Implemented in std::ctype< _CharT >, and std::mask< _CharT >.

do_is() [2/3]

```
template<typename _CharT>
virtual bool std::__ctype_abstract_base< _CharT >::do_is (
            mask __m,
            char_type __c) const  [protected], [pure virtual], [inherited]
```

Test char_type classification.
This function finds a mask M for *c* and compares it to mask *m*.
do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

__c	The char_type to find the mask of.
__m	The mask to compare against.

Returns

(M & __m) != 0.

Implemented in std::ctype< _CharT >, std::ctype< wchar_t >, and std::mask< _CharT >.
Referenced by std::mask< _CharT >::is(), and std::mask< _CharT >::is().

do_is() [3/3]

```
virtual bool std::ctype< char >::do_is (
            mask __m,
            char_type __c) const  [protected], [virtual]
```

Test char_type classification.
This function finds a mask M for *c* and compares it to mask *m*.
do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

__c	The char_type to find the mask of.
__m	The mask to compare against.

Returns

(M & __m) != 0.

do_narrow() [1/4]

```
template<typename _CharT>
virtual char std::__ctype_abstract_base< _CharT >::do_narrow (
            char_type __c,
            char __dfault) const  [protected], [pure virtual], [inherited]
```

Narrow char_type to char.
This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead.
do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char_type to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

Implemented in std::ctype< _CharT >, std::ctype< wchar_t >, and std::mask< _CharT >.
Referenced by std::mask< _CharT >::narrow(), and std::mask< _CharT >::narrow().

do_narrow() [2/4]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_narrow (
            const char_type * __lo,
            const char_type * __hi,
            char __dfault,
            char * __to) const  [protected], [pure virtual], [inherited]
```

Narrow char_type array to char.

This virtual function converts each char_type in the range [__lo,__hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, *__dfault* is used instead.
do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

Implemented in std::ctype< _CharT >, and std::mask< _CharT >.

do_narrow() [3/4]

```
virtual char std::ctype< char >::do_narrow (
            char_type __c,
            char __dfault) const  [inline], [protected], [virtual]
```

Narrow char.
This virtual function converts the char to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. For an underived ctype<char> facet, *c* will be returned unchanged.
do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

do_narrow() [4/4]

```
virtual const char_type * std::ctype< char >::do_narrow (
            const char_type * __lo,
            const char_type * __hi,
            char __dfault,
            char * __to) const  [inline], [protected], [virtual]
```

Narrow char array to char array.
This virtual function converts each char in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an underived ctype<char> facet, the argument will be copied unchanged.
do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

do_scan_is() [1/2]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_scan_is (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [protected], [pure virtual], [inherited]
```

Find char_type matching mask.
This function searches for and returns the first char_type c in [__lo,__hi) for which is(__m,c) is true.
do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to a matching char_type if found, else *__hi*.

Implemented in std::ctype< _CharT >, std::ctype< wchar_t >, and std::mask< _CharT >.
Referenced by std::mask< _CharT >::scan_is().

do_scan_is() [2/2]

```
virtual const char_type * std::ctype< char >::do_scan_is (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [protected], [virtual]
```

Find char_type matching mask.
This function searches for and returns the first char_type c in [__lo,__hi) for which is(__m,c) is true.
do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

_↩ _*m*	The mask to compare against.
_↩ _*lo*	Pointer to start of range.
_↩ _*hi*	Pointer to end of range.

Returns

Pointer to a matching char_type if found, else __*hi*.

do_scan_not() [1/2]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_scan_not (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [protected], [pure virtual], [inherited]
```

Find char_type not matching mask.
This function searches for and returns a pointer to the first char_type c of [lo,hi) for which is(m,c) is false.
do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

_↩ _*m*	The mask to compare against.
_↩ _*lo*	Pointer to start of range.
_↩ _*hi*	Pointer to end of range.

Returns

Pointer to a non-matching char_type if found, else __*hi*.

Implemented in std::ctype< _CharT >, std::ctype< wchar_t >, and std::mask< _CharT >.
Referenced by std::mask< _CharT >::scan_not().

do_scan_not() [2/2]

```
virtual const char_type * std::ctype< char >::do_scan_not (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [protected], [virtual]
```

Find char_type not matching mask.
This function searches for and returns a pointer to the first char_type c of [lo,hi) for which is(m,c) is false.
do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to a non-matching char_type if found, else *__hi*.

do_tolower() [1/4]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_tolower (
            char_type * __lo,
            const char_type * __hi) const  [protected], [pure virtual], [inherited]
```

Convert array to lowercase.
This virtual function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched.
do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

Implemented in std::ctype< _CharT >, and std::mask< _CharT >.

do_tolower() [2/4]

```
template<typename _CharT>
```

```
virtual char_type std::__ctype_abstract_base< _CharT >::do_tolower (
            char_type __c) const  [protected], [pure virtual], [inherited]
```

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

_↩ _c	The char_type to convert.

Returns

The lowercase char_type if convertible, else __c.

Implemented in std::ctype< _CharT >, std::ctype< wchar_t >, and std::mask< _CharT >.

Referenced by std::mask< _CharT >::tolower(), and std::mask< _CharT >::tolower().

do_tolower() [3/4]

```
virtual const char_type * std::ctype< char >::do_tolower (
            char_type * __lo,
            const char_type * __hi) const  [protected], [virtual]
```

Convert array to lowercase.

This virtual function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

_↩ _lo	Pointer to first char in range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

References do_tolower().

do_tolower() [4/4]

```
virtual char_type std::ctype< char >::do_tolower (
            char_type __c) const  [protected], [virtual]
```

Convert to lowercase.

This virtual function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

_↩ _c	The char to convert.

Returns

The lowercase char if convertible, else __c.

References do_tolower().
Referenced by do_tolower(), and do_tolower().

do_toupper() [1/4]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_toupper (
            char_type * __lo,
            const char_type * __hi) const  [protected], [pure virtual], [inherited]
```

Convert array to uppercase.
This virtual function converts each char_type in the range [__lo,__hi) to uppercase if possible. Other elements remain untouched.
do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

Implemented in std::ctype< _CharT >, and std::mask< _CharT >.

do_toupper() [2/4]

```
template<typename _CharT>
virtual char_type std::__ctype_abstract_base< _CharT >::do_toupper (
            char_type __c) const  [protected], [pure virtual], [inherited]
```

Convert to uppercase.
This virtual function converts the char_type argument to uppercase if possible. If not possible (for example, '2'), returns the argument.
do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

_↩ _c	The char_type to convert.

Returns

The uppercase char_type if convertible, else __c.

Implemented in std::ctype< _CharT >, std::ctype< wchar_t >, and std::mask< _CharT >.
Referenced by std::mask< _CharT >::toupper(), and std::mask< _CharT >::toupper().

do_toupper() [3/4]

```
virtual const char_type * std::ctype< char >::do_toupper (
            char_type * __lo,
            const char_type * __hi) const  [protected], [virtual]
```

Convert array to uppercase.
This virtual function converts each char in the range [lo,hi) to uppercase if possible. Other chars remain untouched.
do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

References do_toupper().

do_toupper() [4/4]

```
virtual char_type std::ctype< char >::do_toupper (
            char_type __c) const  [protected], [virtual]
```

Convert to uppercase.
This virtual function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.
do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

_↩ _c	The char to convert.

Returns

The uppercase char if convertible, else __c.

References do_toupper().
Referenced by do_toupper(), and do_toupper().

do_widen() [1/3]

```
template<typename _CharT>
virtual const char * std::__ctype_abstract_base< _CharT >::do_widen (
            const char * __lo,
            const char * __hi,
            char_type * __to) const  [protected], [pure virtual], [inherited]
```

Widen char array.
This function converts each char in the input to char_type using the simplest reasonable transformation.
do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _lo	Pointer to start range.
_↩ _hi	Pointer to end of range.
_↩ _to	Pointer to the destination array.

Returns

__hi.

Implemented in std::ctype< _CharT >, and std::mask< _CharT >.

do_widen() [2/3]

```
virtual char_type std::ctype< char >::do_widen (
            char __c) const  [inline], [protected], [virtual]
```

Widen char.
This virtual function converts the char to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be returned unchanged.
do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _c	The char to convert.

Returns

The converted character.

Implements std::__ctype_abstract_base< _CharT >.
References do_widen().
Referenced by do_widen().

do_widen() [3/3]

```
virtual const char * std::ctype< char >::do_widen (
            const char * __lo,
            const char * __hi,
            char_type * __to) const  [inline], [protected], [virtual]
```

Widen char array.

This function converts each char in the range [lo,hi) to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be copied unchanged.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.
_↩ _to	Pointer to the destination array.

Returns

__hi.

is() [1/6]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::is (
            const char_type * __lo,
            const char_type * __hi,
            mask * __vec) const  [inline], [inherited]
```

Return a mask array.

This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char_type>::do_is().

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

is() [2/6]

```
template<typename _CharT>
bool std::__ctype_abstract_base< _CharT >::is (
            mask __m,
            char_type __c) const  [inline], [inherited]
```

Test char_type classification.
This function finds a mask M for __c and compares it to mask __m. It does so by returning the value of ctype<char_↩ type>::do_is().

Parameters

_↩ _c	The char_type to compare the mask of.
_↩ _m	The mask to compare against.

Returns

(M & __m) != 0.

Referenced by std::time_get< _CharT, _InIter >::get().

is() [3/6]

```
const char * std::ctype< char >::is (
            const char * __lo,
            const char * __hi,
            mask * __vec) const  [inline]
```

Return a mask array.
This function finds the mask for each char in the range [lo, hi) and successively writes it to vec. vec must have as many elements as the char array.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

is() [4/6]

```
const char_type * std::__ctype_abstract_base< char >::is (
            const char_type * __lo,
            const char_type * __hi,
            mask * __vec) const  [inline]
```

Return a mask array.

This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char_type>::do_is().

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

is() [5/6]

```
bool std::ctype< char >::is (
            mask __m,
            char __c) const  [inline]
```

Test char classification.
This function compares the mask table[c] to *__m*.

Parameters

_↩ _c	The char to compare the mask of.
_↩ _m	The mask to compare against.

Returns

True if __m & table[__c] is true, false otherwise.

is() [6/6]

```
bool std::__ctype_abstract_base< char >::is (
            mask __m,
            char_type __c) const  [inline]
```

Test char_type classification.
This function finds a mask M for *__c* and compares it to mask *__m*. It does so by returning the value of ctype<char_↩ type>::do_is().

Parameters

_↩ _c	The char_type to compare the mask of.
_↩ _m	The mask to compare against.

Returns

(M & __m) != 0.

narrow() [1/6]

```
template<typename _CharT>
char std::__ctype_abstract_base< _CharT >::narrow (
            char_type __c,
            char __dfault) const  [inline], [inherited]
```

Narrow char_type to char.
This function converts the char_type to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. It does so by returning ctype<char_type>::do_narrow(__c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char_type to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

Referenced by std::time_get< _CharT, _InIter >::do_get_year(), std::time_get< _CharT, _InIter >::get(), and std::time_put< _CharT, _OutIter >::put().

narrow() [2/6]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::narrow (
            const char_type * __lo,
            const char_type * __hi,
            char __dfault,
            char * __to) const  [inline], [inherited]
```

Narrow array to char array.
This function converts each char_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char_type in the input that cannot be converted, *dfault* is used instead. It does so by returning ctype<char_type>::do_narrow(__lo, __hi, __dfault, __to).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

narrow() [3/6]

```
char std::ctype< char >::narrow (
            char_type __c,
            char __dfault) const  [inline]
```

Narrow char.
This function converts the char to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. For an underived ctype<char> facet, *c* will be returned unchanged.
This function works as if it returns ctype<char>::do_narrow(c). do_narrow() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char to convert.
__dfault	Char to return if conversion fails.

Returns

The converted character.

References std::ctype< _CharT >::do_narrow().

narrow() [4/6]

```
char std::__ctype_abstract_base< char >::narrow (
            char_type __c,
            char __dfault) const  [inline]
```

Narrow char_type to char.
This function converts the char_type to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. It does so by returning ctype<char_type>::do_narrow(__c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char_type to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

narrow() [5/6]

```
const char_type * std::ctype< char >::narrow (
            const char_type * __lo,
```

```
            const char_type * __hi,
            char __dfault,
            char * __to) const  [inline]
```

Narrow char array.

This function converts each char in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an underived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns ctype<char>::do_narrow(lo, hi, dfault, to). do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

References std::ctype< _CharT >::do_narrow().

narrow() [6/6]

```
const char_type * std::__ctype_abstract_base< char >::narrow (
            const char_type * __lo,
            const char_type * __hi,
            char __dfault,
            char * __to) const  [inline]
```

Narrow array to char array.

This function converts each char_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char_type in the input that cannot be converted, *dfault* is used instead. It does so by returning ctype<char_type>::do_narrow(__lo, __hi, __dfault, __to).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

scan_is() [1/3]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_is (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [inline], [inherited]
```

Find char_type matching a mask.
This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char_type>::do_scan_is().

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to matching char_type if found, else *__hi*.

scan_is() [2/3]

```
const char * std::ctype< char >::scan_is (
            mask __m,
            const char * __lo,
            const char * __hi) const  [inline]
```

Find char matching a mask.
This function searches for and returns the first char in [lo,hi) for which is(m,char) is true.

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to a matching char if found, else *__hi*.

scan_is() [3/3]

```
const char_type * std::__ctype_abstract_base< char >::scan_is (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [inline]
```

Find char_type matching a mask.
This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char_type>::do_scan_is().

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to matching char_type if found, else __hi.

scan_not() [1/3]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_not (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [inline], [inherited]
```

Find char_type not matching a mask.
This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char_type>::do_scan_not().

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to first char in range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to non-matching char if found, else __hi.

scan_not() [2/3]

```
const char * std::ctype< char >::scan_not (
            mask __m,
```

```
            const char * __lo,
            const char * __hi) const  [inline]
```

Find char not matching a mask.
This function searches for and returns a pointer to the first char in [__lo,__hi) for which is(m,char) is false.

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to a non-matching char if found, else *__hi*.

scan_not() [3/3]

```
const char_type * std::__ctype_abstract_base< char >::scan_not (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [inline]
```

Find char_type not matching a mask.
This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char_type>::do_scan_not().

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to first char in range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to non-matching char if found, else *__hi*.

table()

```
const mask * std::ctype< char >::table () const throw ( )   [inline]
```

Returns a pointer to the mask table provided to the constructor, or the default from classic_table() if none was provided.

tolower() [1/6]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::tolower (
```

```
            char_type * __lo,
            const char_type * __hi) const  [inline], [inherited]
```

Convert array to lowercase.

This function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_tolower(__lo, __hi).

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

tolower() [2/6]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::tolower (
            char_type __c) const  [inline], [inherited]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_tolower(c).

Parameters

_↩ _c	The char_type to convert.

Returns

The lowercase char_type if convertible, else *__c*.

Referenced by std::time_get< _CharT, _InIter >::get().

tolower() [3/6]

```
const char_type * std::ctype< char >::tolower (
            char_type * __lo,
            const char_type * __hi) const  [inline]
```

Convert array to lowercase.

This function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.
tolower() acts as if it returns ctype<char>:: do_tolower(__lo, __hi). do_tolower() must always return the same result for the same input.

Parameters

_↩ _lo	Pointer to first char in range.

_↩ _hi	Pointer to end of range.

Returns

__hi.

References std::ctype< _CharT >::do_tolower().

tolower() [4/6]

```
const char_type * std::__ctype_abstract_base< char >::tolower (
            char_type * __lo,
            const char_type * __hi) const  [inline]
```

Convert array to lowercase.
This function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_tolower(__lo, __hi).

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

tolower() [5/6]

```
char_type std::ctype< char >::tolower (
            char_type __c) const  [inline]
```

Convert to lowercase.
This function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument. tolower() acts as if it returns ctype<char>::do_tolower(__c). do_tolower() must always return the same result for the same input.

Parameters

_↩ _c	The char to convert.

Returns

The lowercase char if convertible, else *__c*.

References std::ctype< _CharT >::do_tolower().

tolower() [6/6]

```
char_type std::__ctype_abstract_base< char >::tolower (
            char_type __c) const  [inline]
```

Convert to lowercase.
This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_tolower(c).

Parameters

_↩ _c	The char_type to convert.

Returns

The lowercase char_type if convertible, else __c.

toupper() [1/6]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::toupper (
            char_type * __lo,
            const char_type * __hi) const  [inline], [inherited]
```

Convert array to uppercase.
This function converts each char_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_toupper(lo, hi).

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

toupper() [2/6]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::toupper (
            char_type __c) const  [inline], [inherited]
```

Convert to uppercase.
This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_toupper().

Parameters

_↩ _c	The char_type to convert.

Returns

The uppercase char_type if convertible, else __c.

Referenced by std::time_get< _CharT, _InIter >::get().

toupper() [3/6]

```
const char_type * std::ctype< char >::toupper (
            char_type * __lo,
            const char_type * __hi) const  [inline]
```

Convert array to uppercase.
This function converts each char in the range [__lo,__hi) to uppercase if possible. Other chars remain untouched. toupper() acts as if it returns ctype<char>:: do_toupper(__lo, __hi). do_toupper() must always return the same result for the same input.

Parameters

_↩ _lo	Pointer to first char in range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

References std::ctype< _CharT >::do_toupper().

toupper() [4/6]

```
const char_type * std::__ctype_abstract_base< char >::toupper (
            char_type * __lo,
            const char_type * __hi) const  [inline]
```

Convert array to uppercase.
This function converts each char_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_toupper(lo, hi).

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

toupper() [5/6]

```
char_type std::ctype< char >::toupper (
            char_type __c) const  [inline]
```

Convert to uppercase.
This function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument. toupper() acts as if it returns ctype<char>::do_toupper(c). do_toupper() must always return the same result for the same input.

Parameters

_↩ _c	The char to convert.

Returns

The uppercase char if convertible, else __c.

References std::ctype< _CharT >::do_toupper().

toupper() [6/6]

```
char_type std::__ctype_abstract_base< char >::toupper (
            char_type __c) const  [inline]
```

Convert to uppercase.
This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_toupper().

Parameters

_↩ _c	The char_type to convert.

Returns

The uppercase char_type if convertible, else __c.

widen() [1/5]

```
template<typename _CharT>
const char * std::__ctype_abstract_base< _CharT >::widen (
            const char * __lo,
            const char * __hi,
            char_type * __to) const  [inline], [inherited]
```

Widen array to char_type.
This function converts each char in the input to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

_↩ _to	Pointer to the destination array.

Returns

__hi.

widen() [2/5]

```
char_type std::ctype< char >::widen (
            char __c) const  [inline]
```

Widen char.

This function converts the char to char_type using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be returned unchanged.

This function works as if it returns ctype<char>::do_widen(c). do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _c	The char to convert.

Returns

The converted character.

References std::ctype< _CharT >::do_widen().

widen() [3/5]

```
char_type std::__ctype_abstract_base< char >::widen (
            char __c) const  [inline]
```

Widen char to char_type.

This function converts the char argument to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _c	The char to convert.

Returns

The converted char_type.

widen() [4/5]

```
const char * std::ctype< char >::widen (
            const char * __lo,
```

```
            const char * __hi,
            char_type * __to) const  [inline]
```

Widen char array.

This function converts each char in the input to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns ctype<char>::do_widen(c). do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to first char in range.
__hi	Pointer to end of range.
__to	Pointer to the destination array.

Returns

__hi.

References std::ctype< _CharT >::do_widen().

widen() [5/5]

```
const char * std::__ctype_abstract_base< char >::widen (
            const char * __lo,
            const char * __hi,
            char_type * __to) const  [inline]
```

Widen array to char_type.

This function converts each char in the input to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__to	Pointer to the destination array.

Returns

__hi.

6.373.5 Member Data Documentation

id

```
locale::id std::ctype< char >::id  [static]
```

The facet id for ctype<char>.

table_size

```
const size_t std::ctype< char >::table_size  [static]
```

The size of the mask table. It is SCHAR_MAX + 1.
The documentation for this class was generated from the following files:

- locale_facets.h
- ctype_inline.h

6.374 std::ctype< wchar_t > Class Reference

6.374.1 Detailed Description

The ctype<wchar_t> specialization.
This class defines classification and conversion functions for the wchar_t type. It gets used by wchar_t streams for many I/O operations. The wchar_t specialization provides a number of optimizations as well.
ctype<wchar_t> inherits its public methods from __ctype_abstract_base<wchar_t>.

6.374.2 Member Typedef Documentation

char_type

```
typedef wchar_t std::ctype< wchar_t >::char_type
```

Typedef for the template parameter wchar_t.

6.374.3 Constructor & Destructor Documentation

ctype() [1/2]

```
std::ctype< wchar_t >::ctype (
            size_t __refs = 0)  [explicit]
```

Constructor performs initialization.
This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

ctype() [2/2]

```
std::ctype< wchar_t >::ctype (
            __c_locale __cloc,
            size_t __refs = 0)  [explicit]
```

Constructor performs static initialization.
This constructor is used to construct the initial C locale facet.

Parameters

__cloc	Handle to C locale data.
__refs	Passed to the base facet class.

~ctype()

```
virtual std::ctype< wchar_t >::~ctype ()  [protected], [virtual]
```

Destructor.

6.374.4 Member Function Documentation

do_is() [1/2]

```
virtual const char_type * std::ctype< wchar_t >::do_is (
            const char_type * __lo,
            const char_type * __hi,
            mask * __vec) const  [protected], [virtual]
```

Return a mask array.
This function finds the mask for each wchar_t in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.
do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

do_is() [2/2]

```
virtual bool std::ctype< wchar_t >::do_is (
            mask __m,
            char_type __c) const  [protected], [virtual]
```

Test wchar_t classification.
This function finds a mask M for *c* and compares it to mask *m*.
do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

__c	The wchar_t to find the mask of.
__m	The mask to compare against.

Returns

(M & __m) != 0.

Implements std::__ctype_abstract_base< wchar_t >.

do_narrow() [1/2]

```
virtual char std::ctype< wchar_t >::do_narrow (
            char_type __c,
            char __dfault) const  [protected], [virtual]
```

Narrow wchar_t to char.
This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. For an underived ctype<wchar_t> facet, *c* will be cast to char and returned.
do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The wchar_t to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

Implements std::__ctype_abstract_base< wchar_t >.

do_narrow() [2/2]

```
virtual const char_type * std::ctype< wchar_t >::do_narrow (
            const char_type * __lo,
            const char_type * __hi,
            char __dfault,
            char * __to) const  [protected], [virtual]
```

Narrow wchar_t array to char array.
This virtual function converts each wchar_t in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any wchar_t in the input that cannot be converted, *dfault* is used instead. For an underived ctype<wchar_t> facet, the argument will be copied, casting each element to char.
do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

do_scan_is()

```
virtual const char_type * std::ctype< wchar_t >::do_scan_is (
            mask __m,
```

```
            const char_type * __lo,
            const char_type * __hi) const  [protected], [virtual]
```

Find wchar_t matching mask.
This function searches for and returns the first wchar_t c in [__lo,__hi) for which is(__m,c) is true.
do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to a matching wchar_t if found, else __hi.

Implements std::__ctype_abstract_base< wchar_t >.

do_scan_not()

```
virtual const char_type * std::ctype< wchar_t >::do_scan_not (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [protected], [virtual]
```

Find wchar_t not matching mask.
This function searches for and returns a pointer to the first wchar_t c of [__lo,__hi) for which is(__m,c) is false.
do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to a non-matching wchar_t if found, else __hi.

Implements std::__ctype_abstract_base< wchar_t >.

do_tolower() [1/2]

```
virtual const char_type * std::ctype< wchar_t >::do_tolower (
            char_type * __lo,
            const char_type * __hi) const  [protected], [virtual]
```

Convert array to lowercase.
This virtual function converts each wchar_t in the range [lo,hi) to lowercase if possible. Other elements remain untouched.
do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

__hi.

do_tolower() [2/2]

```
virtual char_type std::ctype< wchar_t >::do_tolower (
            char_type __c) const  [protected], [virtual]
```

Convert to lowercase.
This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.
do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

__c	The wchar_t to convert.

Returns

The lowercase wchar_t if convertible, else *__c*.

Implements std::__ctype_abstract_base< wchar_t >.

do_toupper() [1/2]

```
virtual const char_type * std::ctype< wchar_t >::do_toupper (
            char_type * __lo,
            const char_type * __hi) const  [protected], [virtual]
```

Convert array to uppercase.
This virtual function converts each wchar_t in the range [lo,hi) to uppercase if possible. Other elements remain untouched.
do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

do_toupper() [2/2]

```
virtual char_type std::ctype< wchar_t >::do_toupper (
            char_type __c) const  [protected], [virtual]
```

Convert to uppercase.
This virtual function converts the wchar_t argument to uppercase if possible. If not possible (for example, '2'), returns the argument.
do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

_↩ _c	The wchar_t to convert.

Returns

The uppercase wchar_t if convertible, else __c.

Implements std::__ctype_abstract_base< wchar_t >.

do_widen() [1/2]

```
virtual char_type std::ctype< wchar_t >::do_widen (
            char __c) const  [protected], [virtual]
```

Widen char to wchar_t.
This virtual function converts the char to wchar_t using the simplest reasonable transformation. For an underived ctype<wchar_t> facet, the argument will be cast to wchar_t.
do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _c	The char to convert.

Returns

The converted wchar_t.

Implements std::__ctype_abstract_base< wchar_t >.

do_widen() [2/2]

```
virtual const char * std::ctype< wchar_t >::do_widen (
            const char * __lo,
            const char * __hi,
            char_type * __to) const  [protected], [virtual]
```

Widen char array to wchar_t array.
This function converts each char in the input to wchar_t using the simplest reasonable transformation. For an underived ctype<wchar_t> facet, the argument will be copied, casting each element to wchar_t.
do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _*lo*	Pointer to start range.
_↩ _*hi*	Pointer to end of range.
_↩ _*to*	Pointer to the destination array.

Returns

__hi.

is() [1/2]

```
const char_type * std::__ctype_abstract_base< wchar_t >::is (
            const char_type * __lo,
            const char_type * __hi,
            mask * __vec) const  [inline]
```

Return a mask array.
This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char_type>::do_is().

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

is() [2/2]

```
bool std::__ctype_abstract_base< wchar_t >::is (
```

```
            mask __m,
            char_type __c) const  [inline]
```

Test char_type classification.
This function finds a mask M for __c and compares it to mask __m. It does so by returning the value of ctype<char_↩ type>::do_is().

Parameters

_↩ _c	The char_type to compare the mask of.
_↩ _m	The mask to compare against.

Returns

(M & __m) != 0.

narrow() [1/2]

```
char std::__ctype_abstract_base< wchar_t >::narrow (
            char_type __c,
            char __dfault) const  [inline]
```

Narrow char_type to char.
This function converts the char_type to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. It does so by returning ctype<char_type>::do_narrow(__c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char_type to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

narrow() [2/2]

```
const char_type * std::__ctype_abstract_base< wchar_t >::narrow (
            const char_type * __lo,
            const char_type * __hi,
            char __dfault,
            char * __to) const  [inline]
```

Narrow array to char array.
This function converts each char_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char_type in the input that cannot be converted, *dfault* is used instead. It does so by returning ctype<char_type>::do_narrow(__lo, __hi, __dfault, __to).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

scan_is()

```
const char_type * std::__ctype_abstract_base< wchar_t >::scan_is (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [inline]
```

Find char_type matching a mask.

This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char_type>::do_scan_is().

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to matching char_type if found, else *__hi*.

scan_not()

```
const char_type * std::__ctype_abstract_base< wchar_t >::scan_not (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [inline]
```

Find char_type not matching a mask.

This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char_type>::do_scan_not().

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to first char in range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to non-matching char if found, else __hi.

tolower() [1/2]

```
const char_type * std::__ctype_abstract_base< wchar_t >::tolower (
            char_type * __lo,
            const char_type * __hi) const  [inline]
```

Convert array to lowercase.
This function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_tolower(__lo, __hi).

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

tolower() [2/2]

```
char_type std::__ctype_abstract_base< wchar_t >::tolower (
            char_type __c) const  [inline]
```

Convert to lowercase.
This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_tolower(c).

Parameters

_↩ _c	The char_type to convert.

Returns

The lowercase char_type if convertible, else __c.

toupper() [1/2]

```
const char_type * std::__ctype_abstract_base< wchar_t >::toupper (
            char_type * __lo,
            const char_type * __hi) const  [inline]
```

Convert array to uppercase.
This function converts each char_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_toupper(lo, hi).

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

toupper() [2/2]

```
char_type std::__ctype_abstract_base< wchar_t >::toupper (
            char_type __c) const  [inline]
```

Convert to uppercase.
This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_toupper().

Parameters

_↩ _c	The char_type to convert.

Returns

The uppercase char_type if convertible, else *__c*.

widen() [1/2]

```
char_type std::__ctype_abstract_base< wchar_t >::widen (
            char __c) const  [inline]
```

Widen char to char_type.
This function converts the char argument to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _c	The char to convert.

Returns

The converted char_type.

widen() [2/2]

```
const char * std::__ctype_abstract_base< wchar_t >::widen (
            const char * __lo,
            const char * __hi,
            char_type * __to) const  [inline]
```

Widen array to char_type.
This function converts each char in the input to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__to	Pointer to the destination array.

Returns

__hi.

6.374.5 Member Data Documentation

id

```
locale::id std::ctype< wchar_t >::id  [static]
```

The facet id for ctype<wchar_t>.

6.376.1 Detailed Description

template<typename _CharT>
class std::ctype_byname< _CharT >

class ctype_byname [22.2.1.2].

6.376.2 Member Function Documentation

do_is() [1/2]

```
template<typename _CharT>
virtual const char_type * std::ctype< _CharT >::do_is (
            const char_type * __lo,
            const char_type * __hi,
            mask * __vec) const  [protected], [virtual], [inherited]
```

Return a mask array.
This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.
do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

Implements std::__ctype_abstract_base< _CharT >.

do_is() [2/2]

```
template<typename _CharT>
virtual bool std::ctype< _CharT >::do_is (
            mask __m,
            char_type __c) const  [protected], [virtual], [inherited]
```

Test char_type classification.
This function finds a mask M for *c* and compares it to mask *m*.
do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

__c	The char_type to find the mask of.
__m	The mask to compare against.

Returns

(M & __m) != 0.

Implements std::__ctype_abstract_base< _CharT >.

do_narrow() [1/2]

```
template<typename _CharT>
virtual char std::ctype< _CharT >::do_narrow (
            char_type __c,
            char __dfault) const  [protected], [virtual], [inherited]
```

Narrow char_type to char.
This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead.
do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char_type to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

Implements std::__ctype_abstract_base< _CharT >.
Referenced by std::ctype< char >::narrow(), and std::ctype< char >::narrow().

do_narrow() [2/2]

```
template<typename _CharT>
virtual const char_type * std::ctype< _CharT >::do_narrow (
            const char_type * __lo,
            const char_type * __hi,
            char __dfault,
            char * __to) const  [protected], [virtual], [inherited]
```

Narrow char_type array to char.
This virtual function converts each char_type in the range [__lo,__hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, *__dfault* is used instead.
do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

Implements std::__ctype_abstract_base< _CharT >.

do_scan_is()

```
template<typename _CharT>
virtual const char_type * std::ctype< _CharT >::do_scan_is (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [protected], [virtual], [inherited]
```

Find char_type matching mask.
This function searches for and returns the first char_type c in [__lo,__hi) for which is(__m,c) is true.
do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to a matching char_type if found, else *__hi*.

Implements std::__ctype_abstract_base< _CharT >.

do_scan_not()

```
template<typename _CharT>
virtual const char_type * std::ctype< _CharT >::do_scan_not (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [protected], [virtual], [inherited]
```

Find char_type not matching mask.
This function searches for and returns a pointer to the first char_type c of [lo,hi) for which is(m,c) is false.
do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to a non-matching char_type if found, else __*hi*.

Implements std::__ctype_abstract_base< _CharT >.

do_tolower() [1/2]

```
template<typename _CharT>
virtual const char_type * std::ctype< _CharT >::do_tolower (
            char_type * __lo,
            const char_type * __hi) const  [protected], [virtual], [inherited]
```

Convert array to lowercase.
This virtual function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched.
do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

_↩ _*lo*	Pointer to start of range.
_↩ _*hi*	Pointer to end of range.

Returns

__*hi*.

Implements std::__ctype_abstract_base< _CharT >.

do_tolower() [2/2]

```
template<typename _CharT>
virtual char_type std::ctype< _CharT >::do_tolower (
            char_type __c) const  [protected], [virtual], [inherited]
```

Convert to lowercase.
This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.
do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

_↩ _*c*	The char_type to convert.

Returns

The lowercase char_type if convertible, else __*c*.

Implements std::__ctype_abstract_base< _CharT >.
Referenced by std::ctype< char >::tolower(), and std::ctype< char >::tolower().

do_toupper() [1/2]

```
template<typename _CharT>
virtual const char_type * std::ctype< _CharT >::do_toupper (
            char_type * __lo,
            const char_type * __hi) const  [protected], [virtual], [inherited]
```

Convert array to uppercase.
This virtual function converts each char_type in the range [__lo,__hi) to uppercase if possible. Other elements remain untouched.
do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

Implements std::__ctype_abstract_base< _CharT >.

do_toupper() [2/2]

```
template<typename _CharT>
virtual char_type std::ctype< _CharT >::do_toupper (
            char_type __c) const  [protected], [virtual], [inherited]
```

Convert to uppercase.
This virtual function converts the char_type argument to uppercase if possible. If not possible (for example, '2'), returns the argument.
do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

_↩ _c	The char_type to convert.

Returns

The uppercase char_type if convertible, else *__c*.

Implements std::__ctype_abstract_base< _CharT >.
Referenced by std::ctype< char >::toupper(), and std::ctype< char >::toupper().

do_widen() [1/2]

```
template<typename _CharT>
virtual char_type std::ctype< _CharT >::do_widen (
            char __c) const  [protected], [virtual], [inherited]
```

Widen char.

This virtual function converts the char to char_type using the simplest reasonable transformation.
do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _c	The char to convert.

Returns

The converted char_type

Implements std::__ctype_abstract_base< _CharT >.
Referenced by std::ctype< char >::widen(), and std::ctype< char >::widen().

do_widen() [2/2]

```
template<typename _CharT>
virtual const char * std::ctype< _CharT >::do_widen (
            const char * __lo,
            const char * __hi,
            char_type * __to) const  [protected], [virtual], [inherited]
```

Widen char array.
This function converts each char in the input to char_type using the simplest reasonable transformation.
do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _lo	Pointer to start range.
_↩ _hi	Pointer to end of range.
_↩ _to	Pointer to the destination array.

Returns

__hi.

Implements std::__ctype_abstract_base< _CharT >.

is() [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::is (
            const char_type * __lo,
            const char_type * __hi,
            mask * __vec) const  [inline], [inherited]
```

Return a mask array.

This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char_type>::do_is().

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

is() [2/2]

```
template<typename _CharT>
bool std::__ctype_abstract_base< _CharT >::is (
            mask __m,
            char_type __c) const  [inline], [inherited]
```

Test char_type classification.
This function finds a mask M for *__c* and compares it to mask *__m*. It does so by returning the value of ctype<char_↩ type>::do_is().

Parameters

_↩ _*c*	The char_type to compare the mask of.
_↩ _*m*	The mask to compare against.

Returns

(M & __m) != 0.

Referenced by std::time_get< _CharT, _InIter >::get().

narrow() [1/2]

```
template<typename _CharT>
char std::__ctype_abstract_base< _CharT >::narrow (
            char_type __c,
            char __dfault) const  [inline], [inherited]
```

Narrow char_type to char.
This function converts the char_type to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. It does so by returning ctype<char_type>::do_narrow(__c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char_type to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

Referenced by std::time_get< _CharT, _InIter >::do_get_year(), std::time_get< _CharT, _InIter >::get(), and std::time_put< _CharT, _OutIter >::put().

narrow() [2/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::narrow (
            const char_type * __lo,
            const char_type * __hi,
            char __dfault,
            char * __to) const  [inline], [inherited]
```

Narrow array to char array.
This function converts each char_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char_type in the input that cannot be converted, *dfault* is used instead. It does so by returning ctype<char_type>::do_narrow(__lo, __hi, __dfault, __to).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

scan_is()

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_is (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [inline], [inherited]
```

Find char_type matching a mask.
This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char_type>::do_scan_is().

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to matching char_type if found, else __*hi*.

scan_not()

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_not (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [inline], [inherited]
```

Find char_type not matching a mask.

This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char_type>::do_scan_not().

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to first char in range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to non-matching char if found, else __*hi*.

tolower() [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::tolower (
            char_type * __lo,
            const char_type * __hi) const  [inline], [inherited]
```

Convert array to lowercase.

This function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_tolower(__lo, __hi).

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

tolower() [2/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::tolower (
            char_type __c) const  [inline], [inherited]
```

Convert to lowercase.
This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_tolower(c).

Parameters

_↩ _c	The char_type to convert.

Returns

The lowercase char_type if convertible, else __c.

Referenced by std::time_get< _CharT, _InIter >::get().

toupper() [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::toupper (
            char_type * __lo,
            const char_type * __hi) const  [inline], [inherited]
```

Convert array to uppercase.
This function converts each char_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_toupper(lo, hi).

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

toupper() [2/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::toupper (
            char_type __c) const  [inline], [inherited]
```

Convert to uppercase.
This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_toupper().

Parameters

_↩ _c	The char_type to convert.

Returns

The uppercase char_type if convertible, else __c.

Referenced by std::time_get< _CharT, _InIter >::get().

widen() [1/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::widen (
            char __c) const  [inline], [inherited]
```

Widen char to char_type.
This function converts the char argument to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _c	The char to convert.

Returns

The converted char_type.

Referenced by std::money_get< _CharT, _InIter >::do_get(), std::time_get< _CharT, _InIter >::do_get(), std::money_put< _CharT, _Out and std::time_put< _CharT, _OutIter >::do_put().

widen() [2/2]

```
template<typename _CharT>
const char * std::__ctype_abstract_base< _CharT >::widen (
            const char * __lo,
            const char * __hi,
            char_type * __to) const  [inline], [inherited]
```

Widen array to char_type.
This function converts each char in the input to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.
_↩ _to	Pointer to the destination array.

Returns

__hi.

6.376.3 Member Data Documentation

id

```
template<typename _CharT>
locale::id std::ctype< _CharT >::id  [static], [inherited]
```

The facet id for ctype<char_type>.

The documentation for this class was generated from the following file:

- locale_facets.h

6.377 std::ctype_byname< char > Class Reference

6.377.1 Detailed Description

22.2.1.4 Class ctype_byname specializations.

6.377.2 Member Function Documentation

classic_table()

```
const mask * std::ctype< char >::classic_table () throw ( )   [static], [inherited]
```

Returns a pointer to the C locale mask table.

do_is() [1/3]

```
virtual bool std::ctype< char >::do_is (
            mask __m,
            char_type __c) const  [protected], [virtual], [inherited]
```

Test char_type classification.
This function finds a mask M for *c* and compares it to mask *m*.
do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

_↩ _c	The char_type to find the mask of.

_↩ _*m*	The mask to compare against.

Returns

(M & __m) != 0.

do_is() [2/3]

```
virtual const char_type * std::ctype< char >::do_is (
            const char_type * __lo,
            const char_type * __hi,
            mask * __vec) const  [protected], [virtual]
```

Return a mask array.
This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.
do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

do_is() [3/3]

```
virtual bool std::ctype< char >::do_is (
            mask __m,
            char_type __c) const  [protected], [virtual]
```

Test char_type classification.
This function finds a mask M for *c* and compares it to mask *m*.
do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

_↩ _*c*	The char_type to find the mask of.
_↩ _*m*	The mask to compare against.

Returns

(M & __m) != 0.

do_narrow() [1/4]

```
virtual char std::ctype< char >::do_narrow (
            char_type __c,
            char __dfault) const  [inline], [protected], [virtual], [inherited]
```

Narrow char.

This virtual function converts the char to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. For an underived ctype<char> facet, *c* will be returned unchanged.

do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

do_narrow() [2/4]

```
virtual const char_type * std::ctype< char >::do_narrow (
            const char_type * __lo,
            const char_type * __hi,
            char __dfault,
            char * __to) const  [inline], [protected], [virtual], [inherited]
```

Narrow char array to char array.

This virtual function converts each char in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an underived ctype<char> facet, the argument will be copied unchanged.

do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

do_narrow() [3/4]

```
virtual char std::ctype< char >::do_narrow (
            char_type ,
            char __dfault) const  [protected], [virtual]
```

Narrow char_type to char.
This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead.
do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char_type to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

do_narrow() [4/4]

```
virtual const char_type * std::ctype< char >::do_narrow (
            const char_type * __lo,
            const char_type * __hi,
            char __dfault,
            char * __to) const  [protected], [virtual]
```

Narrow char_type array to char.
This virtual function converts each char_type in the range [__lo,__hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, *__dfault* is used instead.
do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

do_scan_is() [1/2]

```
virtual const char_type * std::ctype< char >::do_scan_is (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [protected], [virtual], [inherited]
```

Find char_type matching mask.
This function searches for and returns the first char_type c in [__lo,__hi) for which is(__m,c) is true.
do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to a matching char_type if found, else *__hi*.

do_scan_is() [2/2]

```
virtual const char_type * std::ctype< char >::do_scan_is (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [protected], [virtual]
```

Find char_type matching mask.
This function searches for and returns the first char_type c in [__lo,__hi) for which is(__m,c) is true.
do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to a matching char_type if found, else *__hi*.

do_scan_not() [1/2]

```
virtual const char_type * std::ctype< char >::do_scan_not (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [protected], [virtual], [inherited]
```

Find char_type not matching mask.
This function searches for and returns a pointer to the first char_type c of [lo,hi) for which is(m,c) is false.
do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

_↩ _*m*	The mask to compare against.
_↩ _*lo*	Pointer to start of range.
_↩ _*hi*	Pointer to end of range.

Returns

Pointer to a non-matching char_type if found, else __*hi*.

do_scan_not() [2/2]

```
virtual const char_type * std::ctype< char >::do_scan_not (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [protected], [virtual]
```

Find char_type not matching mask.
This function searches for and returns a pointer to the first char_type c of [lo,hi) for which is(m,c) is false.
do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

_↩ _*m*	The mask to compare against.
_↩ _*lo*	Pointer to start of range.
_↩ _*hi*	Pointer to end of range.

Returns

Pointer to a non-matching char_type if found, else __*hi*.

do_tolower() [1/4]

```
virtual const char_type * std::ctype< char >::do_tolower (
```

```
            char_type * __lo,
            const char_type * __hi) const  [protected], [virtual], [inherited]
```

Convert array to lowercase.
This virtual function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.
do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

_↩ _lo	Pointer to first char in range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

References do_tolower().

do_tolower() [2/4]

```
virtual char_type std::ctype< char >::do_tolower (
            char_type __c) const  [protected], [virtual], [inherited]
```

Convert to lowercase.
This virtual function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.
do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

_↩ _c	The char to convert.

Returns

The lowercase char if convertible, else *__c*.

References do_tolower().
Referenced by do_tolower(), and do_tolower().

do_tolower() [3/4]

```
virtual const char_type * std::ctype< char >::do_tolower (
            char_type * __lo,
            const char_type * __hi) const  [protected], [virtual]
```

Convert array to lowercase.
This virtual function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched.
do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

do_tolower() [4/4]

```
virtual char_type std::ctype< char >::do_tolower (
            char_type __c) const  [protected], [virtual]
```

Convert to lowercase.
This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.
do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

_↩ _c	The char_type to convert.

Returns

The lowercase char_type if convertible, else *__c*.

do_toupper() [1/4]

```
virtual const char_type * std::ctype< char >::do_toupper (
            char_type * __lo,
            const char_type * __hi) const  [protected], [virtual], [inherited]
```

Convert array to uppercase.
This virtual function converts each char in the range [lo,hi) to uppercase if possible. Other chars remain untouched.
do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

References do_toupper().

do_toupper() [2/4]

```
virtual char_type std::ctype< char >::do_toupper (
            char_type __c) const  [protected], [virtual], [inherited]
```

Convert to uppercase.
This virtual function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.
do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

_↩ _c	The char to convert.

Returns

The uppercase char if convertible, else __c.

References do_toupper().
Referenced by do_toupper(), and do_toupper().

do_toupper() [3/4]

```
virtual const char_type * std::ctype< char >::do_toupper (
            char_type * __lo,
            const char_type * __hi) const  [protected], [virtual]
```

Convert array to uppercase.
This virtual function converts each char_type in the range [__lo,__hi) to uppercase if possible. Other elements remain untouched.
do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

do_toupper() [4/4]

```
virtual char_type std::ctype< char >::do_toupper (
            char_type __c) const  [protected], [virtual]
```

Convert to uppercase.
This virtual function converts the char_type argument to uppercase if possible. If not possible (for example, '2'), returns the argument.
do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

_↩ _c	The char_type to convert.

Returns

The uppercase char_type if convertible, else __c.

do_widen() [1/3]

```
virtual const char * std::ctype< char >::do_widen (
            const char * __lo,
            const char * __hi,
            char_type * __to) const  [inline], [protected], [virtual], [inherited]
```

Widen char array.
This function converts each char in the range [lo,hi) to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be copied unchanged.
do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.
_↩ _to	Pointer to the destination array.

Returns

__hi.

do_widen() [2/3]

```
virtual char_type std::ctype< char >::do_widen (
            char __c) const  [protected], [virtual]
```

Widen char.
This virtual function converts the char to char_type using the simplest reasonable transformation.
do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _c	The char to convert.

Returns

The converted char_type

do_widen() [3/3]

```
virtual const char * std::ctype< char >::do_widen (
            const char * __lo,
            const char * __hi,
            char_type * __dest) const  [protected], [virtual]
```

Widen char array.
This function converts each char in the input to char_type using the simplest reasonable transformation.
do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start range.
__hi	Pointer to end of range.
__to	Pointer to the destination array.

Returns

__hi.

is() [1/4]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::is (
            const char_type * __lo,
            const char_type * __hi,
            mask * __vec) const  [inline], [inherited]
```

Return a mask array.
This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char_type>::do_is().

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

is() [2/4]

```
template<typename _CharT>
bool std::__ctype_abstract_base< _CharT >::is (
            mask __m,
            char_type __c) const  [inline], [inherited]
```

Test char_type classification.
This function finds a mask M for *__c* and compares it to mask *__m*. It does so by returning the value of ctype<char_↩ type>::do_is().

Parameters

_↩ _*c*	The char_type to compare the mask of.
_↩ _*m*	The mask to compare against.

Returns

(M & __m) != 0.

Referenced by std::time_get< _CharT, _InIter >::get().

is() [3/4]

```
const char_type * std::__ctype_abstract_base< char >::is (
            const char_type * __lo,
            const char_type * __hi,
            mask * __vec) const  [inline]
```

Return a mask array.
This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char_type>::do_is().

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

is() [4/4]

```
bool std::__ctype_abstract_base< char >::is (
            mask __m,
            char_type __c) const  [inline]
```

Test char_type classification.

This function finds a mask M for __*c* and compares it to mask __*m*. It does so by returning the value of ctype<char_↩ type>::do_is().

Parameters

_↩ _*c*	The char_type to compare the mask of.
_↩ _*m*	The mask to compare against.

Returns

(M & __m) != 0.

narrow() [1/4]

```
template<typename _CharT>
char std::__ctype_abstract_base< _CharT >::narrow (
            char_type __c,
            char __dfault) const  [inline], [inherited]
```

Narrow char_type to char.
This function converts the char_type to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. It does so by returning ctype<char_type>::do_narrow(__c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__*c*	The char_type to convert.
__*dfault*	Char to return if conversion fails.

Returns

The converted char.

