locale than the one currently in use invalidates all cached data held by `*this`.

**isctype()**

```
template<typename _Ch_type>
bool std::regex_traits< _Ch_type >::isctype (
    _Ch_type __c,
    char_class_type __f) const
```

Determines if `c` is a member of an identified class.

**Parameters**

|                  |                                                                 |
|------------------|-----------------------------------------------------------------|
| <code>__c</code> | a character.                                                    |
| <code>__f</code> | a class type (as returned from <code>lookup_classname</code> ). |

**Returns**

true if the character `__c` is a member of the classification represented by `__f`, false otherwise.

**Exceptions**

|                            |                                                    |
|----------------------------|----------------------------------------------------|
| <code>std::bad_cast</code> | if the current locale does not have a ctype facet. |
|----------------------------|----------------------------------------------------|

References [std::use\\_facet\(\)](#).

**length()**

```
template<typename _Ch_type>
std::size_t std::regex_traits< _Ch_type >::length (
    const char_type * __p) [inline], [static]
```

Gives the length of a C-style string starting at `__p`.

**Parameters**

|                  |                                                 |
|------------------|-------------------------------------------------|
| <code>__p</code> | a pointer to the start of a character sequence. |
|------------------|-------------------------------------------------|

**Returns**

the number of characters between `*__p` and the first default-initialized value of type `char_type`. In other words, uses the C-string algorithm for determining the length of a sequence of characters.

**lookup\_classname()**

```
template<typename _Ch_type>
template<typename _Fwd_iter>
regex_traits<_Ch_type>::char_class_type std::regex_traits<_Ch_type>::lookup_classname (
    _Fwd_iter __first,
    _Fwd_iter __last,
    bool __icase = false) const
```

Maps one or more characters to a named character classification.

**Parameters**

|                      |                                              |
|----------------------|----------------------------------------------|
| <code>__first</code> | beginning of the character sequence.         |
| <code>__last</code>  | one-past-the-end of the character sequence.  |
| <code>__icase</code> | ignores the case of the classification name. |

**Returns**

an unspecified value that represents the character classification named by the character sequence designated by the iterator range `[__first, __last)`. If `icase` is true, the returned mask identifies the classification regardless of the case of the characters to be matched (for example, `[[:lower:]]` is the same as `[[:alpha:]]`), otherwise a case-dependent classification is returned. The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns a value that compares equal to 0.

At least the following names (or their wide-character equivalent) are supported.

- d
- w
- s
- alnum
- alpha
- blank
- cntrl
- digit
- graph
- lower

- `print`
- `punct`
- `space`
- `upper`
- `xdigit`

References [std::use\\_facet\(\)](#).

### **lookup\_collatename()**

```
template<typename _Ch_type>
template<typename _Fwd_iter>
regex_traits< _Ch_type >::string_type std::regex_traits< _Ch_type >::lookup_collatename (
    _Fwd_iter __first,
    _Fwd_iter __last) const
```

Gets a collation element by name.

#### **Parameters**

|                      |                                                 |
|----------------------|-------------------------------------------------|
| <code>__first</code> | beginning of the collation element name.        |
| <code>__last</code>  | one-past-the-end of the collation element name. |

#### **Returns**

a sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range `[__first, __last)`. Returns an empty string if the character sequence is not a valid collating element.

References [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::empty\(\)](#), and [std::use\\_facet\(\)](#).

### **transform()**

```
template<typename _Ch_type>
template<typename _Fwd_iter>
string_type std::regex_traits< _Ch_type >::transform (
    _Fwd_iter __first,
    _Fwd_iter __last) const [inline]
```

Gets a sort key for a character sequence.

#### **Parameters**

|                      |                                             |
|----------------------|---------------------------------------------|
| <code>__first</code> | beginning of the character sequence.        |
| <code>__last</code>  | one-past-the-end of the character sequence. |

Returns a sort key for the character sequence designated by the iterator range `[F1, F2)` such that if the character sequence `[G1, G2)` sorts before the character sequence `[H1, H2)` then `v.transform(G1, G2) < v.transform(H1, H2)`. What this really does is provide a more efficient way to compare a string to multiple other strings in locales with fancy collation rules and equivalence classes.

**Returns**

a locale-specific sort key equivalent to the input range.

**Exceptions**

|                            |                                                      |
|----------------------------|------------------------------------------------------|
| <code>std::bad_cast</code> | if the current locale does not have a collate facet. |
|----------------------------|------------------------------------------------------|

**transform\_primary()**

```
template<typename _Ch_type>
template<typename _Fwd_iter>
string_type std::regex_traits<_Ch_type>::transform_primary (
    _Fwd_iter __first,
    _Fwd_iter __last) const [inline]
```

Gets a sort key for a character sequence, independent of case.

**Parameters**

|                      |                                             |
|----------------------|---------------------------------------------|
| <code>__first</code> | beginning of the character sequence.        |
| <code>__last</code>  | one-past-the-end of the character sequence. |

**Effects:** if `typeid(use_facet<collate<_Ch_type>>(getloc())) == typeid(collate_byname<_Ch_type>)` and the form of the sort key returned by `collate_byname<_Ch_type>::transform(__first, __last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

**Todo** Implement this function correctly.

**translate()**

```
template<typename _Ch_type>
char_type std::regex_traits<_Ch_type>::translate (
    char_type __c) const [inline]
```

Performs the identity translation.

**Parameters**

|                  |                                                   |
|------------------|---------------------------------------------------|
| <code>__c</code> | A character to the locale-specific character set. |
|------------------|---------------------------------------------------|

**Returns**

`__c`.

**translate\_nocase()**

```
template<typename _Ch_type>
char_type std::regex_traits<_Ch_type>::translate_nocase (
    char_type __c) const [inline]
```

Translates a character into a case-insensitive equivalent.

**Parameters**

|                  |                                                   |
|------------------|---------------------------------------------------|
| <code>__c</code> | A character to the locale-specific character set. |
|------------------|---------------------------------------------------|

**Returns**

the locale-specific lower-case equivalent of `__c`.

**Exceptions**

|                            |                                                        |
|----------------------------|--------------------------------------------------------|
| <code>std::bad_cast</code> | if the imbued locale does not support the ctype facet. |
|----------------------------|--------------------------------------------------------|

**value()**

```
template<typename _Ch_type>
int std::regex_traits< _Ch_type >::value (
    _Ch_type __ch,
    int __radix) const
```

Converts a digit to an int.

**Parameters**

|                      |                                                                |
|----------------------|----------------------------------------------------------------|
| <code>__ch</code>    | a character representing a digit.                              |
| <code>__radix</code> | the radix if the numeric conversion (limited to 8, 10, or 16). |

**Returns**

the value represented by the digit `__ch` in base `radix` if the character `__ch` is a valid digit in base `radix`; otherwise returns -1.

### 6.886.1 Detailed Description

**template<typename \_Iterator>**

**class std::reverse\_iterator< \_Iterator >**

Bidirectional and random access iterators have corresponding reverse iterator adaptors that iterate through the data structure in the opposite direction. They have the same signatures as the corresponding iterators. The fundamental relation between a reverse iterator and its corresponding iterator *i* is established by the identity:

```
*(reverse_iterator(i)) == *(i - 1)
```

*This mapping is dictated by the fact that while there is always a pointer past the end of an array, there might not be a valid pointer before the beginning of an array.* [24.4.1]/1,2

Reverse iterators can be tricky and surprising at first. Their semantics make sense, however, and the trickiness is a side effect of the requirement that the iterators must be safe.

### 6.886.2 Constructor & Destructor Documentation

#### **reverse\_iterator()** [1/4]

```
template<typename _Iterator>
```

```
std::reverse_iterator< _Iterator >::reverse_iterator () [inline], [constexpr], [noexcept]
```

The default constructor value-initializes member **current**. If it is a pointer, that means it is zero-initialized.

Referenced by [std::reverse\\_iterator< iterator >::operator+\(\)](#), and [std::reverse\\_iterator< iterator >::operator-\(\)](#).

#### **reverse\_iterator()** [2/4]

```
template<typename _Iterator>
```

```
std::reverse_iterator< _Iterator >::reverse_iterator (
    iterator_type __x) [inline], [explicit], [constexpr], [noexcept]
```

This iterator will move in the opposite direction that *x* does.

#### **reverse\_iterator()** [3/4]

```
template<typename _Iterator>
```

```
std::reverse_iterator< _Iterator >::reverse_iterator (
    const reverse_iterator< _Iterator > & __x) [inline], [constexpr], [noexcept]
```

The copy constructor is normal.

**reverse\_iterator()** [4/4]

```
template<typename _Iterator>
template<typename _Iter>
std::reverse_iterator<_Iterator>::reverse_iterator (
    const reverse_iterator<_Iter> &__x) [inline], [constexpr], [noexcept]
```

A reverse\_iterator across other types can be copied if the underlying iterator can be converted to the type of current.

**6.886.3 Member Function Documentation****base()**

```
template<typename _Iterator>
iterator_type std::reverse_iterator<_Iterator>::base () const [inline], [nodiscard], [constexpr],
[noexcept]
```

**Returns**

current, the iterator used for underlying work.

Referenced by [std::operator==\(\)](#).

**operator\*()**

```
template<typename _Iterator>
reference std::reverse_iterator<_Iterator>::operator* () const [inline], [nodiscard], [constexpr]
```

**Returns**

A reference to the value at --current

This requires that --current is dereferenceable.

**Warning**

This implementation requires that for an iterator of the underlying iterator type, x, a reference obtained by \*x remains valid after x has been modified or destroyed. This is a bug: <http://gcc.gnu.org/PR51823>

**operator+()**

```
template<typename _Iterator>
reverse_iterator std::reverse_iterator<_Iterator>::operator+ (
    difference_type __n) const [inline], [nodiscard], [constexpr]
```

**Returns**

A reverse\_iterator that refers to current - \_\_n

The underlying iterator must be a Random Access Iterator.

**operator++()** [1/2]

```
template<typename _Iterator>
reverse_iterator & std::reverse_iterator<_Iterator>::operator++ () [inline], [constexpr]
```

**Returns**

\*this

Decrements the underlying iterator.

**operator++()** [2/2]

```
template<typename _Iterator>
reverse_iterator std::reverse_iterator< _Iterator >::operator++ (
    int ) [inline], [constexpr]
```

**Returns**

The original value of `*this`

Decrements the underlying iterator.

**operator+=()**

```
template<typename _Iterator>
reverse_iterator & std::reverse_iterator< _Iterator >::operator+= (
    difference_type __n) [inline], [constexpr]
```

**Returns**

`*this`

Moves the underlying iterator backwards `__n` steps. The underlying iterator must be a Random Access Iterator.

**operator-()**

```
template<typename _Iterator>
reverse_iterator std::reverse_iterator< _Iterator >::operator- (
    difference_type __n) const [inline], [nodiscard], [constexpr]
```

**Returns**

A `reverse_iterator` that refers to `current - __n`

The underlying iterator must be a Random Access Iterator.

**operator--()** [1/2]

```
template<typename _Iterator>
reverse_iterator & std::reverse_iterator< _Iterator >::operator-- () [inline], [constexpr]
```

**Returns**

`*this`

Increments the underlying iterator.

**operator--()** [2/2]

```
template<typename _Iterator>
reverse_iterator std::reverse_iterator< _Iterator >::operator-- (
    int ) [inline], [constexpr]
```

**Returns**

A `reverse_iterator` with the previous value of `*this`

Increments the underlying iterator.

**operator-=( )**

```
template<typename _Iterator>
reverse_iterator & std::reverse_iterator< _Iterator >::operator-= (
    difference_type __n) [inline], [constexpr]
```

**Returns**

\*this

Moves the underlying iterator forwards `__n` steps. The underlying iterator must be a Random Access Iterator.

**operator->()**

```
template<typename _Iterator>
pointer std::reverse_iterator< _Iterator >::operator-> () const [inline], [nodiscard], [constexpr]
```

**Returns**

A pointer to the value at `--current`

This requires that `--current` is dereferenceable.

**operator[]()**

```
template<typename _Iterator>
reference std::reverse_iterator< _Iterator >::operator[] (
    difference_type __n) const [inline], [nodiscard], [constexpr]
```

**Returns**

The value at `current - __n - 1`

The underlying iterator must be a Random Access Iterator.

### 6.887.1 Detailed Description

```
template<class _CharT, class _Alloc>
class __gnu_cxx::rope<_CharT, _Alloc>
```

This is an SGI extension.

**Todo** Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/↵documentation\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/↵documentation_style.html)

The documentation for this class was generated from the following files:

- [rope](#)
- [ropeimpl.h](#)

## 6.888 std::runtime\_error Class Reference

```
#include <stdexcept_except.h>
```

Inheritance diagram for `std::runtime_error`:

## Public Member Functions

- `runtime_error (const char *)`
- `runtime_error (const runtime_error &) noexcept`

- `runtime_error` (const `string` & \_\_arg)
- `runtime_error` (runtime\_error &&) noexcept
- `runtime_error` & `operator=` (const `runtime_error` &) noexcept
- `runtime_error` & `operator=` (runtime\_error &&) noexcept
- virtual const char \* `what` () const noexcept

### 6.888.1 Detailed Description

One of two subclasses of exception.

Runtime errors represent problems outside the scope of a program; they cannot be easily predicted and can generally only be caught as the program executes.

### 6.888.2 Constructor & Destructor Documentation

#### `runtime_error()`

```
std::runtime_error::runtime_error (
    const string & __arg) [explicit]
```

Takes a character string describing the error.

References `runtime_error()`.

Referenced by `runtime_error()`.

### 6.888.3 Member Function Documentation

#### `what()`

```
virtual const char * std::runtime_error::what () const [virtual], [noexcept]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from `std::exception`.

Reimplemented in `std::experimental::filesystem::v1::filesystem_error`, `std::filesystem::filesystem_error`, and `std::ios_base::failure`.

References `what()`.

Referenced by `what()`.

The documentation for this class was generated from the following file:

- `stdexcept_except.h`

## 6.889 `__gnu_pbds::sample_probe_fn` Class Reference

```
#include <sample_probe_fn.hpp>
```

### Public Types

- typedef std::size\_t `size_type`

### Public Member Functions

- `sample_probe_fn` ()
- `sample_probe_fn` (const `sample_probe_fn` &)
- void `swap` (`sample_probe_fn` &)

### Protected Member Functions

- `size_type` `operator()` (key\_const\_reference r\_key, `size_type` i) const

### 6.889.1 Detailed Description

A sample probe policy.

### 6.889.2 Constructor & Destructor Documentation

#### **sample\_probe\_fn()** [1/2]

```
__gnu_pbds::sample_probe_fn::sample_probe_fn ()
```

Default constructor.

Referenced by [sample\\_probe\\_fn\(\)](#), and [swap\(\)](#).

#### **sample\_probe\_fn()** [2/2]

```
__gnu_pbds::sample_probe_fn::sample_probe_fn (  
    const sample_probe_fn & )
```

Copy constructor.

References [sample\\_probe\\_fn\(\)](#).

### 6.889.3 Member Function Documentation

#### **operator>()()**

```
size_type __gnu_pbds::sample_probe_fn::operator() (  
    key_const_reference r_key,  
    size_type i) const [inline], [protected]
```

Returns the i-th offset from the hash value of some key r\_key.

#### **swap()**

```
void __gnu_pbds::sample_probe_fn::swap (  
    sample_probe_fn & ) [inline]
```

Swaps content.

References [sample\\_probe\\_fn\(\)](#).

The documentation for this class was generated from the following file:

- [sample\\_probe\\_fn.hpp](#)

## 6.890 \_\_gnu\_pbds::sample\_range\_hashing Class Reference

```
#include <sample_range_hashing.hpp>
```

### Public Types

- typedef std::size\_t [size\\_type](#)

### Public Member Functions

- [sample\\_range\\_hashing](#) ()
- [sample\\_range\\_hashing](#) (const [sample\\_range\\_hashing](#) &other)
- void [swap](#) ([sample\\_range\\_hashing](#) &other)

### Protected Member Functions

- void [notify\\_resized](#) ([size\\_type](#))
- [size\\_type](#) [operator\(\)](#) ([size\\_type](#)) const

### 6.890.1 Detailed Description

A sample range-hashing functor.

## 6.890.2 Member Typedef Documentation

### size\_type

typedef std::size\_t \_\_gnu\_pbds::sample\_range\_hashing::size\_type  
Size type.

## 6.890.3 Constructor & Destructor Documentation

### sample\_range\_hashing() [1/2]

\_\_gnu\_pbds::sample\_range\_hashing::sample\_range\_hashing ()  
Default constructor.  
Referenced by [sample\\_range\\_hashing\(\)](#), and [swap\(\)](#).

### sample\_range\_hashing() [2/2]

\_\_gnu\_pbds::sample\_range\_hashing::sample\_range\_hashing (  
const sample\_range\_hashing & other)  
Copy constructor.  
References [sample\\_range\\_hashing\(\)](#).

## 6.890.4 Member Function Documentation

### notify\_resized()

void \_\_gnu\_pbds::sample\_range\_hashing::notify\_resized (  
size\_type ) [protected]  
Notifies the policy object that the container's size has changed to argument's size.

### operator>()

size\_type \_\_gnu\_pbds::sample\_range\_hashing::operator() (  
size\_type ) const [inline], [protected]  
Transforms the \_\_hash value hash into a ranged-hash value.

### swap()

void \_\_gnu\_pbds::sample\_range\_hashing::swap (  
sample\_range\_hashing & other) [inline]  
Swaps content.  
References [sample\\_range\\_hashing\(\)](#).  
The documentation for this class was generated from the following file:

## 6.891 \_\_gnu\_pbds::sample\_ranged\_hash\_fn Class Reference

#include <sample\_ranged\_hash\_fn.hpp>

### Public Types

- typedef std::size\_t **size\_type**

## Public Member Functions

- [sample\\_ranged\\_hash\\_fn](#) ()
- [sample\\_ranged\\_hash\\_fn](#) (const [sample\\_ranged\\_hash\\_fn](#) &)
- void [swap](#) ([sample\\_ranged\\_hash\\_fn](#) &)

## Protected Member Functions

- void [notify\\_resized](#) (size\_type)
- size\_type [operator\(\)](#) (key\_const\_reference) const

### 6.891.1 Detailed Description

A sample ranged-hash functor.

### 6.891.2 Constructor & Destructor Documentation

#### [sample\\_ranged\\_hash\\_fn](#)() [1/2]

```
__gnu_pbds::sample_ranged_hash_fn::sample_ranged_hash_fn ()
```

Default constructor.

Referenced by [sample\\_ranged\\_hash\\_fn](#)(), and [swap](#)().

#### [sample\\_ranged\\_hash\\_fn](#)() [2/2]

```
__gnu_pbds::sample_ranged_hash_fn::sample_ranged_hash_fn (  
    const sample\_ranged\_hash\_fn & )
```

Copy constructor.

References [sample\\_ranged\\_hash\\_fn](#)().

### 6.891.3 Member Function Documentation

#### [notify\\_resized](#)()

```
void __gnu_pbds::sample_ranged_hash_fn::notify_resized (  
    size_type ) [protected]
```

Notifies the policy object that the container's `__size` has changed to `size`.

#### [operator](#)()()

```
size_type __gnu_pbds::sample_ranged_hash_fn::operator() (  
    key_const_reference ) const [inline], [protected]
```

Transforms `key_const_reference` into a position within the table.

#### [swap](#)()

```
void __gnu_pbds::sample_ranged_hash_fn::swap (  
    sample\_ranged\_hash\_fn & ) [inline]
```

Swaps content.

References [sample\\_ranged\\_hash\\_fn](#)().

### 6.893.1 Detailed Description

A sample resize policy.

### 6.893.2 Member Typedef Documentation

#### **size\_type**

```
typedef std::size_t __gnu_pbds::sample_resize_policy::size_type
```

Size type.

### 6.893.3 Constructor & Destructor Documentation

#### **sample\_resize\_policy()**

```
__gnu_pbds::sample_resize_policy::sample_resize_policy ()
```

Default constructor.  
Referenced by [sample\\_range\\_hashing\(\)](#), and [swap\(\)](#).

### 6.893.4 Member Function Documentation

#### **get\_new\_size()**

```
size_type __gnu_pbds::sample_resize_policy::get_new_size (  
    size_type size,  
    size_type num_used_e) const [protected]
```

Queries what the new size should be.

#### **is\_resize\_needed()**

```
bool __gnu_pbds::sample_resize_policy::is_resize_needed () const [inline], [protected]
```

Queries whether a resize is needed.

#### **notify\_cleared()**

```
void __gnu_pbds::sample_resize_policy::notify_cleared () [protected]
```

Notifies the table was cleared.

#### **notify\_erase\_search\_collision()**

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

#### **notify\_erase\_search\_end()**

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_end () [inline], [protected]
```

Notifies a search ended.

#### **notify\_erase\_search\_start()**

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_start () [inline], [protected]
```

Notifies a search started.

#### **notify\_erased()**

```
void __gnu_pbds::sample_resize_policy::notify_erased (  
    size_type num_e) [inline], [protected]
```

Notifies an element was erased.

**notify\_find\_search\_collision()**

```
void __gnu_pbds::sample_resize_policy::notify_find_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

**notify\_find\_search\_end()**

```
void __gnu_pbds::sample_resize_policy::notify_find_search_end () [inline], [protected]
```

Notifies a search ended.

**notify\_find\_search\_start()**

```
void __gnu_pbds::sample_resize_policy::notify_find_search_start () [inline], [protected]
```

Notifies a search started.

**notify\_insert\_search\_collision()**

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

**notify\_insert\_search\_end()**

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_end () [inline], [protected]
```

Notifies a search ended.

**notify\_insert\_search\_start()**

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_start () [inline], [protected]
```

Notifies a search started.

**notify\_inserted()**

```
void __gnu_pbds::sample_resize_policy::notify_inserted (  
    size_type num_e) [inline], [protected]
```

Notifies an element was inserted.

**notify\_resized()**

```
void __gnu_pbds::sample_resize_policy::notify_resized (  
    size_type new_size) [protected]
```

Notifies the table was resized to new\_size.

**sample\_range\_hashing()**

```
__gnu_pbds::sample_resize_policy::sample_range_hashing (  
    const sample_resize_policy & other)
```

Copy constructor.

References `sample_resize_policy()`.

**swap()**

```
void __gnu_pbds::sample_resize_policy::swap (  
    sample_resize_policy & other) [inline]
```

Swaps content.

References `sample_resize_policy()`.

The documentation for this class was generated from the following file:

- [sample\\_resize\\_policy.hpp](#)

## 6.894 \_\_gnu\_pbds::sample\_resize\_trigger Class Reference

```
#include <sample_resize_trigger.hpp>
```

### Public Types

- void [notify\\_resized](#) ([size\\_type](#) new\_size)

#### 6.894.1 Detailed Description

A sample resize trigger policy.

#### 6.894.2 Member Typedef Documentation

##### **size\_type**

```
typedef std::size_t __gnu_pbds::sample_resize_trigger::size_type
```

Size type.

#### 6.894.3 Constructor & Destructor Documentation

##### **sample\_resize\_trigger()**

```
__gnu_pbds::sample_resize_trigger::sample_resize_trigger ()
```

Default constructor.

Referenced by [sample\\_range\\_hashing\(\)](#), and [swap\(\)](#).

#### 6.894.4 Member Function Documentation

##### is\_grow\_needed()

```
bool __gnu_pbds::sample_resize_trigger::is_grow_needed (
    size_type size,
    size_type num_entries) const [inline], [protected]
```

Queries whether a grow is needed.

##### is\_resize\_needed()

```
bool __gnu_pbds::sample_resize_trigger::is_resize_needed () const [inline], [protected]
```

Queries whether a resize is needed.

##### notify\_cleared()

```
void __gnu_pbds::sample_resize_trigger::notify_cleared () [protected]
```

Notifies the table was cleared.

##### notify\_erase\_search\_collision()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

##### notify\_erase\_search\_end()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_end () [inline], [protected]
```

Notifies a search ended.

##### notify\_erase\_search\_start()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_start () [inline], [protected]
```

Notifies a search started.

##### notify\_erased()

```
void __gnu_pbds::sample_resize_trigger::notify_erased (
    size_type num_entries) [inline], [protected]
```

Notifies an element was erased.

##### notify\_externally\_resized()

```
void __gnu_pbds::sample_resize_trigger::notify_externally_resized (
    size_type new_size) [protected]
```

Notifies the table was resized externally.

##### notify\_find\_search\_collision()

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

##### notify\_find\_search\_end()

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_end () [inline], [protected]
```

Notifies a search ended.

**notify\_find\_search\_start()**

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_start () [inline], [protected]
```

Notifies a search started.

**notify\_insert\_search\_collision()**

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_collision () [inline], [protected]
```

Notifies a search encountered a collision.

**notify\_insert\_search\_end()**

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_end () [inline], [protected]
```

Notifies a search ended.

**notify\_insert\_search\_start()**

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_start () [inline], [protected]
```

Notifies a search started.

**notify\_inserted()**

```
void __gnu_pbds::sample_resize_trigger::notify_inserted (
    size_type num_entries) [inline], [protected]
```

Notifies an element was inserted. the total number of entries in the table is num\_entries.

**notify\_resized()**

```
void __gnu_pbds::sample_resize_trigger::notify_resized (
    size_type new_size) [protected]
```

Notifies the table was resized as a result of this object's signifying that a resize is needed.

**sample\_range\_hashing()**

```
__gnu_pbds::sample_resize_trigger::sample_range_hashing (
    const sample_resize_trigger & )
```

Copy constructor.  
References [sample\\_resize\\_trigger\(\)](#).

**swap()**

```
void __gnu_pbds::sample_resize_trigger::swap (
    sample_resize_trigger & ) [inline]
```

Swaps content.  
References [sample\\_resize\\_trigger\(\)](#).  
The documentation for this class was generated from the following file:

- [sample\\_resize\\_trigger.hpp](#)

**6.895 \_\_gnu\_pbds::sample\_size\_policy Class Reference**

```
#include <sample_size_policy.hpp>
```

**Public Types**

### 6.895.1 Detailed Description

A sample size policy.

### 6.895.2 Member Typedef Documentation

#### `size_type`

typedef std::size\_t `__gnu_pbds::sample_size_policy::size_type`  
Size type.

### 6.895.3 Constructor & Destructor Documentation

#### `sample_size_policy()`

`__gnu_pbds::sample_size_policy::sample_size_policy` ()

Default constructor.

Referenced by [sample\\_range\\_hashing\(\)](#), and [swap\(\)](#).

### 6.895.4 Member Function Documentation

#### `get_nearest_larger_size()`

[size\\_type](#) `__gnu_pbds::sample_size_policy::get_nearest_larger_size` (  
    [size\\_type](#) size) const [inline], [protected]

Given a `__size` size, returns a `__size` that is larger.

#### `get_nearest_smaller_size()`

[size\\_type](#) `__gnu_pbds::sample_size_policy::get_nearest_smaller_size` (  
    [size\\_type](#) size) const [inline], [protected]

Given a `__size` size, returns a `__size` that is smaller.

#### `sample_range_hashing()`

`__gnu_pbds::sample_size_policy::sample_range_hashing` (  
    const [sample\\_size\\_policy](#) & )

Copy constructor.

References [sample\\_size\\_policy\(\)](#).

#### `swap()`

void `__gnu_pbds::sample_size_policy::swap` (  
    [sample\\_size\\_policy](#) & other) [inline]

Swaps content.

References [sample\\_size\\_policy\(\)](#).

The documentation for this class was generated from the following file:

- [sample\\_size\\_policy.hpp](#)

## 6.896 `__gnu_pbds::sample_tree_node_update`< `Const_Node_Iter`, `Node_Iter`, `Cmp_Fn`, `_Alloc` > Class Template Reference

```
#include <sample_tree_node_update.hpp>
```

### 6.896.1 Detailed Description

```
template<typename Const_Node_Iter, typename Node_Iter, typename Cmp_Fn, typename _Alloc>
class __gnu_pbds::sample_tree_node_update< Const_Node_Iter, Node_Iter, Cmp_Fn, _Alloc >
```

A sample node updatator.

The documentation for this class was generated from the following file:

- [sample\\_tree\\_node\\_update.hpp](#)

## 6.897 `__gnu_pbds::sample_trie_access_traits` Struct Reference

```
#include <sample_trie_access_traits.hpp>
```

### Public Types

- enum { `max_size` }
- typedef `std::string::const_iterator` `const_iterator`
- typedef char `e_type`
- typedef `rebind_traits< _Alloc, key_type >::const_reference` `key_const_reference`
- typedef `std::string` `key_type`
- typedef `std::size_t` `size_type`

### Static Public Member Functions

- static `const_iterator` `begin` (`key_const_reference`)
- static `size_type` `e_pos` (`e_type`)
- static `const_iterator` `end` (`key_const_reference`)

### 6.897.1 Detailed Description

A sample trie element access traits.

### 6.897.2 Member Typedef Documentation

#### `e_type`

```
typedef char __gnu_pbds::sample_trie_access_traits::e_type
Element type.
```

### 6.897.3 Member Function Documentation

#### `begin()`

```
const_iterator __gnu_pbds::sample_trie_access_traits::begin (
    key_const_reference ) [inline], [static]
```

Returns a `const_iterator` to the first element of `r_key`.

**e\_pos()**

```
size_type __gnu_pbds::sample_trie_access_traits::e_pos (
    e_type ) [inline], [static]
```

Maps an element to a position.

**end()**

```
const_iterator __gnu_pbds::sample_trie_access_traits::end (
    key_const_reference ) [inline], [static]
```

Returns a const\_iterator to the after-last element of r\_key.

The documentation for this struct was generated from the following file:

- [sample\\_trie\\_access\\_traits.hpp](#)

## 6.898 `__gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >` Class Template Reference

```
#include <sample_trie_node_update.hpp>
```

**Public Types**

- typedef std::size\_t **metadata\_type**

**Protected Member Functions**

- [sample\\_trie\\_node\\_update](#) ()
- void [operator](#)() (node\_iterator, node\_const\_iterator) const

**6.898.1 Detailed Description**

```
template<typename Node_Cltr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >
```

A sample node updator.

**6.898.2 Constructor & Destructor Documentation****sample\_trie\_node\_update()**

```
template<typename Node_Cltr, typename Node_Itr, typename _ATraits, typename _Alloc>
__gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >::sample_trie_node_↵
update () [protected]
```

Default constructor.

**6.898.3 Member Function Documentation****operator>()()**

```
template<typename Node_Cltr, typename Node_Itr, typename _ATraits, typename _Alloc>
void __gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >::operator() (
    node_iterator ,
    node_const_iterator ) const [inline], [protected]
```

Updates the rank of a node through a node\_iterator node\_it; end\_nd\_it is the end node iterator.

The documentation for this class was generated from the following file:

- [sample\\_trie\\_node\\_update.hpp](#)

## 6.899 `__gnu_pbds::sample_update_policy` Struct Reference

```
#include <sample_update_policy.hpp>
```

### Public Member Functions

- [sample\\_update\\_policy](#) ()
- [sample\\_update\\_policy](#) (const [sample\\_update\\_policy](#) &)
- void [swap](#) ([sample\\_update\\_policy](#) &other)

### Protected Types

- typedef some\_metadata\_type [metadata\\_type](#)

### Protected Member Functions

- [metadata\\_type operator\(\)](#) () const
- bool [operator\(\)](#) (metadata\_reference) const

#### 6.899.1 Detailed Description

A sample list-update policy.

#### 6.899.2 Member Typedef Documentation

##### `metadata_type`

```
typedef some_metadata_type __gnu_pbds::sample_update_policy::metadata_type [protected]
```

Metadata on which this functor operates.

#### 6.899.3 Constructor & Destructor Documentation

##### `sample_update_policy()` [1/2]

```
__gnu_pbds::sample_update_policy::sample_update_policy ()
```

Default constructor.

Referenced by [sample\\_update\\_policy\(\)](#), and [swap\(\)](#).

##### `sample_update_policy()` [2/2]

```
__gnu_pbds::sample_update_policy::sample_update_policy (  
    const sample_update_policy & )
```

Copy constructor.

References [sample\\_update\\_policy\(\)](#).

#### 6.899.4 Member Function Documentation

##### `operator>()()` [1/2]

```
metadata\_type __gnu_pbds::sample_update_policy::operator() () const [protected]
```

Creates a metadata object.

**operator>()** [2/2]

```
bool __gnu_pbds::sample_update_policy::operator() (
    metadata_reference ) const [protected]
```

Decides whether a metadata object should be moved to the front of the list. A list-update based containers object will call this method to decide whether to move a node to the front of the list. The method should return true if the node should be moved to the front of the list.

**swap()**

```
void __gnu_pbds::sample_update_policy::swap (
    sample_update_policy & other) [inline]
```

Swaps content.

References [sample\\_update\\_policy\(\)](#).

The documentation for this struct was generated from the following file:

- [sample\\_update\\_policy.hpp](#)

**6.900 \_\_gnu\_parallel::sampling\_tag Struct Reference**

```
#include <tags.h>
```

Inheritance diagram for \_\_gnu\_parallel::sampling\_tag:

**Public Member Functions**

- [sampling\\_tag](#) ([\\_ThreadIndex](#) \_\_num\_threads)
- [\\_ThreadIndex](#) [\\_\\_get\\_num\\_threads](#) ()
- void [set\\_num\\_threads](#) ([\\_ThreadIndex](#) \_\_num\_threads)

**6.900.1 Detailed Description**

Forces parallel merging with exact splitting, at compile time.

**6.900.2 Member Function Documentation****\_\_get\_num\_threads()**

```
\_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads () [inline], [inherited]
```

Find out desired number of threads.

### Returns

Desired number of threads.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#), and [\\_\\_gnu\\_parallel::\\_\\_parallel\\_sort\(\)](#).

### set\_num\_threads()

```
void __gnu_parallel::parallel_tag::set_num_threads (
    __ThreadIndex __num_threads) [inline], [inherited]
```

Set the desired number of threads.

### Parameters

|                            |                            |
|----------------------------|----------------------------|
| <code>__num_threads</code> | Desired number of threads. |
|----------------------------|----------------------------|

The documentation for this struct was generated from the following file:

## 6.905 `__gnu_pbds::detail::select_value_type< Key, Mapped >` Struct Template Reference

```
#include <types_traits.hpp>
```

### Public Types

- typedef `std::pair< const Key, Mapped >` **type**

#### 6.905.1 Detailed Description

```
template<typename Key, typename Mapped>
struct __gnu_pbds::detail::select_value_type< Key, Mapped >
```

Choose `value_type` to be a key/value pair or just a key.

The documentation for this struct was generated from the following file:

- [types\\_traits.hpp](#)

## 6.906 `__gnu_pbds::detail::select_value_type< Key, null_type >` Struct Template Reference

```
#include <types_traits.hpp>
```

### Public Types

- typedef `Key` **type**

#### 6.906.1 Detailed Description

```
template<typename Key>
struct __gnu_pbds::detail::select_value_type< Key, null_type >
```

Specialization for sets where the key is the `value_type`.

The documentation for this struct was generated from the following file:

- [types\\_traits.hpp](#)

## 6.907 `std::basic_istream< _CharT, _Traits >::sentry` Class Reference

```
#include <istream>
```

### Public Types

- typedef `__istream_type::__ctype_type` **\_\_ctype\_type**
- typedef `_Traits::int_type` **\_\_int\_type**
- typedef `basic_istream< _CharT, _Traits >` **\_\_istream\_type**
- typedef `basic_streambuf< _CharT, _Traits >` **\_\_streambuf\_type**
- typedef `_Traits traits_type`

### Public Member Functions

- [sentry](#) (`basic_istream< _CharT, _Traits > &__is`, `bool __noskipws=false`)
- [operator bool](#) () const

### 6.907.1 Detailed Description

template<typename \_CharT, typename \_Traits>  
class std::basic\_istream< \_CharT, \_Traits >::sentry

Performs setup work for input streams.

Objects of this class are created before all of the standard extractors are run. It is responsible for *exception-safe prefix and suffix operations*, although only prefix actions are currently required by the standard.

### 6.907.2 Member Typedef Documentation

#### traits\_type

```
template<typename _CharT, typename _Traits>
typedef _Traits std::basic_istream< _CharT, _Traits >::sentry::traits_type
```

Easy access to dependent types.

### 6.907.3 Constructor & Destructor Documentation

#### sentry()

```
template<typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits >::sentry::sentry (
    basic_istream< _CharT, _Traits > & __is,
    bool __noskipws = false) [explicit]
```

The constructor performs all the work.

#### Parameters

|                         |                                       |
|-------------------------|---------------------------------------|
| <code>__is</code>       | The input stream to guard.            |
| <code>__noskipws</code> | Whether to consume whitespace or not. |

If the stream state is good (`__is.good()` is true), then the following actions are performed, otherwise the sentry state is false (*not okay*) and failbit is set in the stream state.

The sentry's preparatory actions are:

1. if the stream is tied to an output stream, `is.tie()->flush()` is called to synchronize the output sequence
2. if `__noskipws` is false, and `ios_base::skipws` is set in `is.flags()`, the sentry extracts and discards whitespace characters from the stream. The currently imbued locale is used to determine whether each character is whitespace.

If the stream state is still good, then the sentry state becomes true (*okay*).

References [std::basic\\_istream< \\_CharT, \\_Traits >::basic\\_istream\(\)](#), [std::ios\\_base::badbit](#), [std::basic\\_ios< \\_CharT, \\_Traits >::good\(\)](#), and [std::ios\\_base::goodbit](#).

### 6.907.4 Member Function Documentation

#### operator bool()

```
template<typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits >::sentry::operator bool () const [inline], [explicit]
```

Quick status checking.

**Returns**

The sentry state.

For ease of use, sentries may be converted to booleans. The return value is that of the sentry state (`true == okay`). The documentation for this class was generated from the following files:

- [istream](#)
- [istream.tcc](#)

**6.908 std::basic\_ostream< \_CharT, \_Traits >::sentry Class Reference**

```
#include <ostream.h>
```

**Public Member Functions**

- [sentry](#) ([basic\\_ostream](#)< \_CharT, \_Traits > &\_\_os)
- [~sentry](#) ()
- [operator bool](#) () const

**6.908.1 Detailed Description**

```
template<typename _CharT, typename _Traits>
class std::basic_ostream< _CharT, _Traits >::sentry
```

Performs setup work for output streams.

Objects of this class are created before all of the standard inserters are run. It is responsible for *exception-safe prefix and suffix operations*.

**6.908.2 Constructor & Destructor Documentation****sentry()**

```
template<typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits >::sentry::sentry (
    basic_ostream< _CharT, _Traits > & __os) [explicit]
```

The constructor performs preparatory work.

**Parameters**

|                   |                             |
|-------------------|-----------------------------|
| <code>__os</code> | The output stream to guard. |
|-------------------|-----------------------------|

If the stream state is good (`__os.good()` is true), then if the stream is tied to another output stream, `is-<tie()->flush()` is called to synchronize the output sequences.

If the stream state is still good, then the sentry state becomes true (*okay*).

References [std::basic\\_ostream< \\_CharT, \\_Traits >::basic\\_ostream\(\)](#), [std::basic\\_ios< \\_CharT, \\_Traits >::bad\(\)](#), [std::ios\\_base::failbit](#), [std::basic\\_ios< \\_CharT, \\_Traits >::good\(\)](#), [std::basic\\_ios< \\_CharT, \\_Traits >::setstate\(\)](#), and [std::basic\\_ios< \\_CharT, \\_Traits >::tie\(\)](#).

**~sentry()**

```
template<typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits >::sentry::~~sentry () [inline]
```

Possibly flushes the stream.

If `ios_base::unitbuf` is set in `os.flags()`, and `std::uncaught_exception()` is true, the sentry destructor flushes the output stream.

References [std::ios\\_base::badbit](#), [std::uncaught\\_exception\(\)](#), and [std::ios\\_base::unitbuf](#).

### 6.908.3 Member Function Documentation

#### operator bool()

```
template<typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits >::sentry::operator bool () const [inline], [explicit]
Quick status checking.
```

#### Returns

The sentry state.

For ease of use, sentries may be converted to booleans. The return value is that of the sentry state (true == okay). The documentation for this class was generated from the following files:

- [ostream.h](#)
- [ostream.tcc](#)

#### 6.912.1 Detailed Description

`template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>  
class std::set< _Key, _Compare, _Alloc >`

A standard container made up of unique keys, which can be retrieved in logarithmic time.

Since

C++98

#### Template Parameters

|                       |                                                                              |
|-----------------------|------------------------------------------------------------------------------|
| <code>_Key</code>     | Type of key objects.                                                         |
| <code>_Compare</code> | Comparison function object type, defaults to <code>less&lt;_Key&gt;</code> . |
| <code>_Alloc</code>   | Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .             |

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys).

Sets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

### 6.912.2 Member Typedef Documentation

#### allocator\_type

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
typedef _Alloc std::set<_Key, _Compare, _Alloc>::allocator_type
Public typedefs.
```

Public typedefs.
```

### value\_type

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵  
_Key>>  
typedef _Key std::set< _Key, _Compare, _Alloc >::value_type  
Public typedefs.
```

### 6.912.3 Constructor & Destructor Documentation

#### set() [1/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
std::set<_Key, _Compare, _Alloc >::set () [default]
```

Default constructor creates no elements.

#### set() [2/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
std::set<_Key, _Compare, _Alloc >::set (
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Creates a set with no elements.

#### Parameters

|                     |                      |
|---------------------|----------------------|
| <code>__comp</code> | Comparator to use.   |
| <code>__a</code>    | An allocator object. |

#### set() [3/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
template<typename _InputIterator>
```

```
std::set<_Key, _Compare, _Alloc >::set (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

Builds a set from a range.

#### Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

Create a set consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is `distance(__first, __last)`).

#### set() [4/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
template<typename _InputIterator>
```

```
std::set<_Key, _Compare, _Alloc >::set (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __comp,
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a set from a range.

**Parameters**

|                      |                       |
|----------------------|-----------------------|
| <code>__first</code> | An input iterator.    |
| <code>__last</code>  | An input iterator.    |
| <code>__comp</code>  | A comparison functor. |
| <code>__a</code>     | An allocator object.  |

Create a set consisting of copies of the elements from `[__first,__last)`. This is linear in  $N$  if the range is already sorted, and  $N\log N$  otherwise (where  $N$  is `distance(__first,__last)`).

**set()** [5/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
    const set< _Key, _Compare, _Alloc > & ) [default]
```

Set copy constructor.

Whether the allocator is copied depends on the allocator traits.

**set()** [6/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
    set< _Key, _Compare, _Alloc > && ) [default]
```

Set move constructor

The newly-created set contains the exact contents of the moved instance. The moved instance is a valid, but unspecified, set.

**set()** [7/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
    initializer_list< value_type > __l,
    const _Compare & __comp = _Compare(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds a set from an `initializer_list`.

**Parameters**

|                     |                                    |
|---------------------|------------------------------------|
| <code>__l</code>    | An <code>initializer_list</code> . |
| <code>__comp</code> | A comparison functor.              |
| <code>__a</code>    | An allocator object.               |

Create a set consisting of copies of the elements in the list. This is linear in  $N$  if the list is already sorted, and  $N\log N$

otherwise (where N is `__l.size()`).

#### set() [8/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::set (
    const allocator_type & __a) [inline], [explicit]
```

Allocator-extended default constructor.

#### set() [9/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::set (
    const set<_Key, _Compare, _Alloc> & __x,
    const __type_identity_t< allocator_type > & __a) [inline]
```

Allocator-extended copy constructor.

#### set() [10/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::set (
    set<_Key, _Compare, _Alloc> && __x,
    const __type_identity_t< allocator_type > & __a) [inline], [noexcept]
```

Allocator-extended move constructor.

#### set() [11/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::set (
    initializer_list< value_type > __l,
    const allocator_type & __a) [inline]
```

Allocator-extended initializer-list constructor.

#### set() [12/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator>
std::set<_Key, _Compare, _Alloc>::set (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a) [inline]
```

Allocator-extended range constructor.