Referenced by std::time_get< _CharT, _InIter >::do_get_year(), std::time_get< _CharT, _InIter >::get(), and std::time_put< _CharT, _OutIter >::put().

narrow() [2/4]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::narrow (
            const char_type * __lo,
            const char_type * __hi,
            char __dfault,
            char * __to) const  [inline], [inherited]
```

Narrow array to char array.
This function converts each char_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char_type in the input that cannot be converted, *dfault* is used instead. It does so by returning ctype<char_type>::do_narrow(__lo, __hi, __dfault, __to).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

narrow() [3/4]

```
char std::__ctype_abstract_base< char >::narrow (
            char_type __c,
            char __dfault) const  [inline]
```

Narrow char_type to char.
This function converts the char_type to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. It does so by returning ctype<char_type>::do_narrow(__c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char_type to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

narrow() [4/4]

```
const char_type * std::__ctype_abstract_base< char >::narrow (
            const char_type * __lo,
            const char_type * __hi,
            char __dfault,
            char * __to) const  [inline]
```

Narrow array to char array.
This function converts each char_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char_type in the input that cannot be converted, *dfault* is used instead. It does so by returning ctype<char_type>::do_narrow(__lo, __hi, __dfault, __to).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

scan_is() [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_is (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [inline], [inherited]
```

Find char_type matching a mask.
This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char_type>::do_scan_is().

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to matching char_type if found, else *__hi*.

scan_is() [2/2]

```
const char_type * std::__ctype_abstract_base< char >::scan_is (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [inline]
```

Find char_type matching a mask.
This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char_type>::do_scan_is().

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to matching char_type if found, else __*hi*.

scan_not() [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_not (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [inline], [inherited]
```

Find char_type not matching a mask.
This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char_type>::do_scan_not().

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to first char in range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to non-matching char if found, else __*hi*.

scan_not() [2/2]

```
const char_type * std::__ctype_abstract_base< char >::scan_not (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [inline]
```

Find char_type not matching a mask.
This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char_type>::do_scan_not().

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to first char in range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to non-matching char if found, else *__hi*.

table()

```
const mask * std::ctype< char >::table () const throw ( )   [inline], [inherited]
```

Returns a pointer to the mask table provided to the constructor, or the default from classic_table() if none was provided.

tolower() [1/4]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::tolower (
            char_type * __lo,
            const char_type * __hi) const  [inline], [inherited]
```

Convert array to lowercase.

This function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_tolower(__lo, __hi).

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

tolower() [2/4]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::tolower (
            char_type __c) const  [inline], [inherited]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_tolower(c).

Parameters

_↩ _c	The char_type to convert.

Returns

The lowercase char_type if convertible, else __c.

Referenced by std::time_get< _CharT, _InIter >::get().

tolower() [3/4]

```
const char_type * std::__ctype_abstract_base< char >::tolower (
            char_type * __lo,
            const char_type * __hi) const  [inline]
```

Convert array to lowercase.
This function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_tolower(__lo, __hi).

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

tolower() [4/4]

```
char_type std::__ctype_abstract_base< char >::tolower (
            char_type __c) const  [inline]
```

Convert to lowercase.
This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_tolower(c).

Parameters

_↩ _c	The char_type to convert.

Returns

The lowercase char_type if convertible, else __c.

toupper() [1/4]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::toupper (
```

```
            char_type * __lo,
            const char_type * __hi) const  [inline], [inherited]
```

Convert array to uppercase.
This function converts each char_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_toupper(lo, hi).

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

toupper() [2/4]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::toupper (
            char_type __c) const  [inline], [inherited]
```

Convert to uppercase.
This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_toupper().

Parameters

_↩ _c	The char_type to convert.

Returns

The uppercase char_type if convertible, else *__c*.

Referenced by std::time_get< _CharT, _InIter >::get().

toupper() [3/4]

```
const char_type * std::__ctype_abstract_base< char >::toupper (
            char_type * __lo,
            const char_type * __hi) const  [inline]
```

Convert array to uppercase.
This function converts each char_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_toupper(lo, hi).

Parameters

_↩ _lo	Pointer to start of range.

_↩ _hi	Pointer to end of range.

Returns

__hi.

toupper() [4/4]

```
char_type std::__ctype_abstract_base< char >::toupper (
            char_type __c) const  [inline]
```

Convert to uppercase.
This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_toupper().

Parameters

_↩ _c	The char_type to convert.

Returns

The uppercase char_type if convertible, else *__c*.

widen() [1/3]

```
template<typename _CharT>
const char * std::__ctype_abstract_base< _CharT >::widen (
            const char * __lo,
            const char * __hi,
            char_type * __to) const  [inline], [inherited]
```

Widen array to char_type.
This function converts each char in the input to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.
_↩ _to	Pointer to the destination array.

Returns

__hi.

widen() [2/3]

```
char_type std::__ctype_abstract_base< char >::widen (
            char __c) const  [inline]
```

Widen char to char_type.
This function converts the char argument to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _c	The char to convert.

Returns

The converted char_type.

widen() [3/3]

```
const char * std::__ctype_abstract_base< char >::widen (
            const char * __lo,
            const char * __hi,
            char_type * __to) const  [inline]
```

Widen array to char_type.
This function converts each char in the input to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.
_↩ _to	Pointer to the destination array.

Returns

__hi.

6.377.3 Member Data Documentation

id

```
locale::id std::ctype< char >::id  [static]
```

The facet id for ctype<char_type>.

table_size

```
const size_t std::ctype< char >::table_size  [static], [inherited]
```

The size of the mask table. It is SCHAR_MAX + 1.
The documentation for this class was generated from the following file:

6.382.1 Detailed Description

3.2.3 Class decimal64.

6.382.2 Constructor & Destructor Documentation

decimal64()

```
std::decimal::decimal64::decimal64 (
            __decfloat64 __z)  [inline]
```

Conforming extension: Conversion from scalar decimal type.
The documentation for this class was generated from the following file:

- decimal

6.383 parallelism_v2::simd_abi::deduce< _Tp, _Np,... > Struct Template Reference

```
#include <simd.h>
```

6.383.1 Detailed Description

template<typename _Tp, size_t _Np, typename...>
struct parallelism_v2::simd_abi::deduce< _Tp, _Np,... >

Template Parameters

_Tp	The requested `value_type` for the elements.
_Np	The requested number of elements.
_Abis	This parameter is ignored, since this implementation cannot make any use of it. Either __a good native ABI is matched and used as `type` alias, or the `fixed_size<_Np>` ABI is used, which internally is built from the best matching native ABIs.

The documentation for this struct was generated from the following file:

- simd.h

6.384 __gnu_pbds::detail::default_comb_hash_fn Struct Reference

`#include <standard_policies.hpp>`

Public Types

- typedef direct_mask_range_hashing type

6.384.1 Detailed Description

Primary template, default_comb_hash_fn.

6.384.2 Member Typedef Documentation

type

`typedef direct_mask_range_hashing __gnu_pbds::detail::default_comb_hash_fn::type`
Dispatched type.
The documentation for this struct was generated from the following file:

- standard_policies.hpp

6.385 std::default_delete< _Tp > Struct Template Reference

`#include <memory>`

Public Member Functions

- constexpr default_delete () noexcept=default
- template<typename _Up, typename = _Require<is_convertible<_Up*, _Tp*>>>
  constexpr default_delete (const default_delete< _Up > &) noexcept
- constexpr void operator() (_Tp *__ptr) const

6.385.1 Detailed Description

template<typename _Tp>
struct std::default_delete< _Tp >

Primary template of default_delete, used by unique_ptr for single objects

Since

C++11

6.385.2 Constructor & Destructor Documentation

default_delete() [1/2]

```
template<typename _Tp>
std::default_delete< _Tp >::default_delete ()  [constexpr], [default], [noexcept]
```

Default constructor.
Referenced by default_delete().

default_delete() [2/2]

```
template<typename _Tp>
template<typename _Up, typename = _Require<is_convertible<_Up*, _Tp*>>>
std::default_delete< _Tp >::default_delete (
            const default_delete< _Up > & )  [inline], [constexpr], [noexcept]
```

Converting constructor.
Allows conversion from a deleter for objects of another type, _Up, only if _Up* is convertible to _Tp*.
References default_delete().

6.385.3 Member Function Documentation

operator()()

```
template<typename _Tp>
void std::default_delete< _Tp >::operator() (
            _Tp * __ptr) const  [inline], [constexpr]
```

Calls `delete __ptr`.
The documentation for this struct was generated from the following file:

- unique_ptr.h

6.386 std::default_delete< _Tp[]> Struct Template Reference

`#include <memory>`

Public Member Functions

- constexpr default_delete () noexcept=default
- template<typename _Up, typename = _Require<is_convertible<_Up(*)[], _Tp(*)[]>>>
  constexpr default_delete (const default_delete< _Up[]> &) noexcept
- template<typename _Up>
  constexpr enable_if< is_convertible< _Up(*)[], _Tp(*)[]>::value >::type operator() (_Up *__ptr) const

6.386.1 Detailed Description

template<typename _Tp>
struct std::default_delete< _Tp[]>

Specialization of default_delete for arrays, used by `unique_ptr<T[]>`

Since

C++11

6.386.2 Constructor & Destructor Documentation

default_delete() [1/2]

```
template<typename _Tp>
std::default_delete< _Tp[]>::default_delete ()  [constexpr], [default], [noexcept]
```

Default constructor.
Referenced by default_delete().

default_delete() [2/2]

```
template<typename _Tp>
template<typename _Up, typename = _Require<is_convertible<_Up(*)[], _Tp(*)[]>>>
std::default_delete< _Tp[]>::default_delete (
            const default_delete< _Up[]> & )  [inline], [constexpr], [noexcept]
```

Converting constructor.
Allows conversion from a deleter for arrays of another type, such as a const-qualified version of `_Tp`.
Conversions from types derived from `_Tp` are not allowed because it is undefined to `delete[]` an array of derived types through a pointer to the base type.
References default_delete().

6.386.3 Member Function Documentation

operator()()

```
template<typename _Tp>
template<typename _Up>
enable_if< is_convertible< _Up(*)[], _Tp(*)[]>::value >::type std::default_delete< _Tp[]>::↩
operator() (
            _Up * __ptr) const  [inline], [constexpr]
```

Calls `delete[] __ptr`.
The documentation for this struct was generated from the following file:

- unique_ptr.h

6.387 __gnu_pbds::detail::default_eq_fn< Key > Struct Template Reference

`#include <standard_policies.hpp>`

Public Types

- typedef std::equal_to< Key > type

6.387.1 Detailed Description

template<typename Key>
struct __gnu_pbds::detail::default_eq_fn< Key >

Primary template, default_eq_fn.

6.387.2 Member Typedef Documentation

type

```
template<typename Key>
typedef std::equal_to<Key> __gnu_pbds::detail::default_eq_fn< Key >::type
```

Dispatched type.
The documentation for this struct was generated from the following file:

- standard_policies.hpp

6.388 __gnu_pbds::detail::default_hash_fn< Key > Struct Template Reference

`#include <standard_policies.hpp>`

Public Types

- typedef std::tr1::hash< Key > type

6.388.1 Detailed Description

template<typename Key>
struct __gnu_pbds::detail::default_hash_fn< Key >

Primary template, default_hash_fn.

6.388.2 Member Typedef Documentation

type

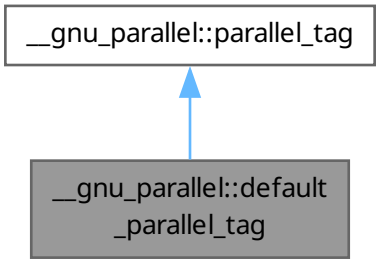
```
template<typename Key>
typedef std::tr1::hash<Key> __gnu_pbds::detail::default_hash_fn< Key >::type
```

Dispatched type.
The documentation for this struct was generated from the following file:

- standard_policies.hpp

6.389 __gnu_parallel::default_parallel_tag Struct Reference

`#include <tags.h>`
Inheritance diagram for __gnu_parallel::default_parallel_tag:



Public Member Functions

- **default_parallel_tag** (_ThreadIndex __num_threads)
- _ThreadIndex __get_num_threads ()
- void set_num_threads (_ThreadIndex __num_threads)

6.389.1 Detailed Description

Recommends parallel execution using the default parallel algorithm.

6.389.2 Member Function Documentation

__get_num_threads()

```
_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads ()  [inline], [inherited]
```

Find out desired number of threads.

Returns

Desired number of threads.

Referenced by __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), and __gnu_parallel::__parallel_sort(

set_num_threads()

```
void __gnu_parallel::parallel_tag::set_num_threads (
            _ThreadIndex __num_threads)  [inline], [inherited]
```

Set the desired number of threads.

Parameters

__num_threads	Desired number of threads.

The documentation for this struct was generated from the following file:

- tags.h

6.390 __gnu_pbds::detail::default_probe_fn< Comb_Probe_Fn > Struct Template Reference

```
#include <standard_policies.hpp>
```

Public Types

- typedef cond_type::__type type

6.390.1 Detailed Description

template<typename Comb_Probe_Fn>
struct __gnu_pbds::detail::default_probe_fn< Comb_Probe_Fn >

Primary template, default_probe_fn.

6.390.2 Member Typedef Documentation

type

```
template<typename Comb_Probe_Fn>
typedef cond_type::__type __gnu_pbds::detail::default_probe_fn< Comb_Probe_Fn >::type
```

Dispatched type.
The documentation for this struct was generated from the following file:

- standard_policies.hpp

6.391 __gnu_pbds::detail::default_resize_policy< Comb_Hash_Fn > Struct Template Reference

`#include <standard_policies.hpp>`

Public Types

- typedef hash_standard_resize_policy< size_policy_type, trigger, false, size_type > type

6.391.1 Detailed Description

template<typename Comb_Hash_Fn>
struct __gnu_pbds::detail::default_resize_policy< Comb_Hash_Fn >

Primary template, default_resize_policy.

6.391.2 Member Typedef Documentation

type

```
template<typename Comb_Hash_Fn>
typedef hash_standard_resize_policy<size_policy_type, trigger, false, size_type> __gnu_pbds::detail::default_resi
Comb_Hash_Fn >::type
```

Dispatched type.
The documentation for this struct was generated from the following file:

- standard_policies.hpp

6.392 std::default_sentinel_t Struct Reference

`#include <iterator_concepts.h>`

6.392.1 Detailed Description

A sentinel type that can be used to check for the end of a range.
For some iterator types the past-the-end sentinel value is independent of the underlying sequence, and a default sentinel can be used with them. For example, a `std::counted_iterator` keeps a count of how many elements remain, and so checking for the past-the-end value only requires checking if that count has reached zero. A past-the-end `std::istream_iterator` is equal to the default-constructed value, which can be easily checked.
Comparing iterators of these types to `std::default_sentinel` is a convenient way to check if the end has been reached.

Since

C++20

The documentation for this struct was generated from the following file:

- iterator_concepts.h

6.393 __gnu_pbds::detail::default_trie_access_traits< Key > Struct Template Reference

6.393.1 Detailed Description

template<typename Key>
struct __gnu_pbds::detail::default_trie_access_traits< Key >

Primary template, default_trie_access_traits.
The documentation for this struct was generated from the following file:

- standard_policies.hpp

6.394 __gnu_pbds::detail::default_trie_access_traits< std::basic_string< Char, Char_Traits, std::allocator< char > > > Struct Template Reference

`#include <standard_policies.hpp>`

Public Types

- typedef trie_string_access_traits< string_type > type

6.394.1 Detailed Description

template<typename Char, typename Char_Traits>
struct __gnu_pbds::detail::default_trie_access_traits< std::basic_string< Char, Char_Traits, std::allocator< char > > >

Partial specialization, default_trie_access_traits.

6.394.2 Member Typedef Documentation

type

```
template<typename Char, typename Char_Traits>
typedef trie_string_access_traits<string_type> __gnu_pbds::detail::default_trie_access_traits<
std::basic_string< Char, Char_Traits, std::allocator< char > > >::type
```

Dispatched type.
The documentation for this struct was generated from the following file:

- standard_policies.hpp

6.395 __gnu_pbds::detail::default_update_policy Struct Reference

`#include <standard_policies.hpp>`

Public Types

- typedef lu_move_to_front_policy type

6.395.1 Detailed Description

Default update policy.

6.395.2 Member Typedef Documentation

type

```
typedef lu_move_to_front_policy __gnu_pbds::detail::default_update_policy::type
```

Dispatched type.
The documentation for this struct was generated from the following file:

6.398.1 Detailed Description

template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::deque< _Tp, _Alloc >

A standard container using fixed-size memory allocation and constant-time manipulation of elements at either end.

Template Parameters

_Tp	Type of element.
_Alloc	Allocator type, defaults to allocator<_Tp>.

Meets the requirements of a container, a reversible container, and a sequence, including the optional sequence requirements.
In previous HP/SGI versions of deque, there was an extra template parameter so users could control the node size. This extension turned out to violate the C++ standard (it can be detected using template template parameters), and it was removed.
Here's how a deque<Tp> manages memory. Each deque has 4 members:

- Tp** _M_map
- size_t _M_map_size
- iterator _M_start, _M_finish

map_size is at least 8. map is an array of map_size pointers-to-*nodes*. (The name map has nothing to do with the std::map class, and **nodes** should not be confused with std::list's usage of *node*.)
A *node* has no specific type name as such, but it is referred to as *node* in this file. It is a simple array-of-Tp. If Tp is very large, there will be one Tp element per node (i.e., an *array* of one). For non-huge Tp's, node size is inversely related to Tp size: the larger the Tp, the fewer Tp's will fit in a node. The goal here is to keep the total size of a node relatively small and constant over different Tp's, to improve allocator efficiency.
Not every pointer in the map array will point to a node. If the initial number of elements in the deque is small, the /middle/ map pointers will be valid, and the ones at the edges will be unused. This same situation will arise as the map grows: available map pointers, if any, will be on the ends. As new nodes are created, only a subset of the map's pointers need to be copied *outward*.
Class invariants:

- For any nonsingular iterator i:
  - i.node points to a member of the map array. (Yes, you read that correctly: i.node does not actually point to a node.) The member of the map array is what actually points to the node.
  - i.first == *(i.node) (This points to the node (first Tp element).)
  - i.last == i.first + node_size
  - i.cur is a pointer in the range [i.first, i.last). NOTE: the implication of this is that i.cur is always a dereferenceable pointer, even if i is a past-the-end iterator.
- Start and Finish are always nonsingular iterators. NOTE: this means that an empty deque must have one node, a deque with <N elements (where N is the node buffer size) must have one node, a deque with N through (2N-1) elements must have two nodes, etc.
- For every node other than start.node and finish.node, every element in the node is an initialized object. If start.↩ node == finish.node, then [start.cur, finish.cur) are initialized objects, and the elements outside that range are uninitialized storage. Otherwise, [start.cur, start.last) and [finish.first, finish.cur) are initialized objects, and ↩ [start.first, start.cur) and [finish.cur, finish.last) are uninitialized storage.
- [map, map + map_size) is a valid, non-empty range.
- [start.node, finish.node] is a valid range contained within [map, map + map_size).

- A pointer in the range [map, map + map_size) points to an allocated node if and only if the pointer is in the range [start.node, finish.node].

  Here's the magic: nothing in deque is **aware** of the discontiguous storage!

  The memory setup and layout occurs in the parent, _Base, and the iterator class is entirely responsible for *leaping* from one node to the next. All the implementation routines for deque itself work only through the start and finish iterators. This keeps the routines simple and sane, and we can use other standard algorithms as well.

6.398.2 Constructor & Destructor Documentation

deque() [1/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque ()  [default]
```

Creates a deque with no elements.
Referenced by insert(), and operator=().

deque() [2/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
            const allocator_type & __a)  [inline], [explicit]
```

Creates a deque with no elements.

Parameters

_↩ _a	An allocator object.

deque() [3/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
            size_type __n,
            const allocator_type & __a = allocator_type())  [inline], [explicit]
```

Creates a deque with default constructed elements.

Parameters

_↩ _n	The number of elements to initially create.
_↩ _a	An allocator.

This constructor fills the deque with *n* default constructed elements.

deque() [4/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
            size_type __n,
            const value_type & __value,
            const allocator_type & __a = allocator_type())  [inline]
```

Creates a deque with copies of an exemplar element.

Parameters

__n	The number of elements to initially create.
__value	An element to copy.
__a	An allocator.

This constructor fills the deque with *__n* copies of *__value*.

deque() [5/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
            const deque< _Tp, _Alloc > & __x)  [inline]
```

Deque copy constructor.

Parameters

_↩ _x	A deque of identical element and allocator types.

The newly-created deque uses a copy of the allocator object used by *__x* (unless the allocator traits dictate a different object).

deque() [6/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
            deque< _Tp, _Alloc > && )  [default]
```

Deque move constructor.
The newly-created deque contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified deque.

deque() [7/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
            const deque< _Tp, _Alloc > & __x,
            const __type_identity_t< allocator_type > & __a)  [inline]
```

Copy constructor with alternative allocator.

deque() [8/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
            deque< _Tp, _Alloc > && __x,
            const __type_identity_t< allocator_type > & __a)  [inline]
```

Move constructor with alternative allocator.

deque() [9/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::deque (
            initializer_list< value_type > __l,
            const allocator_type & __a = allocator_type())  [inline]
```

Builds a deque from an initializer list.

Parameters

_↩ _*l*	An initializer_list.
_↩ _*a*	An allocator object.

Create a deque consisting of copies of the elements in the initializer_list __*l*.
This will call the element type's copy constructor N times (where N is __l.size()) and do no memory reallocation.

deque() [10/10]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
std::deque< _Tp, _Alloc >::deque (
            _InputIterator __first,
            _InputIterator __last,
            const allocator_type & __a = allocator_type())  [inline]
```

Builds a deque from a range.

Parameters

__*first*	An input iterator.
__*last*	An input iterator.
__*a*	An allocator object.

Create a deque consisting of copies of the elements from [__first, __last).
If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor N times (where N is distance(__first,__last)) and do no memory reallocation. But if only input iterators are used, then this will do at most 2N calls to the copy constructor, and logN memory reallocations.

~deque()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::deque< _Tp, _Alloc >::~deque ()  [inline]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

6.398.3 Member Function Documentation

_M_fill_initialize()

```
template<typename _Tp, typename _Alloc>
void deque::_M_fill_initialize (
            const value_type & __value)  [protected]
```

Fills the deque with copies of value.

Parameters

__value	Initial value.

Precondition

_M_start and _M_finish have already been initialized, but none of the deque's elements have yet been constructed.

This function is called only when the user provides an explicit size (with or without an explicit exemplar value).
References std::_Destroy().
Referenced by std::deque< _Tp, polymorphic_allocator< _Tp > >::deque().

_M_new_elements_at_back()

```
template<typename _Tp, typename _Alloc>
void deque::_M_new_elements_at_back (
            size_type __new_elements)  [protected]
```

Memory-handling helpers for the previous internal insert functions.
References _M_reserve_map_at_back(), max_size(), and std::size().
Referenced by std::deque< _Tp, polymorphic_allocator< _Tp > >::_M_reserve_elements_at_back().

_M_new_elements_at_front()

```
template<typename _Tp, typename _Alloc>
void deque::_M_new_elements_at_front (
            size_type __new_elements)  [protected]
```

Memory-handling helpers for the previous internal insert functions.
References _M_reserve_map_at_front(), max_size(), and std::size().
Referenced by std::deque< _Tp, polymorphic_allocator< _Tp > >::_M_reserve_elements_at_front().

_M_pop_back_aux()

```
template<typename _Tp, typename _Alloc>
void deque::_M_pop_back_aux ()  [protected]
```

Helper functions for push_* and pop_*.
Referenced by std::deque< _Tp, polymorphic_allocator< _Tp > >::pop_back().

_M_pop_front_aux()

```
template<typename _Tp, typename _Alloc>
void deque::_M_pop_front_aux ()  [protected]
```

Helper functions for push_* and pop_*.
Referenced by std::deque< _Tp, polymorphic_allocator< _Tp > >::pop_front().

_M_push_back_aux()

```
template<typename _Tp, typename _Alloc>
template<typename... _Args>
void deque::_M_push_back_aux (
            _Args &&... __args)  [protected]
```

Helper functions for push_* and pop_*.
References _M_reserve_map_at_back(), std::forward(), max_size(), and std::size().
Referenced by std::deque< _Tp, polymorphic_allocator< _Tp > >::push_back().

_M_push_front_aux()

```
template<typename _Tp, typename _Alloc>
template<typename... _Args>
void deque::_M_push_front_aux (
            _Args &&... __args)  [protected]
```

Helper functions for push_* and pop_*.
References _M_reserve_map_at_front(), std::forward(), max_size(), and std::size().
Referenced by std::deque< _Tp, polymorphic_allocator< _Tp > >::push_front().

_M_range_check()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::_M_range_check (
            size_type __n) const  [inline], [protected]
```

Safety check used only from at().
Referenced by std::deque< _Tp, polymorphic_allocator< _Tp > >::at(), and std::deque< _Tp, polymorphic_allocator< _Tp > >::at().

_M_range_initialize() [1/2]

```
template<typename _Tp, typename _Alloc>
template<typename _ForwardIterator>
void deque::_M_range_initialize (
            _ForwardIterator __first,
            _ForwardIterator __last,
            std::forward_iterator_tag )  [protected]
```

Fills the deque with whatever is in [first,last).

Parameters

__first	An input iterator.
__last	An input iterator.

If the iterators are actually forward iterators (or better), then the memory layout can be done all at once. Else we move forward using push_back on each value from the iterator.
References std::_Destroy(), std::advance(), and std::distance().

_M_range_initialize() [2/2]

```
template<typename _Tp, typename _Alloc>
template<typename _InputIterator>
void deque::_M_range_initialize (
            _InputIterator __first,
```

```
            _InputIterator __last,
            std::input_iterator_tag )  [protected]
```

Fills the deque with whatever is in [first,last).

Parameters

__first	An input iterator.
__last	An input iterator.

If the iterators are actually forward iterators (or better), then the memory layout can be done all at once. Else we move forward using push_back on each value from the iterator.
References clear(), and push_back().
Referenced by std::deque< _Tp, polymorphic_allocator< _Tp > >::deque(), and std::deque< _Tp, polymorphic_allocator< _Tp > >::de

_M_reallocate_map()

```
template<typename _Tp, typename _Alloc>
void deque::_M_reallocate_map (
            size_type __nodes_to_add,
            bool __add_at_front)  [protected]
```

Memory-handling helpers for the major map.
Makes sure the _M_map has space for new nodes. Does not actually add the nodes. Can invalidate _M_map pointers. (And consequently, deque iterators.)
References std::max(), and max_size().
Referenced by std::deque< _Tp, polymorphic_allocator< _Tp > >::_M_reserve_map_at_back(), and std::deque< _Tp, polymorphic_allo

_M_reserve_elements_at_back()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::_M_reserve_elements_at_back (
            size_type __n)  [inline], [protected]
```

Memory-handling helpers for the previous internal insert functions.

_M_reserve_elements_at_front()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::_M_reserve_elements_at_front (
            size_type __n)  [inline], [protected]
```

Memory-handling helpers for the previous internal insert functions.

_M_reserve_map_at_back()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::_M_reserve_map_at_back (
            size_type __nodes_to_add = 1)  [inline], [protected]
```

Memory-handling helpers for the major map.
Makes sure the _M_map has space for new nodes. Does not actually add the nodes. Can invalidate _M_map pointers. (And consequently, deque iterators.)
Referenced by _M_new_elements_at_back(), and _M_push_back_aux().

_M_reserve_map_at_front()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::_M_reserve_map_at_front (
```

```
            size_type __nodes_to_add = 1)  [inline], [protected]
```

Memory-handling helpers for the major map.
Makes sure the _M_map has space for new nodes. Does not actually add the nodes. Can invalidate _M_map pointers. (And consequently, deque iterators.)
Referenced by _M_new_elements_at_front(), and _M_push_front_aux().

assign() [1/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
void std::deque< _Tp, _Alloc >::assign (
            _InputIterator __first,
            _InputIterator __last)  [inline]
```

Assigns a range to a deque.

Parameters

__first	An input iterator.
__last	An input iterator.

This function fills a deque with copies of the elements in the range [__first,__last).
Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

assign() [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::assign (
            initializer_list< value_type > __l)  [inline]
```

Assigns an initializer list to a deque.

Parameters

__l	An initializer_list.

This function fills a deque with copies of the elements in the initializer_list *__l*.
Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

assign() [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::assign (
            size_type __n,
            const value_type & __val)  [inline]
```

Assigns a given value to a deque.

Parameters

__n	Number of elements to be assigned.
__val	Value to be assigned.

This function fills a deque with *n* copies of the given value. Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

at() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::deque< _Tp, _Alloc >::at (
            size_type __n)  [inline]
```

Provides access to the data contained in the deque.

Parameters

_↩ _n	The index of the element for which data should be accessed.

Returns

Read/write reference to data.

Exceptions

std::out_of_range	If *__n* is an invalid index.

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws out_of_range if the check fails.

at() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque< _Tp, _Alloc >::at (
            size_type __n) const  [inline]
```

Provides access to the data contained in the deque.

Parameters

_↩ _n	The index of the element for which data should be accessed.

Returns

Read-only (constant) reference to data.

Exceptions

std::out_of_range	If *__n* is an invalid index.

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws out_of_range if the check fails.

back() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque< _Tp, _Alloc >::back () const  [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the deque.

back() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::deque< _Tp, _Alloc >::back ()  [inline], [nodiscard], [noexcept]
```

Returns a read/write reference to the data at the last element of the deque.

begin() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque< _Tp, _Alloc >::begin () const  [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

begin() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::begin ()  [inline], [nodiscard], [noexcept]
```

Returns a read/write iterator that points to the first element in the deque. Iteration is done in ordinary element order.
Referenced by std::deque< _Tp, polymorphic_allocator< _Tp > >::deque(), std::deque< _Tp, polymorphic_allocator< _Tp > >::deque std::deque< _Tp, polymorphic_allocator< _Tp > >::~deque(), std::deque< _Tp, polymorphic_allocator< _Tp > >::clear(), std::deque< _Tp, polymorphic_allocator< _Tp > >::front(), std::deque< _Tp, polymorphic_allocator< _Tp > >::front(), std::deque< _Tp, polymorphic_allocator< _Tp > >::insert(), std::deque< _Tp, polymorphic_allocator< _Tp > >::insert(), std::deque< _Tp, polymorphic_allocator< _Tp > >::insert(), std::operator<=>(), and operator=().

cbegin()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque< _Tp, _Alloc >::cbegin () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.
Referenced by std::deque< _Tp, polymorphic_allocator< _Tp > >::insert(), std::deque< _Tp, polymorphic_allocator< _Tp > >::insert() and std::deque< _Tp, polymorphic_allocator< _Tp > >::insert().

cend()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque< _Tp, _Alloc >::cend () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

clear()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::clear ()  [inline], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Referenced by _M_range_initialize().

crbegin()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque< _Tp, _Alloc >::crbegin () const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

crend()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque< _Tp, _Alloc >::crend () const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

emplace()

```
template<typename _Tp, typename _Alloc>
template<typename...  _Args>
deque< _Tp, _Alloc >::iterator deque::emplace (
            const_iterator __position,
            _Args &&...  __args)
```

Inserts an object in deque before specified iterator.

Parameters

__position	A const_iterator into the deque.
__args	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) before the specified location.
References std::forward().
Referenced by std::deque< _Tp, polymorphic_allocator< _Tp > >::insert().

empty()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
bool std::deque< _Tp, _Alloc >::empty () const  [inline], [nodiscard], [noexcept]
```

Returns true if the deque is empty. (Thus begin() would equal end().)

end() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque< _Tp, _Alloc >::end () const  [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

end() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::end ()  [inline], [nodiscard], [noexcept]
```

Returns a read/write iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Referenced by std::deque< _Tp, polymorphic_allocator< _Tp > >::deque(), std::deque< _Tp, polymorphic_allocator< _Tp > >::deque std::deque< _Tp, polymorphic_allocator< _Tp > >::~deque(), std::deque< _Tp, polymorphic_allocator< _Tp > >::back(), std::deque< _Tp, polymorphic_allocator< _Tp > >::back(), std::operator<=>(), and operator=().

erase() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last)  [inline]
```

Remove a range of elements.

Parameters

__first	Iterator pointing to the first element to be erased.
__last	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by *last* prior to erasing (or end()).

This function will erase the elements in the range [__first,__last) and shorten the deque accordingly.

The user is cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::erase (
            const_iterator __position)  [inline]
```

Remove element at given position.

Parameters

__position	Iterator pointing to element to be erased.

Returns

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the deque by one.

The user is cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

front() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque< _Tp, _Alloc >::front () const  [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the deque.

front() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::deque< _Tp, _Alloc >::front ()  [inline], [nodiscard], [noexcept]
```

Returns a read/write reference to the data at the first element of the deque.

get_allocator()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
allocator_type std::deque< _Tp, _Alloc >::get_allocator () const  [inline], [nodiscard], [noexcept]
```

Get a copy of the memory allocation object.
Referenced by operator=().

insert() [1/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::insert (
            const_iterator __p,
            initializer_list< value_type > __l)  [inline]
```

Inserts an initializer list into the deque.

Parameters

_↩ _p	An iterator into the deque.
_↩ _l	An initializer_list.

Returns

An iterator that points to the inserted data.

This function will insert copies of the data in the initializer_list __l into the deque before the location specified by __p. This is known as *list insert*.

insert() [2/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
iterator std::deque< _Tp, _Alloc >::insert (
            const_iterator __position,
            _InputIterator __first,
            _InputIterator __last)  [inline]
```

Inserts a range into the deque.

Parameters

__position	A const_iterator into the deque.
__first	An input iterator.
__last	An input iterator.

Returns

An iterator that points to the inserted data.

This function will insert copies of the data in the range [__first,__last) into the deque before the location specified by *__position*. This is known as *range insert*.

insert() [3/5]

```
template<typename _Tp, typename _Alloc>
deque< _Tp, _Alloc >::iterator deque::insert (
            const_iterator __position,
            const value_type & __x)
```

Inserts given value into deque before specified iterator.

Parameters

__position	A const_iterator into the deque.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location.
References deque(), insert(), push_back(), and push_front().
Referenced by insert().

insert() [4/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::insert (
            const_iterator __position,
            size_type __n,
            const value_type & __x)  [inline]
```

Inserts a number of copies of given data into the deque.

Parameters

__position	A const_iterator into the deque.
__n	Number of elements to be inserted.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by *__position*.

insert() [5/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::insert (
            const_iterator __position,
            value_type && __x)  [inline]
```

Inserts given rvalue into deque before specified iterator.

Parameters

__position	A const_iterator into the deque.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location.

max_size()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::deque< _Tp, _Alloc >::max_size () const  [inline], [nodiscard], [noexcept]
```

Returns the size() of the largest possible deque.
Referenced by _M_new_elements_at_back(), _M_new_elements_at_front(), _M_push_back_aux(), _M_push_front_aux(), and _M_reallocate_map().

operator=() [1/3]

```
template<typename _Tp, typename _Alloc>
deque< _Tp, _Alloc > & deque::operator= (
            const deque< _Tp, _Alloc > & __x)
```

Deque assignment operator.

Parameters

_↩ _x	A deque of identical element and allocator types.

All the elements of *x* are copied.
The newly-created deque uses a copy of the allocator object used by *__x* (unless the allocator traits dictate a different object).
References deque(), std::__addressof(), begin(), end(), get_allocator(), size(), and std::size().

operator=() [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
deque & std::deque< _Tp, _Alloc >::operator= (
            deque< _Tp, _Alloc > && __x)  [inline], [noexcept]
```

Deque move assignment operator.

Parameters

_↩ _x	A deque of identical element and allocator types.

The contents of __x are moved into this deque (without copying, if the allocators permit it). __x is a valid, but unspecified deque.

operator=() [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
deque & std::deque< _Tp, _Alloc >::operator= (
            initializer_list< value_type > __l)  [inline]
```

Assigns an initializer list to a deque.

Parameters

↩ _↩ ↩ _↩ l	An initializer_list.

This function fills a deque with copies of the elements in the initializer_list __l.
Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

operator[]() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque< _Tp, _Alloc >::operator[] (
            size_type __n) const  [inline], [nodiscard], [noexcept]
```

Subscript access to the data contained in the deque.

Parameters

_↩ _n	The index of the element for which data should be accessed.

Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out_of_range lookups are not defined. (For checked lookups see at().)

operator[]() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::deque< _Tp, _Alloc >::operator[] (
            size_type __n)  [inline], [nodiscard], [noexcept]
```

Subscript access to the data contained in the deque.

Parameters

_↩ _n	The index of the element for which data should be accessed.

Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out_of_range lookups are not defined. (For checked lookups see at().)

pop_back()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::pop_back ()  [inline], [noexcept]
```

Removes last element.
This is a typical stack operation. It shrinks the deque by one.
Note that no data is returned, and if the last element's data is needed, it should be retrieved before pop_back() is called.

pop_front()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::pop_front ()  [inline], [noexcept]
```

Removes first element.
This is a typical stack operation. It shrinks the deque by one.
Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop_front() is called.

push_back()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::push_back (
            const value_type & __x)  [inline]
```

Add data to the end of the deque.

Parameters

_↩ _x	Data to be added.

This is a typical stack operation. The function creates an element at the end of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.
Referenced by _M_range_initialize(), and insert().

push_front()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::push_front (
            const value_type & __x)  [inline]
```

Add data to the front of the deque.

Parameters

_↩ _x	Data to be added.

This is a typical stack operation. The function creates an element at the front of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.
Referenced by insert().

rbegin() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque< _Tp, _Alloc >::rbegin () const  [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

rbegin() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::deque< _Tp, _Alloc >::rbegin ()  [inline], [nodiscard], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

rend() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque< _Tp, _Alloc >::rend () const  [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

rend() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::deque< _Tp, _Alloc >::rend ()  [inline], [nodiscard], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

resize() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::resize (
            size_type __new_size)  [inline]
```

Resizes the deque to the specified number of elements.

Parameters

__new_size	Number of elements the deque should contain.

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise default constructed elements are appended.

resize() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::resize (
```

```
            size_type __new_size,
            const value_type & __x)  [inline]
```

Resizes the deque to the specified number of elements.

Parameters

__new_size	Number of elements the deque should contain.
__x	Data with which new elements should be populated.

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise the deque is extended and new elements are populated with given data.

shrink_to_fit()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::shrink_to_fit ()  [inline], [noexcept]
```

A non-binding request to reduce memory use.

size()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::deque< _Tp, _Alloc >::size () const  [inline], [nodiscard], [noexcept]
```

Returns the number of elements in the deque.
Referenced by std::deque< _Tp, polymorphic_allocator< _Tp > >::_M_range_check(), std::operator<=>(), operator=(), std::deque< _Tp, polymorphic_allocator< _Tp > >::resize(), and std::deque< _Tp, polymorphic_allocator< _Tp > >::resize().

swap()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::swap (
            deque< _Tp, _Alloc > & __x)  [inline], [noexcept]
```

Swaps data with another deque.

Parameters

_↩ _x	A deque of the same element and allocator types.

This exchanges the elements between two deques in constant time. (Four pointers, so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(d1,d2) will feed to this function.
Whether the allocators are swapped depends on the allocator traits.
The documentation for this class was generated from the following files:

- stl_deque.h
- deque.tcc

6.399 std::destroying_delete_t Struct Reference

```
#include <new>
```

6.399.1 Detailed Description

Tag type used to declare a class-specific operator delete that can invoke the destructor before deallocating the memory.

The documentation for this struct was generated from the following file:

- new

6.400 std::tr2::direct_bases< _Tp > Struct Template Reference

`#include <type_traits>`

Public Types

- typedef __reflection_typelist< __direct_bases(_Tp)... > **type**

6.400.1 Detailed Description

template<typename _Tp>
struct std::tr2::direct_bases< _Tp >

Enumerate all the direct base classes of a class. Form of a typelist.
The documentation for this struct was generated from the following file:

- tr2/type_traits

6.401 __gnu_pbds::direct_mask_range_hashing< Size_Type > Class Template Reference

`#include <hash_policy.hpp>`
Inheritance diagram for __gnu_pbds::direct_mask_range_hashing< Size_Type >:

- size_type **range_hash** (size_type hash) const
- void **swap** (mask_based_range_hashing &other)

6.401.1 Detailed Description

template<typename Size_Type = std::size_t>
class __gnu_pbds::direct_mask_range_hashing< Size_Type >

A mask range-hashing class (uses a bitmask).

6.401.2 Member Function Documentation

operator()()

```
template<typename Size_Type>
direct_mask_range_hashing< Size_Type >::size_type __gnu_pbds::direct_mask_range_hashing< Size_↩
Type >::operator() (
            size_type hash) const  [inline], [protected]
```

Transforms the __hash value hash into a ranged-hash value (using a bit-mask).
The documentation for this class was generated from the following file:

- hash_policy.hpp

6.402 __gnu_pbds::direct_mod_range_hashing< Size_Type > Class Template Reference

6.405.1 Detailed Description

template<typename _RandomNumberEngine, size_t __p, size_t __r>
class std::discard_block_engine< _RandomNumberEngine, __p, __r >

Produces random numbers from some base engine by discarding blocks of data.

Precondition

$0 \leq r \leq p$

Since

C++11

6.405.2 Member Typedef Documentation

result_type

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
typedef _RandomNumberEngine::result_type std::discard_block_engine< _RandomNumberEngine, __p, __r
>::result_type
```

The type of the generated random value.

6.405.3 Constructor & Destructor Documentation

discard_block_engine() [1/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine ()  [inline]
```

Constructs a default discard_block_engine engine.
The underlying engine is default constructed as well.

discard_block_engine() [2/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
            const _RandomNumberEngine & __rng)  [inline], [explicit]
```

Copy constructs a discard_block_engine engine.
Copies an existing base class random number generator.

Parameters

__rng	An existing (base class) engine object.

discard_block_engine() [3/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
            _RandomNumberEngine && __rng)  [inline], [explicit]
```

Move constructs a discard_block_engine engine.
Copies an existing base class random number generator.

Parameters

__rng	An existing (base class) engine object.

discard_block_engine() [4/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
            result_type __s)  [inline], [explicit]
```

Seed constructs a discard_block_engine engine.
Constructs the underlying generator engine seeded with __s.

Parameters

_↩ _s	A seed value for the base class engine.

discard_block_engine() [5/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
            _Sseq & __q)  [inline], [explicit]
```

Generator construct a discard_block_engine engine.

Parameters

_↩ _q	A seed sequence.

6.405.4 Member Function Documentation

base()

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
const _RandomNumberEngine & std::discard_block_engine< _RandomNumberEngine, __p, __r >::base ()
const  [inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

discard()

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
void std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard (
            unsigned long long __z)  [inline]
```

Discard a sequence of random numbers.

max()

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
constexpr result_type std::discard_block_engine< _RandomNumberEngine, __p, __r >::max ()  [inline],
[static], [constexpr]
```

Gets the maximum value in the generated random number range.

min()

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
constexpr result_type std::discard_block_engine< _RandomNumberEngine, __p, __r >::min ()  [inline],
```

[static], [constexpr]
Gets the minimum value in the generated random number range.

operator()()

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
discard_block_engine< _RandomNumberEngine, __p, __r >::result_type std::discard_block_engine< _↩
RandomNumberEngine, __p, __r >::operator() ()
```
Gets the next value in the generated random number sequence.

seed() [1/3]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
void std::discard_block_engine< _RandomNumberEngine, __p, __r >::seed ()  [inline]
```
Reseeds the discard_block_engine object with the default seed for the underlying base class generator engine.

seed() [2/3]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
template<typename _Sseq>
_If_seed_seq< _Sseq > std::discard_block_engine< _RandomNumberEngine, __p, __r >::seed (
            _Sseq & __q)  [inline]
```
Reseeds the discard_block_engine object with the given seed sequence.

Parameters

_↩ _q	A seed generator function.

seed() [3/3]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
void std::discard_block_engine< _RandomNumberEngine, __p, __r >::seed (
            result_type __s)  [inline]
```
Reseeds the discard_block_engine object with the default seed for the underlying base class generator engine.

6.405.5 Friends And Related Symbol Documentation

operator<<

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
template<typename _RandomNumberEngine1, size_t __p1, size_t __r1, typename _CharT, typename _↩
Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::discard_block_engine< _RandomNumberEngine1, __p1, __r1 > & __x)  [friend]
```
Inserts the current state of a discard_block_engine random number generator engine __x into the output stream __os.

Parameters

__os	An output stream.
__x	A discard_block_engine random number generator engine.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
bool operator== (
             const discard_block_engine< _RandomNumberEngine, __p, __r > & __lhs,
             const discard_block_engine< _RandomNumberEngine, __p, __r > & __rhs)  [friend]
```

Compares two discard_block_engine random number generator objects of the same type for equality.

Parameters

__lhs	A discard_block_engine random number generator object.
__rhs	Another discard_block_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

operator>>

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
template<typename _RandomNumberEngine1, size_t __p1, size_t __r1, typename _CharT, typename _↩
Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
             std::basic_istream< _CharT, _Traits > & __is,
             std::discard_block_engine< _RandomNumberEngine1, __p1, __r1 > & __x)  [friend]
```

Extracts the current state of a % subtract_with_carry_engine random number generator engine __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A discard_block_engine random number generator engine.

Returns

The input stream with the state of __x extracted or in an error state.

6.406.1 Detailed Description

template<typename _IntType = int>
class std::discrete_distribution< _IntType >

A discrete_distribution random number distribution.
This distribution produces random numbers $i, 0 \leq i < n$, distributed according to the probability mass function $p(i|p_0, ..., p_{n-1}) = p_i$.

Since

C++11

6.406.2 Member Typedef Documentation

result_type

```
template<typename _IntType = int>
typedef _IntType std::discrete_distribution< _IntType >::result_type
```

The type of the range of the distribution.

6.406.3 Member Function Documentation

max()

```
template<typename _IntType = int>
result_type std::discrete_distribution< _IntType >::max () const  [inline]
```

Returns the least upper bound value of the distribution.

min()

```
template<typename _IntType = int>
result_type std::discrete_distribution< _IntType >::min () const  [inline]
```

Returns the greatest lower bound value of the distribution.

operator()()

```
template<typename _IntType = int>
template<typename _UniformRandomNumberGenerator>
result_type std::discrete_distribution< _IntType >::operator() (
            _UniformRandomNumberGenerator & __urng)  [inline]
```

Generating functions.
Referenced by operator()().

param() [1/2]

```
template<typename _IntType = int>
param_type std::discrete_distribution< _IntType >::param () const  [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _IntType = int>
void std::discrete_distribution< _IntType >::param (
            const param_type & __param)  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

probabilities()

```
template<typename _IntType = int>
std::vector< double > std::discrete_distribution< _IntType >::probabilities () const  [inline]
```

Returns the probabilities of the distribution.

reset()

```
template<typename _IntType = int>
void std::discrete_distribution< _IntType >::reset ()  [inline]
```

Resets the distribution state.

6.406.4 Friends And Related Symbol Documentation

operator<<

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::discrete_distribution< _IntType1 > & __x)  [friend]
```

Inserts a discrete_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A discrete_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _IntType = int>
bool operator== (
            const discrete_distribution< _IntType > & __d1,
            const discrete_distribution< _IntType > & __d2)  [friend]
```

Return true if two discrete distributions have the same parameters.

operator>>

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::discrete_distribution< _IntType1 > & __x)  [friend]
```

Extracts a discrete_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A discrete_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

6.413.1 Detailed Description

template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
class std::tr2::dynamic_bitset< _WordT, _Alloc >

The dynamic_bitset class represents a sequence of bits.
See N2050, Proposal to Add a Dynamically Sizeable Bitset to the Standard Library. http://www.open-std.↩org/jtc1/sc22/wg21/docs/papers/2006/n2050.pdf
In the general unoptimized case, storage is allocated in word-sized blocks. Let B be the number of bits in a word, then (Nb+(B-1))/B words will be used for storage. B - NbB bits are unused. (They are the high-order bits in the highest word.) It is a class invariant that those unused bits are always zero.
If you think of dynamic_bitset as "a simple array of bits," be aware that your mental picture is reversed: a dynamic_bitset behaves the same way as bits in integers do, with the bit at index 0 in the "least significant / right-hand" position, and

the bit at index Nb-1 in the "most significant / left-hand" position. Thus, unlike other containers, a dynamic_bitset's index "counts from right to left," to put it very loosely.
This behavior is preserved when translating to and from strings. For example, the first line of the following program probably prints "b('a') is 0001100001" on a modern ASCII system.

```
#include <dynamic_bitset>
#include <iostream>
#include <sstream>

using namespace std;

int main()
{
    long         a = 'a';
    dynamic_bitset<> b(a);

    cout « "b('a') is " « b « endl;

    ostringstream s;
    s « b;
    string  str = s.str();
    cout « "index 3 in the string is " « str[3] « " but\n"
         « "index 3 in the bitset is " « b[3] « endl;
}
```

Most of the actual code isn't contained in dynamic_bitset<> itself, but in the base class __dynamic_bitset_base. The base class works with whole words, not with individual bits. This allows us to specialize __dynamic_bitset_base for the important special case where the dynamic_bitset is only a single word.
Extra confusion can result due to the fact that the storage for __dynamic_bitset_base *is* a vector, and is indexed as such. This is carefully encapsulated.

6.413.2 Constructor & Destructor Documentation

dynamic_bitset() [1/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset ()  [default]
```

All bits set to zero.
Referenced by dynamic_bitset(), dynamic_bitset(), operator&=(), operator&=(), operator-=(), operator<<(), operator<<=(), operator=(), operator=(), operator>>(), operator^=(), operator|=(), operator~(), and swap().

dynamic_bitset() [2/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
            const allocator_type & __alloc)  [inline], [explicit]
```

All bits set to zero.

dynamic_bitset() [3/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
            size_type __nbits,
            unsigned long long __val = 0ULL,
            const allocator_type & __alloc = allocator_type())  [inline], [explicit]
```

Initial bits bitwise-copied from a single word (others set to zero).

dynamic_bitset() [4/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
template<typename _CharT, typename _Traits, typename _Alloc1>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
            const std::basic_string< _CharT, _Traits, _Alloc1 > & __str,
```

```
            typename basic_string< _CharT, _Traits, _Alloc1 >::size_type __pos = 0,
            typename basic_string< _CharT, _Traits, _Alloc1 >::size_type __n = std::basic_string<↩
_CharT, _Traits, _Alloc1>::npos,
            _CharT __zero = _CharT('0'),
            _CharT __one = _CharT('1'),
            const allocator_type & __alloc = allocator_type())  [inline], [explicit]
```

Use a subset of a string.

Parameters

__str	A string of '0' and '1' characters.
__pos	Index of the first character in __str to use.
__n	The number of characters to copy.
__zero	The character to use for unset bits.
__one	The character to use for set bits.
__alloc	An allocator.

Exceptions

std::out_of_range	If __pos is bigger the size of __str.
std::invalid_argument	If a character appears in the string which is neither '0' nor '1'.

References std::basic_string< _CharT, _Traits, _Alloc >::npos, and std::basic_string< _CharT, _Traits, _Alloc >::size().

dynamic_bitset() [5/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
            const char * __str,
            const allocator_type & __alloc = allocator_type())  [inline], [explicit]
```

Construct from a string.

Parameters

__str	A string of '0' and '1' characters.
__alloc	An allocator.

Exceptions

std::invalid_argument	If a character appears in the string which is neither '0' nor '1'.

dynamic_bitset() [6/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
            const dynamic_bitset< _WordT, _Alloc > & )  [default]
```

Copy constructor.
References dynamic_bitset().

dynamic_bitset() [7/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
            dynamic_bitset< _WordT, _Alloc > && __b)  [inline], [noexcept]
```

Move constructor.
References dynamic_bitset(), and std::move().

6.413.3 Member Function Documentation

all()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::all () const  [inline]
```

Tests whether all the bits are on.

Returns

True if all the bits are set.

any()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::any () const  [inline]
```

Tests whether any of the bits are on.

Returns

True if at least one bit is set.

append() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
template<typename _BlockInputIterator>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::append (
            _BlockInputIterator __first,
            _BlockInputIterator __last)  [inline]
```

Append an iterator range of blocks.
References append().

append() [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::append (
            block_type __block)  [inline]
```

Append a block.
Referenced by append().

clear()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::clear ()  [inline]
```

Clear the bitset.

count()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::count () const  [inline], [noexcept]
```

Returns the number of bits which are set.

empty()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::empty () const  [inline], [nodiscard], [noexcept]
```

Returns true if the dynamic_bitset is empty.

find_first()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::find_first () const  [inline]
```

Finds the index of the first "on" bit.

Returns

The index of the first bit set, or size() if not found.

See also

find_next

find_next()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::find_next (
            size_t __prev) const  [inline]
```

Finds the index of the next "on" bit after prev.

Returns

The index of the next bit set, or size() if not found.

Parameters

__prev	Where to start searching.

See also

find_first

flip() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::flip ()  [inline]
```

Toggles every bit to its opposite value.

Referenced by operator~().

flip() [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::flip (
            size_type __pos)  [inline]
```

Toggles a given bit to its opposite value.

Parameters

__pos	The index of the bit.

Exceptions

std::out_of_range	If *__pos* is bigger the size of the set.

get_allocator()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
allocator_type std::tr2::dynamic_bitset< _WordT, _Alloc >::get_allocator () const  [inline],
[noexcept]
```

Return the allocator for the bitset.
Referenced by operator=().

max_size()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::max_size ()  [inline], [constexpr], [noexcept]
```

Returns the maximum size of a dynamic_bitset object having the same type as *this. The real answer is max() * bits_per_block but is likely to overflow.
References std::numeric_limits< _Tp >::max().

none()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::none () const  [inline]
```

Tests whether any of the bits are on.

Returns

True if none of the bits are set.

num_blocks()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::num_blocks () const  [inline], [noexcept]
```

Returns the total number of blocks.

operator&=() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator&= (
            const dynamic_bitset< _WordT, _Alloc > & __rhs)  [inline]
```

Operations on dynamic_bitsets.

Parameters

__rhs	A same-sized dynamic_bitset.

These should be self-explanatory.
References dynamic_bitset().

operator&=() [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator&= (
            dynamic_bitset< _WordT, _Alloc > && __rhs)  [inline]
```

Operations on dynamic_bitsets.

Parameters

__rhs	A same-sized dynamic_bitset.

These should be self-explanatory.
References dynamic_bitset(), and std::move().

operator-=()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator-= (
            const dynamic_bitset< _WordT, _Alloc > & __rhs)  [inline]
```

Operations on dynamic_bitsets.

Parameters

__rhs	A same-sized dynamic_bitset.

These should be self-explanatory.
References dynamic_bitset().

operator<<()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset std::tr2::dynamic_bitset< _WordT, _Alloc >::operator<< (
            size_type __pos) const  [inline]
```

Self-explanatory.
References dynamic_bitset().

operator<<=()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator<<= (
            size_type __pos)  [inline]
```

Operations on dynamic_bitsets.

Parameters

__pos	The number of places to shift.

These should be self-explanatory.
References dynamic_bitset().

operator=() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator= (
            const dynamic_bitset< _WordT, _Alloc > & )  [default]
```

Copy assignment operator.
References dynamic_bitset().

operator=() [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator= (
            dynamic_bitset< _WordT, _Alloc > && __b)  [inline], [noexcept]
```

Move assignment operator.
References dynamic_bitset(), and get_allocator().

operator>>()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset std::tr2::dynamic_bitset< _WordT, _Alloc >::operator>> (
            size_type __pos) const  [inline]
```

Self-explanatory.
References dynamic_bitset().

operator>>=()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator>>= (
            size_type __pos)  [inline]
```

Operations on dynamic_bitsets.

Parameters

__pos	The number of places to shift.

These should be self-explanatory.

operator[]() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
reference std::tr2::dynamic_bitset< _WordT, _Alloc >::operator[] (
            size_type __pos)  [inline]
```

Array-indexing support.

Parameters

__pos	Index into the dynamic_bitset.

Returns

A bool for a 'const dynamic_bitset'. For non-const bitsets, an instance of the reference proxy class.

Note

These operators do no range checking and throw no exceptions, as required by DR 11 to the standard.

operator[]() [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
const_reference std::tr2::dynamic_bitset< _WordT, _Alloc >::operator[] (
            size_type __pos) const  [inline]
```

Array-indexing support.

Parameters

__pos	Index into the dynamic_bitset.

Returns

A bool for a 'const dynamic_bitset'. For non-const bitsets, an instance of the reference proxy class.

Note

These operators do no range checking and throw no exceptions, as required by DR 11 to the standard.

operator^=()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator^= (
            const dynamic_bitset< _WordT, _Alloc > & __rhs)  [inline]
```

Operations on dynamic_bitsets.

Parameters

__rhs	A same-sized dynamic_bitset.

These should be self-explanatory.
References dynamic_bitset().

operator"|=()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator|= (
            const dynamic_bitset< _WordT, _Alloc > & __rhs)  [inline]
```

Operations on dynamic_bitsets.

Parameters

__rhs	A same-sized dynamic_bitset.

These should be self-explanatory.
References dynamic_bitset().

operator~()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset std::tr2::dynamic_bitset< _WordT, _Alloc >::operator~ () const  [inline]
```

See the no-argument flip().
References dynamic_bitset(), and flip().

push_back()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::push_back (
            bool __bit)  [inline]
```

Push a bit onto the high end of the bitset.
References size().

reset() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::reset ()  [inline]
```

Sets every bit to false.

reset() [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::reset (
            size_type __pos)  [inline]
```

Sets a given bit to false.

Parameters

__pos	The index of the bit.

Exceptions

std::out_of_range	If *__pos* is bigger the size of the set.

Same as writing `set(__pos, false)`.

resize()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::resize (
            size_type __nbits,
            bool __value = false)  [inline]
```

Resize the bitset.
Referenced by std::tr2::operator>>().

set() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::set ()  [inline]
```

Sets every bit to true.

set() [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::set (
            size_type __pos,
            bool __val = true)  [inline]
```

Sets a given bit to a particular value.

Parameters

__pos	The index of the bit.
__val	Either true or false, defaults to true.

Exceptions

std::out_of_range	If *__pos* is bigger the size of the set.

size()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::size () const  [inline], [noexcept]
```

Returns the total number of bits.

Referenced by std::tr2::operator>>(), and push_back().

swap()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::swap (
            dynamic_bitset< _WordT, _Alloc > & __b)  [inline], [noexcept]
```

Swap with another bitset.

References dynamic_bitset().

test()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::test (
            size_type __pos) const  [inline]
```

Tests the value of a bit.

Parameters

__pos	The index of a bit.

Returns

The value at *__pos*.

Exceptions

std::out_of_range	If *__pos* is bigger the size of the set.

to_string()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
template<typename _CharT = char, typename _Traits = std::char_traits<_CharT>, typename _Alloc1 =
std::allocator<_CharT>>
std::basic_string< _CharT, _Traits, _Alloc1 > std::tr2::dynamic_bitset< _WordT, _Alloc >::to_↩
string (
            _CharT __zero = _CharT('0'),
            _CharT __one = _CharT('1')) const  [inline]
```

Returns a character interpretation of the dynamic_bitset.

Returns

The string equivalent of the bits.

Note the ordering of the bits: decreasing character positions correspond to increasing bit positions (see the main class notes for an example).

to_ullong()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
unsigned long long std::tr2::dynamic_bitset< _WordT, _Alloc >::to_ullong () const  [inline]
```

Returns a numerical interpretation of the dynamic_bitset.

Returns

The integral equivalent of the bits.

Exceptions

std::overflow_error	If there are too many bits to be represented in an `unsigned long`.

to_ulong()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
unsigned long std::tr2::dynamic_bitset< _WordT, _Alloc >::to_ulong () const  [inline]
```

Returns a numerical interpretation of the dynamic_bitset.

Returns

The integral equivalent of the bits.

Exceptions

std::overflow_error	If there are too many bits to be represented in an `unsigned long`.

6.418.1 Detailed Description

template<typename _CharT>
class __gnu_cxx::enc_filebuf< _CharT >

class enc_filebuf.

6.418.2 Member Function Documentation

_M_create_pback()

```
void std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_create_pback ()  [inline],
[protected], [inherited]
```

Initializes pback buffers, and moves normal buffers to safety. Assumptions: _M_in_cur has already been moved back

_M_destroy_pback()

```
void std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_destroy_pback () throw ( )
[inline], [protected], [inherited]
```

Deactivates pback buffer contents, and restores normal buffer. Assumptions: The pback buffer has only moved forward.

_M_set_buffer()

```
void std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_set_buffer (
            streamsize __off)  [inline], [protected], [inherited]
```

This function sets the pointers of the internal buffer, both get and put areas. Typically:
__off == egptr() - eback() upon underflow/uflow (**read** mode); __off == 0 upon overflow (**write** mode); __off == -1 upon open, setbuf, seekoff/pos (**uncommitted** mode).
NB: epptr() - pbase() == _M_buf_size - 1, since _M_buf_size reflects the actual allocated memory and the last cell is reserved for the overflow char of a full put area.
Referenced by seekpos(), and setbuf().

close()

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::__filebuf_type * std::basic_filebuf< ↩
_CharT, encoding_char_traits< _CharT > >::close ()  [inherited]
```

Closes the currently associated file.

Returns

`this` on success, NULL on failure

If no file is currently open, this function immediately fails.
If a *put buffer area* exists, `overflow(eof)` is called to flush all the characters. The file is then closed.
If any operations fail, this function also fails.

eback()

```
char_type * std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::eback () const  [inline],
[protected], [inherited]
```

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

egptr()

```
char_type * std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::egptr () const  [inline],
[protected], [inherited]
```

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

epptr()

```
char_type * std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::epptr () const  [inline],
[protected], [inherited]
```

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

gbump()

```
void std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::gbump (
            int __n)  [inline], [protected], [inherited]
```

Moving the read position.

Parameters

_↩ _n	The delta by which to move.

This just advances the read position without returning any data.

getloc()

```
locale std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::getloc () const  [inline],
[inherited]
```

Locale access.

Returns

The current locale in effect.

If pubimbue(loc) has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.

gptr()

```
char_type * std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::gptr () const  [inline],
[protected], [inherited]
```

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

imbue()

```
void std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::imbue (
            const locale & __loc)  [protected], [virtual], [inherited]
```

Changes translations.

Parameters

__loc	A new locale.

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

Note

Base class version does nothing.

Reimplemented from std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >.

in_avail()

```
streamsize std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::in_avail ()  [inline],
[inherited]
```

Looking ahead into the stream.

Returns

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

is_open()

```
bool std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::is_open () const throw ( )
[inline], [nodiscard], [inherited]
```

Returns true if the external file is open.

open()

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::__filebuf_type * std::basic_filebuf< ↩
_CharT, encoding_char_traits< _CharT > >::open (
            const char * __s,
            ios_base::openmode __mode)  [inherited]
```

Opens an external file.

Parameters

__s	The name of the file.
__mode	The open mode flags.

Returns

`this` on success, NULL on failure

If a file is already open, this function immediately fails. Otherwise it tries to open the file named *__s* using the flags given in *__mode*.
Table 92, adapted here, gives the relation between openmode combinations and the equivalent `fopen()` flags. (NB: lines app, in|out|app, in|app, binary|app, binary|in|out|app, and binary|in|app per DR 596)

ios_base Flag combination				stdio equivalent
binary	in	out	trunc	app	
		+		w
		+	+	a
			+	a
	+	+		w
	+			r
	+	+		r+
	+	+	+	w+
	+	+	+	a+
	+		+	a+
+		+		wb
+		+	+	ab
+			+	ab
+		+	+	wb
+	+			rb
+	+	+		r+b
+	+	+	+	w+b
+	+	+	+	a+b
+	+		+	a+b

overflow()

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::int_type std::basic_filebuf< _CharT,
encoding_char_traits< _CharT > >::overflow (
            int_type __c = _Traits::eof())  [protected], [virtual], [inherited]
```

Consumes data from the buffer; writes to the controlled sequence.

Parameters

_↩ _c	An additional character to consume.

Returns

eof() to indicate failure, something else (usually __c, or not_eof())

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character *c* is also written out, if __c is not `eof()`.
For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.
A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

Note

Base class version does nothing, returns eof().

Reimplemented from std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >.
References _M_ext_buf, and _M_ext_next.

pbackfail()

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::int_type std::basic_filebuf< _CharT,
encoding_char_traits< _CharT > >::pbackfail (
            int_type __c = _Traits::eof())  [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

Parameters

_↩ _c	The character to be inserted back into the sequence.

Returns

eof() on failure, *some other value* on success

Postcondition

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

Note

Base class version does nothing, returns eof().

Reimplemented from std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >.
References _M_ext_buf, _M_ext_next, eback(), and std::min().

pbase()

```
char_type * std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::pbase () const  [inline],
[protected], [inherited]
```

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

pbump()

```
void std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::pbump (
            int __n)  [inline], [protected], [inherited]
```

Moving the write position.

Parameters

_↩ _n	The delta by which to move.

This just advances the write position without returning any data.

pptr()

```
char_type * std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::pptr () const  [inline],
[protected], [inherited]
```

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

pubimbue()

```
locale std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::pubimbue (
            const locale & __loc)  [inline], [inherited]
```

Entry point for imbue().

Parameters

__loc	The new locale.

Returns

The previous locale.

Calls the derived imbue(__loc).

pubseekoff()

```
pos_type std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::pubseekoff (
            off_type __off,
            ios_base::seekdir __way,
            ios_base::openmode __mode = ios_base::in | ios_base::out)  [inline], [inherited]
```

Alters the stream position.

Parameters

__off	Offset.

__way	Value for ios_base::seekdir.
__mode	Value for ios_base::openmode.

Calls virtual seekoff function.

pubseekpos()

```
pos_type std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::pubseekpos (
            pos_type __sp,
            ios_base::openmode __mode = ios_base::in | ios_base::out)  [inline], [inherited]
```

Alters the stream position.

Parameters

__sp	Position
__mode	Value for ios_base::openmode.

Calls virtual seekpos function.

pubsetbuf()

```
basic_streambuf * std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::pubsetbuf (
            char_type * __s,
            streamsize __n)  [inline], [inherited]
```

Entry points for derived buffer functions.
The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

pubsync()

```
int std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::pubsync ()  [inline], [inherited]
```

Calls virtual sync function.

sbumpc()

```
int_type std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::sbumpc ()  [inline],
[inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.

seekoff()

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::pos_type std::basic_filebuf< _CharT,
encoding_char_traits< _CharT > >::seekoff (
            off_type __off,
            ios_base::seekdir __way,
            ios_base::openmode __mode = ios_base::in | ios_base::out)  [protected], [virtual],
[inherited]
```

Alters the stream positions.
Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >.

seekpos()

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::pos_type std::basic_filebuf< _CharT,
encoding_char_traits< _CharT > >::seekpos (
            pos_type __pos,
            ios_base::openmode __mode = ios_base::in | ios_base::out)  [protected], [virtual],
[inherited]
```

Alters the stream positions.
Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >.
References _M_reading, and _M_set_buffer().

setbuf()

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::__streambuf_type * std::basic_filebuf<
_CharT, encoding_char_traits< _CharT > >::setbuf (
            char_type * __s,
            streamsize __n)  [protected], [virtual], [inherited]
```

Manipulates the buffer.

Parameters

__s	Pointer to a buffer area.
__n	Size of *__s*.

Returns

`this`

If no file has been opened, and both *__s* and *__n* are zero, then the stream becomes unbuffered. Otherwise, *__s* is used as a buffer; see https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering for more.
Reimplemented from std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >.
References _M_reading, _M_set_buffer(), and gptr().

setg()

```
void std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::setg (
            char_type * __gbeg,
            char_type * __gnext,
            char_type * __gend)  [inline], [protected], [inherited]
```

Setting the three read area pointers.

Parameters

__gbeg	A pointer.
__gnext	A pointer.
__gend	A pointer.

Postcondition

__gbeg == `eback()`, *__gnext* == `gptr()`, and *__gend* == `egptr()`

setp()

```
void std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::setp (
            char_type * __pbeg,
            char_type * __pend)  [inline], [protected], [inherited]
```

Setting the three write area pointers.

Parameters

__pbeg	A pointer.
__pend	A pointer.

Postcondition

__pbeg == `pbase()`, *__pbeg* == `pptr()`, and *__pend* == `epptr()`

sgetc()

```
int_type std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::sgetc ()  [inline],
[inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

sgetn()

```
streamsize std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::sgetn (
            char_type * __s,
            streamsize __n)  [inline], [inherited]
```

Entry point for xsgetn.

Parameters

_↩ _s	A buffer area.
_↩ _n	A count.

Returns xsgetn(__s,__n). The effect is to fill __s[0] through __s[__n-1] with characters from the input sequence, if possible.

showmanyc()

```
streamsize std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::showmanyc ()  [protected],
[virtual], [inherited]
```

Investigating the data available.

Returns

An estimate of the number of characters available in the input sequence, or -1.

If it returns a positive value, then successive calls to `underflow()` *will not return* `traits::eof()` *until at least that number of characters have been supplied. If* `showmanyc()` *returns -1, then calls to* `underflow()` *or* `uflow()` *will fail.* [27.5.2.4.3]/1

Note

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to underflow or uflow] will not return* `eof()` *but that they will return immediately.*

The standard adds that *the morphemes of* `showmanyc` *are* ***es-how-many-see****, not* ***show-manic****.*

Reimplemented from std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >.

snextc()

```
int_type std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::snextc ()  [inline],
[inherited]
```

Getting the next character.

Returns

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

sputbackc()

```
int_type std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::sputbackc (
            char_type __c)  [inline], [inherited]
```

Pushing characters back into the input stream.

Parameters

_↩ _c	The character to push back.

Returns

The previous character, if possible.

Similar to sungetc(), but __c is pushed onto the stream instead of *the previous character.* If successful, the next character fetched from the input stream will be __c.

sputc()

```
int_type std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::sputc (
            char_type __c)  [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

_↩ _c	A character to output.

Returns

__c, if possible.

One of two public output functions.
If a write position is available for the output sequence (i.e., the buffer is not full), stores __c in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(↩ __c)`.

sputn()

```
streamsize std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::sputn (
            const char_type * __s,
            streamsize __n)  [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

_↩ _s	A buffer read area.
_↩ _n	A count.

One of two public output functions.
Returns xsputn(__s,__n). The effect is to write __s[0] through __s[__n-1] to the output sequence, if possible.

sungetc()

```
int_type std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::sungetc ()  [inline],
[inherited]
```

Moving backwards in the input stream.

Returns

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns pbackfail(). The effect is to *unget* the last character *gotten*.

sync()

```
int std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::sync ()  [protected], [virtual],
[inherited]
```

Synchronizes the buffer arrays with the controlled sequences.

Returns

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

Note

Base class version does nothing, returns zero.

Reimplemented from std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >.

uflow()

```
virtual int_type std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::uflow ()  [inline],
[protected], [virtual], [inherited]
```

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

underflow()

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::int_type std::basic_filebuf< _CharT,
encoding_char_traits< _CharT > >::underflow ()  [protected], [virtual], [inherited]
```

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.
For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.
A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html

Note

Base class version does nothing, returns eof().

Reimplemented from std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >.

xsgetn()

```
streamsize std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::xsgetn (
            char_type * __s,
            streamsize __n)  [protected], [virtual], [inherited]
```

Multiple character extraction.

Parameters

_↩ _s	A buffer area.
_↩ _n	Maximum number of characters to assign.

Returns

The number of characters assigned.

Fills __s[0] through __s[__n-1] with characters from the input sequence, as if by `sbumpc()`. Stops when either __n characters have been copied, or when `traits::eof()` would be copied.
It is expected that derived classes provide a more efficient implementation by overriding this definition.
Reimplemented from std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >.

xsputn()

```
streamsize std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::xsputn (
            const char_type * __s,
            streamsize __n)  [protected], [virtual], [inherited]
```

Multiple character insertion.

Parameters

_↩ _s	A buffer area.
_↩ _n	Maximum number of characters to write.

Returns

The number of characters written.

Writes __s[0] through __s[__n-1] to the output sequence, as if by `sputc()`. Stops when either *n* characters have been copied, or when `sputc()` would return `traits::eof()`.
It is expected that derived classes provide a more efficient implementation by overriding this definition.
Reimplemented from std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >.

6.418.3 Member Data Documentation

_M_buf

```
char_type* std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_buf  [protected],
[inherited]
```

Pointer to the beginning of internal buffer.

_M_buf_locale

```
locale std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::_M_buf_locale  [protected],
[inherited]
```

Current locale setting.

_M_buf_size

size_t std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_buf_size [protected], [inherited]

Actual size of internal buffer. This number is equal to the size of the put area + 1 position, reserved for the overflow char of a full area.

_M_ext_buf

char* std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_ext_buf [protected], [inherited]

Buffer for external characters. Used for input when codecvt::always_noconv() == false. When valid, this corresponds to eback().

Referenced by overflow(), and pbackfail().

_M_ext_buf_size

streamsize std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_ext_buf_size [protected], [inherited]

Size of buffer held by _M_ext_buf.

_M_ext_next

const char* std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_ext_next [protected], [inherited]

Pointers into the buffer held by _M_ext_buf that delimit a subsequence of bytes that have been read but not yet converted. When valid, _M_ext_next corresponds to egptr().

Referenced by overflow(), and pbackfail().

_M_in_beg

char_type* std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::_M_in_beg [protected], [inherited]

Start of get area.

_M_in_cur

char_type* std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::_M_in_cur [protected], [inherited]

Current read area.

_M_in_end

char_type* std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::_M_in_end [protected], [inherited]

End of get area.

_M_mode

ios_base::openmode std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_mode [protected], [inherited]

Place to stash in || out || in | out settings for current filebuf.

_M_out_beg

char_type* std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::_M_out_beg [protected], [inherited]

Start of put area.

_M_out_cur

char_type* std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::_M_out_cur [protected], [inherited]

Current put area.

_M_out_end

char_type* std::basic_streambuf< _CharT, encoding_char_traits< _CharT > >::_M_out_end [protected], [inherited]

End of put area.

_M_pback

char_type std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_pback [protected], [inherited]

Necessary bits for putback buffer management.

Note

pbacks of over one character are not currently supported.

_M_pback_cur_save

char_type* std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_pback_cur_save [protected], [inherited]

Necessary bits for putback buffer management.

Note

pbacks of over one character are not currently supported.

_M_pback_end_save

char_type* std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_pback_end_save [protected], [inherited]

Necessary bits for putback buffer management.

Note

pbacks of over one character are not currently supported.

_M_pback_init

bool std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_pback_init [protected], [inherited]

Necessary bits for putback buffer management.

Note

pbacks of over one character are not currently supported.

_M_reading

bool std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_reading [protected], [inherited]

_M_reading == false && _M_writing == false for **uncommitted** mode; _M_reading == true for **read** mode; _M_writing == true for **write** mode;

NB: _M_reading == true && _M_writing == true is unused.

Referenced by seekpos(), and setbuf().

The documentation for this class was generated from the following file:

- enc_filebuf.h

6.419 __gnu_cxx::encoding_char_traits< _CharT > Struct Template Reference

6.419.1 Detailed Description

template<**typename _CharT**>
struct __gnu_cxx::encoding_char_traits< **_CharT** >

encoding_char_traits
The documentation for this struct was generated from the following file:

6.434.1 Detailed Description

Abstract base class for types defining a category of error codes.
An error category defines a context that gives meaning to the integer stored in an `error_code` or `error_condition` object. For example, the standard `errno` constants such a `EINVAL` and `ENOMEM` are associated with the "generic" category and other OS-specific error numbers are associated with the "system" category, but a user-defined category might give different meanings to the same numerical values.
A user-defined category can override the `equivalent` member functions to define correspondence between errors in different categories. For example, a category for errors from disk I/O could consider some of its error numbers equivalent to ENOSPC and ENOENT in the generic category.

Since

C++11

6.434.2 Member Function Documentation

default_error_condition()

```
virtual error_condition std::error_category::default_error_condition (
            int __i) const  [virtual], [noexcept]
```

Return an error_condition corresponding to `i` in this category.

equivalent() [1/2]

```
virtual bool std::error_category::equivalent (
            const error_code & __code,
            int __i) const  [virtual], [noexcept]
```

Test whether `code` corresponds to `i` for this category.

equivalent() [2/2]

```
virtual bool std::error_category::equivalent (
            int __i,
            const error_condition & __cond) const  [virtual], [noexcept]
```

Test whether `cond` corresponds to `i` for this category.

message()

```
virtual string std::error_category::message (
            int ) const  [pure virtual]
```

A description of the error condition corresponding to the number.
References message().
Referenced by message(), std::error_code::message(), and std::error_condition::message().

name()

```
virtual const char * std::error_category::name () const  [pure virtual], [noexcept]
```
A string that identifies the error category.

operator<=>()

```
strong_ordering std::error_category::operator<=> (
            const error_category & __rhs) const  [inline], [nodiscard], [noexcept]
```
Ordered comparison that defines a total order for error categories.
References operator<=>().
Referenced by operator<=>().

operator==()

```
bool std::error_category::operator== (
            const error_category & __other) const  [inline], [noexcept]
```
An error_category only compares equal to itself.
The documentation for this class was generated from the following file:

6.435.1 Detailed Description

Class error_code
This class is a value type storing an integer error number and a category that gives meaning to the error number. Typically this is done close the the point where the error happens, to capture the original error value.
An `error_code` object can be used to store the original error value emitted by some subsystem, with a category relevant to the subsystem. For example, errors from POSIX library functions can be represented by an `errno` value and the "generic" category, but errors from an HTTP library might be represented by an HTTP response status code (e.g. 404) and a custom category defined by the library.

Since

C++11

6.435.2 Constructor & Destructor Documentation

error_code()

```
template<typename _ErrorCodeEnum, typename = _Check<_ErrorCodeEnum>>
std::error_code::error_code (
            _ErrorCodeEnum __e)  [inline], [noexcept]
```

Initialize with a user-defined type, by calling make_error_code.
References make_error_code().

6.435.3 Member Function Documentation

category()

```
const error_category & std::error_code::category () const  [inline], [noexcept]
```

The error category that this error belongs to.
Referenced by message().

default_error_condition()

```
error_condition std::error_code::default_error_condition () const  [noexcept]
```

An `error_condition` for this error's category and value.

message()

```
string std::error_code::message () const  [inline]
```

The category's description of the value.
References category(), std::error_category::message(), message(), and value().
Referenced by message().

operator bool()

```
std::error_code::operator bool () const  [inline], [explicit], [noexcept]
```

Test whether `value()` is non-zero.

value()

```
int std::error_code::value () const  [inline], [noexcept]
```

The error value.
Referenced by message().
The documentation for this class was generated from the following file:

6.436.1 Detailed Description

Class error_condition
This class represents error conditions that may be visible at an API boundary. Different `error_code` values that can occur within a library or module might map to the same `error_condition`.
An `error_condition` represents something that the program can test for, and subsequently take appropriate action.

Since

C++11

6.436.2 Constructor & Destructor Documentation

error_condition() [1/3]

```
std::error_condition::error_condition ()  [inline], [noexcept]
```

Initialize with a zero (no error) value and the generic category.
References std::generic_category().
Referenced by make_error_condition(), operator<=>(), operator==(), and operator==().

error_condition() [2/3]

```
std::error_condition::error_condition (
            int __v,
            const error_category & __cat)  [inline], [noexcept]
```

Initialize with the specified value and category.

error_condition() [3/3]

```
template<typename _ErrorConditionEnum, typename = _Check<_ErrorConditionEnum>>
std::error_condition::error_condition (
            _ErrorConditionEnum __e)  [inline], [noexcept]
```

Initialize with a user-defined type, by calling make_error_condition.
References make_error_condition().

6.436.3 Member Function Documentation

assign()

```
void std::error_condition::assign (
            int __v,
            const error_category & __cat)  [inline], [noexcept]
```

Set the value and category.
Referenced by clear().

category()

```
const error_category & std::error_condition::category () const  [inline], [noexcept]
```

The error category that this error belongs to.
Referenced by message().

clear()

```
void std::error_condition::clear ()  [inline], [noexcept]
```

Reset the value and category to the default-constructed state.
References assign(), and std::generic_category().

message()

```
string std::error_condition::message () const  [inline]
```

The category's description of the value.
References category(), std::error_category::message(), and value().

operator bool()

```
std::error_condition::operator bool () const  [inline], [explicit], [noexcept]
```

Test whether `value()` is non-zero.

value()

```
int std::error_condition::value () const  [inline], [noexcept]
```

The error value.
Referenced by message().

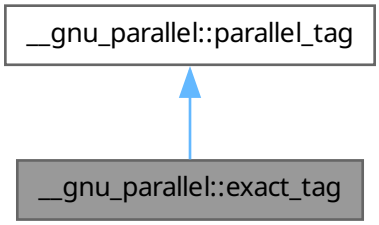
6.437 __gnu_parallel::exact_tag Struct Reference

```
#include <tags.h>
```

Inheritance diagram for __gnu_parallel::exact_tag:



Public Member Functions

- **exact_tag** (_ThreadIndex __num_threads)
- _ThreadIndex __get_num_threads ()
- void set_num_threads (_ThreadIndex __num_threads)

6.437.1 Detailed Description

Forces parallel merging with exact splitting, at compile time.

6.437.2 Member Function Documentation

__get_num_threads()

```
_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads ()  [inline], [inherited]
```

Find out desired number of threads.

Returns

Desired number of threads.

Referenced by __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), and __gnu_parallel::__parallel_sort(

set_num_threads()

```
void __gnu_parallel::parallel_tag::set_num_threads (
            _ThreadIndex __num_threads)  [inline], [inherited]
```

Set the desired number of threads.

Parameters

__num_threads	Desired number of threads.

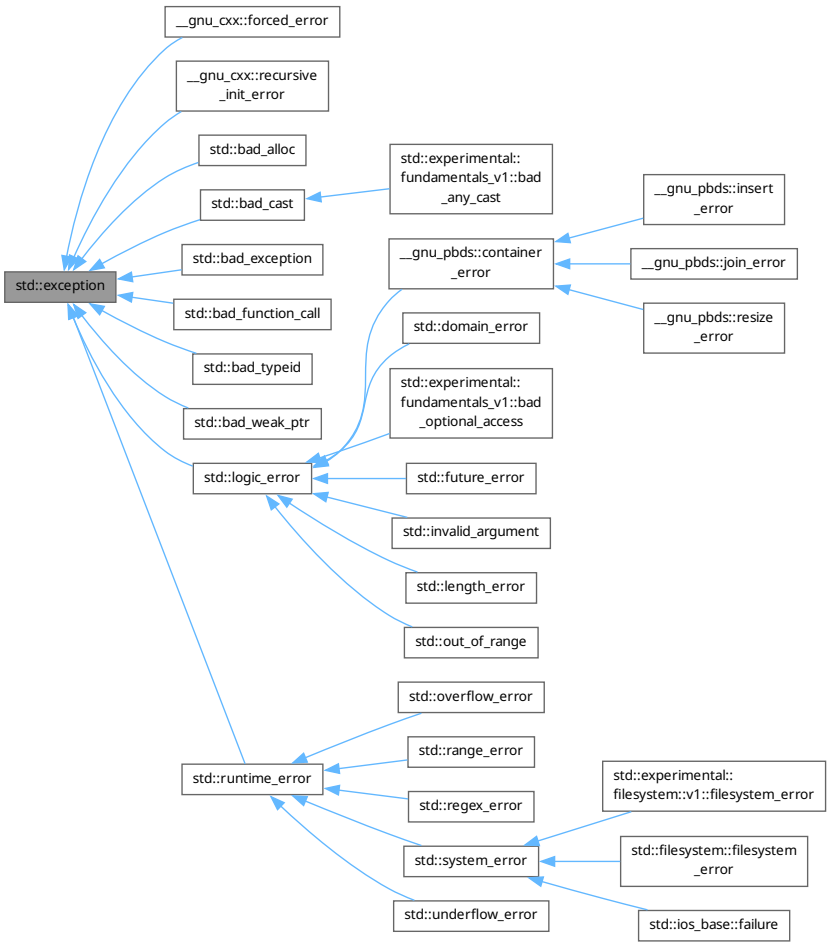
6.438 std::exception Class Reference

`#include <exception.h>`
Inheritance diagram for std::exception:



Public Member Functions

- _GLIBCXX26_CONSTEXPR **exception** (const exception &)=default
- _GLIBCXX26_CONSTEXPR **exception** (exception &&)=default
- _GLIBCXX26_CONSTEXPR exception & **operator=** (const exception &)=default
- _GLIBCXX26_CONSTEXPR exception & **operator=** (exception &&)=default
- virtual constexpr const char * what () const noexcept

6.438.1 Detailed Description

Base class for all library exceptions.
This is the base class for all exceptions thrown by the standard library, and by certain language expressions. You are free to derive your own exception classes, or use a different hierarchy, or to throw non-class data (e.g., fundamental types).

6.438.2 Member Function Documentation

what()

```
virtual constexpr const char * std::exception::what () const  [inline], [constexpr], [virtual],
[noexcept]
```

Returns a C-style character string describing the general cause of the current error.
Reimplemented in std::bad_alloc, std::bad_cast, std::bad_exception, std::bad_function_call, std::bad_typeid, std::bad_weak_ptr, std::experimental::filesystem::v1::filesystem_error, std::experimental::fundamentals_v1::bad_any_cast, std::filesystem::filesystem_error, std::future_error, std::ios_base::failure, std::logic_error, and std::runtime_error.

6.441.1 Detailed Description

template<typename _RealType = double>
class std::exponential_distribution< _RealType >

An exponential continuous distribution for random numbers.
The formula for the exponential probability density function is $p(x|\lambda) = \lambda e^{-\lambda x}$.

Table 2305: Distribution Statistics

Mean	$\frac{1}{\lambda}$
Median	$\frac{\ln 2}{\lambda}$
Mode	$zero$
Range	$[0, \infty]$
Standard Deviation	$\frac{1}{\lambda}$

Since

C++11

6.441.2 Member Typedef Documentation

result_type

```
template<typename _RealType = double>
typedef _RealType std::exponential_distribution< _RealType >::result_type
```

The type of the range of the distribution.

6.441.3 Constructor & Destructor Documentation

exponential_distribution() [1/2]

```
template<typename _RealType = double>
std::exponential_distribution< _RealType >::exponential_distribution ()  [inline]
```

Constructs an exponential distribution with inverse scale parameter 1.0.

exponential_distribution() [2/2]

```
template<typename _RealType = double>
std::exponential_distribution< _RealType >::exponential_distribution (
            _RealType __lambda)  [inline], [explicit]
```

Constructs an exponential distribution with inverse scale parameter λ.

6.441.4 Member Function Documentation

lambda()

```
template<typename _RealType = double>
_RealType std::exponential_distribution< _RealType >::lambda () const  [inline]
```

Returns the inverse scale parameter of the distribution.

max()

```
template<typename _RealType = double>
result_type std::exponential_distribution< _RealType >::max () const  [inline]
```

Returns the least upper bound value of the distribution.

min()

```
template<typename _RealType = double>
result_type std::exponential_distribution< _RealType >::min () const  [inline]
```

Returns the greatest lower bound value of the distribution.

operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::exponential_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng)  [inline]
```

Generating functions.
Referenced by operator()().

param() [1/2]

```
template<typename _RealType = double>
param_type std::exponential_distribution< _RealType >::param () const  [inline]
```

Returns the parameter set of the distribution.

Referenced by std::operator>>().

param() [2/2]

```
template<typename _RealType = double>
void std::exponential_distribution< _RealType >::param (
            const param_type & __param)  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

reset()

```
template<typename _RealType = double>
void std::exponential_distribution< _RealType >::reset ()  [inline]
```

Resets the distribution state.
Has no effect on exponential distributions.

6.441.5 Friends And Related Symbol Documentation

operator==

```
template<typename _RealType = double>
bool operator== (
            const exponential_distribution< _RealType > & __d1,
            const exponential_distribution< _RealType > & __d2)  [friend]
```

Return true if two exponential distributions have the same parameters.

6.443.1 Detailed Description

template<typename _RealType = double>
class std::extreme_value_distribution< _RealType >

A extreme_value_distribution random number distribution.
The formula for the normal probability mass function is

$$p(x|a,b) = \frac{1}{b}\exp(\frac{a-x}{b} - \exp(\frac{a-x}{b}))$$

Since

C++11

6.443.2 Member Typedef Documentation

result_type

```
template<typename _RealType = double>
typedef _RealType std::extreme_value_distribution< _RealType >::result_type
```

The type of the range of the distribution.

6.443.3 Member Function Documentation

a()

```
template<typename _RealType = double>
_RealType std::extreme_value_distribution< _RealType >::a () const  [inline]
```

Return the a parameter of the distribution.

b()

```
template<typename _RealType = double>
_RealType std::extreme_value_distribution< _RealType >::b () const  [inline]
```

Return the b parameter of the distribution.

max()

```
template<typename _RealType = double>
result_type std::extreme_value_distribution< _RealType >::max () const  [inline]
```

Returns the least upper bound value of the distribution.

min()

```
template<typename _RealType = double>
result_type std::extreme_value_distribution< _RealType >::min () const  [inline]
```

Returns the greatest lower bound value of the distribution.

operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::extreme_value_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng)  [inline]
```

Generating functions.
Referenced by operator()().

param() [1/2]

```
template<typename _RealType = double>
param_type std::extreme_value_distribution< _RealType >::param () const  [inline]
```

Returns the parameter set of the distribution.
Referenced by std::operator>>().

param() [2/2]

```
template<typename _RealType = double>
void std::extreme_value_distribution< _RealType >::param (
            const param_type & __param)  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

reset()

```
template<typename _RealType = double>
void std::extreme_value_distribution< _RealType >::reset ()  [inline]
```

Resets the distribution state.

6.443.4 Friends And Related Symbol Documentation

operator==

```
template<typename _RealType = double>
bool operator== (
            const extreme_value_distribution< _RealType > & __d1,
            const extreme_value_distribution< _RealType > & __d2)  [friend]
```

Return true if two extreme value distributions have the same parameters.
The documentation for this class was generated from the following files:

- static __c_locale **_S_lc_ctype_c_locale** (__c_locale __cloc, const char *__s)

Friends

- class **locale**
- class **locale::_Impl**

6.444.1 Detailed Description

Localization functionality base class.
The facet class is the base class for a localization feature, such as money, time, and number printing. It provides common support for facets and reference management.
Facets may not be copied or assigned.

6.444.2 Constructor & Destructor Documentation

facet()

```
std::locale::facet::facet (
            size_t __refs = 0) throw ( )   [inline], [explicit], [protected]
```

Facet constructor.
This is the constructor provided by the standard. If refs is 0, the facet is destroyed when the last referencing locale is destroyed. Otherwise the facet will never be destroyed.

Parameters

__refs	The initial value for reference count.

Referenced by std::__cxx11::collate< _CharT >::collate(), std::__cxx11::collate< _CharT >::collate(), std::messages< _CharT >::messa
std::messages< _CharT >::messages(), std::money_get< _CharT, _InIter >::money_get(), std::money_put< _CharT, _OutIter >::money

6.450.1 Detailed Description

template<typename _RealType = double>
class std::fisher_f_distribution< _RealType >

A fisher_f_distribution random number distribution.
The formula for the normal probability mass function is

$$p(x|m,n) = \frac{\Gamma((m+n)/2)}{\Gamma(m/2)\Gamma(n/2)}(\frac{m}{n})^{m/2}x^{(m/2)-1}(1+\frac{mx}{n})^{-(m+n)/2}$$

Since

C++11

6.450.2 Member Typedef Documentation

result_type

```
template<typename _RealType = double>
typedef _RealType std::fisher_f_distribution< _RealType >::result_type
```

The type of the range of the distribution.

6.450.3 Member Function Documentation

max()

```
template<typename _RealType = double>
result_type std::fisher_f_distribution< _RealType >::max () const  [inline]
```

Returns the least upper bound value of the distribution.

min()

```
template<typename _RealType = double>
result_type std::fisher_f_distribution< _RealType >::min () const  [inline]
```

Returns the greatest lower bound value of the distribution.

operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::fisher_f_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng)  [inline]
```

Generating functions.

param() [1/2]

```
template<typename _RealType = double>
param_type std::fisher_f_distribution< _RealType >::param () const  [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _RealType = double>
void std::fisher_f_distribution< _RealType >::param (
            const param_type & __param)  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

reset()

```
template<typename _RealType = double>
void std::fisher_f_distribution< _RealType >::reset ()  [inline]
```

Resets the distribution state.

6.450.4 Friends And Related Symbol Documentation

operator<<

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::fisher_f_distribution< _RealType1 > & __x)  [friend]
```

Inserts a fisher_f_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A fisher_f_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _RealType = double>
bool operator== (
            const fisher_f_distribution< _RealType > & __d1,
            const fisher_f_distribution< _RealType > & __d2)  [friend]
```

Return true if two Fisher f distributions have the same parameters and the sequences that would be generated are equal.

operator>>

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::fisher_f_distribution< _RealType1 > & __x)  [friend]
```

Extracts a fisher_f_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A fisher_f_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

6.454.1 Detailed Description

template<typename _Tp, typename _Alloc = allocator<_Tp>>
class std::forward_list< _Tp, _Alloc >

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

Since

C++11

Template Parameters

_Tp	Type of element.
_Alloc	Allocator type, defaults to allocator<_Tp>.

Meets the requirements of a `container`, a `sequence`, including the `optional sequence requirements` with the exception of `at` and `operator[]`.
This is a *singly linked* list. Traversal up the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike std::vector and std::deque, random-access iterators are not provided, so subscripting (`[]`) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.
Also unlike the other standard containers, std::forward_list provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

6.454.2 Constructor & Destructor Documentation

forward_list() `[1/10]`

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list ()  [default]
```

Creates a forward_list with no elements.
Referenced by insert_after(), insert_after(), merge(), operator=(), remove(), remove_if(), resize(), resize(), sort(), splice_after(), and unique().

forward_list() [2/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
            const _Alloc & __al)  [inline], [explicit], [noexcept]
```

Creates a forward_list with no elements.

Parameters

_↩ _al	An allocator object.

forward_list() [3/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
            const forward_list< _Tp, _Alloc > & __list,
            const __type_identity_t< _Alloc > & __al)  [inline]
```

Copy constructor with allocator argument.

Parameters

__list	Input list to copy.
__al	An allocator object.

forward_list() [4/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
            forward_list< _Tp, _Alloc > && __list,
            const __type_identity_t< _Alloc > & __al)  [inline], [noexcept]
```

Move constructor with allocator argument.

Parameters

__list	Input list to move.
__al	An allocator object.

forward_list() [5/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
            size_type __n,
            const _Alloc & __al = _Alloc())  [inline], [explicit]
```

Creates a forward_list with default constructed elements.

Parameters

_↩ _*n*	The number of elements to initially create.
_↩ _*al*	An allocator object.

This constructor creates the forward_list with ___n default constructed elements.

forward_list() [6/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
            size_type __n,
            const _Tp & __value,
            const _Alloc & __al = _Alloc())  [inline]
```

Creates a forward_list with copies of an exemplar element.

Parameters

__n	The number of elements to initially create.
__value	An element to copy.
__al	An allocator object.

This constructor fills the forward_list with ___n copies of ___value.

forward_list() [7/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
std::forward_list< _Tp, _Alloc >::forward_list (
            _InputIterator __first,
            _InputIterator __last,
            const _Alloc & __al = _Alloc())  [inline]
```

Builds a forward_list from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__al	An allocator object.

Create a forward_list consisting of copies of the elements from [___first,___last). This is linear in N (where N is distance(___first,___last)).

forward_list() [8/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
```

```
            const forward_list< _Tp, _Alloc > & __list)  [inline]
```

The forward_list copy constructor.