#### ~set()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::~~set () [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

#### 6.912.4 Member Function Documentation

##### begin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
iterator std::set< _Key, _Compare, _Alloc >::begin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

##### cbegin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
iterator std::set< _Key, _Compare, _Alloc >::cbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

##### cend()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
iterator std::set< _Key, _Compare, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

##### clear()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
void std::set< _Key, _Compare, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in a set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

##### contains() [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
template<typename _Kt>
```

```
auto std::set< _Key, _Compare, _Alloc >::contains (
    const _Kt & __x) const -> decltype(_M_t._M_find_tr(__x), void()), true) [inline]
```

Finds whether an element with the given key exists.

##### Parameters

|                  |                                |
|------------------|--------------------------------|
| <code>↵</code>   | Key of elements to be located. |
| <code>__x</code> |                                |

##### Returns

True if there is an element with the specified key.

**contains()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
bool std::set<_Key, _Compare, _Alloc >::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                  |                                |
|------------------|--------------------------------|
| <code>__x</code> | Key of elements to be located. |
|------------------|--------------------------------|

**Returns**

True if there is an element with the specified key.

**count()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::set<_Key, _Compare, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

|                  |                     |
|------------------|---------------------|
| <code>__x</code> | Element to located. |
|------------------|---------------------|

**Returns**

Number of elements with specified key.

This function only makes sense for multisets; for set the result will either be 0 (not present) or 1 (present).

**crbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::set<_Key, _Compare, _Alloc >::crbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

**crend()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::set<_Key, _Compare, _Alloc >::crend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

**emplace()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args>
std::pair< iterator, bool > std::set< _Key, _Compare, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Attempts to build and insert an element into the set.

**Parameters**

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__args</code> | Arguments used to generate an element. |
|---------------------|----------------------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

**emplace\_hint()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args>
iterator std::set< _Key, _Compare, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Attempts to insert an element into the set.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__args</code> | Arguments used to generate the element to be inserted.                        |

**Returns**

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires logarithmic time (if the hint is not taken).

**empty()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
bool std::set< _Key, _Compare, _Alloc >::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the set is empty.

**end()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
iterator std::set<_Key, _Compare, _Alloc>::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

**equal\_range()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
std::pair< iterator, iterator > std::set<_Key, _Compare, _Alloc>::equal_range (
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

**equal\_range()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
std::pair< const_iterator, const_iterator > std::set<_Key, _Compare, _Alloc>::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

**erase()** [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
size_type std::set< _Key, _Compare, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <code>__x</code> | Key of element to be erased. |
|------------------|------------------------------|

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from a set.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from a set.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find() [1/2]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc >::find (
    const key_type & __x) [inline]
```

Tries to locate an element in a set.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__x</code> | Element to be located. |
|------------------|------------------------|

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

**find() [2/2]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::set<_Key, _Compare, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in a set.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__x</code> | Element to be located. |
|------------------|------------------------|

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

**get\_allocator()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
allocator_type std::set< _Key, _Compare, _Alloc >::get_allocator () const [inline], [noexcept]
```

Returns the allocator object with which the set was constructed.

**insert() [1/5]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
template<typename _InputIterator>
```

```
void std::set< _Key, _Compare, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

**Parameters**

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

**insert() [2/5]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
std::pair< iterator, bool > std::set< _Key, _Compare, _Alloc >::insert (
    const value_type & __x) [inline]
```

Attempts to insert an element into the set.

**Parameters**

|                  |                         |
|------------------|-------------------------|
| <code>__x</code> | Element to be inserted. |
|------------------|-------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

Referenced by `std::set< _Key, _Cmp, polymorphic_allocator< _Key > >::insert()`.

**insert() [3/5]**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
iterator std::set< _Key, _Compare, _Alloc >::insert (
    const_iterator __position,
    const value_type & __x) [inline]
```

Attempts to insert an element into the set.

#### Parameters

|                         |                                                                               |
|-------------------------|-------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>        | Element to be inserted.                                                       |

#### Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

If a heterogeneous key `__k` matches a range of elements, an iterator to the first is returned.

Insertion requires logarithmic time (if the hint is not taken).

#### insert() [4/5]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc >::insert (
    const_iterator __position,
    value_type && __x) [inline]
```

Attempts to insert an element into the set.

#### Parameters

|                         |                                                                               |
|-------------------------|-------------------------------------------------------------------------------|
| <code>__position</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>        | Element to be inserted.                                                       |

#### Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

If a heterogeneous key `__k` matches a range of elements, an iterator to the first is returned.

Insertion requires logarithmic time (if the hint is not taken).

#### insert() [5/5]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
void std::set<_Key, _Compare, _Alloc >::insert (
    initializer_list<value_type> & __l) [inline]
```

Attempts to insert a list of elements into the set.

**Parameters**

|                 |                                                                                    |
|-----------------|------------------------------------------------------------------------------------|
| <code>↵</code>  | A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted. |
| <code>_↵</code> |                                                                                    |
| <code>↵</code>  |                                                                                    |
| <code>_↵</code> |                                                                                    |
| <code>/</code>  |                                                                                    |

Complexity similar to that of the range constructor.

**key\_comp()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
key_compare std::set< _Key, _Compare, _Alloc >::key_comp () const [inline]
```

Returns the comparison object with which the set was constructed.

**lower\_bound()** [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
iterator std::set< _Key, _Compare, _Alloc >::lower_bound (
    const key_type & __x) [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_x</code> |                    |

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

**lower\_bound()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
const_iterator std::set< _Key, _Compare, _Alloc >::lower_bound (
    const key_type & __x) const [inline]
```

Finds the beginning of a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_x</code> |                    |

**Returns**

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

**max\_size()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
size_type std::set<_Key, _Compare, _Alloc>::max_size () const [inline], [noexcept]
```

Returns the maximum size of the set.

**operator=()** [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
set & std::set<_Key, _Compare, _Alloc>::operator= (
    const set<_Key, _Compare, _Alloc> & ) [default]
```

Set assignment operator.

Whether the allocator is copied depends on the allocator traits.

**operator=()** [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
set & std::set<_Key, _Compare, _Alloc>::operator= (
    initializer_list<value_type> & __l) [inline]
```

Set list assignment operator.

**Parameters**

|   |                      |
|---|----------------------|
| ↵ | An initializer_list. |
| ↵ |                      |
| ↵ |                      |
| ↵ |                      |
| / |                      |

This function fills a set with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the set and that the resulting set's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
set & std::set<_Key, _Compare, _Alloc>::operator= (
    set<_Key, _Compare, _Alloc> && ) [default]
```

Move assignment operator.

**rbegin()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
reverse_iterator std::set< _Key, _Compare, _Alloc >::rbegin () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

### rend()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
reverse_iterator std::set< _Key, _Compare, _Alloc >::rend () const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

### size()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
size_type std::set< _Key, _Compare, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the set.

### swap()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
void std::set< _Key, _Compare, _Alloc >::swap (
    set< _Key, _Compare, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another set.

### Parameters

|                  |                                                |
|------------------|------------------------------------------------|
| <code>↵</code>   | A set of the same element and allocator types. |
| <code>__x</code> |                                                |

This exchanges the elements between two sets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Referenced by [std::swap\(\)](#).

### upper\_bound() [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
iterator std::set< _Key, _Compare, _Alloc >::upper_bound (
    const key_type & __x) [inline]
```

Finds the end of a subsequence matching given key.

### Parameters

|                  |                    |
|------------------|--------------------|
| <code>↵</code>   | Key to be located. |
| <code>__x</code> |                    |

**Returns**

Iterator pointing to the first element greater than key, or end().

**upper\_bound()** [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::set<_Key, _Compare, _Alloc>::upper_bound (
    const key_type & __x) const [inline]
```

Finds the end of a subsequence matching given key.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

**Returns**

Iterator pointing to the first element greater than key, or end().

**value\_comp()**

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
value_compare std::set<_Key, _Compare, _Alloc>::value_comp () const [inline]
```

Returns the comparison object with which the set was constructed.

### 6.913.1 Detailed Description

```
template<typename _Res>
class std::shared_future< _Res >
```

Primary template for shared\_future.

### 6.913.2 Constructor & Destructor Documentation

#### **shared\_future()** [1/3]

```
template<typename _Res>
std::shared_future< _Res >::shared_future (
    const shared_future< _Res > & __sf) [inline], [noexcept]
```

Copy constructor.

#### **shared\_future()** [2/3]

```
template<typename _Res>
std::shared_future< _Res >::shared_future (
    future< _Res > && __uf) [inline], [noexcept]
```

Construct from a future rvalue.

References [std::move\(\)](#).

#### **shared\_future()** [3/3]

```
template<typename _Res>
std::shared_future< _Res >::shared_future (
    shared_future< _Res > && __sf) [inline], [noexcept]
```

Construct from a shared\_future rvalue.

References [std::move\(\)](#).

### 6.913.3 Member Function Documentation

#### M\_get\_result()

```
template<typename _Res>
```

```
__result_type std::__basic_future<_Res>::_M_get_result () const [inline], [protected], [inherited]
```

Wait for the state to be ready and rethrow any stored exception.

Referenced by [std::future<\\_Res>::get\(\)](#), and [std::shared\\_future<\\_Res>::get\(\)](#).

#### get()

```
template<typename _Res>
```

```
const _Res & std::shared_future<_Res>::get () const [inline]
```

Retrieving the value.

References [std::\\_\\_basic\\_future<\\_Res>::\\_M\\_get\\_result\(\)](#).

The documentation for this class was generated from the following file:

### 6.917.1 Detailed Description

**template<typename \_Tp>**  
**class std::shared\_ptr< \_Tp >**

A smart pointer with reference-counted copy semantics.

Since

C++11

A `shared_ptr` object is either empty or *owns* a pointer passed to the constructor. Copies of a `shared_ptr` share ownership of the same pointer. When the last `shared_ptr` that owns the pointer is destroyed or reset, the owned pointer is freed (either by `delete` or by invoking a custom deleter that was passed to the constructor).

A `shared_ptr` also stores another pointer, which is usually (but not always) the same pointer as it owns. The stored pointer can be retrieved by calling the `get()` member function.

The equality and relational operators for `shared_ptr` only compare the stored pointer returned by `get()`, not the owned pointer. To test whether two `shared_ptr` objects share ownership of the same pointer see `std::shared_ptr::owner_before` and `std::owner_less`.

### 6.917.2 Member Typedef Documentation

#### element\_type

```
template<typename _Tp>
```

```
using std::shared\_ptr< _Tp >::element_type
```

The type pointed to by the stored pointer, `remove_extent_t<_Tp>`.

### 6.917.3 Constructor & Destructor Documentation

#### `shared_ptr()` [1/14]

```
template<typename _Tp>
```

```
std::shared\_ptr< _Tp >::shared_ptr () [inline], [constexpr], [noexcept]
```

Construct an empty `shared_ptr`.

#### Postcondition

```
use_count()==0 && get()==0
```

#### `shared_ptr()` [2/14]

```
template<typename _Tp>
```

```
std::shared\_ptr< _Tp >::shared_ptr (
    const shared\_ptr< _Tp > & ) [default], [noexcept]
```

Copy constructor.

#### `shared_ptr()` [3/14]

```
template<typename _Tp>
```

```
template<typename _Yp, typename = _Constructible<_Yp*>>
```

```
std::shared\_ptr< _Tp >::shared_ptr (
    _Yp * __p) [inline], [explicit]
```

Construct a `shared_ptr` that owns the pointer `__p`.

#### Parameters

|                                 |                                                               |
|---------------------------------|---------------------------------------------------------------|
| <code><a href="#">_↵</a></code> | A pointer that is convertible to <code>element_type*</code> . |
| <code><a href="#">_p</a></code> |                                                               |

#### Postcondition

```
use_count() == 1 && get() == \_p
```

#### Exceptions

|                                                 |                                                              |
|-------------------------------------------------|--------------------------------------------------------------|
| <code><a href="#">std::bad_alloc</a>, in</code> | which case <code>delete <a href="#">_p</a></code> is called. |
|-------------------------------------------------|--------------------------------------------------------------|

#### `shared_ptr()` [4/14]

```
template<typename _Tp>
```

```
template<typename _Yp, typename _Deleter, typename = _Constructible<_Yp*, _Deleter>>
```

```
std::shared\_ptr< _Tp >::shared_ptr (
```

```

    __Yp * __p,
    _Deleter __d) [inline]

```

Construct a shared\_ptr that owns the pointer `__p` and the deleter `__d`.

#### Parameters

|                  |            |
|------------------|------------|
| <code>__p</code> | A pointer. |
| <code>__d</code> | A deleter. |

#### Postcondition

`use_count() == 1 && get() == __p`

#### Exceptions

|                                  |                                             |
|----------------------------------|---------------------------------------------|
| <code>std::bad_alloc</code> , in | which case <code>__d(__p)</code> is called. |
|----------------------------------|---------------------------------------------|

Requirements: `_Deleter`'s copy constructor and destructor must not throw  
`__shared_ptr` will release `__p` by calling `__d(__p)`

#### shared\_ptr() [5/14]

```

template<typename _Tp>
template<typename _Deleter>
std::shared_ptr<_Tp>::shared_ptr (
    nullptr_t __p,
    _Deleter __d) [inline]

```

Construct a shared\_ptr that owns a null pointer and the deleter `__d`.

#### Parameters

|                  |                          |
|------------------|--------------------------|
| <code>__p</code> | A null pointer constant. |
| <code>__d</code> | A deleter.               |

#### Postcondition

`use_count() == 1 && get() == __p`

#### Exceptions

|                                  |                                             |
|----------------------------------|---------------------------------------------|
| <code>std::bad_alloc</code> , in | which case <code>__d(__p)</code> is called. |
|----------------------------------|---------------------------------------------|

Requirements: `_Deleter`'s copy constructor and destructor must not throw  
The last owner will call `__d(__p)`

**shared\_ptr()** [6/14]

```

template<typename _Tp>
template<typename _Yp, typename _Deleter, typename _Alloc, typename = _Constructible<_Yp*, _↵
Deleter, _Alloc>>
std::shared_ptr< _Tp >::shared_ptr (
    _Yp * __p,
    _Deleter __d,
    _Alloc __a) [inline]

```

Construct a shared\_ptr that owns the pointer `__p` and the deleter `__d`.

**Parameters**

|                        |               |
|------------------------|---------------|
| <code>↵<br/>__p</code> | A pointer.    |
| <code>↵<br/>__d</code> | A deleter.    |
| <code>↵<br/>__a</code> | An allocator. |

**Postcondition**

`use_count() == 1 && get() == __p`

**Exceptions**

|                                  |                                             |
|----------------------------------|---------------------------------------------|
| <code>std::bad_alloc</code> , in | which case <code>__d(__p)</code> is called. |
|----------------------------------|---------------------------------------------|

Requirements: `_Deleter`'s copy constructor and destructor must not throw `_Alloc`'s copy constructor and destructor must not throw.

`__shared_ptr` will release `__p` by calling `__d(__p)`

**shared\_ptr()** [7/14]

```

template<typename _Tp>
template<typename _Deleter, typename _Alloc>
std::shared_ptr< _Tp >::shared_ptr (
    nullptr_t __p,
    _Deleter __d,
    _Alloc __a) [inline]

```

Construct a shared\_ptr that owns a null pointer and the deleter `__d`.

**Parameters**

|                        |                          |
|------------------------|--------------------------|
| <code>↵<br/>__p</code> | A null pointer constant. |
| <code>↵<br/>__d</code> | A deleter.               |
| <code>↵<br/>__a</code> | An allocator.            |

**Postcondition**

```
use_count() == 1 && get() == __p
```

**Exceptions**

|                                     |                                             |
|-------------------------------------|---------------------------------------------|
| <a href="#">std::bad_alloc</a> , in | which case <code>__d(__p)</code> is called. |
|-------------------------------------|---------------------------------------------|

Requirements: `_Deleter`'s copy constructor and destructor must not throw `_Alloc`'s copy constructor and destructor must not throw.

The last owner will call `__d(__p)`

**shared\_ptr() [8/14]**

```
template<typename _Tp>
template<typename _Yp>
std::shared_ptr< _Tp >::shared_ptr (
    const shared_ptr< _Yp > & __r,
    element_type * __p) [inline], [noexcept]
```

Constructs a `shared_ptr` instance that stores `__p` and shares ownership with `__r`.

**Parameters**

|                  |                                                                    |
|------------------|--------------------------------------------------------------------|
| <code>__r</code> | A <code>shared_ptr</code> .                                        |
| <code>__p</code> | A pointer that will remain valid while <code>*__r</code> is valid. |

**Postcondition**

```
get() == __p && use_count() == __r.use_count()
```

This can be used to construct a `shared_ptr` to a sub-object of an object managed by an existing `shared_ptr`. The complete object will remain valid while any `shared_ptr` owns it, even if they don't store a pointer to the complete object.

```
shared_ptr<pair<int,int>> pii(new pair<int,int>());
shared_ptr<int> pi(pii, &pii->first);
assert(pii.use_count() == 2);
```

**shared\_ptr() [9/14]**

```
template<typename _Tp>
template<typename _Yp>
std::shared_ptr< _Tp >::shared_ptr (
    shared_ptr< _Yp > && __r,
    element_type * __p) [inline], [noexcept]
```

Constructs a `shared_ptr` instance that stores `__p` and shares ownership with `__r`.

**Parameters**

|                       |                                                          |
|-----------------------|----------------------------------------------------------|
| $\leftarrow$<br>$\_r$ | A shared_ptr.                                            |
| $\leftarrow$<br>$\_p$ | A pointer that will remain valid while $\_\_r$ is valid. |

**Postcondition**

```
get() == __p && !__r.use_count() && !__r.get()
```

**Since**

C++17

This can be used to construct a shared\_ptr to a sub-object of an object managed by an existing shared\_ptr. The complete object will remain valid while any shared\_ptr owns it, even if they don't store a pointer to the complete object.

```
shared_ptr<pair<int,int>> pii(new pair<int,int>());
shared_ptr<int> pi1(pii, &pii->first);
assert(pii.use_count() == 2);
shared_ptr<int> pi2(std::move(pii), &pii->second);
assert(pii.use_count() == 0);
```

**shared\_ptr()** [10/14]

```
template<typename _Tp>
template<typename _Yp, typename = _Constructible<const shared_ptr<_Yp>&>>
std::shared_ptr<_Tp >::shared_ptr (
    const shared_ptr<_Yp > & __r) [inline], [noexcept]
```

If  $\_\_r$  is empty, constructs an empty shared\_ptr; otherwise construct a shared\_ptr that shares ownership with  $\_\_r$ .

**Parameters**

|                                                                         |               |
|-------------------------------------------------------------------------|---------------|
| $\leftarrow$<br>$\_\leftarrow$<br>$\leftarrow$<br>$\_\leftarrow$<br>$r$ | A shared_ptr. |
|-------------------------------------------------------------------------|---------------|

**Postcondition**

```
get() == __r.get() && use_count() == __r.use_count()
```

**shared\_ptr()** [11/14]

```
template<typename _Tp>
std::shared_ptr<_Tp >::shared_ptr (
    shared_ptr<_Tp > && __r) [inline], [noexcept]
```

Move-constructs a shared\_ptr instance from  $\_\_r$ .

**Parameters**

|          |                      |
|----------|----------------------|
| ↩        | A shared_ptr rvalue. |
| ↩        |                      |
| ↩        |                      |
| ↩        |                      |
| <i>r</i> |                      |

**Postcondition**

\*this contains the old value of \_\_r, \_\_r is empty.

**shared\_ptr() [12/14]**

```
template<typename _Tp>
template<typename _Yp, typename = _Constructible<shared_ptr<_Yp>>>
std::shared_ptr<_Tp>::shared_ptr (
    shared_ptr<_Yp> && __r) [inline], [noexcept]
```

Move-constructs a shared\_ptr instance from \_\_r.

**Parameters**

|          |                      |
|----------|----------------------|
| ↩        | A shared_ptr rvalue. |
| ↩        |                      |
| ↩        |                      |
| ↩        |                      |
| <i>r</i> |                      |

**Postcondition**

\*this contains the old value of \_\_r, \_\_r is empty.

**shared\_ptr() [13/14]**

```
template<typename _Tp>
template<typename _Yp, typename = _Constructible<const weak_ptr<_Yp>&>>
std::shared_ptr<_Tp>::shared_ptr (
    const weak_ptr<_Yp> & __r) [inline], [explicit]
```

Constructs a shared\_ptr that shares ownership with \_\_r and stores a copy of the pointer stored in \_\_r.

**Parameters**

|          |             |
|----------|-------------|
| ↩        | A weak_ptr. |
| ↩        |             |
| ↩        |             |
| ↩        |             |
| <i>r</i> |             |

**Postcondition**

`use_count() == __r.use_count()`

**Exceptions**

|                           |                                                                                |
|---------------------------|--------------------------------------------------------------------------------|
| <code>bad_weak_ptr</code> | when <code>__r.expired()</code> , in which case the constructor has no effect. |
|---------------------------|--------------------------------------------------------------------------------|

**shared\_ptr()** [14/14]

```
template<typename _Tp>
std::shared_ptr< _Tp >::shared_ptr (
    nullptr_t ) [inline], [constexpr], [noexcept]
```

Construct an empty `shared_ptr`.

**Postcondition**

`use_count() == 0 && get() == nullptr`

**6.917.4 Member Function Documentation****get()**

```
template<typename _Tp, _Lock_policy _Lp>
element_type * std::__shared_ptr< _Tp, _Lp >::get () const [inline], [noexcept], [inherited]
```

Return the stored pointer.

**operator bool()**

```
template<typename _Tp, _Lock_policy _Lp>
std::__shared_ptr< _Tp, _Lp >::operator bool () const [inline], [explicit], [noexcept], [inherited]
```

Return true if the stored pointer is not null.

**owner\_before()** [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
template<typename _Tp1>
bool std::__shared_ptr< _Tp, _Lp >::owner_before (
    __shared_ptr< _Tp1, _Lp > const & __rhs) const [inline], [noexcept], [inherited]
```

Define an ordering based on ownership.

This function defines a strict weak ordering between two `shared_ptr` or `weak_ptr` objects, such that one object is less than the other unless they share ownership of the same pointer, or are both empty.

**owner\_before()** [2/2]

```
template<typename _Tp, _Lock_policy _Lp>
template<typename _Tp1>
bool std::__shared_ptr< _Tp, _Lp >::owner_before (
    __weak_ptr< _Tp1, _Lp > const & __rhs) const [inline], [noexcept], [inherited]
```

Define an ordering based on ownership.

This function defines a strict weak ordering between two `shared_ptr` or `weak_ptr` objects, such that one object is less than the other unless they share ownership of the same pointer, or are both empty.

**swap()**

```
template<typename _Tp, _Lock_policy _Lp>
void std::__shared_ptr< _Tp, _Lp >::swap (
    __shared_ptr< _Tp, _Lp > & __other) [inline], [noexcept], [inherited]
```

Exchange both the owned pointer and the stored pointer.

**unique()**

```
template<typename _Tp, _Lock_policy _Lp>
bool std::__shared_ptr< _Tp, _Lp >::unique () const [inline], [noexcept], [inherited]
```

Return true if use\_count() == 1.

**use\_count()**

```
template<typename _Tp, _Lock_policy _Lp>
long std::__shared_ptr< _Tp, _Lp >::use_count () const [inline], [noexcept], [inherited]
```

If \*this owns a pointer, return the number of owners, otherwise zero.

The documentation for this class was generated from the following files:

#### 6.919.1 Detailed Description

```
template<typename _RandomNumberEngine, size_t __k>
class std::shuffle_order_engine<_RandomNumberEngine, __k>
```

Produces random numbers by reordering random numbers from some base engine.

The values from the base engine are stored in a sequence of size `__k` and shuffled by an algorithm that depends on those values.

C++11

## 6.919.2 Member Typedef Documentation

### result\_type

```
template<typename _RandomNumberEngine, size_t __k>
typedef _RandomNumberEngine::result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::result_type
```

The type of the generated random value.

## 6.919.3 Constructor & Destructor Documentation

### shuffle\_order\_engine() [1/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine () [inline]
```

Constructs a default shuffle\_order\_engine engine.

The underlying engine is default constructed as well.

### shuffle\_order\_engine() [2/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
    const _RandomNumberEngine & __rng) [inline], [explicit]
```

Copy constructs a shuffle\_order\_engine engine.

Copies an existing base class random number generator.

#### Parameters

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__rng</code> | An existing (base class) engine object. |
|--------------------|-----------------------------------------|

### shuffle\_order\_engine() [3/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
    _RandomNumberEngine && __rng) [inline], [explicit]
```

Move constructs a shuffle\_order\_engine engine.

Copies an existing base class random number generator.

#### Parameters

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__rng</code> | An existing (base class) engine object. |
|--------------------|-----------------------------------------|

### shuffle\_order\_engine() [4/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
    result_type __s) [inline], [explicit]
```

Seed constructs a shuffle\_order\_engine engine.

Constructs the underlying generator engine seeded with `__s`.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A seed value for the base class engine. |
|------------------|-----------------------------------------|

**shuffle\_order\_engine()** [5/5]

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
    _Sseq & __q) [inline], [explicit]
```

Generator construct a shuffle\_order\_engine engine.

**Parameters**

|                  |                  |
|------------------|------------------|
| <code>__q</code> | A seed sequence. |
|------------------|------------------|

**6.919.4 Member Function Documentation****base()**

```
template<typename _RandomNumberEngine, size_t __k>
const _RandomNumberEngine & std::shuffle_order_engine< _RandomNumberEngine, __k >::base () const
[inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

**discard()**

```
template<typename _RandomNumberEngine, size_t __k>
void std::shuffle_order_engine< _RandomNumberEngine, __k >::discard (
    unsigned long long __z) [inline]
```

Discard a sequence of random numbers.

**max()**

```
template<typename _RandomNumberEngine, size_t __k>
constexpr result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::max () [inline],
[static], [constexpr]
```

Gets the maximum value in the generated random number range.

**min()**

```
template<typename _RandomNumberEngine, size_t __k>
constexpr result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::min () [inline],
[static], [constexpr]
```

Gets the minimum value in the generated random number range.

**operator>()**

```
template<typename _RandomNumberEngine, size_t __k>
shuffle_order_engine< _RandomNumberEngine, __k >::result_type std::shuffle_order_engine< __
RandomNumberEngine, __k >::operator() ()
```

Gets the next value in the generated random number sequence.

References [std::max\(\)](#), and [std::min\(\)](#).

#### seed() [1/3]

```
template<typename _RandomNumberEngine, size_t __k>
void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed () [inline]
```

Reseeds the shuffle\_order\_engine object with the default seed for the underlying base class generator engine.

#### seed() [2/3]

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _Sseq>
_If_seed_seq< _Sseq > std::shuffle_order_engine< _RandomNumberEngine, __k >::seed (
    _Sseq & __q) [inline]
```

Reseeds the shuffle\_order\_engine object with the given seed sequence.

#### Parameters

|                    |                            |
|--------------------|----------------------------|
| <a href="#">_↔</a> | A seed generator function. |
| <a href="#">_q</a> |                            |

#### seed() [3/3]

```
template<typename _RandomNumberEngine, size_t __k>
void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed (
    result_type __s) [inline]
```

Reseeds the shuffle\_order\_engine object with the default seed for the underlying base class generator engine.

### 6.919.5 Friends And Related Symbol Documentation

#### operator<<

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _RandomNumberEngine1, size_t __k1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::shuffle_order_engine< _RandomNumberEngine1, __k1 > & __x) [friend]
```

Inserts the current state of a shuffle\_order\_engine random number generator engine \_\_x into the output stream \_\_os.

#### Parameters

|                      |                                                        |
|----------------------|--------------------------------------------------------|
| <a href="#">__os</a> | An output stream.                                      |
| <a href="#">__x</a>  | A shuffle_order_engine random number generator engine. |

#### Returns

The output stream with the state of \_\_x inserted or in an error state.

**operator==**

```
template<typename _RandomNumberEngine, size_t __k>
bool operator== (
    const shuffle_order_engine< _RandomNumberEngine, __k > & __lhs,
    const shuffle_order_engine< _RandomNumberEngine, __k > & __rhs) [friend]
```

Compares two shuffle\_order\_engine random number generator objects of the same type for equality.

**Parameters**

|                    |                                                              |
|--------------------|--------------------------------------------------------------|
| <code>__lhs</code> | A shuffle_order_engine random number generator object.       |
| <code>__rhs</code> | Another shuffle_order_engine random number generator object. |

**Returns**

true if the infinite sequences of generated values would be equal, false otherwise.

**operator>>**

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _RandomNumberEngine1, size_t __k1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::shuffle_order_engine< _RandomNumberEngine1, __k1 > & __x) [friend]
```

Extracts the current state of a % subtract\_with\_carry\_engine random number generator engine `__x` from the input stream `__is`.

**Parameters**

|                   |                                                        |
|-------------------|--------------------------------------------------------|
| <code>__is</code> | An input stream.                                       |
| <code>__x</code>  | A shuffle_order_engine random number generator engine. |

**Returns**

The input stream with the state of `__x` extracted or in an error state.

#### 6.921.1 Detailed Description

Class defining one-dimensional subset of an array.

The slice class represents a one-dimensional subset of an array, specified by three parameters: start offset, size, and stride. The start offset is the index of the first element of the array that is part of the subset. The size is the total number of elements in the subset. Stride is the distance between each successive array element to include in the subset.

For example, with an array of size 10, and a slice with offset 1, size 3 and stride 2, the subset consists of array elements 1, 3, and 5.

## Friends

- class valarray< \_Tp >

### 6.922.1 Detailed Description

template<typename \_Tp>  
class std::slice\_array< \_Tp >

Reference to one-dimensional subset of an array.

A slice\_array is a reference to the actual elements of an array specified by a slice. The way to get a slice\_array is to call operator[](slice) on a valarray. The returned slice\_array then permits carrying operations out on the referenced subset of elements in the original valarray. For example, operator+=(valarray) will add values to the subset of elements in the underlying valarray this slice\_array refers to.

## Parameters

|           |               |
|-----------|---------------|
| <i>Tp</i> | Element type. |
|-----------|---------------|

## 6.922.2 Member Function Documentation

### **operator%=( )**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator%= (
    const valarray< _Tp > & ) const
```

Modulo slice elements by corresponding elements of *v*.

### **operator&=( )**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator&= (
    const valarray< _Tp > & ) const
```

Logical and slice elements with corresponding elements of *v*.

### **operator\*=( )**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator*= (
    const valarray< _Tp > & ) const
```

Multiply slice elements by corresponding elements of *v*.

### **operator+=( )**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator+= (
    const valarray< _Tp > & ) const
```

Add corresponding elements of *v* to slice elements.

### **operator-=( )**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator-= (
    const valarray< _Tp > & ) const
```

Subtract corresponding elements of *v* from slice elements.

### **operator/=( )**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator/= (
    const valarray< _Tp > & ) const
```

Divide slice elements by corresponding elements of *v*.

### **operator<<=( )**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator<<= (
    const valarray< _Tp > & ) const
```

Left shift slice elements by corresponding elements of *v*.

### **operator>>=( )**

```
template<typename _Tp>
void std::slice_array< _Tp >::operator>>= (
    const valarray< _Tp > & ) const
```

Right shift slice elements by corresponding elements of *v*.

### **operator<sup>^</sup>=( )**

```
template<typename _Tp>
void std::slice_array<_Tp>::operator^= (
    const valarray<_Tp> & ) const
```

Logical xor slice elements with corresponding elements of *v*.

### **operator" |=()**

```
template<typename _Tp>
void std::slice_array<_Tp>::operator|= (
    const valarray<_Tp> & ) const
```

Logical or slice elements with corresponding elements of *v*.

The documentation for this class was generated from the following files:

#### 6.926.1 Detailed Description

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
```

```
class __gnu_pbds::detail::splay_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >
```

Splay tree.

## 6.926.2 Member Function Documentation

### node\_begin() [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>
```

```
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu↵
pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_b↵
egin () [inline], [inherited]
```

Returns a `node_iterator` corresponding to the node at the root of the tree.

### node\_begin() [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>
```

```
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __↵
gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node↵
begin () const [inline], [inherited]
```

Returns a const `node_iterator` corresponding to the node at the root of the tree.

### node\_end() [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>
```

```
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu↵
pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_e↵
nd () [inline], [inherited]
```

Returns a `node_iterator` corresponding to a node just after a leaf of the tree.

### node\_end() [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>
```

```
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __↵
gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node↵
end () const [inline], [inherited]
```

Returns a const `node_iterator` corresponding to a node just after a leaf of the tree.

The documentation for this class was generated from the following file:

- [splay\\_tree.hpp](#)

## 6.927 \_\_gnu\_pbds::detail::splay\_tree\_node\_< Value\_Type, Metadata, \_Alloc > Struct Template Reference

### 6.929.1 Detailed Description

`template<typename _Tp, typename _Sequence = deque<_Tp>>`  
**class** `std::stack< _Tp, _Sequence >`

A standard container giving FILO behavior.

## Template Parameters

|                        |                                                                          |
|------------------------|--------------------------------------------------------------------------|
| <code>_Tp</code>       | Type of element.                                                         |
| <code>_Sequence</code> | Type of underlying sequence, defaults to <code>deque&lt;_Tp&gt;</code> . |

Meets many of the requirements of a [container](#), but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-last-out stack behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `back`, `push_back`, and `pop_back`, such as `std::list`, `std::vector`, or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push`, `pop`, and `top`, which are standard stack/FILO operations.

### 6.929.2 Constructor & Destructor Documentation

#### `stack()`

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<is_default_constructible<↔
_Seq>::value>::type>
std::stack<_Tp, _Sequence>::stack () [inline]
```

Default constructor creates no elements.

### 6.929.3 Member Function Documentation

#### `empty()`

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
bool std::stack<_Tp, _Sequence>::empty () const [inline], [nodiscard]
```

Returns true if the stack is empty.

#### `pop()`

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::stack<_Tp, _Sequence>::pop () [inline]
```

Removes first element.

This is a typical stack operation. It shrinks the stack by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

#### `push()`

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::stack<_Tp, _Sequence>::push (
    const value_type & __x) [inline]
```

Add data to the top of the stack.

#### Parameters

|                  |                   |
|------------------|-------------------|
| <code>__x</code> | Data to be added. |
|------------------|-------------------|

This is a typical stack operation. The function creates an element at the top of the stack and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

#### `size()`

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
size_type std::stack<_Tp, _Sequence>::size () const [inline], [nodiscard]
```

Returns the number of elements in the stack.

**top()** [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::stack<_Tp, _Sequence>::top () [inline], [nodiscard]
```

Returns a read/write reference to the data at the first element of the stack.

**top()** [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::stack<_Tp, _Sequence>::top () const [inline], [nodiscard]
```

Returns a read-only (constant) reference to the data at the first element of the stack.

The documentation for this class was generated from the following file:

- [stl\\_stack.h](#)

**6.930 \_\_gnu\_cxx::stdio\_filebuf<\_CharT, \_Traits> Class Template Reference**

### 6.930.1 Detailed Description

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
class __gnu_cxx::stdio_filebuf< _CharT, _Traits >
```

Provides a layer of compatibility for C/POSIX.

This GNU extension provides extensions for working with standard C FILE\*'s and POSIX file descriptors. It must be instantiated by the user with the type of character used in the file stream, e.g., `stdio_filebuf<char>`.

### 6.930.2 Constructor & Destructor Documentation

#### `stdio_filebuf()` [1/3]

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf () [inline]
deferred initialization
References std::basic\_filebuf<\_CharT, \_Traits>::basic\_filebuf\(\).
```

#### `stdio_filebuf()` [2/3]

```
template<typename _CharT, typename _Traits>
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf (
    int __fd,
    std::ios_base::openmode __mode,
    size_t __size = static_cast<size_t>( BUFSIZ ))
```

#### Parameters

|                     |                                                         |
|---------------------|---------------------------------------------------------|
| <code>__fd</code>   | An open file descriptor.                                |
| <code>__mode</code> | Same meaning as in a standard filebuf.                  |
| <code>__size</code> | Optimal or preferred size of internal buffer, in chars. |

This constructor associates a file stream buffer with an open POSIX file descriptor. The file descriptor will be automatically closed when the `stdio_filebuf` is closed/destroyed.

References [std::basic\\_filebuf<\\_CharT, \\_Traits>::\\_M\\_buf\\_size](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::\\_M\\_mode](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::\\_M\\_reading](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::\\_M\\_set\\_buffer\(\)](#), and [std::basic\\_filebuf<\\_CharT, \\_Traits>::is\\_open\(\)](#).

#### `stdio_filebuf()` [3/3]

```
template<typename _CharT, typename _Traits>
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf (
    std::__c_file * __f,
```

```
std::ios_base::openmode __mode,
size_t __size = static_cast<size_t>( BUFSIZ ))
```

### Parameters

|                     |                                                                                      |
|---------------------|--------------------------------------------------------------------------------------|
| <code>__f</code>    | An open FILE*.                                                                       |
| <code>__mode</code> | Same meaning as in a standard filebuf.                                               |
| <code>__size</code> | Optimal or preferred size of internal buffer, in chars. Defaults to system's BUFSIZ. |

This constructor associates a file stream buffer with an open C FILE\*. The FILE\* will not be automatically closed when the stdio\_filebuf is closed/destroyed.

References [std::basic\\_filebuf<\\_CharT, \\_Traits>::\\_M\\_buf\\_size](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::\\_M\\_mode](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::\\_M\\_reading](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::\\_M\\_set\\_buffer\(\)](#), and [std::basic\\_filebuf<\\_CharT, \\_Traits>::is\\_open\(\)](#).

### ~stdio\_filebuf()

```
template<typename _CharT, typename _Traits>
__gnu_cxx::stdio_filebuf<_CharT, _Traits>::~~stdio_filebuf () [virtual]
```

Closes the external data stream if the file descriptor constructor was used.

## 6.930.3 Member Function Documentation

### \_M\_create\_pback()

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf<_CharT, _Traits>::_M_create_pback () [inline], [protected], [inherited]
```

Initializes pback buffers, and moves normal buffers to safety. Assumptions: `_M_in_cur` has already been moved back. Referenced by [pbackfail\(\)](#).

### \_M\_destroy\_pback()

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf<_CharT, _Traits>::_M_destroy_pback () throw ( ) [inline], [protected], [inherited]
```

Deactivates pback buffer contents, and restores normal buffer. Assumptions: The pback buffer has only moved forward. Referenced by [overflow\(\)](#), [seekoff\(\)](#), [seekpos\(\)](#), [underflow\(\)](#), and [xsgetn\(\)](#).

### \_M\_set\_buffer()

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf<_CharT, _Traits>::_M_set_buffer (
    streamsize __off) [inline], [protected], [inherited]
```

This function sets the pointers of the internal buffer, both get and put areas. Typically:

`__off == egptr() - eback()` upon underflow/uflow (**read** mode); `__off == 0` upon overflow (**write** mode); `__off == -1` upon open, setbuf, seekoff/pos (**uncommitted** mode).

NB: `egptr() - pbase() == _M_buf_size - 1`, since `_M_buf_size` reflects the actual allocated memory and the last cell is reserved for the overflow char of a full put area.

Referenced by [\\_\\_gnu\\_cxx::stdio\\_filebuf<\\_CharT, \\_Traits>::stdio\\_filebuf\(\)](#), [\\_\\_gnu\\_cxx::stdio\\_filebuf<\\_CharT, \\_Traits>::stdio\\_filebuf\(\)](#), [close\(\)](#), [imbue\(\)](#), [open\(\)](#), [overflow\(\)](#), [pbackfail\(\)](#), [underflow\(\)](#), [xsgetn\(\)](#), and [xsputn\(\)](#).

**close()**

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::__filebuf_type * std::basic_filebuf< _CharT, _Traits >::close
() [inherited]
```

Closes the currently associated file.

**Returns**

`this` on success, `NULL` on failure

If no file is currently open, this function immediately fails.

If a *put buffer area* exists, `overflow(eof)` is called to flush all the characters. The file is then closed.

If any operations fail, this function also fails.

References `basic_filebuf()`, `_M_mode`, `_M_pback_init`, `_M_reading`, `_M_set_buffer()`, and `is_open()`.

Referenced by `std::basic_filebuf< char_type, traits_type >::~~basic_filebuf()`, and `open()`.

**eback()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::eback () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::basic_filebuf< char_type, traits_type >::_M_destroy_pback()`, `std::basic_filebuf< _CharT, _Traits >::imbue()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow()`, `std::basic_filebuf< _CharT, _Traits >::pbackfail()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos()`, `std::basic_streambuf< char_type, traits_type >::sputbackc()`, `std::basic_streambuf< char_type, traits_type >::sungetc()`, `std::basic_filebuf< _CharT, _Traits >::underflow()`, and `std::basic_filebuf< _CharT, _Traits >::xsgetn()`.

**egptr()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::egptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::basic_filebuf< char_type, traits_type >::_M_create_pback()`, `std::basic_streambuf< char_type, traits_type >::in_avail()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow()`, `std::basic_streambuf< char_type, traits_type >::sbumpc()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos()`, `std::basic_streambuf< char_type, traits_type >::sgetc()`, `std::basic_filebuf< _CharT, _Traits >::showmanyc()`, `std::basic_stringbuf< char_type, traits_type, _Alloc >::underflow()`, `std::basic_filebuf< _CharT, _Traits >::underflow()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::underflow()`, `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow()`, `std::basic_filebuf< _CharT, _Traits >::xsgetn()`, and `xsgetn()`.

**epptr()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::epptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Referenced by [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::overflow\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::seekoff\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::seekpos\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sputc\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::xsputn\(\)](#), and [xsputn\(\)](#).

**fd()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
int __gnu_cxx::stdio_filebuf< _CharT, _Traits >::fd () [inline]
```

**Returns**

The underlying file descriptor.

Once associated with an external data stream, this function can be used to access the underlying POSIX file descriptor. Note that there is no way for the library to track what you do with the descriptor, so be careful.

**file()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
std::__c_file * __gnu_cxx::stdio_filebuf< _CharT, _Traits >::file () [inline]
```

**Returns**

The underlying FILE\*.

This function can be used to access the underlying "C" file pointer. Note that there is no way for the library to track what you do with the file, so be careful.

**gbump()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::gbump (
    int __n) [inline], [protected], [inherited]
```

Moving the read position.

**Parameters**

|       |                             |
|-------|-----------------------------|
| $\_n$ | The delta by which to move. |
|-------|-----------------------------|

This just advances the read position without returning any data.

Referenced by [std::basic\\_filebuf< \\_CharT, \\_Traits >::pbackfail\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::pbackfail\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sbumpc\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sputbackc\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sungetc\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::uflow\(\)](#), and [std::basic\\_filebuf< \\_CharT, \\_Traits >::xsgetn\(\)](#).

**getloc()**

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf<_CharT, _Traits>::getloc() const [inline], [inherited]
Locale access.
```

**Returns**

The current locale in effect.

If `pubimbue(loc)` has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.

Referenced by `std::basic_streambuf<char_type, traits_type>::pubimbue()`.

**gptr()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf<_CharT, _Traits>::gptr() const [inline], [protected], [inherited]
Access to the get area.
```

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::basic_filebuf<char_type, traits_type>::_M_create_pback()`, `std::basic_filebuf<char_type, traits_type>::_M_destroy`, `std::basic_filebuf<_CharT, _Traits>::imbue()`, `std::basic_streambuf<char_type, traits_type>::in_avail()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::pbackfail()`, `std::basic_streambuf<char_type, traits_type>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`, `std::basic_streambuf<char_type, traits_type>::sgetc()`, `std::basic_filebuf<_CharT, _Traits>::showmanyc()`, `std::basic_stringbuf<char_type, traits_type>::showmanyc()`, `std::basic_streambuf<char_type, traits_type>::sungetc()`, `std::basic_streambuf<char_type, traits_type>::uflow()`, `std::basic_filebuf<_CharT, _Traits>::underflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::underflow()`, `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::underflow()`, `std::basic_filebuf<_CharT, _Traits>::xsgetn()`, and `xsgetn()`.

**imbue()**

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf<_CharT, _Traits>::imbue (
    const locale & __loc) [protected], [virtual], [inherited]
```

Changes translations.

**Parameters**

|                    |               |
|--------------------|---------------|
| <code>__loc</code> | A new locale. |
|--------------------|---------------|

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from `streambuf` can safely cache results of calls to locale functions and to members of facets so obtained.*

**Note**

Base class version does nothing.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `_M_ext_buf`, `_M_ext_next`, `_M_mode`, `_M_reading`, `_M_set_buffer()`, `std::ios_base::cur`, `std::basic_streambuf<_CharT, _Traits>::gptr()`, `is_open()`, and `seekoff()`.

**in\_avail()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::in_avail () [inline], [inherited]
```

Looking ahead into the stream.