Parameters

__list	A forward_list of identical element and allocator types.

forward_list() [9/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
            forward_list< _Tp, _Alloc > && )  [default]
```

The forward_list move constructor.

Parameters

__list	A forward_list of identical element and allocator types.

The newly-created forward_list contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified forward_list.

forward_list() [10/10]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
            std::initializer_list< _Tp > __il,
            const _Alloc & __al = _Alloc())  [inline]
```

Builds a forward_list from an initializer_list.

Parameters

_↩ _il	An initializer_list of value_type.
_↩ _al	An allocator object.

Create a forward_list consisting of copies of the elements in the initializer_list __il. This is linear in __il.size().

~forward_list()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::~forward_list ()  [inline], [noexcept]
```

The forward_list dtor.

6.454.3 Member Function Documentation

assign() [1/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
void std::forward_list< _Tp, _Alloc >::assign (
            _InputIterator __first,
            _InputIterator __last)  [inline]
```

Assigns a range to a forward_list.

Parameters

__first	An input iterator.
__last	An input iterator.

This function fills a forward_list with copies of the elements in the range [__first,__last).
Note that the assignment completely changes the forward_list and that the number of elements of the resulting forward_list is the same as the number of elements assigned.
Referenced by std::forward_list< _Tp, polymorphic_allocator< _Tp > >::assign(), operator=(), std::forward_list< _Tp, polymorphic_alloc and std::forward_list< _Tp, polymorphic_allocator< _Tp > >::operator=().

assign() [2/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::assign (
            size_type __n,
            const _Tp & __val)  [inline]
```

Assigns a given value to a forward_list.

Parameters

__n	Number of elements to be assigned.
__val	Value to be assigned.

This function fills a forward_list with __n copies of the given value. Note that the assignment completely changes the forward_list, and that the resulting forward_list has __n elements.

assign() [3/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::assign (
            std::initializer_list< _Tp > __il)  [inline]
```

Assigns an initializer_list to a forward_list.

Parameters

__il	An initializer_list of value_type.

Replace the contents of the forward_list with copies of the elements in the initializer_list __il. This is linear in __il.size().

before_begin() [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list< _Tp, _Alloc >::before_begin () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points before the first element in the forward_list. Iteration is done in ordinary element order.

before_begin() [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::before_begin ()  [inline], [noexcept]
```

Returns a read/write iterator that points before the first element in the forward_list. Iteration is done in ordinary element order.

Referenced by std::forward_list< _Tp, polymorphic_allocator< _Tp > >::assign(), std::forward_list< _Tp, polymorphic_allocator< _Tp > insert_after(), insert_after(), resize(), and resize().

begin() [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list< _Tp, _Alloc >::begin () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the forward_list. Iteration is done in ordinary element order.

begin() [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::begin ()  [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the forward_list. Iteration is done in ordinary element order.

Referenced by std::forward_list< _Tp, polymorphic_allocator< _Tp > >::assign(), std::forward_list< _Tp, polymorphic_allocator< _Tp > and unique().

cbefore_begin()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list< _Tp, _Alloc >::cbefore_begin () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points before the first element in the forward_list. Iteration is done in ordinary element order.

Referenced by std::forward_list< _Tp, polymorphic_allocator< _Tp > >::assign(), std::forward_list< _Tp, polymorphic_allocator< _Tp > std::forward_list< _Tp, polymorphic_allocator< _Tp > >::emplace_front(), std::forward_list< _Tp, polymorphic_allocator< _Tp > >::pus remove(), remove_if(), and unique().

cbegin()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list< _Tp, _Alloc >::cbegin () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the forward_list. Iteration is done in ordinary element order.

Referenced by std::operator==().

cend()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list< _Tp, _Alloc >::cend () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the forward_list. Iteration is done in ordinary element order.

Referenced by std::operator==().

clear()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::clear ()  [inline], [noexcept]
```

Erases all the elements.
Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Referenced by std::forward_list< _Tp, polymorphic_allocator< _Tp > >::assign(), std::forward_list< _Tp, polymorphic_allocator< _Tp > operator=(), and std::forward_list< _Tp, polymorphic_allocator< _Tp > >::operator=().

emplace_after()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename... _Args>
iterator std::forward_list< _Tp, _Alloc >::emplace_after (
            const_iterator __pos,
            _Args &&... __args)  [inline]
```

Constructs object in forward_list after the specified iterator.

Parameters

__pos	A const_iterator into the forward_list.
__args	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type `T` constructed with `T(std::forward<Args>(args)...)` after the specified location. Due to the nature of a forward_list this operation can be done in constant time, and does not invalidate iterators and references.

emplace_front()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
template<typename... _Args>
reference std::forward_list< _Tp, _Alloc >::emplace_front (
            _Args &&... __args)  [inline]
```

Constructs object in forward_list at the front of the list.

Parameters

__args	Arguments.

This function will insert an object of type `Tp` constructed with `Tp(std::forward<Args>(args)...)` at the front of the list Due to the nature of a forward_list this operation can be done in constant time, and does not invalidate iterators and references.

empty()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
bool std::forward_list< _Tp, _Alloc >::empty () const  [inline], [noexcept]
```

Returns true if the forward_list is empty. (Thus begin() would equal end().)
Referenced by insert_after(), and sort().

end() [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
```

```
const_iterator std::forward_list< _Tp, _Alloc >::end () const  [inline], [noexcept]
```
Returns a read-only iterator that points one past the last element in the forward_list. Iteration is done in ordinary element order.

end() [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::end ()  [inline], [noexcept]
```
Returns a read/write iterator that points one past the last element in the forward_list. Iteration is done in ordinary element order.
Referenced by std::forward_list< _Tp, polymorphic_allocator< _Tp > >::assign(), std::forward_list< _Tp, polymorphic_allocator< _Tp > insert_after(), insert_after(), resize(), resize(), and unique().

erase_after() [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::erase_after (
            const_iterator __pos)  [inline]
```
Removes the element pointed to by the iterator following `pos`.

Parameters

__pos	Iterator pointing before element to be erased.

Returns

An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

This function will erase the element at the given position and thus shorten the forward_list by one.
Due to the nature of a forward_list this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Referenced by std::forward_list< _Tp, polymorphic_allocator< _Tp > >::assign(), std::forward_list< _Tp, polymorphic_allocator< _Tp > resize(), and resize().

erase_after() [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::erase_after (
            const_iterator __pos,
            const_iterator __last)  [inline]
```
Remove a range of elements.

Parameters

__pos	Iterator pointing before the first element to be erased.
__last	Iterator pointing to one past the last element to be erased.

Returns

`__last`

This function will erase the elements in the range `(__pos,__last)` and shorten the forward_list accordingly.
This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed.
The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

front() [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
reference std::forward_list< _Tp, _Alloc >::front ()  [inline]
```

Returns a read/write reference to the data at the first element of the forward_list.
Referenced by std::forward_list< _Tp, polymorphic_allocator< _Tp > >::emplace_front().

front() [2/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
const_reference std::forward_list< _Tp, _Alloc >::front () const  [inline]
```

Returns a read-only (constant) reference to the data at the first element of the forward_list.

get_allocator()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
allocator_type std::forward_list< _Tp, _Alloc >::get_allocator () const  [inline], [noexcept]
```

Get a copy of the memory allocation object.
Referenced by insert_after(), insert_after(), remove(), remove_if(), and unique().

insert_after() [1/4]

```
template<typename _Tp, typename _Alloc>
template<typename _InputIterator, typename>
forward_list< _Tp, _Alloc >::iterator forward_list::insert_after (
            const_iterator __pos,
            _InputIterator __first,
            _InputIterator __last)
```

Inserts a range into the forward_list.

Parameters

__pos	An iterator into the forward_list.
__first	An input iterator.
__last	An input iterator.

Returns

An iterator pointing to the last inserted element or __pos if `__first == __last`.

This function will insert copies of the data in the range `[ __first, __last)` into the forward_list after the location specified by `__pos`.
This operation is linear in the number of elements inserted and does not invalidate iterators and references.
References forward_list(), before_begin(), empty(), end(), and get_allocator().

insert_after() [2/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::insert_after (
            const_iterator __pos,
            const _Tp & __val)  [inline]
```

Inserts given value into forward_list after specified iterator.

Parameters

__pos	An iterator into the forward_list.
__val	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value after the specified location. Due to the nature of a forward_list this operation can be done in constant time, and does not invalidate iterators and references.
Referenced by std::forward_list< _Tp, polymorphic_allocator< _Tp > >::assign(), std::forward_list< _Tp, polymorphic_allocator< _Tp > std::forward_list< _Tp, polymorphic_allocator< _Tp > >::insert_after(), and resize().

insert_after() [3/4]

```
template<typename _Tp, typename _Alloc>
forward_list< _Tp, _Alloc >::iterator forward_list::insert_after (
            const_iterator __pos,
            size_type __n,
            const _Tp & __val)
```

Inserts a number of copies of given data into the forward_list.

Parameters

__pos	An iterator into the forward_list.
__n	Number of elements to be inserted.
__val	Data to be inserted.

Returns

An iterator pointing to the last inserted copy of `val` or `pos` if `n == 0`.

This function will insert a specified number of copies of the given data after the location specified by `pos`.
This operation is linear in the number of elements inserted and does not invalidate iterators and references.
References forward_list(), before_begin(), end(), and get_allocator().

insert_after() [4/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::insert_after (
            const_iterator __pos,
            std::initializer_list< _Tp > __il)  [inline]
```

Inserts the contents of an initializer_list into forward_list after the specified iterator.

Parameters

__pos	An iterator into the forward_list.
__il	An initializer_list of value_type.

Returns

An iterator pointing to the last inserted element or __pos if __il is empty.

This function will insert copies of the data in the initializer_list __il into the forward_list before the location specified by __pos.
This operation is linear in the number of elements inserted and does not invalidate iterators and references.

max_size()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
size_type std::forward_list< _Tp, _Alloc >::max_size () const  [inline], [noexcept]
```

Returns the largest possible number of elements of forward_list.

merge() [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::merge (
            forward_list< _Tp, _Alloc > && __list)  [inline]
```

Merge sorted lists.

Parameters

__list	Sorted list to merge.

Assumes that both __list and this list are sorted according to operator<(). Merges elements of __list into this list in sorted order, leaving __list empty when complete. Elements in this list precede elements in __list that are equal.
Referenced by std::forward_list< _Tp, polymorphic_allocator< _Tp > >::merge().

merge() [2/2]

```
template<typename _Tp, typename _Alloc>
template<typename _Comp>
void forward_list::merge (
            forward_list< _Tp, _Alloc > && __list,
            _Comp __comp)
```

Merge sorted lists according to comparison function.

Parameters

__list	Sorted list to merge.
__comp	Comparison function defining sort order.

Assumes that both __list and this list are sorted according to comp. Merges elements of __list into this list in sorted order, leaving __list empty when complete. Elements in this list precede elements in __list that are equivalent according to comp().
References forward_list(), std::__addressof(), and std::move().

operator=() [1/3]

```
template<typename _Tp, typename _Alloc>
forward_list< _Tp, _Alloc > & forward_list::operator= (
            const forward_list< _Tp, _Alloc > & __list)
```

The forward_list assignment operator.

Parameters

__list	A forward_list of identical element and allocator types.

All the elements of `__list` are copied.
Whether the allocator is copied depends on the allocator traits.
References forward_list(), std::__addressof(), assign(), and clear().

operator=() [2/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
forward_list & std::forward_list< _Tp, _Alloc >::operator= (
            forward_list< _Tp, _Alloc > && __list)  [inline], [noexcept]
```

The forward_list move assignment operator.

Parameters

__list	A forward_list of identical element and allocator types.

The contents of `__list` are moved into this forward_list (without copying, if the allocators permit it).
Afterwards *__list* is a valid, but unspecified forward_list
Whether the allocator is moved depends on the allocator traits.

operator=() [3/3]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
forward_list & std::forward_list< _Tp, _Alloc >::operator= (
            std::initializer_list< _Tp > __il)  [inline]
```

The forward_list initializer list assignment operator.

Parameters

_↩ _il	An initializer_list of value_type.

Replace the contents of the forward_list with copies of the elements in the initializer_list `__il`. This is linear in `__↩ il.size()`.

pop_front()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::pop_front ()  [inline]
```

Removes first element.
This is a typical stack operation. It shrinks the forward_list by one. Due to the nature of a forward_list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.
Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

push_front()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::push_front (
            const _Tp & __val)  [inline]
```

Add data to the front of the forward_list.

Parameters

__val	Data to be added.

This is a typical stack operation. The function creates an element at the front of the forward_list and assigns the given data to it. Due to the nature of a forward_list this operation can be done in constant time, and does not invalidate iterators and references.

remove()

```
template<typename _Tp, typename _Alloc>
auto forward_list::remove (
            const _Tp & __val)
```

Remove all elements equal to value.

Parameters

__val	The value to remove.

Removes every element in the list equal to `__val`. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
References forward_list(), cbefore_begin(), get_allocator(), and splice_after().

remove_if()

```
template<typename _Tp, typename _Alloc>
template<typename _Pred>
auto forward_list::remove_if (
            _Pred __pred) -> __remove_return_type
```

Remove all elements satisfying a predicate.

Parameters

__pred	Unary predicate function or object.

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
References forward_list(), cbefore_begin(), get_allocator(), and splice_after().

resize() [1/2]

```
template<typename _Tp, typename _Alloc>
void forward_list::resize (
            size_type __sz)
```

Resizes the forward_list to the specified number of elements.

Parameters

__sz	Number of elements the forward_list should contain.

This function will resize the forward_list to the specified number of elements. If the number is smaller than the forward_list's current number of elements the forward_list is truncated, otherwise the forward_list is extended and the new elements are default constructed.
References forward_list(), before_begin(), end(), and erase_after().

resize() [2/2]

```
template<typename _Tp, typename _Alloc>
void forward_list::resize (
            size_type __sz,
            const value_type & __val)
```

Resizes the forward_list to the specified number of elements.

Parameters

__sz	Number of elements the forward_list should contain.
__val	Data with which new elements should be populated.

This function will resize the forward_list to the specified number of elements. If the number is smaller than the forward_list's current number of elements the forward_list is truncated, otherwise the forward_list is extended and new elements are populated with given data.
References forward_list(), before_begin(), end(), erase_after(), and insert_after().

reverse()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::reverse ()  [inline], [noexcept]
```

Reverse the elements in list.
Reverse the order of elements in the list in linear time.

sort() [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::sort ()  [inline]
```

Sort the elements of the list.
Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.
Referenced by std::forward_list< _Tp, polymorphic_allocator< _Tp > >::sort().

sort() [2/2]

```
template<typename _Tp, class _Alloc>
template<typename _Comp>
void forward_list::sort (
            _Comp __comp)
```

Sort the forward_list using a comparison function.
Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.
References forward_list(), and empty().

splice_after() [1/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::splice_after (
            const_iterator __pos,
            forward_list< _Tp, _Alloc > && ,
            const_iterator __before,
            const_iterator __last)  [inline], [noexcept]
```

Insert range from another forward_list.

Parameters

__pos	Iterator referencing the element to insert after.
__list	Source list.
__before	Iterator referencing before the start of range in __list.
__last	Iterator referencing the end of range in __list.

Removes elements in the range (__before,__last) and inserts them after __pos in constant time.
Undefined if __pos is in (__before,__last).

splice_after() [2/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::splice_after (
            const_iterator __pos,
            forward_list< _Tp, _Alloc > && __list)  [inline], [noexcept]
```

Insert contents of another forward_list.

Parameters

__pos	Iterator referencing the element to insert after.
__list	Source list.

The elements of list are inserted in constant time after the element referenced by pos. list becomes an empty list.
Requires this != &x.
Referenced by remove(), remove_if(), std::forward_list< _Tp, polymorphic_allocator< _Tp > >::splice_after(), and unique().

splice_after() [3/4]

```
template<typename _Tp, typename _Alloc>
void forward_list::splice_after (
            const_iterator __pos,
            forward_list< _Tp, _Alloc > && __list,
            const_iterator __i)  [noexcept]
```

Insert element from another forward_list.

Parameters

__pos	Iterator referencing the element to insert after.
__list	Source list.

__i	Iterator referencing the element before the element to move.

Removes the element in list __list referenced by __i and inserts it into the current list after __pos.
References forward_list().

splice_after() [4/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::splice_after (
            const_iterator __pos,
            forward_list< _Tp, _Alloc > & ,
            const_iterator __before,
            const_iterator __last)  [inline], [noexcept]
```

Insert range from another forward_list.

Parameters

__pos	Iterator referencing the element to insert after.
__list	Source list.
__before	Iterator referencing before the start of range in __list.
__last	Iterator referencing the end of range in __list.

Removes elements in the range (__before,__last) and inserts them after __pos in constant time.
Undefined if __pos is in (__before,__last).

swap()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::swap (
            forward_list< _Tp, _Alloc > & __list)  [inline], [noexcept]
```

Swaps data with another forward_list.

Parameters

__list	A forward_list of the same element and allocator types.

This exchanges the elements between two lists in constant time. Note that the global std::swap() function is overloaded such that std::swap(l1, l2) will feed to this function.
Whether the allocators are swapped depends on the allocator traits.

unique() [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
__remove_return_type std::forward_list< _Tp, _Alloc >::unique ()  [inline]
```

Remove consecutive duplicate elements.
For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Referenced by std::forward_list< _Tp, polymorphic_allocator< _Tp > >::unique().

unique() [2/2]

```
template<typename _Tp, typename _Alloc>
template<typename _BinPred>
auto forward_list::unique (
            _BinPred __binary_pred) -> __remove_return_type
```

Remove consecutive elements satisfying a predicate.

Parameters

__binary_pred	Binary predicate function or object.

For each consecutive set of elements [first,last) that satisfy predicate(first,i) where i is an iterator in [first,last), remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
References forward_list(), begin(), cbefore_begin(), end(), get_allocator(), and splice_after().

6.455 std::fpos< _StateT > Class Template Reference

```
#include <postypes.h>
```

Public Member Functions

- **fpos** (const fpos &)=default
- fpos (streamoff __off)
- operator streamoff () const
- fpos operator+ (streamoff __off) const
- fpos & operator+= (streamoff __off)
- streamoff operator- (const fpos &__other) const
- fpos operator- (streamoff __off) const
- fpos & operator-= (streamoff __off)
- fpos & **operator=** (const fpos &)=default
- _StateT state () const
- void state (_StateT __st)

6.455.1 Detailed Description

template<typename _StateT>
class std::fpos< _StateT >

Class representing stream positions.
The standard places no requirements upon the template parameter StateT. In this implementation StateT must be DefaultConstructible, CopyConstructible and Assignable. The standard only requires that fpos should contain a member of type StateT. In this implementation it also contains an offset stored as a signed integer.

Parameters

StateT	Type passed to and returned from state().

6.455.2 Constructor & Destructor Documentation

fpos()

```
template<typename _StateT>
std::fpos< _StateT >::fpos (
            streamoff __off)  [inline]
```

Construct position from offset.

6.455.3 Member Function Documentation

operator streamoff()

```
template<typename _StateT>
std::fpos< _StateT >::operator streamoff () const  [inline]
```

Convert to streamoff.

operator+()

```
template<typename _StateT>
fpos std::fpos< _StateT >::operator+ (
            streamoff __off) const  [inline]
```

Add position and offset.

operator+=()

```
template<typename _StateT>
fpos & std::fpos< _StateT >::operator+= (
            streamoff __off)  [inline]
```

Add offset to this position.

operator-() [1/2]

```
template<typename _StateT>
streamoff std::fpos< _StateT >::operator- (
            const fpos< _StateT > & __other) const  [inline]
```

Subtract position to return offset.

operator-() [2/2]

```
template<typename _StateT>
fpos std::fpos< _StateT >::operator- (
            streamoff __off) const  [inline]
```

Subtract offset from position.

operator-=()

```
template<typename _StateT>
fpos & std::fpos< _StateT >::operator-= (
            streamoff __off)  [inline]
```

Subtract offset from this position.

state() [1/2]

```
template<typename _StateT>
_StateT std::fpos< _StateT >::state () const  [inline]
```

Return the last set value of *st*.

state() [2/2]

```
template<typename _StateT>
void std::fpos< _StateT >::state (
            _StateT __st)  [inline]
```

Remember the value of *st*.

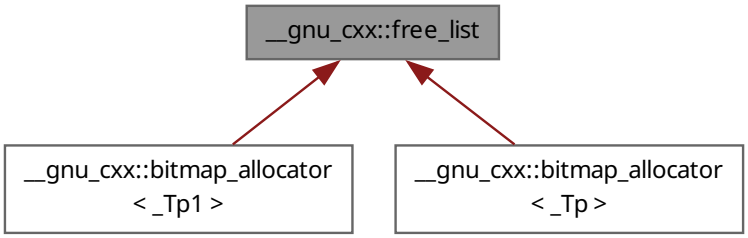
The documentation for this class was generated from the following file:

- postypes.h

6.456 __gnu_cxx::free_list Class Reference

`#include <bitmap_allocator.h>`

Inheritance diagram for __gnu_cxx::free_list:



Public Types

- typedef __mutex **__mutex_type**
- typedef vector_type::iterator **iterator**
- typedef std::size_t * **value_type**
- typedef __detail::__mini_vector< value_type > **vector_type**

Public Member Functions

- void _M_clear ()
- std::size_t * _M_get (std::size_t __sz)
- void _M_insert (std::size_t *__addr) throw ()

6.456.1 Detailed Description

The free list class for managing chunks of memory to be given to and returned by the bitmap_allocator.

6.456.2 Member Function Documentation

_M_clear()

```
void __gnu_cxx::free_list::_M_clear ()
```

This function just clears the internal Free List, and gives back all the memory to the OS.

_M_get()

```
std::size_t * __gnu_cxx::free_list::_M_get (
            std::size_t __sz)
```

This function gets a block of memory of the specified size from the free list.

Parameters

__sz	The size in bytes of the memory required.

Returns

A pointer to the new memory block of size at least equal to that requested.

_M_insert()

```
void __gnu_cxx::free_list::_M_insert (
            std::size_t * __addr) throw ( )   [inline]
```

This function returns the block of memory to the internal free list.

Parameters

__addr	The pointer to the memory block that was given by a call to the _M_get function.

Referenced by __gnu_cxx::bitmap_allocator< _Tp1 >::_M_deallocate_single_object().
The documentation for this class was generated from the following file:

- bitmap_allocator.h

6.457 std::from_chars_result Struct Reference

#include <charconv>
```

Public Member Functions

- constexpr **operator bool** () const noexcept

Public Attributes

- errc **ec**
- const char * **ptr**

Friends

- bool **operator==** (const from_chars_result &, const from_chars_result &)=default

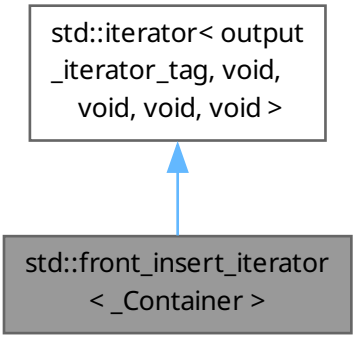
6.457.1 Detailed Description

Result type of std::from_chars.
The documentation for this struct was generated from the following file:

- charconv

6.458 std::front_insert_iterator< _Container > Class Template Reference

`#include <stl_iterator.h>`
Inheritance diagram for std::front_insert_iterator< _Container >:



Public Types

- typedef _Container container_type
- using **difference_type**
- typedef output_iterator_tag iterator_category
- typedef void pointer
- typedef void reference
- typedef void value_type

Public Member Functions

- constexpr front_insert_iterator (_Container &__x)
- constexpr front_insert_iterator & operator* ()
- constexpr front_insert_iterator & operator++ ()
- constexpr front_insert_iterator operator++ (int)
- constexpr front_insert_iterator & operator= (const typename _Container::value_type &__value)
- constexpr front_insert_iterator & **operator=** (typename _Container::value_type &&__value)

Protected Attributes

- _Container * **container**

6.458.1 Detailed Description

template<typename _Container>
class std::front_insert_iterator< _Container >

Turns assignment into insertion.
These are output iterators, constructed from a container-of-T. Assigning a T to the iterator prepends it to the container using push_front.
Tip: Using the front_inserter function to create these iterators can save typing.

6.458.2 Member Typedef Documentation

container_type

```
template<typename _Container>
typedef _Container std::front_insert_iterator< _Container >::container_type
```

A nested typedef for the type of whatever container you used.

iterator_category

```
typedef output_iterator_tag std::iterator< output_iterator_tag, void, void, void, void >::↩
iterator_category  [inherited]
```

One of the tag types.

pointer

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::pointer  [inherited]
```

This type represents a pointer-to-value_type.

reference

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::reference  [inherited]
```

This type represents a reference-to-value_type.

value_type

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type  [inherited]
```

The type "pointed to" by the iterator.

6.458.3 Constructor & Destructor Documentation

front_insert_iterator()

```
template<typename _Container>
std::front_insert_iterator< _Container >::front_insert_iterator (
            _Container & __x)  [inline], [explicit], [constexpr]
```

The only way to create this iterator is with a container.
References std::__addressof().

6.458.4 Member Function Documentation

operator*()

```
template<typename _Container>
front_insert_iterator & std::front_insert_iterator< _Container >::operator* ()  [inline], [nodiscard],
[constexpr]
```

Simply returns *this.

operator++() [1/2]

```
template<typename _Container>
front_insert_iterator & std::front_insert_iterator< _Container >::operator++ ()  [inline], [constexpr]
```

Simply returns *this. (This iterator does not *move*.).

operator++() [2/2]

```
template<typename _Container>
front_insert_iterator std::front_insert_iterator< _Container >::operator++ (
            int )  [inline], [constexpr]
```

Simply returns *this. (This iterator does not *move*.).

operator=()

```
template<typename _Container>
front_insert_iterator & std::front_insert_iterator< _Container >::operator= (
            const typename _Container::value_type & __value)  [inline], [constexpr]
```

Parameters

__value	An instance of whatever type container_type::const_reference is; presumably a reference-to-const T for container<T>.

Returns

This iterator, for chained operations.

This kind of iterator doesn't really have a *position* in the container (you can think of the position as being permanently at the front, if you like). Assigning a value to the iterator will always prepend the value to the front of the container.
The documentation for this class was generated from the following file:

- const type_info & target_type () const noexcept

- template<typename _Functor>
  _Functor * target () noexcept
- template<typename _Functor>
  const _Functor * target () const noexcept

6.459.1 Detailed Description

template<typename _Res, typename... _ArgTypes>
class std::function< _Res(_ArgTypes...)>

Polymorphic function wrapper.

Since

C++11

6.459.2 Constructor & Destructor Documentation

function() [1/5]

```
template<typename _Res, typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::function () [inline], [noexcept]
```

Default construct creates an empty function call wrapper.

Postcondition

`!(bool)*this`

References function().
Referenced by function(), function(), function(), function(), function(), operator=(), operator=(), operator=(), operator=(), operator=(), swap(), and target().

function() [2/5]

```
template<typename _Res, typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::function (
            nullptr_t ) [inline], [noexcept]
```

Creates an empty function call wrapper.

Postcondition

! (bool)*this

References function().

function() [3/5]

```
template<typename _Res, typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::function (
            const function< _Res(_ArgTypes...)> & __x) [inline]
```

Function copy constructor.

Parameters

_↩ _x	A function object with identical call signature.

Postcondition

`bool(*this) == bool(__x)`

The newly-created function contains a copy of the target of `__x` (if it has one).
References function().

function() [4/5]

```
template<typename _Res, typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::function (
            function< _Res(_ArgTypes...)> && __x) [inline], [noexcept]
```

Function move constructor.

Parameters

_↩ _x	A function object rvalue with identical call signature.

The newly-created function contains the target of `__x` (if it has one).
References function().

function() [5/5]

```
template<typename _Res, typename... _ArgTypes>
template<typename _Functor, typename _Constraints = _Requires<_Callable<_Functor>>>
std::function< _Res(_ArgTypes...)>::function (
            _Functor && __f) [inline], [noexcept]
```

Builds a function that targets a copy of the incoming function object.

Parameters

↩ _↩ ↩ _↩ *f*	A function object that is callable with parameters of type `ArgTypes...` and returns a value convertible to `Res`.

The newly-created function object will target a copy of `__f`. If `__f` is `reference_wrapper<F>`, then this function object will contain a reference to the function object `__f.get()`. If `__f` is a null function pointer, null pointer-to-member, or empty `std::function`, the newly-created object will be empty.
If `__f` is a non-null function pointer or an object of type `reference_wrapper<F>`, this function will not throw.
References function(), and std::forward().

6.459.3 Member Function Documentation

operator bool()

```
template<typename _Res, typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::operator bool () const [inline], [explicit], [noexcept]
```

Determine if the function wrapper has a target.

Returns

`true` when this function object contains a target, or `false` when it is empty.

This function will not throw exceptions.

operator()()

```
template<typename _Res, typename... _ArgTypes>
_Res std::function< _Res(_ArgTypes...)>::operator() (
            _ArgTypes... __args) const [inline]
```

Invokes the function targeted by `*this`.

Returns

the result of the target.

Exceptions

`bad_function_call`	when `!(bool)*this`

The function call operator invokes the target function object stored by `this`.
References std::forward(), and operator()().
Referenced by operator()().

operator=() [1/5]

```
template<typename _Res, typename... _ArgTypes>
template<typename _Functor>
_Requires< _Callable< _Functor >, function & > std::function< _Res(_ArgTypes...)>::operator= (
            _Functor && __f) [inline], [noexcept]
```

Function assignment to a new target.

Parameters

↩ _↩ ↩ _↩ *f*	A function object that is callable with parameters of type `_ArgTypes...` and returns a value convertible to `_Res`.

Returns

`*this`

Since

C++11

This function object wrapper will target a copy of `__f`. If `__f` is `reference_wrapper<F>`, then this function object will contain a reference to the function object `__f.get()`. If `__f` is a null function pointer or null pointer-to-member, this object will be empty.
If `__f` is a non-null function pointer or an object of type `reference_wrapper<F>`, this function will not throw.
References function(), std::forward(), and operator=().

operator=() [2/5]

```
template<typename _Res, typename... _ArgTypes>
function & std::function< _Res(_ArgTypes...)>::operator= (
            const function< _Res(_ArgTypes...)> & __x)  [inline]
```

Function assignment operator.

Parameters

_↩ *_x*	A function with identical call signature.

Postcondition

`(bool)*this == (bool)x`

Returns

`*this`

The target of `__x` is copied to `*this`. If `__x` has no target, then `*this` will be empty.
If `__x` targets a function pointer or a reference to a function object, then this operation will not throw an exception.
References function(), and operator=().
Referenced by operator=(), operator=(), operator=(), operator=(), and operator=().

operator=() [3/5]

```
template<typename _Res, typename... _ArgTypes>
function & std::function< _Res(_ArgTypes...)>::operator= (
            function< _Res(_ArgTypes...)> && __x)  [inline], [noexcept]
```

Function move-assignment operator.

Parameters

_↩ _x	A function rvalue with identical call signature.

Returns

`*this`

The target of `__x` is moved to `*this`. If `__x` has no target, then `*this` will be empty.
If `__x` targets a function pointer or a reference to a function object, then this operation will not throw an exception.
References function(), std::move(), and operator=().

operator=() [4/5]

```
template<typename _Res, typename...  _ArgTypes>
function & std::function< _Res(_ArgTypes...)>::operator= (
            nullptr_t )  [inline], [noexcept]
```

Function assignment to empty.

Postcondition

`!(bool)*this`

Returns

`*this`

The target of `*this` is deallocated, leaving it empty.
References function(), and operator=().

operator=() [5/5]

```
template<typename _Res, typename...  _ArgTypes>
template<typename _Functor>
function & std::function< _Res(_ArgTypes...)>::operator= (
            reference_wrapper< _Functor > __f)  [inline], [noexcept]
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.
References function(), and operator=().

swap()

```
template<typename _Res, typename...  _ArgTypes>
void std::function< _Res(_ArgTypes...)>::swap (
            function< _Res(_ArgTypes...)> & __x)  [inline], [noexcept]
```

Swap the targets of two function objects.

Parameters

_↩ _x	A function with identical call signature.

Swap the targets of `this` function object and `__f`. This function will not throw exceptions.
References function(), and swap().
Referenced by swap().

target() [1/2]

```
template<typename _Res, typename... _ArgTypes>
template<typename _Functor>
const _Functor * std::function< _Res(_ArgTypes...)>::target () const [inline], [noexcept]
```
Access the stored target function object.

Returns

Returns a pointer to the stored target function object, if `typeid(_Functor).equals(target_type())`; otherwise, a null pointer.

This function does not throw exceptions.
References target(), and target_type().

target() [2/2]

```
template<typename _Res, typename... _ArgTypes>
template<typename _Functor>
_Functor * std::function< _Res(_ArgTypes...)>::target () [inline], [noexcept]
```
Access the stored target function object.

Returns

Returns a pointer to the stored target function object, if `typeid(_Functor).equals(target_type())`; otherwise, a null pointer.

This function does not throw exceptions.
References function(), and target().
Referenced by target(), and target().

target_type()

```
template<typename _Res, typename... _ArgTypes>
const type_info & std::function< _Res(_ArgTypes...)>::target_type () const [inline], [noexcept]
```
Determine the type of the target of this function object wrapper.

Returns

the type identifier of the target function object, or `typeid(void)` if `!(bool)*this`.

This function will not throw exceptions.
References target_type().
Referenced by target(), and target_type().

6.460.1 Detailed Description

template<typename _Res, typename... _ArgTypes, bool _Noex>
class std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>

Non-owning polymorphic function wrapper.

Since

C++26

The `std::function_ref` class template is a non-owning call wrapper, that refers to a bound object. Using function_ref outside of the lifetime of the bound object has undefined behavior.
It supports const-qualification and no-throw guarantees. The qualifications and exception-specification of the signature are respected when invoking the reference function.

6.460.2 Constructor & Destructor Documentation

function_ref() [1/5]

```
template<typename _Res, typename...  _ArgTypes, bool _Noex>
template<typename _Fn>
std::function_ref< _Res(_ArgTypes...)  _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref (
            _Fn * __fn)  [inline], [noexcept]
```

Target and bound object is function pointed by parameter.

function_ref() [2/5]

```
template<typename _Res, typename...  _ArgTypes, bool _Noex>
template<typename _Fn, typename _Vt = remove_reference_t<_Fn>>
std::function_ref< _Res(_ArgTypes...)  _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref (
            _Fn && __f)  [inline], [constexpr], [noexcept]
```

Target and bound object is object referenced by parameter.
References std::addressof(), and std::forward().

function_ref() [3/5]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<auto __fn, typename _Fn>
std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref (
            constant_wrapper< __fn, _Fn > ) [inline], [constexpr], [noexcept]
```

Target object is __fn. There is no bound object.
References std::__invoke().

function_ref() [4/5]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<auto __fn, typename _Fn, typename _Up, typename _Td = remove_reference_t<_Up>>
std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref (
            constant_wrapper< __fn, _Fn > ,
            _Up && __ref) [inline], [constexpr], [noexcept]
```

Target object is equivalent to std::bind_front<_fn>(std::ref(__ref)). Bound object is object referenced by second parameter.
References std::addressof().

function_ref() [5/5]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<auto __fn, typename _Fn, typename _Td>
std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref (
            constant_wrapper< __fn, _Fn > ,
            _Td _GLIBCXX_MOF_CV * __ptr) [inline], [constexpr], [noexcept]
```

Target object is equivalent to std::bind_front<_fn>(__ptr). Bound object is object pointed by second parameter (if any).

6.460.3 Member Function Documentation

operator()()

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
_Res std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator() (
            _ArgTypes... __args) const [inline], [noexcept]
```

Invoke the target object.
The bound object will be invoked using the supplied arguments, and as const or non-const, as dictated by the template arguments of the `function_ref` specialization.
References std::forward().

6.465.1 Detailed Description

template<typename _RealType = double>
class std::gamma_distribution< _RealType >

A gamma continuous distribution for random numbers.
The formula for the gamma probability density function is:

$$p(x|\alpha,\beta) = \frac{1}{\beta\Gamma(\alpha)}(x/\beta)^{\alpha-1}e^{-x/\beta}$$

Since

C++11

6.465.2 Member Typedef Documentation

result_type

```
template<typename _RealType = double>
typedef _RealType std::gamma_distribution< _RealType >::result_type
```

The type of the range of the distribution.

6.465.3 Constructor & Destructor Documentation

gamma_distribution() [1/2]

```
template<typename _RealType = double>
std::gamma_distribution< _RealType >::gamma_distribution ()  [inline]
```

Constructs a gamma distribution with parameters 1 and 1.

gamma_distribution() [2/2]

```
template<typename _RealType = double>
std::gamma_distribution< _RealType >::gamma_distribution (
            _RealType __alpha_val,
            _RealType __beta_val = _RealType(1))  [inline], [explicit]
```

Constructs a gamma distribution with parameters α and β.

6.465.4 Member Function Documentation

alpha()

```
template<typename _RealType = double>
_RealType std::gamma_distribution< _RealType >::alpha () const  [inline]
```

Returns the α of the distribution.

beta()

```
template<typename _RealType = double>
_RealType std::gamma_distribution< _RealType >::beta () const  [inline]
```

Returns the β of the distribution.

max()

```
template<typename _RealType = double>
result_type std::gamma_distribution< _RealType >::max () const  [inline]
```

Returns the least upper bound value of the distribution.

min()

```
template<typename _RealType = double>
result_type std::gamma_distribution< _RealType >::min () const  [inline]
```

Returns the greatest lower bound value of the distribution.

operator()() [1/2]

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::gamma_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng)  [inline]
```

Generating functions.
Referenced by operator()().

operator()() [2/2]

```
template<typename _RealType>
template<typename _UniformRandomNumberGenerator>
gamma_distribution< _RealType >::result_type std::gamma_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng,
            const param_type & __param)
```

Marsaglia, G. and Tsang, W. W. "A Simple Method for Generating Gamma Variables" ACM Transactions on Mathematical Software, 26, 3, 363-372, 2000.
References std::log(), and std::pow().

param() [1/2]

```
template<typename _RealType = double>
param_type std::gamma_distribution< _RealType >::param () const  [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _RealType = double>
void std::gamma_distribution< _RealType >::param (
            const param_type & __param)  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

reset()

```
template<typename _RealType = double>
void std::gamma_distribution< _RealType >::reset ()  [inline]
```

Resets the distribution state.

6.465.5 Friends And Related Symbol Documentation

operator<<

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::gamma_distribution< _RealType1 > & __x)  [friend]
```

Inserts a gamma_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A gamma_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _RealType = double>
bool operator== (
            const gamma_distribution< _RealType > & __d1,
            const gamma_distribution< _RealType > & __d2)  [friend]
```

Return true if two gamma distributions have the same parameters and the sequences that would be generated are equal.

operator>>

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::gamma_distribution< _RealType1 > & __x)  [friend]
```

Extracts a gamma_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A gamma_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

6.466.1 Detailed Description

template<typename _IntType = int>
class std::geometric_distribution< _IntType >

A discrete geometric random number distribution.
The formula for the geometric probability density function is $p(i|p) = p(1-p)^i$ where p is the parameter of the distribution.

Since

C++11

6.466.2 Member Typedef Documentation

result_type

```
template<typename _IntType = int>
typedef _IntType std::geometric_distribution< _IntType >::result_type
```

The type of the range of the distribution.

6.466.3 Member Function Documentation

max()

```
template<typename _IntType = int>
result_type std::geometric_distribution< _IntType >::max () const  [inline]
```

Returns the least upper bound value of the distribution.

min()

```
template<typename _IntType = int>
result_type std::geometric_distribution< _IntType >::min () const  [inline]
```

Returns the greatest lower bound value of the distribution.

operator()()

```
template<typename _IntType = int>
template<typename _UniformRandomNumberGenerator>
result_type std::geometric_distribution< _IntType >::operator() (
            _UniformRandomNumberGenerator & __urng)  [inline]
```

Generating functions.
Referenced by operator()().

p()

```
template<typename _IntType = int>
double std::geometric_distribution< _IntType >::p () const  [inline]
```

Returns the distribution parameter p.

param() [1/2]

```
template<typename _IntType = int>
param_type std::geometric_distribution< _IntType >::param () const  [inline]
```

Returns the parameter set of the distribution.
Referenced by std::operator>>().

param() [2/2]

```
template<typename _IntType = int>
void std::geometric_distribution< _IntType >::param (
            const param_type & __param)  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

reset()

```
template<typename _IntType = int>
void std::geometric_distribution< _IntType >::reset ()  [inline]
```

Resets the distribution state.
Does nothing for the geometric distribution.

6.466.4 Friends And Related Symbol Documentation

operator==

```
template<typename _IntType = int>
bool operator== (
            const geometric_distribution< _IntType > & __d1,
            const geometric_distribution< _IntType > & __d2)  [friend]
```

Return true if two geometric distributions have the same parameters.

6.467.1 Detailed Description

template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn = detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
class __gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy, Store_Hash, _Alloc >

A general-probing hash-based associative container.

Template Parameters

Key	Key type.
Mapped	Map type.
Hash_Fn	Hashing functor.
Eq_Fn	Equal functor.
Comb_Probe_Fn	Combining probe functor. If Hash_Fn is not null_type, then this is the ranged-probe functor; otherwise, this is the range-hashing functor. XXX See Design::Hash-Based Containers::Hash Policies.
Probe_Fn	Probe functor.
Resize_Policy	Resizes hash.
Store_Hash	Indicates whether the hash value will be stored along with each key. If Hash_Fn is null_type, then the container will not compile if this value is true
_Alloc	Allocator type.

Base tag choices are: gp_hash_tag.
Base is basic_hash_table.

6.467.2 Constructor & Destructor Documentation

gp_hash_table() [1/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↩
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
```

```
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb↩
_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_↩
Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table ()  [inline]
```

Default constructor.

gp_hash_table() [2/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↩
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb↩
_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_↩
Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
            const hash_fn & h)  [inline]
```

Constructor taking some policy objects. r_hash_fn will be copied by the hash_fn object of the container object.

gp_hash_table() [3/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↩
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb↩
_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_↩
Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
            const hash_fn & h,
            const eq_fn & e)  [inline]
```

Constructor taking some policy objects. r_hash_fn will be copied by the hash_fn object of the container object, and r_eq_fn will be copied by the eq_fn object of the container object.

gp_hash_table() [4/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↩
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb↩
_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_↩
Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
            const hash_fn & h,
            const eq_fn & e,
            const comb_probe_fn & cp)  [inline]
```

Constructor taking some policy objects. r_hash_fn will be copied by the hash_fn object of the container object, r_eq_fn will be copied by the eq_fn object of the container object, and r_comb_probe_fn will be copied by the comb_probe_fn object of the container object.

gp_hash_table() [5/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↩
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb↩
_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_↩
```

```
Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
             const hash_fn & h,
             const eq_fn & e,
             const comb_probe_fn & cp,
             const probe_fn & p)  [inline]
```

Constructor taking some policy objects. r_hash_fn will be copied by the hash_fn object of the container object, r_eq_fn will be copied by the eq_fn object of the container object, r_comb_probe_fn will be copied by the comb_probe_fn object of the container object, and r_probe_fn will be copied by the probe_fn object of the container object.

gp_hash_table() [6/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↩
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb↩
_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_↩
Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
             const hash_fn & h,
             const eq_fn & e,
             const comb_probe_fn & cp,
             const probe_fn & p,
             const resize_policy & rp)  [inline]
```

Constructor taking some policy objects. r_hash_fn will be copied by the hash_fn object of the container object, r_eq_fn will be copied by the eq_fn object of the container object, r_comb_probe_fn will be copied by the comb_probe_fn object of the container object, r_probe_fn will be copied by the probe_fn object of the container object, and r_resize_policy will be copied by the Resize_Policy object of the container object.

gp_hash_table() [7/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↩
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb↩
_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_↩
Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
             It first,
             It last)  [inline]
```

Constructor taking __iterators to a range of value_types. The value_types between first_it and last_it will be inserted into the container object.

gp_hash_table() [8/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↩
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb↩
_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_↩
Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
```

```
            It first,
            It last,
            const hash_fn & h)  [inline]
```

Constructor taking __iterators to a range of value_types and some policy objects. The value_types between first_it and last_it will be inserted into the container object. r_hash_fn will be copied by the hash_fn object of the container object.

gp_hash_table() [9/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↩
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb↩
_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_↩
Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
            It first,
            It last,
            const hash_fn & h,
            const eq_fn & e)  [inline]
```

Constructor taking __iterators to a range of value_types and some policy objects. The value_types between first_it and last_it will be inserted into the container object. r_hash_fn will be copied by the hash_fn object of the container object, and r_eq_fn will be copied by the eq_fn object of the container object.

gp_hash_table() [10/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↩
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb↩
_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_↩
Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
            It first,
            It last,
            const hash_fn & h,
            const eq_fn & e,
            const comb_probe_fn & cp)  [inline]
```

Constructor taking __iterators to a range of value_types and some policy objects. The value_types between first_it and last_it will be inserted into the container object. r_hash_fn will be copied by the hash_fn object of the container object, r_eq_fn will be copied by the eq_fn object of the container object, and r_comb_probe_fn will be copied by the comb_probe_fn object of the container object.

gp_hash_table() [11/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↩
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb↩
_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_↩
Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
            It first,
```

```
            It last,
            const hash_fn & h,
            const eq_fn & e,
            const comb_probe_fn & cp,
            const probe_fn & p)  [inline]
```

Constructor taking __iterators to a range of value_types and some policy objects. The value_types between first_it and last_it will be inserted into the container object. r_hash_fn will be copied by the hash_fn object of the container object, r_eq_fn will be copied by the eq_fn object of the container object, r_comb_probe_fn will be copied by the comb_probe_fn object of the container object, and r_probe_fn will be copied by the probe_fn object of the container object.

gp_hash_table() [12/12]

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↩
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb↩

6.469.1 Detailed Description

template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
class __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_Fn, Probe_Fn, Resize_Policy >

A general-probing hash-based container.

Template Parameters

Key	Key type.
Mapped	Map type.
Hash_Fn	Hashing functor. Default is __gnu_cxx::hash.
Eq_Fn	Equal functor. Default std::equal_to<Key>
_Alloc	Allocator type.
Store_Hash	If key type stores extra metadata. Defaults to false.
Comb_Probe_Fn	Combining probe functor. If Hash_Fn is not null_type, then this is the ranged-probe functor; otherwise, this is the range-hashing functor. XXX See Design::Hash-Based Containers::Hash Policies. Default direct_mask_range_hashing.
Probe_Fn	Probe functor. Defaults to linear_probe_fn, also quadratic_probe_fn.
Resize_Policy	Resizes hash. Defaults to hash_standard_resize_policy, using hash_exponential_size_policy and hash_load_check_resize_trigger.

Bases are: detail::hash_eq_fn, Resize_Policy, detail::ranged_probe_fn, detail::types_traits. (Optional: detail::debug_↩ map_base.)

6.469.2 Member Enumeration Documentation

anonymous enum

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
anonymous enum
```

Value stores hash, true or false.

6.469.3 Member Function Documentation

empty()

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
bool __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_↩
Fn, Probe_Fn, Resize_Policy >::empty () const  [inline], [nodiscard]
```

True if size() == 0.

get_comb_probe_fn() [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
Comb_Probe_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_comb_probe_fn ()
```

Return current comb_probe_fn.

get_comb_probe_fn() [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
const Comb_Probe_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_↩
Hash, Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_comb_probe_fn () const
```

Return current const comb_probe_fn.

get_eq_fn() [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
Eq_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_↩
Probe_Fn, Probe_Fn, Resize_Policy >::get_eq_fn ()
```

Return current eq_fn.

get_eq_fn() [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
const Eq_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,
Comb_Probe_Fn, Probe_Fn, Resize_Policy >::get_eq_fn () const
```

Return current const eq_fn.

get_hash_fn() [1/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
Hash_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_↩
Probe_Fn, Probe_Fn, Resize_Policy >::get_hash_fn ()
```

Return current hash_fn.

get_hash_fn() [2/2]

```
template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool
Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>
const Hash_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,

Friends

- template<typename _Tp>
  class **valarray**

6.479.1 Detailed Description

Class defining multi-dimensional subset of an array.
The slice class represents a multi-dimensional subset of an array, specified by three parameter sets: start offset, size array, and stride array. The start offset is the index of the first element of the array that is part of the subset. The size and stride array describe each dimension of the slice. Size is the number of elements in that dimension, and stride is the distance in the array between successive elements in that dimension. Each dimension's size and stride is taken to begin at an array element described by the previous dimension. The size array and stride array must be the same size. For example, if you have offset==3, stride[0]==11, size[1]==3, stride[1]==3, then slice[0,0]==array[3], slice[0,1]==array[6], slice[0,2]==array[9], slice[1,0]==array[14], slice[1,1]==array[17], slice[1,2]==array[20].

Friends

- class **valarray< _Tp >**

6.480.1 Detailed Description

template<typename _Tp>
class std::gslice_array< _Tp >

Reference to multi-dimensional subset of an array.
A gslice_array is a reference to the actual elements of an array specified by a gslice. The way to get a gslice_array is to call operator[](gslice) on a valarray. The returned gslice_array then permits carrying operations out on the referenced subset of elements in the original valarray. For example, operator+=(valarray) will add values to the subset of elements in the underlying valarray this gslice_array refers to.

Parameters

Tp	Element type.

6.480.2 Member Function Documentation

operator%=()

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator%= (
            const valarray< _Tp > & ) const
```

Modulo slice elements by corresponding elements of *v*.

operator&=()

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator&= (
            const valarray< _Tp > & ) const
```

Logical and slice elements with corresponding elements of *v*.

operator*=()

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator*= (
            const valarray< _Tp > & ) const
```

Multiply slice elements by corresponding elements of *v*.

operator+=()

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator+= (
            const valarray< _Tp > & ) const
```

Add corresponding elements of *v* to slice elements.

operator-=()

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator-= (
            const valarray< _Tp > & ) const
```

Subtract corresponding elements of *v* from slice elements.

operator/=()

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator/= (
            const valarray< _Tp > & ) const
```

Divide slice elements by corresponding elements of *v*.

operator<<=()

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator<<= (
            const valarray< _Tp > & ) const
```

Left shift slice elements by corresponding elements of *v*.

operator>>=()

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator>>= (
            const valarray< _Tp > & ) const
```

Right shift slice elements by corresponding elements of *v*.

operator^=()

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator^= (
            const valarray< _Tp > & ) const
```

Logical xor slice elements with corresponding elements of *v*.

operator"" |=()

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator|= (
            const valarray< _Tp > & ) const
```

Logical or slice elements with corresponding elements of *v*.

6.505 std::hash< experimental::optional< _Tp > > Struct Template Reference

`#include <optional>`

Public Types

- using **argument_type**
- using **result_type**

Public Member Functions

- size_t **operator()** (const experimental::optional< _Tp > &__t) const noexcept(noexcept(hash< _Tp > {}(*__t)))

6.505.1 Detailed Description

template<typename _Tp>
struct std::hash< experimental::optional< _Tp > >

std::hash partial specialization for experimental::optional
The documentation for this struct was generated from the following file:

- experimental/optional

6.506 std::hash< experimental::shared_ptr< _Tp > > Struct Template Reference

`#include <shared_ptr.h>`

Public Member Functions

- size_t **operator()** (const experimental::shared_ptr< _Tp > &__s) const noexcept

6.506.1 Detailed Description

template<typename _Tp>
struct std::hash< experimental::shared_ptr< _Tp > >

std::hash specialization for shared_ptr.
The documentation for this struct was generated from the following file:

- experimental/bits/shared_ptr.h

6.507 std::hash< float > Struct Reference

`#include <functional_hash.h>`

Public Member Functions

- size_t **operator()** (float __val) const noexcept

6.507.1 Detailed Description

Specialization for float.
The documentation for this struct was generated from the following file:

- functional_hash.h

6.508 std::hash< int > Struct Reference

`#include <functional_hash.h>`

Public Member Functions

- size_t **operator()** (int __val) const noexcept

6.508.1 Detailed Description

Explicit specialization for int.
The documentation for this struct was generated from the following file:

- functional_hash.h

6.509 std::hash< long > Struct Reference

`#include <functional_hash.h>`

Public Member Functions

- size_t **operator()** (long __val) const noexcept

6.509.1 Detailed Description

Explicit specialization for long.
The documentation for this struct was generated from the following file:

- functional_hash.h

6.510 std::hash< long double > Struct Reference

`#include <functional_hash.h>`

Public Member Functions

- size_t **operator()** (long double __val) const noexcept

6.510.1 Detailed Description

Specialization for long double.
The documentation for this struct was generated from the following file:

- functional_hash.h

6.511 std::hash< long long > Struct Reference

`#include <functional_hash.h>`

Public Member Functions

- size_t **operator()** (long long __val) const noexcept

6.511.1 Detailed Description

Explicit specialization for long long.
The documentation for this struct was generated from the following file:

- functional_hash.h

6.512 std::hash< shared_ptr< _Tp > > Struct Template Reference

`#include <shared_ptr.h>`

Public Member Functions

- size_t **operator()** (const shared_ptr< _Tp > &__s) const noexcept

6.512.1 Detailed Description

template<typename _Tp>
struct std::hash< shared_ptr< _Tp > >

std::hash specialization for shared_ptr.
The documentation for this struct was generated from the following file:

- bits/shared_ptr.h

6.513 std::hash< short > Struct Reference

`#include <functional_hash.h>`

Public Member Functions

- size_t **operator()** (short __val) const noexcept

6.513.1 Detailed Description

Explicit specialization for short.
The documentation for this struct was generated from the following file:

- functional_hash.h

6.514 std::hash< signed char > Struct Reference

`#include <functional_hash.h>`

Public Member Functions

- size_t **operator()** (signed char __val) const noexcept

6.514.1 Detailed Description

Explicit specialization for signed char.
The documentation for this struct was generated from the following file:

- functional_hash.h

6.515 std::hash< thread::id > Struct Reference

`#include <std_thread.h>`

Public Member Functions

- size_t **operator()** (const thread::id &__id) const noexcept

6.515.1 Detailed Description

std::hash specialization for thread::id.
The documentation for this struct was generated from the following file:

- std_thread.h

6.516 std::hash< type_index > Struct Reference

`#include <typeindex>`

Public Types

- typedef type_index **argument_type**
- typedef size_t **result_type**

Public Member Functions

- size_t **operator()** (const type_index &__ti) const noexcept

6.516.1 Detailed Description

std::hash specialization for type_index.
The documentation for this struct was generated from the following file:

- typeindex

6.517 std::hash< unique_ptr< _Tp, _Dp > > Struct Template Reference

`#include <unique_ptr.h>`

6.517.1 Detailed Description

template<typename _Tp, typename _Dp>
struct std::hash< unique_ptr< _Tp, _Dp > >

std::hash specialization for unique_ptr.
The documentation for this struct was generated from the following file:

- unique_ptr.h

6.518 std::hash< unsigned char > Struct Reference

`#include <functional_hash.h>`

Public Member Functions

- size_t **operator()** (unsigned char __val) const noexcept

6.518.1 Detailed Description

Explicit specialization for unsigned char.
The documentation for this struct was generated from the following file:

- functional_hash.h

6.519 std::hash< unsigned int > Struct Reference

`#include <functional_hash.h>`

Public Member Functions

- size_t **operator()** (unsigned int __val) const noexcept

6.519.1 Detailed Description

Explicit specialization for unsigned int.
The documentation for this struct was generated from the following file:

- functional_hash.h

6.520 std::hash< unsigned long > Struct Reference

`#include <functional_hash.h>`

Public Member Functions

- size_t **operator()** (unsigned long __val) const noexcept

6.520.1 Detailed Description

Explicit specialization for unsigned long.
The documentation for this struct was generated from the following file:

- functional_hash.h

6.521 std::hash< unsigned long long > Struct Reference

`#include <functional_hash.h>`

Public Member Functions

- size_t **operator()** (unsigned long long __val) const noexcept

6.521.1 Detailed Description

Explicit specialization for unsigned long long.
The documentation for this struct was generated from the following file:

- functional_hash.h

6.522 std::hash< unsigned short > Struct Reference

`#include <functional_hash.h>`

Public Member Functions

- size_t **operator()** (unsigned short __val) const noexcept

6.522.1 Detailed Description

Explicit specialization for unsigned short.
The documentation for this struct was generated from the following file:

- functional_hash.h

6.523 std::hash< wchar_t > Struct Reference

`#include <functional_hash.h>`

Public Member Functions

- size_t **operator()** (wchar_t __val) const noexcept

6.523.1 Detailed Description

Explicit specialization for wchar_t.
The documentation for this struct was generated from the following file:

- functional_hash.h

6.524 std::hash<::bitset< _Nb > > Struct Template Reference

`#include <bitset>`

Public Member Functions

- size_t **operator()** (const ::bitset< _Nb > &__b) const noexcept

6.524.1 Detailed Description

template<size_t _Nb>
struct std::hash<::bitset< _Nb > >

std::hash specialization for bitset.
The documentation for this struct was generated from the following file:

- bitset

6.525 std::hash<::vector< bool, _Alloc > > Struct Template Reference

`#include <stl_bvector.h>`

Public Member Functions

- size_t **operator()** (const ::vector< bool, _Alloc > &) const noexcept

6.525.1 Detailed Description

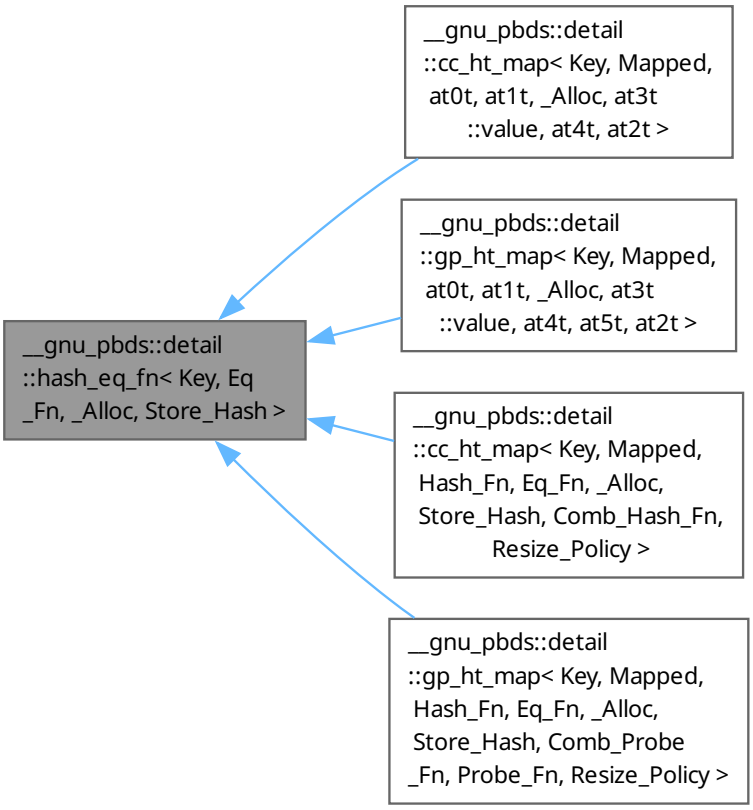
template<typename _Alloc>
struct std::hash<::vector< bool, _Alloc > >

std::hash specialization for vector<bool>.
The documentation for this struct was generated from the following files:

- stl_bvector.h
- vector.tcc

6.526 __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, Store_Hash > Struct Template Reference

Inheritance diagram for __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, Store_Hash >:



6.526.1 Detailed Description

template<typename Key, typename Eq_Fn, typename _Alloc, bool Store_Hash>
struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, Store_Hash >

Primary template.
The documentation for this struct was generated from the following file:

- hash_eq_fn.hpp

6.527 __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, false > Struct Template Reference

```
#include <hash_eq_fn.hpp>
```

Public Types

- typedef Eq_Fn **eq_fn_base**

- typedef rebind_traits< _Alloc, Key >::const_reference **key_const_reference**

Public Member Functions

- **hash_eq_fn** (const Eq_Fn &r_eq_fn)
- bool **operator()** (key_const_reference r_lhs_key, key_const_reference r_rhs_key) const
- void **swap** (const hash_eq_fn &other)

6.527.1 Detailed Description

template<typename Key, typename Eq_Fn, typename _Alloc>
struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, false >

Specialization 1 - The client requests that hash values not be stored.
The documentation for this struct was generated from the following file:

- hash_eq_fn.hpp

6.528 __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, true > Struct Template Reference

`#include <hash_eq_fn.hpp>`

Public Types

- typedef Eq_Fn **eq_fn_base**
- typedef rebind_traits< _Alloc, Key >::const_reference **key_const_reference**
- typedef _Alloc::size_type **size_type**

Public Member Functions

- **hash_eq_fn** (const Eq_Fn &r_eq_fn)
- bool **operator()** (key_const_reference r_lhs_key, size_type lhs_hash, key_const_reference r_rhs_key, size_type rhs_hash) const
- void **swap** (const hash_eq_fn &other)

6.528.1 Detailed Description

template<typename Key, class Eq_Fn, class _Alloc>
struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, true >

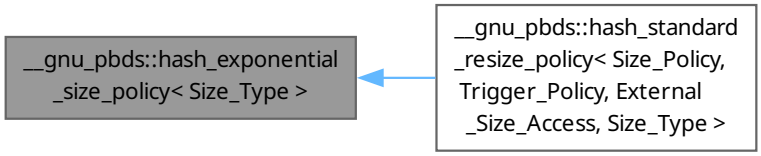
Specialization 2 - The client requests that hash values be stored.
The documentation for this struct was generated from the following file:

- hash_eq_fn.hpp

6.529 __gnu_pbds::hash_exponential_size_policy< Size_Type > Class Template Reference

`#include <hash_policy.hpp>`

Inheritance diagram for __gnu_pbds::hash_exponential_size_policy< Size_Type >:



Public Types

- typedef Size_Type **size_type**

Public Member Functions

- hash_exponential_size_policy (size_type start_size=8, size_type grow_factor=2)
- void **swap** (hash_exponential_size_policy< Size_Type > &other)

Protected Member Functions

- size_type **get_nearest_larger_size** (size_type size) const
- size_type **get_nearest_smaller_size** (size_type size) const

6.529.1 Detailed Description

template<typename Size_Type = std::size_t>
class __gnu_pbds::hash_exponential_size_policy< Size_Type >

A size policy whose sequence of sizes form an exponential sequence (typically powers of 2.

6.529.2 Constructor & Destructor Documentation

hash_exponential_size_policy()

```
template<typename Size_Type>
__gnu_pbds::hash_exponential_size_policy< Size_Type >::hash_exponential_size_policy (
            size_type start_size = 8,
            size_type grow_factor = 2)
```

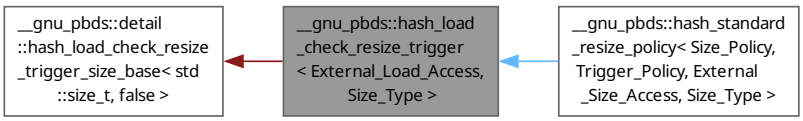
Default constructor, or onstructor taking a start_size, or constructor taking a start size and grow_factor. The policy will use the sequence of sizes start_size, start_size∗ grow_factor, start_size∗ grow_factor^2, ...
The documentation for this class was generated from the following file:

- hash_policy.hpp

6.530 __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type > Class Template Reference

```
#include <hash_policy.hpp>
```

Inheritance diagram for __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >:



Public Types

- enum { external_load_access }
- typedef Size_Type **size_type**

Public Member Functions

- hash_load_check_resize_trigger (float load_min=0.125, float load_max=0.5)
- std::pair< float, float > get_loads () const
- void set_loads (std::pair< float, float > load_pair)
- void **swap** (hash_load_check_resize_trigger &other)

- bool **is_resize_needed** () const
- void notify_cleared ()
- void **notify_erase_search_collision** ()
- void **notify_erase_search_end** ()
- void **notify_erase_search_start** ()
- void **notify_erased** (size_type num_entries)
- void **notify_externally_resized** (size_type new_size)
- void **notify_find_search_collision** ()
- void **notify_find_search_end** ()
- void **notify_find_search_start** ()
- void **notify_insert_search_collision** ()
- void **notify_insert_search_end** ()
- void **notify_insert_search_start** ()
- void notify_inserted (size_type num_entries)
- void notify_resized (size_type new_size)

6.530.1 Detailed Description

template<bool External_Load_Access = false, typename Size_Type = std::size_t>
class __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >

A resize trigger policy based on a load check. It keeps the load factor between some load factors load_min and load↩
_max.

6.530.2 Member Enumeration Documentation

anonymous enum

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
anonymous enum
```

Enumerator

external_load_access	Specifies whether the load factor can be accessed externally. The two options have different trade-offs in terms of flexibility, genericity, and encapsulation.

6.530.3 Constructor & Destructor Documentation

hash_load_check_resize_trigger()

```
template<bool External_Load_Access, typename Size_Type>
__gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::hash_load_check_↩
resize_trigger (
            float load_min = 0.125,
            float load_max = 0.5)
```

Default constructor, or constructor taking load_min and load_max load factors between which this policy will keep the actual load.

6.530.4 Member Function Documentation

get_loads()

```
template<bool External_Load_Access, typename Size_Type>
std::pair< float, float > __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size↩
_Type >::get_loads () const  [inline]
```

Returns a pair of the minimal and maximal loads, respectively.

notify_cleared()

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::notify_↩
cleared ()  [protected]
```

Notifies the table was cleared.

notify_inserted()

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::notify_↩
inserted (
            size_type num_entries)  [inline], [protected]
```

Notifies an element was inserted. The total number of entries in the table is num_entries.

notify_resized()

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::notify_↩
resized (
            size_type new_size)  [protected]
```

Notifies the table was resized as a result of this object's signifying that a resize is needed.

References notify_resized().
Referenced by notify_resized().

set_loads()

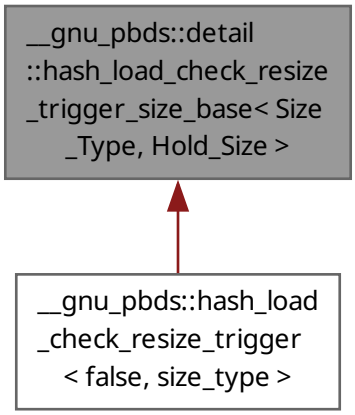
```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::set_loads (
            std::pair< float, float > load_pair)
```

Sets the loads through a pair of the minimal and maximal loads, respectively.
The documentation for this class was generated from the following file:

- hash_policy.hpp

6.531 __gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, Hold_Size > Class Template Reference

Inheritance diagram for __gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, Hold_Size >:



6.531.1 Detailed Description

template<typename Size_Type, bool Hold_Size>
class __gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, Hold_Size >

Primary template.
The documentation for this class was generated from the following file:

- hash_load_check_resize_trigger_size_base.hpp

6.532 __gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, true > Class Template Reference

6.536.1 Detailed Description

A size policy whose sequence of sizes form a nearly-exponential sequence of primes.

6.536.2 Member Typedef Documentation

size_type

```
typedef std::size_t __gnu_pbds::hash_prime_size_policy::size_type
```

Size type.

6.536.3 Constructor & Destructor Documentation

hash_prime_size_policy()

```
__gnu_pbds::hash_prime_size_policy::hash_prime_size_policy (
            size_type start_size = 8)  [inline]
```

Default constructor, or onstructor taking a start_size The policy will use the sequence of sizes approximately start_size, start_size∗ 2, start_size∗ 2^2, ...

6.538.1 Detailed Description

template<typename Size_Policy = hash_exponential_size_policy<>, typename Trigger_Policy = hash_load_check_resize_trigger<>, bool External_Size_Access = false, typename Size_Type = std::size_t>
class __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_Type >

A resize policy which delegates operations to size and trigger policies.

6.538.2 Member Enumeration Documentation

anonymous enum

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
anonymous enum  [inherited]
```

Enumerator

external_load_access	Specifies whether the load factor can be accessed externally. The two options have different trade-offs in terms of flexibility, genericity, and encapsulation.

6.538.3 Constructor & Destructor Documentation

hash_standard_resize_policy() [1/3]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↩
_Type>
__gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size↩
_Type >::hash_standard_resize_policy ()
```

Default constructor.

hash_standard_resize_policy() [2/3]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↩
_Type>
__gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size↩
_Type >::hash_standard_resize_policy (
            const Size_Policy & r_size_policy)
```

constructor taking some policies r_size_policy will be copied by the Size_Policy object of this object.

hash_standard_resize_policy() [3/3]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↩
_Type>
__gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size↩
_Type >::hash_standard_resize_policy (
            const Size_Policy & r_size_policy,
            const Trigger_Policy & r_trigger_policy)
```

constructor taking some policies. r_size_policy will be copied by the Size_Policy object of this object. r_trigger_policy will be copied by the Trigger_Policy object of this object.

6.538.4 Member Function Documentation

get_actual_size()

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↩
_Type>
hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_Type >::↩
size_type __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_↩
Access, Size_Type >::get_actual_size () const  [inline]
```

Returns the actual size of the container.

get_loads()

```
template<bool External_Load_Access, typename Size_Type>
std::pair< float, float > __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size↩
_Type >::get_loads () const  [inline], [inherited]
```

Returns a pair of the minimal and maximal loads, respectively.

get_new_size()

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↩
_Type>
hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_Type >::↩
size_type __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_↩
Access, Size_Type >::get_new_size (
```

```
            size_type size,
            size_type num_used_e) const  [protected]
```

Queries what the new size should be, when the container is resized naturally. The current __size of the container is size, and the number of used entries within the container is num_used_e.

get_size_policy() [1/2]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↩
_Type>
Size_Policy & __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_↩
Size_Access, Size_Type >::get_size_policy ()
```

Access to the Size_Policy object used.

get_size_policy() [2/2]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↩
_Type>
const Size_Policy & __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External↩
_Size_Access, Size_Type >::get_size_policy () const
```

Const access to the Size_Policy object used.

get_trigger_policy() [1/2]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↩
_Type>
Trigger_Policy & __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_↩
Size_Access, Size_Type >::get_trigger_policy ()
```

Access to the Trigger_Policy object used.

get_trigger_policy() [2/2]

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↩
_Type>
const Trigger_Policy & __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy,
External_Size_Access, Size_Type >::get_trigger_policy () const
```

Access to the Trigger_Policy object used.

resize()

```
template<typename Size_Policy, typename Trigger_Policy, bool External_Size_Access, typename Size↩
_Type>
void __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access,
Size_Type >::resize (
            size_type suggested_new_size)
```

Resizes the container to suggested_new_size, a suggested size (the actual size will be determined by the Size_Policy object).

set_loads()

```
template<bool External_Load_Access, typename Size_Type>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::set_loads (
            std::pair< float, float > load_pair)  [inherited]
```

Sets the loads through a pair of the minimal and maximal loads, respectively.
The documentation for this class was generated from the following file:

6.539 std::chrono::hh_mm_ss< _Duration > Class Template Reference

`#include <chrono>`

Public Types

- using **precision**

Public Member Functions

- constexpr **hh_mm_ss** (_Duration __d)
- constexpr chrono::hours **hours** () const noexcept
- constexpr bool **is_negative** () const noexcept
- constexpr chrono::minutes **minutes** () const noexcept
- constexpr **operator precision** () const noexcept
- constexpr chrono::seconds **seconds** () const noexcept
- constexpr precision **subseconds** () const noexcept
- constexpr precision **to_duration** () const noexcept

Static Public Attributes

- static constexpr unsigned **fractional_width**

6.539.1 Detailed Description

template<typename _Duration>
class std::chrono::hh_mm_ss< _Duration >

Utility for splitting a duration into hours, minutes, and seconds
This is a convenience type that provides accessors for the constituent parts (hours, minutes, seconds and subseconds) of a duration.

Since

C++20

The documentation for this class was generated from the following file:

- chrono

6.540 std::locale::id Class Reference

`#include <locale_classes.h>`

Public Member Functions

- id ()
- size_t **_M_id** () const throw ()

Friends

- template<typename _Facet>
  const _Facet * **__try_use_facet** (const locale &__loc)
- template<typename _Facet>
  bool has_facet (const locale &__loc) throw ()
- class **locale**
- class **locale::_Impl**
- template<typename _Facet>
  const _Facet & use_facet (const locale &__loc)

6.540.1 Detailed Description

Facet ID class.
The ID class provides facets with an index used to identify them. Every facet class must define a public static member locale::id, or be derived from a facet that provides this member, otherwise the facet cannot be used in a locale. The locale::id ensures that each class type gets a unique identifier.

6.540.2 Constructor & Destructor Documentation

id()

```
std::locale::id::id ()  [inline]
```
Constructor.

6.540.3 Friends And Related Symbol Documentation

has_facet

```
template<typename _Facet>
bool has_facet (
            const locale & __loc) throw ( )   [friend]
```
Test for the presence of a facet.
has_facet tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

Template Parameters

_Facet	The facet type to test the presence of.

Parameters

__loc	The locale to test.

Returns

true if __loc contains a facet of type _Facet, else false.

use_facet

```
template<typename _Facet>
const _Facet & use_facet (
            const locale & __loc)  [friend]
```
Return a facet.
use_facet looks for and returns a reference to a facet of type Facet where Facet is the template parameter. If has_↩ facet(locale) is true, there is a suitable facet to return. It throws std::bad_cast if the locale doesn't contain a facet of type Facet.

Template Parameters

_Facet	The facet type to access.

Parameters

__loc	The locale to use.

Returns

Reference to facet of type Facet.

Exceptions

std::bad_cast	if `__loc` doesn't contain a facet of type _Facet.

The documentation for this class was generated from the following file:

- locale_classes.h

6.544.1 Detailed Description

template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
class std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >

Produces random numbers by combining random numbers from some base engine to produce random numbers with a specified number of bits __w.

Since

C++11

6.544.2 Member Typedef Documentation

result_type

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
typedef _UIntType std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::result_↩
type
```

The type of the generated random value.

6.544.3 Constructor & Destructor Documentation

independent_bits_engine() [1/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine ()
[inline]
```

Constructs a default independent_bits_engine engine.
The underlying engine is default constructed as well.
Referenced by operator==.

independent_bits_engine() [2/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
            const _RandomNumberEngine & __rng)  [inline], [explicit]
```

Copy constructs a independent_bits_engine engine.
Copies an existing base class random number generator.

Parameters

__rng	An existing (base class) engine object.

independent_bits_engine() [3/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
            _RandomNumberEngine && __rng)  [inline], [explicit]
```

Move constructs a independent_bits_engine engine.
Copies an existing base class random number generator.

Parameters

__rng	An existing (base class) engine object.

References std::move().

independent_bits_engine() [4/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
            result_type __s)  [inline], [explicit]
```

Seed constructs a independent_bits_engine engine.
Constructs the underlying generator engine seeded with __s.

Parameters

_↩ _s	A seed value for the base class engine.

independent_bits_engine() [5/5]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
            _Sseq & __q)  [inline], [explicit]
```

Generator construct a independent_bits_engine engine.

Parameters

_↩ _q	A seed sequence.

6.544.4 Member Function Documentation

base()

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
const _RandomNumberEngine & std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType
>::base () const  [inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

discard()

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
```

```
void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::discard (
            unsigned long long __z)  [inline]
```
Discard a sequence of random numbers.

max()

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
constexpr result_type std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::max ()
[inline], [static], [constexpr]
```
Gets the maximum value in the generated random number range.

min()

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
constexpr result_type std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::min ()
[inline], [static], [constexpr]
```
Gets the minimum value in the generated random number range.

operator()()

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::result_type std::independent_bits_engine<
_RandomNumberEngine, __w, _UIntType >::operator() ()
```
Gets the next value in the generated random number sequence.
References std::__lg(), std::__numeric_limits_base::digits, and std::numeric_limits< _Tp >::max().

seed() [1/3]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::seed ()  [inline]
```
Reseeds the independent_bits_engine object with the default seed for the underlying base class generator engine.

seed() [2/3]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
template<typename _Sseq>
_If_seed_seq< _Sseq > std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::seed
(
            _Sseq & __q)  [inline]
```
Reseeds the independent_bits_engine object with the given seed sequence.

Parameters

_↩ _q	A seed generator function.

seed() [3/3]

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::seed (
            result_type __s)  [inline]
```
Reseeds the independent_bits_engine object with the default seed for the underlying base class generator engine.

6.544.5 Friends And Related Symbol Documentation

operator==

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
bool operator== (
             const independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __lhs,
             const independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __rhs)  [friend]
```

Compares two independent_bits_engine random number generator objects of the same type for equality.

Parameters

__lhs	A independent_bits_engine random number generator object.
__rhs	Another independent_bits_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

References independent_bits_engine().

operator>>

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
template<typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
             std::basic_istream< _CharT, _Traits > & __is,
             std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __x)  [friend]
```

Extracts the current state of a % subtract_with_carry_engine random number generator engine __x from the input stream __is.

Parameters

__is	An input stream.
__x	A independent_bits_engine random number generator engine.

Returns

The input stream with the state of __x extracted or in an error state.

The documentation for this class was generated from the following files:

- class **valarray**< **_Tp** >

6.545.1 Detailed Description

template<**class _Tp**>
class std::indirect_array< **_Tp** >

Reference to arbitrary subset of an array.
An indirect_array is a reference to the actual elements of an array specified by an ordered array of indices. The way to get an indirect_array is to call operator[](valarray<size_t>) on a valarray. The returned indirect_array then permits carrying operations out on the referenced subset of elements in the original valarray.

For example, if an indirect_array is obtained using the array (4,2,0) as an argument, and then assigned to an array containing (1,2,3), then the underlying array will have array[0]==3, array[2]==2, and array[4]==1.

Parameters

Tp	Element type.

6.545.2 Member Function Documentation

operator%=()

```
template<class _Tp>
void std::indirect_array< _Tp >::operator%= (
            const valarray< _Tp > & ) const
```

Modulo slice elements by corresponding elements of *v*.

operator&=()

```
template<class _Tp>
void std::indirect_array< _Tp >::operator&= (
            const valarray< _Tp > & ) const
```

Logical and slice elements with corresponding elements of *v*.

operator*=()

```
template<class _Tp>
void std::indirect_array< _Tp >::operator*= (
            const valarray< _Tp > & ) const
```

Multiply slice elements by corresponding elements of *v*.

operator+=()

```
template<class _Tp>
void std::indirect_array< _Tp >::operator+= (
            const valarray< _Tp > & ) const
```

Add corresponding elements of *v* to slice elements.

operator-=()

```
template<class _Tp>
void std::indirect_array< _Tp >::operator-= (
            const valarray< _Tp > & ) const
```

Subtract corresponding elements of *v* from slice elements.

operator/=()

```
template<class _Tp>
void std::indirect_array< _Tp >::operator/= (
            const valarray< _Tp > & ) const
```

Divide slice elements by corresponding elements of *v*.

operator<<=()

```
template<class _Tp>
void std::indirect_array< _Tp >::operator<<= (
```

```
            const valarray< _Tp > & ) const
```

Left shift slice elements by corresponding elements of *v*.

operator>>=()

```
template<class _Tp>
void std::indirect_array< _Tp >::operator>>= (
            const valarray< _Tp > & ) const
```

Right shift slice elements by corresponding elements of *v*.

operator^=()

```
template<class _Tp>
void std::indirect_array< _Tp >::operator^= (
            const valarray< _Tp > & ) const
```

Logical xor slice elements with corresponding elements of *v*.

operator"|=()

```
template<class _Tp>
void std::indirect_array< _Tp >::operator|= (
            const valarray< _Tp > & ) const
```

Logical or slice elements with corresponding elements of *v*.

6.547 std::inout_ptr_t< _Smart, _Pointer, _Args > Class Template Reference

`#include <>`

Public Member Functions

- **inout_ptr_t** (_Smart &__smart, _Args... __args)
- **inout_ptr_t** (const inout_ptr_t &)=delete
- **operator _Pointer** * () const noexcept
- **operator void** ** () const noexcept

6.547.1 Detailed Description

template<typename _Smart, typename _Pointer, typename... _Args>
class std::inout_ptr_t< _Smart, _Pointer, _Args >

Smart pointer adaptor for functions taking an inout pointer parameter.

Template Parameters

_Smart	The type of pointer to adapt.
_Pointer	The type of pointer to convert to.
_Args...	Argument types used when resetting the smart pointer.

Since

C++23

The documentation for this class was generated from the following file:

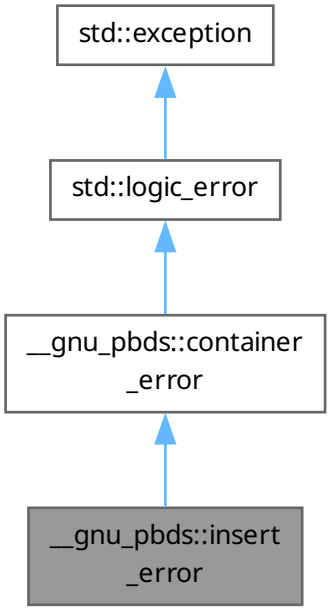
6.549 __gnu_pbds::insert_error Struct Reference

`#include <exception.hpp>`

Inheritance diagram for __gnu_pbds::insert_error:



Public Member Functions

- virtual const char * what () const noexcept

6.549.1 Detailed Description

An entry cannot be inserted into a container object for logical reasons (not, e.g., if memory is unabvailable, in which case the allocator_type's exception will be thrown).

6.549.2 Member Function Documentation

what()

```
virtual const char * std::logic_error::what () const  [virtual], [noexcept], [inherited]
```

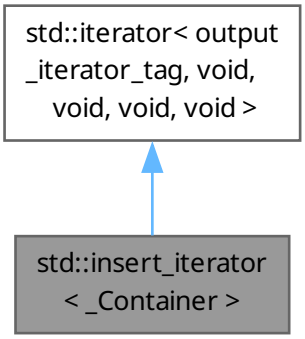
Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).
Reimplemented from std::exception.
Reimplemented in std::future_error.
References what().
Referenced by what().
The documentation for this struct was generated from the following file:

- exception.hpp

6.550 std::insert_iterator< _Container > Class Template Reference

```
#include <stl_iterator.h>
```

Inheritance diagram for std::insert_iterator< _Container >:



Public Types

- typedef _Container container_type
- using **difference_type**
- typedef output_iterator_tag iterator_category
- typedef void pointer
- typedef void reference
- typedef void value_type

Public Member Functions

- constexpr insert_iterator (_Container &__x, _Iter __i)
- constexpr insert_iterator & operator∗ ()
- constexpr insert_iterator & operator++ ()
- constexpr insert_iterator & operator++ (int)
- constexpr insert_iterator & operator= (const typename _Container::value_type &__value)
- constexpr insert_iterator & **operator=** (typename _Container::value_type &&__value)

Protected Attributes

- _Container ∗ **container**
- _Iter **iter**

6.550.1 Detailed Description

template<**typename _Container**>
class std::insert_iterator< **_Container** >

Turns assignment into insertion.
These are output iterators, constructed from a container-of-T. Assigning a T to the iterator inserts it in the container at the iterator's position, rather than overwriting the value at that position.
(Sequences will actually insert a *copy* of the value before the iterator's position.)
Tip: Using the inserter function to create these iterators can save typing.

6.550.2 Member Typedef Documentation

container_type

```
template<typename _Container>
typedef _Container std::insert_iterator< _Container >::container_type
```

A nested typedef for the type of whatever container you used.

iterator_category

```
typedef output_iterator_tag std::iterator< output_iterator_tag, void, void, void, void >::↩
iterator_category  [inherited]
```

One of the tag types.

pointer

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::pointer  [inherited]
```

This type represents a pointer-to-value_type.

reference

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::reference  [inherited]
```

This type represents a reference-to-value_type.

value_type

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type  [inherited]
```

The type "pointed to" by the iterator.

6.550.3 Constructor & Destructor Documentation

insert_iterator()

```
template<typename _Container>
std::insert_iterator< _Container >::insert_iterator (
            _Container & __x,
            _Iter __i)  [inline], [constexpr]
```

The only way to create this iterator is with a container and an initial position (a normal iterator into the container).
References std::__addressof().

6.550.4 Member Function Documentation

operator∗()

```
template<typename _Container>
insert_iterator & std::insert_iterator< _Container >::operator* ()  [inline], [nodiscard], [constexpr]
```

Simply returns ∗this.

operator++() [1/2]

```
template<typename _Container>
insert_iterator & std::insert_iterator< _Container >::operator++ ()  [inline], [constexpr]
```

Simply returns ∗this. (This iterator does not *move*.).

operator++() [2/2]

```
template<typename _Container>
insert_iterator & std::insert_iterator< _Container >::operator++ (
            int )  [inline], [constexpr]
```

Simply returns *this. (This iterator does not *move*.).

operator=()

```
template<typename _Container>
insert_iterator & std::insert_iterator< _Container >::operator= (
            const typename _Container::value_type & __value)  [inline], [constexpr]
```

Parameters

__value	An instance of whatever type container_type::const_reference is; presumably a reference-to-const T for container<T>.

Returns

This iterator, for chained operations.

This kind of iterator maintains its own position in the container. Assigning a value to the iterator will insert the value into the container at the place before the iterator.
The position is maintained such that subsequent assignments will insert values immediately after one another. For example,

```
// vector v contains A and Z

insert_iterator i (v, ++v.begin());
i = 1;
i = 2;
i = 3;

// vector v contains A, 1, 2, 3, and Z
```

6.554.1 Detailed Description

The base of the I/O class hierarchy.
This class defines everything that can be defined about I/O that does not depend on the type of characters being input or output. Most people will only see `ios_base` when they need to specify the full name of the various I/O flags (e.g., the openmodes).

6.554.2 Member Typedef Documentation

event_callback

```
typedef void(* std::ios_base::event_callback) (event __e, ios_base &__b, int __i)
```

The type of an event callback function.

Parameters

__e	One of the members of the event enum.
__b	Reference to the ios_base object.
__i	The integer provided when the callback was registered.

Event callbacks are user defined functions that get called during several ios_base and basic_ios functions, specifically imbue(), copyfmt(), and ~ios().

fmtflags

```
typedef _Ios_Fmtflags std::ios_base::fmtflags
```

This is a bitmask type.

_Ios_Fmtflags is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type fmtflags are:

- boolalpha
- dec
- fixed
- hex
- internal
- left
- oct
- right
- scientific
- showbase
- showpoint
- showpos
- skipws
- unitbuf
- uppercase
- adjustfield

- basefield
- floatfield

iostate

`typedef _Ios_Iostate std::ios_base::iostate`
This is a bitmask type.
_Ios_Iostate is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type iostate are:

- badbit
- eofbit
- failbit
- goodbit

openmode

`typedef _Ios_Openmode std::ios_base::openmode`
This is a bitmask type.
_Ios_Openmode is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type openmode are:

- app
- ate
- binary
- in
- out
- trunc

seekdir

`typedef _Ios_Seekdir std::ios_base::seekdir`
This is an enumerated type.
_Ios_Seekdir is implementation-defined. Defined values of type seekdir are:

- beg
- cur, equivalent to `SEEK_CUR` in the C standard library.
- end, equivalent to `SEEK_END` in the C standard library.

6.554.3 Member Enumeration Documentation

event

`enum std::ios_base::event`
The set of events that may be passed to an event callback.
erase_event is used during ~ios() and copyfmt(). imbue_event is used during imbue(). copyfmt_event is used during copyfmt().

6.554.4 Constructor & Destructor Documentation

~ios_base()

```
virtual std::ios_base::~ios_base ()  [virtual]
```

Invokes each callback with erase_event. Destroys local storage.
Note that the ios_base object for the standard streams never gets destroyed. As a result, any callbacks registered with the standard streams will not get invoked with erase_event (unless copyfmt is used).

6.554.5 Member Function Documentation

_M_getloc()

```
const locale & std::ios_base::_M_getloc () const  [inline]
```

Locale access.

Returns

A reference to the current locale.

Like getloc above, but returns a reference instead of generating a copy.
Referenced by std::money_get< _CharT, _InIter >::do_get(), std::num_get< _CharT, _InIter >::do_get(), std::time_get< _CharT, _InIter
std::time_get< _CharT, _InIter >::do_get_date(), std::time_get< _CharT, _InIter >::do_get_monthname(), std::time_get< _CharT, _InIte
std::time_get< _CharT, _InIter >::do_get_weekday(), std::time_get< _CharT, _InIter >::do_get_year(), std::num_put< _CharT, _OutIter
std::time_put< _CharT, _OutIter >::do_put(), std::time_get< _CharT, _InIter >::get(), and std::time_put< _CharT, _OutIter >::put().

flags() [1/2]

```
fmtflags std::ios_base::flags () const  [inline], [nodiscard]
```

Access to format flags.

Returns

The format control flags for both input and output.

Referenced by std::basic_ios< _CharT, _Traits >::copyfmt(), std::num_get< _CharT, _InIter >::do_get(), std::num_get< _CharT, _InIter >
std::num_put< _CharT, _OutIter >::do_put(), std::num_put< _CharT, _OutIter >::do_put(), std::chrono::operator<<(),
std::philox_engine< uint_fast32_t, 32, 4, 10, 0xCD9E8D57, 0x9E3779B9, 0xD2511F53, 0xBB67AE85 >::operator<<,
std::__detail::operator>>(), std::operator>>(), std::operator>>(), std::operator>>(), std::operator>>(), std::operator>>(),
std::operator>>(), std::operator>>(), and std::philox_engine< uint_fast32_t, 32, 4, 10, 0xCD9E8D57, 0x9E3779B9, 0xD2511F53, 0xBB

flags() [2/2]

```
fmtflags std::ios_base::flags (
            fmtflags __fmtfl)  [inline]
```

Setting new format flags all at once.

Parameters

__fmtfl	The new flags to set.

Returns

The previous format control flags.

This function overwrites all the format flags with *__fmtfl*.

getloc()

```
locale std::ios_base::getloc () const  [inline], [nodiscard]
```

Locale access.

Returns

A copy of the current locale.

If `imbue(loc)` has previously been called, then this function returns `loc`. Otherwise, it returns a copy of `std::locale()`, the global C++ locale.
Referenced by std::basic_ios< _CharT, _Traits >::copyfmt(), std::money_put< _CharT, _OutIter >::do_put(), std::basic_ios< _CharT, _Tr
std::chrono::operator<<(), std::operator>>(), std::operator>>(), and std::ws().

imbue()

```
locale std::ios_base::imbue (
            const locale & __loc) throw ( )
```

Setting a new locale.

Parameters

__loc	The new locale.

Returns

The previous locale.

Sets the new locale for this stream, and then invokes each callback with imbue_event.
Referenced by std::basic_ios< _CharT, _Traits >::imbue().

iword()

```
long & std::ios_base::iword (
            int __ix)  [inline]
```

Access to integer array.

Parameters

__ix	Index into the array.

Returns

A reference to an integer associated with the index.

The iword function provides access to an array of integers that can be used for any purpose. The array grows as required to hold the supplied index. All integers in the array are initialized to 0.
The implementation reserves several indices. You should use xalloc to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.
References iword().
Referenced by iword().

precision() [1/2]

```
streamsize std::ios_base::precision () const  [inline], [nodiscard]
```
Flags access.

Returns

The precision to generate on certain output operations.

Be careful if you try to give a definition of *precision* here; see DR 189.
Referenced by std::basic_ios< _CharT, _Traits >::copyfmt(), and std::chrono::operator<<().

precision() [2/2]

```
streamsize std::ios_base::precision (
            streamsize __prec)  [inline]
```
Changing flags.

Parameters

__prec	The new precision value.

Returns

The previous value of precision().

pword()

```
void *& std::ios_base::pword (
            int __ix)  [inline]
```
Access to void pointer array.

Parameters

_↩ _ix	Index into the array.

Returns

A reference to a void* associated with the index.

The pword function provides access to an array of pointers that can be used for any purpose. The array grows as required to hold the supplied index. All pointers in the array are initialized to 0.
The implementation reserves several indices. You should use xalloc to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

register_callback()

```
void std::ios_base::register_callback (
            event_callback __fn,
            int __index)
```
Add the callback __fn with parameter __index.

Parameters

__fn	The function to add.
__index	The integer to pass to the function when invoked.

Registers a function as an event callback with an integer parameter to be passed to the function when invoked. Multiple copies of the function are allowed. If there are multiple callbacks, they are invoked in the order they were registered.

setf() [1/2]

```
fmtflags std::ios_base::setf (
            fmtflags __fmtfl)  [inline]
```

Setting new format flags.

Parameters

__fmtfl	Additional flags to set.

Returns

The previous format control flags.

This function sets additional flags in format control. Flags that were previously set remain set.
Referenced by std::__detail::operator>>().

setf() [2/2]

```
fmtflags std::ios_base::setf (
            fmtflags __fmtfl,
            fmtflags __mask)  [inline]
```

Setting new format flags.

Parameters

__fmtfl	Additional flags to set.
__mask	The flags mask for *fmtfl*.

Returns

The previous format control flags.

This function clears *mask* in the format flags, then sets *fmtfl* `&` *mask*. An example mask is `ios_base::adjustfield`.

sync_with_stdio()

```
bool std::ios_base::sync_with_stdio (
            bool __sync = true)  [static]
```

Interaction with the standard C I/O objects.

Parameters

__sync	Whether to synchronize or not.

Returns

True if the standard streams were previously synchronized.

The synchronization referred to is *only* that between the standard C facilities (e.g., stdout) and the standard C++ objects (e.g., cout). User-declared streams are unaffected. See https://gcc.gnu.org/onlinedocs/libstdc++/manual/fstreams.html#std.io.filestreams.binary

unsetf()

```
void std::ios_base::unsetf (
            fmtflags __mask)  [inline]
```

Clearing format flags.

Parameters

__mask	The flags to unset.

This function clears *__mask* in the format flags.

width() [1/2]

```
streamsize std::ios_base::width () const  [inline], [nodiscard]
```

Flags access.

Returns

The minimum field width to generate on output operations.

Minimum field width refers to the number of characters.
Referenced by std::basic_ios< _CharT, _Traits >::copyfmt(), std::num_put< _CharT, _OutIter >::do_put(), std::operator>>(), and std::operator>>().

width() [2/2]

```
streamsize std::ios_base::width (
            streamsize __wide)  [inline]
```

Changing flags.

Parameters

__wide	The new width value.

Returns

The previous value of width().

xalloc()

```
int std::ios_base::xalloc () throw ( )   [static]
```
Access to unique indices.

Returns

An integer different from all previous calls.

This function returns a unique integer every time it is called. It can be used for any purpose, but is primarily intended to be a unique index for the iword and pword functions. The expectation is that an application calls xalloc in order to obtain an index in the iword and pword arrays that can be used without fear of conflict.
The implementation maintains a static variable that is incremented and returned on each invocation. xalloc is guaranteed to return an index that is safe to use in the iword and pword arrays.

6.554.6 Member Data Documentation

adjustfield

```
const fmtflags std::ios_base::adjustfield  [static]
```
A mask of left|right|internal. Useful for the 2-arg form of `setf`.
Referenced by std::num_put< _CharT, _OutIter >::do_put(), std::internal(), std::left(), and std::right().

app