**Returns**

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

**is\_open()**

```
template<typename _CharT, typename _Traits>
bool std::basic_filebuf< _CharT, _Traits >::is_open () const throw ( ) [inline], [nodiscard],
[inherited]
```

Returns true if the external file is open.

Referenced by `__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf()`, `__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf()`, `close()`, `imbue()`, `open()`, `seekoff()`, `seekpos()`, `setbuf()`, and `showmanyc()`.

**open() [1/3]**

```
template<typename _CharT, typename _Traits>
template<typename _Path>
_If_fs_path< _Path, __filebuf_type * > std::basic_filebuf< _CharT, _Traits >::open (
    const _Path & __s,
    ios_base::openmode __mode) [inline], [inherited]
```

Opens an external file.

**Parameters**

|                     |                                                            |
|---------------------|------------------------------------------------------------|
| <code>__s</code>    | The name of the file, as a <code>filesystem::path</code> . |
| <code>__mode</code> | The open mode flags.                                       |

**Returns**

`this` on success, `NULL` on failure

**open() [2/3]**

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::__filebuf_type * std::basic_filebuf< _CharT, _Traits >::open (
    const char * __s,
    ios_base::openmode __mode) [inherited]
```

Opens an external file.

**Parameters**

|                  |                       |
|------------------|-----------------------|
| <code>__s</code> | The name of the file. |
|------------------|-----------------------|

|                     |                      |
|---------------------|----------------------|
| <code>__mode</code> | The open mode flags. |
|---------------------|----------------------|

**Returns**

`this` on success, `NULL` on failure

If a file is already open, this function immediately fails. Otherwise it tries to open the file named `__s` using the flags given in `__mode`.

Table 92, adapted here, gives the relation between openmode combinations and the equivalent `fopen()` flags. (NB: lines `app`, `in|out|app`, `in|app`, `binary|app`, `binary|in|out|app`, and `binary|in|app` per DR 596)

| ios_base Flag combination |    |     |       |     | stdio equivalent |
|---------------------------|----|-----|-------|-----|------------------|
| binary                    | in | out | trunc | app |                  |
| -----                     |    |     |       |     |                  |
|                           |    | +   |       |     | w                |
|                           |    | +   |       | +   | a                |
|                           |    |     |       | +   | a                |
|                           |    | +   | +     |     | w                |
|                           | +  |     |       |     | r                |
|                           | +  | +   |       |     | r+               |
|                           | +  | +   | +     |     | w+               |
|                           | +  | +   |       | +   | a+               |
|                           | +  |     |       | +   | a+               |
| -----                     |    |     |       |     |                  |
| +                         |    | +   |       |     | wb               |
| +                         |    | +   |       | +   | ab               |
| +                         |    |     |       | +   | ab               |
| +                         |    | +   | +     |     | wb               |
| +                         | +  |     |       |     | rb               |
| +                         | +  | +   |       |     | r+b              |
| +                         | +  | +   | +     |     | w+b              |
| +                         | +  | +   |       | +   | a+b              |
| +                         | +  |     |       | +   | a+b              |
| -----                     |    |     |       |     |                  |

References `_M_mode`, `_M_reading`, `_M_set_buffer()`, `std::ios_base::ate`, `close()`, `std::ios_base::end`, `is_open()`, and `seekoff()`.

Referenced by `std::basic_filebuf<char_type, traits_type>::open()`, and `std::basic_filebuf<char_type, traits_type>::open()`.

**open() [3/3]**

```
template<typename _CharT, typename _Traits>
__filebuf_type * std::basic_filebuf<_CharT, _Traits>::open (
    const std::string & __s,
    ios_base::openmode __mode) [inline], [inherited]
```

Opens an external file.

**Parameters**

|                     |                       |
|---------------------|-----------------------|
| <code>__s</code>    | The name of the file. |
| <code>__mode</code> | The open mode flags.  |

**Returns**

`this` on success, `NULL` on failure

**overflow()**

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::int_type std::basic_filebuf< _CharT, _Traits >::overflow (
    int_type __c = _Traits::eof()) [protected], [virtual], [inherited]
```

Consumes data from the buffer; writes to the controlled sequence.

**Parameters**

|                  |                                     |
|------------------|-------------------------------------|
| <code>__c</code> | An additional character to consume. |
|------------------|-------------------------------------|

**Returns**

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

References `_M_buf_size`, `_M_destroy_pback()`, `_M_mode`, `_M_reading`, `_M_set_buffer()`, `std::ios_base::app`, `std::ios_base::cur`, `std::ios_base::out`, `std::basic_streambuf< _CharT, _Traits >::pbase()`, `std::basic_streambuf< _CharT, _Traits >::pbackfail()`, and `std::basic_streambuf< _CharT, _Traits >::pptr()`.

Referenced by `pbackfail()`, `sync()`, `underflow()`, and `xsgetn()`.

**pbackfail()**

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::int_type std::basic_filebuf< _CharT, _Traits >::pbackfail (
    int_type __c = _Traits::eof()) [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

**Parameters**

|                  |                                                      |
|------------------|------------------------------------------------------|
| <code>__c</code> | The character to be inserted back into the sequence. |
|------------------|------------------------------------------------------|

**Returns**

`eof()` on failure, *some other value* on success

**Postcondition**

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

**Note**

Base class version does nothing, returns eof().

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `_M_create_pback()`, `_M_mode`, `_M_pback_init`, `_M_reading`, `_M_set_buffer()`, `std::ios_base::cur`, `std::basic_streambuf<_CharT, _Traits>::eback()`, `std::basic_streambuf<_CharT, _Traits>::gbump()`, `std::basic_streambuf<_CharT, _Traits>::in`, `overflow()`, `seekoff()`, and `underflow()`.

**pbase()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf<_CharT, _Traits>::pbase () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

Referenced by `std::basic_filebuf<_CharT, _Traits>::overflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, `std::basic_filebuf<_CharT, _Traits>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::str()`, `std::basic_filebuf<_CharT, _Traits>::sync()`, and `std::basic_filebuf<_CharT, _Traits>::xsputn()`.

**pbump()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::pbump (
    int __n) [inline], [protected], [inherited]
```

Moving the write position.

**Parameters**

|                  |                             |
|------------------|-----------------------------|
| <code>__n</code> | The delta by which to move. |
|------------------|-----------------------------|

This just advances the write position without returning any data.

Referenced by `std::basic_filebuf<_CharT, _Traits>::overflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, and `std::basic_streambuf<_CharT, _Traits>::sputc()`.

**pptr()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf<_CharT, _Traits>::pptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

Referenced by `std::basic_filebuf<_CharT, _Traits>::overflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, `std::basic_filebuf<_CharT, _Traits>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`, `std::basic_streambuf<_CharT, _Traits>::str()`, `std::basic_filebuf<_CharT, _Traits>::sync()`, `std::basic_filebuf<_CharT, _Traits>::xsputn()`, and `xsputn()`.

**pubimbue()**

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::pubimbue (
    const locale & __loc) [inline], [inherited]
```

Entry point for imbue().

**Parameters**

|                    |                 |
|--------------------|-----------------|
| <code>__loc</code> | The new locale. |
|--------------------|-----------------|

**Returns**

The previous locale.

Calls the derived imbue(\_\_loc).

**pubseekoff()**

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
    off_type __off,
    ios_base::seekdir __way,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

**Parameters**

|                     |                               |
|---------------------|-------------------------------|
| <code>__off</code>  | Offset.                       |
| <code>__way</code>  | Value for ios_base::seekdir.  |
| <code>__mode</code> | Value for ios_base::openmode. |

Calls virtual seekoff function.

**pubseekpos()**

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
    pos_type __sp,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

**Parameters**

|                     |                               |
|---------------------|-------------------------------|
| <code>__sp</code>   | Position                      |
| <code>__mode</code> | Value for ios_base::openmode. |

Calls virtual seekpos function.

**pubsetbuf()**

```
template<typename _CharT, typename _Traits>
basic_streambuf * std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
```

```
char_type * __s,
streamsize __n) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

### **pubsync()**

```
template<typename _CharT, typename _Traits>
int std::basic_streambuf<_CharT, _Traits>::pubsync () [inline], [inherited]
```

Calls virtual sync function.

Referenced by `std::basic_istream<_CharT, _Traits>::sync()`.

### **sbumpc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sbumpc () [inline], [inherited]
```

Getting the next character.

#### **Returns**

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.

Referenced by `std::basic_istream<char_type, traits_type>::get()`, `std::basic_istream<_CharT, _Traits>::ignore()`, and `std::basic_streambuf<char_type, traits_type>::snextc()`.

### **seekoff()**

```
template<typename _CharT, typename _Traits>
basic_filebuf<_CharT, _Traits>::pos_type std::basic_filebuf<_CharT, _Traits>::seekoff (
    off_type ,
    ios_base::seekdir ,
    ios_base::openmode = ios_base::in | ios_base::out) [protected], [virtual], [inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

#### **Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `_M_destroy_pback()`, `_M_reading`, `std::ios_base::cur`, `is_open()`, `std::basic_streambuf<_CharT, _Traits>::pbase()`, and `std::basic_streambuf<_CharT, _Traits>::pptr()`.

Referenced by `imbue()`, `open()`, and `pbackfail()`.

### **seekpos()**

```
template<typename _CharT, typename _Traits>
basic_filebuf<_CharT, _Traits>::pos_type std::basic_filebuf<_CharT, _Traits>::seekpos (
    pos_type ,
    ios_base::openmode = ios_base::in | ios_base::out) [protected], [virtual], [inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `_M_destroy_pback()`, `std::ios_base::beg`, and `is_open()`.

**setbuf()**

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::__streambuf_type * std::basic_filebuf< _CharT, _Traits >::↵
setbuf (
    char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Manipulates the buffer.

**Parameters**

|                        |                            |
|------------------------|----------------------------|
| <code>↵<br/>__s</code> | Pointer to a buffer area.  |
| <code>↵<br/>__n</code> | Size of <code>__s</code> . |

**Returns**

`this`

If no file has been opened, and both `__s` and `__n` are zero, then the stream becomes unbuffered. Otherwise, `__s` is used as a buffer; see [https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html↵  
#io.streambuf.buffering](https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering) for more.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `_M_buf`, `_M_buf_size`, and `is_open()`.

**setg()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setg (
    char_type * __gbeg,
    char_type * __gnext,
    char_type * __gend) [inline], [protected], [inherited]
```

Setting the three read area pointers.

**Parameters**

|                      |            |
|----------------------|------------|
| <code>__gbeg</code>  | A pointer. |
| <code>__gnext</code> | A pointer. |
| <code>__gend</code>  | A pointer. |

**Postcondition**

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::wbuffer_convert()`, `std::basic_filebuf<char_type, traits_type>::_M_create()`, `std::basic_filebuf<char_type, traits_type>::_M_destroy_pback()`, `std::basic_filebuf<char_type, traits_type>::_M_set_buffer()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekpos()`, and `std::basic_filebuf<_CharT, _Traits>::xsgetn()`.

**setp()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::setp (
    char_type * __pbeg,
    char_type * __pend) [inline], [protected], [inherited]
```

Setting the three write area pointers.

**Parameters**

|                     |            |
|---------------------|------------|
| <code>__pbeg</code> | A pointer. |
| <code>__pend</code> | A pointer. |

**Postcondition**

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == epptr()`

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::wbuffer_convert()`, and `std::basic_filebuf<char_type, traits_type>::_M_s`

**sgetc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sgetc () [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

Referenced by `std::basic_istream<char_type, traits_type>::get()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<_CharT, _Traits>::ignore()`, `std::basic_istream<_CharT, _Traits>::ign` and `std::basic_streambuf<char_type, traits_type>::snextc()`.

**sgetn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sgetn (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for `xsgetn`.

**Parameters**

|                  |                |
|------------------|----------------|
| <code>__s</code> | A buffer area. |
| <code>__n</code> | A count.       |

Returns `xsgetn(__s,__n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

**showmanyc()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_filebuf< _CharT, _Traits >::showmanyc () [protected], [virtual], [inherited]
Investigating the data available.
```

**Returns**

An estimate of the number of characters available in the input sequence, or -1.

*If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail.* [27.5.2.4.3]/1

**Note**

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to `underflow` or `uflow`] will not return `eof()` but that they will return immediately.*

The standard adds that *the morphemes of `showmanyc` are **es-how-many-see**, not **show-manic**.*

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

References `_M_mode`, `std::ios_base::binary`, `std::basic_streambuf< _CharT, _Traits >::egptr()`, `std::basic_streambuf< _CharT, _Traits >::ios_base::in`, and `is_open()`.

**snextc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::snextc () [inline], [inherited]
Getting the next character.
```

**Returns**

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

Referenced by `std::basic_istream< char_type, traits_type >::get()`, `std::basic_istream< _CharT, _Traits >::get()`, `std::basic_istream< _CharT, char_traits< _CharT > >::get()`, and `std::basic_istream< _CharT, char_traits< _CharT > >::readsome()`.

**sputbackc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sputbackc (
    char_type __c) [inline], [inherited]
```

Pushing characters back into the input stream.

**Parameters**

|                  |                             |
|------------------|-----------------------------|
| <code>__c</code> | The character to push back. |
|------------------|-----------------------------|

**Returns**

The previous character, if possible.

Similar to `sungetc()`, but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

Referenced by `std::basic_istream<_CharT, _Traits>::putback()`.

**sputc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputc (
    char_type __c) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__c</code> | A character to output. |
|------------------|------------------------|

**Returns**

`__c`, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores `__c` in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(__c)`.

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::overflow()`.

**sputn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sputn (
    const char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|                  |                     |
|------------------|---------------------|
| <code>__s</code> | A buffer read area. |
| <code>__n</code> | A count.            |

One of two public output functions.

Returns `xputn(__s, __n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

**sungetc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sungetc () [inline], [inherited]
```

Moving backwards in the input stream.

**Returns**

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbackfail()`. The effect is to *unget* the last character *gotten*.

Referenced by [std::basic\\_istream< \\_CharT, \\_Traits >::unget\(\)](#).

**sync()**

```
template<typename _CharT, typename _Traits>
int std::basic_filebuf< _CharT, _Traits >::sync () [protected], [virtual], [inherited]
```

Synchronizes the buffer arrays with the controlled sequences.

**Returns**

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

**Note**

Base class version does nothing, returns zero.

Reimplemented from [std::basic\\_streambuf< \\_CharT, \\_Traits >](#).

References [overflow\(\)](#), [std::basic\\_streambuf< \\_CharT, \\_Traits >::pbase\(\)](#), and [std::basic\\_streambuf< \\_CharT, \\_Traits >::pptr\(\)](#).

**uflow()**

```
template<typename _CharT, typename _Traits>
virtual int_type std::basic_streambuf< _CharT, _Traits >::uflow () [inline], [protected], [virtual],
[inherited]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Reimplemented in [\\_\\_gnu\\_cxx::stdio\\_sync\\_filebuf< \\_CharT, \\_Traits >](#).

Referenced by [std::basic\\_streambuf< char\\_type, traits\\_type >::sbumpc\(\)](#), and [xsgetn\(\)](#).

**underflow()**

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::int_type std::basic_filebuf< _CharT, _Traits >::underflow ()
[protected], [virtual], [inherited]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `_M_buf_size`, `_M_destroy_pback()`, `_M_mode`, `_M_set_buffer()`, `std::basic_streambuf<_CharT, _Traits>::eback()`, `std::basic_streambuf<_CharT, _Traits>::egptr()`, `std::basic_streambuf<_CharT, _Traits>::gptr()`, `std::ios_base::in`, and `overflow()`.

Referenced by `pbackfail()`.

**xsgetn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_filebuf<_CharT, _Traits>::xsgetn (
    char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character extraction.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A buffer area.                          |
| <code>__n</code> | Maximum number of characters to assign. |

**Returns**

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `_M_buf_size`, `_M_destroy_pback()`, `_M_mode`, `_M_pback_init`, `_M_reading`, `_M_set_buffer()`, `std::basic_streambuf<_CharT, _Traits>::egptr()`, `std::basic_streambuf<_CharT, _Traits>::gbump()`, `std::basic_streambuf<_CharT, _Traits>::in`, `std::ios_base::in`, `overflow()`, `std::basic_streambuf<_CharT, _Traits>::setg()`, and `std::basic_streambuf<char_type, traits_type>::xsgetn()`.

**xspn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_filebuf<_CharT, _Traits>::xspn (
    const char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character insertion.

**Parameters**

|                  |                                        |
|------------------|----------------------------------------|
| <code>__s</code> | A buffer area.                         |
| <code>__n</code> | Maximum number of characters to write. |

**Returns**

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `_M_buf_size`, `_M_mode`, `_M_reading`, `_M_set_buffer()`, `std::ios_base::app`, `std::basic_streambuf<_CharT, _Traits>::eptr()`, `std::ios_base::out`, `std::basic_streambuf<_CharT, _Traits>::pbase()`, `std::basic_streambuf<_CharT, _Traits>::pptr()`, and `std::basic_streambuf<char_type, traits_type>::xspn()`.

**6.930.4 Member Data Documentation****`_M_buf`**

```
template<typename _CharT, typename _Traits>
char_type* std::basic_filebuf<_CharT, _Traits>::_M_buf [protected], [inherited]
```

Pointer to the beginning of internal buffer.

Referenced by `basic_filebuf()`, and `setbuf()`.

**`_M_buf_locale`**

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf<_CharT, _Traits>::_M_buf_locale [protected], [inherited]
```

Current locale setting.

Referenced by `std::basic_filebuf<_CharT, _Traits>::basic_filebuf()`.

**`_M_buf_size`**

```
template<typename _CharT, typename _Traits>
size_t std::basic_filebuf<_CharT, _Traits>::_M_buf_size [protected], [inherited]
```

Actual size of internal buffer. This number is equal to the size of the put area + 1 position, reserved for the overflow char of a full area.

Referenced by `basic_filebuf()`, `__gnu_cxx::stdio_filebuf<_CharT, _Traits>::stdio_filebuf()`, `__gnu_cxx::stdio_filebuf<_CharT, _Traits>::overflow()`, `setbuf()`, `underflow()`, `xsgn()`, and `xspn()`.

**`_M_ext_buf`**

```
template<typename _CharT, typename _Traits>
char* std::basic_filebuf<_CharT, _Traits>::_M_ext_buf [protected], [inherited]
```

Buffer for external characters. Used for input when `codecvt::always_noconv() == false`. When valid, this corresponds to `eback()`.

Referenced by `basic_filebuf()`, and `imbue()`.

**`_M_ext_buf_size`**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_filebuf<_CharT, _Traits>::_M_ext_buf_size [protected], [inherited]
```

Size of buffer held by `_M_ext_buf`.

Referenced by [basic\\_filebuf\(\)](#).

### `_M_ext_next`

```
template<typename _CharT, typename _Traits>
```

```
const char* std::basic\_filebuf<_CharT, _Traits>::_M_ext_next [protected], [inherited]
```

Pointers into the buffer held by `_M_ext_buf` that delimit a subsequence of bytes that have been read but not yet converted. When valid, `_M_ext_next` corresponds to `egptr()`.

Referenced by [basic\\_filebuf\(\)](#), and [imbue\(\)](#).

### `_M_in_beg`

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic\_streambuf<_CharT, _Traits>::_M_in_beg [protected], [inherited]
```

Start of get area.

### `_M_in_cur`

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic\_streambuf<_CharT, _Traits>::_M_in_cur [protected], [inherited]
```

Current read area.

### `_M_in_end`

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic\_streambuf<_CharT, _Traits>::_M_in_end [protected], [inherited]
```

End of get area.

### `_M_mode`

```
template<typename _CharT, typename _Traits>
```

```
ios_base::openmode std::basic\_filebuf<_CharT, _Traits>::_M_mode [protected], [inherited]
```

Place to stash in || out || in | out settings for current filebuf.

Referenced by [basic\\_filebuf\(\)](#), [\\_\\_gnu\\_cxx::stdio\\_filebuf<\\_CharT, \\_Traits>::stdio\\_filebuf\(\)](#), [\\_\\_gnu\\_cxx::stdio\\_filebuf<\\_CharT, \\_Traits>::close\(\)](#), [imbue\(\)](#), [open\(\)](#), [overflow\(\)](#), [pbackfail\(\)](#), [showmanyc\(\)](#), [underflow\(\)](#), [xsgetn\(\)](#), and [xsputn\(\)](#).

### `_M_out_beg`

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic\_streambuf<_CharT, _Traits>::_M_out_beg [protected], [inherited]
```

Start of put area.

### `_M_out_cur`

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic\_streambuf<_CharT, _Traits>::_M_out_cur [protected], [inherited]
```

Current put area.

### `_M_out_end`

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic\_streambuf<_CharT, _Traits>::_M_out_end [protected], [inherited]
```

End of put area.

### **`_M_pback`**

```
template<typename _CharT, typename _Traits>
char_type std::basic_filebuf< _CharT, _Traits >::_M_pback [protected], [inherited]
```

Necessary bits for putback buffer management.

#### **Note**

pbacks of over one character are not currently supported.

Referenced by [basic\\_filebuf\(\)](#).

### **`_M_pback_cur_save`**

```
template<typename _CharT, typename _Traits>
char_type* std::basic_filebuf< _CharT, _Traits >::_M_pback_cur_save [protected], [inherited]
```

Necessary bits for putback buffer management.

#### **Note**

pbacks of over one character are not currently supported.

Referenced by [basic\\_filebuf\(\)](#).

### **`_M_pback_end_save`**

```
template<typename _CharT, typename _Traits>
char_type* std::basic_filebuf< _CharT, _Traits >::_M_pback_end_save [protected], [inherited]
```

Necessary bits for putback buffer management.

#### **Note**

pbacks of over one character are not currently supported.

Referenced by [basic\\_filebuf\(\)](#).

### **`_M_pback_init`**

```
template<typename _CharT, typename _Traits>
bool std::basic_filebuf< _CharT, _Traits >::_M_pback_init [protected], [inherited]
```

Necessary bits for putback buffer management.

#### **Note**

pbacks of over one character are not currently supported.

Referenced by [basic\\_filebuf\(\)](#), [close\(\)](#), [pbackfail\(\)](#), and [xsgetn\(\)](#).

### **`_M_reading`**

```
template<typename _CharT, typename _Traits>
bool std::basic_filebuf< _CharT, _Traits >::_M_reading [protected], [inherited]
_M_reading == false && _M_writing == false for uncommitted mode; _M_reading == true for read mode; _M_writing
== true for write mode;
```

NB: `_M_reading == true && _M_writing == true` is unused.

Referenced by [basic\\_filebuf\(\)](#), [\\_\\_gnu\\_cxx::stdio\\_filebuf< \\_CharT, \\_Traits >::stdio\\_filebuf\(\)](#), [\\_\\_gnu\\_cxx::stdio\\_filebuf< \\_CharT, \\_Traits >::close\(\)](#), [imbue\(\)](#), [open\(\)](#), [overflow\(\)](#), [pbackfail\(\)](#), [seekoff\(\)](#), [xsgetn\(\)](#), and [xsputn\(\)](#).

The documentation for this class was generated from the following file:

- [stdio\\_filebuf.h](#)

**6.931 `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>` Class Template Reference**

```
#include <stdio_sync_filebuf.h>
```

Inheritance diagram for `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>`:

**Public Types**

- typedef `_CharT` **char\_type**
- typedef `traits_type::int_type` **int\_type**
- typedef `traits_type::off_type` **off\_type**
- typedef `traits_type::pos_type` **pos\_type**
- typedef `_Traits` **traits\_type**

**Public Member Functions**

### 6.931.1 Detailed Description

**template**<typename `_CharT`, typename `_Traits` = `std::char_traits<_CharT>`>  
**class** `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>`

Provides a layer of compatibility for C.

This GNU extension provides extensions for working with standard C FILE\*'s. It must be instantiated by the user with the type of character used in the file stream, e.g., `stdio_filebuf<char>`.

### 6.931.2 Member Function Documentation

#### **eback()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic\_streambuf<\_CharT, \_Traits>::eback\(\) const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by [std::basic\\_filebuf<char\\_type, traits\\_type>::\\_M\\_destroy\\_pback\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::imbue\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::overflow\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::pbackfail\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::seekoff\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::seekpos\(\)](#), [std::basic\\_streambuf<char\\_type, traits\\_type>::sputbackc\(\)](#), [std::basic\\_streambuf<char\\_type, traits\\_type>::sungetc\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::underflow\(\)](#), and [std::basic\\_filebuf<\\_CharT, \\_Traits>::xsgetn\(\)](#).

#### **egptr()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic\_streambuf<\_CharT, \_Traits>::egptr\(\) const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by [std::basic\\_filebuf<char\\_type, traits\\_type>::\\_M\\_create\\_pback\(\)](#), [std::basic\\_streambuf<char\\_type, traits\\_type>::in\\_avail\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::overflow\(\)](#), [std::basic\\_streambuf<char\\_type, traits\\_type>::sbumpc\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::seekoff\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::seekpos\(\)](#), [std::basic\\_streambuf<char\\_type, traits\\_type>::sgetc\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::showmanyc\(\)](#), [std::basic\\_stringbuf<char\\_type, traits\\_type>::underflow\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>::underflow\(\)](#), [std::wbuffer\\_convert<\\_Codecvt, \\_Elem, \\_Tr>::underflow\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits>::xsgetn\(\)](#), and [xsgetn\(\)](#).

**epptr()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::epptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Referenced by [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::overflow\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::seekoff\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::seekpos\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sputc\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::xsputn\(\)](#), and [xsputn\(\)](#).

**file()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
std::__c_file * __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::file () [inline]
```

**Returns**

The underlying FILE\*.

This function can be used to access the underlying C file pointer. Note that there is no way for the library to track what you do with the file, so be careful.

**gbump()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::gbump (
    int __n) [inline], [protected], [inherited]
```

Moving the read position.

**Parameters**

|       |                             |
|-------|-----------------------------|
| $\_n$ | The delta by which to move. |
|-------|-----------------------------|

This just advances the read position without returning any data.

Referenced by [std::basic\\_filebuf< \\_CharT, \\_Traits >::pbackfail\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::pbackfail\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sbumpc\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sputbackc\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sungetc\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::uflow\(\)](#), and [std::basic\\_filebuf< \\_CharT, \\_Traits >::xsgetn\(\)](#).

**getloc()**

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::getloc () const [inline], [inherited]
```

Locale access.

**Returns**

The current locale in effect.

If pubimbue(loc) has been called, then the most recent loc is returned. Otherwise the global locale in effect at the time of construction is returned.

Referenced by [std::basic\\_streambuf< char\\_type, traits\\_type >::pubimbue\(\)](#).

**gptr()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::gptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::basic_filebuf< char_type, traits_type >::_M_create_pback()`, `std::basic_filebuf< char_type, traits_type >::_M_destroy`, `std::basic_filebuf< _CharT, _Traits >::imbue()`, `std::basic_streambuf< char_type, traits_type >::in_avail()`, `std::basic_stringbuf< _CharT, _Traits >::pbackfail()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::pbackfail()`, `std::basic_streambuf< char_type, traits_type >::seekoff()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_streambuf< char_type, traits_type >::sgetc()`, `std::basic_filebuf< _CharT, _Traits >::showmanyc()`, `std::basic_stringbuf< char >::showmanyc()`, `std::basic_streambuf< char_type, traits_type >::sungetc()`, `std::basic_streambuf< char_type, traits_type >::uflow()`, `std::basic_filebuf< _CharT, _Traits >::underflow()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::underflow()`, `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow()`, `std::basic_filebuf< _CharT, _Traits >::xsgetn()`, and `xsgetn()`.

**imbue()**

```
template<typename _CharT, typename _Traits>
virtual void std::basic_streambuf< _CharT, _Traits >::imbue (
    const locale & __loc) [inline], [protected], [virtual], [inherited]
```

Changes translations.

**Parameters**

|                    |               |
|--------------------|---------------|
| <code>__loc</code> | A new locale. |
|--------------------|---------------|

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

**Note**

Base class version does nothing.

Reimplemented in `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >`, `std::basic_filebuf< _CharT, std::char_traits< _CharT > >`, `std::basic_filebuf< char >`, `std::basic_filebuf< char_type, traits_type >`, and `std::basic_filebuf< wchar_t >`.

Referenced by `std::basic_streambuf< char_type, traits_type >::pubimbue()`.

**in\_avail()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::in_avail () [inline], [inherited]
```

Looking ahead into the stream.

**Returns**

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

**overflow()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::overflow (
    int_type __c = traits_type::eof()) [inline], [protected], [virtual]
```

Consumes data from the buffer; writes to the controlled sequence.

**Parameters**

|                  |                                     |
|------------------|-------------------------------------|
| <code>__c</code> | An additional character to consume. |
|------------------|-------------------------------------|

**Returns**

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character *c* is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from [std::basic\\_streambuf< \\_CharT, \\_Traits >](#).

**pbackfail()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::pbackfail (
    int_type __c = traits_type::eof()) [inline], [protected], [virtual]
```

Tries to back up the input sequence.

**Parameters**

|                  |                                                      |
|------------------|------------------------------------------------------|
| <code>__c</code> | The character to be inserted back into the sequence. |
|------------------|------------------------------------------------------|

**Returns**

`eof()` on failure, *some other value* on success

**Postcondition**

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from [std::basic\\_streambuf< \\_CharT, \\_Traits >](#).

**pbase()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::pbase () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

Referenced by `std::basic_filebuf<_CharT, _Traits>::overflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, `std::basic_filebuf<_CharT, _Traits>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::str()`, `std::basic_filebuf<_CharT, _Traits>::sync()`, and `std::basic_filebuf<_CharT, _Traits>::xsputn()`.

**pbump()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::pbump (
    int __n) [inline], [protected], [inherited]
```

Moving the write position.

**Parameters**

|                  |                             |
|------------------|-----------------------------|
| <code>__n</code> | The delta by which to move. |
|------------------|-----------------------------|

This just advances the write position without returning any data.

Referenced by `std::basic_filebuf<_CharT, _Traits>::overflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, and `std::basic_streambuf<char_type, traits_type>::sputc()`.

**pptr()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::pptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

Referenced by `std::basic_filebuf<_CharT, _Traits>::overflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, `std::basic_filebuf<_CharT, _Traits>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`, `std::basic_streambuf<char_type, traits_type>::str()`, `std::basic_filebuf<_CharT, _Traits>::sync()`, `std::basic_filebuf<_CharT, _Traits>::xsputn()`, and `xsputn()`.

**pubimbue()**

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::pubimbue (
    const locale & __loc) [inline], [inherited]
```

Entry point for imbue().

**Parameters**

|                    |                 |
|--------------------|-----------------|
| <code>__loc</code> | The new locale. |
|--------------------|-----------------|

**Returns**

The previous locale.

Calls the derived `imbue(__loc)`.

**pubseekoff()**

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
    off_type __off,
    ios_base::seekdir __way,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

**Parameters**

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__off</code>  | Offset.                                     |
| <code>__way</code>  | Value for <code>ios_base::seekdir</code> .  |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual `seekoff` function.

**pubseekpos()**

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
    pos_type __sp,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]
```

Alters the stream position.

**Parameters**

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__sp</code>   | Position                                    |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual `seekpos` function.

**pubsetbuf()**

```
template<typename _CharT, typename _Traits>
basic_streambuf * std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

**pubsync()**

```
template<typename _CharT, typename _Traits>
int std::basic_streambuf< _CharT, _Traits >::pubsync () [inline], [inherited]
```

Calls virtual sync function.

Referenced by `std::basic_istream<_CharT, _Traits>::sync()`.

**sbumpc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sbumpc () [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.

Referenced by `std::basic_iostream<char_type, traits_type>::get()`, `std::basic_istream<_CharT, _Traits>::ignore()`, and `std::basic_streambuf<char_type, traits_type>::snextc()`.

**seekoff()**

```
template<typename _CharT, typename _Traits>
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekoff (
    off_type ,
    ios_base::seekdir ,
    ios_base::openmode = ios_base::in | ios_base::out) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<char>`, `std::basic_filebuf<char_type, traits_type>`, `std::basic_filebuf<wchar_t>`, `std::basic_stringbuf<_CharT, _Traits>`, `std::basic_stringbuf<char>`, and `std::basic_stringbuf<wchar_t>`.

Referenced by `std::basic_streambuf<char_type, traits_type>::pubseekoff()`.

**seekpos()**

```
template<typename _CharT, typename _Traits>
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekpos (
    pos_type ,
    ios_base::openmode = ios_base::in | ios_base::out) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

**Note**

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<char>`, `std::basic_filebuf<char_type, traits_type>`, `std::basic_filebuf<wchar_t>`, `std::basic_stringbuf<_CharT, _Traits>`, `std::basic_stringbuf<char>`, and `std::basic_stringbuf<wchar_t>`.

Referenced by `std::basic_streambuf<char_type, traits_type>::pubseekpos()`.

**setbuf()**

```
template<typename _CharT, typename _Traits>
virtual basic_streambuf< char_type, _Traits > * std::basic_streambuf< _CharT, _Traits >::setbuf
(
    char_type * ,
    streamsize ) [inline], [protected], [virtual], [inherited]
```

Manipulates the buffer.

Each derived class provides its own appropriate behavior. See the next-to-last paragraph of <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering> for more on this function.

**Note**

Base class version does nothing, returns `this`.

Reimplemented in `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >`, `std::basic_filebuf< _CharT, std::char_traits< _CharT > >`, `std::basic_filebuf< char >`, `std::basic_filebuf< char_type, traits_type >`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >`, and `std::basic_stringbuf< char >`.

Referenced by `std::basic_streambuf< char_type, traits_type >::pubsetbuf()`.

**setg()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setg (
    char_type * __gbeg,
    char_type * __gnext,
    char_type * __gend) [inline], [protected], [inherited]
```

Setting the three read area pointers.

**Parameters**

|                      |            |
|----------------------|------------|
| <code>__gbeg</code>  | A pointer. |
| <code>__gnext</code> | A pointer. |
| <code>__gend</code>  | A pointer. |

**Postcondition**

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

Referenced by `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert()`, `std::basic_filebuf< char_type, traits_type >::_M_create()`, `std::basic_filebuf< char_type, traits_type >::_M_destroy_pback()`, `std::basic_filebuf< char_type, traits_type >::_M_set_buffer()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos()`, and `std::basic_filebuf< _CharT, _Traits >::xsgetn()`.

**setp()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setp (
    char_type * __pbeg,
    char_type * __pend) [inline], [protected], [inherited]
```

Setting the three write area pointers.

**Parameters**

|                     |            |
|---------------------|------------|
| <code>__pbeg</code> | A pointer. |
| <code>__pend</code> | A pointer. |

**Postcondition**

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == epptr()`

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::wbuffer_convert()`, and `std::basic_filebuf<char_type, traits_type>::_M_s`

**sgetc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sgetc () [inline], [inherited]
Getting the next character.
```

**Returns**

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

Referenced by `std::basic_iostream<char_type, traits_type>::get()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<_CharT, _Traits>::ignore()`, `std::basic_istream<_CharT, _Traits>::ignore()`, and `std::basic_streambuf<char_type, traits_type>::snextc()`.

**sgetn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sgetn (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for `xsgetn`.

**Parameters**

|                  |                |
|------------------|----------------|
| <code>__s</code> | A buffer area. |
| <code>__n</code> | A count.       |

Returns `xsgetn(__s, __n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

**showmanyc()**

```
template<typename _CharT, typename _Traits>
virtual streamsize std::basic_streambuf<_CharT, _Traits>::showmanyc () [inline], [protected],
[virtual], [inherited]
Investigating the data available.
```

## Returns

An estimate of the number of characters available in the input sequence, or -1.

*If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail.* [27.5.2.4.3]/1

## Note

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to `underflow` or `uflow`] will not return `eof()` but that they will return immediately.*

The standard adds that *the morphemes of `showmanyc` are **es-how-many-see**, not **show-manic**.*

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, `std::basic_filebuf<char>`, `std::basic_filebuf<char_type, traits_type>`, `std::basic_filebuf<wchar_t>`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>`, `std::basic_stringbuf<char>`, and `std::basic_stringbuf<wchar_t>`.

Referenced by `std::basic_streambuf<char_type, traits_type>::in_avail()`.

## snextc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::snextc () [inline], [inherited]
```

Getting the next character.

## Returns

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

Referenced by `std::basic_istream<char_type, traits_type>::get()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<_CharT, char_traits<_CharT>>::get()`, and `std::basic_istream<_CharT, char_traits<_CharT>>::readsome()`.

## sputbackc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputbackc (
    char_type __c) [inline], [inherited]
```

Pushing characters back into the input stream.

## Parameters

|                  |                             |
|------------------|-----------------------------|
| <code>__c</code> | The character to push back. |
|------------------|-----------------------------|

## Returns

The previous character, if possible.

Similar to `sungetc()`, but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

Referenced by `std::basic_istream<_CharT, _Traits>::putback()`.

**sputc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::putc (
    char_type __c) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|                  |                        |
|------------------|------------------------|
| <code>__c</code> | A character to output. |
|------------------|------------------------|

**Returns**

`__c`, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores `__c` in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(__c)`.

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::overflow()`.

**sputn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::sputn (
    const char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|                  |                     |
|------------------|---------------------|
| <code>__s</code> | A buffer read area. |
| <code>__n</code> | A count.            |

One of two public output functions.

Returns `xsgputn(__s, __n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

**sungetc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sungetc () [inline], [inherited]
```

Moving backwards in the input stream.

**Returns**

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbackfail()`. The effect is to *unget* the last character *gotten*.

Referenced by `std::basic_istream<_CharT, _Traits>::unget()`.

**sync()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::sync () [inline], [protected],
[virtual]
```

Synchronizes the buffer arrays with the controlled sequences.

**Returns**

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

**Note**

Base class version does nothing, returns zero.

Reimplemented from [std::basic\\_streambuf< \\_CharT, \\_Traits >](#).

**uflow()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::uflow () [inline], [protected],
[virtual]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Reimplemented from [std::basic\\_streambuf< \\_CharT, \\_Traits >](#).

**underflow()**

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::underflow () [inline], [protected],
[virtual]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from [std::basic\\_streambuf< \\_CharT, \\_Traits >](#).

**xsggetn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::xsggetn (
    char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character extraction.

**Parameters**

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A buffer area.                          |
| <code>__n</code> | Maximum number of characters to assign. |

**Returns**

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, `std::basic_filebuf<char>`, and `std::basic_filebuf<char_type, traits_type>`.

References `egptr()`, `gptr()`, `std::min()`, and `uflow()`.

Referenced by `std::basic_streambuf<char_type, traits_type>::sgetn()`.

**xsputn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::xsputn (
    const char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character insertion.

**Parameters**

|                  |                                        |
|------------------|----------------------------------------|
| <code>__s</code> | A buffer area.                         |
| <code>__n</code> | Maximum number of characters to write. |

**Returns**

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, `std::basic_filebuf<char>`, and `std::basic_filebuf<char_type, traits_type>`.

References `epptr()`, `std::min()`, `overflow()`, and `pptr()`.

Referenced by `std::basic_streambuf<char_type, traits_type>::sputn()`.

### 6.932 `std::chrono::steady_clock` Struct Reference

```
#include <chrono.h>
```

#### **Public Types**

- typedef [chrono::nanoseconds](#) **duration**
- typedef duration::period **period**

- typedef `duration::rep` **rep**
- typedef `chrono::time_point< steady_clock, duration >` **time\_point**

### Static Public Member Functions

- static `time_point` **now** () noexcept

### Static Public Attributes

- static constexpr bool **is\_steady**

#### 6.932.1 Detailed Description

Monotonic clock.

Time returned has the property of only increasing at a uniform rate.

The documentation for this struct was generated from the following file:

- [chrono.h](#)

### 6.933 `__gnu_pbds::detail::stored_data<_Tv, _Th, Store_Hash >` Struct Template Reference

```
#include <types_traits.hpp>
```

Inheritance diagram for `__gnu_pbds::detail::stored_data<_Tv, _Th, Store_Hash >`:

### Public Types

- typedef `_Th` **hash\_type**
- typedef `_Tv` **value\_type**

### Public Attributes

- `hash_type` **m\_hash**
- `value_type` **m\_value**

### 6.933.1 Detailed Description

```
template<typename _Tv, typename _Th, bool Store_Hash>
struct __gnu_pbds::detail::stored_data< _Tv, _Th, Store_Hash >
```

Primary template for representation of stored data. Two types of data can be stored: value and hash.  
The documentation for this struct was generated from the following file:

- [types\\_traits.hpp](#)

### 6.934 \_\_gnu\_pbds::detail::stored\_data< \_Tv, \_Th, false > Struct Template Reference

```
#include <types_traits.hpp>
```

Inheritance diagram for \_\_gnu\_pbds::detail::stored\_data< \_Tv, \_Th, false >:

#### Public Types

- typedef `_Th` **hash\_type**
- typedef `_Tv` **value\_type**

#### Public Attributes

- hash\_type **m\_hash**
- value\_type **m\_value**

### 6.934.1 Detailed Description

```
template<typename _Tv, typename _Th>
struct __gnu_pbds::detail::stored_data< _Tv, _Th, false >
```

Specialization for representation of stored data of just value type.  
The documentation for this struct was generated from the following file:

- [types\\_traits.hpp](#)

**6.935 \_\_gnu\_pbds::detail::stored\_hash<\_Th> Struct Template Reference**

```

### 6.938.1 Detailed Description

`template<typename _RealType = double>  
class std::student_t_distribution< _RealType >`

A `student_t_distribution` random number distribution.

The formula for the normal probability mass function is:

$$p(x|n) = \frac{1}{\sqrt{(n\pi)}} \frac{\Gamma((n+1)/2)}{\Gamma(n/2)} \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2}$$

Since

C++11

### 6.938.2 Member Typedef Documentation

#### result\_type

`template<typename _RealType = double>  
typedef _RealType std::student_t_distribution< _RealType >::result_type`  
The type of the range of the distribution.

### 6.938.3 Member Function Documentation

#### max()

`template<typename _RealType = double>  
result_type std::student_t_distribution< _RealType >::max () const [inline]`  
Returns the least upper bound value of the distribution.

#### min()

`template<typename _RealType = double>  
result_type std::student_t_distribution< _RealType >::min () const [inline]`  
Returns the greatest lower bound value of the distribution.

**operator()()**

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::student_t_distribution<_RealType>::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

**param() [1/2]**

```
template<typename _RealType = double>
param_type std::student_t_distribution<_RealType>::param () const [inline]
```

Returns the parameter set of the distribution.

**param() [2/2]**

```
template<typename _RealType = double>
void std::student_t_distribution<_RealType>::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _RealType = double>
void std::student_t_distribution<_RealType>::reset () [inline]
```

Resets the distribution state.

**6.938.4 Friends And Related Symbol Documentation****operator<<**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream<_CharT, _Traits> & operator<< (
    std::basic_ostream<_CharT, _Traits> & __os,
    const std::student_t_distribution<_RealType1> & __x) [friend]
```

Inserts a student\_t\_distribution random number distribution `__x` into the output stream `__os`.

**Parameters**

|                   |                                                      |
|-------------------|------------------------------------------------------|
| <code>__os</code> | An output stream.                                    |
| <code>__x</code>  | A student_t_distribution random number distribution. |

**Returns**

The output stream with the state of `__x` inserted or in an error state.

**operator==**

```
template<typename _RealType = double>
bool operator== (
    const student_t_distribution< _RealType > & __d1,
    const student_t_distribution< _RealType > & __d2) [friend]
```

Return true if two Student t distributions have the same parameters and the sequences that would be generated are equal.