```
const openmode std::ios_base::app  [static]
```
Seek to end before each write.
Referenced by std::basic_filebuf< char_type, traits_type >::_M_set_buffer(), std::basic_filebuf< _CharT, _Traits >::overflow(), and std::basic_filebuf< _CharT, _Traits >::xsputn().

ate

```
const openmode std::ios_base::ate  [static]
```
Open and seek to end immediately after opening.
Referenced by std::basic_filebuf< _CharT, _Traits >::open().

badbit

```
const iostate std::ios_base::badbit  [static]
```
Indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file).
Referenced by std::basic_istream< _CharT, _Traits >::sentry::sentry(), std::basic_ostream< _CharT, _Traits >::sentry::~sentry(), std::basic_ios< _CharT, _Traits >::clear(), std::basic_ostream< _CharT, _Traits >::flush(), std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _Traits >::ignore(), std::basic_iostream< char_type, traits_typ std::basic_ostream< _CharT, _Traits >::operator<<(), std::basic_iostream< char_type, traits_type >::operator>>(), std::basic_istream< _CharT, _Traits >::operator>>(), std::operator>>(), std::basic_ostream< _CharT, _Traits >::put(), std::basic_istream< _CharT, _Traits >::putback(), std::basic_istream< _CharT, _Traits >::readsome(), std::basic_iostream< char_type, t std::basic_istream< _CharT, _Traits >::seekg(), std::basic_istream< _CharT, _Traits >::seekg(), std::basic_istream< _CharT, _Traits >:: std::basic_istream< _CharT, _Traits >::tellg(), std::basic_istream< _CharT, _Traits >::unget(), and std::ws().

basefield

```
const fmtflags std::ios_base::basefield  [static]
```
A mask of dec|oct|hex. Useful for the 2-arg form of `setf`.
Referenced by std::dec(), std::num_get< _CharT, _InIter >::do_get(), std::num_put< _CharT, _OutIter >::do_put(), std::hex(), and std::oct().

beg

const seekdir std::ios_base::beg [static]
Request a seek relative to the beginning of the stream.
Referenced by std::basic_filebuf< _CharT, _Traits >::seekpos().

binary

const openmode std::ios_base::binary [static]
Perform input and output in binary mode (as opposed to text mode). This is probably not what you think it is; see https://gcc.gnu.org/onlinedocs/libstdc++/manual/fstreams.html#std.io.filestreams.binary.
Referenced by std::basic_filebuf< _CharT, _Traits >::showmanyc().

boolalpha

const fmtflags std::ios_base::boolalpha [static]
Insert/extract bool in alphabetic rather than numeric format.
Referenced by std::boolalpha(), std::num_get< _CharT, _InIter >::do_get(), std::num_put< _CharT, _OutIter >::do_put(), and std::noboolalpha().

cur

const seekdir std::ios_base::cur [static]
Request a seek relative to the current position within the sequence.
Referenced by std::basic_filebuf< _CharT, _Traits >::imbue(), std::basic_filebuf< _CharT, _Traits >::overflow(), std::basic_filebuf< _CharT, _Traits >::pbackfail(), std::basic_filebuf< _CharT, _Traits >::seekoff(), std::basic_stringbuf< _CharT, _Traits, std::basic_istream< _CharT, _Traits >::tellg(), and std::basic_ostream< _CharT, _Traits >::tellp().

dec

const fmtflags std::ios_base::dec [static]
Converts integer input or generates integer output in decimal base.
Referenced by std::dec(), std::philox_engine< uint_fast32_t, 32, 4, 10, 0xCD9E8D57, 0x9E3779B9, 0xD2511F53, 0xBB67AE85 >::opera and std::philox_engine< uint_fast32_t, 32, 4, 10, 0xCD9E8D57, 0x9E3779B9, 0xD2511F53, 0xBB67AE85 >::operator>>.

end

const seekdir std::ios_base::end [static]
Request a seek relative to the current end of the sequence.
Referenced by std::basic_filebuf< _CharT, _Traits >::open(), and std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff().

eofbit

const iostate std::ios_base::eofbit [static]
Indicates that an input operation reached the end of an input sequence.
Referenced by std::num_get< _CharT, _InIter >::do_get(), std::num_get< _CharT, _InIter >::do_get(), std::num_get< _CharT, _InIter >:: std::num_get< _CharT, _InIter >::do_get(), std::time_get< _CharT, _InIter >::do_get(), std::time_get< _CharT, _InIter >::do_get_date(), std::time_get< _CharT, _InIter >::do_get_monthname(), std::time_get< _CharT, _InIter >::do_get_time(), std::time_get< _CharT, _InIter std::time_get< _CharT, _InIter >::do_get_year(), std::basic_iostream< char_type, traits_type >::get(), std::basic_istream< _CharT, _Tra std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _Traits >::get(), std::time_get< _CharT, _InIter >::get(), std::basic_istream< _CharT, _Traits >::ignore(), std::basic_istream< _CharT, _Traits >::operator>>(), std::operator>>(), std::basic_istream< _CharT, _Traits >::putback(), std::basic_istream< _CharT, _Traits >::readsome(), std::basic_iostream< char_type, t std::basic_istream< _CharT, _Traits >::seekg(), std::basic_istream< _CharT, _Traits >::seekg(), std::basic_istream< _CharT, char_traits std::basic_istream< _CharT, _Traits >::unget(), and std::ws().

failbit

```
const iostate std::ios_base::failbit [static]
```

Indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.

Referenced by std::basic_ostream< _CharT, _Traits >::sentry::sentry(), std::basic_fstream< char >::close(), std::basic_ifstream< char > std::basic_ofstream< char >::close(), std::num_get< _CharT, _InIter >::do_get(), std::time_get< _CharT, _InIter >::do_get_monthname std::time_get< _CharT, _InIter >::do_get_weekday(), std::time_get< _CharT, _InIter >::do_get_year(), std::basic_iostream< char_type, std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _Traits >::get(), std::time_get< _CharT, _InIter >::get(), std::basic_fstream< char >::open(), std::basic_fstream< char >::open(), std::basic_ifstream< char >::open(), std::basic_ifstream< char >::open(), std::basic_ofstream< char >::open(), std::basic_ofstream< char >::open(), std::operator<<(), std::basic_iostream< char_type, traits_type >::operator>>(), std::basic_istream< _CharT, _Traits >::operator>>(), std::basic_istream< _CharT, _Traits >::operator>>(), std::operator>>(), std::basic_iostream< char_type, traits_type >::seekg(), std::basic_istream< _CharT, _Traits >::seekg(), std::basic_istream< _CharT, _Traits >::seekg(), std::basic_ostream< _CharT, _Traits > and std::basic_ostream< _CharT, _Traits >::seekp().

fixed

```
const fmtflags std::ios_base::fixed [static]
```

Generate floating-point output in fixed-point notation.

Referenced by std::fixed(), and std::hexfloat().

floatfield

```
const fmtflags std::ios_base::floatfield [static]
```

A mask of scientific|fixed. Useful for the 2-arg form of `setf`.

Referenced by std::defaultfloat(), std::fixed(), std::hexfloat(), and std::scientific().

goodbit

```
const iostate std::ios_base::goodbit [static]
```

Indicates all is well.

Referenced by std::basic_istream< _CharT, _Traits >::sentry::sentry(), std::num_get< _CharT, _InIter >::do_get(), std::time_get< _CharT, _InIter >::do_get(), std::time_get< _CharT, _InIter >::do_get_monthname(), std::time_get< _CharT, _InIter >::d std::time_get< _CharT, _InIter >::do_get_year(), std::basic_ostream< _CharT, _Traits >::flush(), std::basic_istream< _CharT, _Traits >: std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _Traits >::get(), std::time_get< _CharT, _InIter >::get(), std::basic_istream< _CharT, _Traits >::getline(), std::basic_istream< _CharT, _Traits >::ignore() std::basic_istream< _CharT, _Traits >::ignore(), std::basic_istream< _CharT, _Traits >::ignore(), std::basic_iostream< char_type, traits_ std::basic_ostream< _CharT, _Traits >::operator<<(), std::basic_iostream< char_type, traits_type >::operator>>(), std::basic_istream< _CharT, _Traits >::operator>>(), std::basic_istream< _CharT, _Traits >::operator>>(), std::operator>>(), std::basic_ostream< _CharT, _Traits >::put(), std::basic_istream< _CharT, _Traits >::putback(), std::basic_istream< _CharT, _Traits >:: std::basic_iostream< char_type, traits_type >::seekg(), std::basic_istream< _CharT, _Traits >::seekg(), std::basic_istream< _CharT, _T std::basic_istream< _CharT, _Traits >::sync(), std::basic_istream< _CharT, char_traits< _CharT > >::tellg(), std::basic_istream< _Cha and std::ws().

hex

```
const fmtflags std::ios_base::hex [static]
```

Converts integer input or generates integer output in hexadecimal base.

Referenced by std::num_get< _CharT, _InIter >::do_get(), std::num_put< _CharT, _OutIter >::do_put(), and std::hex().

in

```
const openmode std::ios_base::in [static]
```

Open for input. Default for `ifstream` and fstream.
Referenced by std::basic_fstream< char >::basic_fstream(), std::basic_fstream< char >::basic_fstream(), std::basic_fstream< char >::b
std::basic_ifstream< char >::basic_ifstream(), std::basic_ifstream< char >::basic_ifstream(), std::basic_ifstream< char >::basic_ifstrea
std::basic_istringstream< char >::basic_istringstream(), std::basic_stringbuf< char >::basic_stringbuf(), std::basic_stringstream< char >
std::basic_filebuf< char_type, traits_type >::_M_set_buffer(), std::basic_fstream< char >::open(), std::basic_fstream< char >::open(),
std::basic_fstream< char >::open(), std::basic_ifstream< char >::open(), std::basic_ifstream< char >::open(),
std::basic_ifstream< char >::open(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_filebuf< _CharT, _Traits >::p
std::basic_streambuf< char_type, traits_type >::pubseekoff(), std::basic_streambuf< char_type, traits_type >::pubseekpos(),
std::basic_istream< _CharT, _Traits >::seekg(), std::basic_istream< _CharT, _Traits >::seekg(), std::basic_streambuf< char_type, traits
std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_stringbuf< char >::seekoff(), std::basic_streambuf< char_type, trait
std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos(), std::basic_stringbuf< char >::seekpos(), std::basic_filebuf< _CharT, _Traits >
std::basic_stringbuf< char >::showmanyc(), std::basic_istream< _CharT, _Traits >::tellg(), std::basic_filebuf< _CharT, _Traits >::underfl
std::basic_stringbuf< _CharT, _Traits, _Alloc >::underflow(), and std::basic_filebuf< _CharT, _Traits >::xsgetn().

internal

```
const fmtflags std::ios_base::internal  [static]
```

Adds fill characters at a designated internal point in certain generated output, or identical to `right` if no such point is designated.
Referenced by std::internal().

left

```
const fmtflags std::ios_base::left  [static]
```

Adds fill characters on the right (final positions) of certain generated output. (I.e., the thing you print is flush left.).
Referenced by std::num_put< _CharT, _OutIter >::do_put(), std::left(), and std::philox_engine< uint_fast32_t, 32, 4, 10, 0xCD9E8D57, 0x

oct

```
const fmtflags std::ios_base::oct  [static]
```

Converts integer input or generates integer output in octal base.
Referenced by std::oct().

out

```
const openmode std::ios_base::out  [static]
```

Open for output. Default for `ofstream` and fstream.
Referenced by std::basic_fstream< char >::basic_fstream(), std::basic_fstream< char >::basic_fstream(), std::basic_fstream< char >::b
std::basic_ofstream< char >::basic_ofstream(), std::basic_ofstream< char >::basic_ofstream(), std::basic_ofstream< char >::basic_ofs
std::basic_ostringstream< char >::basic_ostringstream(), std::basic_stringbuf< char >::basic_stringbuf(), std::basic_stringstream< char
std::basic_filebuf< char_type, traits_type >::_M_set_buffer(), std::basic_fstream< char >::open(), std::basic_fstream< char >::open(),
std::basic_fstream< char >::open(), std::basic_ofstream< char >::open(), std::basic_ofstream< char >::open(),
std::basic_ofstream< char >::open(), std::basic_filebuf< _CharT, _Traits >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::o
std::basic_stringbuf< _CharT, _Traits, _Alloc >::pbackfail(), std::basic_streambuf< char_type, traits_type >::pubseekoff(),
std::basic_streambuf< char_type, traits_type >::pubseekpos(), std::basic_streambuf< char_type, traits_type >::seekoff(),
std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_stringbuf< char >::seekoff(), std::basic_ostream< _CharT, _Traits >
std::basic_ostream< _CharT, _Traits >::seekp(), std::basic_streambuf< char_type, traits_type >::seekpos(), std::basic_stringbuf< _Cha
std::basic_stringbuf< char >::seekpos(), std::basic_ostream< _CharT, _Traits >::tellp(), and std::basic_filebuf< _CharT, _Traits >::xsput

right

```
const fmtflags std::ios_base::right  [static]
```

Adds fill characters on the left (initial positions) of certain generated output. (I.e., the thing you print is flush right.).
Referenced by std::right().

scientific

```
const fmtflags std::ios_base::scientific  [static]
```
Generates floating-point output in scientific notation.
Referenced by std::hexfloat(), and std::scientific().

showbase

```
const fmtflags std::ios_base::showbase  [static]
```
Generates a prefix indicating the numeric base of generated integer output.
Referenced by std::num_put< _CharT, _OutIter >::do_put(), std::noshowbase(), and std::showbase().

showpoint

```
const fmtflags std::ios_base::showpoint  [static]
```
Generates a decimal-point character unconditionally in generated floating-point output.
Referenced by std::noshowpoint(), and std::showpoint().

showpos

```
const fmtflags std::ios_base::showpos  [static]
```
Generates a + sign in non-negative generated numeric output.
Referenced by std::noshowpos(), and std::showpos().

skipws

```
const fmtflags std::ios_base::skipws  [static]
```
Skips leading white space before certain input operations.
Referenced by std::noskipws(), std::__detail::operator>>(), std::philox_engine< uint_fast32_t, 32, 4, 10, 0xCD9E8D57, 0x9E3779B9, 0x
and std::skipws().

trunc

```
const openmode std::ios_base::trunc  [static]
```
Truncate an existing stream when opening. Default for `ofstream`.

unitbuf

```
const fmtflags std::ios_base::unitbuf  [static]
```
Flushes output after each output operation.
Referenced by std::basic_ostream< _CharT, _Traits >::sentry::~sentry(), std::nounitbuf(), and std::unitbuf().

uppercase

```
const fmtflags std::ios_base::uppercase  [static]
```
Replaces certain lowercase letters with their uppercase equivalents in generated output.
Referenced by std::num_put< _CharT, _OutIter >::do_put(), std::nouppercase(), and std::uppercase().

6.560 std::is_bind_expression< _Tp > Struct Template Reference

`#include <functional>`

6.560.1 Detailed Description

template<typename _Tp>
struct std::is_bind_expression< _Tp >

Trait that identifies a bind expression.
Determines if the given type `_Tp` is a function object that should be treated as a subexpression when evaluating calls to function objects returned by `std::bind`.
C++11 [func.bind.isbind].

Since

C++11

The documentation for this struct was generated from the following file:

- functional

6.561 std::is_bind_expression< _Bind< _Signature > > Struct Template Reference

`#include <functional>`

6.561.1 Detailed Description

template<typename _Signature>
struct std::is_bind_expression< _Bind< _Signature > >

Class template _Bind is always a bind expression.
The documentation for this struct was generated from the following file:

- functional

6.562 std::is_bind_expression< _Bind_result< _Result, _Signature > > Struct Template Reference

`#include <functional>`

6.562.1 Detailed Description

template<typename _Result, typename _Signature>
struct std::is_bind_expression< _Bind_result< _Result, _Signature > >

Class template _Bind_result is always a bind expression.
The documentation for this struct was generated from the following file:

- functional

6.563 std::is_bind_expression< const _Bind< _Signature > > Struct Template Reference

`#include <functional>`

6.563.1 Detailed Description

template<typename _Signature>
struct std::is_bind_expression< const _Bind< _Signature > >

Class template _Bind is always a bind expression.
The documentation for this struct was generated from the following file:

- functional

6.564 std::is_bind_expression< const _Bind_result< _Result, _Signature > > Struct Template Reference

`#include <functional>`

6.564.1 Detailed Description

template<typename _Result, typename _Signature>
struct std::is_bind_expression< const _Bind_result< _Result, _Signature > >

Class template _Bind_result is always a bind expression.
The documentation for this struct was generated from the following file:

- functional

6.565 std::is_bind_expression< const volatile _Bind< _Signature > > Struct Template Reference

`#include <functional>`

6.565.1 Detailed Description

template<typename _Signature>
struct std::is_bind_expression< const volatile _Bind< _Signature > >

Class template _Bind is always a bind expression.
The documentation for this struct was generated from the following file:

- functional

6.566 std::is_bind_expression< const volatile _Bind_result< _Result, _Signature > > Struct Template Reference

`#include <functional>`

6.566.1 Detailed Description

template<typename _Result, typename _Signature>
struct std::is_bind_expression< const volatile _Bind_result< _Result, _Signature > >

Class template _Bind_result is always a bind expression.
The documentation for this struct was generated from the following file:

- functional

6.567 std::is_bind_expression< volatile _Bind< _Signature > > Struct Template Reference

`#include <functional>`

6.567.1 Detailed Description

template<typename _Signature>
struct std::is_bind_expression< volatile _Bind< _Signature > >

Class template _Bind is always a bind expression.
The documentation for this struct was generated from the following file:

- functional

6.568 std::is_bind_expression< volatile _Bind_result< _Result, _Signature > > Struct Template Reference

`#include <functional>`

6.568.1 Detailed Description

template<typename _Result, typename _Signature>
struct std::is_bind_expression< volatile _Bind_result< _Result, _Signature > >

Class template _Bind_result is always a bind expression.

6.580 std::is_error_code_enum< future_errc > Struct Reference

`#include <future>`

6.580.1 Detailed Description

Specialization that allows `future_errc` to convert to `error_code`.
The documentation for this struct was generated from the following file:

- future

6.581 std::is_error_condition_enum< _Tp > Struct Template Reference

`#include <system_error>`

6.581.1 Detailed Description

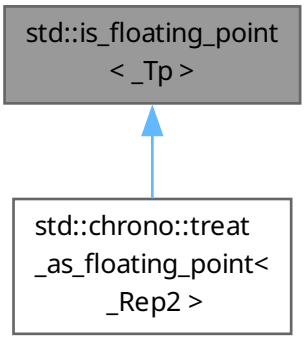
template<typename _Tp>
struct std::is_error_condition_enum< _Tp >

is_error_condition_enum
The documentation for this struct was generated from the following file:

- system_error

6.582 std::is_floating_point< _Tp > Struct Template Reference

`#include <type_traits>`
Inheritance diagram for std::is_floating_point< _Tp >:



6.582.1 Detailed Description

template<typename _Tp>
struct std::is_floating_point< _Tp >

is_floating_point
The documentation for this struct was generated from the following file:

- type_traits

6.583 std::is_function< _Tp > Struct Template Reference

`#include <type_traits>`

6.583.1 Detailed Description

template<typename _Tp>
struct std::is_function< _Tp >

is_function
The documentation for this struct was generated from the following file:

- type_traits

6.584 std::is_fundamental< _Tp > Struct Template Reference

`#include <type_traits>`

6.584.1 Detailed Description

template<typename _Tp>
struct std::is_fundamental< _Tp >

is_fundamental
The documentation for this struct was generated from the following file:

- type_traits

6.585 std::is_integral< _Tp > Struct Template Reference

`#include <type_traits>`

6.585.1 Detailed Description

template<typename _Tp>
struct std::is_integral< _Tp >

is_integral
The documentation for this struct was generated from the following file:

- type_traits

6.586 std::is_layout_compatible< _Tp, _Up > Struct Template Reference

`#include <type_traits>`

6.586.1 Detailed Description

template<typename _Tp, typename _Up>
struct std::is_layout_compatible< _Tp, _Up >

- Remove references and cv-qualifiers.

  Since

  C++20
  C++20

The documentation for this struct was generated from the following file:

- type_traits

6.587 std::is_literal_type< _Tp > Struct Template Reference

`#include <type_traits>`

6.587.1 Detailed Description

template<typename _Tp>
struct std::is_literal_type< _Tp >

is_literal_type

Deprecated Deprecated in C++17, removed in C++20. The idea of a literal type isn't useful.

The documentation for this struct was generated from the following file:

- type_traits

6.588 std::is_lvalue_reference< typename > Struct Template Reference

`#include <type_traits>`

6.588.1 Detailed Description

template<typename>

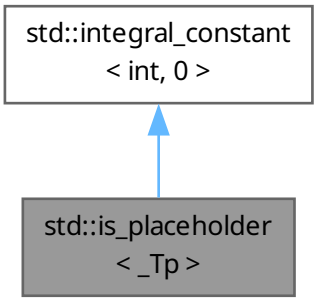
6.603 std::is_placeholder< _Tp > Struct Template Reference

`#include <functional>`
Inheritance diagram for std::is_placeholder< _Tp >:



Public Types

- using **type**
- using **value_type**

Public Member Functions

- constexpr **operator value_type** () const noexcept

Static Public Attributes

- static constexpr int **value**

6.603.1 Detailed Description

template<**typename _Tp**>
struct std::is_placeholder< **_Tp** >

Determines if the given type _Tp is a placeholder in a bind() expression and, if so, which placeholder it is.
C++11 [func.bind.isplace].

Since

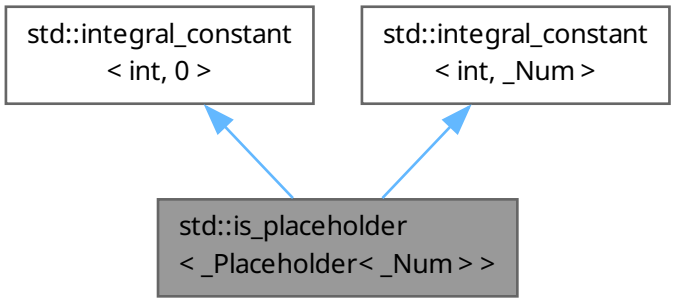
C++11

The documentation for this struct was generated from the following file:

- functional

6.604 std::is_placeholder< _Placeholder< _Num > > Struct Template Reference

`#include <functional>`
Inheritance diagram for std::is_placeholder< _Placeholder< _Num > >:



Public Types

- using **type**
- using **value_type**

Public Member Functions

- constexpr **operator value_type** () const noexcept

Static Public Attributes

- static constexpr int **value**

6.604.1 Detailed Description

template<**int _Num**>
struct std::is_placeholder< **_Placeholder**< **_Num** > >

Partial specialization of is_placeholder that provides the placeholder number for the placeholder objects defined by libstdc++.

Since

C++11

The documentation for this struct was generated from the following file:

- functional

6.605 std::is_pod< _Tp > Struct Template Reference

`#include <type_traits>`

6.605.1 Detailed Description

template<typename _Tp>
struct std::is_pod< _Tp >

is_pod

Deprecated Deprecated in C++20. Use `is_standard_layout && is_trivial` instead.

The documentation for this struct was generated from the following file:

- type_traits

6.606 std::is_pointer< _Tp > Struct Template Reference

`#include <type_traits>`

6.606.1 Detailed Description

template<typename _Tp>
struct std::is_pointer< _Tp >

is_pointer
The documentation for this struct was generated from the following file:

- type_traits

6.607 std::is_pointer_interconvertible_base_of< _Base, _Derived > Struct Template Reference

`#include <type_traits>`

6.607.1 Detailed Description

template<typename _Base, typename _Derived>
struct std::is_pointer_interconvertible_base_of< _Base, _Derived >

True if `_Derived` is standard-layout and has a base class of type `_Base`.

Since

C++20

The documentation for this struct was generated from the following file:

- type_traits

6.629.1 Detailed Description

template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename _Dist = ptrdiff_t>
class std::istream_iterator< _Tp, _CharT, _Traits, _Dist >

Provides input iterator semantics for streams.

6.629.2 Member Typedef Documentation

difference_type

```
typedef ptrdiff_t std::iterator< input_iterator_tag, _Tp, ptrdiff_t, const _Tp *, const _Tp &
>::difference_type  [inherited]
```

Distance between iterators is represented as this type.

iterator_category

```
typedef input_iterator_tag std::iterator< input_iterator_tag, _Tp, ptrdiff_t, const _Tp *, const
_Tp & >::iterator_category  [inherited]
```

One of the tag types.

pointer

```
typedef const _Tp * std::iterator< input_iterator_tag, _Tp, ptrdiff_t, const _Tp *, const _Tp &
>::pointer  [inherited]
```

This type represents a pointer-to-value_type.

reference

```
typedef const _Tp & std::iterator< input_iterator_tag, _Tp, ptrdiff_t, const _Tp *, const _Tp &
>::reference  [inherited]
```

This type represents a reference-to-value_type.

value_type

```
typedef _Tp std::iterator< input_iterator_tag, _Tp, ptrdiff_t, const _Tp *, const _Tp & >::↩
value_type  [inherited]
```

The type "pointed to" by the iterator.

6.629.3 Constructor & Destructor Documentation

istream_iterator() [1/2]

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename
_Dist = ptrdiff_t>
std::istream_iterator< _Tp, _CharT, _Traits, _Dist >::istream_iterator ()  [inline], [constexpr],
[noexcept]
```

Construct end of input stream iterator.
Referenced by operator==.

istream_iterator() [2/2]

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename
_Dist = ptrdiff_t>
std::istream_iterator< _Tp, _CharT, _Traits, _Dist >::istream_iterator (
            istream_type & __s)  [inline]
```

Construct start of input stream iterator.
References std::__addressof().

6.629.4 Friends And Related Symbol Documentation

operator==

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename
_Dist = ptrdiff_t>
bool operator== (
            const istream_iterator< _Tp, _CharT, _Traits, _Dist > & __x,
            const istream_iterator< _Tp, _CharT, _Traits, _Dist > & __y)  [friend]
```

Return true if the iterators refer to the same stream, or are both at end-of-stream.
References istream_iterator().
The documentation for this class was generated from the following file:

- stream_iterator.h

6.630 std::istreambuf_iterator< _CharT, _Traits > Class Template Reference

6.630.1 Detailed Description

template<typename _CharT, typename _Traits>
class std::istreambuf_iterator< _CharT, _Traits >

Provides input iterator semantics for streambufs.

6.630.2 Member Typedef Documentation

char_type

```
template<typename _CharT, typename _Traits>
typedef _CharT std::istreambuf_iterator< _CharT, _Traits >::char_type
```
Public typedefs.

difference_type

```
typedef _Traits::off_type std::iterator< input_iterator_tag, _CharT, _Traits::off_type, _CharT *,
_CharT >::difference_type  [inherited]
```
Distance between iterators is represented as this type.

int_type

```
template<typename _CharT, typename _Traits>
typedef _Traits::int_type std::istreambuf_iterator< _CharT, _Traits >::int_type
```
Public typedefs.

istream_type

```
template<typename _CharT, typename _Traits>
typedef basic_istream<_CharT, _Traits> std::istreambuf_iterator< _CharT, _Traits >::istream_type
```
Public typedefs.

iterator_category

```
typedef input_iterator_tag std::iterator< input_iterator_tag, _CharT, _Traits::off_type, _CharT *,
_CharT >::iterator_category  [inherited]
```
One of the tag types.

pointer

```
template<typename _CharT, typename _Traits>
using std::istreambuf_iterator< _CharT, _Traits >::pointer
```
Public typedefs.

reference

```
typedef _CharT std::iterator< input_iterator_tag, _CharT, _Traits::off_type, _CharT *, _CharT
>::reference  [inherited]
```
This type represents a reference-to-value_type.

streambuf_type

```
template<typename _CharT, typename _Traits>
typedef basic_streambuf<_CharT, _Traits> std::istreambuf_iterator< _CharT, _Traits >::streambuf↩
_type
```
Public typedefs.

traits_type

```
template<typename _CharT, typename _Traits>
typedef _Traits std::istreambuf_iterator< _CharT, _Traits >::traits_type
```
Public typedefs.

value_type

```
typedef _CharT std::iterator< input_iterator_tag, _CharT, _Traits::off_type, _CharT *, _CharT
>::value_type  [inherited]
```
The type "pointed to" by the iterator.

6.630.3 Constructor & Destructor Documentation

istreambuf_iterator() [1/3]

```
template<typename _CharT, typename _Traits>
std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator ()  [inline], [constexpr], [noexcept]
```
Construct end of input stream iterator.
Referenced by equal(), and operator++().

istreambuf_iterator() [2/3]

```
template<typename _CharT, typename _Traits>
std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator (
            istream_type & __s)  [inline], [noexcept]
```
Construct start of input stream iterator.

istreambuf_iterator() [3/3]

```
template<typename _CharT, typename _Traits>
std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator (
            streambuf_type * __s)  [inline], [noexcept]
```
Construct start of streambuf iterator.

6.630.4 Member Function Documentation

equal()

```
template<typename _CharT, typename _Traits>
bool std::istreambuf_iterator< _CharT, _Traits >::equal (
            const istreambuf_iterator< _CharT, _Traits > & __b) const  [inline], [nodiscard]
```
Return true both iterators are end or both are not end.
References istreambuf_iterator().

operator∗()

```
template<typename _CharT, typename _Traits>
char_type std::istreambuf_iterator< _CharT, _Traits >::operator* () const  [inline], [nodiscard]
```
Return the current character pointed to by iterator. This returns streambuf.sgetc(). It cannot be assigned. NB: The result of operator∗() on an end of stream is undefined.

operator++() [1/2]

```
template<typename _CharT, typename _Traits>
istreambuf_iterator & std::istreambuf_iterator< _CharT, _Traits >::operator++ ()  [inline]
```
Advance the iterator. Calls streambuf.sbumpc().

operator++() [2/2]

```
template<typename _CharT, typename _Traits>
istreambuf_iterator std::istreambuf_iterator< _CharT, _Traits >::operator++ (
            int )  [inline]
```

Advance the iterator. Calls streambuf.sbumpc().
References istreambuf_iterator().
The documentation for this class was generated from the following files:

- iosfwd.h
- streambuf_iterator.h

6.633.1 Detailed Description

An iterator for the components of a path.

Since

C++17

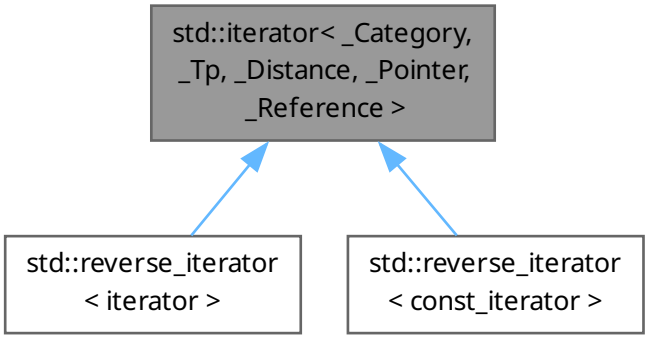
The documentation for this class was generated from the following file:

- bits/fs_path.h

6.634 std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference > Struct Template Reference

`#include <stl_iterator_base_types.h>`

Inheritance diagram for std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >:



Public Types

- typedef _Distance difference_type
- typedef _Category iterator_category
- typedef _Pointer pointer
- typedef _Reference reference
- typedef _Tp value_type

6.634.1 Detailed Description

template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference = _Tp&>
struct std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >

Common iterator class.
This class does nothing but define nested typedefs. Iterator classes can inherit from this class to save some work. The typedefs are then used in specializations and overloading.
In particular, there are no default implementations of requirements such as `operator++` and the like. (How could there be?)

Deprecated Deprecated since C++17. The recommended alternative is to simply define the typedefs directly in your iterator class.

6.634.2 Member Typedef Documentation

difference_type

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _↩
Tp*, typename _Reference = _Tp&>
typedef _Distance std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::difference_↩
type
```

Distance between iterators is represented as this type.

iterator_category

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _↩
Tp*, typename _Reference = _Tp&>
typedef _Category std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::iterator_↩
category
```

One of the tag types.

pointer

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _↩
Tp*, typename _Reference = _Tp&>
typedef _Pointer std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::pointer
```

This type represents a pointer-to-value_type.

reference

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _↩
Tp*, typename _Reference = _Tp&>
typedef _Reference std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::reference
```

This type represents a reference-to-value_type.

value_type

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _↩
Tp*, typename _Reference = _Tp&>
typedef _Tp std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::value_type
```

The type "pointed to" by the iterator.
The documentation for this struct was generated from the following file:

- stl_iterator_base_types.h

6.635 std::iterator_traits< _Iterator > Struct Template Reference

6.635.1 Detailed Description

template<typename _Iterator>
struct std::iterator_traits< _Iterator >

Traits class for iterators.
This class does nothing but define nested typedefs. The general version simply declares aliases for the nested typedefs from the Iterator argument. Partial specializations for pointers define the typedefs appropriately for the semantics of pointers.
The documentation for this struct was generated from the following file:

- iterator_concepts.h

6.636 std::iterator_traits< _Tp * > Struct Template Reference

```
#include <stl_iterator_base_types.h>
```

Public Types

- using **difference_type**
- using **iterator_category**
- using **iterator_concept**
- using **pointer**

- using **reference**
- using **value_type**

6.636.1 Detailed Description

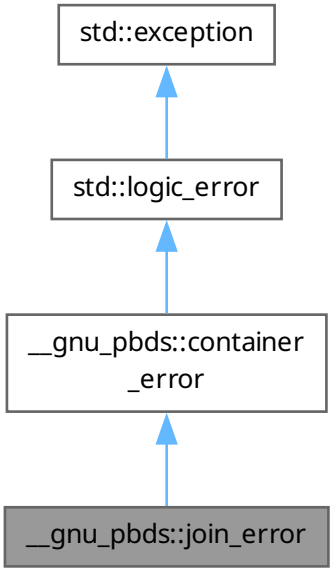
template<**typename _Tp**>
requires is_object_v<**_Tp**>
struct std::iterator_traits< **_Tp** * >

Partial specialization for object pointer types.
The documentation for this struct was generated from the following file:

- stl_iterator_base_types.h

6.637 __gnu_pbds::join_error Struct Reference

`#include <exception.hpp>`
Inheritance diagram for __gnu_pbds::join_error:



Public Member Functions

- virtual const char * what () const noexcept

6.637.1 Detailed Description

A join cannot be performed logical reasons (i.e., the ranges of the two container objects being joined overlaps.

6.637.2 Member Function Documentation

what()

```
virtual const char * std::logic_error::what () const  [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).
Reimplemented from std::exception.
Reimplemented in std::future_error.
References what().
Referenced by what().
The documentation for this struct was generated from the following file:

- exception.hpp

6.638 __gnu_pbds::detail::left_child_next_sibling_heap< Value_Type, Cmp_Fn, Node_Metadata, _Alloc > Class Template Reference

6.639.1 Detailed Description

template<typename Node, typename _Alloc>
class __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >

Const point-type iterator.

6.639.2 Member Typedef Documentation

const_pointer

```
template<typename Node, typename _Alloc>
typedef base_type::const_pointer __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::const_pointer
```

Iterator's const pointer type.

const_reference

```
template<typename Node, typename _Alloc>
typedef base_type::const_reference __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::const_reference
```

Iterator's const reference type.

difference_type

```
template<typename Node, typename _Alloc>
typedef _Alloc::difference_type __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::difference_type
```

Difference type.

iterator_category

```
template<typename Node, typename _Alloc>
typedef std::forward_iterator_tag __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::iterator_category
```

Category.

pointer

```
template<typename Node, typename _Alloc>
typedef base_type::pointer __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::pointer
```

Iterator's pointer type.

reference

```
template<typename Node, typename _Alloc>
typedef base_type::reference __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::reference
```

Iterator's reference type.

value_type

```
template<typename Node, typename _Alloc>
typedef base_type::value_type __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::value_type
```

Iterator's value type.

6.639.3 Constructor & Destructor Documentation

left_child_next_sibling_heap_const_iterator_() [1/2]

6.651.1 Detailed Description

template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
class std::linear_congruential_engine< _UIntType, __a, __c, __m >

A model of a linear congruential random number generator.
A random number generator that produces pseudorandom numbers via linear function:

$$x_{i+1} \leftarrow (ax_i + c) \bmod m$$

The template parameter `_UIntType` must be an unsigned integral type large enough to store values up to (__m-1). If the template parameter `__m` is 0, the modulus `__m` used is std::numeric_limits<_UIntType>::max() plus 1. Otherwise, the template parameters `__a` and `__c` must be less than `__m`.
The size of the state is 1.

Since

C++11

6.651.2 Member Typedef Documentation

result_type

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
typedef _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::result_type
```

The type of the generated random value.

6.651.3 Constructor & Destructor Documentation

linear_congruential_engine() [1/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine ()  [inline]
```

Constructs a linear_congruential_engine random number generator engine with seed 1.

linear_congruential_engine() [2/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine (
            result_type __s)  [inline], [explicit]
```

Constructs a linear_congruential_engine random number generator engine with seed __s. The default seed value is 1.

Parameters

_↩ _s	The initial seed value.

linear_congruential_engine() [3/3]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine (
            _Sseq & __q)  [inline], [explicit]
```

Constructs a linear_congruential_engine random number generator engine seeded from the seed sequence __q.

Parameters

_↩ _q	the seed sequence.

6.651.4 Member Function Documentation

discard()

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
void std::linear_congruential_engine< _UIntType, __a, __c, __m >::discard (
            unsigned long long __z)  [inline]
```

Discard a sequence of random numbers.

max()

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
constexpr result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::max ()  [inline],
```

[static], [constexpr]
Gets the largest possible value in the output range.

min()

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
constexpr result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::min ()  [inline],
[static], [constexpr]
```
Gets the smallest possible value in the output range.
The minimum depends on the __c parameter: if it is zero, the minimum generated must be > 0, otherwise 0 is allowed.

operator()()

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::operator() ()  [inline]
```
Gets the next random number in the sequence.

seed() [1/2]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq>
auto std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed (
            _Sseq & __q) -> _If_seed_seq< _Sseq >
```
Reseeds the linear_congruential_engine random number generator engine sequence using values from the seed sequence __q.

Parameters

_↩ _q	the seed sequence.

Seeds the LCR engine with a value generated by __q.
References std::__lg(), std::__numeric_limits_base::digits, and seed().

seed() [2/2]

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
void std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed (
            result_type __s = default_seed)
```
Reseeds the linear_congruential_engine random number generator engine sequence to the seed __s.

Parameters

_↩ _s	The new seed.

Seeds the LCR with integral value __s, adjusted so that the ring identity is never a member of the convergence set.
Referenced by std::linear_congruential_engine< uint_fast32_t, 16807UL, 0UL, 2147483647UL >::linear_congruential_engine(), std::linear_congruential_engine< uint_fast32_t, 16807UL, 0UL, 2147483647UL >::linear_congruential_engine(), and seed().

6.651.5 Friends And Related Symbol Documentation

operator<<

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _UIntType1, _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT,
typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::linear_congruential_engine< _UIntType1, __a1, __c1, __m1 > & __lcr)  [friend]
```

Writes the textual representation of the state x(i) of x to __os.

Parameters

__os	The output stream.
__lcr	A % linear_congruential_engine random number generator.

Returns

__os.

operator==

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
bool operator== (
            const linear_congruential_engine< _UIntType, __a, __c, __m > & __lhs,
            const linear_congruential_engine< _UIntType, __a, __c, __m > & __rhs)  [friend]
```

Compares two linear congruential random number generator objects of the same type for equality.

Parameters

__lhs	A linear congruential random number generator object.
__rhs	Another linear congruential random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

operator>>

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _UIntType1, _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT,
typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::linear_congruential_engine< _UIntType1, __a1, __c1, __m1 > & __lcr)  [friend]
```

Sets the state of the engine by reading its textual representation from __is.
The textual representation must have been previously written using an output stream whose imbued locale and whose type's template specialization arguments _CharT and _Traits were the same as those of __is.

Parameters

__is	The input stream.
__lcr	A % linear_congruential_engine random number generator.

Returns

__is.

6.651.6 Member Data Documentation

increment

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::increment  [static],
[constexpr]
```

An increment.

modulus

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::modulus  [static], [constexpr]
```

The modulus.

multiplier

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::multiplier  [static],
[constexpr]
```

The multiplier.

6.654.1 Detailed Description

template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::list< _Tp, _Alloc >

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

Template Parameters

_Tp	Type of element.
_Alloc	Allocator type, defaults to allocator<_Tp>.

Meets the requirements of a `container`, a `reversible container`, and a `sequence`, including the `optional sequence requirements` with the exception of `at` and `operator[]`.
This is a *doubly linked* list. Traversal up and down the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike std::vector and std::deque, random-access iterators are not provided, so subscripting ([]) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.
Also unlike the other standard containers, std::list provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.
A couple points on memory allocation for list<Tp>:
First, we never actually allocate a Tp, we allocate List_node<Tp>'s and trust [20.1.5]/4 to DTRT. This is to ensure that after elements from list<X,Alloc1> are spliced into list<X,Alloc2>, destroying the memory of the second list is a valid operation, i.e., Alloc1 giveth and Alloc2 taketh away.
Second, a list conceptually represented as

```
A <---> B <---> C <---> D
```

is actually circular; a link exists between A and D. The list class holds (as its only data member) a private list::iterator pointing to *D*, not to *A!* To get to the head of the list, we start at the tail and move forward by one. When this member iterator's next/previous pointers refer to itself, the list is empty.

6.654.2 Constructor & Destructor Documentation

list() [1/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list ()  [default]
```

Creates a list with no elements.

Referenced by erase(), insert(), insert(), insert(), merge(), merge(), operator=(), remove(), remove_if(), unique(), and unique().

list() [2/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
            const allocator_type & __a)  [inline], [explicit], [noexcept]
```

Creates a list with no elements.

Parameters

_↩ _a	An allocator object.

list() [3/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
            size_type __n,
            const allocator_type & __a = allocator_type())  [inline], [explicit]
```

Creates a list with default constructed elements.

Parameters

_↩ _n	The number of elements to initially create.
_↩ _a	An allocator object.

This constructor fills the list with __n default constructed elements.

list() [4/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
            size_type __n,
            const value_type & __value,
            const allocator_type & __a = allocator_type())  [inline]
```

Creates a list with copies of an exemplar element.

Parameters

__n	The number of elements to initially create.
__value	An element to copy.

__a	An allocator object.

This constructor fills the list with *__n* copies of *__value*.

list() [5/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
            const list< _Tp, _Alloc > & __x)  [inline]
```

List copy constructor.

Parameters

_↩ _x	A list of identical element and allocator types.

The newly-created list uses a copy of the allocation object used by *__x* (unless the allocator traits dictate a different object).

list() [6/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
            list< _Tp, _Alloc > && )  [default]
```

List move constructor.

The newly-created list contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified list.

list() [7/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
            initializer_list< value_type > __l,
            const allocator_type & __a = allocator_type())  [inline]
```

Builds a list from an initializer_list.

Parameters

_↩ _l	An initializer_list of value_type.
_↩ _a	An allocator object.

Create a list consisting of copies of the elements in the initializer_list *__l*. This is linear in __l.size().

list() [8/8]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
```

```
std::list< _Tp, _Alloc >::list (
            _InputIterator __first,
            _InputIterator __last,
            const allocator_type & __a = allocator_type())  [inline]
```

Builds a list from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__a	An allocator object.

Create a list consisting of copies of the elements from [*__first*,*__last*). This is linear in N (where N is distance(*__first*,↩ *__last*)).

~list()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::~list ()  [default]
```

No explicit dtor needed as the _Base dtor takes care of things. The _Base dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

6.654.3 Member Function Documentation

_M_create_node()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename...  _Args>
_Node_ptr std::list< _Tp, _Alloc >::_M_create_node (
            _Args &&...  __args)  [inline], [protected]
```

Parameters

__args	An instance of user data.

Allocates space for a new node and constructs a copy of *__args* in it.
Referenced by emplace(), and insert().

assign() [1/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
void std::list< _Tp, _Alloc >::assign (
            _InputIterator __first,
            _InputIterator __last)  [inline]
```

Assigns a range to a list.

Parameters

__first	An input iterator.
__last	An input iterator.

This function fills a list with copies of the elements in the range [__*first*,__*last*).
Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned.

assign() [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::assign (
            initializer_list< value_type > __l)  [inline]
```

Assigns an initializer_list to a list.

Parameters

↩ _↩ ↩ _↩ *l*	An initializer_list of value_type.

Replace the contents of the list with copies of the elements in the initializer_list __*l*. This is linear in __l.size().

assign() [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::assign (
            size_type __n,
            const value_type & __val)  [inline]
```

Assigns a given value to a list.

Parameters

__*n*	Number of elements to be assigned.
__*val*	Value to be assigned.

This function fills a list with __*n* copies of the given value. Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned.

back() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::list< _Tp, _Alloc >::back () const  [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the list.

back() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::list< _Tp, _Alloc >::back ()  [inline], [nodiscard], [noexcept]
```

Returns a read/write reference to the data at the last element of the list.

begin() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::list< _Tp, _Alloc >::begin () const  [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

begin() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::begin ()  [inline], [nodiscard], [noexcept]
```

Returns a read/write iterator that points to the first element in the list. Iteration is done in ordinary element order.
Referenced by std::list< _Tp, polymorphic_allocator< _Tp > >::list(), insert(), insert(), merge(), merge(), std::operator<=>(), operator=(), std::list< _Tp, polymorphic_allocator< _Tp > >::operator=(), remove(), remove_if(), std::list< _Tp, polymorphic_allocator< _ unique(), and unique().

cbegin()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::list< _Tp, _Alloc >::cbegin () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

cend()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::list< _Tp, _Alloc >::cend () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

clear()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::clear ()  [inline], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Referenced by operator=().

crbegin()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list< _Tp, _Alloc >::crbegin () const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

crend()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list< _Tp, _Alloc >::crend () const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

emplace()

```
template<typename _Tp, typename _Alloc>
template<typename...  _Args>
list< _Tp, _Alloc >::iterator list::emplace (
            const_iterator __position,
            _Args &&...  __args)
```

Constructs object in list before specified iterator.

Parameters

__position	A const_iterator into the list.
__args	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.
References _M_create_node(), and std::forward().

empty()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
bool std::list< _Tp, _Alloc >::empty () const  [inline], [nodiscard], [noexcept]
```

Returns true if the list is empty. (Thus begin() would equal end().)
Referenced by insert(), and std::list< _Tp, polymorphic_allocator< _Tp > >::splice().

end() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::list< _Tp, _Alloc >::end () const  [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

end() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::end ()  [inline], [nodiscard], [noexcept]
```

Returns a read/write iterator that points one past the last element in the list. Iteration is done in ordinary element order.
Referenced by std::list< _Tp, polymorphic_allocator< _Tp > >::list(), merge(), merge(), std::operator<=>(), operator=(), std::list< _Tp, polymorphic_allocator< _Tp > >::operator=(), and std::list< _Tp, polymorphic_allocator< _Tp > >::splice().

erase() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last)  [inline], [noexcept]
```

Remove a range of elements.

Parameters

__first	Iterator pointing to the first element to be erased.
__last	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by *last* prior to erasing (or end()).

This function will erase the elements in the range [first,last) and shorten the list accordingly.
This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/2]

```
template<typename _Tp, typename _Alloc>
list< _Tp, _Alloc >::iterator list::erase (
            const_iterator __position)  [noexcept]
```

Remove element at given position.