**operator>>**

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::student_t_distribution< _RealType1 > & __x) [friend]
```

Extracts a student\_t\_distribution random number distribution \_\_x from the input stream \_\_is.

**Parameters**

|                   |                                                          |
|-------------------|----------------------------------------------------------|
| <code>__is</code> | An input stream.                                         |
| <code>__x</code>  | A student_t_distribution random number generator engine. |

**Returns**

The input stream with \_\_x extracted or in an error state.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

**6.939 std::sub\_match<\_Bilter > Class Template Reference**

### 6.939.1 Detailed Description

**template<typename \_Bilter>**  
**class std::sub\_match<\_Bilter >**

A sequence of characters matched by a particular marked sub-expression.

An object of this class is essentially a pair of iterators marking a matched subexpression within a regular expression pattern match. Such objects can be converted to and compared with `std::basic_string` objects of the same character type as the pattern matched by the regular expression.

A `sub_match<Iter>` has a public base class of type `pair<Iter, Iter>`, so inherits `pair`'s data members named `first` and `second`. The iterators that make up the pair are the usual half-open interval referencing the actual original pattern matched.

Since

C++11

## 6.939.2 Member Function Documentation

### compare() [1/3]

```
template<typename _BiIter>
int std::sub_match< _BiIter >::compare (
    const string_type & __s) const [inline]
```

Compares this `sub_match` to a string.

#### Parameters

|                  |                                                      |
|------------------|------------------------------------------------------|
| <code>__s</code> | A string to compare to this <code>sub_match</code> . |
|------------------|------------------------------------------------------|

#### Return values

|                 |                                                              |
|-----------------|--------------------------------------------------------------|
| <i>negative</i> | This matched sequence will collate before <code>__s</code> . |
| <i>zero</i>     | This matched sequence is equivalent to <code>__s</code> .    |
| <i>positive</i> | This matched sequence will collate after <code>__s</code> .  |

### compare() [2/3]

```
template<typename _BiIter>
int std::sub_match< _BiIter >::compare (
    const sub_match< _BiIter > & __s) const [inline]
```

Compares this and another matched sequence.

#### Parameters

|                  |                                                  |
|------------------|--------------------------------------------------|
| <code>__s</code> | Another matched sequence to compare to this one. |
|------------------|--------------------------------------------------|

#### Return values

|                 |                                                              |
|-----------------|--------------------------------------------------------------|
| <i>negative</i> | This matched sequence will collate before <code>__s</code> . |
| <i>zero</i>     | This matched sequence is equivalent to <code>__s</code> .    |
| <i>positive</i> | This matched sequence will collate after <code>__s</code> .  |

Referenced by `std::sub_match< const char * >::operator==(,)`, and `std::sub_match< const char * >::operator==(,)`.

### compare() [3/3]

```
template<typename _BiIter>
int std::sub_match< _BiIter >::compare (
    const value_type * __s) const [inline]
```

Compares this `sub_match` to a string.

**Parameters**

|                 |                                                      |
|-----------------|------------------------------------------------------|
| <code>_↔</code> | A string to compare to this <code>sub_match</code> . |
| <code>_s</code> |                                                      |

**Return values**

|                 |                                                              |
|-----------------|--------------------------------------------------------------|
| <i>negative</i> | This matched sequence will collate before <code>__s</code> . |
| <i>zero</i>     | This matched sequence is equivalent to <code>__s</code> .    |
| <i>positive</i> | This matched sequence will collate after <code>__s</code> .  |

**length()**

```
template<typename _BiIter>
difference_type std::sub_match<_BiIter >::length () const [inline], [noexcept]
```

Gets the length of the matching sequence.

**operator string\_type()**

```
template<typename _BiIter>
std::sub_match<_BiIter >::operator string_type () const [inline]
```

Gets the matching sequence as a string.

**Returns**

the matching sequence as a string.

This is the implicit conversion operator. It is identical to the `str()` member function except that it will want to pop up in unexpected places and cause a great deal of confusion and cursing from the unwary.

**str()**

```
template<typename _BiIter>
string_type std::sub_match<_BiIter >::str () const [inline]
```

Gets the matching sequence as a string.

**Returns**

the matching sequence as a string.

Referenced by `std::sub_match<const char * >::operator string_type()`.

**swap()**

```
template<typename _BiIter>
void std::sub_match<_BiIter >::swap (
    sub_match<_BiIter > & __s) [inline], [noexcept]
```

Swap the values of two `sub_match` objects.

The documentation for this class was generated from the following file:

- [regex.h](#)

### 6.941.1 Detailed Description

```
template<typename UIntType, size_t __w, size_t __s, size_t __r>
class std::subtract_with_carry_engine< UIntType, __w, __s, __r >
```

The Marsaglia-Zaman generator.

This is a model of a Generalized Fibonacci discrete random number generator, sometimes referred to as the SWC generator.

A discrete random number generator that produces pseudorandom numbers using:

$$x_i \leftarrow (x_{i-s} - x_{i-r} - carry_{i-1}) \bmod m$$

The size of the state is  $r$  and the maximum period of the generator is  $(m^r - m^s - 1)$ .

Since

C++11

### 6.941.2 Member Typedef Documentation

#### result\_type

```
template<typename UIntType, size_t __w, size_t __s, size_t __r>
typedef UIntType std::subtract\_with\_carry\_engine< UIntType, __w, __s, __r >::result_type
```

The type of the generated random value.

### 6.941.3 Constructor & Destructor Documentation

#### subtract\_with\_carry\_engine() [1/2]

```
template<typename UIntType, size_t __w, size_t __s, size_t __r>
std::subtract\_with\_carry\_engine< UIntType, __w, __s, __r >::subtract_with_carry_engine (
    result\_type __sd) [inline], [explicit]
```

Constructs an explicitly seeded [subtract\\_with\\_carry\\_engine](#) random number generator.

**subtract\_with\_carry\_engine()** [2/2]

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::subtract_with_carry_engine (
    _Sseq & __q) [inline], [explicit]
```

Constructs a subtract\_with\_carry\_engine random number engine seeded from the seed sequence \_\_q.

**Parameters**

|                   |                    |
|-------------------|--------------------|
| $\leftrightarrow$ | the seed sequence. |
| <i>q</i>          |                    |

**6.941.4 Member Function Documentation****discard()**

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
void std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::discard (
    unsigned long long __z) [inline]
```

Discard a sequence of random numbers.

**max()**

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
constexpr result_type std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::max () [inline],
[static], [constexpr]
```

Gets the inclusive maximum value of the range of random integers returned by this generator.

**min()**

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
constexpr result_type std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::min () [inline],
[static], [constexpr]
```

Gets the inclusive minimum value of the range of random integers returned by this generator.

**operator()()**

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
subtract_with_carry_engine< _UIntType, __w, __s, __r >::result_type std::subtract_with_carry_engine<
    _UIntType, __w, __s, __r >::operator() ()
```

Gets the next random number in the sequence.

**seed()** [1/2]

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
template<typename _Sseq>
auto std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::seed (
    _Sseq & __q) -> _If_seed_seq< _Sseq >
```

Seeds the initial state  $x_0$  of the % subtract\_with\_carry\_engine random number generator.

**seed()** [2/2]

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
```

```
void std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::seed (
    result_type __sd = 0u)
```

Seeds the initial state  $x_0$  of the random number generator.

N1688[4.19] modifies this as follows. If `__value == 0`, sets value to 19780503. In any case, with a linear congruential generator  $lcg(i)$  having parameters  $m_{lcg} = 2147483563$ ,  $a_{lcg} = 40014$ ,  $c_{lcg} = 0$ , and  $lcg(0) = value$ , sets  $x_{-r} \dots x_{-1}$  to  $lcg(1) \bmod m \dots lcg(r) \bmod m$  respectively. If  $x_{-1} = 0$  set carry to 1, otherwise sets carry to 0.

Referenced by `std::subtract_with_carry_engine< uint_fast32_t, 24, 10, 24 >::subtract_with_carry_engine()`, and `std::subtract_with_carry_engine< uint_fast32_t, 24, 10, 24 >::subtract_with_carry_engine()`.

### 6.941.5 Friends And Related Symbol Documentation

#### operator<<

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
template<typename _UIntType1, size_t __w1, size_t __s1, size_t __r1, typename _CharT, typename _Traits>
Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::subtract_with_carry_engine< _UIntType1, __w1, __s1, __r1 > & __x) [friend]
```

Inserts the current state of a % `subtract_with_carry_engine` random number generator engine `__x` into the output stream `__os`.

#### Parameters

|                   |                                                                             |
|-------------------|-----------------------------------------------------------------------------|
| <code>__os</code> | An output stream.                                                           |
| <code>__x</code>  | A % <code>subtract_with_carry_engine</code> random number generator engine. |

#### Returns

The output stream with the state of `__x` inserted or in an error state.

#### operator==

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
bool operator== (
    const subtract_with_carry_engine< _UIntType, __w, __s, __r > & __lhs,
    const subtract_with_carry_engine< _UIntType, __w, __s, __r > & __rhs) [friend]
```

Compares two % `subtract_with_carry_engine` random number generator objects of the same type for equality.

#### Parameters

|                    |                                                                                   |
|--------------------|-----------------------------------------------------------------------------------|
| <code>__lhs</code> | A % <code>subtract_with_carry_engine</code> random number generator object.       |
| <code>__rhs</code> | Another % <code>subtract_with_carry_engine</code> random number generator object. |

#### Returns

true if the infinite sequences of generated values would be equal, false otherwise.

**operator>>**

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
template<typename _UIntType1, size_t __w1, size_t __s1, size_t __r1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::subtract_with_carry_engine< _UIntType1, __w1, __s1, __r1 > & __x) [friend]
```

Extracts the current state of a % `subtract_with_carry_engine` random number generator engine `__x` from the input stream `__is`.

**Parameters**

|                   |                                                                             |
|-------------------|-----------------------------------------------------------------------------|
| <code>__is</code> | An input stream.                                                            |
| <code>__x</code>  | A % <code>subtract_with_carry_engine</code> random number generator engine. |

**Returns**

The input stream with the state of `__x` extracted or in an error state.

### 6.942.1 Detailed Description

The `subtractive_rng` class is documented on [SGI's site](#). Note that this code assumes that `int` is 32 bits.

### 6.942.2 Member Typedef Documentation

#### `argument_type`

typedef unsigned int [std::unary\\_function](#)< unsigned int, unsigned int >::argument\_type [inherited]  
`argument_type` is the type of the argument

#### `result_type`

typedef unsigned int [std::unary\\_function](#)< unsigned int, unsigned int >::result\_type [inherited]  
`result_type` is the return type

### 6.942.3 Constructor & Destructor Documentation

#### `subtractive_rng()` [1/2]

```
__gnu_cxx::subtractive_rng::subtractive_rng (  
    unsigned int __seed) [inline]
```

Ctor allowing you to initialize the seed.

#### `subtractive_rng()` [2/2]

```
__gnu_cxx::subtractive_rng::subtractive_rng () [inline]
```

Default ctor; initializes its state with some number you don't see.

### 6.942.4 Member Function Documentation

#### `operator()()`

```
unsigned int __gnu_cxx::subtractive_rng::operator() (  
    unsigned int __limit) [inline]
```

Returns a number less than the argument.

- const error\_code & **code** () const noexcept
- system\_error & **operator=** (const system\_error &)=default
- virtual const char \* **what** () const noexcept

### 6.945.1 Detailed Description

An exception type that includes an `error_code` value.

Typically used to report errors from the operating system and other low-level APIs.

Since

C++11

### 6.945.2 Member Function Documentation

**what()**

```
virtual const char * std::runtime_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#), [std::filesystem::filesystem\\_error](#), and [std::ios\\_base::failure](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

- size\_type [size](#) () const

## Protected Attributes

- struct std::\_Temporary\_buffer::\_Impl **\_M\_impl**
- size\_type **\_M\_original\_len**

### 6.947.1 Detailed Description

**template<class \_ForwardIterator, class \_Tp = typename std::iterator\_traits<\_ForwardIterator>::value\_type>**  
**struct \_\_gnu\_cxx::temporary\_buffer< \_ForwardIterator, \_Tp >**

This class provides similar behavior and semantics of the standard functions `get_temporary_buffer()` and `return_temporary_buffer()`, but encapsulated in a type vaguely resembling a standard container.

By default, a `temporary_buffer<Iter>` stores space for objects of whatever type the `Iter` iterator points to. It is constructed from a typical `[first,last)` range, and provides the `begin()`, `end()`, `size()` functions, as well as `requested_size()`. For non-trivial types, copies of `*first` will be used to initialize the storage.

`malloc` is used to obtain underlying storage.

Like `get_temporary_buffer()`, not all the requested memory may be available. Ideally, the created buffer will be large enough to hold a copy of `[first,last)`, but if `size()` is less than `requested_size()`, then this didn't happen.

### 6.947.2 Constructor & Destructor Documentation

#### `temporary_buffer()`

```
template<class _ForwardIterator, class _Tp = typename std::iterator_traits<_ForwardIterator>::value_type>
```

```
__gnu_cxx::temporary_buffer< _ForwardIterator, _Tp >::temporary_buffer (  
    _ForwardIterator __first,  
    _ForwardIterator __last) [inline]
```

Requests storage large enough to hold a copy of `[first,last)`.

References [std::\\_Temporary\\_buffer<\\_ForwardIterator, \\_Tp>::\\_Temporary\\_buffer\(\)](#), and [\\_\\_gnu\\_cxx::distance\(\)](#).

#### `~temporary_buffer()`

```
template<class _ForwardIterator, class _Tp = typename std::iterator_traits<_ForwardIterator>::value_type>
```

```
__gnu_cxx::temporary_buffer< _ForwardIterator, _Tp >::~~temporary_buffer () [inline]
```

Destroys objects and frees storage.

### 6.947.3 Member Function Documentation

#### `_M_requested_size()`

```
template<typename _ForwardIterator, typename _Tp>
size_type std::\_Temporary\_buffer< _ForwardIterator, _Tp >::_M_requested_size () const [inline],
[inherited]
```

Returns the size requested by the constructor; may be >size().

#### `begin()`

```
template<typename _ForwardIterator, typename _Tp>
iterator std::\_Temporary\_buffer< _ForwardIterator, _Tp >::begin () [inline], [inherited]
```

As per Table mumble.

Referenced by [\\_Temporary\\_buffer\(\)](#).

#### `end()`

```
template<typename _ForwardIterator, typename _Tp>
iterator std::\_Temporary\_buffer< _ForwardIterator, _Tp >::end () [inline], [inherited]
```

As per Table mumble.

Referenced by [\\_Temporary\\_buffer\(\)](#).

#### `size()`

```
template<typename _ForwardIterator, typename _Tp>
size_type std::\_Temporary\_buffer< _ForwardIterator, _Tp >::size () const [inline], [inherited]
```

As per Table mumble.

### Related Symbols

(Note that these are not member symbols.)

- `bool operator== (thread::id __x, thread::id __y) noexcept`
- `void swap (thread &__x, thread &__y) noexcept`

#### 6.950.1 Detailed Description

A `std::thread` represents a new thread of execution.

The default constructor creates an object that does not own a thread. The `thread(F&&, Args&&...)` constructor invokes a callable in a new thread, and owns that new thread. A `std::thread` that owns a thread is *joinable*. Joining a thread waits for it to finish executing, which happens when the callable running in that thread returns.

A `std::thread` cannot be copied, but can be moved. Moving a joinable object transfers ownership of its thread to another object.

A joinable `std::thread` must be explicitly joined (or detached) before it is destroyed or assigned to. Attempting to destroy a joinable thread will terminate the whole process.

Since

C++11

### 6.950.2 Member Function Documentation

#### `native_handle()`

```
native_handle_type std::thread::native_handle () [inline]
```

#### Precondition

thread is joinable

### 6.958.1 Detailed Description

```
template<typename _CharT, typename _InIter>
class std::time_get< _CharT, _InIter >
```

Primary class template `time_get`.

This facet encapsulates the code to parse and return a date or time from a string. It is used by the istream numeric extraction operators.

The `time_get` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `time_get` facet.

### 6.958.2 Member Typedef Documentation

#### char\_type

```
template<typename _CharT, typename _InIter>
typedef _CharT std::time_get< _CharT, _InIter >::char_type
```

Public typedefs.

#### iter\_type

```
template<typename _CharT, typename _InIter>
typedef _InIter std::time_get< _CharT, _InIter >::iter_type
```

Public typedefs.

### 6.958.3 Constructor & Destructor Documentation

#### time\_get()

```
template<typename _CharT, typename _InIter>
std::time_get< _CharT, _InIter >::time_get (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

#### Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

References [std::locale::facet::facet\(\)](#).

#### ~time\_get()

```
template<typename _CharT, typename _InIter>
virtual std::time_get< _CharT, _InIter >::~~time_get () [inline], [protected], [virtual]
```

Destructor.

### 6.958.4 Member Function Documentation

#### date\_order()

```
template<typename _CharT, typename _InIter>
dateorder std::time_get< _CharT, _InIter >::date_order () const [inline]
```

Return preferred order of month, day, and year.

This function returns an enum from `time_base::dateorder` giving the preferred ordering if the format `x` given to `time_↵put::put()` only uses month, day, and year. If the format `x` for the associated locale uses other fields, this function returns `time_base::dateorder::noorder`.

NOTE: The library always returns `noorder` at the moment.

#### Returns

A member of `time_base::dateorder`.

References [do\\_date\\_order\(\)](#).

#### do\_date\_order()

```
template<typename _CharT, typename _InIter>
_GLIBCXX_END_NAMESPACE_LDBL_OR_CXX11 time_base::dateorder std::time_get< _CharT, _InIter >::do_↵
date_order () const [protected], [virtual]
```

Return preferred order of month, day, and year.

This function returns an enum from `time_base::dateorder` giving the preferred ordering if the format `x` given to `time_↵put::put()` only uses month, day, and year. This function is a hook for derived classes to change the value returned.

#### Returns

A member of `time_base::dateorder`.

Referenced by [date\\_order\(\)](#).

#### do\_get()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get (
    iter_type __s,
    iter_type __end,
    ios_base & __f,
    ios_base::iostate & __err,
    tm * __tm,
    char __format,
    char __modifier) const [inline], [protected]
```

Parse input string according to format.

This function parses the string according to the provided format and optional modifier. This function is a hook for derived classes to change the value returned.

#### See also

[get\(\)](#) for more details.

#### Parameters

|                    |                           |
|--------------------|---------------------------|
| <code>__s</code>   | Start of string to parse. |
| <code>__end</code> | End of string to parse.   |
| <code>__f</code>   | Source of the locale.     |
|                    |                           |

|                         |                                  |
|-------------------------|----------------------------------|
| <code>__err</code>      | Error flags to set.              |
| <code>__tm</code>       | Pointer to struct tm to fill in. |
| <code>__format</code>   | Format specifier.                |
| <code>__modifier</code> | Format modifier.                 |

**Returns**

Iterator to first char not parsed.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::goodbit](#), [std::use\\_facet\(\)](#), and [std::\\_\\_ctype\\_abstract\\_base< \\_CharT, \\_InIter >::do\\_get\\_date\(\)](#).  
Referenced by [get\(\)](#), and [get\(\)](#).

**do\_get\_date()**

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_date (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [protected], [virtual]
```

Parse input date string.

This function parses a date according to the format *X* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

[get\\_date\(\)](#) for details.

**Parameters**

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond date string.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), and [std::use\\_facet\(\)](#).  
Referenced by [get\\_date\(\)](#).

**do\_get\_monthname()**

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_monthname (
    iter_type __beg,
    iter_type __end,
```

```

ios_base & __io,
ios_base::iostate & __err,
tm * __tm) const [protected], [virtual]

```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

`get_monthname()` for details.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

#### Returns

Iterator to first char beyond month name.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), and [std::use\\_facet\(\)](#).

Referenced by [get\\_monthname\(\)](#).

#### do\_get\_time()

```

template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_time (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [protected], [virtual]

```

Parse input time string.

This function parses a time according to the format *x* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

`get_time()` for details.

#### Parameters

|                    |                           |
|--------------------|---------------------------|
| <code>__beg</code> | Start of string to parse. |
| <code>__end</code> | End of string to parse.   |
| <code>__io</code>  | Source of the locale.     |

|                    |                                  |
|--------------------|----------------------------------|
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond time string.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), and [std::use\\_facet\(\)](#).

Referenced by [get\\_time\(\)](#).

**do\_get\_weekday()**

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_weekday (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [protected], [virtual]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

[get\\_weekday\(\)](#) for details.

**Parameters**

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond weekday name.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), and [std::use\\_facet\(\)](#).

Referenced by [get\\_weekday\(\)](#).

**do\_get\_year()**

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_year (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
```

```
ios_base::iostate & __err,  
tm * __tm) const [protected], [virtual]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

## See also

get\_year() for details.

## Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

## Returns

Iterator to first char beyond year.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), [std::\\_\\_ctype\\_abstract\\_base<\\_](#) and [std::use\\_facet\(\)](#).

Referenced by [get\\_year\(\)](#).

```
get() [1/2]
```

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get (
    iter_type __s,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm,
    char __format,
    char __modifier = 0) const [inline]
```

Parse input string according to format.

This function calls `time_get::do_get` with the provided parameters.

## See also

do\_get() and get().

## Parameters

|                    |                           |
|--------------------|---------------------------|
| <code>__s</code>   | Start of string to parse. |
| <code>__end</code> | End of string to parse.   |

|                         |                                  |
|-------------------------|----------------------------------|
| <code>__io</code>       | Source of the locale.            |
| <code>__err</code>      | Error flags to set.              |
| <code>__tm</code>       | Pointer to struct tm to fill in. |
| <code>__format</code>   | Format specifier.                |
| <code>__modifier</code> | Format modifier.                 |

**Returns**

Iterator to first char not parsed.

References [do\\_get\(\)](#).

**get()** [2/2]

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::get (
    iter_type __s,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm,
    const char_type * __fmt,
    const char_type * __fmtend) const [inline]
```

Parse input string according to format.

This function parses the input string according to a provided format string. It does the inverse of `time_put::put`. The format string follows the format specified for `strptime(3)/strptime(3)`. The actual parsing is done by `time_get::do_get`.

**Parameters**

|                       |                                  |
|-----------------------|----------------------------------|
| <code>__s</code>      | Start of string to parse.        |
| <code>__end</code>    | End of string to parse.          |
| <code>__io</code>     | Source of the locale.            |
| <code>__err</code>    | Error flags to set.              |
| <code>__tm</code>     | Pointer to struct tm to fill in. |
| <code>__fmt</code>    | Start of the format string.      |
| <code>__fmtend</code> | End of the format string.        |

**Returns**

Iterator to first char not parsed.

References [std::ios\\_base::M\\_getloc\(\)](#), [do\\_get\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >::is\(\)](#), [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >::narrow\(\)](#), [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >::toupper\(\)](#), and [std::use\\_facet\(\)](#).

**get\_date()**

```
template<typename _CharT, typename _InIter>
```

```

iter_type std::time_get< _CharT, _InIter >::get_date (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline]

```

Parse input date string.

This function parses a date according to the format *x* and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_date()`.

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

#### Parameters

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__beg</code> | Start of string to parse.               |
| <code>__end</code> | End of string to parse.                 |
| <code>__io</code>  | Source of the locale.                   |
| <code>__err</code> | Error flags to set.                     |
| <code>__tm</code>  | Pointer to struct <i>tm</i> to fill in. |

#### Returns

Iterator to first char beyond date string.

References `do_get_date()`.

#### get\_monthname()

```

template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_monthname (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline]

```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_monthname()`.

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

#### Parameters

|                    |                           |
|--------------------|---------------------------|
| <code>__beg</code> | Start of string to parse. |
| <code>__end</code> | End of string to parse.   |
| <code>__io</code>  | Source of the locale.     |

|                    |                                  |
|--------------------|----------------------------------|
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond month name.

References [do\\_get\\_monthname\(\)](#).

**get\_time()**

```
template<typename _CharT, typename _InIter>
iter_type std::time_get<_CharT, _InIter>::get_time (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline]
```

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_time()`.

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

**Parameters**

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond time string.

References [do\\_get\\_time\(\)](#).

**get\_weekday()**

```
template<typename _CharT, typename _InIter>
iter_type std::time_get<_CharT, _InIter>::get_weekday (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_weekday()`.

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

#### Returns

Iterator to first char beyond weekday name.

References [do\\_get\\_weekday\(\)](#).

#### get\_year()

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_year (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_year()`.

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

#### Returns

Iterator to first char beyond year.

References [do\\_get\\_year\(\)](#).

### 6.958.5 Member Data Documentation

#### id

### 6.959.1 Detailed Description

```
template<typename _CharT, typename _InIter>
class std::time_get_byname< _CharT, _InIter >
```

class time\_get\_byname [22.2.5.2].

## 6.959.2 Member Function Documentation

### date\_order()

```
template<typename _CharT, typename _InIter>
```

```
dateorder std::time_get<_CharT, _InIter>::date_order () const [inline], [inherited]
```

Return preferred order of month, day, and year.

This function returns an enum from `time_base::dateorder` giving the preferred ordering if the format `x` given to `time_←put::put()` only uses month, day, and year. If the format `x` for the associated locale uses other fields, this function returns `time_base::dateorder::noorder`.

NOTE: The library always returns `noorder` at the moment.

#### Returns

A member of `time_base::dateorder`.

References [do\\_date\\_order\(\)](#).

### do\_date\_order()

```
template<typename _CharT, typename _InIter>
```

```
_GLIBCXX_END_NAMESPACE_LDBL_OR_CXX11 time_base::dateorder std::time_get<_CharT, _InIter>::do_←date_order () const [protected], [virtual], [inherited]
```

Return preferred order of month, day, and year.

This function returns an enum from `time_base::dateorder` giving the preferred ordering if the format `x` given to `time_←put::put()` only uses month, day, and year. This function is a hook for derived classes to change the value returned.

#### Returns

A member of `time_base::dateorder`.

Referenced by [date\\_order\(\)](#).

### do\_get()

```
template<typename _CharT, typename _InIter>
```

```
_InIter std::time_get<_CharT, _InIter>::do_get (
    iter_type __s,
    iter_type __end,
    ios_base & __f,
    ios_base::iostate & __err,
    tm * __tm,
    char __format,
    char __modifier) const [inline], [protected], [inherited]
```

Parse input string according to format.

This function parses the string according to the provided format and optional modifier. This function is a hook for derived classes to change the value returned.

#### See also

[get\(\)](#) for more details.

#### Parameters

|                  |                           |
|------------------|---------------------------|
| <code>__s</code> | Start of string to parse. |
|------------------|---------------------------|

|                         |                                  |
|-------------------------|----------------------------------|
| <code>__end</code>      | End of string to parse.          |
| <code>__f</code>        | Source of the locale.            |
| <code>__err</code>      | Error flags to set.              |
| <code>__tm</code>       | Pointer to struct tm to fill in. |
| <code>__format</code>   | Format specifier.                |
| <code>__modifier</code> | Format modifier.                 |

#### Returns

Iterator to first char not parsed.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::goodbit](#), [std::use\\_facet\(\)](#), and [std::\\_\\_ctype\\_abstract\\_base<\\_](#)  
Referenced by [get\(\)](#), and [get\(\)](#).

#### do\_get\_date()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_date (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [protected], [virtual], [inherited]
```

Parse input date string.

This function parses a date according to the format *X* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

#### See also

[get\\_date\(\)](#) for details.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

#### Returns

Iterator to first char beyond date string.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), and [std::use\\_facet\(\)](#).  
Referenced by [get\\_date\(\)](#).

**do\_get\_monthname()**

```
template<typename _CharT, typename _InIter>
_InIter std::time_get<_CharT, _InIter>::do_get_monthname (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [protected], [virtual], [inherited]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get\_monthname() for details.

**Parameters**

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond month name.

References [std::ios\\_base::M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), and [std::use\\_facet\(\)](#).

Referenced by [get\\_monthname\(\)](#).

**do\_get\_time()**

```
template<typename _CharT, typename _InIter>
_InIter std::time_get<_CharT, _InIter>::do_get_time (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [protected], [virtual], [inherited]
```

Parse input time string.

This function parses a time according to the format x and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

[get\\_time\(\)](#) for details.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

#### Returns

Iterator to first char beyond time string.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), and [std::use\\_facet\(\)](#).

Referenced by [get\\_time\(\)](#).

#### do\_get\_weekday()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_weekday (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [protected], [virtual], [inherited]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

[get\\_weekday\(\)](#) for details.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

#### Returns

Iterator to first char beyond weekday name.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), and [std::use\\_facet\(\)](#).

Referenced by [get\\_weekday\(\)](#).

**do\_get\_year()**

```
template<typename _CharT, typename _InIter>
_InIter std::time_get<_CharT, _InIter>::do_get_year (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [protected], [virtual], [inherited]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

[get\\_year\(\)](#) for details.

**Parameters**

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

**Returns**

Iterator to first char beyond year.

References [std::ios\\_base::M\\_getloc\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), [std::\\_\\_ctype\\_abstract\\_base<\\_CharT, \\_InIter>](#) and [std::use\\_facet\(\)](#).

Referenced by [get\\_year\(\)](#).

**get()** [1/2]

```
template<typename _CharT, typename _InIter>
iter_type std::time_get<_CharT, _InIter>::get (
    iter_type __s,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm,
    char __format,
    char __modifier = 0) const [inline], [inherited]
```

Parse input string according to format.

This function calls [time\\_get::do\\_get](#) with the provided parameters.

See also

`do_get()` and `get()`.

#### Parameters

|                         |                                  |
|-------------------------|----------------------------------|
| <code>__s</code>        | Start of string to parse.        |
| <code>__end</code>      | End of string to parse.          |
| <code>__io</code>       | Source of the locale.            |
| <code>__err</code>      | Error flags to set.              |
| <code>__tm</code>       | Pointer to struct tm to fill in. |
| <code>__format</code>   | Format specifier.                |
| <code>__modifier</code> | Format modifier.                 |

#### Returns

Iterator to first char not parsed.

References [do\\_get\(\)](#).

#### `get()` [2/2]

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::get (
    iter_type __s,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm,
    const char_type * __fmt,
    const char_type * __fmtend) const [inline], [inherited]
```

Parse input string according to format.

This function parses the input string according to a provided format string. It does the inverse of `time_put::put`. The format string follows the format specified for `strftime(3)/strptime(3)`. The actual parsing is done by `time_get::do_get`.

#### Parameters

|                       |                                  |
|-----------------------|----------------------------------|
| <code>__s</code>      | Start of string to parse.        |
| <code>__end</code>    | End of string to parse.          |
| <code>__io</code>     | Source of the locale.            |
| <code>__err</code>    | Error flags to set.              |
| <code>__tm</code>     | Pointer to struct tm to fill in. |
| <code>__fmt</code>    | Start of the format string.      |
| <code>__fmtend</code> | End of the format string.        |

**Returns**

Iterator to first char not parsed.

References [std::ios\\_base::M\\_getloc\(\)](#), [do\\_get\(\)](#), [std::ios\\_base::eofbit](#), [std::ios\\_base::failbit](#), [std::ios\\_base::goodbit](#), [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>::is\(\)](#), [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>::narrow\(\)](#), [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>::toupper\(\)](#), and [std::use\\_facet\(\)](#).

**get\_date()**

```
template<typename _CharT, typename _InIter>
iter_type std::time_get<_CharT, _InIter>::get_date (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline], [inherited]
```

Parse input date string.

This function parses a date according to the format *x* and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_date()`.

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

**Parameters**

|                    |                                         |
|--------------------|-----------------------------------------|
| <code>__beg</code> | Start of string to parse.               |
| <code>__end</code> | End of string to parse.                 |
| <code>__io</code>  | Source of the locale.                   |
| <code>__err</code> | Error flags to set.                     |
| <code>__tm</code>  | Pointer to struct <i>tm</i> to fill in. |

**Returns**

Iterator to first char beyond date string.

References [do\\_get\\_date\(\)](#).

**get\_monthname()**

```
template<typename _CharT, typename _InIter>
iter_type std::time_get<_CharT, _InIter>::get_monthname (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline], [inherited]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_monthname()`.

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err != ios_base::failbit`. If parsing reads all the characters, `err != ios_base::eofbit`.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

#### Returns

Iterator to first char beyond month name.

References [do\\_get\\_monthname\(\)](#).

#### get\_time()

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_time (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline], [inherited]
```

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_time()`.

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, `err != ios_base::failbit`. If parsing reads all the characters, `err != ios_base::eofbit`.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

#### Returns

Iterator to first char beyond time string.

References [do\\_get\\_time\(\)](#).

#### get\_weekday()

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_weekday (
```

```

iter_type __beg,
iter_type __end,
ios_base & __io,
ios_base::iostate & __err,
tm * __tm) const [inline], [inherited]

```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling time\_get::do\_get\_weekday().

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, err |= ios\_base::failbit. If parsing reads all the characters, err |= ios\_base::eofbit.

#### Parameters

|                    |                                  |
|--------------------|----------------------------------|
| <code>__beg</code> | Start of string to parse.        |
| <code>__end</code> | End of string to parse.          |
| <code>__io</code>  | Source of the locale.            |
| <code>__err</code> | Error flags to set.              |
| <code>__tm</code>  | Pointer to struct tm to fill in. |

#### Returns

Iterator to first char beyond weekday name.

References [do\\_get\\_weekday\(\)](#).

#### get\_year()

```

template<typename _CharT, typename _InIter>
iter_type std::time_get<_CharT, _InIter>::get_year (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm) const [inline], [inherited]

```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling time\_get::do\_get\_year().

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, err |= ios\_base::failbit. If parsing reads all the characters, err |= ios\_base::eofbit.

#### Parameters

|                    |                           |
|--------------------|---------------------------|
| <code>__beg</code> | Start of string to parse. |
| <code>__end</code> | End of string to parse.   |
| <code>__io</code>  | Source of the locale.     |
| <code>__err</code> | Error flags to set.       |

|                   |                                  |
|-------------------|----------------------------------|
| <code>__tm</code> | Pointer to struct tm to fill in. |
|-------------------|----------------------------------|

#### Returns

Iterator to first char beyond year.

References [do\\_get\\_year\(\)](#).

### 6.961.1 Detailed Description

```
template<typename _CharT, typename _OutIter>
class std::time_put< _CharT, _OutIter >
```

Primary class template `time_put`.

This facet encapsulates the code to format and output dates and times according to formats used by `strftime()`.

The `time_put` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `time_put` facet.

### 6.961.2 Member Typedef Documentation

#### `char_type`

```
template<typename _CharT, typename _OutIter>
typedef _CharT std::time_put< _CharT, _OutIter >::char_type
```

Public typedefs.

#### `iter_type`

```
template<typename _CharT, typename _OutIter>
typedef _OutIter std::time_put< _CharT, _OutIter >::iter_type
```

Public typedefs.

### 6.961.3 Constructor & Destructor Documentation

#### `time_put()`

```
template<typename _CharT, typename _OutIter>
std::time_put< _CharT, _OutIter >::time_put (
    size_t __refs = 0) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

#### Parameters

|                     |                                 |
|---------------------|---------------------------------|
| <code>__refs</code> | Passed to the base facet class. |
|---------------------|---------------------------------|

References [std::locale::facet::facet\(\)](#).

**~time\_put()**

```
template<typename _CharT, typename _OutIter>
virtual std::time_put< _CharT, _OutIter >::~~time_put () [inline], [protected], [virtual]
Destructor.
```

**6.961.4 Member Function Documentation****do\_put()**

```
template<typename _CharT, typename _OutIter>
_OutIter std::time_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    char __format,
    char __mod) const [protected], [virtual]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

**See also**

[put\(\)](#) for more details.

**Parameters**

|                       |                                              |
|-----------------------|----------------------------------------------|
| <code>__s</code>      | The stream to write to.                      |
| <code>__io</code>     | Source of locale.                            |
| <code>__fill</code>   | char_type to use for padding.                |
| <code>__tm</code>     | Struct tm with date and time info to format. |
| <code>__format</code> | Format char.                                 |
| <code>__mod</code>    | Optional modifier char.                      |

**Returns**

Iterator after writing.

References [std::ios\\_base::M\\_getloc\(\)](#), [std::use\\_facet\(\)](#), and [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>::widen\(\)](#).

Referenced by [put\(\)](#), and [put\(\)](#).

**put() [1/2]**

```
template<typename _CharT, typename _OutIter>
iter_type std::time_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
```

```
char __format,
char __mod = 0) const [inline]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. The format and modifier are interpreted as by strftime(). It does so by returning time\_put::do\_put().

#### Parameters

|                       |                                              |
|-----------------------|----------------------------------------------|
| <code>__s</code>      | The stream to write to.                      |
| <code>__io</code>     | Source of locale.                            |
| <code>__fill</code>   | char_type to use for padding.                |
| <code>__tm</code>     | Struct tm with date and time info to format. |
| <code>__format</code> | Format char.                                 |
| <code>__mod</code>    | Optional modifier char.                      |

#### Returns

Iterator after writing.

References [do\\_put\(\)](#).

#### put() [2/2]

```
template<typename _CharT, typename _OutIter>
_OutIter std::time_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    const _CharT * __beg,
    const _CharT * __end) const
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format string. The format string is interpreted as by strftime().

#### Parameters

|                     |                                              |
|---------------------|----------------------------------------------|
| <code>__s</code>    | The stream to write to.                      |
| <code>__io</code>   | Source of locale.                            |
| <code>__fill</code> | char_type to use for padding.                |
| <code>__tm</code>   | Struct tm with date and time info to format. |
| <code>__beg</code>  | Start of format string.                      |
| <code>__end</code>  | End of format string.                        |

**Returns**

Iterator after writing.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [do\\_put\(\)](#), [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >::narrow\(\)](#), and [std::use\\_facet\(\)](#).

## 6.962.1 Detailed Description

```
template<typename _CharT, typename _OutIter>
class std::time_put_byname< _CharT, _OutIter >
```

class time\_put\_byname [22.2.5.4].

## 6.962.2 Member Function Documentation

### do\_put()

```
template<typename _CharT, typename _OutIter>
_OutIter std::time_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    char __format,
    char __mod) const [protected], [virtual], [inherited]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

### See also

`put()` for more details.

### Parameters

|                   |                         |
|-------------------|-------------------------|
| <code>__s</code>  | The stream to write to. |
| <code>__io</code> | Source of locale.       |

|                       |                                              |
|-----------------------|----------------------------------------------|
| <code>__fill</code>   | char_type to use for padding.                |
| <code>__tm</code>     | Struct tm with date and time info to format. |
| <code>__format</code> | Format char.                                 |
| <code>__mod</code>    | Optional modifier char.                      |

**Returns**

Iterator after writing.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [std::use\\_facet\(\)](#), and [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >::widen\(\)](#).

Referenced by [put\(\)](#), and [put\(\)](#).

**put()** [1/2]

```
template<typename _CharT, typename _OutIter>
iter_type std::time_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    char __format,
    char __mod = 0) const [inline], [inherited]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. The format and modifier are interpreted as by strftime(). It does so by returning time\_put::do\_put().

**Parameters**

|                       |                                              |
|-----------------------|----------------------------------------------|
| <code>__s</code>      | The stream to write to.                      |
| <code>__io</code>     | Source of locale.                            |
| <code>__fill</code>   | char_type to use for padding.                |
| <code>__tm</code>     | Struct tm with date and time info to format. |
| <code>__format</code> | Format char.                                 |
| <code>__mod</code>    | Optional modifier char.                      |

**Returns**

Iterator after writing.

References [do\\_put\(\)](#).

**put()** [2/2]

```
template<typename _CharT, typename _OutIter>
_OutIter std::time_put< _CharT, _OutIter >::put (
    iter_type __s,
```

```

ios_base & __io,
char_type __fill,
const tm * __tm,
const _CharT * __beg,
const _CharT * __end) const [inherited]

```

Format and output a time or date.

This function formats the data in struct tm according to the provided format string. The format string is interpreted as by strftime().

#### Parameters

|                     |                                              |
|---------------------|----------------------------------------------|
| <code>__s</code>    | The stream to write to.                      |
| <code>__io</code>   | Source of locale.                            |
| <code>__fill</code> | char_type to use for padding.                |
| <code>__tm</code>   | Struct tm with date and time info to format. |
| <code>__beg</code>  | Start of format string.                      |
| <code>__end</code>  | End of format string.                        |

#### Returns

Iterator after writing.

References [std::ios\\_base::\\_M\\_getloc\(\)](#), [do\\_put\(\)](#), [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>::narrow\(\)](#), and [std::use\\_facet\(\)](#).

### 6.962.3 Member Data Documentation

#### id

```

template<typename _CharT, typename _OutIter>
locale::id std::time_put<_CharT, _OutIter>::id [static], [inherited]

```

Numpunct facet id.

The documentation for this class was generated from the following file:

## 6.963 std::timed\_mutex Class Reference

```
#include <mutex>
```

#### Public Types

- typedef \_\_native\_type \* **native\_handle\_type**

#### Public Member Functions

- **timed\_mutex** (const timed\_mutex &)=delete
- void **lock** ()
- native\_handle\_type **native\_handle** () noexcept
- timed\_mutex & **operator=** (const timed\_mutex &)=delete
- bool **try\_lock** () noexcept

- `template<class _Rep, class _Period>`  
`bool try_lock_for (const chrono::duration< _Rep, _Period > &__rtime)`
- `template<class _Clock, class _Duration>`  
`bool try_lock_until (const chrono::time\_point< _Clock, _Duration > &__atime)`
- `void unlock ()`

**Friends**

- `class \_\_timed\_mutex\_impl< timed\_mutex >`

**6.963.1 Detailed Description**

The standard timed mutex type.

A non-recursive mutex that supports a timeout when trying to acquire the lock.

Since

C++11

The documentation for this class was generated from the following file:

- [mutex](#)

**6.964 `std::to_chars_result` Struct Reference**

```
#include <charconv>
```

**Public Member Functions**

- `constexpr operator bool () const noexcept`

**Public Attributes**

- `errc ec`
- `char * ptr`

**Friends**

- `bool operator== (const to\_chars\_result &, const to\_chars\_result &)=default`

**6.964.1 Detailed Description**

Result type of `std::to_chars`.

The documentation for this struct was generated from the following file:

- [charconv](#)

**6.965 `std::chrono::treat_as_floating_point`< \_Rep > Struct Template Reference**

```
#include <chrono.h>
```

Inheritance diagram for `std::chrono::treat_as_floating_point<_Rep>`:

#### 6.965.1 Detailed Description

```
template<typename _Rep>
struct std::chrono::treat_as_floating_point<_Rep>
```

Trait indicating whether to treat a type as a floating-point type.

The chrono library uses this trait to tell whether a `duration` can represent fractional values of the given precision, or only integral values.

You should specialize this trait for your own numeric types that are used with `duration` and can represent non-integral values.

Since

C++11

The documentation for this struct was generated from the following file:

- [chrono.h](#)

#### 6.966 `__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >` Class Template Reference

```
#include <assoc_container.hpp>
```

Inheritance diagram for `__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >`:

## Public Types

- typedef Cmp\_Fn `cmp_fn`
- typedef Node\_Update `node_update`

## Public Member Functions

- `tree` (const `cmp_fn` &c)
- `tree` (const tree &other)
- template<typename It>  
`tree` (It first, It last)
- template<typename It>  
`tree` (It first, It last, const `cmp_fn` &c)
- tree & `operator=` (const tree &other)
- void `swap` (tree &other)

### 6.966.1 Detailed Description

```

template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_
tree_tag, template< typename Node_Cltr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class
Node_Update = null_node_update, typename _Alloc = std::allocator<char>>>
class __gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >

```

A tree-based container.

## Template Parameters

|                    |                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>Key</i>         | Key type.                                                                                                                             |
| <i>Mapped</i>      | Map type.                                                                                                                             |

| <i>Node_Update</i> | Updates tree internal-nodes, restores invariants when invalidated. XXX See <code>design::tree-based-containersnode</code> invariants. |
| <i>_Alloc</i>      | Allocator type.                                                                                                                       |

Base tag choices are: `ov_tree_tag`, `rb_tree_tag`, `splay_tree_tag`.

Base is `basic_branch`.

### 6.966.2 Member Typedef Documentation

#### `cmp_fn`

```
template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_↵
tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
typedef Cmp_Fn \_\_gnu\_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::cmp_fn
Comparison functor type.
```

### 6.966.3 Constructor & Destructor Documentation

#### `tree()` [1/3]

```
template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_↵
tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
\_\_gnu\_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
    const cmp\_fn & c) [inline]
```

Constructor taking some policy objects. `r_cmp_fn` will be copied by the `Cmp_Fn` object of the container object.

#### `tree()` [2/3]

```
template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_↵
tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
template<typename It>
\_\_gnu\_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
    It first,
    It last) [inline]
```

Constructor taking `__iterators` to a range of `value_types`. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

#### `tree()` [3/3]

```
template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_↵
tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
template<typename It>
\_\_gnu\_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
    It first,
```

```

        It last,
        const cmp_fn & c) [inline]

```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and `last_it` will be inserted into the container object. `r_cmp_fn` will be copied by the `cmp_fn` object of the container object. The documentation for this class was generated from the following file:

- [assoc\\_container.hpp](#)

## 6.967 `__gnu_pbds::detail::tree_metadata_helper< Node_Update, _BTp >` Struct Template Reference

### 6.967.1 Detailed Description

```

template<typename Node_Update, bool _BTp>
struct __gnu_pbds::detail::tree_metadata_helper< Node_Update, _BTp >

```

Tree metadata helper.

The documentation for this struct was generated from the following file:

- [tree\\_policy/node\\_metadata\\_selector.hpp](#)

## 6.968 `__gnu_pbds::detail::tree_metadata_helper< Node_Update, false >` Struct Template Reference

```

#include <node_metadata_selector.hpp>

```

### Public Types

- typedef `Node_Update::metadata_type` **type**

### 6.968.1 Detailed Description

```

template<typename Node_Update>
struct __gnu_pbds::detail::tree_metadata_helper< Node_Update, false >

```

Specialization, false.

The documentation for this struct was generated from the following file:

- [tree\\_policy/node\\_metadata\\_selector.hpp](#)

## 6.969 `__gnu_pbds::detail::tree_metadata_helper< Node_Update, true >` Struct Template Reference

```

#include <node_metadata_selector.hpp>

```

### Public Types

- typedef `null_type` **type**

### 6.969.1 Detailed Description

```

template<typename Node_Update>
struct __gnu_pbds::detail::tree_metadata_helper< Node_Update, true >

```

Specialization, true.

The documentation for this struct was generated from the following file:

- [tree\\_policy/node\\_metadata\\_selector.hpp](#)

## 6.970 `__gnu_pbds::detail::tree_node_metadata_dispatch< Key, Data, Cmp_Fn, Node_Update, _Alloc >` Struct Template Reference

```
#include <node_metadata_selector.hpp>
```

### Public Types

- typedef `tree_metadata_helper< __node_u, null_update >::type` **type**

#### 6.970.1 Detailed Description

```
template<typename Key, typename Data, typename Cmp_Fn, template< typename Node_Cltr, typename
Const_Iterator, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::tree_node_metadata_dispatch< Key, Data, Cmp_Fn, Node_Update, _Alloc >
```

Tree node metadata dispatch.

The documentation for this struct was generated from the following file:

- [tree\\_policy/node\\_metadata\\_selector.hpp](#)

## 6.971 `__gnu_pbds::tree_order_statistics_node_update< Node_Cltr, Node_Itr, Cmp_Fn, _Alloc >` Class Template Reference

```
#include <tree_policy.hpp>
```

Inheritance diagram for `__gnu_pbds::tree_order_statistics_node_update< Node_Cltr, Node_Itr, Cmp_Fn, _Alloc >`:

### Public Types

- typedef `_Alloc` **allocator\_type**
- typedef `Cmp_Fn` **cmp\_fn**
- typedef `node_const_iterator::value_type` **const\_iterator**
- typedef `node_iterator::value_type` **iterator**
- typedef `base_type::key_const_reference` **key\_const\_reference**
- typedef `base_type::key_type` **key\_type**

- typedef size\_type **metadata\_type**
- typedef Node\_Cltr **node\_const\_iterator**
- typedef Node\_Itr **node\_iterator**
- typedef allocator\_type::size\_type **size\_type**

### Public Member Functions

- iterator [find\\_by\\_order](#) (size\_type)
- const\_iterator [find\\_by\\_order](#) (size\_type) const
- size\_type [order\\_of\\_key](#) (key\_const\_reference) const

### Protected Member Functions

- void [operator\(\)](#) (node\_iterator, node\_const\_iterator) const

#### 6.971.1 Detailed Description

**template<typename Node\_Cltr, typename Node\_Itr, typename Cmp\_Fn, typename \_Alloc>**  
**class** `__gnu_pbds::tree_order_statistics_node_update< Node_Cltr, Node_Itr, Cmp_Fn, _Alloc >`

Functor updating ranks of entrees.

#### 6.971.2 Member Function Documentation

##### [find\\_by\\_order\(\)](#) [1/2]

```
template<typename Node_CItr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>
tree\_order\_statistics\_node\_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::iterator \_\_gnu\_pbds::tree\_order\_statist
Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::find_by_order (
    size_type order) [inline]
```

Finds an entry by `__order`. Returns an iterator to the entry with the `__order` order, or an iterator to the container object's end if order is at least the size of the container object.

##### [find\\_by\\_order\(\)](#) [2/2]

```
template<typename Node_CItr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>
tree\_order\_statistics\_node\_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::const_iterator \_\_gnu\_pbds::tree\_order\_s
Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::find_by_order (
    size_type order) const [inline]
```

Finds an entry by `__order`. Returns a `const_iterator` to the entry with the `__order` order, or a `const_iterator` to the container object's end if order is at least the size of the container object.

##### [operator\(\)](#)

```
template<typename Node_CItr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>
void \_\_gnu\_pbds::tree\_order\_statistics\_node\_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::↵
operator() (
    node_iterator node_it,
    node_const_iterator end_nd_it) const [inline], [protected]
```

Updates the rank of a node through a `node_iterator` `node_it`; `end_nd_it` is the end node iterator.

##### [order\\_of\\_key\(\)](#)

```
template<typename Node_CItr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>
tree\_order\_statistics\_node\_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::size_type \_\_gnu\_pbds::tree\_order\_statist
```

```
Node_CIttr, Node_Itr, Cmp_Fn, _Alloc >::order_of_key (
    key_const_reference r_key) const [inline]
```

Returns the order of a key within a sequence. For example, if `r_key` is the smallest key, this method will return 0; if `r_key` is a key between the smallest and next key, this method will return 1; if `r_key` is a key larger than the largest key, this method will return the size of `r_c`.

The documentation for this class was generated from the following file:

- [tree\\_policy.hpp](#)

## 6.972 \_\_gnu\_pbds::tree\_tag Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for `__gnu_pbds::tree_tag`:

### 6.972.1 Detailed Description

Basic tree structure.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.973 \_\_gnu\_pbds::detail::tree\_traits< Key, Data, Cmp\_Fn, Node\_Update, Tag, \_Alloc > Struct Template Reference

### 6.973.1 Detailed Description

```
template<typename Key, typename Data, typename Cmp_Fn, template< typename Node_CIttr, typename
Node_Itr, typename Cmp_Fn_, typename _Alloc > class Node_Update, typename Tag, typename _Alloc>
struct __gnu_pbds::detail::tree_traits< Key, Data, Cmp_Fn, Node_Update, Tag, _Alloc >
```

Tree traits class, primary template.

The documentation for this struct was generated from the following file:

- [branch\\_policy/traits.hpp](#)

## 6.974 `__gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc > Struct` Template Reference

```
#include <traits.hpp>
```

### Public Types

- typedef `tree_node_metadata_dispatch< Key, Mapped, Cmp_Fn, Node_Update, _Alloc >::type` `metadata_type`
- typedef `ov_tree_node_const_it_< value_type, metadata_type, _Alloc >` `node_const_iterator`
- typedef `ov_tree_node_it_< value_type, metadata_type, _Alloc >` `node_iterator`
- typedef `Node_Update< node_const_iterator, node_iterator, Cmp_Fn, _Alloc >` `node_update`
- typedef `__gnu_pbds::null_node_update< node_const_iterator, node_iterator, Cmp_Fn, _Alloc > * null_node_`  
`_update_pointer`

#### 6.974.1 Detailed Description

```
template<typename Key, typename Mapped, class Cmp_Fn, template< typename Node_CItr, class Node_Itr,
class Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >
```

Tree traits.

#### 6.974.2 Member Typedef Documentation

##### `node_const_iterator`

```
template<typename Key, typename Mapped, class Cmp_Fn, template< typename Node_CItr, class Node_Itr,
class Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
typedef ov_tree_node_const_it_< value_type, metadata_type, _Alloc> __gnu_pbds::detail::tree_traits<
Key, Mapped, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >::node_const_iterator
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

The documentation for this struct was generated from the following file:

- [ov\\_tree\\_map\\_/traits.hpp](#)

## 6.975 `__gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, rb_tree_tag, _Alloc > Struct` Template Reference

```

Specialization.

### 6.978.2 Member Typedef Documentation

#### `node_const_iterator`

```
typedef bin_search_tree_const_node_it_< rb_tree_node_< types_traits< Key, null_type, _Alloc, false >::value_type, tree_node_metadata_dispatch< Key, null_type, Cmp_Fn, Node_Update, _Alloc >::type, _Alloc >, point_const_iterator, point_iterator, _Alloc> __gnu_pbds::detail::bin_search_tree_traits< Key, null_type, Cmp_Fn, Node_Update, rb_tree_node_< types_traits< Key, null_type, _Alloc, false >::value_type, tree_node_metadata_dispatch< Key, null_type, Cmp_Fn, Node_Update, _Alloc >::type, _Alloc >, _Alloc >::node_const_iterator [inherited]
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

The documentation for this struct was generated from the following file:

- [rb\\_tree\\_map\\_/traits.hpp](#)

### 6.979 `__gnu_pbds::detail::tree_traits< Key, null_type, Cmp_Fn, Node_Update, splay_tree_tag, _Alloc >` Struct Template Reference

```
#include <traits.hpp>
```

Inheritance diagram for `__gnu_pbds::detail::tree_traits< Key, null_type, Cmp_Fn, Node_Update, splay_tree_tag, _Alloc >`:

## Public Types

- typedef `bin_search_tree_const_it_< typename node_alloc_traits::pointer, typename type_traits::value_type, typename type_traits::pointer, typename type_traits::const_pointer, typename type_traits::reference, typename type_traits::const_reference, false, _Alloc >` **const\_reverse\_iterator**
- typedef `splay_tree_node_< types_traits< Key, null_type, _Alloc, false >::value_type, tree_node_metadata_dispatch< Key, null_type, Cmp_Fn, Node_Update, _Alloc >::type, _Alloc >` **node**
- typedef `bin_search_tree_const_node_it_< splay_tree_node_< types_traits< Key, null_type, _Alloc, false >::value_type, tree_node_metadata_dispatch< Key, null_type, Cmp_Fn, Node_Update, _Alloc >::type, _Alloc >, point_const_iterator, point_iterator, _Alloc >` **node\_const\_iterator**
- typedef `bin_search_tree_node_it_< splay_tree_node_< types_traits< Key, null_type, _Alloc, false >::value_type, tree_node_metadata_dispatch< Key, null_type, Cmp_Fn, Node_Update, _Alloc >::type, _Alloc >, point_const_iterator, point_iterator, _Alloc >` **node\_iterator**
- typedef `Node_Update< node_const_iterator, node_iterator, Cmp_Fn, _Alloc >` **node\_update**
- typedef `__gnu_pbds::null_node_update< node_const_iterator, node_iterator, Cmp_Fn, _Alloc > * null_node_update_pointer`
- typedef `bin_search_tree_const_it_< typename node_alloc_traits::pointer, typename type_traits::value_type, typename type_traits::pointer, typename type_traits::const_pointer, typename type_traits::reference, typename type_traits::const_reference, true, _Alloc >` **point\_const\_iterator**
- typedef `bin_search_tree_it_< typename node_alloc_traits::pointer, typename type_traits::value_type, typename type_traits::pointer, typename type_traits::const_pointer, typename type_traits::reference, typename type_traits::const_reference, true, _Alloc >` **point\_iterator**
- typedef `bin_search_tree_it_< typename node_alloc_traits::pointer, typename type_traits::value_type, typename type_traits::pointer, typename type_traits::const_pointer, typename type_traits::reference, typename type_traits::const_reference, false, _Alloc >` **reverse\_iterator**

### 6.979.1 Detailed Description

`template<typename Key, class Cmp_Fn, template< typename Node_Cltr, class Node_Itr, class Cmp_Fn_<_>, typename _Alloc_ > class Node_Update, typename _Alloc>`

`struct __gnu_pbds::detail::tree_traits< Key, null_type, Cmp_Fn, Node_Update, splay_tree_tag, _Alloc >`

Specialization.

### 6.979.2 Member Typedef Documentation

#### `node_const_iterator`

```
typedef bin_search_tree_const_node_it_< splay_tree_node_< types_traits< Key, null_type, _Alloc,
false >::value_type, tree_node_metadata_dispatch< Key, null_type, Cmp_Fn, Node_Update, _Alloc
>::type, _Alloc >, point_const_iterator, point_iterator, _Alloc> __gnu_pbds::detail::bin_search_tree_traits<
Key, null_type, Cmp_Fn, Node_Update, splay_tree_node_< types_traits< Key, null_type, _Alloc,
false >::value_type, tree_node_metadata_dispatch< Key, null_type, Cmp_Fn, Node_Update, _Alloc
>::type, _Alloc >, _Alloc >::node_const_iterator [inherited]
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

The documentation for this struct was generated from the following file:

- `splay_tree_/traits.hpp`

## 6.980 `__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >` Class Template Reference

```
#include <assoc_container.hpp>
```

Inheritance diagram for `__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >`:

## Public Types

[trie](#) (It first, It last)
- template<typename It>  
[trie](#) (It first, It last, const [access\\_traits](#) &t)
- trie & **operator=** (const trie &other)
- void **swap** (trie &other)

### 6.980.1 Detailed Description

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_Cltr, typename Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>>
```

```
class __gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >
```

A trie-based container.

**Template Parameters**

|                    |                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>Key</i>         | Key type.                                                                                                                             |
| <i>Mapped</i>      | Map type.                                                                                                                             |
| <i>_ATraits</i>    | Element access traits.                                                                                                                |
| <i>Tag</i>         | Instantiating data structure type, see <code>container_tag</code> .                                                                   |
| <i>Node_Update</i> | Updates trie internal-nodes, restores invariants when invalidated. XXX See <code>design::tree-based-containersnode</code> invariants. |
| <i>_Alloc</i>      | Allocator type.                                                                                                                       |

Base tag choice is `pat_trie_tag`.

Base is `basic_branch`.

**6.980.2 Member Typedef Documentation****access\_traits**

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access_traits<Key>::type,
        typename Tag = pat_trie_tag, template< typename Node_CItr, typename Node_CItr, typename _ATraits_,
        typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
```

```
typedef _ATraits __gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::access_traits
```

Element access traits type.

**6.980.3 Constructor & Destructor Documentation****trie() [1/3]**

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access_traits<Key>::type,
        typename Tag = pat_trie_tag, template< typename Node_CItr, typename Node_CItr, typename _ATraits_,
        typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
```

```
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
    const access_traits & t) [inline]
```

Constructor taking some policy objects. `r_access_traits` will be copied by the `_ATraits` object of the container object.

**trie() [2/3]**

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access_traits<Key>::type,
        typename Tag = pat_trie_tag, template< typename Node_CItr, typename Node_CItr, typename _ATraits_,
        typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
```

```
template<typename It>
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
    It first,
    It last) [inline]
```

Constructor taking `__iterators` to a range of `value_types`. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

**trie() [3/3]**

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access_traits<Key>::type,
        typename Tag = pat_trie_tag, template< typename Node_CItr, typename Node_CItr, typename _ATraits_,
        typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
```

```
It, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc
= std::allocator<char>>
template<typename It>
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
    It first,
    It last,
    const access_traits & t) [inline]
```

Constructor taking \_\_iterators to a range of value\_types and some policy objects. The value\_types between first\_it and last\_it will be inserted into the container object.

The documentation for this class was generated from the following file:

- [assoc\\_container.hpp](#)

## 6.981 \_\_gnu\_pbds::detail::trie\_metadata\_helper< Node\_Update, \_BTp > Struct Template Reference

### 6.981.1 Detailed Description

### 6.985.1 Detailed Description

`template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>`  
`class __gnu_pbds::trie_order_statistics_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >`

Functor updating ranks of entrees.

### 6.985.2 Member Function Documentation

#### `find_by_order()` [1/2]

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
__gnu_pbds::trie_order_statistics_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::iterator
__gnu_pbds::trie_order_statistics_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::find_by_order (
    size_type order) [inline]
```

Finds an entry by `__order`. Returns an iterator to the entry with the `__order` order, or an iterator to the container object's end if order is at least the size of the container object.

#### `find_by_order()` [2/2]

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
__gnu_pbds::trie_order_statistics_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::const_iterator
__gnu_pbds::trie_order_statistics_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::find_by_order (
    size_type order) const [inline]
```

Finds an entry by `__order`. Returns a const\_iterator to the entry with the `__order` order, or a const\_iterator to the container object's end if order is at least the size of the container object.

#### `operator()()`

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
void __gnu_pbds::trie_order_statistics_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::operator() (
    node_iterator nd_it,
    node_const_iterator ) const [inline], [protected]
```

Updates the rank of a node through a node\_iterator `node_it`; `end_nd_it` is the end node iterator.

#### `order_of_key()`

```
template<typename Node_CIttr, typename Node_Itr, typename _ATraits, typename _Alloc>
__gnu_pbds::trie_order_statistics_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::size_type
__gnu_pbds::trie_order_statistics_node_update< Node_CIttr, Node_Itr, _ATraits, _Alloc >::order_of_key (
    key_const_reference r_key) const [inline]
```

Returns the order of a key within a sequence. For example, if `r_key` is the smallest key, this method will return 0; if `r_key` is a key between the smallest and next key, this method will return 1; if `r_key` is a key larger than the largest key, this method will return the size of `r_c`.

## order\_of\_prefix()

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::size_type __gnu_pbds::trie_order_statistics_node_update<
Node_CItr, Node_Itr, _ATraits, _Alloc >::order_of_prefix (
    a_const_iterator b,
    a_const_iterator e) const [inline]
```

Returns the order of a prefix within a sequence. For example, if [b, e) is the smallest prefix, this method will return 0; if r\_key is a key between the smallest and next key, this method will return 1; if r\_key is a key larger than the largest key, this method will return the size of r\_c.

The documentation for this class was generated from the following file:

- [trie\\_policy.hpp](#)

### 6.987.1 Detailed Description

```
template<typename Node_Citr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::trie_prefix_search_node_update< Node_Citr, Node_Itr, _ATraits, _Alloc >
```

A node updatator that allows tries to be searched for the range of values that match a certain prefix.

### 6.987.2 Member Typedef Documentation

#### `a_const_iterator`

```
template<typename Node_Citr, typename Node_Itr, typename _ATraits, typename _Alloc>
typedef access_traits::const_iterator __gnu_pbds::trie_prefix_search_node_update< Node_Citr,
Node_Itr, _ATraits, _Alloc >::a_const_iterator
Const element iterator.
```

#### `access_traits`

```
template<typename Node_Citr, typename Node_Itr, typename _ATraits, typename _Alloc>
typedef _ATraits __gnu_pbds::trie_prefix_search_node_update< Node_Citr, Node_Itr, _ATraits, _↵
Alloc >::access_traits
Element access traits.
```

#### `allocator_type`

```
template<typename Node_Citr, typename Node_Itr, typename _ATraits, typename _Alloc>
typedef _Alloc __gnu_pbds::trie_prefix_search_node_update< Node_Citr, Node_Itr, _ATraits, _Alloc
>::allocator_type
_Alloc type.
```

#### `size_type`

```
template<typename Node_Citr, typename Node_Itr, typename _ATraits, typename _Alloc>
typedef allocator_type::size_type __gnu_pbds::trie_prefix_search_node_update< Node_Citr, Node_↵
Itr, _ATraits, _Alloc >::size_type
Size type.
```

### 6.987.3 Member Function Documentation

#### `operator>()`

```
template<typename Node_Citr, typename Node_Itr, typename _ATraits, typename _Alloc>
void __gnu_pbds::trie_prefix_search_node_update< Node_Citr, Node_Itr, _ATraits, _Alloc >::↵
operator() (
    node_iterator node_it,
    node_const_iterator end_nd_it) const [inline], [protected]
```

Called to update a node's metadata.

#### `prefix_range()` [1/4]

```
template<typename Node_Citr, typename Node_Itr, typename _ATraits, typename _Alloc>
std::pair< typename trie_prefix_search_node_update< Node_Citr, Node_Itr, _ATraits, _Alloc >::↵
iterator, typename trie_prefix_search_node_update< Node_Citr, Node_Itr, _ATraits, _Alloc >::↵
```

```

iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc
>::prefix_range (
    a_const_iterator b,
    a_const_iterator e)

```

Finds the iterator range corresponding to all values whose prefixes match [b, e).

#### prefix\_range() [2/4]

```

template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
std::pair< typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::↵
const_iterator, typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc
>::const_iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, ↵
_Alloc >::prefix_range (
    a_const_iterator b,
    a_const_iterator e) const

```

Finds the const iterator range corresponding to all values whose prefixes match [b, e).

#### prefix\_range() [3/4]

```

template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
std::pair< typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::↵
iterator, typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::↵
iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc
>::prefix_range (
    key_const_reference r_key)

```

Finds the iterator range corresponding to all values whose prefixes match r\_key.

#### prefix\_range() [4/4]

```

template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
std::pair< typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::↵
const_iterator, typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc
>::const_iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, ↵
_Alloc >::prefix_range (
    key_const_reference r_key) const

```

Finds the const iterator range corresponding to all values whose prefixes match r\_key.

String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::e_type
```

Element type.

### 6.988.3 Member Function Documentation

#### begin()

```
template<typename String, typename String::value_type Min_E_Val, typename String::value_type Max_↵
_E_Val, bool Reverse, typename _Alloc>
trie\_string\_access\_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::__const_iterator \_\_gnu\_pbds::trie\_stri
```

```
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::begin (
    key_const_reference r_key) [inline], [static]
```

Returns a `const_iterator` to the first element of `key_const_reference` argument.

### **e\_pos()**

```
template<typename String, typename String::value_type Min_E_Val, typename String::value_type Max←
_E_Val, bool Reverse, typename _Alloc>
trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::size_type __gnu_pbds::trie_string_acc
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::e_pos (
    e_type e) [inline], [static]
```

Maps an element to a position.

### **end()**

```
template<typename String, typename String::value_type Min_E_Val, typename String::value_type Max←
_E_Val, bool Reverse, typename _Alloc>
trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::const_iterator __gnu_pbds::trie_strin
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::end (
    key_const_reference r_key) [inline], [static]
```

Returns a `const_iterator` to the after-last element of `key_const_reference` argument.

The documentation for this struct was generated from the following file:

### 6.991.1 Detailed Description

```
template<typename Key, typename Mapped, typename _ATraits, template< typename Node_CItr, typename
Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::trie_traits< Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >
```

Specialization.

### 6.991.2 Member Typedef Documentation

#### **node\_const\_iterator**

```
template<typename Key, typename Mapped, typename _ATraits, template< typename Node_CItr, typename
Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
```

```
typedef base_type::Node_citer<node, leaf, head, inode, const_iterator, iterator, _Alloc> __gnu_pbds::detail::tr
Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >::node_const_iterator
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

#### **node\_update**

```
template<typename Key, typename Mapped, typename _ATraits, template< typename Node_CItr, typename
Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
```

```
typedef Node_Update<node_const_iterator, node_iterator, _ATraits, _Alloc> __gnu_pbds::detail::trie_traits<
Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >::node_update
```

Type for node update.

## synth\_access\_traits

```
template<typename Key, typename Mapped, typename _ATraits, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
typedef __gnu_pbds::detail::synth_access_traits<type_traits, false, access_traits> __gnu_pbds::detail::trie_traits<
Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >::synth_access_traits
```

Type for synthesized traits.

The documentation for this struct was generated from the following file:

- [pat\\_trie\\_/traits.hpp](#)

## 6.992 `__gnu_pbds::detail::trie_traits< Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >` Struct Template Reference

### 6.992.1 Detailed Description

```
template<typename Key, typename _ATraits, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::trie_traits< Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >
```

Specialization.

### 6.992.2 Member Typedef Documentation

#### node\_const\_iterator

```
template<typename Key, typename _ATraits, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
typedef base_type::_Node_citer<node, leaf, head, inode, const_iterator, iterator, _Alloc> __gnu_pbds::detail::trie_traits<
Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >::node_const_iterator
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

## node\_update

```
template<typename Key, typename _ATraits, template< typename Node_CItr, typename Node_Itr, typename
Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
typedef Node_Update<node_const_iterator, node_iterator, _ATraits, _Alloc> __gnu_pbds::detail::trie_traits<
Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >::node_update
Type for node update.
```

## synth\_access\_traits

```
template<typename Key, typename _ATraits, template< typename Node_CItr, typename Node_Itr, typename
Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
typedef __gnu_pbds::detail::synth_access_traits<type_traits, true, access_traits> __gnu_pbds::detail::trie_traits<
Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >::synth_access_traits
Type for synthesized traits.
```

The documentation for this struct was generated from the following file:

- [pat\\_trie\\_/traits.hpp](#)

## 6.993 \_\_gnu\_pbds::trivial\_iterator\_tag Struct Reference

```
#include <tag_and_trait.hpp>
```

### 6.993.1 Detailed Description

A trivial iterator tag. Signifies that the iterators has none of std::iterators's movement abilities.

The documentation for this struct was generated from the following file:

- [tag\\_and\\_trait.hpp](#)

## 6.994 std::try\_to\_lock\_t Struct Reference

```
#include <std_mutex.h>
```

### 6.994.1 Detailed Description

Try to acquire ownership of the mutex without blocking.

The documentation for this struct was generated from the following file:

- [std\\_mutex.h](#)

## 6.995 std::tuple<\_Elements> Class Template Reference

```
#include <tuple>
```

### 6.996.1 Detailed Description

```
template<typename _T1, typename _T2>
class std::tuple< _T1, _T2 >
```

Partial specialization, 2-element tuple. Includes construction and assignment from a pair.  
The documentation for this class was generated from the following file:

- [tuple](#)

### 6.997 std::tuple\_element< \_\_i, \_Tp > Struct Template Reference

#### 6.997.1 Detailed Description

```
template<size_t __i, typename _Tp>
struct std::tuple_element< __i, _Tp >
```

Gives the type of the ith element of a given tuple type.  
The documentation for this struct was generated from the following file:

- [utility.h](#)

### 6.998 std::tuple\_element< 0, pair< \_Tp1, \_Tp2 > > Struct Template Reference

### 6.1008.1 Detailed Description

Part of RTTI.

The `type_info` class describes type information generated by an implementation.

### 6.1008.2 Constructor & Destructor Documentation

#### `~type_info()`

```
virtual std::type_info::~~type_info () [virtual]
```

Destructor first. Being the first non-inline virtual function, this controls in which translation unit the vtable is emitted. The compiler makes use of that information to know where to emit the runtime-mandated `type_info` structures in the new-abi.

### 6.1008.3 Member Function Documentation

#### `before()`

```
bool std::type_info::before (
    const type_info & __arg) const [noexcept]
```

Returns true if `*this` precedes `__arg` in the implementation's collation order.

#### `name()`

```
const char * std::type_info::name () const [inline], [noexcept]
```

Returns an *implementation-defined* byte string; this is not portable between compilers!

The documentation for this class was generated from the following file:

- `typeinfo`

## 6.1009 std::type\_info Class Reference

```
#include <typeinfo>
```

### Public Member Functions

- virtual `~type_info ()`

- struct **time\_zone::\_Impl**
- class **time\_zone\_link**
- struct **tzdb**

### 6.1012.1 Detailed Description

The list of `chrono::tzdb` objects

A single object of this type is constructed by the C++ runtime, and can be accessed by calling `chrono::get_tzdb_list()`.

The front of the list is the current `tzdb` object and can be accessed via `chrono::get_tzdb_list().front()` or `chrono::get_tzdb()` or `*chrono::get_tzdb_list().begin()`.

The `chrono::reload_tzdb()` function will check for a newer version and if found, insert it at the front of the list.

Since

C++20

### 6.1012.2 Member Function Documentation

#### erase\_after()

```
const_iterator std::chrono::tzdb_list::erase_after (
    const_iterator __p)
```

Remove the tzdb object *after* the one the iterator refers to.

Calling this function concurrently with any of `front()`, `begin()`, or `end()` does not cause a data race, but in general this function is not thread-safe. The behaviour may be undefined if erasing an element from the list while another thread is calling the same function, or incrementing an iterator into the list, or accessing the element being erased (unless it is accessed through an iterator).

#### Parameters

|                  |                             |
|------------------|-----------------------------|
| <code>__p</code> | A dereferenceable iterator. |
|------------------|-----------------------------|

#### Returns

An iterator the element after the one that was erased (or `end()` if there is no such element).

#### Since

C++20

References [erase\\_after\(\)](#).

Referenced by [erase\\_after\(\)](#).

#### front()

```
const tzdb & std::chrono::tzdb_list::front () const [noexcept]
```

Access the current tzdb at the front of the list.

This returns a reference to the same object as `chrono::get_tzdb()`.

#### Returns

A reference to the current tzdb object.

#### Since

C++20

The documentation for this class was generated from the following file:

- [chrono](#)

### 6.1013 `__gnu_cxx::unary_compose<_Operation1,_Operation2>` Class Template Reference

**6.1017.2 Member Function Documentation****what()**

```
virtual const char * std::runtime_error::what () const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::experimental::filesystem::v1::filesystem\\_error](#), [std::filesystem::filesystem\\_error](#), and [std::ios\\_base::failure](#).

References [what\(\)](#).

Referenced by [what\(\)](#).

### 6.1019.1 Detailed Description

```
template<typename _IntType = int>
class std::uniform_int_distribution< _IntType >
```

Uniform discrete distribution for random numbers. A discrete random distribution on the range  $[min, max]$  with equal probability throughout the range.

Since

C++11

### 6.1019.2 Member Typedef Documentation

#### result\_type

```
template<typename _IntType = int>
typedef _IntType std::uniform_int_distribution< _IntType >::result_type
The type of the range of the distribution.
```

### 6.1019.3 Constructor & Destructor Documentation

#### uniform\_int\_distribution() [1/2]

```
template<typename _IntType = int>
std::uniform_int_distribution< _IntType >::uniform_int_distribution () [inline]
Constructs a uniform distribution object.
```

#### uniform\_int\_distribution() [2/2]

```
template<typename _IntType = int>
std::uniform_int_distribution< _IntType >::uniform_int_distribution (
    _IntType __a,
    _IntType __b = __gnu_cxx::__int_traits<_IntType>::__max) [inline], [explicit]
Constructs a uniform distribution object.
```

### 6.1019.4 Member Function Documentation

#### max()

```
template<typename _IntType = int>
result_type std::uniform_int_distribution< _IntType >::max () const [inline]
Returns the inclusive upper bound of the distribution range.
```

#### min()

```
template<typename _IntType = int>
result_type std::uniform_int_distribution< _IntType >::min () const [inline]
Returns the inclusive lower bound of the distribution range.
```

**operator()**

```
template<typename _IntType = int>
template<typename _UniformRandomBitGenerator>
result_type std::uniform_int_distribution< _IntType >::operator() (
    _UniformRandomBitGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator\(\)](#).

**param()** [1/2]

```
template<typename _IntType = int>
param_type std::uniform_int_distribution< _IntType >::param () const [inline]
```

Returns the parameter set of the distribution.

Referenced by [std::operator>\(\)](#).

**param()** [2/2]

```
template<typename _IntType = int>
void std::uniform_int_distribution< _IntType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _IntType = int>
void std::uniform_int_distribution< _IntType >::reset () [inline]
```

Resets the distribution state.

Does nothing for the uniform integer distribution.

**6.1019.5 Friends And Related Symbol Documentation****operator==**

```
template<typename _IntType = int>
bool operator== (
    const uniform_int_distribution< _IntType > & __d1,
    const uniform_int_distribution< _IntType > & __d2) [friend]
```

Return true if two uniform integer distributions have the same parameters.

The documentation for this class was generated from the following file:

### 6.1020.1 Detailed Description

```
template<typename _RealType = double>
class std::uniform_real_distribution<_RealType>
```

Uniform continuous distribution for random numbers.

A continuous random distribution on the range [min, max) with equal probability throughout the range. The URNG should be real-valued and deliver number in the range [0, 1).

Since

C++11

### 6.1020.2 Member Typedef Documentation

#### [result\\_type](#)

```
template<typename _RealType = double>
typedef _RealType std::uniform\_real\_distribution<\_RealType>::result\_type
```

The type of the range of the distribution.

### 6.1020.3 Constructor & Destructor Documentation

#### uniform\_real\_distribution() [1/2]

```
template<typename _RealType = double>
std::uniform_real_distribution< _RealType >::uniform_real_distribution () [inline]
```

Constructs a `uniform_real_distribution` object.

The lower bound is set to 0.0 and the upper bound to 1.0

#### uniform\_real\_distribution() [2/2]

```
template<typename _RealType = double>
std::uniform_real_distribution< _RealType >::uniform_real_distribution (
    _RealType __a,
    _RealType __b = _RealType(1)) [inline], [explicit]
```

Constructs a `uniform_real_distribution` object.

#### Parameters

|                  |                                           |
|------------------|-------------------------------------------|
| <code>__a</code> | [IN] The lower bound of the distribution. |
| <code>__b</code> | [IN] The upper bound of the distribution. |

### 6.1020.4 Member Function Documentation

#### max()

```
template<typename _RealType = double>
result_type std::uniform_real_distribution< _RealType >::max () const [inline]
```

Returns the inclusive upper bound of the distribution range.

#### min()

```
template<typename _RealType = double>
result_type std::uniform_real_distribution< _RealType >::min () const [inline]
```

Returns the inclusive lower bound of the distribution range.

#### operator>()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::uniform_real_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator>\(\)](#).

#### param() [1/2]

```
template<typename _RealType = double>
param_type std::uniform_real_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Referenced by [std::operator>>\(\)](#).

**param()** [2/2]

```
template<typename _RealType = double>
void std::uniform_real_distribution< _RealType >::param (
    const param_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _RealType = double>
void std::uniform_real_distribution< _RealType >::reset () [inline]
```

Resets the distribution state.

Does nothing for the uniform real distribution.

**6.1020.5 Friends And Related Symbol Documentation****operator==**

```
template<typename _RealType = double>
bool operator== (
    const uniform_real_distribution< _RealType > & __d1,
    const uniform_real_distribution< _RealType > & __d2) [friend]
```

Return true if two uniform real distributions have the same parameters.

## Related Symbols

(Note that these are not member symbols.)

- template<typename \_Mutex>  
void [swap](#) (unique\_lock< \_Mutex > &\_\_x, unique\_lock< \_Mutex > &\_\_y) noexcept

### 6.1021.1 Detailed Description

**template<typename \_Mutex>**  
**class std::unique\_lock< \_Mutex >**

A movable scoped lock type.

A unique\_lock controls mutex ownership within a scope. Ownership of the mutex can be delayed until after construction and can be transferred to another unique\_lock by move construction or move assignment. If a mutex lock is owned when the destructor runs ownership will be released.

Since

C++11

### 6.1021.2 Friends And Related Symbol Documentation

#### swap()

```
template<typename _Mutex>
void swap (
    unique_lock< _Mutex > & __x,
    unique_lock< _Mutex > & __y) [related]
```

Swap overload for unique\_lock objects.

The documentation for this class was generated from the following file:

- [unique\\_lock.h](#)

### 6.1022.1 Detailed Description

`template<typename _Tp, typename _Dp = default_delete<_Tp>>`  
`class std::unique_ptr< _Tp, _Dp >`

A move-only smart pointer that manages unique ownership of a resource.

Since

C++11

### 6.1022.2 Constructor & Destructor Documentation

#### unique\_ptr() [1/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp, _Dp >::unique_ptr () [inline], [constexpr], [noexcept]
```

Default constructor, creates a unique\_ptr that owns nothing.

#### unique\_ptr() [2/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    pointer __p) [inline], [explicit], [constexpr], [noexcept]
```

Takes ownership of a pointer.

#### Parameters

|                                     |                                                     |
|-------------------------------------|-----------------------------------------------------|
| <code>__↵</code><br><code>_p</code> | A pointer to an object of <code>element_type</code> |
|-------------------------------------|-----------------------------------------------------|

The deleter will be value-initialized.

#### unique\_ptr() [3/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = deleter_type, typename = _Require<is_copy_constructible<_Del>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    pointer __p,
    const deleter_type & __d) [inline], [constexpr], [noexcept]
```

Takes ownership of a pointer.

#### Parameters

|                                     |                                                     |
|-------------------------------------|-----------------------------------------------------|
| <code>__↵</code><br><code>_p</code> | A pointer to an object of <code>element_type</code> |
| <code>__↵</code><br><code>_d</code> | A reference to a deleter.                           |

The deleter will be initialized with `__d`

#### unique\_ptr() [4/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = deleter_type, typename = _Require<is_move_constructible<_Del>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    pointer __p,
    __enable_if_t<!is_lvalue_reference< _Del >::value, _Del && > __d) [inline], [constexpr],
[noexcept]
```

Takes ownership of a pointer.

#### Parameters

|                  |                                                     |
|------------------|-----------------------------------------------------|
| <code>__p</code> | A pointer to an object of <code>element_type</code> |
| <code>__d</code> | An rvalue reference to a (non-reference) deleter.   |

The deleter will be initialized with `std::move(__d)`

#### unique\_ptr() [5/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    nullptr_t ) [inline], [constexpr], [noexcept]
```

Creates a `unique_ptr` that owns nothing.

#### unique\_ptr() [6/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    unique_ptr< _Tp, _Dp > && ) [default]
```

Move constructor.

#### unique\_ptr() [7/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Up, typename _Ep, typename = _Require< __safe_conversion_up<_Up, _Ep>, __
conditional_t<is_reference<_Dp>::value, is_same<_Ep, _Dp>, is_convertible<_Ep, _Dp>>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    unique_ptr< _Up, _Ep > && __u) [inline], [constexpr], [noexcept]
```

Converting constructor from another type.

Requires that the pointer owned by `__u` is convertible to the type of pointer owned by this object, `__u` does not own an array, and `__u` has a compatible deleter type.

#### unique\_ptr() [8/8]

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    auto_ptr< _Up > && __u) [inline], [noexcept]
```

Converting constructor from `auto_ptr`.

**~unique\_ptr()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::~~unique_ptr () [inline], [constexpr], [noexcept]
```

Destructor, invokes the deleter if the stored pointer is not null.

**6.1022.3 Member Function Documentation****get()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr< _Tp, _Dp >::get () const [inline], [constexpr], [noexcept]
```

Return the stored pointer.

Referenced by [std::unique\\_ptr<\\_State>::operator bool\(\)](#), [std::unique\\_ptr<\\_State>::operator->\(\)](#), [std::operator<\(\)>](#), [std::operator<\(\)>](#), [std::operator<\(\)>](#), [std::unique\\_ptr<\\_State>::operator<<\(\)](#), [std::operator==\(\)](#), [std::operator>\(\)](#), and [std::operator>\(\)](#).

**get\_deleter() [1/2]**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
const deleter_type & std::unique_ptr< _Tp, _Dp >::get_deleter () const [inline], [constexpr],
[noexcept]
```

Return a reference to the stored deleter.

**get\_deleter() [2/2]**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
deleter_type & std::unique_ptr< _Tp, _Dp >::get_deleter () [inline], [constexpr], [noexcept]
```

Return a reference to the stored deleter.

Referenced by [std::unique\\_ptr<\\_State>::~~unique\\_ptr\(\)](#), and [std::unique\\_ptr<\\_State>::operator=\(\)](#).

**operator bool()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::operator bool () const [inline], [explicit], [constexpr], [noexcept]
```

Return true if the stored pointer is not null.

**operator\*()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
add_lvalue_reference< element_type >::type std::unique_ptr< _Tp, _Dp >::operator* () const [inline],
[constexpr], [noexcept]
```

Dereference the stored pointer.

**operator->()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr< _Tp, _Dp >::operator-> () const [inline], [constexpr], [noexcept]
```

Return the stored pointer.

**operator=() [1/3]**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
unique_ptr & std::unique_ptr< _Tp, _Dp >::operator= (
    nullptr_t ) [inline], [constexpr], [noexcept]
```

Reset the unique\_ptr to empty, invoking the deleter if necessary.

**operator=()** [2/3]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
unique_ptr & std::unique_ptr<_Tp, _Dp>::operator= (
    unique_ptr<_Tp, _Dp> && ) [default]
```

Move assignment operator.

Invokes the deleter if this object owns a pointer.

**operator=()** [3/3]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Up, typename _Ep>
enable_if< __and< __safe_conversion_up<_Up, _Ep>, is_assignable< deleter_type &, _Ep && >
::value, unique_ptr & >::type std::unique_ptr<_Tp, _Dp>::operator= (
    unique_ptr<_Up, _Ep> && __u) [inline], [constexpr], [noexcept]
```

Assignment from another type.

**Parameters**

|       |                                                                                                |
|-------|------------------------------------------------------------------------------------------------|
| $\_U$ | The object to transfer ownership from, which owns a convertible pointer to a non-array object. |
|-------|------------------------------------------------------------------------------------------------|

Invokes the deleter if this object owns a pointer.

**release()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr<_Tp, _Dp>::release () [inline], [constexpr], [noexcept]
```

Release ownership of any stored pointer.

**reset()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
void std::unique_ptr<_Tp, _Dp>::reset (
    pointer __p = pointer()) [inline], [constexpr], [noexcept]
```

Replace the stored pointer.

**Parameters**

|       |                           |
|-------|---------------------------|
| $\_p$ | The new pointer to store. |
|-------|---------------------------|

The deleter will be invoked if a pointer is already owned.

Referenced by [std::unique\\_ptr<\\_State>::operator=\(\)](#), and [std::unique\\_ptr<\\_State>::operator=\(\)](#).

**swap()**

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
void std::unique_ptr<_Tp, _Dp>::swap (
    unique_ptr<_Tp, _Dp> & __u) [inline], [constexpr], [noexcept]
```

Exchange the pointer and deleter with another object.

### 6.1023.1 Detailed Description

**template<typename \_Tp, typename \_Dp>**  
**class std::unique\_ptr< \_Tp[], \_Dp >**

A move-only smart pointer that manages unique ownership of an array.

Since

C++11

### 6.1023.2 Constructor & Destructor Documentation

**unique\_ptr()** [1/6]

```
template<typename _Tp, typename _Dp>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr () [inline], [constexpr], [noexcept]
```

Default constructor, creates a unique\_ptr that owns nothing.

References [unique\\_ptr\(\)](#).

Referenced by [unique\\_ptr\(\)](#), [unique\\_ptr\(\)](#), [unique\\_ptr\(\)](#), [unique\\_ptr\(\)](#), [unique\\_ptr\(\)](#), [unique\\_ptr\(\)](#), [~unique\\_ptr\(\)](#), [operator=\(\)](#), [operator=\(\)](#), [operator=\(\)](#), and [swap\(\)](#).

**unique\_ptr()** [2/6]

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename _Vp = _Dp, typename = _DeleterConstraint<_Vp>, typename = typename
enable_if< __safe_conversion_raw<_Up>::value, bool>::type>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    _Up __p) [inline], [explicit], [constexpr], [noexcept]
```

Takes ownership of a pointer.

**Parameters**

|                                                                                                                      |                                                                                             |
|----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <a href="#"></a><br><code>_p</code> | A pointer to an array of a type safely convertible to an array of <code>element_type</code> |
|----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|

The deleter will be value-initialized.

References [unique\\_ptr\(\)](#).

**unique\_ptr()** [3/6]

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename _Del = deleter_type, typename = _Require<__safe_conversion_raw<
_Up>, is_copy_constructible<_Del>>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    _Up __p,
    const deleter_type & __d) [inline], [constexpr], [noexcept]
```

Takes ownership of a pointer.

**Parameters**

|                                                                                                                      |                                                                                             |
|----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <a href="#"></a><br><code>_p</code> | A pointer to an array of a type safely convertible to an array of <code>element_type</code> |
| <a href="#"></a><br><code>_d</code> | A reference to a deleter.                                                                   |

The deleter will be initialized with `__d`

References [unique\\_ptr\(\)](#).