Parameters

__position	Iterator pointing to element to be erased.

Returns

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the list by one.
Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
References list(), and erase().
Referenced by erase(), resize(), and resize().

front() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::list< _Tp, _Alloc >::front () const  [inline], [nodiscard], [noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the list.

front() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::list< _Tp, _Alloc >::front ()  [inline], [nodiscard], [noexcept]
```

Returns a read/write reference to the data at the first element of the list.

get_allocator()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
allocator_type std::list< _Tp, _Alloc >::get_allocator () const  [inline], [noexcept]
```

Get a copy of the memory allocation object.
Referenced by insert(), insert(), remove(), remove_if(), unique(), and unique().

insert() [1/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::insert (
            const_iterator __p,
            initializer_list< value_type > __l)  [inline]
```

Inserts the contents of an initializer_list into list before specified const_iterator.

Parameters

__p	A const_iterator into the list.
__l	An initializer_list of value_type.

Returns

An iterator pointing to the first element inserted (or __p).

This function will insert copies of the data in the initializer_list __l into the list before the location specified by __p.
This operation is linear in the number of elements inserted and does not invalidate iterators and references.

insert() [2/5]

```
template<typename _Tp, typename _Alloc>
template<typename _InputIterator, typename>
list< _Tp, _Alloc >::iterator list::insert (
            const_iterator __position,
            _InputIterator __first,
            _InputIterator __last)
```

Inserts a range into the list.

Parameters

__position	An iterator into the list.
__first	An input iterator.
__last	An input iterator.

Returns

Since C++11, an iterator pointing to the first element inserted (or __position). In C++98 this returns void.

This function will insert copies of the data in the range [__first,__last) into the list before the location specified by __position.
This operation is linear in the number of elements inserted and does not invalidate iterators and references.
References list(), begin(), empty(), get_allocator(), and splice().

insert() [3/5]

```
template<typename _Tp, typename _Alloc>
list< _Tp, _Alloc >::iterator list::insert (
            const_iterator __position,
            const value_type & __x)
```

Inserts given value into list before specified iterator.

Parameters

__position	An iterator into the list.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.
References list(), _M_create_node(), and insert().
Referenced by insert(), and resize().

insert() [4/5]

```
template<typename _Tp, typename _Alloc>
list< _Tp, _Alloc >::iterator list::insert (
             const_iterator __position,
             size_type __n,
             const value_type & __x)
```

Inserts a number of copies of given data into the list.

Parameters

__position	An iterator into the list.
__n	Number of elements to be inserted.
__x	Data to be inserted.

Returns

Since C++11, an iterator pointing to the first element inserted (or `__position`). In C++98 this returns void.

This function will insert a specified number of copies of the given data before the location specified by `__position`. This operation is linear in the number of elements inserted and does not invalidate iterators and references.
References list(), begin(), get_allocator(), and splice().

insert() [5/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::insert (
             const_iterator __position,
             value_type && __x)  [inline]
```

Inserts given value into list before specified iterator.

Parameters

__position	An iterator into the list.

__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

max_size()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::list< _Tp, _Alloc >::max_size () const  [inline], [nodiscard], [noexcept]
```

Returns the size() of the largest possible list.

merge() [1/2]

```
template<typename _Tp, typename _Alloc>
void list::merge (
            list< _Tp, _Alloc > && __x)
```

Merge sorted lists.

Parameters

_↩ _x	Sorted list to merge.

Assumes that both __x and this list are sorted according to operator<(). Merges elements of __x into this list in sorted order, leaving __x empty when complete. Elements in this list precede elements in __x that are equal.
References list(), std::__addressof(), std::begin(), begin(), std::end(), end(), and merge().
Referenced by merge(), and merge().

merge() [2/2]

```
template<typename _Tp, typename _Alloc>
template<typename _StrictWeakOrdering>
void list::merge (
            list< _Tp, _Alloc > && __x,
            _StrictWeakOrdering __comp)
```

Merge sorted lists according to comparison function.

Template Parameters

_StrictWeakOrdering	Comparison function defining sort order.

Parameters

__x	Sorted list to merge.
__comp	Comparison functor.

Assumes that both __x and this list are sorted according to StrictWeakOrdering. Merges elements of __x into this list in sorted order, leaving __x empty when complete. Elements in this list precede elements in __x that are equivalent according to StrictWeakOrdering().
References list(), std::__addressof(), std::begin(), begin(), std::end(), end(), and merge().

operator=() [1/3]

```
template<typename _Tp, typename _Alloc>
list< _Tp, _Alloc > & list::operator= (
            const list< _Tp, _Alloc > & __x)
```

List assignment operator.

Parameters

_↩ _x	A list of identical element and allocator types.

All the elements of __x are copied.
Whether the allocator is copied depends on the allocator traits.
References list(), std::__addressof(), begin(), clear(), and end().

operator=() [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
list & std::list< _Tp, _Alloc >::operator= (
            initializer_list< value_type > __l)  [inline]
```

List initializer list assignment operator.

Parameters

↩ _↩ ↩ _↩ l	An initializer_list of value_type.

Replace the contents of the list with copies of the elements in the initializer_list __l. This is linear in l.size().

operator=() [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
list & std::list< _Tp, _Alloc >::operator= (
            list< _Tp, _Alloc > && __x)  [inline], [noexcept]
```

List move assignment operator.

Parameters

_↩ _x	A list of identical element and allocator types.

The contents of __x are moved into this list (without copying).
Afterwards __x is a valid, but unspecified list
Whether the allocator is moved depends on the allocator traits.

pop_back()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::pop_back ()  [inline], [noexcept]
```

Removes last element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before pop_back() is called.

pop_front()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::pop_front ()  [inline], [noexcept]
```

Removes first element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop_front() is called.

push_back()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::push_back (
            const value_type & __x)  [inline]
```

Add data to the end of the list.

Parameters

_↩ _x	Data to be added.

This is a typical stack operation. The function creates an element at the end of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

push_front()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::push_front (
            const value_type & __x)  [inline]
```

Add data to the front of the list.

Parameters

_↩ _x	Data to be added.

This is a typical stack operation. The function creates an element at the front of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

rbegin() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
```

```
const_reverse_iterator std::list< _Tp, _Alloc >::rbegin () const  [inline], [nodiscard], [noexcept]
```
Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

rbegin() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::list< _Tp, _Alloc >::rbegin ()  [inline], [nodiscard], [noexcept]
```
Returns a read/write reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

remove()

```
template<typename _Tp, typename _Alloc>
list< _Tp, _Alloc >::__remove_return_type list::remove (
            const _Tp & __value)
```
Remove all elements equal to value.

Parameters

__value	The value to remove.

Removes every element in the list equal to *value*. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
References list(), std::begin(), begin(), std::end(), get_allocator(), size(), and splice().

remove_if()

```
template<typename _Tp, typename _Alloc>
template<typename _Predicate>
list< _Tp, _Alloc >::__remove_return_type list::remove_if (
            _Predicate __pred)
```
Remove all elements satisfying a predicate.

Template Parameters

_Predicate	Unary predicate function or object.

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
References list(), std::begin(), begin(), std::end(), get_allocator(), size(), and splice().

rend() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list< _Tp, _Alloc >::rend () const  [inline], [nodiscard], [noexcept]
```
Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

rend() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
```

```
reverse_iterator std::list< _Tp, _Alloc >::rend ()  [inline], [nodiscard], [noexcept]
```
Returns a read/write reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

resize() [1/2]

```
template<typename _Tp, typename _Alloc>
void list::resize (
            size_type __new_size)
```
Resizes the list to the specified number of elements.

Parameters

__new_size	Number of elements the list should contain.

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise default constructed elements are appended.
References std::end(), and erase().

resize() [2/2]

```
template<typename _Tp, typename _Alloc>
void list::resize (
            size_type __new_size,
            const value_type & __x)
```
Resizes the list to the specified number of elements.

Parameters

__new_size	Number of elements the list should contain.
__x	Data with which new elements should be populated.

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise the list is extended and new elements are populated with given data.
References std::end(), erase(), and insert().

reverse()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::reverse ()  [inline], [noexcept]
```
Reverse the elements in list.
Reverse the order of elements in the list in linear time.

size()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::list< _Tp, _Alloc >::size () const  [inline], [nodiscard], [noexcept]
```
Returns the number of elements in the list.
Referenced by std::operator<=>(), remove(), remove_if(), unique(), and unique().

sort() [1/2]

```
template<typename _Tp, typename _Alloc>
```

```
void list::sort ()
```

Sort the elements.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

References std::begin(), std::empty(), and std::end().

sort() [2/2]

```
template<typename _Tp, typename _Alloc>
template<typename _StrictWeakOrdering>
void list::sort (
            _StrictWeakOrdering __comp)
```

Sort the elements according to comparison function.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

References std::begin(), std::empty(), and std::end().

splice() [1/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
            const_iterator __position,
            list< _Tp, _Alloc > && __x)  [inline], [noexcept]
```

Insert contents of another list.

Parameters

__position	Iterator referencing the element to insert before.
__x	Source list.

The elements of *__x* are inserted in constant time in front of the element referenced by *__position*. *__x* becomes an empty list.

Requires this != *__x*.

Referenced by insert(), insert(), remove(), remove_if(), unique(), and unique().

splice() [2/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
            const_iterator __position,
            list< _Tp, _Alloc > && __x,
            const_iterator __first,
            const_iterator __last)  [inline], [noexcept]
```

Insert range from another list.

Parameters

__position	Iterator referencing the element to insert before.
__x	Source list.
__first	Iterator referencing the start of range in x.
__last	Iterator referencing the end of range in x.

Removes elements in the range [__first,__last) and inserts them before __*position* in constant time. Undefined if __*position* is in [__first,__last).

splice() [3/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
            const_iterator __position,
            list< _Tp, _Alloc > && __x,
            const_iterator __i)  [inline], [noexcept]
```

Insert element from another list.

Parameters

__*position*	Iterator referencing the element to insert before.
__*x*	Source list.
__*i*	Iterator referencing the element to move.

Removes the element in list __*x* referenced by __*i* and inserts it into the current list before __*position*.

splice() [4/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
            const_iterator __position,
            list< _Tp, _Alloc > & __x,
            const_iterator __first,
            const_iterator __last)  [inline], [noexcept]
```

Insert range from another list.

Parameters

__*position*	Const_iterator referencing the element to insert before.
__*x*	Source list.
__*first*	Const_iterator referencing the start of range in x.
__*last*	Const_iterator referencing the end of range in x.

Removes elements in the range [__first,__last) and inserts them before __*position* in constant time. Undefined if __*position* is in [__first,__last).

splice() [5/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
            const_iterator __position,
```

```
            list< _Tp, _Alloc > & __x,
            const_iterator __i)  [inline], [noexcept]
```

Insert element from another list.

Parameters

__position	Iterator referencing the element to insert before.
__x	Source list.
__i	Iterator referencing the element to move.

Removes the element in list *__x* referenced by *__i* and inserts it into the current list before *__position*.

swap()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::swap (
            list< _Tp, _Alloc > & __x)  [inline], [noexcept]
```

Swaps data with another list.

Parameters

_↩ _x	A list of the same element and allocator types.

This exchanges the elements between two lists in constant time. Note that the global std::swap() function is specialized such that std::swap(l1,l2) will feed to this function.
Whether the allocators are swapped depends on the allocator traits.

unique() [1/2]

```
template<typename _Tp, typename _Alloc>
list< _Tp, _Alloc >::__remove_return_type list::unique ()
```

Remove consecutive duplicate elements.
For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
References list(), std::begin(), begin(), std::end(), get_allocator(), size(), and splice().

unique() [2/2]

```
template<typename _Tp, typename _Alloc>
template<typename _BinaryPredicate>
list< _Tp, _Alloc >::__remove_return_type list::unique (
            _BinaryPredicate __binary_pred)
```

Remove consecutive elements satisfying a predicate.

Template Parameters

_BinaryPredicate	Binary predicate function or object.

For each consecutive set of elements [first,last) that satisfy predicate(first,i) where i is an iterator in [first,last), remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
References list(), std::begin(), begin(), std::end(), get_allocator(), size(), and splice().
The documentation for this class was generated from the following files:

- list.tcc

6.655 __gnu_pbds::list_update< Key, Mapped, Eq_Fn, Update_Policy, _Alloc > Class Template Reference

`#include <assoc_container.hpp>`

Public Types

- typedef list_update_tag **container_category**
- typedef Eq_Fn **eq_fn**
- typedef Update_Policy **update_policy**

Public Member Functions

- **list_update** (const list_update &other)
- template<typename It>
  list_update (It first, It last)
- list_update & **operator=** (const list_update &other)
- void **swap** (list_update &other)

6.655.1 Detailed Description

template<typename Key, typename Mapped, class Eq_Fn = typename detail::default_eq_fn<Key>::type, class Update_Policy = detail::default_update_policy::type, class _Alloc = std::allocator<char>>
class __gnu_pbds::list_update< Key, Mapped, Eq_Fn, Update_Policy, _Alloc >

A list-update based associative container.

Template Parameters

Key	Key type.
Mapped	Map type.
Eq_Fn	Equal functor.
Update_Policy	Update policy, determines when an element will be moved to the front of the list.
_Alloc	Allocator type.

Base is detail::lu_map.

6.655.2 Constructor & Destructor Documentation

list_update()

```
template<typename Key, typename Mapped, class Eq_Fn = typename detail::default_eq_fn<Key>::type,
class Update_Policy = detail::default_update_policy::type, class _Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::list_update< Key, Mapped, Eq_Fn, Update_Policy, _Alloc >::list_update (
            It first,
            It last)  [inline]
```

Constructor taking __iterators to a range of value_types. The value_types between first_it and last_it will be inserted into the container object.

6.657.1 Detailed Description

Container class for localization functionality.
The locale class is first a class wrapper for C library locales. It is also an extensible container for user-defined localization. A locale is a collection of facets that implement various localization features such as money, time, and number printing. Constructing C++ locales does not change the C library locale.
This library supports efficient construction and copying of locales through a reference counting implementation of the locale class.

6.657.2 Member Typedef Documentation

category

```
typedef int std::locale::category
```

Definition of locale::category.

6.657.3 Constructor & Destructor Documentation

locale() [1/8]

```
std::locale::locale () throw ( )
```

Default constructor.
Constructs a copy of the global locale. If no locale has been explicitly set, this is the C locale.
Referenced by locale(), locale(), locale(), locale(), locale(), locale(), locale(), ~locale(), combine(), global(), has_facet, operator()(), operator=(), operator==(), and use_facet.

locale() [2/8]

```
std::locale::locale (
            const locale & __other) throw ( )
```

Copy constructor.
Constructs a copy of *other*.

Parameters

__other	The locale to copy.

References locale().

locale() [3/8]

```
std::locale::locale (
            const char * __s)  [explicit]
```

Named locale constructor.
Constructs a copy of the named C library locale.

Parameters

_↩ _s	Name of the locale to construct.

Exceptions

std::runtime_error	if __s is null or an undefined locale.

References locale().

locale() [4/8]

```
std::locale::locale (
            const locale & __base,
            const char * __s,
            category __cat)
```

Construct locale with facets from another locale.
Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If base is named, this locale instance will also be named.

Parameters

__base	The locale to copy.
__s	Name of the locale to use facets from.
__cat	Set of categories defining the facets to use from __s.

Exceptions

std::runtime_error	if __s is null or an undefined locale.

References locale().

locale() [5/8]

```
std::locale::locale (
            const std::string & __s)  [inline], [explicit]
```

Named locale constructor.
Constructs a copy of the named C library locale.

Parameters

__s	Name of the locale to construct.

Exceptions

std::runtime_error	if __s is an undefined locale.

References locale().

locale() [6/8]

```
std::locale::locale (
```

```
            const locale & __base,
            const std::string & __s,
            category __cat)  [inline]
```

Construct locale with facets from another locale.
Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If base is named, this locale instance will also be named.

Parameters

__base	The locale to copy.
__s	Name of the locale to use facets from.
__cat	Set of categories defining the facets to use from __s.

Exceptions

std::runtime_error	if __s is an undefined locale.

References locale().

locale() [7/8]

```
std::locale::locale (
            const locale & __base,
            const locale & __add,
            category __cat)
```

Construct locale with facets from another locale.
Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale *add*. If *base* and *add* are named, this locale instance will also be named.

Parameters

__base	The locale to copy.
__add	The locale to use facets from.
__cat	Set of categories defining the facets to use from add.

References locale().

locale() [8/8]

```
template<typename _Facet>
std::locale::locale (
            const locale & __other,
            _Facet * __f)
```

Construct locale with another facet.
Constructs a copy of the locale *__other*. The facet *__f* is added to *__other*, replacing an existing facet of type Facet if there is one. If *__f* is null, this locale is a copy of *__other*.

Parameters

__other	The locale to copy.
__f	The facet to add in.

References locale().

~locale()

```
std::locale::~locale () throw ( )
```
Locale destructor.
References locale().

6.657.4 Member Function Documentation

classic()

```
const locale & std::locale::classic ()  [static], [nodiscard]
```
Return reference to the C locale.

combine()

```
template<typename _Facet>
locale std::locale::combine (
            const locale & __other) const  [nodiscard]
```
Construct locale with another facet.
Constructs and returns a new copy of this locale. Adds or replaces an existing facet of type Facet from the locale *other* into the new locale.

Template Parameters

_Facet	The facet type to copy from other

Parameters

__other	The locale to copy from.

Returns

Newly constructed locale.

Exceptions

std::runtime_error	if __other has no facet of type _Facet.

References locale().
Referenced by operator=().

global()

```
locale std::locale::global (
            const locale & __loc)  [static]
```

Set global locale.

This function sets the global locale to the argument and returns a copy of the previous global locale. If the argument has a name, it will also call std::setlocale(LC_ALL, loc.name()).

Parameters

__loc	The new locale to make global.

Returns

Copy of the old global locale.

References locale().

name()

```
string std::locale::name () const  [nodiscard]
```

Return locale name.

Returns

Locale name or "*" if unnamed.

References name().
Referenced by name().

operator()()

```
template<typename _Char, typename _Traits, typename _Alloc>
bool std::locale::operator() (
            const basic_string< _Char, _Traits, _Alloc > & __s1,
            const basic_string< _Char, _Traits, _Alloc > & __s2) const  [nodiscard]
```

Compare two strings according to collate.

Template operator to compare two strings using the compare function of the collate facet in this locale. One use is to provide the locale to the sort function. For example, a vector v of strings could be sorted according to locale loc by doing:

```
std::sort(v.begin(), v.end(), loc);
```

Parameters

__s1	First string to compare.
__s2	Second string to compare.

Returns

True if collate<_Char> facet compares __s1 < __s2, else false.

References locale().

operator=()

```
const locale & std::locale::operator= (
            const locale & __other) throw ( )
```

Assignment operator.
Set this locale to be a copy of *other*.

Parameters

__other	The locale to copy.

Returns

A reference to this locale.

References locale(), and combine().

operator==()

```
bool std::locale::operator== (
            const locale & __other) const throw ( )   [nodiscard]
```

Locale equality.

Parameters

__other	The locale to compare against.

Returns

True if other and this refer to the same locale instance, are copies, or have the same name. False otherwise.

References locale(), and operator==().
Referenced by operator==().

6.657.5 Friends And Related Symbol Documentation

has_facet

```
template<typename _Facet>
bool has_facet (
            const locale & __loc) throw ( )   [friend]
```

Test for the presence of a facet.
has_facet tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

Template Parameters

_Facet	The facet type to test the presence of.

Parameters

__loc	The locale to test.

Returns

true if __loc contains a facet of type _Facet, else false.

References locale().

use_facet

```
template<typename _Facet>
const _Facet & use_facet (
             const locale & __loc)  [friend]
```

Return a facet.
use_facet looks for and returns a reference to a facet of type Facet where Facet is the template parameter. If has_facet(locale) is true, there is a suitable facet to return. It throws std::bad_cast if the locale doesn't contain a facet of type Facet.

Template Parameters

_Facet	The facet type to access.

Parameters

__loc	The locale to use.

Returns

Reference to facet of type Facet.

Exceptions

std::bad_cast	if __loc doesn't contain a facet of type _Facet.

References locale().

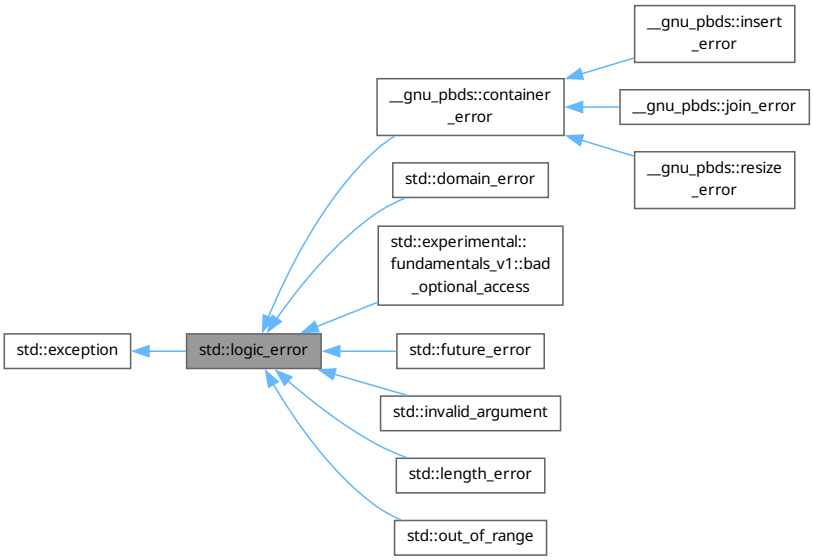
Inheritance diagram for std::logic_error:



Public Member Functions

- **logic_error** (const char *)
- **logic_error** (const logic_error &) noexcept
- logic_error (const string &__arg)
- **logic_error** (logic_error &&) noexcept
- logic_error & **operator=** (const logic_error &) noexcept
- logic_error & **operator=** (logic_error &&) noexcept
- virtual const char * what () const noexcept

6.659.1 Detailed Description

One of two subclasses of exception.
Logic errors represent problems in the internal logic of a program; in theory, these are preventable, and even detectable before the program runs (e.g., violations of class invariants).

6.659.2 Constructor & Destructor Documentation

logic_error()

```
std::logic_error::logic_error (
            const string & __arg)  [explicit]
```

Takes a character string describing the error.
References logic_error().
Referenced by logic_error().

6.659.3 Member Function Documentation

what()

```
virtual const char * std::logic_error::what () const  [virtual], [noexcept]
```

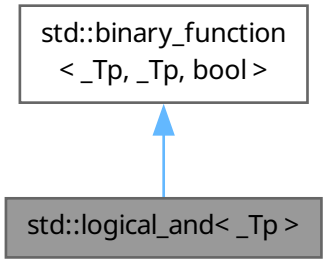
Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).
Reimplemented from std::exception.
Reimplemented in std::future_error.
References what().
Referenced by what().
The documentation for this class was generated from the following file:

- stdexcept_except.h

6.660 std::logical_and< _Tp > Struct Template Reference

```
#include <stl_function.h>
```

Inheritance diagram for std::logical_and< _Tp >:



Public Types

- typedef _Tp first_argument_type
- typedef bool result_type
- typedef _Tp second_argument_type

Public Member Functions

- constexpr bool **operator()** (const _Tp &__x, const _Tp &__y) const

6.660.1 Detailed Description

template<typename _Tp>
struct std::logical_and< _Tp >

One of the Boolean operations functors.

6.660.2 Member Typedef Documentation

first_argument_type

`typedef _Tp std::binary_function< _Tp, _Tp, bool >::first_argument_type [inherited]`
`first_argument_type` is the type of the first argument

result_type

`typedef bool std::binary_function< _Tp, _Tp, bool >::result_type [inherited]`
`result_type` is the return type

second_argument_type

`typedef _Tp std::binary_function< _Tp, _Tp, bool >::second_argument_type [inherited]`
`second_argument_type` is the type of the second argument
The documentation for this struct was generated from the following file:

6.666.1 Detailed Description

template<typename _RealType = double>
class std::lognormal_distribution< _RealType >

A lognormal_distribution random number distribution.
The formula for the normal probability mass function is

$$p(x|m,s) = \frac{1}{sx\sqrt{2\pi}} \exp -\frac{(\ln x - m)^2}{2s^2}$$

Since

C++11

6.666.2 Member Typedef Documentation

result_type

```
template<typename _RealType = double>
typedef _RealType std::lognormal_distribution< _RealType >::result_type
```

The type of the range of the distribution.

6.666.3 Member Function Documentation

max()

```
template<typename _RealType = double>
result_type std::lognormal_distribution< _RealType >::max () const  [inline]
```

Returns the least upper bound value of the distribution.

min()

```
template<typename _RealType = double>
result_type std::lognormal_distribution< _RealType >::min () const  [inline]
```

Returns the greatest lower bound value of the distribution.

operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::lognormal_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng)  [inline]
```

Generating functions.
Referenced by operator()().

param() [1/2]

```
template<typename _RealType = double>
param_type std::lognormal_distribution< _RealType >::param () const  [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _RealType = double>
void std::lognormal_distribution< _RealType >::param (
            const param_type & __param)  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

reset()

```
template<typename _RealType = double>
void std::lognormal_distribution< _RealType >::reset ()  [inline]
```

Resets the distribution state.

6.666.4 Friends And Related Symbol Documentation

operator<<

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::lognormal_distribution< _RealType1 > & __x)  [friend]
```

Inserts a lognormal_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A lognormal_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _RealType = double>
bool operator== (
            const lognormal_distribution< _RealType > & __d1,
            const lognormal_distribution< _RealType > & __d2)  [friend]
```

Return true if two lognormal distributions have the same parameters and the sequences that would be generated are equal.

operator>>

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::lognormal_distribution< _RealType1 > & __x)  [friend]
```

Extracts a lognormal_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A lognormal_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

The documentation for this class was generated from the following files:

Public Member Functions

- metadata_type operator() () const
- bool operator() (metadata_reference r_data) const

Private Member Functions

- template<typename Metadata_Reference>
  bool **operator()** (Metadata_Reference r_data, size_type m_max_count) const
- lu_counter_metadata< size_type > **operator()** (size_type max_size) const

6.668.1 Detailed Description

template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
class __gnu_pbds::lu_counter_policy< Max_Count, _Alloc >

A list-update policy that moves elements to the front of the list based on the counter algorithm.

6.668.2 Member Typedef Documentation

metadata_reference

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
typedef detail::rebind_traits<_Alloc,metadata_type>::reference __gnu_pbds::lu_counter_policy<
Max_Count, _Alloc >::metadata_reference
```

Reference to metadata on which this functor operates.

metadata_type

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
typedef detail::lu_counter_metadata<size_type> __gnu_pbds::lu_counter_policy< Max_Count, _Alloc
>::metadata_type
```

Metadata on which this functor operates.

6.668.3 Member Enumeration Documentation

anonymous enum

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
anonymous enum
```

Enumerator

max_count	When some element is accessed this number of times, it will be moved to the front of the list.

6.668.4 Member Function Documentation

operator()() [1/2]

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
metadata_type __gnu_pbds::lu_counter_policy< Max_Count, _Alloc >::operator() () const  [inline]
```

Creates a metadata object.

References max_count.

operator()() [2/2]

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
bool __gnu_pbds::lu_counter_policy< Max_Count, _Alloc >::operator() (
            metadata_reference r_data) const  [inline]
```

Decides whether a metadata object should be moved to the front of the list.

References max_count.

6.670.1 Detailed Description

template<typename Key, typename Mapped, typename Eq_Fn, typename _Alloc, typename Update_Policy>
class __gnu_pbds::detail::lu_map< Key, Mapped, Eq_Fn, _Alloc, Update_Policy >

list-based (with updates) associative container. Skip to the lu, my darling.
The documentation for this class was generated from the following file:

- lu_map_.hpp

6.671 __gnu_pbds::lu_move_to_front_policy< _Alloc > Class Template Reference

`#include <list_update_policy.hpp>`

Public Types

- typedef _Alloc **allocator_type**
- typedef detail::rebind_traits< _Alloc, metadata_type >::reference metadata_reference
- typedef null_type metadata_type

Public Member Functions

- metadata_type operator() () const
- bool operator() (metadata_reference r_metadata) const

6.671.1 Detailed Description

template<typename _Alloc = std::allocator<char>>
class __gnu_pbds::lu_move_to_front_policy< _Alloc >

A list-update policy that unconditionally moves elements to the front of the list. A null type means that each link in a list-based container does not actually need metadata.

6.671.2 Member Typedef Documentation

metadata_reference

```
template<typename _Alloc = std::allocator<char>>
typedef detail::rebind_traits<_Alloc,metadata_type>::reference __gnu_pbds::lu_move_to_front_policy<
_Alloc >::metadata_reference
```

Reference to metadata on which this functor operates.

metadata_type

```
template<typename _Alloc = std::allocator<char>>
typedef null_type __gnu_pbds::lu_move_to_front_policy< _Alloc >::metadata_type
```

Metadata on which this functor operates.

6.671.3 Member Function Documentation

operator()() [1/2]

```
template<typename _Alloc = std::allocator<char>>
metadata_type __gnu_pbds::lu_move_to_front_policy< _Alloc >::operator() () const  [inline]
```

Creates a metadata object.

operator()() [2/2]

```
template<typename _Alloc = std::allocator<char>>
bool __gnu_pbds::lu_move_to_front_policy< _Alloc >::operator() (
            metadata_reference r_metadata) const  [inline]
```

Decides whether a metadata object should be moved to the front of the list.
The documentation for this class was generated from the following file:

- list_update_policy.hpp

6.672 std::make_signed< _Tp > Struct Template Reference

`#include <type_traits>`

6.676.1 Detailed Description

template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
class std::map< _Key, _Tp, _Compare, _Alloc >

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

Since

C++98

Template Parameters

_Key	Type of key objects.
_Tp	Type of mapped objects.
_Compare	Comparison function object type, defaults to less<_Key>.
_Alloc	Allocator type, defaults to allocator<pair<const _Key, _Tp>.

Meets the requirements of a container, a reversible container, and an associative container (using unique keys). For a map<Key,T> the key_type is Key, the mapped_type is T, and the value_type is std::pair<const Key,T>.
Maps support bidirectional iterators.
The private tree data is declared exactly the same way for map and multimap; the distinction is made entirely in how the tree functions are called (*_unique versus *_equal, same as the standard).

6.676.2 Constructor & Destructor Documentation

map() [1/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map ()  [default]
```

Default constructor creates no elements.

map() [2/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            const _Compare & __comp,
            const allocator_type & __a = allocator_type())  [inline], [explicit]
```

Creates a map with no elements.

Parameters

__comp	A comparison object.
__a	An allocator object.

map() [3/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            const map< _Key, _Tp, _Compare, _Alloc > & )  [default]
```

Map copy constructor.
Whether the allocator is copied depends on the allocator traits.

map() [4/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            map< _Key, _Tp, _Compare, _Alloc > && )  [default]
```

Map move constructor.
The newly-created map contains the exact contents of the moved instance. The moved instance is a valid, but unspecified, map.

map() [5/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            initializer_list< value_type > __l,
            const _Compare & __comp = _Compare(),
            const allocator_type & __a = allocator_type())  [inline]
```

Builds a map from an initializer_list.

Parameters

__l	An initializer_list.
__comp	A comparison object.
__a	An allocator object.

Create a map consisting of copies of the elements in the initializer_list *__l*. This is linear in N if the range is already sorted, and NlogN otherwise (where N is *__l.size()*).

map() [6/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            const allocator_type & __a)  [inline], [explicit]
```

Allocator-extended default constructor.

map() [7/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            const map< _Key, _Tp, _Compare, _Alloc > & __m,
            const __type_identity_t< allocator_type > & __a)  [inline]
```

Allocator-extended copy constructor.

map() [8/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
```

```
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            map< _Key, _Tp, _Compare, _Alloc > && __m,
            const __type_identity_t< allocator_type > & __a)  [inline], [noexcept]
```

Allocator-extended move constructor.

map() [9/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            initializer_list< value_type > __l,
            const allocator_type & __a)  [inline]
```

Allocator-extended initializer-list constructor.

map() [10/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            _InputIterator __first,
            _InputIterator __last,
            const allocator_type & __a)  [inline]
```

Allocator-extended range constructor.

map() [11/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            _InputIterator __first,
            _InputIterator __last)  [inline]
```

Builds a map from a range.

Parameters

__first	An input iterator.
__last	An input iterator.

Create a map consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

map() [12/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            _InputIterator __first,
            _InputIterator __last,
            const _Compare & __comp,
            const allocator_type & __a = allocator_type())  [inline]
```

Builds a map from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__comp	A comparison functor.
__a	An allocator object.

Create a map consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

~map()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::~map ()  [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

6.676.3 Member Function Documentation

at()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
mapped_type & std::map< _Key, _Tp, _Compare, _Alloc >::at (
            const key_type & __k)  [inline]
```

Access to map data.

Parameters

_↩ _k	The key for which data should be retrieved.

Returns

A reference to the data whose key is equivalent to *__k*, if such a data is present in the map.

Exceptions

std::out_of_range	If no such data is present.

If a heterogeneous key __k matches a range of elements, the first is chosen.

begin() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::begin () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

begin() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::begin ()  [inline], [noexcept]
```

Returns a read/write iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

cbegin()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::cbegin () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

cend()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::cend () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

clear()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::map< _Key, _Tp, _Compare, _Alloc >::clear ()  [inline], [noexcept]
```

Erases all elements in a map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

contains() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt>
auto std::map< _Key, _Tp, _Compare, _Alloc >::contains (
             const _Kt & __x) const -> decltype(_M_t._M_find_tr(__x), void(), true)  [inline]
```

Finds whether an element with the given key exists.

Parameters

_↩ _x	Key of (key, value) pairs to be located.

Returns

True if there is an element with the specified key.

contains() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
bool std::map< _Key, _Tp, _Compare, _Alloc >::contains (
            const key_type & __x) const  [inline]
```

Finds whether an element with the given key exists.

Parameters

_↩ _x	Key of (key, value) pairs to be located.

Returns

True if there is an element with the specified key.

count()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map< _Key, _Tp, _Compare, _Alloc >::count (
            const key_type & __x) const  [inline]
```

Finds the number of elements with given key.

Parameters

_↩ _x	Key of (key, value) pairs to be located.

Returns

Number of elements with specified key.

This function only makes sense for multimaps; for map the result will either be 0 (not present) or 1 (present).

crbegin()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::crbegin () const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

crend()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::crend () const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

emplace()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
std::pair< iterator, bool > std::map< _Key, _Tp, _Compare, _Alloc >::emplace (
            _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the map.

Parameters

__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.
Insertion requires logarithmic time.

emplace_hint()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::emplace_hint (
            const_iterator __pos,
            _Args &&... __args) [inline]
```

Attempts to build and insert a std::pair into the map.

Parameters

__pos	An iterator that serves as a hint as to where the pair should be inserted.
__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the std::pair built from *__args* (may or may not be that std::pair).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument emplace() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires logarithmic time (if the hint is not taken).
Referenced by std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::emplace(), and std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert().

empty()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
bool std::map< _Key, _Tp, _Compare, _Alloc >::empty () const  [inline], [nodiscard], [noexcept]
```

Returns true if the map is empty. (Thus begin() would equal end().)

end() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::end () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

end() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::end ()  [inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Referenced by std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::at(), std::map< _Key, _Tp, _Cmp, po
std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert(), and std::map< _Key, _Tp, _Cmp, polymorp

equal_range() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair< iterator, iterator > std::map< _Key, _Tp, _Compare, _Alloc >::equal_range (
            const key_type & __x)  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pairs to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

equal_range() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair< const_iterator, const_iterator > std::map< _Key, _Tp, _Compare, _Alloc >::equal_range
(
            const key_type & __x) const  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pairs to be located.

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).
This function probably only makes sense for multimaps.

erase() [1/5]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<__heterogeneous_tree_key< map > _Kt>
size_type std::map< _Key, _Tp, _Compare, _Alloc >::erase (
             _Kt && __x)  [inline]
```

Erases elements according to the provided key.

Parameters

_↩ _x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/5]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map< _Key, _Tp, _Compare, _Alloc >::erase (
             const key_type & __x)  [inline]
```

Erases elements according to the provided key.

Parameters

_↩ _x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/5]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last)  [inline]
```

Erases a [first,last) range of elements from a map.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [4/5]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::erase (
            const_iterator __position)  [inline]
```

Erases an element from a map.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [5/5]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
iterator std::map< _Key, _Tp, _Compare, _Alloc >::erase (
            iterator __position)  [inline]
```

Erases an element from a map.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

find() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::find (
            const key_type & __x)  [inline]
```

Tries to locate an element in a map.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::find (
            const key_type & __x) const  [inline]
```

Tries to locate an element in a map.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

get_allocator()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
allocator_type std::map< _Key, _Tp, _Compare, _Alloc >::get_allocator () const  [inline], [noexcept]
```

Get a copy of the memory allocation object.

insert() [1/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
void std::map< _Key, _Tp, _Compare, _Alloc >::insert (
             _InputIterator __first,
             _InputIterator __last)  [inline]
```

Template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair >::value, pair< iterator, bool > > std::map<
_Key, _Tp, _Compare, _Alloc >::insert (
             _Pair && __x)  [inline]
```

Attempts to insert a std::pair into the map.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.
Insertion requires logarithmic time.

insert() [3/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair< iterator, bool > std::map< _Key, _Tp, _Compare, _Alloc >::insert (
            const value_type & __x)  [inline]
```

Attempts to insert a std::pair into the map.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.
Insertion requires logarithmic time.
Referenced by std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert(), and std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::operator[]().

insert() [4/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair >::value, iterator > std::map< _Key, _Tp, _↩
Compare, _Alloc >::insert (
            const_iterator __position,
            _Pair && __x)  [inline]
```

Attempts to insert a std::pair into the map.

Parameters

__position	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↩ associative.insert_hints for more on *hinting*.
Insertion requires logarithmic time (if the hint is not taken).

insert() [5/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::insert (
            const_iterator __position,
            const value_type & __x)  [inline]
```

Attempts to insert a std::pair into the map.

Parameters

__position	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires logarithmic time (if the hint is not taken).

insert() [6/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::insert (
            const_iterator __position,
            value_type && __x)  [inline]
```

Attempts to insert a std::pair into the map.

Parameters

__position	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires logarithmic time (if the hint is not taken).

insert() [7/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::map< _Key, _Tp, _Compare, _Alloc >::insert (
            std::initializer_list< value_type > __list)  [inline]
```

Attempts to insert a list of std::pairs into the map.

Parameters

__list	A std::initializer_list<value_type> of pairs to be inserted.

Complexity similar to that of the range constructor.

insert() [8/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair< iterator, bool > std::map< _Key, _Tp, _Compare, _Alloc >::insert (
            value_type && __x)  [inline]
```

Attempts to insert a std::pair into the map.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.
Insertion requires logarithmic time.

key_comp()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
key_compare std::map< _Key, _Tp, _Compare, _Alloc >::key_comp () const  [inline]
```

Returns the key comparison object out of which the map was constructed.
Referenced by std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::at(), std::map< _Key, _Tp, _Cmp, po
std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert(), and std::map< _Key, _Tp, _Cmp, polymorp

lower_bound() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
            const key_type & __x)  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.
Referenced by std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::at(), std::map< _Key, _Tp, _Cmp, po
std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert(), and std::map< _Key, _Tp, _Cmp, polymorp

lower_bound() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
            const key_type & __x) const  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

max_size()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map< _Key, _Tp, _Compare, _Alloc >::max_size () const  [inline], [noexcept]
```

Returns the maximum size of the map.

operator=() [1/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
map & std::map< _Key, _Tp, _Compare, _Alloc >::operator= (
            const map< _Key, _Tp, _Compare, _Alloc > & )  [default]
```

Map assignment operator.
Whether the allocator is copied depends on the allocator traits.

operator=() [2/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
map & std::map< _Key, _Tp, _Compare, _Alloc >::operator= (
            initializer_list< value_type > __l)  [inline]
```

Map list assignment operator.

Parameters

↩ _↩ ↩ _↩ *l*	An initializer_list.

This function fills a map with copies of the elements in the initializer list *__l*.
Note that the assignment completely changes the map and that the resulting map's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
map & std::map< _Key, _Tp, _Compare, _Alloc >::operator= (
            map< _Key, _Tp, _Compare, _Alloc > && )  [default]
```

Move assignment operator.

operator[]()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
mapped_type & std::map< _Key, _Tp, _Compare, _Alloc >::operator[] (
            const key_type & __k)  [inline]
```

Subscript ([]) access to map data.

Parameters

_↩ *_k*	The key for which data should be retrieved.

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ([]) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.
If a heterogeneous key matches a range of elements, the first is chosen.
Lookup requires logarithmic time.

rbegin() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rbegin () const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

rbegin() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rbegin ()  [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

rend() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rend () const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

rend() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rend ()  [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

size()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map< _Key, _Tp, _Compare, _Alloc >::size () const  [inline], [noexcept]
```

Returns the size of the map.

swap()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::map< _Key, _Tp, _Compare, _Alloc >::swap (
            map< _Key, _Tp, _Compare, _Alloc > & __x)  [inline], [noexcept]
```

Swaps data with another map.

Parameters

_↩ _x	A map of the same element and allocator types.

This exchanges the elements between two maps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.
Whether the allocators are swapped depends on the allocator traits.

upper_bound() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (
            const key_type & __x)  [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to the first element greater than key, or end().

upper_bound() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (
            const key_type & __x) const  [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

value_comp()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
value_compare std::map< _Key, _Tp, _Compare, _Alloc >::value_comp () const  [inline]
```

Returns a value comparison object, built from the key comparison object out of which the map was constructed.
The documentation for this class was generated from the following file:

6.677.1 Detailed Description

template<**class _Tp**>
class std::mask_array< **_Tp** >

Reference to selected subset of an array.
A mask_array is a reference to the actual elements of an array specified by a bitmask in the form of an array of bool. The way to get a mask_array is to call operator[](valarray<bool>) on a valarray. The returned mask_array then permits carrying operations out on the referenced subset of elements in the original valarray.
For example, if a mask_array is obtained using the array (false, true, false, true) as an argument, the mask array has two elements referring to array[1] and array[3] in the underlying array.

Parameters

Tp	Element type.

6.677.2 Member Function Documentation

operator%=()

```
template<class _Tp>
void std::mask_array< _Tp >::operator%= (
            const valarray< _Tp > & ) const
```

Modulo slice elements by corresponding elements of *v*.

operator&=()

```
template<class _Tp>
void std::mask_array< _Tp >::operator&= (
            const valarray< _Tp > & ) const
```

Logical and slice elements with corresponding elements of *v*.

operator*=()

```
template<class _Tp>
void std::mask_array< _Tp >::operator*= (
            const valarray< _Tp > & ) const
```

Multiply slice elements by corresponding elements of *v*.

operator+=()

```
template<class _Tp>
void std::mask_array< _Tp >::operator+= (
            const valarray< _Tp > & ) const
```

Add corresponding elements of *v* to slice elements.

operator-=()

```
template<class _Tp>
void std::mask_array< _Tp >::operator-= (
            const valarray< _Tp > & ) const
```

Subtract corresponding elements of *v* from slice elements.

operator/=()

```
template<class _Tp>
void std::mask_array< _Tp >::operator/= (
            const valarray< _Tp > & ) const
```

Divide slice elements by corresponding elements of *v*.

operator<<=()

```
template<class _Tp>
void std::mask_array< _Tp >::operator<<= (
            const valarray< _Tp > & ) const
```

Left shift slice elements by corresponding elements of *v*.

operator>>=()

```
template<class _Tp>
void std::mask_array< _Tp >::operator>>= (
            const valarray< _Tp > & ) const
```

Right shift slice elements by corresponding elements of *v*.

operator^=()

```
template<class _Tp>
void std::mask_array< _Tp >::operator^= (
            const valarray< _Tp > & ) const
```

Logical xor slice elements with corresponding elements of *v*.

operator"|=()

```
template<class _Tp>
void std::mask_array< _Tp >::operator|= (
            const valarray< _Tp > & ) const
```

Logical or slice elements with corresponding elements of *v*.

6.679.1 Detailed Description

template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
class std::match_results< _Bi_iter, _Alloc >

The results of a match or search operation.
A collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template match_results.
This class satisfies the Sequence requirements, with the exception that only the operations defined for a const-qualified Sequence are supported.
The sub_match object stored at index 0 represents sub-expression 0, i.e. the whole match. In this case the sub_↩
match member matched is always true. The sub_match object stored at index n denotes what matched the marked sub-expression n within the matched expression. If the sub-expression n participated in a regular expression match then the sub_match member matched evaluates to true, and members first and second denote the range of characters [first, second) which formed that match. Otherwise matched is false, and members first and second point to the end of the sequence that was searched.

Since

C++11

6.679.2 Constructor & Destructor Documentation

match_results() [1/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results ()  [inline]
```

Constructs a default match_results container.

Postcondition

size() returns 0 and str() returns an empty string.

match_results() [2/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
            const _Alloc & __a)  [inline], [explicit], [noexcept]
```

Constructs a default match_results container.

Postcondition

size() returns 0 and str() returns an empty string.

match_results() [3/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
            const match_results< _Bi_iter, _Alloc > & )  [default]
```

Copy constructs a match_results.

match_results() [4/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
            match_results< _Bi_iter, _Alloc > && )  [default], [noexcept]
```

Move constructs a match_results.

~match_results()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::~match_results ()  [default]
```

Destroys a match_results object.

match_results() [5/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
            const match_results< _Bi_iter, _Alloc > & __m,
            const _Alloc & __a)  [inline]
```

Constructs a default match_results container.

Postcondition

size() returns 0 and str() returns an empty string.

match_results() [6/6]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
            match_results< _Bi_iter, _Alloc > && __m,
            const _Alloc & __a)  [inline], [noexcept]
```

Constructs a default match_results container.

Postcondition

size() returns 0 and str() returns an empty string.

6.679.3 Member Function Documentation

begin()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results< _Bi_iter, _Alloc >::begin () const  [inline], [noexcept]
```

Gets an iterator to the start of the sub_match collection.

Referenced by std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::cbegin(), and std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::operator==().

cbegin()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results< _Bi_iter, _Alloc >::cbegin () const  [inline], [noexcept]
```

Gets an iterator to the start of the sub_match collection.

cend()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results< _Bi_iter, _Alloc >::cend () const  [inline], [noexcept]
```

Gets an iterator to one-past-the-end of the collection.

empty()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
bool std::match_results< _Bi_iter, _Alloc >::empty () const  [inline], [nodiscard], [noexcept]
```

Indicates if the match_results contains no results.

Return values

true	The match_results object is empty.
false	The match_results object is not empty.

Referenced by std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >::operator==(), std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::prefix(), and std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::suffix().

end()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results< _Bi_iter, _Alloc >::end () const  [inline], [noexcept]
```

Gets an iterator to one-past-the-end of the collection.
Referenced by std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::cend(), and std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::operator==().

format() [1/4]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
template<typename _Out_iter, typename _St, typename _Sa>
_Out_iter std::match_results< _Bi_iter, _Alloc >::format (
            _Out_iter __out,
            const basic_string< char_type, _St, _Sa > & __fmt,
            match_flag_type __flags = regex_constants::format_default) const  [inline]
```

Precondition

ready() == true

format() [2/4]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
template<typename _Out_iter>
_Out_iter std::match_results< _Bi_iter, _Alloc >::format (
            _Out_iter __out,
            const char_type * __fmt_first,
            const char_type * __fmt_last,
            match_flag_type __flags = regex_constants::format_default) const
```

Precondition

ready() == true

Referenced by std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::format(), std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::format(), and std::match_results< _BidirectionalIterator, polymorphic↩ _allocator< sub_match< _BidirectionalIterator > > >< const char * >::format().

format() [3/4]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
template<typename _St, typename _Sa>
basic_string< char_type, _St, _Sa > std::match_results< _Bi_iter, _Alloc >::format (
            const basic_string< char_type, _St, _Sa > & __fmt,
            match_flag_type __flags = regex_constants::format_default) const  [inline]
```

Precondition

ready() == true

format() [4/4]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
string_type std::match_results< _Bi_iter, _Alloc >::format (
            const char_type * __fmt,
            match_flag_type __flags = regex_constants::format_default) const  [inline]
```

Precondition

ready() == true

get_allocator()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
allocator_type std::match_results< _Bi_iter, _Alloc >::get_allocator () const  [inline], [noexcept]
```

Gets a copy of the allocator.

length()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
difference_type std::match_results< _Bi_iter, _Alloc >::length (
            size_type __sub = 0) const  [inline]
```

Gets the length of the indicated submatch.