**unique\_ptr()** [4/6]

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename _Del = deleter_type, typename = _Require<__safe_conversion_raw<
_Up>, is_move_constructible<_Del>>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    _Up __p,
    __enable_if_t<!is_lvalue_reference< _Del >::value, _Del && > __d) [inline], [constexpr],
[noexcept]
```

Takes ownership of a pointer.

**Parameters**

|                                                                                                                        |                                                                                             |
|------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <a href="#"></a><br><code>_p</code> | A pointer to an array of a type safely convertible to an array of <code>element_type</code> |
| <a href="#"></a><br><code>_d</code> | A reference to a deleter.                                                                   |

The deleter will be initialized with `std::move(__d)`

References [unique\\_ptr\(\)](#), and [std::move\(\)](#).

**unique\_ptr()** [5/6]

```
template<typename _Tp, typename _Dp>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
```

```
unique_ptr< _Tp[], _Dp > && ) [default]
```

Move constructor.

References [unique\\_ptr\(\)](#).

### unique\_ptr() [6/6]

```
template<typename _Tp, typename _Dp>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    nullptr_t ) [inline], [constexpr], [noexcept]
```

Creates a unique\_ptr that owns nothing.

References [unique\\_ptr\(\)](#).

### ~unique\_ptr()

```
template<typename _Tp, typename _Dp>
std::unique_ptr< _Tp[], _Dp >::~~unique_ptr () [inline], [constexpr]
```

Destructor, invokes the deleter if the stored pointer is not null.

References [unique\\_ptr\(\)](#), and [get\\_deleter\(\)](#).

## 6.1023.3 Member Function Documentation

### get()

```
template<typename _Tp, typename _Dp>
pointer std::unique_ptr< _Tp[], _Dp >::get () const [inline], [constexpr], [noexcept]
```

Return the stored pointer.

References [get\(\)](#).

Referenced by [get\(\)](#), [operator bool\(\)](#), and [operator\[\]\(\)](#).

### get\_deleter() [1/2]

```
template<typename _Tp, typename _Dp>
const deleter_type & std::unique_ptr< _Tp[], _Dp >::get_deleter () const [inline], [constexpr],
[noexcept]
```

Return a reference to the stored deleter.

References [get\\_deleter\(\)](#).

### get\_deleter() [2/2]

```
template<typename _Tp, typename _Dp>
deleter_type & std::unique_ptr< _Tp[], _Dp >::get_deleter () [inline], [constexpr], [noexcept]
```

Return a reference to the stored deleter.

References [get\\_deleter\(\)](#).

Referenced by [~unique\\_ptr\(\)](#), [get\\_deleter\(\)](#), [get\\_deleter\(\)](#), and [operator=\(\)](#).

### operator bool()

```
template<typename _Tp, typename _Dp>
std::unique_ptr< _Tp[], _Dp >::operator bool () const [inline], [explicit], [constexpr], [noexcept]
```

Return true if the stored pointer is not null.

References [get\(\)](#).

**operator\*()**

```
add_lvalue_reference< element_type >::type std::unique_ptr< _Tp, _Dp >::operator* () const [inline],
[constexpr], [noexcept]
```

Dereference the stored pointer.

**operator->()**

```
pointer std::unique_ptr< _Tp, _Dp >::operator-> () const [inline], [constexpr], [noexcept]
```

Return the stored pointer.

**operator=() [1/3]**

```
template<typename _Tp, typename _Dp>
unique_ptr & std::unique_ptr< _Tp[], _Dp >::operator= (
    nullptr_t ) [inline], [constexpr], [noexcept]
```

Reset the unique\_ptr to empty, invoking the deleter if necessary.

References [unique\\_ptr\(\)](#), [operator=\(\)](#), and [reset\(\)](#).

**operator=() [2/3]**

```
template<typename _Tp, typename _Dp>
unique_ptr & std::unique_ptr< _Tp[], _Dp >::operator= (
    unique_ptr< _Tp[], _Dp > && ) [default]
```

Move assignment operator.

Invokes the deleter if this object owns a pointer.

References [unique\\_ptr\(\)](#), and [operator=\(\)](#).

Referenced by [operator=\(\)](#), [operator=\(\)](#), and [operator=\(\)](#).

**operator=() [3/3]**

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename _Ep>
enable_if< __and< __safe_conversion_up< _Up, _Ep >, is_assignable< deleter_type &, _Ep && >
>::value, unique_ptr & >::type std::unique_ptr< _Tp[], _Dp >::operator= (
    unique_ptr< _Up, _Ep > && __u) [inline], [constexpr], [noexcept]
```

Assignment from another type.

**Parameters**

|                    |                                                                                             |
|--------------------|---------------------------------------------------------------------------------------------|
| <a href="#">_↵</a> | The object to transfer ownership from, which owns a convertible pointer to an array object. |
| <a href="#">_U</a> |                                                                                             |

Invokes the deleter if this object owns a pointer.

References [unique\\_ptr\(\)](#), [std::forward\(\)](#), [get\\_deleter\(\)](#), [operator=\(\)](#), and [reset\(\)](#).

**operator[]()**

```
template<typename _Tp, typename _Dp>
std::add_lvalue_reference< element_type >::type std::unique_ptr< _Tp[], _Dp >::operator[] (
    size_t __i) const [inline], [constexpr]
```

Access an element of owned array.

References [get\(\)](#), and [operator\[\]\(\)](#).

Referenced by [operator\[\]\(\)](#).

**release()**

```
template<typename _Tp, typename _Dp>
pointer std::unique_ptr<_Tp[], _Dp>::release () [inline], [constexpr], [noexcept]
```

Release ownership of any stored pointer.

References [release\(\)](#).

Referenced by [release\(\)](#).

**reset()**

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename = _Require< __or_<is_same<_Up, pointer>, __and_<is_same<pointer,
element_type*>, is_pointer<_Up>, is_convertible< typename remove_pointer<_Up>::type(*)[], element_↵
_type(*)[] > > > >>
void std::unique_ptr<_Tp[], _Dp>::reset (
    _Up __p) [inline], [constexpr], [noexcept]
```

Replace the stored pointer.

**Parameters**

|       |                           |
|-------|---------------------------|
| $\_p$ | The new pointer to store. |
|-------|---------------------------|

The deleter will be invoked if a pointer is already owned.

References [std::move\(\)](#), and [reset\(\)](#).

Referenced by [operator=\(\)](#), [operator=\(\)](#), and [reset\(\)](#).

**swap()**

```
template<typename _Tp, typename _Dp>
void std::unique_ptr<_Tp[], _Dp>::swap (
    unique_ptr<_Tp[], _Dp> & __u) [inline], [constexpr], [noexcept]
```

Exchange the pointer and deleter with another object.

References [unique\\_ptr\(\)](#), and [swap\(\)](#).

Referenced by [swap\(\)](#).

**6.1023.4 Friends And Related Symbol Documentation****operator<<()**

```
basic_ostream<_CharT, _Traits> & operator<< (
    basic_ostream<_CharT, _Traits> & __os,
    const unique_ptr<_Tp, _Dp> & __p) [related]
```

Stream output operator for unique\_ptr.

Since

C++20

**swap()**

```
enable_if< __is_swappable<_Dp>::value >::type swap (
    unique_ptr<_Tp, _Dp> & __x,
    unique_ptr<_Tp, _Dp> & __y) [related]
```

Swap overload for unique\_ptr.

The documentation for this class was generated from the following files:

- [unique\\_ptr.h](#)
- [auto\\_ptr.h](#)

## 6.1024 std::\_\_debug::unordered\_map< \_Key, \_Tp, \_Hash, \_Pred, \_Alloc > Class Template Reference

class ::[\\_\\_gnu\\_debug::Safe\\_local\\_iterator](#)

### 6.1024.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Hash = std::hash<_Key>, typename _Pred = std::equal<_Key>,
typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
class std::__debug::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >
```

Class std::unordered\_map with safety/checking/debug instrumentation.  
The documentation for this class was generated from the following file:

- [debug/unordered\\_map](#)

### 6.1025 std::unordered\_map< \_Key, \_Tp, \_Hash, \_Pred, \_Alloc > Class Template Reference

```
#include <unordered_map>
```

## Friends

- `template<typename _Key1, typename _Tp1, typename _Hash1, typename _Pred1, typename _Alloc1>`  
`bool operator==` (const `unordered_map< _Key1, _Tp1, _Hash1, _Pred1, _Alloc1 >` &, const `unordered_map< _Key1, _Tp1, _Hash1, _Pred1, _Alloc1 >` &)

### 6.1025.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
class std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >
```

A standard container composed of unique keys (containing at most one of each key value) that associates values of another type with the keys.

Since

C++11

#### Template Parameters

|                     |                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------|
| <code>_Key</code>   | Type of key objects.                                                                                  |
| <code>_Tp</code>    | Type of mapped objects.                                                                               |
| <code>_Hash</code>  | Hashing function object type, defaults to <code>hash&lt;_Key&gt;</code> .                             |
| <code>_Pred</code>  | Predicate function object type, defaults to <code>equal_to&lt;_Key&gt;</code> .                       |
| <code>_Alloc</code> | Allocator type, defaults to <code>std::allocator&lt;std::pair&lt;const _Key, _Tp&gt;&gt;&gt;</code> . |

Meets the requirements of a [container](#), and [unordered associative container](#)

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__umap_hashtable`.

### 6.1025.2 Member Typedef Documentation

#### `allocator_type`

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
typedef _Hashtable::allocator_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::allocator_type
```

Public typedefs.

#### `const_iterator`

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
typedef _Hashtable::const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::const_iterator
```

Iterator-related typedefs.

#### `const_local_iterator`

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
typedef _Hashtable::const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::const_local_iterator
```

Iterator-related typedefs.

#### `const_pointer`

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
typedef _Hashtable::const_pointer std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::const_↵
pointer
```

Iterator-related typedefs.

### const\_reference

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::const_reference std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::↵
const_reference
```

Iterator-related typedefs.

### difference\_type

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::difference_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::↵
difference_type
```

Iterator-related typedefs.

### hasher

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::hasher std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::hasher
```

Public typedefs.

### iterator

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::iterator
```

Iterator-related typedefs.

### key\_equal

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::key_equal std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::key_equal
```

Public typedefs.

### key\_type

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::key_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::key_type
```

Public typedefs.

### local\_iterator

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::local_↵
_iterator
```

Iterator-related typedefs.

**mapped\_type**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::mapped_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::mapped_type
Public typedefs.
```

**pointer**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::pointer std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::pointer
Iterator-related typedefs.
```

**reference**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::reference std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::reference
Iterator-related typedefs.
```

**size\_type**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::size_type
Iterator-related typedefs.
```

**value\_type**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
typedef _Hashtable::value_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::value_type
Public typedefs.
```

**6.1025.3 Constructor & Destructor Documentation****unordered\_map() [1/7]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map () [default]
Default constructor.
```

**unordered\_map() [2/7]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    size_type __n,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

**Parameters**

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eqf</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

**unordered\_map()** [3/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator>
std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eqf = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_map from a range.

**Parameters**

|                      |                                    |
|----------------------|------------------------------------|
| <code>__first</code> | An input iterator.                 |
| <code>__last</code>  | An input iterator.                 |
| <code>__n</code>     | Minimal initial number of buckets. |
| <code>__hf</code>    | A hash functor.                    |
| <code>__eqf</code>   | A key equality functor.            |
| <code>__a</code>     | An allocator object.               |

Create an unordered\_map consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is `distance(__first, __last)`).

**unordered\_map()** [4/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    const unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

**unordered\_map()** [5/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>
```

```
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

### unordered\_map() [6/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    const allocator_type & __a) [inline], [explicit]
```

Creates an unordered\_map with no elements.

#### Parameters

|                  |                      |
|------------------|----------------------|
| <code>__a</code> | An allocator object. |
|------------------|----------------------|

### unordered\_map() [7/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    initializer_list< value_type > __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eqf = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_map from an initializer\_list.

#### Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__l</code>   | An initializer_list.               |
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eqf</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Create an unordered\_map consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

## 6.1025.4 Member Function Documentation

### at() [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>
```

```
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<__heterogeneous_hash_key< unordered_map > _Kt>
mapped_type & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::at (
    const _Kt & __k) [inline]
```

Access to unordered\_map data.

#### Parameters

|                                        |                                             |
|----------------------------------------|---------------------------------------------|
| <a href="#"><code>_↵<br/>_k</code></a> | The key for which data should be retrieved. |
|----------------------------------------|---------------------------------------------|

#### Returns

A reference to the data whose key is equal to `__k`, if such a data is present in the unordered\_map.

#### Exceptions

|                                                |                             |
|------------------------------------------------|-----------------------------|
| <a href="#"><code>std::out_of_range</code></a> | If no such data is present. |
|------------------------------------------------|-----------------------------|

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<__heterogeneous_hash_key< unordered_map > _Kt>
const mapped_type & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::at (
    const _Kt & __k) const [inline]
```

Access to unordered\_map data.

#### Parameters

|                                        |                                             |
|----------------------------------------|---------------------------------------------|
| <a href="#"><code>_↵<br/>_k</code></a> | The key for which data should be retrieved. |
|----------------------------------------|---------------------------------------------|

#### Returns

A reference to the data whose key is equal to `__k`, if such a data is present in the unordered\_map.

#### Exceptions

|                                                |                             |
|------------------------------------------------|-----------------------------|
| <a href="#"><code>std::out_of_range</code></a> | If no such data is present. |
|------------------------------------------------|-----------------------------|

#### at() [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
mapped_type & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::at (
    const key_type & __k) [inline]
```

Access to unordered\_map data.

**Parameters**

|                       |                                             |
|-----------------------|---------------------------------------------|
| <code>↔<br/>_k</code> | The key for which data should be retrieved. |
|-----------------------|---------------------------------------------|

**Returns**

A reference to the data whose key is equal to `__k`, if such a data is present in the `unordered_map`.

**Exceptions**

|                                |                             |
|--------------------------------|-----------------------------|
| <code>std::out_of_range</code> | If no such data is present. |
|--------------------------------|-----------------------------|

**at()** [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<↔  
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
const mapped_type & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::at (  
    const key_type & __k) const [inline]
```

Access to `unordered_map` data.

**Parameters**

|                       |                                             |
|-----------------------|---------------------------------------------|
| <code>↔<br/>_k</code> | The key for which data should be retrieved. |
|-----------------------|---------------------------------------------|

**Returns**

A reference to the data whose key is equal to `__k`, if such a data is present in the `unordered_map`.

**Exceptions**

|                                |                             |
|--------------------------------|-----------------------------|
| <code>std::out_of_range</code> | If no such data is present. |
|--------------------------------|-----------------------------|

**begin()** [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<↔  
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin () const [inline],  
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_map`.

**begin()** [2/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<↔  
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the `unordered_map`.

**begin()** [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::begin (
    size_type __n) [inline]
```

Returns a read/write iterator pointing to the first bucket element.

**Parameters**

|                 |                   |
|-----------------|-------------------|
| <code>_↔</code> | The bucket index. |
| <code>_n</code> |                   |

**Returns**

A read/write local iterator.

**begin()** [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::begin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|                 |                   |
|-----------------|-------------------|
| <code>_↔</code> | The bucket index. |
| <code>_n</code> |                   |

**Returns**

A read-only local iterator.

**bucket\_count()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::bucket_count () const [inline],
[noexcept]
```

Returns the number of buckets of the unordered\_map.

**cbegin()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::cbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_map.

**cbegin()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|                 |                   |
|-----------------|-------------------|
| <code>_↵</code> | The bucket index. |
| <code>_n</code> |                   |

**Returns**

A read-only local iterator.

**cend()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cend () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_map`.

**cend()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cend (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|                 |                   |
|-----------------|-------------------|
| <code>_↵</code> | The bucket index. |
| <code>_n</code> |                   |

**Returns**

A read-only local iterator.

**clear()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in an `unordered_map`. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Kt>
auto std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::contains (
    const _Kt & __x) const -> decltype(_M_h._M_find_tr(__x), void()), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                  |                                |
|------------------|--------------------------------|
| <code>__x</code> | Key of elements to be located. |
|------------------|--------------------------------|

**Returns**

True if there is any element with the specified key.

**contains()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
bool std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                  |                                |
|------------------|--------------------------------|
| <code>__x</code> | Key of elements to be located. |
|------------------|--------------------------------|

**Returns**

True if there is any element with the specified key.

**count()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

|                  |               |
|------------------|---------------|
| <code>__x</code> | Key to count. |
|------------------|---------------|

**Returns**

Number of elements with specified key.

This function only makes sense for unordered\_multimap; for unordered\_map the result will either be 0 (not present) or 1 (present).

**emplace()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
std::pair< iterator, bool > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the unordered\_map.

**Parameters**

|                     |                                                                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__args</code> | Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor). |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the unordered\_map. An unordered\_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered\_map. Insertion requires amortized constant time.

**emplace\_hint()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the unordered\_map.

**Parameters**

|                     |                                                                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the pair should be inserted.                                                                |
| <code>__args</code> | Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor). |

**Returns**

An iterator that points to the element with key of the std::pair built from \_\_args (may or may not be that std::pair).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument emplace() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

**empty()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

```
bool std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::empty () const [inline], [nodiscard],
[noexcept]
```

Returns true if the unordered\_map is empty.

#### end() [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::end () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_map.

#### end() [2/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the unordered\_map.

#### end() [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::end (
    size_type __n) [inline]
```

Returns a read/write iterator pointing to one past the last bucket elements.

#### Parameters

|       |                   |
|-------|-------------------|
| $\_↵$ | The bucket index. |
| $\_n$ |                   |

#### Returns

A read/write local iterator.

#### end() [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const_local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::end (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

#### Parameters

|       |                   |
|-------|-------------------|
| $\_↵$ | The bucket index. |
| $\_n$ |                   |

#### Returns

A read-only local iterator.

**equal\_range()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::pair< iterator, iterator > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_range (
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for `unordered_multimap`.

**equal\_range()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::pair< const_iterator, const_iterator > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for `unordered_multimap`.

**erase()** [1/5]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<__heterogeneous_hash_key< unordered_map > _Kt>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    _Kt && __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <code>__x</code> | Key of element to be erased. |
|------------------|------------------------------|

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from an unordered\_map. For an unordered\_map the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [2/5]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <code>__x</code> | Key of element to be erased. |
|------------------|------------------------------|

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from an unordered\_map. For an unordered\_map the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [3/5]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from an unordered\_map.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from an unordered\_map. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [4/5]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::erase (
    const_iterator __position) [inline]
```

Erases an element from an unordered\_map.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered\_map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [5/5]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::erase (
    iterator __position) [inline]
```

Erases an element from an unordered\_map.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered\_map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::find (
    const key_type & __x) [inline]
```

Tries to locate an element in an unordered\_map.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↔</code> | Key to be located. |
| <code>_x</code> |                    |

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

**find() [2/2]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in an unordered\_map.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↔</code> | Key to be located. |
| <code>_x</code> |                    |

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

**get\_allocator()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
allocator_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::get_allocator () const
[inline], [noexcept]
```

Returns the allocator object used by the unordered\_map.

**hash\_function()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
hasher std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::hash_function () const [inline]
```

Returns the hash functor object with which the unordered\_map was constructed.

**insert() [1/8]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator>
void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

#### Parameters

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

#### insert() [2/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair && >::value, pair< iterator, bool > > std::unordered_map<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    _Pair && __x) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

#### Parameters

|                  |                                                                                   |
|------------------|-----------------------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |
|------------------|-----------------------------------------------------------------------------------|

#### Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`.

Insertion requires amortized constant time.

#### insert() [3/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::pair< iterator, bool > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

#### Parameters

|                  |                                                                                   |
|------------------|-----------------------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |
|------------------|-----------------------------------------------------------------------------------|

#### Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`.

Insertion requires amortized constant time.

**insert()** [4/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::unordered_map<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    _Pair && __x) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

**Parameters**

|                     |                                                                            |
|---------------------|----------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted. |
| <code>__x</code>    | Pair to be inserted (see std::make_pair for easy creation of pairs).       |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

**insert()** [5/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

**Parameters**

|                     |                                                                            |
|---------------------|----------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted. |
| <code>__x</code>    | Pair to be inserted (see std::make_pair for easy creation of pairs).       |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

**insert()** [6/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    value_type && __x) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

**Parameters**

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>    | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

**insert()** [7/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of elements into the `unordered_map`.

**Parameters**

|                  |                                                                                    |
|------------------|------------------------------------------------------------------------------------|
| <code>__l</code> | A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted. |
|------------------|------------------------------------------------------------------------------------|

Complexity similar to that of the range constructor.

**insert()** [8/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair< iterator, bool > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    value_type && __x) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

**Parameters**

|                 |                                                                      |
|-----------------|----------------------------------------------------------------------|
| <code>_↔</code> | Pair to be inserted (see std::make_pair for easy creation of pairs). |
| <code>_X</code> |                                                                      |

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered\_map. An unordered\_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered\_map.

Insertion requires amortized constant time.

**key\_eq()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
key_equal std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::key_eq () const [inline]
```

Returns the key comparison object with which the unordered\_map was constructed.

**load\_factor()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
float std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::load_factor () const [inline],
[noexcept]
```

Returns the average number of elements per bucket.

**max\_bucket\_count()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count () const [inline],
[noexcept]
```

Returns the maximum number of buckets of the unordered\_map.

**max\_load\_factor() [1/2]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
float std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],
[noexcept]
```

Returns a positive number that the unordered\_map tries to keep the load factor less than or equal to.

**max\_load\_factor() [2/2]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↔
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor (
float __z) [inline]
```

Change the unordered\_map maximum load factor.

**Parameters**

|                 |                              |
|-----------------|------------------------------|
| <code>_↵</code> | The new maximum load factor. |
| <code>_Z</code> |                              |

**max\_size()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_size () const [inline],
[noexcept]
```

Returns the maximum size of the unordered\_map.

**operator=()** [1/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_map & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
const unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

**operator=()** [2/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_map & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
initializer_list< value_type > __l) [inline]
```

Unordered\_map list assignment operator.

**Parameters**

|                 |                      |
|-----------------|----------------------|
| <code>↵</code>  | An initializer_list. |
| <code>_↵</code> |                      |
| <code>↵</code>  |                      |
| <code>_↵</code> |                      |
| <code>/</code>  |                      |

This function fills an unordered\_map with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered\_map and that the resulting unordered\_map's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_map & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

**operator[]()** [1/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

```
template<__heterogeneous_hash_key< unordered_map > _Kt>
mapped_type & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator[] (
    _Kt && __k) [inline]
```

Subscript ( [] ) access to unordered\_map data.

#### Parameters

|                  |                                             |
|------------------|---------------------------------------------|
| <code>__k</code> | The key for which data should be retrieved. |
|------------------|---------------------------------------------|

#### Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ( [] ) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned. Lookup requires constant time.

#### operator[]() [2/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
mapped_type & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator[] (
    const key_type & __k) [inline]
```

Subscript ( [] ) access to unordered\_map data.

#### Parameters

|                  |                                             |
|------------------|---------------------------------------------|
| <code>__k</code> | The key for which data should be retrieved. |
|------------------|---------------------------------------------|

#### Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ( [] ) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned. Lookup requires constant time.

#### operator[]() [3/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
mapped_type & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator[] (
    key_type && __k) [inline]
```

Subscript ( [] ) access to unordered\_map data.

#### Parameters

|                  |                                             |
|------------------|---------------------------------------------|
| <code>__k</code> | The key for which data should be retrieved. |
|------------------|---------------------------------------------|

**Returns**

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ( `[]` )operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned. Lookup requires constant time.

**rehash()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::rehash (
    size_type __n) [inline]
```

May rehash the unordered\_map.

**Parameters**

|                  |                            |
|------------------|----------------------------|
| <code>__n</code> | The new number of buckets. |
|------------------|----------------------------|

Rehash will occur only if the new number of buckets respect the unordered\_map maximum load factor.

**reserve()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::reserve (
    size_type __n) [inline]
```

Prepare the unordered\_map for a specified number of elements.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <code>__n</code> | Number of elements required. |
|------------------|------------------------------|

Same as `rehash(ceil(n / max_load_factor()))`.

**size()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the unordered\_map.

**swap()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::swap (
    unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another unordered\_map.

**Parameters**

|                   |                                                           |
|-------------------|-----------------------------------------------------------|
| <a href="#">↔</a> | An unordered_map of the same element and allocator types. |
| <a href="#">x</a> |                                                           |

This exchanges the elements between two unordered\_map in constant time. Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.

The documentation for this class was generated from the following file:

- [unordered\\_map.h](#)

## 6.1026 std::\_\_debug::unordered\_multimap< \_Key, \_Tp, \_Hash, \_Pred, \_Alloc > Class Template Reference

unordered_multimap< _Key1, _Tp1, _Hash1, _Pred1, _Alloc1 > &)`

### 6.1027.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
class std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >
```

A standard container composed of equivalent keys (possibly containing multiple of each key value) that associates values of another type with the keys.

Since

C++11

#### Template Parameters

|                     |                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------|
| <code>_Key</code>   | Type of key objects.                                                                              |
| <code>_Tp</code>    | Type of mapped objects.                                                                           |
| <code>_Hash</code>  | Hashing function object type, defaults to <code>hash&lt;_Key&gt;</code> .                         |
| <code>_Pred</code>  | Predicate function object type, defaults to <code>equal_to&lt;_Key&gt;</code> .                   |
| <code>_Alloc</code> | Allocator type, defaults to <code>std::allocator&lt;std::pair&lt;const _Key, _Tp&gt;&gt;</code> . |

Meets the requirements of a [container](#), and [unordered associative container](#)

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__ummap_hashtable`.

### 6.1027.2 Member Typedef Documentation

#### allocator\_type

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,

value_type
Public typedefs.
```

**6.1027.3 Constructor & Destructor Documentation****unordered\_multimap() [1/7]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_multimap () [default]
Default constructor.
```

**unordered\_multimap() [2/7]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_multimap (
    size_type __n,
    const hasher & __hf = hasher(),
```

```
const key_equal & __eq1 = key_equal(),
const allocator_type & __a = allocator_type() [inline], [explicit]
```

Default constructor creates no elements.

#### Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eq1</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

#### unordered\_multimap() [3/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type() [inline]
```

Builds an unordered\_multimap from a range.

#### Parameters

|                      |                                    |
|----------------------|------------------------------------|
| <code>__first</code> | An input iterator.                 |
| <code>__last</code>  | An input iterator.                 |
| <code>__n</code>     | Minimal initial number of buckets. |
| <code>__hf</code>    | A hash functor.                    |
| <code>__eq1</code>   | A key equality functor.            |
| <code>__a</code>     | An allocator object.               |

Create an unordered\_multimap consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is `distance(__first,__last)`).

#### unordered\_multimap() [4/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

**unordered\_multimap()** [5/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

**unordered\_multimap()** [6/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    const allocator_type & __a) [inline], [explicit]
```

Creates an unordered\_multimap with no elements.

**Parameters**

|                  |                      |
|------------------|----------------------|
| <code>__a</code> | An allocator object. |
|------------------|----------------------|

**unordered\_multimap()** [7/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    initializer_list< value_type > __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_multimap from an initializer\_list.

**Parameters**

|                    |                                    |
|--------------------|------------------------------------|
| <code>__l</code>   | An initializer_list.               |
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eq1</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Create an unordered\_multimap consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

## 6.1027.4 Member Function Documentation

### begin() [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::begin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_multimap.

### begin() [2/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the unordered\_multimap.

### begin() [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::begin (
    size_type __n) [inline]
```

Returns a read/write iterator pointing to the first bucket element.

#### Parameters

|                  |                   |
|------------------|-------------------|
| <code>_↵</code>  | The bucket index. |
| <code>__n</code> |                   |

#### Returns

A read/write local iterator.

### begin() [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::begin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

#### Parameters

|                  |                   |
|------------------|-------------------|
| <code>_↵</code>  | The bucket index. |
| <code>__n</code> |                   |

#### Returns

A read-only local iterator.

**bucket\_count()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::bucket_count () const [inline],
[noexcept]
```

Returns the number of buckets of the unordered\_multimap.

**cbegin() [1/2]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::cbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_multimap.

**cbegin() [2/2]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::cbegin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|                 |                   |
|-----------------|-------------------|
| <code>_↔</code> | The bucket index. |
| <code>_n</code> |                   |

**Returns**

A read-only local iterator.

**cend() [1/2]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::cend () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_multimap.

**cend() [2/2]**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::cend (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|                 |                   |
|-----------------|-------------------|
| <code>_↔</code> | The bucket index. |
| <code>_n</code> |                   |

**Returns**

A read-only local iterator.

**clear()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::clear () [inline], [noexcept]
```

Erases all elements in an `unordered_multimap`. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Kt>
auto std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::contains (
    const _Kt & __x) const -> decltype(_M_h._M_find_tr(__x), void()), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                   |                                |
|-------------------|--------------------------------|
| <code>_Key</code> | Key of elements to be located. |
| <code>__x</code>  |                                |

**Returns**

True if there is any element with the specified key.

**contains()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
bool std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                   |                                |
|-------------------|--------------------------------|
| <code>_Key</code> | Key of elements to be located. |
| <code>__x</code>  |                                |

**Returns**

True if there is any element with the specified key.

**count()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
```

```
size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements.

#### Parameters

|                  |               |
|------------------|---------------|
| <code>__x</code> | Key to count. |
|------------------|---------------|

#### Returns

Number of elements with specified key.

#### emplace()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the unordered\_multimap.

#### Parameters

|                     |                                                                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__args</code> | Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor). |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------|

#### Returns

An iterator that points to the inserted pair.

This function attempts to build and insert a (key, value) pair into the unordered\_multimap. Insertion requires amortized constant time.

#### emplace\_hint()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the unordered\_multimap.

#### Parameters

|                     |                                                                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the pair should be inserted.                                                                |
| <code>__args</code> | Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor). |

**Returns**

An iterator that points to the element with key of the `std::pair` built from `__args`.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

**empty()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
bool std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::empty () const [inline], [nodiscard],
[noexcept]
```

Returns true if the `unordered_multimap` is empty.

**end()** [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::end () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_multimap`.

**end()** [2/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the `unordered_multimap`.

**end()** [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::end (
    size_type __n) [inline]
```

Returns a read/write iterator pointing to one past the last bucket elements.

**Parameters**

|                 |                   |
|-----------------|-------------------|
| <code>_↵</code> | The bucket index. |
| <code>_n</code> |                   |

**Returns**

A read/write local iterator.

**end()** [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

```
const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::end (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

#### Parameters

|                 |                   |
|-----------------|-------------------|
| <code>_↵</code> | The bucket index. |
| <code>_n</code> |                   |

#### Returns

A read-only local iterator.

#### equal\_range() [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::pair< iterator, iterator > std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::↵
equal_range (
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

#### Parameters

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_x</code> |                    |

#### Returns

Pair of iterators that possibly points to the subsequence matching given key.

#### equal\_range() [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↵
_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::pair< const_iterator, const_iterator > std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _↵
Alloc >::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

#### Parameters

|                 |                    |
|-----------------|--------------------|
| <code>_↵</code> | Key to be located. |
| <code>_x</code> |                    |

#### Returns

Pair of iterators that possibly points to the subsequence matching given key.

**erase()** [1/5]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<__heterogeneous_hash_key< unordered_multimap > _Kt>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    _Kt && __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                  |                               |
|------------------|-------------------------------|
| <code>__x</code> | Key of elements to be erased. |
|------------------|-------------------------------|

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [2/5]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                  |                               |
|------------------|-------------------------------|
| <code>__x</code> | Key of elements to be erased. |
|------------------|-------------------------------|

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [3/5]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_multimap`.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from an `unordered_multimap`. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [4/5]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::erase (
    const_iterator __position) [inline]
```

Erases an element from an `unordered_multimap`.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [5/5]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::erase (
    iterator __position) [inline]
```

Erases an element from an `unordered_multimap`.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) [inline]
```

Tries to locate an element in an unordered\_multimap.

**Parameters**

|                   |                    |
|-------------------|--------------------|
| <code>_Key</code> | Key to be located. |
| <code>__x</code>  |                    |

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

**find()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in an unordered\_multimap.

**Parameters**

|                   |                    |
|-------------------|--------------------|
| <code>_Key</code> | Key to be located. |
| <code>__x</code>  |                    |

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

**get\_allocator()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
allocator_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::get_allocator () const
[inline], [noexcept]
```

Returns the allocator object used by the unordered\_multimap.

**hash\_function()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
hasher std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::hash_function () const [inline]
```

Returns the hash functor object with which the unordered\_multimap was constructed.

**insert()** [1/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _InputIterator>
void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

**Parameters**

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

**insert()** [2/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Pair>
__enable_if_t<is_constructible<value_type, _Pair &&>::value, iterator> std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc>::insert (
    _Pair && __x) [inline]
```

Inserts a std::pair into the unordered\_multimap.

**Parameters**

|                  |                                                                      |
|------------------|----------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see std::make_pair for easy creation of pairs). |
|------------------|----------------------------------------------------------------------|

**Returns**

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

**insert()** [3/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::insert (
    const value_type & __x) [inline]
```

Inserts a std::pair into the unordered\_multimap.

**Parameters**

|                  |                                                                      |
|------------------|----------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see std::make_pair for easy creation of pairs). |
|------------------|----------------------------------------------------------------------|

**Returns**

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

**insert()** [4/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    _Pair && __x) [inline]
```

Inserts a std::pair into the unordered\_multimap.

**Parameters**

|                     |                                                                            |
|---------------------|----------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted. |
| <code>__x</code>    | Pair to be inserted (see std::make_pair for easy creation of pairs).       |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

**insert()** [5/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x) [inline]
```

Inserts a std::pair into the unordered\_multimap.

**Parameters**

|                     |                                                                            |
|---------------------|----------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted. |
| <code>__x</code>    | Pair to be inserted (see std::make_pair for easy creation of pairs).       |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

**insert()** [6/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    value_type && __x) [inline]
```

Inserts a `std::pair` into the `unordered_multimap`.

**Parameters**

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the pair should be inserted.        |
| <code>__x</code>    | Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs). |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

**insert()** [7/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    initializer_list<value_type > __l) [inline]
```

Attempts to insert a list of elements into the `unordered_multimap`.

**Parameters**

|                  |                                                                                    |
|------------------|------------------------------------------------------------------------------------|
| <code>__l</code> | A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted. |
|------------------|------------------------------------------------------------------------------------|

Complexity similar to that of the range constructor.

**insert()** [8/8]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    value_type && __x) [inline]
```

Inserts a std::pair into the unordered\_multimap.

**Parameters**

|                  |                                                                      |
|------------------|----------------------------------------------------------------------|
| <code>__x</code> | Pair to be inserted (see std::make_pair for easy creation of pairs). |
|------------------|----------------------------------------------------------------------|

**Returns**

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

**key\_eq()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
key_equal std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::key_eq () const [inline]
```

Returns the key comparison object with which the unordered\_multimap was constructed.

**load\_factor()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::load_factor () const [inline],
[noexcept]
```

Returns the average number of elements per bucket.

**max\_bucket\_count()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count () const
[inline], [noexcept]
```

Returns the maximum number of buckets of the unordered\_multimap.

**max\_load\_factor()** [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],
[noexcept]
```

Returns a positive number that the unordered\_multimap tries to keep the load factor less than or equal to.

**max\_load\_factor()** [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

```
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor (
    float __z) [inline]
```

Change the unordered\_multimap maximum load factor.

#### Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__z</code> | The new maximum load factor. |
|------------------|------------------------------|

#### max\_size()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_size () const [inline],
[noexcept]
```

Returns the maximum size of the unordered\_multimap.

#### operator=() [1/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

#### operator=() [2/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Unordered\_multimap list assignment operator.

#### Parameters

|                  |                      |
|------------------|----------------------|
| <code>__l</code> | An initializer_list. |
|------------------|----------------------|

This function fills an unordered\_multimap with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered\_multimap and that the resulting unordered\_multimap's size is the same as the number of elements assigned.

#### operator=() [3/3]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

**rehash()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::rehash (
    size_type __n) [inline]
```

May rehash the unordered\_multimap.

**Parameters**

|                  |                            |
|------------------|----------------------------|
| <code>__n</code> | The new number of buckets. |
|------------------|----------------------------|

Rehash will occur only if the new number of buckets respect the unordered\_multimap maximum load factor.

**reserve()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::reserve (
    size_type __n) [inline]
```

Prepare the unordered\_multimap for a specified number of elements.

**Parameters**

|                  |                              |
|------------------|------------------------------|
| <code>__n</code> | Number of elements required. |
|------------------|------------------------------|

Same as rehash(ceil(n / max\_load\_factor())).

**size()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::size () const [inline],
[noexcept]
```

Returns the size of the unordered\_multimap.

**swap()**

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::swap (
    unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another unordered\_multimap.

**Parameters**

|                  |                                                                |
|------------------|----------------------------------------------------------------|
| <code>__x</code> | An unordered_multimap of the same element and allocator types. |
|------------------|----------------------------------------------------------------|

This exchanges the elements between two unordered\_multimap in constant time. Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.

The documentation for this class was generated from the following file:

- [unordered\\_map.h](#)

## 6.1028 std::\_\_debug::unordered\_multiset< \_Value, \_Hash, \_Pred, \_Alloc > Class Template Reference

## Friends

- `template<typename _Value1, typename _Hash1, typename _Pred1, typename _Alloc1>  
bool operator== (const unordered_multiset< _Value1, _Hash1, _Pred1, _Alloc1 > &, const unordered_multiset<  
_Value1, _Hash1, _Pred1, _Alloc1 > &)`

## 6.1029.1 Detailed Description

`template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, type-  
name _Alloc = allocator<_Value>>>`  
**class** `std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >`

A standard container composed of equivalent keys (possibly containing multiple of each key value) in which the elements' keys are the elements themselves.

Since

C++11

## Template Parameters

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| <code>_Value</code> | Type of key objects.                                                              |
| <code>_Hash</code>  | Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .       |
| <code>_Pred</code>  | Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> . |
| <code>_Alloc</code> | Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .                  |

Meets the requirements of a [container](#), and [unordered associative container](#)  
 Base is `_Hashtable`, dispatched at compile time via template alias `__umset_hashtable`.

## 6.1029.2 Member Typedef Documentation

### `allocator_type`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::allocator_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::↵
allocator_type
Public typedefs.
```

**const\_iterator**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::const_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::const_iterator
Iterator-related typedefs.
```

**const\_local\_iterator**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::const_local_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::const_local_iterator
Iterator-related typedefs.
```

**const\_pointer**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::const_pointer std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::const_pointer
Iterator-related typedefs.
```

**const\_reference**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::const_reference std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::const_reference
Iterator-related typedefs.
```

**difference\_type**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::difference_type std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::difference_type
Iterator-related typedefs.
```

**hasher**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::hasher std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::hasher
Public typedefs.
```

**iterator**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::iterator
Iterator-related typedefs.
```

**key\_equal**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::key_equal std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::key_equal
Public typedefs.
```

**key\_type**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::key_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::key_type
Public typedefs.
```

**local\_iterator**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::local_iterator
local_iterator
Iterator-related typedefs.
```

**pointer**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::pointer std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::pointer
Iterator-related typedefs.
```

**reference**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::reference std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::reference
Iterator-related typedefs.
```

**size\_type**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::size_type
Iterator-related typedefs.
```

**value\_type**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::value_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::value_type
type
Public typedefs.
```

**6.1029.3 Constructor & Destructor Documentation****unordered\_multiset()** [1/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
```

```

typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset () [default]
Default constructor.

```

### unordered\_multiset() [2/7]

```

template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    size_type __n,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline], [explicit]

```

Default constructor creates no elements.

#### Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eq1</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

### unordered\_multiset() [3/7]

```

template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]

```

Builds an unordered\_multiset from a range.

#### Parameters

|                      |                                    |
|----------------------|------------------------------------|
| <code>__first</code> | An input iterator.                 |
| <code>__last</code>  | An input iterator.                 |
| <code>__n</code>     | Minimal initial number of buckets. |
| <code>__hf</code>    | A hash functor.                    |
| <code>__eq1</code>   | A key equality functor.            |
| <code>__a</code>     | An allocator object.               |

Create an `unordered_multiset` consisting of copies of the elements from `[__first,__last)`. This is linear in `N` (where `N` is `distance(__first,__last)`).

#### `unordered_multiset()` [4/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    const unordered_multiset< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

#### `unordered_multiset()` [5/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    unordered_multiset< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

#### `unordered_multiset()` [6/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    initializer_list< value_type > __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an `unordered_multiset` from an `initializer_list`.

#### Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__l</code>   | An <code>initializer_list</code> . |
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eq1</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

Create an `unordered_multiset` consisting of copies of the elements in the list. This is linear in `N` (where `N` is `__l.size()`).

#### `unordered_multiset()` [7/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    const allocator_type & __a) [inline], [explicit]
```

Creates an unordered\_multiset with no elements.

#### Parameters

|                  |                      |
|------------------|----------------------|
| <code>__a</code> | An allocator object. |
|------------------|----------------------|

### 6.1029.4 Member Function Documentation

#### begin() [1/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_multiset.

#### begin() [2/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_multiset.

#### begin() [3/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

#### Parameters

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

#### Returns

A read-only local iterator.

#### begin() [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|       |                   |
|-------|-------------------|
| $\_n$ | The bucket index. |
|-------|-------------------|

**Returns**

A read-only local iterator.

**bucket\_count()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::bucket_count () const [inline],
[noexcept]
```

Returns the number of buckets of the unordered\_multiset.

**cbegin() [1/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_multiset.

**cbegin() [2/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|       |                   |
|-------|-------------------|
| $\_n$ | The bucket index. |
|-------|-------------------|

**Returns**

A read-only local iterator.

**cend() [1/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_multiset.

**cend()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|                   |                   |
|-------------------|-------------------|
| $\leftrightarrow$ | The bucket index. |
| $n$               |                   |

**Returns**

A read-only local iterator.

**clear()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::clear () [inline], [noexcept]
```

Erases all elements in an unordered\_multiset.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**contains()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt>
auto std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::contains (
    const _Kt & __x) const -> decltype(_M_h._M_find_tr(__x), void()), true) [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                   |                                |
|-------------------|--------------------------------|
| $\leftrightarrow$ | Key of elements to be located. |
| $x$               |                                |

**Returns**

True if there is any element with the specified key.

**contains()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                 |                                |
|-----------------|--------------------------------|
| <code>_↔</code> | Key of elements to be located. |
| <code>_X</code> |                                |

**Returns**

True if there is any element with the specified key.

**count()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

|                 |                     |
|-----------------|---------------------|
| <code>_↔</code> | Element to located. |
| <code>_X</code> |                     |

**Returns**

Number of elements with specified key.

**emplace()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Builds and insert an element into the unordered\_multiset.

**Parameters**

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__args</code> | Arguments used to generate an element. |
|---------------------|----------------------------------------|

**Returns**

An iterator that points to the inserted element.

Insertion requires amortized constant time.

**emplace\_hint()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace_hint (
```

```
const_iterator __pos,
_Args &&... __args) [inline]
```

Inserts an element into the unordered\_multiset.

#### Parameters

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__args</code> | Arguments used to generate the element to be inserted.                        |

#### Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert_hints)

Insertion requires amortized constant time.

#### empty()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::empty () const [inline], [nodiscard],
[noexcept]
```

Returns true if the unordered\_multiset is empty.

#### end() [1/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::end () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_multiset.

#### end() [2/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::end () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_multiset.

#### end() [3/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::end (
    size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

#### Parameters

|                        |                   |
|------------------------|-------------------|
| <code>↵<br/>__n</code> | The bucket index. |
|------------------------|-------------------|

**Returns**

A read-only local iterator.

**end()** [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

**Parameters**

|       |                   |
|-------|-------------------|
| $\_n$ | The bucket index. |
|-------|-------------------|

**Returns**

A read-only local iterator.

**equal\_range()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, iterator > std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::equal_
_range (
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

**Parameters**

|       |                    |
|-------|--------------------|
| $\_x$ | Key to be located. |
|-------|--------------------|

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

**equal\_range()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< const_iterator, const_iterator > std::unordered_multiset< _Value, _Hash, _Pred, _Alloc
>::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

|                 |                    |
|-----------------|--------------------|
| <code>_↔</code> | Key to be located. |
| <code>_X</code> |                    |

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

**erase() [1/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

**Parameters**

|                 |                              |
|-----------------|------------------------------|
| <code>_↔</code> | Key of element to be erased. |
| <code>_X</code> |                              |

**Returns**

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase() [2/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_multiset`.

**Parameters**

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [3/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from an unordered\_multiset.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered\_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase()** [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    iterator __position) [inline]
```

Erases an element from an unordered\_multiset.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered\_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) [inline]
```

Tries to locate an element in an unordered\_multiset.

**Parameters**

|                 |                        |
|-----------------|------------------------|
| <code>_↔</code> | Element to be located. |
| <code>_X</code> |                        |

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**find() [2/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in an unordered\_multiset.

**Parameters**

|                 |                        |
|-----------------|------------------------|
| <code>_↔</code> | Element to be located. |
| <code>_X</code> |                        |

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

**get\_allocator()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
allocator_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::get_allocator () const
[inline], [noexcept]
```

Returns the allocator object used by the unordered\_multiset.

**hash\_function()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
hasher std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::hash_function () const [inline]
```

Returns the hash functor object with which the unordered\_multiset was constructed.

**insert() [1/6]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that inserts a range of elements.

#### Parameters

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

#### insert() [2/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x) [inline]
```

Inserts an element into the `unordered_multiset`.

#### Parameters

|                  |                         |
|------------------|-------------------------|
| <code>__x</code> | Element to be inserted. |
|------------------|-------------------------|

#### Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

#### insert() [3/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x) [inline]
```

Inserts an element into the `unordered_multiset`.

#### Parameters

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>    | Element to be inserted.                                                       |

#### Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires amortized constant.

**insert()** [4/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    value_type && __x) [inline]
```

Inserts an element into the unordered\_multiset.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>    | Element to be inserted.                                                       |

**Returns**

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert_hints)

Insertion requires amortized constant.

**insert()** [5/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    initializer_list< value_type > __l) [inline]
```

Inserts a list of elements into the unordered\_multiset.

**Parameters**

|                                                                                            |                                                                 |
|--------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| <code>↵</code><br><code>__↵</code><br><code>↵</code><br><code>__↵</code><br><code>/</code> | A std::initializer_list<value_type> of elements to be inserted. |
|--------------------------------------------------------------------------------------------|-----------------------------------------------------------------|

Complexity similar to that of the range constructor.

**insert()** [6/6]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    value_type && __x) [inline]
```

Inserts an element into the unordered\_multiset.

**Parameters**

|                 |                         |
|-----------------|-------------------------|
| <code>_↔</code> | Element to be inserted. |
| <code>_X</code> |                         |

**Returns**

An iterator that points to the inserted element.

Insertion requires amortized constant time.

**key\_eq()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
key_equal std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::key_eq () const [inline]
```

Returns the key comparison object with which the `unordered_multiset` was constructed.

**load\_factor()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::load_factor () const [inline],
[noexcept]
```

Returns the average number of elements per bucket.

**max\_bucket\_count()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_bucket_count () const
[inline], [noexcept]
```

Returns the maximum number of buckets of the `unordered_multiset`.

**max\_load\_factor() [1/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],
[noexcept]
```

Returns a positive number that the `unordered_multiset` tries to keep the load factor less than or equal to.

**max\_load\_factor() [2/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor (
    float __z) [inline]
```

Change the `unordered_multiset` maximum load factor.

**Parameters**

|                 |                              |
|-----------------|------------------------------|
| <code>_↔</code> | The new maximum load factor. |
| <code>_Z</code> |                              |

**max\_size()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_size () const [inline],
[noexcept]
```

Returns the maximum size of the unordered\_multiset.

**operator=()** [1/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
    const unordered_multiset< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

**operator=()** [2/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Unordered\_multiset list assignment operator.

**Parameters**

|   |                      |
|---|----------------------|
| ↩ | An initializer_list. |
| ↩ |                      |
| ↩ |                      |
| ↩ |                      |
| / |                      |

This function fills an unordered\_multiset with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the unordered\_multiset and that the resulting unordered\_multiset's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
    unordered_multiset< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

**rehash()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::rehash (
    size_type __n) [inline]
```

May rehash the unordered\_multiset.

**Parameters**

|                   |                            |
|-------------------|----------------------------|
| $\leftrightarrow$ | The new number of buckets. |
| $n$               |                            |

Rehash will occur only if the new number of buckets respect the unordered\_multiset maximum load factor.

**reserve()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::reserve (
    size_type __n) [inline]
```

Prepare the unordered\_multiset for a specified number of elements.

**Parameters**

|                   |                              |
|-------------------|------------------------------|
| $\leftrightarrow$ | Number of elements required. |
| $n$               |                              |

Same as rehash(ceil(n / max\_load\_factor())).

**size()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::size () const [inline], [noexcept]
```

Returns the size of the unordered\_multiset.

**swap()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::swap (
    unordered_multiset< _Value, _Hash, _Pred, _Alloc > & __x) [inline], [noexcept]
```

Swaps data with another unordered\_multiset.

**Parameters**

|                   |                                                                |
|-------------------|----------------------------------------------------------------|
| $\leftrightarrow$ | An unordered_multiset of the same element and allocator types. |
| $x$               |                                                                |

This exchanges the elements between two sets in constant time. Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.

The documentation for this class was generated from the following file:

### 6.1030.1 Detailed Description

template<typename \_Value, typename \_Hash = std::hash<\_Value>, typename \_Pred = std::equal\_to<\_Value>,  
typename \_Alloc = std::allocator<\_Value>>  
class std::\_\_debug::unordered\_set< \_Value, \_Hash, \_Pred, \_Alloc >

Class std::unordered\_set with safety/checking/debug instrumentation.

The documentation for this class was generated from the following file:

- [debug/unordered\\_set](#)

## 6.1031 std::unordered\_set< \_Value, \_Hash, \_Pred, \_Alloc > Class Template Reference

```
#include <unordered_set>

### 6.1031.1 Detailed Description

`template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>`  
`class std::unordered_set< _Value, _Hash, _Pred, _Alloc >`

A standard container composed of unique keys (containing at most one of each key value) in which the elements' keys are the elements themselves.

Since

C++11

## Template Parameters

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| <code>_Value</code> | Type of key objects.                                                              |
| <code>_Hash</code>  | Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .       |
| <code>_Pred</code>  | Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> . |
| <code>_Alloc</code> | Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .                  |

Meets the requirements of a [container](#), and [unordered associative container](#)

Base is `_Hashtable`, dispatched at compile time via template alias `__uset_hashtable`.

### 6.1031.2 Member Typedef Documentation

#### `allocator_type`

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::allocator_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::allocator↵
_type
Public typedefs.
```

**const\_iterator**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::const_↵
iterator
```

Iterator-related typedefs.

**const\_local\_iterator**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::↵
const_local_iterator
```

Iterator-related typedefs.

**const\_pointer**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::const_pointer std::unordered_set<_Value, _Hash, _Pred, _Alloc>::const_↵
pointer
```

Iterator-related typedefs.

**const\_reference**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::const_reference std::unordered_set<_Value, _Hash, _Pred, _Alloc>::const_↵
reference
```

Iterator-related typedefs.

**difference\_type**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::difference_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::difference↵
_type
```

Iterator-related typedefs.

**hasher**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::hasher std::unordered_set<_Value, _Hash, _Pred, _Alloc>::hasher
```

Public typedefs.

**iterator**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::iterator
```

Iterator-related typedefs.

**key\_equal**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::key_equal std::unordered_set< _Value, _Hash, _Pred, _Alloc >::key_equal
Public typedefs.
```

**key\_type**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::key_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::key_type
Public typedefs.
```

**local\_iterator**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::local_↵
iterator
Iterator-related typedefs.
```

**pointer**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::pointer std::unordered_set< _Value, _Hash, _Pred, _Alloc >::pointer
Iterator-related typedefs.
```

**reference**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::reference std::unordered_set< _Value, _Hash, _Pred, _Alloc >::reference
Iterator-related typedefs.
```

**size\_type**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::size_type
Iterator-related typedefs.
```

**value\_type**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::value_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::value_type
Public typedefs.
```

**6.1031.3 Constructor & Destructor Documentation****unordered\_set()** [1/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
std::unordered_set<_Value, _Hash, _Pred, _Alloc>::unordered_set () [default]
```

Default constructor.

### unordered\_set() [2/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
std::unordered_set<_Value, _Hash, _Pred, _Alloc>::unordered_set (
    size_type __n,
    const hasher & __hf = hasher(),
    const key_equal & __eqf = key_equal(),
    const allocator_type & __a = allocator_type()) [inline], [explicit]
```

Default constructor creates no elements.

#### Parameters

|                    |                                    |
|--------------------|------------------------------------|
| <code>__n</code>   | Minimal initial number of buckets. |
| <code>__hf</code>  | A hash functor.                    |
| <code>__eqf</code> | A key equality functor.            |
| <code>__a</code>   | An allocator object.               |

### unordered\_set() [3/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
template<typename _InputIterator>
```

```
std::unordered_set<_Value, _Hash, _Pred, _Alloc>::unordered_set (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eqf = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an unordered\_set from a range.

#### Parameters

|                      |                                    |
|----------------------|------------------------------------|
| <code>__first</code> | An input iterator.                 |
| <code>__last</code>  | An input iterator.                 |
| <code>__n</code>     | Minimal initial number of buckets. |
| <code>__hf</code>    | A hash functor.                    |
| <code>__eqf</code>   | A key equality functor.            |
| <code>__a</code>     | An allocator object.               |

Create an `unordered_set` consisting of copies of the elements from `[__first,__last)`. This is linear in `N` (where `N` is `distance(__first,__last)`).

#### `unordered_set()` [4/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    const unordered_set< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

#### `unordered_set()` [5/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    unordered_set< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

#### `unordered_set()` [6/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    const allocator_type & __a) [inline], [explicit]
```

Creates an `unordered_set` with no elements.

#### Parameters

|                  |                      |
|------------------|----------------------|
| <code>__a</code> | An allocator object. |
|------------------|----------------------|

#### `unordered_set()` [7/7]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    initializer_list< value_type > __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type()) [inline]
```

Builds an `unordered_set` from an `initializer_list`.

#### Parameters

|                  |                                    |
|------------------|------------------------------------|
| <code>__l</code> | An <code>initializer_list</code> . |
| <code>__n</code> | Minimal initial number of buckets. |

|                    |                         |
|--------------------|-------------------------|
| <code>__hf</code>  | A hash functor.         |
| <code>__eqf</code> | A key equality functor. |
| <code>__a</code>   | An allocator object.    |

Create an `unordered_set` consisting of copies of the elements in the list. This is linear in  $N$  (where  $N$  is `l.size()`).

#### 6.1031.4 Member Function Documentation

##### **begin()** [1/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_set`.

##### **begin()** [2/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_set`.

##### **begin()** [3/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin (
    size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

#### Parameters

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

#### Returns

A read-only local iterator.

##### **begin()** [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|                   |                   |
|-------------------|-------------------|
| $\leftrightarrow$ | The bucket index. |
| $n$               |                   |

**Returns**

A read-only local iterator.

**bucket\_count()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::bucket_count () const [inline],
[noexcept]
```

Returns the number of buckets of the unordered\_set.

**cbegin() [1/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin () const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered\_set.

**cbegin() [2/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin (
size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

|                   |                   |
|-------------------|-------------------|
| $\leftrightarrow$ | The bucket index. |
| $n$               |                   |

**Returns**

A read-only local iterator.

**cend() [1/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cend () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_set.

**cend() [2/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::cend (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

#### Parameters

|                  |                   |
|------------------|-------------------|
| <code>__n</code> | The bucket index. |
|------------------|-------------------|

#### Returns

A read-only local iterator.

#### clear()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set<_Value, _Hash, _Pred, _Alloc>::clear () [inline], [noexcept]
```

Erases all elements in an unordered\_set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

#### contains() [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt>
auto std::unordered_set<_Value, _Hash, _Pred, _Alloc>::contains (
    const _Kt & __x) const -> decltype(_M_h._M_find_tr(__x), void(), true) [inline]
```

Finds whether an element with the given key exists.

#### Parameters

|                  |                                |
|------------------|--------------------------------|
| <code>__x</code> | Key of elements to be located. |
|------------------|--------------------------------|

#### Returns

True if there is any element with the specified key.

#### contains() [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_set<_Value, _Hash, _Pred, _Alloc>::contains (
    const key_type & __x) const [inline]
```

Finds whether an element with the given key exists.

**Parameters**

|                 |                                |
|-----------------|--------------------------------|
| <code>_↔</code> | Key of elements to be located. |
| <code>_X</code> |                                |

**Returns**

True if there is any element with the specified key.

**count()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::count (
    const key_type & __x) const [inline]
```

Finds the number of elements.

**Parameters**

|                 |                     |
|-----------------|---------------------|
| <code>_↔</code> | Element to located. |
| <code>_X</code> |                     |

**Returns**

Number of elements with specified key.

This function only makes sense for `unordered_multisets`; for `unordered_set` the result will either be 0 (not present) or 1 (present).

**emplace()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args) [inline]
```

Attempts to build and insert an element into the `unordered_set`.

**Parameters**

|                     |                                        |
|---------------------|----------------------------------------|
| <code>__args</code> | Arguments used to generate an element. |
|---------------------|----------------------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a `bool` that is true if the element was actually inserted.

This function attempts to build and insert an element into the `unordered_set`. An `unordered_set` relies on unique keys and thus an element is only inserted if it is not already present in the `unordered_set`.

Insertion requires amortized constant time.

**emplace\_hint()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args) [inline]
```

Attempts to insert an element into the unordered\_set.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__pos</code>  | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__args</code> | Arguments used to generate the element to be inserted.                        |

**Returns**

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires amortized constant time.

**empty()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_set< _Value, _Hash, _Pred, _Alloc >::empty () const [inline], [nodiscard],
[noexcept]
```

Returns true if the unordered\_set is empty.

**end() [1/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end () const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_set.

**end() [2/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end () [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered\_set.

**end() [3/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

#### Parameters

|                        |                   |
|------------------------|-------------------|
| <code>_↔<br/>_n</code> | The bucket index. |
|------------------------|-------------------|

#### Returns

A read-only local iterator.

#### **end()** [4/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

#### Parameters

|                        |                   |
|------------------------|-------------------|
| <code>_↔<br/>_n</code> | The bucket index. |
|------------------------|-------------------|

#### Returns

A read-only local iterator.

#### **equal\_range()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, iterator > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::equal_range
(
    const key_type & __x) [inline]
```

Finds a subsequence matching given key.

#### Parameters

|                        |                    |
|------------------------|--------------------|
| <code>_↔<br/>_x</code> | Key to be located. |
|------------------------|--------------------|

#### Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

#### **equal\_range()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
std::pair< const_iterator, const_iterator > std::unordered_set< _Value, _Hash, _Pred, _Alloc
>::equal_range (
    const key_type & __x) const [inline]
```

Finds a subsequence matching given key.

#### Parameters

|                  |                    |
|------------------|--------------------|
| <code>__x</code> | Key to be located. |
|------------------|--------------------|

#### Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

#### erase() [1/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x) [inline]
```

Erases elements according to the provided key.

#### Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__x</code> | Key of element to be erased. |
|------------------|------------------------------|

#### Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered\_set. For an unordered\_set the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

#### erase() [2/4]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline]
```

Erases a [`__first`,`__last`) range of elements from an unordered\_set.

#### Parameters

|                      |                                                           |
|----------------------|-----------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be erased. |
| <code>__last</code>  | Iterator pointing to the end of the range to be erased.   |

**Returns**

The iterator `__last`.

This function erases a sequence of elements from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase() [3/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __position) [inline]
```

Erases an element from an `unordered_set`.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**erase() [4/4]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    iterator __position) [inline]
```

Erases an element from an `unordered_set`.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__position</code> | An iterator pointing to the element to be erased. |
|-------------------------|---------------------------------------------------|

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**find() [1/2]**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::find (
    const key_type & __x) [inline]
```

Tries to locate an element in an unordered\_set.

#### Parameters

|                  |                        |
|------------------|------------------------|
| <code>__x</code> | Element to be located. |
|------------------|------------------------|

#### Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

#### find() [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::find (
    const key_type & __x) const [inline]
```

Tries to locate an element in an unordered\_set.

#### Parameters

|                  |                        |
|------------------|------------------------|
| <code>__x</code> | Element to be located. |
|------------------|------------------------|

#### Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

#### get\_allocator()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
allocator_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::get_allocator () const [inline],
[noexcept]
```

Returns the allocator object used by the unordered\_set.

#### hash\_function()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
hasher std::unordered_set<_Value, _Hash, _Pred, _Alloc>::hash_function () const [inline]
```

Returns the hash functor object with which the unordered\_set was constructed.

#### insert() [1/8]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
template<typename _InputIterator>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last) [inline]
```

A template function that attempts to insert a range of elements.

#### Parameters

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the start of the range to be inserted. |
| <code>__last</code>  | Iterator pointing to the end of the range.                  |

Complexity similar to that of the range constructor.

#### insert() [2/8]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<__heterogeneous_hash_key< unordered_set > _Kt>
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    _Kt && __x) [inline]
```

Attempts to insert an element into the `unordered_set`.

#### Parameters

|                  |                         |
|------------------|-------------------------|
| <code>__x</code> | Element to be inserted. |
|------------------|-------------------------|

#### Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a `bool` that is true if the element was actually inserted.

This function attempts to insert an element into the `unordered_set`. An `unordered_set` relies on unique keys and thus an element is only inserted if it is not already present in the `unordered_set`. Insertion requires amortized constant time.

#### insert() [3/8]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x) [inline]
```

Attempts to insert an element into the `unordered_set`.

#### Parameters

|                  |                         |
|------------------|-------------------------|
| <code>__x</code> | Element to be inserted. |
|------------------|-------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the unordered\_set. An unordered\_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered\_set.

Insertion requires amortized constant time.

**insert()** [4/8]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x) [inline]
```

Attempts to insert an element into the unordered\_set.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>    | Element to be inserted.                                                       |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert_hints)

Insertion requires amortized constant.

**insert()** [5/8]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    value_type && __x) [inline]
```

Attempts to insert an element into the unordered\_set.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>    | Element to be inserted.                                                       |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert_hints)

Insertion requires amortized constant.

**insert()** [6/8]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<__heterogeneous_hash_key< unordered_set > _Kt>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator ,
    _Kt && __x) [inline]
```

Attempts to insert an element into the `unordered_set`.

**Parameters**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <code>__hint</code> | An iterator that serves as a hint as to where the element should be inserted. |
| <code>__x</code>    | Element to be inserted.                                                       |

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert_hints)

Insertion requires amortized constant.

**insert()** [7/8]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    initializer_list< value_type > __l) [inline]
```

Attempts to insert a list of elements into the `unordered_set`.

**Parameters**

|                |                                                                                    |
|----------------|------------------------------------------------------------------------------------|
| ↵              | A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted. |
| ↵              |                                                                                    |
| ↵              |                                                                                    |
| ↵              |                                                                                    |
| <code>l</code> |                                                                                    |

Complexity similar to that of the range constructor.

**insert()** [8/8]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    value_type && __x) [inline]
```

Attempts to insert an element into the unordered\_set.

**Parameters**

|                  |                         |
|------------------|-------------------------|
| <code>__x</code> | Element to be inserted. |
|------------------|-------------------------|

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the unordered\_set. An unordered\_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered\_set.

Insertion requires amortized constant time.

**key\_eq()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
key_equal std::unordered_set< _Value, _Hash, _Pred, _Alloc >::key_eq () const [inline]
```

Returns the key comparison object with which the unordered\_set was constructed.

**load\_factor()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_set< _Value, _Hash, _Pred, _Alloc >::load_factor () const [inline], [noexcept]
```

Returns the average number of elements per bucket.

**max\_bucket\_count()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_bucket_count () const [inline],
[noexcept]
```

Returns the maximum number of buckets of the unordered\_set.

**max\_load\_factor()** [1/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_load_factor () const [inline],
[noexcept]
```

Returns a positive number that the unordered\_set tries to keep the load factor less than or equal to.

**max\_load\_factor()** [2/2]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_load_factor (
    float __z) [inline]
```

Change the unordered\_set maximum load factor.

#### Parameters

|                  |                              |
|------------------|------------------------------|
| <code>__z</code> | The new maximum load factor. |
|------------------|------------------------------|

#### max\_size()

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_size () const [inline], [noexcept]
```

Returns the maximum size of the unordered\_set.

#### operator=() [1/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
    const unordered_set< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

#### operator=() [2/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline]
```

Unordered\_set list assignment operator.

#### Parameters

|                  |                      |
|------------------|----------------------|
| <code>__l</code> | An initializer_list. |
|------------------|----------------------|

This function fills an unordered\_set with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the unordered\_set and that the resulting unordered\_set's size is the same as the number of elements assigned.

#### operator=() [3/3]

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
    unordered_set< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

**rehash()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set<_Value, _Hash, _Pred, _Alloc>::rehash (
    size_type __n) [inline]
```

May rehash the unordered\_set.

**Parameters**

|                     |                            |
|---------------------|----------------------------|
| $\leftarrow$<br>__n | The new number of buckets. |
|---------------------|----------------------------|

Rehash will occur only if the new number of buckets respect the unordered\_set maximum load factor.

**reserve()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set<_Value, _Hash, _Pred, _Alloc>::reserve (
    size_type __n) [inline]
```

Prepare the unordered\_set for a specified number of elements.

**Parameters**

|                     |                              |
|---------------------|------------------------------|
| $\leftarrow$<br>__n | Number of elements required. |
|---------------------|------------------------------|

Same as rehash(ceil(n / max\_load\_factor())).

**size()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::size () const [inline], [noexcept]
```

Returns the size of the unordered\_set.

**swap()**

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set<_Value, _Hash, _Pred, _Alloc>::swap (
    unordered_set<_Value, _Hash, _Pred, _Alloc> & __x) [inline], [noexcept]
```

Swaps data with another unordered\_set.

**Parameters**

|                     |                                                           |
|---------------------|-----------------------------------------------------------|
| $\leftarrow$<br>__x | An unordered_set of the same element and allocator types. |
|---------------------|-----------------------------------------------------------|

This exchanges the elements between two sets in constant time. Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.

#### 6.1032.1 Detailed Description

A non-thread-safe memory resource that manages pools of fixed-size blocks.

Since

C++17

**6.1032.2 Member Function Documentation****do\_allocate()**

```
void * std::pmr::unsynchronized_pool_resource::do_allocate (
    size_t __bytes,
    size_t __alignment) [override], [protected], [virtual]
```

Implements [std::pmr::memory\\_resource](#).

**do\_deallocate()**

```
void std::pmr::unsynchronized_pool_resource::do_deallocate (
    void * __p,
    size_t __bytes,
    size_t __alignment) [override], [protected], [virtual]
```

Implements [std::pmr::memory\\_resource](#).

**do\_is\_equal()**

```
bool std::pmr::unsynchronized_pool_resource::do_is_equal (
    const memory_resource & __other) const [inline], [override], [protected], [virtual],
[noexcept]
```

Implements [std::pmr::memory\\_resource](#).

The documentation for this class was generated from the following file:

## 6.1036.1 Detailed Description

**template<class \_Tp>**

**class std::valarray< \_Tp >**

Smart array designed to support numeric processing.

A valarray is an array that provides constraints intended to allow for effective optimization of numeric array processing by reducing the aliasing that can result from pointer representations. It represents a one-dimensional array from which different multidimensional subsets can be accessed and modified.

## Template Parameters

|                  |                              |
|------------------|------------------------------|
| <code>_Tp</code> | Type of object in the array. |
|------------------|------------------------------|

### 6.1036.2 Constructor & Destructor Documentation

#### valarray()

```
template<class _Tp>
std::valarray< _Tp >::valarray (
    const _Tp * __restrict__,
    size_t )
```

Construct an array initialized to the first  $n$  elements of  $t$ .

References [valarray\(\)](#).

### 6.1036.3 Member Function Documentation

#### begin()

```
template<class _Tp>
iterator std::valarray< _Tp >::begin () [inline], [nodiscard], [noexcept]
```

Return an iterator pointing to the first element of the valarray.

#### end()

```
template<class _Tp>
iterator std::valarray< _Tp >::end () [inline], [nodiscard], [noexcept]
```

Return an iterator pointing to one past the last element of the valarray.

#### operator"!"()

```
template<class _Tp>
_UnaryOp< __logical_not >::_Rt std::valarray< _Tp >::operator! () const
```

Return a new valarray by applying unary ! to each element.

#### operator%=() [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator%= (
    const _Tp & )
```

Set each element  $e$  of array to  $e \% t$ .

References [valarray\(\)](#).

#### operator%=() [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator%= (
    const valarray< _Tp > & )
```

Modulo elements of array by corresponding elements of  $v$ .

References [valarray\(\)](#).

#### operator&=() [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator&= (
    const _Tp & )
```

Set each element  $e$  of array to  $e \& t$ .

References [valarray\(\)](#).

**operator&=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator&= (
    const valarray< _Tp > & )
```

Logical and corresponding elements of *v* with elements of array.

References [valarray\(\)](#).

**operator\*=()** [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator*= (
    const _Tp & )
```

Multiply each element of array by *t*.

References [valarray\(\)](#).

**operator\*=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator*= (
    const valarray< _Tp > & )
```

Multiply elements of array by corresponding elements of *v*.

References [valarray\(\)](#).

**operator+()**

```
template<class _Tp>
UnaryOp< __unary_plus >::Rt std::valarray< _Tp >::operator+ () const
```

Return a new valarray by applying unary + to each element.

**operator+=()** [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator+= (
    const _Tp & )
```

Add *t* to each element of array.

References [valarray\(\)](#).

**operator+=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator+= (
    const valarray< _Tp > & )
```

Add corresponding elements of *v* to elements of array.

References [valarray\(\)](#).

**operator-()**

```
template<class _Tp>
UnaryOp< __negate >::Rt std::valarray< _Tp >::operator- () const
```

Return a new valarray by applying unary - to each element.

**operator-=()** [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator-= (
    const _Tp & )
```

Subtract *t* to each element of array.

References [valarray\(\)](#).

**operator-=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator-= (
    const valarray< _Tp > & )
```

Subtract corresponding elements of *v* from elements of array.

References [valarray\(\)](#).

**operator/=()** [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator/= (
    const _Tp & )
```

Divide each element of array by *t*.

References [valarray\(\)](#).

**operator/=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator/= (
    const valarray< _Tp > & )
```

Divide elements of array by corresponding elements of *v*.

References [valarray\(\)](#).

**operator<<=()** [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator<<= (
    const _Tp & )
```

Left shift each element *e* of array by *t* bits.

References [valarray\(\)](#).

**operator<<=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator<<= (
    const valarray< _Tp > & )
```

Left shift elements of array by corresponding elements of *v*.

**operator>>=()** [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator>>= (
    const _Tp & )
```

Right shift each element *e* of array by *t* bits.

References [valarray\(\)](#).

**operator>>=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator>>= (
    const valarray< _Tp > & )
```

Right shift elements of array by corresponding elements of *v*.

References [valarray\(\)](#).

**operator^=()** [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator^= (
    const _Tp & )
```

Set each element *e* of array to  $e \wedge t$ .

References [valarray\(\)](#).

**operator^=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator^= (
    const valarray< _Tp > & )
```

Logical xor corresponding elements of *v* with elements of array.

References [valarray\(\)](#).

**operator" |=()** [1/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator|= (
    const _Tp & )
```

Set each element *e* of array to  $e \mid t$ .

**operator" |=()** [2/2]

```
template<class _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator|= (
    const valarray< _Tp > & )
```

Logical or corresponding elements of *v* with elements of array.

References [valarray\(\)](#).

**operator~()**

```
template<class _Tp>
_UnaryOp< __bitwise_not >::_Rt std::valarray< _Tp >::operator~ () const
```

Return a new valarray by applying unary  $\sim$  to each element.

The documentation for this class was generated from the following file:

- [valarray](#)

### 6.1038.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::vector<_Tp, _Alloc >
```

A standard container which offers fixed time access to individual elements in any order.

Since

C++98

#### Template Parameters

|                     |                                                                 |
|---------------------|-----------------------------------------------------------------|
| <code>_Tp</code>    | Type of element.                                                |
| <code>_Alloc</code> | Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> . |

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `push_front` and `pop_front`.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ( `[]` ) access is also provided as with C-style arrays.

### 6.1038.2 Constructor & Destructor Documentation

#### `vector()` [1/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc >::vector () [default]
```

Creates a vector with no elements.

Referenced by [insert\(\)](#), and [operator=\(\)](#).

#### `vector()` [2/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc >::vector (
    const allocator_type & __a) [inline], [explicit], [constexpr], [noexcept]
```

Creates a vector with no elements.

#### Parameters

|                  |                      |
|------------------|----------------------|
| <code>__a</code> | An allocator object. |
|------------------|----------------------|

#### `vector()` [3/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc >::vector (
    size_type __n,
    const allocator_type & __a = allocator_type()) [inline], [explicit], [constexpr]
```

Creates a vector with default constructed elements.

**Parameters**

|                  |                                             |
|------------------|---------------------------------------------|
| <code>__n</code> | The number of elements to initially create. |
| <code>__a</code> | An allocator.                               |

This constructor fills the vector with `__n` default constructed elements.

**vector() [4/10]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    size_type __n,
    const value_type & __value,
    const allocator_type & __a = allocator_type()) [inline], [constexpr]
```

Creates a vector with copies of an exemplar element.

**Parameters**

|                      |                                             |
|----------------------|---------------------------------------------|
| <code>__n</code>     | The number of elements to initially create. |
| <code>__value</code> | An element to copy.                         |
| <code>__a</code>     | An allocator.                               |

This constructor fills the vector with `__n` copies of `__value`.

**vector() [5/10]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    const vector< _Tp, _Alloc > & __x) [inline], [constexpr]
```

Vector copy constructor.

**Parameters**

|                  |                                                    |
|------------------|----------------------------------------------------|
| <code>__x</code> | A vector of identical element and allocator types. |
|------------------|----------------------------------------------------|

All the elements of `__x` are copied, but any unused capacity in `__x` will not be copied (i.e. `capacity() == size()` in the new vector).

The newly-created vector uses a copy of the allocator object used by `__x` (unless the allocator traits dictate a different object).

**vector() [6/10]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    vector< _Tp, _Alloc > && ) [default], [noexcept]
```

Vector move constructor.

The newly-created vector contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified vector.

**vector()** [7/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc>::vector (
    const vector<_Tp, _Alloc> & __x,
    const __type_identity_t< allocator_type > & __a) [inline], [constexpr]
```

Copy constructor with alternative allocator.

**vector()** [8/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc>::vector (
    vector<_Tp, _Alloc> && __rv,
    const __type_identity_t< allocator_type > & __m) [inline], [constexpr], [noexcept]
```

Move constructor with alternative allocator.

**vector()** [9/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc>::vector (
    initializer_list< value_type > __l,
    const allocator_type & __a = allocator_type()) [inline], [constexpr]
```

Builds a vector from an initializer list.

**Parameters**

|                          |                      |
|--------------------------|----------------------|
| $\leftrightarrow$<br>__l | An initializer_list. |
| $\leftrightarrow$<br>__a | An allocator.        |

Create a vector consisting of copies of the elements in the initializer\_list \_\_l.

This will call the element type's copy constructor N times (where N is \_\_l.size()) and do no memory reallocation.

**vector()** [10/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
std::vector<_Tp, _Alloc>::vector (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a = allocator_type()) [inline], [constexpr]
```

Builds a vector from a range.

**Parameters**

|         |                    |
|---------|--------------------|
| __first | An input iterator. |
| __last  | An input iterator. |
| __a     | An allocator.      |

Create a vector consisting of copies of the elements from `[first,last)`.

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor  $N$  times (where  $N$  is `distance(first,last)`) and do no memory reallocation. But if only input iterators are used, then this will do at most  $2N$  calls to the copy constructor, and  $\log N$  memory reallocations.

### `~vector()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::~~vector () [inline], [constexpr], [noexcept]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

## 6.1038.3 Member Function Documentation

### `_M_allocate_and_copy()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _ForwardIterator>
_Alloc_result std::vector< _Tp, _Alloc >::_M_allocate_and_copy (
    size_type __n,
    _ForwardIterator __first,
    _ForwardIterator __last) [inline], [constexpr], [protected]
```

Memory expansion handler. Uses the member allocation function to obtain at least  $n$  objects worth of memory, copies `[first, last)` into it, reports what was actually allocated.

Referenced by [reserve\(\)](#).

### `_M_range_check()`

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::_M_range_check (
    size_type __n) const [inline], [constexpr], [protected]
```

Safety check used only from `at()`.

Referenced by [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::at\(\)](#), and [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::at\(\)](#).

### `assign()` [1/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
void std::vector< _Tp, _Alloc >::assign (
    _InputIterator __first,
    _InputIterator __last) [inline], [constexpr]
```

Assigns a range to a vector.

#### Parameters

|                      |                    |
|----------------------|--------------------|
| <code>__first</code> | An input iterator. |
| <code>__last</code>  | An input iterator. |

This function fills a vector with copies of the elements in the range `[__first,__last)`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

### `assign()` [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
```

```
void std::vector<_Tp, _Alloc >::assign (
    initializer_list< value_type > __l) [inline], [constexpr]
```

Assigns an initializer list to a vector.

#### Parameters

|                      |                      |
|----------------------|----------------------|
| $\leftrightarrow$    | An initializer_list. |
| $\_ \leftrightarrow$ |                      |
| $\leftrightarrow$    |                      |
| $\_ \leftrightarrow$ |                      |
| $/$                  |                      |

This function fills a vector with copies of the elements in the initializer list  $\_l$ .

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

#### assign() [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc >::assign (
    size_type __n,
    const value_type & __val) [inline], [constexpr]
```

Assigns a given value to a vector.

#### Parameters

|         |                                    |
|---------|------------------------------------|
| $\_n$   | Number of elements to be assigned. |
| $\_val$ | Value to be assigned.              |

This function fills a vector with  $\_n$  copies of the given value. Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

#### at() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector<_Tp, _Alloc >::at (
    size_type __n) [inline], [nodiscard], [constexpr]
```

Provides access to the data contained in the vector.

#### Parameters

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| $\_ \leftrightarrow$ | The index of the element for which data should be accessed. |
| $\_n$                |                                                             |

**Returns**

Read/write reference to data.

**Exceptions**

|                                                |                                          |
|------------------------------------------------|------------------------------------------|
| <a href="#"><code>std::out_of_range</code></a> | If <code>__n</code> is an invalid index. |
|------------------------------------------------|------------------------------------------|

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

**at()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::at (
    size_type __n) const [inline], [nodiscard], [constexpr]
```

Provides access to the data contained in the vector.

**Parameters**

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| <code>__n</code> | The index of the element for which data should be accessed. |
|------------------|-------------------------------------------------------------|

**Returns**

Read-only (constant) reference to data.

**Exceptions**

|                                                |                                          |
|------------------------------------------------|------------------------------------------|
| <a href="#"><code>std::out_of_range</code></a> | If <code>__n</code> is an invalid index. |
|------------------------------------------------|------------------------------------------|

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

**back()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::back () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the vector.

**back()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::back () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write reference to the data at the last element of the vector.

**begin()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector< _Tp, _Alloc >::begin () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

**begin()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
```

```
iterator std::vector<\_Tp, \_Alloc>::begin\(\) [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Referenced by [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::vector\(\)](#), [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::crend\(\)](#), [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::empty\(\)](#), [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::erase\(\)](#), [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::erase\(\)](#), [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::front\(\)](#), [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::front\(\)](#), [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::insert\(\)](#), [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::insert\(\)](#), [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::insert\(\)](#), [\\_\\_gnu\\_parallel::multiseq\\_partition\(\)](#), [\\_\\_gnu\\_parallel::multiseq\\_selection\(\)](#), [\\_\\_gnu\\_parallel::multiway\\_merge\\_exact\\_splitting\(\)](#), [std::operator<=>\(\)](#), [operator=\(\)](#), [std::operator==\(\)](#), [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::rend\(\)](#), and [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::rend\(\)](#).

**capacity()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
```

```
size_type std::vector<\_Tp, \_Alloc>::capacity\(\) const [inline], [nodiscard], [constexpr], [noexcept]
```

Returns the total number of elements that the vector can hold before needing to allocate more memory.

Referenced by [operator=\(\)](#), and [reserve\(\)](#).

**cbegin()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
```

```
const_iterator std::vector<\_Tp, \_Alloc>::cbegin\(\) const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Referenced by [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::erase\(\)](#), [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::erase\(\)](#), [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::insert\(\)](#), [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::insert\(\)](#), and [std::vector<\\_Tp, polymorphic\\_allocator<\\_Tp>>::insert\(\)](#).

**cend()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
```

```
const_iterator std::vector<\_Tp, \_Alloc>::cend\(\) const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

**clear()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
```

```
void std::vector<\_Tp, \_Alloc>::clear\(\) [inline], [constexpr], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Referenced by [operator=\(\)](#).

**crbegin()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
```

```
const_reverse_iterator std::vector<\_Tp, \_Alloc>::crbegin\(\) const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

**crend()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector< _Tp, _Alloc >::crend () const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

**data()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
_Tp * std::vector< _Tp, _Alloc >::data () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a pointer such that `[data(), data() + size())` is a valid range. For a non-empty vector, `data() == &front()`.

**emplace()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename... _Args>
iterator std::vector< _Tp, _Alloc >::emplace (
    const_iterator __position,
    _Args &&... __args) [inline], [constexpr]
```

Inserts an object in vector before specified iterator.

**Parameters**

|                         |                                                |
|-------------------------|------------------------------------------------|
| <code>__position</code> | A <code>const_iterator</code> into the vector. |
| <code>__args</code>     | Arguments.                                     |

**Returns**

An iterator that points to the inserted data.

This function will insert an object of type `T` constructed with `T(std::forward<Args>(args)...) before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.`

**empty()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
bool std::vector< _Tp, _Alloc >::empty () const [inline], [nodiscard], [constexpr], [noexcept]
```

Returns true if the vector is empty. (Thus `begin()` would equal `end()`.)

Referenced by [std::discrete\\_distribution< \\_IntType >::probabilities\(\)](#).

**end() [1/2]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector< _Tp, _Alloc >::end () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

**end() [2/2]**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::end () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Referenced by `std::vector< _Tp, polymorphic_allocator< _Tp > >::vector()`, `std::vector< _Tp, polymorphic_allocator< _Tp > >::back()`, `std::vector< _Tp, polymorphic_allocator< _Tp > >::back()`, `std::vector< _Tp, polymorphic_allocator< _Tp > >::crbegin()`, `std::vector< _Tp, polymorphic_allocator< _Tp > >::empty()`, `__gnu_parallel::multiseq_partition()`, `__gnu_parallel::multiseq_selection()`, `__gnu_parallel::multiway_merge_exact_splitting()`, `std::operator<=>()`, `operator=()`, `std::operator==()`, `std::vector< _Tp, polymorphic_allocator< _Tp > >::rbegin()`.

### erase() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last) [inline], [constexpr]
```

Remove a range of elements.

#### Parameters

|                      |                                                              |
|----------------------|--------------------------------------------------------------|
| <code>__first</code> | Iterator pointing to the first element to be erased.         |
| <code>__last</code>  | Iterator pointing to one past the last element to be erased. |

#### Returns

An iterator pointing to the element pointed to by `__last` prior to erasing (or `end()`).

This function will erase the elements in the range `[__first,__last)` and shorten the vector accordingly.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

### erase() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::erase (
    const_iterator __position) [inline], [constexpr]
```

Remove element at given position.

#### Parameters

|                         |                                            |
|-------------------------|--------------------------------------------|
| <code>__position</code> | Iterator pointing to element to be erased. |
|-------------------------|--------------------------------------------|

#### Returns

An iterator pointing to the next element (or `end()`).

This function will erase the element at the given position and thus shorten the vector by one.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

### front() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::front () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the vector.

### front() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::front () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write reference to the data at the first element of the vector.

### get\_allocator()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
allocator_type std::Vector\_base< _Tp, _Alloc >::get_allocator () const [inline], [constexpr],
[noexcept]
```

Get a copy of the memory allocation object.

References [get\\_allocator\(\)](#).

Referenced by [get\\_allocator\(\)](#).

### insert() [1/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
iterator std::vector< _Tp, _Alloc >::insert (
    const_iterator __position,
    _InputIterator __first,
    _InputIterator __last) [inline], [constexpr]
```

Inserts a range into the vector.

#### Parameters

|                         |                                   |
|-------------------------|-----------------------------------|
| <code>__position</code> | A const_iterator into the vector. |
| <code>__first</code>    | An input iterator.                |
| <code>__last</code>     | An input iterator.                |

#### Returns

An iterator that points to the inserted data.

This function will insert copies of the data in the range [`__first`,`__last`) into the vector before the location specified by *pos*. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

### insert() [2/5]

```
template<typename _Tp, typename _Alloc>
vector< _Tp, _Alloc >::iterator vector::insert (
    const_iterator __position,
    const value_type & __x) [constexpr]
```

Inserts given value into vector before specified iterator.

#### Parameters

|                         |                                   |
|-------------------------|-----------------------------------|
| <code>__position</code> | A const_iterator into the vector. |
|-------------------------|-----------------------------------|

|                  |                      |
|------------------|----------------------|
| <code>__x</code> | Data to be inserted. |
|------------------|----------------------|

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

References [vector\(\)](#), [std::begin\(\)](#), [std::cbegin\(\)](#), [std::end\(\)](#), [insert\(\)](#), and [std::move\(\)](#).

Referenced by [insert\(\)](#).

**insert()** [3/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector<_Tp, _Alloc>::insert (
    const_iterator __position,
    initializer_list< value_type > __l) [inline], [constexpr]
```

Inserts an initializer\_list into the vector.

**Parameters**

|                         |                              |
|-------------------------|------------------------------|
| <code>__position</code> | An iterator into the vector. |
| <code>__l</code>        | An initializer_list.         |

This function will insert copies of the data in the initializer\_list *l* into the vector before the location specified by *position*. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

**insert()** [4/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector<_Tp, _Alloc>::insert (
    const_iterator __position,
    size_type __n,
    const value_type & __x) [inline], [constexpr]
```

Inserts a number of copies of given data into the vector.

**Parameters**

|                         |                                    |
|-------------------------|------------------------------------|
| <code>__position</code> | A const_iterator into the vector.  |
| <code>__n</code>        | Number of elements to be inserted. |
| <code>__x</code>        | Data to be inserted.               |

**Returns**

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by *position*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

**insert()** [5/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::insert (
    const_iterator __position,
    value_type && __x) [inline], [constexpr]
```

Inserts given rvalue into vector before specified iterator.

**Parameters**

|                         |                                   |
|-------------------------|-----------------------------------|
| <code>__position</code> | A const_iterator into the vector. |
| <code>__x</code>        | Data to be inserted.              |

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

**max\_size()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::vector< _Tp, _Alloc >::max_size () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns the size() of the largest possible vector.

Referenced by [reserve\(\)](#).

**operator=()** [1/3]

```
template<typename _Tp, typename _Alloc>
vector< _Tp, _Alloc > & vector::operator= (
    const vector< _Tp, _Alloc > & __x) [constexpr]
```

Vector assignment operator.

**Parameters**

|                  |                                                    |
|------------------|----------------------------------------------------|
| <code>__x</code> | A vector of identical element and allocator types. |
|------------------|----------------------------------------------------|

All the elements of `__x` are copied, but any unused capacity in `__x` will not be copied.

Whether the allocator is copied depends on the allocator traits.

References [vector\(\)](#), [std::\\_\\_addressof\(\)](#), [std::\\_Destroy\(\)](#), [begin\(\)](#), [capacity\(\)](#), [clear\(\)](#), [std::end\(\)](#), [end\(\)](#), [std::size\(\)](#), and [size\(\)](#).

**operator=()** [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
vector & std::vector<_Tp, _Alloc >::operator= (
    initializer_list< value_type > __l) [inline], [constexpr]
```

Vector list assignment operator.

**Parameters**

|                 |                      |
|-----------------|----------------------|
| $\leftarrow$    | An initializer_list. |
| $\_ \leftarrow$ |                      |
| $\leftarrow$    |                      |
| $\_ \leftarrow$ |                      |
| $/$             |                      |

This function fills a vector with copies of the elements in the initializer list  $\_ /$ .

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

**operator=()** [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
vector & std::vector<_Tp, _Alloc >::operator= (
    vector<_Tp, _Alloc > && __x) [inline], [constexpr], [noexcept]
```

Vector move assignment operator.

**Parameters**

|                 |                                                    |
|-----------------|----------------------------------------------------|
| $\_ \leftarrow$ | A vector of identical element and allocator types. |
| $\_ x$          |                                                    |

The contents of  $\_ x$  are moved into this vector (without copying, if the allocators permit it). Afterwards  $\_ x$  is a valid, but unspecified vector.

Whether the allocator is moved depends on the allocator traits.

**operator[]()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector<_Tp, _Alloc >::operator[] (
    size_type __n) const [inline], [nodiscard], [constexpr], [noexcept]
```

Subscript access to the data contained in the vector.

**Parameters**

|                 |                                                             |
|-----------------|-------------------------------------------------------------|
| $\_ \leftarrow$ | The index of the element for which data should be accessed. |
| $\_ n$          |                                                             |

**Returns**

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out\_of\_range lookups are not defined. (For checked lookups see at().)

**operator[]()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::operator[] (
    size_type __n) [inline], [nodiscard], [constexpr], [noexcept]
```

Subscript access to the data contained in the vector.

**Parameters**

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| <code>__n</code> | The index of the element for which data should be accessed. |
|------------------|-------------------------------------------------------------|

**Returns**

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

**pop\_back()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::pop_back () [inline], [constexpr], [noexcept]
```

Removes last element.

This is a typical stack operation. It shrinks the vector by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

**push\_back()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::push_back (
    const value_type & __x) [inline], [constexpr]
```

Add data to the end of the vector.

**Parameters**

|                  |                   |
|------------------|-------------------|
| <code>__x</code> | Data to be added. |
|------------------|-------------------|

This is a typical stack operation. The function creates an element at the end of the vector and assigns the given data to it. Due to the nature of a vector this operation can be done in constant time if the vector has preallocated space available.

Referenced by [\\_\\_gnu\\_parallel::multiseq\\_partition\(\)](#), and [\\_\\_gnu\\_parallel::multiseq\\_selection\(\)](#).

**rbegin()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector< _Tp, _Alloc >::rbegin () const [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

**rbegin()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::vector<_Tp, _Alloc>::rbegin () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

**rend()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector<_Tp, _Alloc>::rend () const [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

**rend()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::vector<_Tp, _Alloc>::rend () [inline], [nodiscard], [constexpr], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

**reserve()**

```
template<typename _Tp, typename _Alloc>
void vector::reserve (
    size_type __n) [constexpr]
```

Attempt to preallocate enough memory for specified number of elements.

**Parameters**

|       |                              |
|-------|------------------------------|
| $\_n$ | Number of elements required. |
|-------|------------------------------|

**Exceptions**

|                                   |                                          |
|-----------------------------------|------------------------------------------|
| <a href="#">std::length_error</a> | If $n$ exceeds <code>max_size()</code> . |
|-----------------------------------|------------------------------------------|

This function attempts to reserve enough memory for the vector to hold the specified number of elements. If the number requested is more than `max_size()`, `length_error` is thrown.

The advantage of this function is that if optimal code is a necessity and the user can determine the number of elements that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of vector data.

References [std::\\_Destroy\(\)](#), [\\_M\\_allocate\\_and\\_copy\(\)](#), [capacity\(\)](#), [max\\_size\(\)](#), and [std::size\(\)](#).

**resize()** [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::resize (
    size_type __new_size) [inline], [constexpr]
```

Resizes the vector to the specified number of elements.

**Parameters**

|                         |                                               |
|-------------------------|-----------------------------------------------|
| <code>__new_size</code> | Number of elements the vector should contain. |
|-------------------------|-----------------------------------------------|

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise default constructed elements are appended.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_shrink\\_and\\_double\(\)](#), and [\\_\\_gnu\\_parallel::multiway\\_merge\\_exact\\_splitting\(\)](#).

**resize()** [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::resize (
    size_type __new_size,
    const value_type & __x) [inline], [constexpr]
```

Resizes the vector to the specified number of elements.

**Parameters**

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| <code>__new_size</code> | Number of elements the vector should contain.     |
| <code>__x</code>        | Data with which new elements should be populated. |

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise the vector is extended and new elements are populated with given data.

**shrink\_to\_fit()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::shrink_to_fit () [inline], [constexpr]
```

A non-binding request to reduce capacity() to size().

**size()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::vector< _Tp, _Alloc >::size () const [inline], [nodiscard], [constexpr], [noexcept]
```

Returns the number of elements in the vector.

Referenced by [\\_\\_gnu\\_parallel::\\_\\_shrink\(\)](#), [\\_\\_gnu\\_parallel::\\_\\_shrink\\_and\\_double\(\)](#), [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::\\_\\_gnu\\_parallel::list\\_partition\(\)](#), [operator=\(\)](#), [std::operator==\(\)](#), [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::resize\(\)](#), and [std::vector< \\_Tp, polymorphic\\_allocator< \\_Tp > >::resize\(\)](#).

**swap()**

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::swap (
    vector< _Tp, _Alloc > & __x) [inline], [constexpr], [noexcept]
```

Swaps data with another vector.

**Parameters**

|                  |                                                   |
|------------------|---------------------------------------------------|
| <code>__↔</code> | A vector of the same element and allocator types. |
| <code>__X</code> |                                                   |

This exchanges the elements between two vectors in constant time. (Three pointers, so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(v1,v2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

The documentation for this class was generated from the following files:

- [stl\\_vector.h](#)
- [vector.tcc](#)

## 6.1039 `std::vector< bool, _Alloc >` Class Template Reference

## 6.1039.1 Detailed Description

template<typename **\_Alloc**>  
class **std::vector< bool, \_Alloc >**

A specialization of vector for booleans which offers fixed time access to individual elements in any order.

Since

C++98

### Template Parameters

|                     |                 |
|---------------------|-----------------|
| <code>_Alloc</code> | Allocator type. |
|---------------------|-----------------|

Note that `vector<bool>` does not actually meet the requirements for being a container. This is because the reference and pointer types are not really references and pointers to `bool`. See DR96 for details.

See also

`vector` for function documentation.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ( `[]` ) access is also provided as with C-style arrays.

### 6.1039.2 Member Function Documentation

#### **\_M\_allocate\_and\_copy()**

```
_Alloc_result std::vector< bool, _Alloc >::_M_allocate_and_copy (
    size_type __n,
    _ForwardIterator __first,
    _ForwardIterator __last) [inline], [constexpr], [protected]
```

Memory expansion handler. Uses the member allocation function to obtain at least *n* objects worth of memory, copies [*first*, *last*) into it, reports what was actually allocated.

#### **get\_allocator()**

```
() const
```

Get a copy of the memory allocation object.

### 6.1042.1 Detailed Description

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
class std::wbuffer_convert< _Codecvt, _Elem, _Tr >
```

Buffer conversions.

### 6.1042.2 Member Typedef Documentation

#### `__streambuf_type`

```
template<typename _CharT, typename _Traits>
typedef basic_streambuf<char_type, traits_type> std::basic_streambuf< _CharT, _Traits >::__streambuf_type [inherited]
This is a non-standard type.
```

#### `char_type`

```
template<typename _CharT, typename _Traits>
typedef std::basic_streambuf< _CharT, _Traits >::char_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

**int\_type**

```
template<typename _CharT, typename _Traits>
```

```
typedef traits_type::int_type std::basic_streambuf< _CharT, _Traits >::int_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

**off\_type**

```
template<typename _CharT, typename _Traits>
```

```
typedef traits_type::off_type std::basic_streambuf< _CharT, _Traits >::off_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

**pos\_type**

```
template<typename _CharT, typename _Traits>
```

```
typedef traits_type::pos_type std::basic_streambuf< _CharT, _Traits >::pos_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

**traits\_type**

```
template<typename _CharT, typename _Traits>
```

```
typedef _Traits std::basic_streambuf< _CharT, _Traits >::traits_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

**6.1042.3 Constructor & Destructor Documentation****wbuffer\_convert() [1/2]**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
```

```
std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert () [inline]
```

Default constructor.

References [wbuffer\\_convert\(\)](#).

Referenced by [wbuffer\\_convert\(\)](#).

**wbuffer\_convert() [2/2]**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
```

```
std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert (
```

```
    __streambuf * __bytebuf,
```

```
    _Codecvt * __pcvt = new _Codecvt,
```

```
    state_type __state = state_type()) [inline], [explicit]
```

Constructor.

**Parameters**

|                        |                                    |
|------------------------|------------------------------------|
| <code>__bytebuf</code> | The underlying byte stream buffer. |
| <code>__pcvt</code>    | The facet to use for conversions.  |
| <code>__state</code>   | Initial conversion state.          |

Takes ownership of `__pcvt` and will delete it in the destructor.

References [std::basic\\_streambuf< \\_CharT, \\_Traits >::setg\(\)](#), and [std::basic\\_streambuf< \\_CharT, \\_Traits >::setp\(\)](#).

## 6.1042.4 Member Function Documentation

### eback()

```
template<typename _CharT, typename _Traits>
```

```
char_type * std::basic_streambuf< _CharT, _Traits >::eback () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Referenced by `std::basic_filebuf< char_type, traits_type >::M_destroy_pback()`, `std::basic_filebuf< _CharT, _Traits >::imbue()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow()`, `std::basic_filebuf< _CharT, _Traits >::pbackfail()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos()`, `std::basic_streambuf< char_type, traits_type >::sputbackc()`, `std::basic_streambuf< char_type, traits_type >::sungetc()`, `std::basic_filebuf< _CharT, _Traits >::underflow()`, and `std::basic_filebuf< _CharT, _Traits >::xsgetn()`.

### egptr()

```
template<typename _CharT, typename _Traits>
```

```
char_type * std::basic_streambuf< _CharT, _Traits >::egptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Referenced by `std::basic_filebuf< char_type, traits_type >::M_create_pback()`, `std::basic_streambuf< char_type, traits_type >::in_avail()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow()`, `std::basic_streambuf< char_type, traits_type >::sbumpc()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos()`, `std::basic_streambuf< char_type, traits_type >::sgetc()`, `std::basic_filebuf< _CharT, _Traits >::showmanyc()`, `std::basic_stringbuf< char_type, traits_type >::underflow()`, `std::basic_filebuf< _CharT, _Traits >::underflow()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::underflow()`, `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow()`, `std::basic_filebuf< _CharT, _Traits >::xsgetn()`, and `xsgetn()`.

### epptr()

```
template<typename _CharT, typename _Traits>
```

```
char_type * std::basic_streambuf< _CharT, _Traits >::epptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- ep\_ptr() returns the end pointer for the output sequence

Referenced by `std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos()`, `std::basic_streambuf< char_type, traits_type >::sputc()`, `std::basic_filebuf< _CharT, _Traits >::xsputn()`, and `xsputn()`.

**gbump()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::gbump (
    int __n) [inline], [protected], [inherited]
```

Moving the read position.

**Parameters**

|                 |                             |
|-----------------|-----------------------------|
| <code>_↔</code> | The delta by which to move. |
| <code>_n</code> |                             |

This just advances the read position without returning any data.

Referenced by [std::basic\\_filebuf< \\_CharT, \\_Traits >::pbackfail\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::pbackfail\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sbumpc\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sputbackc\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sungetc\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::uflow\(\)](#), and [std::basic\\_filebuf< \\_CharT, \\_Traits >::xsgetn\(\)](#).

**getloc()**

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::getloc () const [inline], [inherited]
```

Locale access.

**Returns**

The current locale in effect.

If [pubimbue\(loc\)](#) has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.

Referenced by [std::basic\\_streambuf< char\\_type, traits\\_type >::pubimbue\(\)](#).

**gptr()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::gptr () const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- [eback\(\)](#) returns the beginning pointer for the input sequence
- [gptr\(\)](#) returns the next pointer for the input sequence
- [egptr\(\)](#) returns the end pointer for the input sequence

Referenced by [std::basic\\_filebuf< char\\_type, traits\\_type >::\\_M\\_create\\_pback\(\)](#), [std::basic\\_filebuf< char\\_type, traits\\_type >::\\_M\\_destroy](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::imbue\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::in\\_avail\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::pbackfail\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::pbackfail\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::pbackfail\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::seekoff\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sgetc\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::seekoff\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::showmanyc\(\)](#), [std::basic\\_stringbuf< char >::showmanyc\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::sungetc\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::uflow\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::underflow\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::underflow\(\)](#), [std::wbuffer\\_convert< \\_Codecvt, \\_Elem, \\_Tr >::underflow\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::xsgetn\(\)](#), and [xsgetn\(\)](#).

**imbue()**

```
template<typename _CharT, typename _Traits>
virtual void std::basic_streambuf< _CharT, _Traits >::imbue (
    const locale & __loc) [inline], [protected], [virtual], [inherited]
```

Changes translations.

**Parameters**

|                    |               |
|--------------------|---------------|
| <code>__loc</code> | A new locale. |
|--------------------|---------------|

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

**Note**

Base class version does nothing.

Reimplemented in `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >`, `std::basic_filebuf< _CharT, std::char_traits< _CharT > >`, `std::basic_filebuf< char >`, `std::basic_filebuf< char_type, traits_type >`, and `std::basic_filebuf< wchar_t >`.

Referenced by `std::basic_streambuf< char_type, traits_type >::pubimbue()`.

**in\_avail()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::in_avail () [inline], [inherited]
```

Looking ahead into the stream.

**Returns**

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

**overflow()**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
_Wide_streambuf::int_type std::wbuffer_convert< _Codecvt, _Elem, _Tr >::overflow (
    typename _Wide_streambuf::int_type __c) [inline], [protected], [virtual]
```

Consumes data from the buffer; writes to the controlled sequence.

**Parameters**

|                  |                                     |
|------------------|-------------------------------------|
| <code>__c</code> | An additional character to consume. |
|------------------|-------------------------------------|

**Returns**

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

**Note**

Base class version does nothing, returns eof().

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits >](#).

References [std::basic\\_streambuf<\\_CharT, \\_Traits >::sputc\(\)](#).

**pbackfail()**

```
template<typename _CharT, typename _Traits>
virtual int_type std::basic_streambuf<_CharT, _Traits >::pbackfail (
    int_type __c = traits_type::eof()) [inline], [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

**Parameters**

|                                                                                                   |                                                      |
|---------------------------------------------------------------------------------------------------|------------------------------------------------------|
| <a href="#"></a> | The character to be inserted back into the sequence. |
| <code>__c</code>                                                                                  |                                                      |

**Returns**

eof() on failure, *some other value* on success

**Postcondition**

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

**Note**

Base class version does nothing, returns eof().

Reimplemented in [\\_\\_gnu\\_cxx::stdio\\_sync\\_filebuf<\\_CharT, \\_Traits >](#), [std::basic\\_filebuf<\\_CharT, \\_Traits >](#), [std::basic\\_filebuf<\\_CharT, \\_Traits >](#), [std::basic\\_filebuf<char >](#), [std::basic\\_filebuf<char\\_type, traits\\_type >](#), [std::basic\\_filebuf<wchar\\_t >](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits >](#), [std::basic\\_stringbuf<char >](#), and [std::basic\\_stringbuf<wchar\\_t >](#).

Referenced by [std::basic\\_streambuf<char\\_type, traits\\_type >::sputbackc\(\)](#), and [std::basic\\_streambuf<char\\_type, traits\\_type >::sungetc\(\)](#).

**pbase()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf<_CharT, _Traits >::pbase () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

Referenced by [std::basic\\_filebuf<\\_CharT, \\_Traits >::overflow\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc >::overflow\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits >::seekoff\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc >::seekoff\(\)](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits >::str\(\)](#), [std::basic\\_filebuf<\\_CharT, \\_Traits >::sync\(\)](#), and [std::basic\\_filebuf<\\_CharT, \\_Traits >::xsputn\(\)](#).

**pbump()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::pbump (
    int __n) [inline], [protected], [inherited]
```

Moving the write position.

**Parameters**

|                  |                             |
|------------------|-----------------------------|
| <code>__n</code> | The delta by which to move. |
|------------------|-----------------------------|

This just advances the write position without returning any data.

Referenced by [std::basic\\_filebuf< \\_CharT, \\_Traits >::overflow\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::overflow\(\)](#), and [std::basic\\_streambuf< char\\_type, traits\\_type >::sputc\(\)](#).

**pptr()**

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::pptr () const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- [pbase\(\)](#) returns the beginning pointer for the output sequence
- [pptr\(\)](#) returns the next pointer for the output sequence
- [epptr\(\)](#) returns the end pointer for the output sequence

Referenced by [std::basic\\_filebuf< \\_CharT, \\_Traits >::overflow\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::overflow\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::seekoff\(\)](#), [std::basic\\_stringbuf< \\_CharT, \\_Traits, \\_Alloc >::seekoff\(\)](#), [std::basic\\_streambuf< char\\_type, traits\\_type >::seekoff\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::sync\(\)](#), [std::basic\\_filebuf< \\_CharT, \\_Traits >::xsputn\(\)](#), and [xsputn\(\)](#).

**pubimbue()**

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::pubimbue (
    const locale & __loc) [inline], [inherited]
```

Entry point for imbue().

**Parameters**

|                    |                 |
|--------------------|-----------------|
| <code>__loc</code> | The new locale. |
|--------------------|-----------------|

**Returns**

The previous locale.

Calls the derived [imbue\(\\_\\_loc\)](#).

**pubseekoff()**

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
    off_type __off,
```

```

        ios_base::seekdir __way,
        ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]

```

Alters the stream position.

#### Parameters

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__off</code>  | Offset.                                     |
| <code>__way</code>  | Value for <code>ios_base::seekdir</code> .  |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual seekoff function.

#### pubseekpos()

```

template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
    pos_type __sp,
    ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]

```

Alters the stream position.

#### Parameters

|                     |                                             |
|---------------------|---------------------------------------------|
| <code>__sp</code>   | Position                                    |
| <code>__mode</code> | Value for <code>ios_base::openmode</code> . |

Calls virtual seekpos function.

#### pubsetbuf()

```

template<typename _CharT, typename _Traits>
basic_streambuf * std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
    char_type * __s,
    streamsize __n) [inline], [inherited]

```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

#### pubsync()

```

template<typename _CharT, typename _Traits>
int std::basic_streambuf< _CharT, _Traits >::pubsync () [inline], [inherited]

```

Calls virtual sync function.

Referenced by `std::basic_istream< _CharT, _Traits >::sync()`.

#### sbumpc()

```

template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sbumpc () [inline], [inherited]

```

Getting the next character.

## Returns

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.

Referenced by `std::basic_iostream< char_type, traits_type >::get()`, `std::basic_istream< _CharT, _Traits >::ignore()`, and `std::basic_streambuf< char_type, traits_type >::snextc()`.

## seekoff()

```
template<typename _CharT, typename _Traits>
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekoff (
    off_type ,
    ios_base::seekdir ,
    ios_base::openmode = ios_base::in | ios_base::out) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

## Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >`, `std::basic_filebuf< char >`, `std::basic_filebuf< char_type, traits_type >`, `std::basic_filebuf< wchar_t >`, `std::basic_stringbuf< _CharT, _Traits >`, `std::basic_stringbuf< char >`, and `std::basic_stringbuf< wchar_t >`.

Referenced by `std::basic_streambuf< char_type, traits_type >::pubseekoff()`.

## seekpos()

```
template<typename _CharT, typename _Traits>
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekpos (
    pos_type ,
    ios_base::openmode = ios_base::in | ios_base::out) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

## Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >`, `std::basic_filebuf< char >`, `std::basic_filebuf< char_type, traits_type >`, `std::basic_filebuf< wchar_t >`, `std::basic_stringbuf< _CharT, _Traits >`, `std::basic_stringbuf< char >`, and `std::basic_stringbuf< wchar_t >`.

Referenced by `std::basic_streambuf< char_type, traits_type >::pubseekpos()`.

## setbuf()

```
template<typename _CharT, typename _Traits>
virtual basic_streambuf< char_type, _Traits > * std::basic_streambuf< _CharT, _Traits >::setbuf
(
    char_type * ,
    streamsize ) [inline], [protected], [virtual], [inherited]
```

Manipulates the buffer.

Each derived class provides its own appropriate behavior. See the next-to-last paragraph of <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering> for more on this function.

**Note**

Base class version does nothing, returns `this`.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, `std::basic_filebuf<char>`, `std::basic_filebuf<char_type, traits_type>`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>`, and `std::basic_stringbuf<char>`.

Referenced by `std::basic_streambuf<char_type, traits_type>::pubsetbuf()`.

**setg()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::setg (
    char_type * __gbeg,
    char_type * __gnext,
    char_type * __gend) [inline], [protected], [inherited]
```

Setting the three read area pointers.

**Parameters**

|                      |            |
|----------------------|------------|
| <code>__gbeg</code>  | A pointer. |
| <code>__gnext</code> | A pointer. |
| <code>__gend</code>  | A pointer. |

**Postcondition**

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::wbuffer_convert()`, `std::basic_filebuf<char_type, traits_type>::M_create()`, `std::basic_filebuf<char_type, traits_type>::M_destroy_pback()`, `std::basic_filebuf<char_type, traits_type>::M_set_buffer()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekpos()`, and `std::basic_filebuf<_CharT, _Traits>::xsgetn()`.

**setp()**

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::setp (
    char_type * __pbeg,
    char_type * __pend) [inline], [protected], [inherited]
```

Setting the three write area pointers.

**Parameters**

|                     |            |
|---------------------|------------|
| <code>__pbeg</code> | A pointer. |
| <code>__pend</code> | A pointer. |

**Postcondition**

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == epptr()`

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::wbuffer_convert()`, and `std::basic_filebuf<char_type, traits_type>::M_s`

**sgetc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sgetc () [inline], [inherited]
```

Getting the next character.

**Returns**

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

Referenced by `std::basic_istream< char_type, traits_type >::get()`, `std::basic_istream< _CharT, _Traits >::get()`, `std::basic_istream< _CharT, _Traits >::get()`, `std::basic_istream< _CharT, _Traits >::ignore()`, `std::basic_istream< _CharT, _Traits >::ignore()` and `std::basic_streambuf< char_type, traits_type >::snextc()`.

**sgetn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::sgetn (
    char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for `xsgetn`.

**Parameters**

|                  |                |
|------------------|----------------|
| <code>__s</code> | A buffer area. |
| <code>__n</code> | A count.       |

Returns `xsgetn(__s,__n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

**showmanyc()**

```
template<typename _CharT, typename _Traits>
virtual streamsize std::basic_streambuf< _CharT, _Traits >::showmanyc () [inline], [protected],
[virtual], [inherited]
```

Investigating the data available.

**Returns**

An estimate of the number of characters available in the input sequence, or -1.

*If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail. [27.5.2.4.3]/1*

**Note**

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to `underflow` or `uflow`] will not return `eof()` but that they will return immediately.*

The standard adds that *the morphemes of `showmanyc` are **es-how-many-see**, not **show-manic**.*

Reimplemented in [std::basic\\_filebuf<\\_CharT, \\_Traits>](#), [std::basic\\_filebuf<\\_CharT, encoding\\_char\\_traits<\\_CharT>>](#), [std::basic\\_filebuf<\\_CharT, std::char\\_traits<\\_CharT>>](#), [std::basic\\_filebuf<char>](#), [std::basic\\_filebuf<char\\_type, traits\\_type>](#), [std::basic\\_filebuf<wchar\\_t>](#), [std::basic\\_stringbuf<\\_CharT, \\_Traits, \\_Alloc>](#), [std::basic\\_stringbuf<char>](#), and [std::basic\\_stringbuf<wchar\\_t>](#).

Referenced by [std::basic\\_streambuf<char\\_type, traits\\_type>::in\\_avail\(\)](#).

### snextc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::snextc () [inline], [inherited]
```

Getting the next character.

#### Returns

The next character, or eof.

Calls [sbumpc\(\)](#), and if that function returns `traits::eof()`, so does this function. Otherwise, [sgetc\(\)](#).

Referenced by [std::basic\\_iostream<char\\_type, traits\\_type>::get\(\)](#), [std::basic\\_istream<\\_CharT, \\_Traits>::get\(\)](#), [std::basic\\_istream<\\_CharT, char\\_traits<\\_CharT>>::get\(\)](#), and [std::basic\\_istream<\\_CharT, char\\_traits<\\_CharT>>::readsome\(\)](#).

### sputbackc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputbackc (
    char_type __c) [inline], [inherited]
```

Pushing characters back into the input stream.

#### Parameters

|                                  |                             |
|----------------------------------|-----------------------------|
| <a href="#"><code>__c</code></a> | The character to push back. |
|----------------------------------|-----------------------------|

#### Returns

The previous character, if possible.

Similar to [sungetc\(\)](#), but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

Referenced by [std::basic\\_istream<\\_CharT, \\_Traits>::putback\(\)](#).

### sputc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputc (
    char_type __c) [inline], [inherited]
```

Entry point for all single-character output functions.

#### Parameters

|                                  |                        |
|----------------------------------|------------------------|
| <a href="#"><code>__c</code></a> | A character to output. |
|----------------------------------|------------------------|

**Returns**

\_\_c, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores \_\_c in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(↵__c)`.

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::overflow()`.

**sputn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sputn (
    const char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for all single-character output functions.

**Parameters**

|          |                     |
|----------|---------------------|
| ↵<br>__s | A buffer read area. |
| ↵<br>__n | A count.            |

One of two public output functions.

Returns `xsputn(__s, __n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

**state()**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
state_type std::wbuffer_convert<_Codecvt, _Elem, _Tr>::state () const [inline], [noexcept]
```

The conversion state following the last conversion.

**sungetc()**

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sungetc () [inline], [inherited]
```

Moving backwards in the input stream.

**Returns**

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbackfail()`. The effect is to *unget* the last character *gotten*.

Referenced by `std::basic_istream<_CharT, _Traits>::unget()`.

**sync()**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
int std::wbuffer_convert<_Codecvt, _Elem, _Tr>::sync () [inline], [protected], [virtual]
```

Synchronizes the buffer arrays with the controlled sequences.

**Returns**

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

**Note**

Base class version does nothing, returns zero.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits >](#).

**uflow()**

```
template<typename _CharT, typename _Traits>
virtual int_type std::basic_streambuf<_CharT, _Traits >::uflow () [inline], [protected], [virtual],
[inherited]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Reimplemented in [\\_\\_gnu\\_cxx::stdio\\_sync\\_filebuf<\\_CharT, \\_Traits >](#).

Referenced by [std::basic\\_streambuf<char\\_type, traits\\_type >::sbumpc\(\)](#), and [xsgetn\(\)](#).

**underflow()**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
_Wide_streambuf::int_type std::wbuffer_convert<_Codecvt, _Elem, _Tr >::underflow () [inline],
[protected], [virtual]
```

Fetches more data from the controlled sequence.

**Returns**

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

**Note**

Base class version does nothing, returns `eof()`.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits >](#).

References [std::basic\\_streambuf<\\_CharT, \\_Traits >::egptr\(\)](#), and [std::basic\\_streambuf<\\_CharT, \\_Traits >::gptr\(\)](#).

**xsgetn()**

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits >::xsgetn (
    char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character extraction.

#### Parameters

|                  |                                         |
|------------------|-----------------------------------------|
| <code>__s</code> | A buffer area.                          |
| <code>__n</code> | Maximum number of characters to assign. |

#### Returns

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in [std::basic\\_filebuf<\\_CharT, \\_Traits>](#), [std::basic\\_filebuf<\\_CharT, encoding\\_char\\_traits<\\_CharT>>](#), [std::basic\\_filebuf<\\_CharT, std::char\\_traits<\\_CharT>>](#), [std::basic\\_filebuf<char>](#), and [std::basic\\_filebuf<char\\_type, traits\\_type>](#).

References [egptr\(\)](#), [gptra\(\)](#), [std::min\(\)](#), and [uflow\(\)](#).

Referenced by [std::basic\\_streambuf<char\\_type, traits\\_type>::sgetn\(\)](#).

#### `xspn()`

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::xspn (
    const char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character insertion.

#### Parameters

|                  |                                        |
|------------------|----------------------------------------|
| <code>__s</code> | A buffer area.                         |
| <code>__n</code> | Maximum number of characters to write. |

#### Returns

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in [std::basic\\_filebuf<\\_CharT, \\_Traits>](#), [std::basic\\_filebuf<\\_CharT, encoding\\_char\\_traits<\\_CharT>>](#), [std::basic\\_filebuf<\\_CharT, std::char\\_traits<\\_CharT>>](#), [std::basic\\_filebuf<char>](#), and [std::basic\\_filebuf<char\\_type, traits\\_type>](#).

References [epptr\(\)](#), [std::min\(\)](#), [overflow\(\)](#), and [pptr\(\)](#).

Referenced by [std::basic\\_streambuf<char\\_type, traits\\_type>::spn\(\)](#).

### 6.1042.5 Member Data Documentation

#### `_M_buf_locale`

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf<_CharT, _Traits>::_M_buf_locale [protected], [inherited]
```

Current locale setting.

Referenced by [std::basic\\_filebuf<\\_CharT, \\_Traits>::basic\\_filebuf\(\)](#).

### **\_M\_in\_beg**

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf<_CharT, _Traits>::_M_in_beg [protected], [inherited]
Start of get area.
```

### 6.1043.1 Detailed Description

```
template<typename _Tp>
class std::weak_ptr<_Tp>
```

A non-owning observer for a pointer owned by a shared\_ptr.

Since

C++11

A weak\_ptr provides a safe alternative to a raw pointer when you want a non-owning reference to an object that is managed by a shared\_ptr.

Unlike a raw pointer, a weak\_ptr can be converted to a new shared\_ptr that shares ownership with every other shared\_ptr that already owns the pointer. In other words you can upgrade from a non-owning "weak" reference to an owning shared\_ptr, without having access to any of the existing shared\_ptr objects.

Also unlike a raw pointer, a weak\_ptr does not become "dangling" after the object it points to has been destroyed. Instead, a weak\_ptr becomes *expired* and can no longer be converted to a shared\_ptr that owns the freed pointer, so you cannot accidentally access the pointed-to object after it has been destroyed.

The documentation for this class was generated from the following file:

- [bits/shared\\_ptr.h](#)

**6.1044.1 Detailed Description**

**template<typename \_RealType = double>**  
**class std::weibull\_distribution<\_RealType>**

A weibull\_distribution random number distribution.  
 The formula for the normal probability density function is:

$$p(x|\alpha, \beta) = \frac{\alpha}{\beta} \left(\frac{x}{\beta}\right)^{\alpha-1} \exp\left(-\left(\frac{x}{\beta}\right)^{\alpha}\right)$$

Since

C++11

### 6.1044.2 Member Typedef Documentation

#### result\_type

```
template<typename _RealType = double>
typedef _RealType std::weibull\_distribution< _RealType >::result_type
```

The type of the range of the distribution.

### 6.1044.3 Member Function Documentation

#### a()

```
template<typename _RealType = double>
_RealType std::weibull\_distribution< _RealType >::a () const [inline]
```

Return the  $a$  parameter of the distribution.

#### b()

```
template<typename _RealType = double>
_RealType std::weibull\_distribution< _RealType >::b () const [inline]
```

Return the  $b$  parameter of the distribution.

#### max()

```
template<typename _RealType = double>
result\_type std::weibull\_distribution< _RealType >::max () const [inline]
```

Returns the least upper bound value of the distribution.

#### min()

```
template<typename _RealType = double>
result\_type std::weibull\_distribution< _RealType >::min () const [inline]
```

Returns the greatest lower bound value of the distribution.

#### operator>()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result\_type std::weibull\_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng) [inline]
```

Generating functions.

Referenced by [operator>\(\)\(\)](#).

#### param() [1/2]

```
template<typename _RealType = double>
param\_type std::weibull\_distribution< _RealType >::param () const [inline]
```

Returns the parameter set of the distribution.

Referenced by [std::operator>>\(\)](#).

#### param() [2/2]

```
template<typename _RealType = double>
void std::weibull\_distribution< _RealType >::param (
    const param\_type & __param) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

|                      |                                            |
|----------------------|--------------------------------------------|
| <code>__param</code> | The new parameter set of the distribution. |
|----------------------|--------------------------------------------|

**reset()**

```
template<typename _RealType = double>
void std::weibull_distribution< _RealType >::reset () [inline]
Resets the distribution state.
```

**6.1044.4 Friends And Related Symbol Documentation****operator==**

```
template<typename _RealType = double>
bool operator== (
    const weibull_distribution< _RealType > & __d1,
    const weibull_distribution< _RealType > & __d2) [friend]
```

Return true if two Weibull distributions have the same parameters.

The documentation for this class was generated from the following files:

- [random.h](#)
- [bits/random.tcc](#)

### 6.1045.1 Detailed Description

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>, type-
name _Byte_alloc = allocator<char>>
class std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >
```

String conversions.

### 6.1045.2 Constructor & Destructor Documentation

#### `wstring_convert()` [1/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert () [inline]
Default constructor.
```

#### `wstring_convert()` [2/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
    _Codecvt * __pcvt) [inline], [explicit]
Constructor.
```

#### Parameters

|                     |                                   |
|---------------------|-----------------------------------|
| <code>__pcvt</code> | The facet to use for conversions. |
|---------------------|-----------------------------------|

Takes ownership of `__pcvt` and will delete it in the destructor.

#### `wstring_convert()` [3/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
    _Codecvt * __pcvt,
    state_type __state) [inline]
Construct with an initial conversion state.
```

#### Parameters

|                      |                                   |
|----------------------|-----------------------------------|
| <code>__pcvt</code>  | The facet to use for conversions. |
| <code>__state</code> | Initial conversion state.         |

Takes ownership of `__pcvt` and will delete it in the destructor. The object's conversion state will persist between conversions.

**wstring\_convert()** [4/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
    const byte_string & __byte_err,
    const wide_string & __wide_err = wide_string()) [inline], [explicit]
```

Construct with error strings.

**Parameters**

|                         |                                                |
|-------------------------|------------------------------------------------|
| <code>__byte_err</code> | A string to return on failed conversions.      |
| <code>__wide_err</code> | A wide string to return on failed conversions. |

**6.1045.3 Member Function Documentation****converted()**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
size_t std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::converted () const
[inline], [noexcept]
```

The number of elements successfully converted in the last conversion.

**from\_bytes()** [1/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
    char __byte) [inline]
```

Convert from bytes.

References [from\\_bytes\(\)](#).

Referenced by [from\\_bytes\(\)](#), [from\\_bytes\(\)](#), and [from\\_bytes\(\)](#).

**from\_bytes()** [2/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
    const byte_string & __str) [inline]
```

Convert from bytes.

References [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::data\(\)](#), [from\\_bytes\(\)](#), and [std::basic\\_string<\\_CharT, \\_Traits, \\_Alloc>::size\(\)](#).

**from\_bytes()** [3/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
    const char * __first,
    const char * __last) [inline]
```

Convert from bytes.

**from\_bytes()** [4/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>>
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
    const char * __ptr) [inline]
```

Convert from bytes.

References [from\\_bytes\(\)](#).

**state()**

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>>
state_type std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::state () const
[inline]
```

The final conversion state of the last conversion.

**to\_bytes()** [1/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
    _Elem __wchar) [inline]
```

Convert to bytes.

References [to\\_bytes\(\)](#).

Referenced by [to\\_bytes\(\)](#), [to\\_bytes\(\)](#), and [to\\_bytes\(\)](#).

**to\_bytes()** [2/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
    const _Elem * __first,
    const _Elem * __last) [inline]
```

Convert to bytes.

**to\_bytes()** [3/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
    const _Elem * __ptr) [inline]
```

Convert to bytes.

References [std::basic\\_string< \\_Elem, char\\_traits< \\_Elem >, \\_Wide\\_alloc >::length\(\)](#), and [to\\_bytes\(\)](#).

**to\_bytes()** [4/4]

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
    const wide_string & __wstr) [inline]
```

Convert to bytes.

References [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::data\(\)](#), [std::basic\\_string< \\_CharT, \\_Traits, \\_Alloc >::size\(\)](#), and [to\\_bytes\(\)](#).

### 7.3.1 Detailed Description

This file is a GNU extension to the Standard C++ Library (possibly containing extensions from the HP/SGI STL subset).

## 7.4 parallel/algorithm File Reference

### Macros

- `#define _PARALLEL_ALGORITHM`

#### 7.4.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

## 7.5 any File Reference

### 7.5.1 Detailed Description

This is a Standard C++ Library header.

## 7.6 experimental/any File Reference

### Classes

- class `std::experimental::fundamentals_v1::any`
- class `std::experimental::fundamentals_v1::bad_any_cast`

### Namespaces

- namespace `std`
- namespace `std::experimental`

### Macros

- `#define __cpp_lib_experimental_any`
- `#define _GLIBCXX_EXPERIMENTAL_ANY`

### Functions

- `template<typename _ValueType>`  
`_ValueType std::experimental::any_cast (const any &__any)`
- `void std::experimental::swap (any &__x, any &__y) noexcept`
- `template<typename _ValueType, typename enable_if< is_move_constructible< _ValueType >::value &&!is_lvalue_reference< _ValueType >::value, bool >::type = false>`  
`_ValueType std::experimental::any_cast (any &&__any)`
- `template<typename _ValueType, typename enable_if<!is_move_constructible< _ValueType >::value||is_lvalue_reference< _ValueType >::value, bool >::type = true>`  
`_ValueType std::experimental::any_cast (any &&__any)`
- `template<typename _ValueType>`  
`_ValueType std::experimental::any_cast (any &__any)`
- `template<typename _ValueType>`  
`_ValueType * std::experimental::any_cast (any *__any) noexcept`
- `template<typename _ValueType>`  
`const _ValueType * std::experimental::any_cast (const any *__any) noexcept`

### 7.6.1 Detailed Description

This is a TS C++ Library header.

## 7.7 array File Reference

### Classes

- struct [std::array< \\_Tp, \\_Nm >](#)

### 7.9.1 Detailed Description

This is a Standard C++ Library header.

## 7.10 auto\_ptr.h File Reference

### Classes

- class `std::auto_ptr<_Tp>`
- struct `std::auto_ptr_ref<_Tp1>`

### Namespaces

- namespace `std`

### 7.10.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<memory>`.

## 7.11 backward\_warning.h File Reference

### 7.11.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iosfwd>`.

## 7.12 hash\_fun.h File Reference

### Namespaces

- namespace `__gnu_cxx`

### Typedefs

- typedef `__SIZE_TYPE__ __gnu_cxx::size_t`

### Functions

- `size_t __gnu_cxx::__stl_hash_string (const char *__s)`

### 7.12.1 Detailed Description

This file is a GNU extension to the Standard C++ Library (possibly containing extensions from the HP/SGI STL subset).

## 7.13 hash\_map File Reference

### Classes

- class [\\_\\_gnu\\_cxx::allocator<\\_Tp>](#)

### 7.40.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<chrono>`.

### 7.40.2 Function Documentation

#### **ceil()**

```
template<typename _ToDur, typename _Rep, typename _Period>
__enable_if_is_duration< _ToDur > std::chrono::ceil (
    const duration< _Rep, _Period > &__d) [nodiscard], [constexpr]
```

Convert a duration to type `ToDur` and round up.

If the duration cannot be represented exactly in the result type, returns the closest value that is greater than the argument.

#### Template Parameters

|                     |                                     |
|---------------------|-------------------------------------|
| <code>_ToDur</code> | The result type must be a duration. |
|---------------------|-------------------------------------|

#### Parameters

|                  |             |
|------------------|-------------|
| <code>__d</code> | A duration. |
|------------------|-------------|

#### Returns

The value of `__d` converted to type `_ToDur`.

Since

C++17

#### 7.41.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<chrono>`.

## 7.42 codecvt.h File Reference

### Classes

- class `std::__codecvt_abstract_base<_InternT, _ExternT, _StateT>`
- class `std::codecvt<_InternT, _ExternT, _StateT>`
- class `std::codecvt<char, char, mbstate_t>`
- class `std::codecvt<char16_t, char, mbstate_t>`
- class `std::codecvt<char32_t, char, mbstate_t>`
- class `std::codecvt<wchar_t, char, mbstate_t>`
- class `std::codecvt_base`
- class `std::codecvt_byname<_InternT, _ExternT, _StateT>`

### Namespaces

- namespace `std`

### Functions

- `template bool std::has_facet< codecvt<char, char, mbstate_t> > (const locale &)`
- `template bool std::has_facet< codecvt<wchar_t, char, mbstate_t> > (const locale &)`
- `template const codecvt<char, char, mbstate_t> & std::use_facet< codecvt<char, char, mbstate_t> > (const locale &)`
- `template const codecvt<wchar_t, char, mbstate_t> & std::use_facet< codecvt<wchar_t, char, mbstate_t> > (const locale &)`

## Variables

- `template<typename _InternT, typename _ExternT, typename _StateT>`  
`locale::id std::codecvt< _InternT, _ExternT, _StateT >::id`

### 7.42.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

## 7.43 concept\_check.h File Reference

### Macros

- `#define __glibcxx_class_requires(_a, _b)`
- `#define __glibcxx_class_requires2(_a, _b, _c)`
- `#define __glibcxx_class_requires3(_a, _b, _c, _d)`
- `#define __glibcxx_class_requires4(_a, _b, _c, _d, _e)`
- `#define __glibcxx_function_requires(...)`

### 7.43.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iterator>`.

## 7.44 cow\_string.h File Reference

### Classes

- class `std::basic_string< _CharT, _Traits, _Alloc >`

### Namespaces

- namespace `std`

### Functions

- `template<typename _Operation>`  
`void std::basic_string< _CharT, _Traits, _Alloc >__resize_and_overwrite (const size\_type __n, _Operation __op)`

### Variables

- `template<typename _CharT, typename _Traits, typename _Alloc>`  
`const basic\_string< _CharT, _Traits, _Alloc >::size_type std::basic_string< _CharT, _Traits, _Alloc >::npos`

### 7.44.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<string>`.

Defines the reference-counted COW string implementation.

## 7.45 cpp\_type\_traits.h File Reference

### Namespaces

- namespace `std`

## Macros

- `#define __INT_N(TYPE)`

## Functions

- `template<typename _Iterator>`  
`constexpr _Iterator std::__miter_base (_Iterator __it)`

## Variables

- `template<typename _ValT, typename _Tp>`  
`constexpr bool std::__can_use_memchr_for_find`

### 7.45.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ext/type_traits.h>`.

## 7.46 cpyfunc\_impl.h File Reference

### Classes

- class `std::copyable\_function<\_Res\(\_ArgTypes...\) \_GLIBCXX\_MOF\_CV noexcept\(\_Noex\)>`

### Namespaces

- namespace `std`

## Macros

- `#define _GLIBCXX_MOF_CV_REF`
- `#define _GLIBCXX_MOF_INV_QUALS`
- `#define _GLIBCXX_MOF_REF`

### 7.46.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<functional>`.

## 7.47 cxxabi\_forced.h File Reference

### Classes

- class `\_\_cxxabiv1::\_\_forced\_unwind`

### 7.47.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<cxxabi.h>`.

## 7.48 cxxabi\_init\_exception.h File Reference

### Namespaces

- namespace `std`

## Macros

- `#define _GLIBCXX_CDTOR_CALLABI`
- `#define _GLIBCXX_HAVE_CDTOR_CALLABI`

## Functions

- `void * __cxxabiv1::__cxa_allocate_exception (size_t) noexcept`
- `void __cxxabiv1::__cxa_free_exception (void *) noexcept`
- `__cxa_refcounted_exception * __cxxabiv1::__cxa_init_primary_exception (void * __object, std::type\_info * __tinfo, void (* __dest)(void *)) noexcept`

### 7.48.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly.

## 7.49 deque.tcc File Reference

### Namespaces

- namespace [std](#)

### Functions

### 7.168.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<deque>`.

### 7.168.2 Macro Definition Documentation

#### `_GLIBCXX_DEQUE_BUF_SIZE`

```
#define _GLIBCXX_DEQUE_BUF_SIZE
```

This function controls the size of memory nodes.

### Parameters

|                     |                         |
|---------------------|-------------------------|
| <code>__size</code> | The size of an element. |
|---------------------|-------------------------|

### Returns

The number (not byte size) of elements per node.

This function started off as a compiler kludge from SGI, but seems to be a useful wrapper around a repeated constant expression. The **512** is tunable (and no other code needs to change), but no investigation has been done since inheriting the SGI code. Touch `_GLIBCXX_DEQUE_BUF_SIZE` only if you know what you are doing, however: changing it breaks the binary compatibility!!

### 7.206.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<utility>`.

This file contains the parts of `<utility>` needed by other headers, so they don't need to include the whole of `<utility>`.