Parameters

__sub	indicates the submatch.

Precondition

ready() == true

This function returns the length of the indicated submatch, or the length of the entire match if __sub is zero (the default).

max_size()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
size_type std::match_results< _Bi_iter, _Alloc >::max_size () const  [inline], [noexcept]
```

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or mark_count() + 1 if a match was successful. Some matches may be empty.

Returns

the number of matches found.

operator=() [1/2]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
match_results & std::match_results< _Bi_iter, _Alloc >::operator= (
            const match_results< _Bi_iter, _Alloc > & )  [default]
```

Assigns rhs to ∗this.

operator=() [2/2]

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
match_results & std::match_results< _Bi_iter, _Alloc >::operator= (
            match_results< _Bi_iter, _Alloc > && )  [default]
```

Move-assigns rhs to ∗this.

operator[]()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_reference std::match_results< _Bi_iter, _Alloc >::operator[] (
            size_type __sub) const  [inline]
```

Gets a sub_match reference for the match or submatch.

Parameters

__sub	indicates the submatch.

Precondition

ready() == true

This function gets a reference to the indicated submatch, or the entire match if __sub is zero.
If __sub >= size() then this function returns a sub_match with a special value indicating no submatch.

position()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
difference_type std::match_results< _Bi_iter, _Alloc >::position (
            size_type __sub = 0) const  [inline]
```

Gets the offset of the beginning of the indicated submatch.

Parameters

__sub	indicates the submatch.

Precondition

ready() == true

This function returns the offset from the beginning of the target sequence to the beginning of the submatch, unless the value of __sub is zero (the default), in which case this function returns the offset from the beginning of the target sequence to the beginning of the match.

prefix()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_reference std::match_results< _Bi_iter, _Alloc >::prefix () const  [inline]
```

Gets a sub_match representing the match prefix.

Precondition

ready() == true

This function gets a reference to a sub_match object representing the part of the target range between the start of the target range and the start of the match.
Referenced by std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::operator==().

ready()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
bool std::match_results< _Bi_iter, _Alloc >::ready () const  [inline], [noexcept]
```

Indicates if the match_results is ready.

Return values

true	The object has a fully-established result state.
false	The object is not ready.

Referenced by std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::operator==(), std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::operator[](), std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::prefix(), and std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::suffix().

size()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
size_type std::match_results< _Bi_iter, _Alloc >::size () const  [inline], [noexcept]
```

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or mark_count() + 1 if a match was successful. Some matches may be empty.

Returns

the number of matches found.

Referenced by std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::operator==(), and std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::operator[]().

str()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
string_type std::match_results< _Bi_iter, _Alloc >::str (
             size_type __sub = 0) const  [inline]
```

Gets the match or submatch converted to a string type.

Parameters

__sub	indicates the submatch.

Precondition

ready() == true

This function gets the submatch (or match, if __sub is zero) extracted from the target range and converted to the associated string type.

suffix()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_reference std::match_results< _Bi_iter, _Alloc >::suffix () const  [inline]
```

Gets a sub_match representing the match suffix.

Precondition

ready() == true

This function gets a reference to a sub_match object representing the part of the target range between the end of the match and the end of the target range.
Referenced by std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::operator==().

swap()

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
void std::match_results< _Bi_iter, _Alloc >::swap (
            match_results< _Bi_iter, _Alloc > & __that)  [inline], [noexcept]
```

Swaps the contents of two match_results.
Referenced by std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::swap().

6.687.1 Detailed Description

template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
class std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >

A generalized feedback shift register discrete random number generator.

This algorithm avoids multiplication and division and is designed to be friendly to a pipelined architecture. If the parameters are chosen correctly, this generator will produce numbers with a very long period and fairly good apparent entropy, although still not cryptographically strong.
The best way to use this generator is with the predefined mt19937 class.
This algorithm was originally invented by Makoto Matsumoto and Takuji Nishimura.

Template Parameters

_↩ _w	Word size, the number of bits in each element of the state vector.
_↩ _n	The degree of recursion.
_↩ _m	The period parameter.
_↩ _r	The separation point bit index.
_↩ _a	The last row of the twist matrix.
_↩ _u	The first right-shift tempering matrix parameter.
_↩ _d	The first right-shift tempering matrix mask.
_↩ _s	The first left-shift tempering matrix parameter.
_↩ _b	The first left-shift tempering matrix mask.
_↩ _t	The second left-shift tempering matrix parameter.
_↩ _c	The second left-shift tempering matrix mask.
_↩ _l	The second right-shift tempering matrix parameter.
_↩ _f	Initialization multiplier.

Since

C++11

6.687.2 Member Typedef Documentation

result_type

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size↩
_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType
__f>
typedef _UIntType std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __↩
s, __b, __t, __c, __l, __f >::result_type
```

The type of the generated random value.

6.687.3 Constructor & Destructor Documentation

mersenne_twister_engine()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size↩
_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType
__f>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, ↩
__l, __f >::mersenne_twister_engine (
            _Sseq & __q)  [inline], [explicit]
```

Constructs a mersenne_twister_engine random number generator engine seeded from the seed sequence __q.

Parameters

_↩ _q	the seed sequence.

6.687.4 Member Function Documentation

discard()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size↩
_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType
__f>
void std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, ↩
__c, __l, __f >::discard (
            unsigned long long __z)
```

Discard a sequence of random numbers.

max()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size↩
_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType
__f>
constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d,
__s, __b, __t, __c, __l, __f >::max ()  [inline], [static], [constexpr]
```

Gets the largest possible value in the output range.

min()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::min () [inline], [static], [constexpr]
```

Gets the smallest possible value in the output range.

6.687.5 Friends And Related Symbol Documentation

operator<<

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
template<typename _UIntType1, size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::mersenne_twister_engine< _UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1, __f1 > & __x) [friend]
```

Inserts the current state of a % mersenne_twister_engine random number generator engine __x into the output stream __os.

Parameters

__os	An output stream.
__x	A % mersenne_twister_engine random number generator engine.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
bool operator== (
            const mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, _b, __t, __c, __l, __f > & __lhs,
            const mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, _b, __t, __c, __l, __f > & __rhs) [friend]
```

Compares two % mersenne_twister_engine random number generator objects of the same type for equality.

Parameters

__lhs	A % mersenne_twister_engine random number generator object.
__rhs	Another % mersenne_twister_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

operator>>

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
template<typename _UIntType1, size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::mersenne_twister_engine< _UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1, __f1 > & __x)  [friend]
```

Extracts the current state of a % mersenne_twister_engine random number generator engine __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A % mersenne_twister_engine random number generator engine.

Returns

The input stream with the state of __x extracted or in an error state.

6.688.1 Detailed Description

template<typename _CharT>
class std::messages< _CharT >

Primary class template messages.
This facet encapsulates the code to retrieve messages from message catalogs. The only thing defined by the standard for this facet is the interface. All underlying functionality is implementation-defined.
This library currently implements 3 versions of the message facet. The first version (gnu) is a wrapper around gettext, provided by libintl. The second version (ieee) is a wrapper around catgets. The final version (default) does no actual translation. These implementations are only provided for char and wchar_t instantiations.
The messages template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the messages facet.

6.688.2 Member Typedef Documentation

char_type

```
template<typename _CharT>
typedef _CharT std::messages< _CharT >::char_type
```

Public typedefs.

string_type

```
template<typename _CharT>
typedef basic_string<_CharT> std::messages< _CharT >::string_type
```

Public typedefs.

6.688.3 Constructor & Destructor Documentation

messages() [1/2]

```
template<typename _CharT>
std::messages< _CharT >::messages (
            size_t __refs = 0)  [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

References std::locale::facet::facet().

messages() [2/2]

```
template<typename _CharT>
std::messages< _CharT >::messages (
            __c_locale __cloc,
            const char * __s,
            size_t __refs = 0)  [explicit]
```

Internal constructor. Not for general use.
This is a constructor for use by the library itself to set up new locales.

Parameters

__cloc	The C locale.
__s	The name of a locale.
__refs	Refcount to pass to the base class.

References std::locale::facet::facet().

~messages()

```
template<typename _CharT>
std::messages< _CharT >::~messages ()  [protected], [virtual]
```

Destructor.

6.688.4 Member Function Documentation

do_get()

```
string std::messages< char >::do_get (
            catalog ,
            int ,

6.696.1 Detailed Description

Money format ordering data.
This class contains an ordered array of 4 fields to represent the pattern for formatting a money amount. Each field may contain one entry from the part enum. symbol, sign, and value must be present and the remaining field must contain either none or space.

See also

moneypunct::pos_format() and moneypunct::neg_format() for details of how these fields are interpreted.

The documentation for this class was generated from the following file:

- locale_facets_nonio.h

6.697.1 Detailed Description

template<typename _CharT, typename _InIter>
class std::money_get< _CharT, _InIter >

Primary class template money_get.
This facet encapsulates the code to parse and return a monetary amount from a string.
The money_get template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the money_get facet.

6.697.2 Member Typedef Documentation

```
template<typename _CharT, typename _InIter>
typedef _CharT std::money_get< _CharT, _InIter >::char_type
```

Public typedefs.

iter_type

```
template<typename _CharT, typename _InIter>
typedef _InIter std::money_get< _CharT, _InIter >::iter_type
```

Public typedefs.

string_type

```
template<typename _CharT, typename _InIter>
typedef basic_string<_CharT> std::money_get< _CharT, _InIter >::string_type
```

Public typedefs.

6.697.3 Constructor & Destructor Documentation

money_get()

```
template<typename _CharT, typename _InIter>
std::money_get< _CharT, _InIter >::money_get (
            size_t __refs = 0)  [inline], [explicit]
```

Constructor performs initialization.
This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

References std::locale::facet::facet().

~money_get()

```
template<typename _CharT, typename _InIter>
virtual std::money_get< _CharT, _InIter >::~money_get ()  [inline], [protected], [virtual]
```

Destructor.

6.697.4 Member Function Documentation

do_get() [1/2]

```
template<typename _CharT, typename _InIter>
_InIter std::money_get< _CharT, _InIter >::do_get (
            iter_type __s,
            iter_type __end,
            bool __intl,
            ios_base & __io,
            ios_base::iostate & __err,
            long double & __units) const  [protected], [virtual]
```

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See also

get() for details.

References std::basic_string< _CharT, _Traits, _Alloc >::c_str().

Referenced by get(), and get().

do_get() [2/2]

```
template<typename _CharT, typename _InIter>
_InIter std::money_get< _CharT, _InIter >::do_get (
            iter_type __s,
            iter_type __end,
            bool __intl,
            ios_base & __io,
            ios_base::iostate & __err,
            string_type & __digits) const  [protected], [virtual]
```

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See also

get() for details.

References std::ios_base::_M_getloc(), std::use_facet(), and std::__ctype_abstract_base< _CharT >::widen().

get() [1/2]

```
template<typename _CharT, typename _InIter>
iter_type std::money_get< _CharT, _InIter >::get (
            iter_type __s,
            iter_type __end,
            bool __intl,
            ios_base & __io,
```

```
            ios_base::iostate & __err,
            long double & __units) const  [inline]
```

Read and parse a monetary value.

This function reads characters from *__s*, interprets them as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and returns the result in *units* as an integral value moneypunct::frac_digits() * the actual amount. For example, the string $10.01 in a US locale would store 1001 in *units*.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets err=(err|io.failbit). If the stream is consumed before finishing parsing, sets err=(err|io.failbit|io.eofbit). *units* is unchanged if parsing fails.

This function works by returning the result of do_get().

Parameters

__s	Start of characters to parse.
__end	End of characters to parse.
__intl	Parameter to use_facet<moneypunct<CharT,intl> >.
__io	Source of facets and io state.
__err	Error field to set if parsing fails.
__units	Place to store result of parsing.

Returns

Iterator referencing first character beyond valid money amount.

References do_get().

get() [2/2]

```
template<typename _CharT, typename _InIter>
iter_type std::money_get< _CharT, _InIter >::get (
            iter_type __s,
            iter_type __end,
            bool __intl,
            ios_base & __io,
            ios_base::iostate & __err,
            string_type & __digits) const  [inline]
```

Read and parse a monetary value.

This function reads characters from *__s*, interprets them as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and returns the result in *digits*. For example, the string $10.01 in a US locale would store `1001` in *digits*.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets err=(err|io.failbit). If the stream is consumed before finishing parsing, sets err=(err|io.failbit|io.eofbit).

This function works by returning the result of do_get().

Parameters

__s	Start of characters to parse.

__end	End of characters to parse.
__intl	Parameter to use_facet<moneypunct<CharT,intl> >.
__io	Source of facets and io state.
__err	Error field to set if parsing fails.
__digits	Place to store result of parsing.

Returns

Iterator referencing first character beyond valid money amount.

References do_get().

6.698.1 Detailed Description

template<typename _CharT, typename _OutIter>
class std::money_put< _CharT, _OutIter >

Primary class template money_put.
This facet encapsulates the code to format and output a monetary amount.
The money_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the money_put facet.

6.698.2 Member Typedef Documentation

char_type

```
template<typename _CharT, typename _OutIter>
typedef _CharT std::money_put< _CharT, _OutIter >::char_type
```

Public typedefs.

iter_type

```
template<typename _CharT, typename _OutIter>
typedef _OutIter std::money_put< _CharT, _OutIter >::iter_type
```

Public typedefs.

string_type

```
template<typename _CharT, typename _OutIter>
typedef basic_string<_CharT> std::money_put< _CharT, _OutIter >::string_type
```

Public typedefs.

6.698.3 Constructor & Destructor Documentation

money_put()

```
template<typename _CharT, typename _OutIter>
std::money_put< _CharT, _OutIter >::money_put (
            size_t __refs = 0)  [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

References std::locale::facet::facet().

~money_put()

```
template<typename _CharT, typename _OutIter>
virtual std::money_put< _CharT, _OutIter >::~money_put ()  [inline], [protected], [virtual]
```

Destructor.

6.698.4 Member Function Documentation

do_put() [1/2]

```
template<typename _CharT, typename _OutIter>
_OutIter std::money_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            bool __intl,
            ios_base & __io,
            char_type __fill,
            const string_type & __digits) const  [protected], [virtual]
```

Format and output a monetary value.

This function formats *digits* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to *__s*. For example, the string `1001` in a US locale would write `$10.01` to *__s*. This function is a hook for derived classes to change the value returned.

See also

put().

Parameters

__s	The stream to write to.
__intl	Parameter to use_facet<moneypunct<CharT,intl> >.

__io	Source of facets and io state.
__fill	char_type to use for padding.
__digits	Place to store result of parsing.

Returns

Iterator after writing.

do_put() [2/2]

```
template<typename _CharT, typename _OutIter>
_OutIter std::money_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            bool __intl,
            ios_base & __io,
            char_type __fill,
            long double __units) const  [protected], [virtual]
```

Format and output a monetary value.
This function formats *units* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to *__s*. For example, the value 1001 in a US locale would write `$10.01` to *__s*.
This function is a hook for derived classes to change the value returned.

See also

put().

Parameters

__s	The stream to write to.
__intl	Parameter to use_facet<moneypunct<CharT,intl> >.
__io	Source of facets and io state.
__fill	char_type to use for padding.
__units	Place to store result of parsing.

Returns

Iterator after writing.

References std::ios_base::getloc(), std::use_facet(), and std::__ctype_abstract_base< _CharT >::widen().
Referenced by put(), and put().

put() [1/2]

```
template<typename _CharT, typename _OutIter>
iter_type std::money_put< _CharT, _OutIter >::put (
```

```
            iter_type __s,
            bool __intl,
            ios_base & __io,
            char_type __fill,
            const string_type & __digits) const  [inline]
```

Format and output a monetary value.
This function formats *digits* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to *__s*. For example, the string `1001` in a US locale would write `$10.01` to *__s*. This function works by returning the result of do_put().

Parameters

__s	The stream to write to.
__intl	Parameter to use_facet<moneypunct<CharT,intl> >.
__io	Source of facets and io state.
__fill	char_type to use for padding.
__digits	Place to store result of parsing.

Returns

Iterator after writing.

References do_put().

put() [2/2]

```
template<typename _CharT, typename _OutIter>
iter_type std::money_put< _CharT, _OutIter >::put (
            iter_type __s,
            bool __intl,
            ios_base & __io,
            char_type __fill,
            long double __units) const  [inline]
```

Format and output a monetary value.
This function formats *units* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to *__s*. For example, the value 1001 in a US locale would write `$10.01` to *__s*. This function works by returning the result of do_put().

Parameters

__s	The stream to write to.
__intl	Parameter to use_facet<moneypunct<CharT,intl> >.
__io	Source of facets and io state.
__fill	char_type to use for padding.

__units	Place to store result of parsing.

Returns

Iterator after writing.

References do_put().

6.699.1 Detailed Description

template<typename _CharT, bool _Intl>
class std::moneypunct< _CharT, _Intl >

Primary class template moneypunct.
This facet encapsulates the punctuation, grouping and other formatting features of money amount string representations.

6.699.2 Member Typedef Documentation

char_type

```
template<typename _CharT, bool _Intl>
typedef _CharT std::moneypunct< _CharT, _Intl >::char_type
```

Public typedefs.

string_type

```
template<typename _CharT, bool _Intl>
typedef basic_string<_CharT> std::moneypunct< _CharT, _Intl >::string_type
```

Public typedefs.

6.699.3 Constructor & Destructor Documentation

moneypunct() [1/3]

```
template<typename _CharT, bool _Intl>
std::moneypunct< _CharT, _Intl >::moneypunct (
            size_t __refs = 0)  [inline], [explicit]
```

Constructor performs initialization.
This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

References std::locale::facet::facet().

moneypunct() [2/3]

```
template<typename _CharT, bool _Intl>
std::moneypunct< _CharT, _Intl >::moneypunct (
            __cache_type * __cache,
            size_t __refs = 0)  [inline], [explicit]
```

Constructor performs initialization.
This is an internal constructor.

Parameters

__cache	Cache for optimization.
__refs	Passed to the base facet class.

References std::locale::facet::facet().

moneypunct() [3/3]

```
template<typename _CharT, bool _Intl>
std::moneypunct< _CharT, _Intl >::moneypunct (
            __c_locale __cloc,
            const char * __s,
            size_t __refs = 0)  [inline], [explicit]
```

Internal constructor. Not for general use.
This is a constructor for use by the library itself to set up new locales.

Parameters

__cloc	The C locale.
__s	The name of a locale.
__refs	Passed to the base facet class.

References std::locale::facet::facet().

~moneypunct()

```
template<typename _CharT, bool _Intl>
virtual std::moneypunct< _CharT, _Intl >::~moneypunct ()  [protected], [virtual]
```

Destructor.

6.699.4 Member Function Documentation

curr_symbol()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct< _CharT, _Intl >::curr_symbol () const  [inline]
```

Return currency symbol string.
This function returns a string_type to use as a currency symbol. It does so by returning returning moneypunct<char↩ _type>::do_curr_symbol().

Returns

string_type representing a currency symbol.

References do_curr_symbol().

decimal_point()

```
template<typename _CharT, bool _Intl>
char_type std::moneypunct< _CharT, _Intl >::decimal_point () const  [inline]
```

Return decimal point character.
This function returns a char_type to use as a decimal point. It does so by returning returning moneypunct<char_↩ type>::do_decimal_point().

Returns

char_type representing a decimal point.

References do_decimal_point().

do_curr_symbol()

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_curr_symbol () const  [inline], [protected],
[virtual]
```

Return currency symbol string.

This function returns a string_type to use as a currency symbol. This function is a hook for derived classes to change the value returned.

See also

curr_symbol() for details.

Returns

string_type representing a currency symbol.

Referenced by curr_symbol().

do_decimal_point()

```
template<typename _CharT, bool _Intl>
virtual char_type std::moneypunct< _CharT, _Intl >::do_decimal_point () const  [inline], [protected],
[virtual]
```

Return decimal point character.

Returns a char_type to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Referenced by decimal_point().

do_frac_digits()

```
template<typename _CharT, bool _Intl>
virtual int std::moneypunct< _CharT, _Intl >::do_frac_digits () const  [inline], [protected],
[virtual]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

See also

frac_digits() for details.

Returns

Number of digits in amount fraction.

Referenced by frac_digits().

do_grouping()

```
template<typename _CharT, bool _Intl>
virtual string std::moneypunct< _CharT, _Intl >::do_grouping () const  [inline], [protected],
[virtual]
```

Return grouping specification.
Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

grouping() for details.

Returns

String representing grouping specification.

Referenced by grouping().

do_neg_format()

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_neg_format () const  [inline], [protected],
[virtual]
```

Return pattern for money values.
This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

See also

neg_format() for details.

Returns

Pattern for money values.

Referenced by neg_format().

do_negative_sign()

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_negative_sign () const  [inline], [protected],
[virtual]
```

Return negative sign string.
This function returns a string_type to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

See also

negative_sign() for details.

Returns

string_type representing a negative sign.

Referenced by negative_sign().

do_pos_format()

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_pos_format () const  [inline], [protected],
[virtual]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

See also

pos_format() for details.

Returns

Pattern for money values.

Referenced by pos_format().

do_positive_sign()

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_positive_sign () const  [inline], [protected],
[virtual]
```

Return positive sign string.

This function returns a string_type to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

See also

positive_sign() for details.

Returns

string_type representing a positive sign.

Referenced by positive_sign().

do_thousands_sep()

```
template<typename _CharT, bool _Intl>
virtual char_type std::moneypunct< _CharT, _Intl >::do_thousands_sep () const  [inline], [protected],
[virtual]
```

Return thousands separator character.

Returns a char_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Referenced by thousands_sep().

frac_digits()

```
template<typename _CharT, bool _Intl>
int std::moneypunct< _CharT, _Intl >::frac_digits () const  [inline]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning returning moneypunct<char_type>::do_frac_digits().

The fractional part of a money amount is optional. But if it is present, there must be frac_digits() digits.

Returns

Number of digits in amount fraction.

References do_frac_digits().

grouping()

```
template<typename _CharT, bool _Intl>
string std::moneypunct< _CharT, _Intl >::grouping () const  [inline]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpret as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns `\003\002` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `32`, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling moneypunct<char_type>::do_grouping().

Returns

string representing grouping specification.

References do_grouping().

neg_format()

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct< _CharT, _Intl >::neg_format () const  [inline]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning moneypunct<char_type>::do_pos_format() or moneypunct<char_type>::do_neg_format().

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of curr_symbol() may be present. The sign field indicates that the value of positive_sign() or negative_sign() must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and pos_format() pattern {symbol,sign,value,none}, curr_symbol() == '$' positive_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

References do_neg_format().

negative_sign()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct< _CharT, _Intl >::negative_sign () const  [inline]
```

Return negative sign string.

This function returns a string_type to use as a sign for negative amounts. It does so by returning returning moneypunct<char_type>::do_negative_sign().

If the return value contains more than one character, the first character appears in the position indicated by neg_format() and the remainder appear at the end of the formatted string.

Returns

string_type representing a negative sign.

References do_negative_sign().

pos_format()

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct< _CharT, _Intl >::pos_format () const  [inline]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning moneypunct<char_type>::do_pos_format() or moneypunct<char_type>::do_neg_format().

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of curr_symbol() may be present. The sign field indicates that the value of positive_sign() or negative_sign() must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and pos_format() pattern {symbol,sign,value,none}, curr_symbol() == '$' positive_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

References do_pos_format().

positive_sign()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct< _CharT, _Intl >::positive_sign () const  [inline]
```

Return positive sign string.

This function returns a string_type to use as a sign for positive amounts. It does so by returning returning moneypunct<char_type>::do_positive_sign().

If the return value contains more than one character, the first character appears in the position indicated by pos_format() and the remainder appear at the end of the formatted string.

Returns

string_type representing a positive sign.

References do_positive_sign().

thousands_sep()

```
template<typename _CharT, bool _Intl>
char_type std::moneypunct< _CharT, _Intl >::thousands_sep () const  [inline]
```

Return thousands separator character.

This function returns a char_type to use as a thousands separator. It does so by returning returning moneypunct<char_type>::do_thousands_sep().

Returns

char_type representing a thousands separator.

References do_thousands_sep().

template<typename _CharT, bool _Intl>
class std::moneypunct_byname< _CharT, _Intl >

class moneypunct_byname [22.2.6.4].

6.700.2 Member Function Documentation

curr_symbol()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct< _CharT, _Intl >::curr_symbol () const  [inline], [inherited]
```

Return currency symbol string.
This function returns a string_type to use as a currency symbol. It does so by returning returning moneypunct<char_type>::do_curr_symbol().

Returns

string_type representing a currency symbol.

References do_curr_symbol().

decimal_point()

```
template<typename _CharT, bool _Intl>
char_type std::moneypunct< _CharT, _Intl >::decimal_point () const  [inline], [inherited]
```

Return decimal point character.
This function returns a char_type to use as a decimal point. It does so by returning returning moneypunct<char_type>::do_decimal_point().

Returns

char_type representing a decimal point.

References do_decimal_point().

do_curr_symbol()

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_curr_symbol () const  [inline], [protected],
[virtual], [inherited]
```

Return currency symbol string.
This function returns a string_type to use as a currency symbol. This function is a hook for derived classes to change the value returned.

See also

curr_symbol() for details.

Returns

string_type representing a currency symbol.

Referenced by curr_symbol().

do_decimal_point()

```
template<typename _CharT, bool _Intl>
virtual char_type std::moneypunct< _CharT, _Intl >::do_decimal_point () const  [inline], [protected],
[virtual], [inherited]
```

Return decimal point character.
Returns a char_type to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Referenced by decimal_point().

do_frac_digits()

```
template<typename _CharT, bool _Intl>
virtual int std::moneypunct< _CharT, _Intl >::do_frac_digits () const  [inline], [protected],
[virtual], [inherited]
```

Return number of digits in fraction.
This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

See also

frac_digits() for details.

Returns

Number of digits in amount fraction.

Referenced by frac_digits().

do_grouping()

```
template<typename _CharT, bool _Intl>
virtual string std::moneypunct< _CharT, _Intl >::do_grouping () const  [inline], [protected],
[virtual], [inherited]
```

Return grouping specification.
Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

grouping() for details.

Returns

String representing grouping specification.

Referenced by grouping().

do_neg_format()

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_neg_format () const  [inline], [protected],
[virtual], [inherited]
```

Return pattern for money values.
This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

See also

neg_format() for details.

Returns

Pattern for money values.

Referenced by neg_format().

do_negative_sign()

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_negative_sign () const  [inline], [protected],
[virtual], [inherited]
```

Return negative sign string.
This function returns a string_type to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

See also

negative_sign() for details.

Returns

string_type representing a negative sign.

Referenced by negative_sign().

do_pos_format()

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_pos_format () const  [inline], [protected],
[virtual], [inherited]
```

Return pattern for money values.
This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

See also

pos_format() for details.

Returns

Pattern for money values.

Referenced by pos_format().

do_positive_sign()

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct< _CharT, _Intl >::do_positive_sign () const  [inline], [protected],
[virtual], [inherited]
```

Return positive sign string.
This function returns a string_type to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

See also

positive_sign() for details.

Returns

string_type representing a positive sign.

Referenced by positive_sign().

do_thousands_sep()

```
template<typename _CharT, bool _Intl>
virtual char_type std::moneypunct< _CharT, _Intl >::do_thousands_sep () const  [inline], [protected],
[virtual], [inherited]
```

Return thousands separator character.
Returns a char_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Referenced by thousands_sep().

frac_digits()

```
template<typename _CharT, bool _Intl>
int std::moneypunct< _CharT, _Intl >::frac_digits () const  [inline], [inherited]
```

Return number of digits in fraction.
This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning returning moneypunct<char_type>::do_frac_digits().
The fractional part of a money amount is optional. But if it is present, there must be frac_digits() digits.

Returns

Number of digits in amount fraction.

References do_frac_digits().

grouping()

```
template<typename _CharT, bool _Intl>
string std::moneypunct< _CharT, _Intl >::grouping () const  [inline], [inherited]
```

Return grouping specification.
This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.
Each char in the return string is interpret as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.
For example, if the grouping() returns `\003\002` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `32`, this would put more than 50 digits into the least significant group if the character set is ASCII.
The string is returned by calling moneypunct<char_type>::do_grouping().

Returns

string representing grouping specification.

References do_grouping().

neg_format()

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct< _CharT, _Intl >::neg_format () const  [inline], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning moneypunct<char_type>::do_pos_format() or moneypunct<char_type>::do_neg_format().

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field. The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of curr_symbol() may be present. The sign field indicates that the value of positive_sign() or negative_↩ sign() must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and pos_format() pattern {symbol,sign,value,none}, curr_symbol() == '$' positive_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

References do_neg_format().

negative_sign()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct< _CharT, _Intl >::negative_sign () const  [inline], [inherited]
```

Return negative sign string.

This function returns a string_type to use as a sign for negative amounts. It does so by returning returning moneypunct<char_type>::do_negative_sign().

If the return value contains more than one character, the first character appears in the position indicated by neg_format() and the remainder appear at the end of the formatted string.

Returns

string_type representing a negative sign.

References do_negative_sign().

pos_format()

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct< _CharT, _Intl >::pos_format () const  [inline], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning moneypunct<char_type>::do_pos_format() or moneypunct<char_type>::do_neg_format().

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field. The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of curr_symbol() may be present. The sign field indicates that the value of positive_sign() or negative_↩ sign() must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and pos_format() pattern {symbol,sign,value,none}, curr_symbol() == '$' positive_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

References do_pos_format().

positive_sign()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct< _CharT, _Intl >::positive_sign () const  [inline], [inherited]
```

Return positive sign string.
This function returns a string_type to use as a sign for positive amounts. It does so by returning returning moneypunct<char_type>::do_positive_sign().
If the return value contains more than one character, the first character appears in the position indicated by pos_format() and the remainder appear at the end of the formatted string.

Returns

string_type representing a positive sign.

References do_positive_sign().

thousands_sep()

```
template<typename _CharT, bool _Intl>
char_type std::moneypunct< _CharT, _Intl >::thousands_sep () const  [inline], [inherited]
```

Return thousands separator character.
This function returns a char_type to use as a thousands separator. It does so by returning returning moneypunct<char_type>::do_thousands_sep().

Returns

char_type representing a thousands separator.

References do_thousands_sep().

6.701.1 Detailed Description

A memory resource that allocates from a fixed-size buffer.
The main feature of a `pmr::monotonic_buffer_resource` is that its `do_deallocate` does nothing. This makes it very fast because there is no need to manage a free list, and every allocation simply returns a new block of memory, rather than searching for a suitably-sized free block. Because deallocating is a no-op, the amount of memory used by the resource only grows until `release()` (or the destructor) is called to return all memory to upstream.
A `monotonic_buffer_resource` can be initialized with a buffer that will be used to satisfy all allocation requests, until the buffer is full. After that a new buffer will be allocated from the upstream resource. By using a stack buffer and `pmr::null_memory_resource()` as the upstream you can get a memory resource that only uses the stack and never dynamically allocates.

Since

C++17

6.701.2 Member Function Documentation

do_allocate()

```
void * std::pmr::monotonic_buffer_resource::do_allocate (
            size_t __bytes,
            size_t __alignment)  [inline], [override], [protected], [virtual]
```

Implements std::pmr::memory_resource.

do_deallocate()

```
void std::pmr::monotonic_buffer_resource::do_deallocate (
            void * ,
            size_t ,
            size_t )  [inline], [override], [protected], [virtual]
```

Implements std::pmr::memory_resource.

do_is_equal()

```
bool std::pmr::monotonic_buffer_resource::do_is_equal (
            const memory_resource & __other) const  [inline], [override], [protected], [virtual],
[noexcept]
```

Implements std::pmr::memory_resource.

6.702.1 Detailed Description

template<typename _Iterator>
class std::move_iterator< _Iterator >

An iterator adaptor that yields an rvalue reference.
Class template move_iterator is an iterator adapter with the same behavior as the underlying iterator except that its dereference operator implicitly converts the value returned by the underlying iterator's dereference operator to an rvalue reference. Some generic algorithms can be called with move iterators to replace copying with moving.
The documentation for this class was generated from the following file:

- bits/stl_iterator.h

6.703.1 Detailed Description

template<typename _Res, typename... _ArgTypes, bool _Noex>
class std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>

Polymorphic function wrapper.

Since

C++23

The `std::move_only_function` class template is a call wrapper similar to `std::function`, but does not require the stored target function to be copyable.
It also supports const-qualification, ref-qualification, and no-throw guarantees. The qualifications and exception-specification of the `move_only_function::operator()` member function are respected when invoking the target function.

6.703.2 Constructor & Destructor Documentation

move_only_function() [1/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
() [inline], [noexcept]
```

Creates an empty object.
References move_only_function().
Referenced by move_only_function(), move_only_function(), move_only_function(), move_only_function(), move_only_function(), move_only_function(), operator=(), operator=(), operator=(), operator==, swap(), and swap.

move_only_function() [2/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
(
            nullptr_t ) [inline], [noexcept]
```

Creates an empty object.
References move_only_function().

move_only_function() [3/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
(
            move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> && __x)
[inline], [noexcept]
```

Moves the target object, leaving the source empty.
References move_only_function().

move_only_function() [4/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Fn, typename _Vt = decay_t<_Fn>>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
(
            _Fn && __f) [inline], [noexcept]
```

Stores a target object initialized from the argument.
References move_only_function(), and std::forward().

move_only_function() [5/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Tp, typename... _Args>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
(
            in_place_type_t< _Tp > ,
            _Args &&... __args) [inline], [explicit], [noexcept]
```

Stores a target object initialized from the arguments.
References move_only_function(), and std::forward().

move_only_function() [6/6]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Tp, typename _Up, typename... _Args>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::move_only_function
(
            in_place_type_t< _Tp > ,
            initializer_list< _Up > __il,
            _Args &&... __args) [inline], [explicit], [noexcept]
```

Stores a target object initialized from the arguments.
References move_only_function(), and std::forward().

6.703.3 Member Function Documentation

operator bool()

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator bool ()
const [inline], [explicit], [noexcept]
```

True if a target object is present, false otherwise.

operator()()

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
_Res std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator() (
            _ArgTypes... __args) [inline], [noexcept]
```

Invoke the target object.

The target object will be invoked using the supplied arguments, and as an lvalue or rvalue, and as const or non-const, as dictated by the template arguments of the `move_only_function` specialization.

Precondition

Must not be empty.

References std::forward(), and operator()().

Referenced by operator()().

operator=() [1/3]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
template<typename _Fn>
move_only_function & std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_↩
Noex)>::operator= (
            _Fn && __f) [inline], [noexcept]
```

Stores a new target object, initialized from the argument.

References move_only_function(), std::forward(), and operator=().

operator=() [2/3]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
move_only_function & std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_↩
Noex)>::operator= (
            move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> && __x)
[inline], [noexcept]
```

Stores a new target object, leaving `x` empty.

References move_only_function(), std::addressof(), and operator=().

Referenced by operator=(), operator=(), and operator=().

operator=() [3/3]

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
move_only_function & std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_↩
Noex)>::operator= (
            nullptr_t ) [inline], [noexcept]
```

Destroys the target object (if any).

References move_only_function(), and operator=().

swap()

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
void std::move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::swap (
            move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __x)
[inline], [noexcept]
```

Exchange the target objects (if any).
References move_only_function(), and swap().
Referenced by swap(), and swap.

6.703.4 Friends And Related Symbol Documentation

operator==

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
bool operator== (
            const move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & _↩
_x,
            nullptr_t ) [friend]
```

Check for emptiness by comparing with `nullptr`.
References move_only_function(), and operator==.
Referenced by operator==.

swap

```
template<typename _Res, typename... _ArgTypes, bool _Noex>
void swap (
            move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __x,
            move_only_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)> & __y)
[friend]
```

Exchange the target objects (if any).
References move_only_function(), and swap().

6.706.1 Detailed Description

template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> > >
class std::multimap< _Key, _Tp, _Compare, _Alloc >

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

Since

C++98

Template Parameters

_Key	Type of key objects.
_Tp	Type of mapped objects.
_Compare	Comparison function object type, defaults to less<_Key>.
_Alloc	Allocator type, defaults to allocator<pair<const _Key, _Tp>.

Meets the requirements of a container, a reversible container, and an associative container (using equivalent keys). For a multimap<Key,T> the key_type is Key, the mapped_type is T, and the value_type is std::pair<const Key,T>.
Multimaps support bidirectional iterators.
The private tree data is declared exactly the same way for map and multimap; the distinction is made entirely in how the tree functions are called (*_unique versus *_equal, same as the standard).

6.706.2 Constructor & Destructor Documentation

multimap() [1/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap ()  [default]
```

Default constructor creates no elements.

multimap() [2/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            const _Compare & __comp,
            const allocator_type & __a = allocator_type())  [inline], [explicit]
```

Creates a multimap with no elements.

Parameters

__comp	A comparison object.
__a	An allocator object.

multimap() [3/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            const multimap< _Key, _Tp, _Compare, _Alloc > & )  [default]
```

Multimap copy constructor.
Whether the allocator is copied depends on the allocator traits.

multimap() [4/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            multimap< _Key, _Tp, _Compare, _Alloc > && )  [default]
```

Multimap move constructor.
The newly-created multimap contains the exact contents of the moved instance. The moved instance is a valid, but unspecified multimap.

multimap() [5/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            initializer_list< value_type > __l,
            const _Compare & __comp = _Compare(),
            const allocator_type & __a = allocator_type())  [inline]
```

Builds a multimap from an initializer_list.

Parameters

__l	An initializer_list.
__comp	A comparison functor.
__a	An allocator object.

Create a multimap consisting of copies of the elements from the initializer_list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is *__l.size()*).

multimap() [6/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            const allocator_type & __a)  [inline], [explicit]
```

Allocator-extended default constructor.

multimap() [7/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            const multimap< _Key, _Tp, _Compare, _Alloc > & __m,
            const __type_identity_t< allocator_type > & __a)  [inline]
```

Allocator-extended copy constructor.

multimap() [8/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            multimap< _Key, _Tp, _Compare, _Alloc > && __m,
            const __type_identity_t< allocator_type > & __a)  [inline], [noexcept]
```

Allocator-extended move constructor.

multimap() [9/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            initializer_list< value_type > __l,
            const allocator_type & __a)  [inline]
```

Allocator-extended initializer-list constructor.

multimap() [10/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            _InputIterator __first,
            _InputIterator __last,
            const allocator_type & __a)  [inline]
```

Allocator-extended range constructor.

multimap() [11/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            _InputIterator __first,
            _InputIterator __last)  [inline]
```

Builds a multimap from a range.

Parameters

__first	An input iterator.
__last	An input iterator.

Create a multimap consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

multimap() [12/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
```

```
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            _InputIterator __first,
            _InputIterator __last,
            const _Compare & __comp,
            const allocator_type & __a = allocator_type())  [inline]
```

Builds a multimap from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__comp	A comparison functor.
__a	An allocator object.

Create a multimap consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

~multimap()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::~multimap ()  [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

6.706.3 Member Function Documentation

begin() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::begin () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

begin() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::begin ()  [inline], [noexcept]
```

Returns a read/write iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

cbegin()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::cbegin () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

cend()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::cend () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

clear()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::multimap< _Key, _Tp, _Compare, _Alloc >::clear ()  [inline], [noexcept]
```

Erases all elements in a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

contains() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt>
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::contains (
             const _Kt & __x) const -> decltype(_M_t._M_find_tr(__x), void(), true)  [inline]
```

Finds whether an element with the given key exists.

Parameters

_↩ _x	Key of (key, value) pairs to be located.

Returns

True if there is any element with the specified key.

contains() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
bool std::multimap< _Key, _Tp, _Compare, _Alloc >::contains (
             const key_type & __x) const  [inline]
```

Finds whether an element with the given key exists.

Parameters

_↩ _x	Key of (key, value) pairs to be located.

Returns

True if there is any element with the specified key.

count()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::count (
            const key_type & __x) const  [inline]
```

Finds the number of elements with given key.

Parameters

_↩ _x	Key of (key, value) pairs to be located.

Returns

Number of elements with specified key.

crbegin()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::crbegin () const  [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

crend()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::crend () const  [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

emplace()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::emplace (
            _Args &&... __args)  [inline]
```

Build and insert a std::pair into the multimap.

Parameters

__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the inserted (key,value) pair.

This function builds and inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.
Insertion requires logarithmic time.

emplace_hint()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::emplace_hint (
            const_iterator __pos,
            _Args &&... __args)  [inline]
```

Builds and inserts a std::pair into the multimap.

Parameters

__pos	An iterator that serves as a hint as to where the pair should be inserted.
__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↩
html#containers.associative.insert_hints
Insertion requires logarithmic time (if the hint is not taken).

empty()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
bool std::multimap< _Key, _Tp, _Compare, _Alloc >::empty () const  [inline], [nodiscard], [noexcept]
```

Returns true if the multimap is empty.

end() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::end () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

end() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::end ()  [inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

equal_range() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair< iterator, iterator > std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_range (
            const key_type & __x)  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pairs to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

equal_range() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair< const_iterator, const_iterator > std::multimap< _Key, _Tp, _Compare, _Alloc >::↩
equal_range (
            const key_type & __x) const  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pairs to be located.

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

erase() [1/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
            const key_type & __x)  [inline]
```

Erases elements according to the provided key.

Parameters

_↩ _*x*	Key of element to be erased.

Returns

The number of elements erased.

This function erases all elements located by the given key from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last)  [inline]
```

Erases a [first,last) range of elements from a multimap.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased .

Returns

The iterator *__last*.

This function erases a sequence of elements from a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
            const_iterator __position)  [inline]
```

Erases an element from a multimap.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [4/4]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
            iterator __position)  [inline]
```

Erases an element from a multimap.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

find() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::find (
            const key_type & __x)  [inline]
```

Tries to locate an element in a multimap.

Parameters

_↩ *_x*	Key of (key, value) pair to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::find (
            const key_type & __x) const  [inline]
```

Tries to locate an element in a multimap.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

get_allocator()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
allocator_type std::multimap< _Key, _Tp, _Compare, _Alloc >::get_allocator () const  [inline],
[noexcept]
```

Get a copy of the memory allocation object.

insert() [1/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator>
void std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
            _InputIterator __first,
            _InputIterator __last)  [inline]
```

A template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair >::value, iterator > std::multimap< _Key, _↩
Tp, _Compare, _Alloc >::insert (
            _Pair && __x)  [inline]
```

Inserts a std::pair into the multimap.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.
Insertion requires logarithmic time.

insert() [3/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
            const value_type & __x)  [inline]
```

Inserts a std::pair into the multimap.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.
Insertion requires logarithmic time.
Referenced by std::multimap< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::insert().

insert() [4/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair>
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::multimap< _Key,
_Tp, _Compare, _Alloc >::insert (
            const_iterator __position,
            _Pair && __x)  [inline]
```

Inserts a std::pair into the multimap.

Parameters

__position	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires logarithmic time (if the hint is not taken).

insert() [5/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
            const_iterator __position,
            const value_type & __x)  [inline]
```

Inserts a std::pair into the multimap.

Parameters

__position	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires logarithmic time (if the hint is not taken).

insert() [6/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
            const_iterator __position,
            value_type && __x)  [inline]
```

Inserts a std::pair into the multimap.

Parameters

__position	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires logarithmic time (if the hint is not taken).

insert() [7/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
            initializer_list< value_type > __l)  [inline]
```

Attempts to insert a list of std::pairs into the multimap.

Parameters

↩ _↩ ↩ _↩ *l*	A std::initializer_list<value_type> of pairs to be inserted.

Complexity similar to that of the range constructor.

insert() [8/8]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
            value_type && __x)  [inline]
```

Inserts a std::pair into the multimap.

Parameters

_↩ *_x*	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.
Insertion requires logarithmic time.

key_comp()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
key_compare std::multimap< _Key, _Tp, _Compare, _Alloc >::key_comp () const  [inline]
```

Returns the key comparison object out of which the multimap was constructed.

lower_bound() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (
            const key_type & __x)  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

lower_bound() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (
            const key_type & __x) const  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful the iterator will point to the next greatest element or, if no such greater element exists, to end().

max_size()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::max_size () const  [inline], [noexcept]
```

Returns the maximum size of the multimap.

operator=() [1/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
multimap & std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
            const multimap< _Key, _Tp, _Compare, _Alloc > & )  [default]
```

Multimap assignment operator.
Whether the allocator is copied depends on the allocator traits.

operator=() [2/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
multimap & std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
            initializer_list< value_type > __l)  [inline]
```

Multimap list assignment operator.

Parameters

↩ _↩ ↩ _↩ *l*	An initializer_list.

This function fills a multimap with copies of the elements in the initializer list *__l*.
Note that the assignment completely changes the multimap and that the resulting multimap's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
multimap & std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
            multimap< _Key, _Tp, _Compare, _Alloc > && )  [default]
```

Move assignment operator.

rbegin() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rbegin () const  [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

rbegin() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rbegin ()  [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

rend() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rend () const  [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

rend() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rend ()  [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

size()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::size () const  [inline], [noexcept]
```

Returns the size of the multimap.

swap()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::multimap< _Key, _Tp, _Compare, _Alloc >::swap (
            multimap< _Key, _Tp, _Compare, _Alloc > & __x)  [inline], [noexcept]
```

Swaps data with another multimap.

Parameters

_↩ _x	A multimap of the same element and allocator types.

This exchanges the elements between two multimaps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.
Whether the allocators are swapped depends on the allocator traits.
Referenced by std::swap().

upper_bound() [1/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
            const key_type & __x)  [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to the first element greater than key, or end().

upper_bound() [2/2]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
            const key_type & __x) const  [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

value_comp()

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
value_compare std::multimap< _Key, _Tp, _Compare, _Alloc >::value_comp () const  [inline]
```

Returns a value comparison object, built from the key comparison object out of which the multimap was constructed.

6.710.1 Detailed Description

template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
class std::multiset< _Key, _Compare, _Alloc >

A standard container made up of elements, which can be retrieved in logarithmic time.

Since

C++98

Template Parameters

_Key	Type of key objects.
_Compare	Comparison function object type, defaults to less<_Key>.
_Alloc	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a container, a reversible container, and an associative container (using equivalent keys). For a `multiset<Key>` the key_type and value_type are Key.
Multisets support bidirectional iterators.
The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (*_unique versus *_equal, same as the standard).

6.710.2 Constructor & Destructor Documentation

multiset() [1/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset ()  [default]
```

Default constructor creates no elements.

multiset() [2/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
            const _Compare & __comp,
            const allocator_type & __a = allocator_type())  [inline], [explicit]
```

Creates a multiset with no elements.

Parameters

__comp	Comparator to use.
__a	An allocator object.

multiset() [3/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
template<typename _InputIterator>
std::multiset< _Key, _Compare, _Alloc >::multiset (
```

```
            _InputIterator __first,
            _InputIterator __last)  [inline]
```

Builds a multiset from a range.

Parameters

__first	An input iterator.
__last	An input iterator.

Create a multiset consisting of copies of the elements from [first,last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

multiset() [4/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
template<typename _InputIterator>
std::multiset< _Key, _Compare, _Alloc >::multiset (
            _InputIterator __first,
            _InputIterator __last,
            const _Compare & __comp,
            const allocator_type & __a = allocator_type())  [inline]
```

Builds a multiset from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__comp	A comparison functor.
__a	An allocator object.

Create a multiset consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

multiset() [5/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
            const multiset< _Key, _Compare, _Alloc > & )  [default]
```

Multiset copy constructor.
Whether the allocator is copied depends on the allocator traits.

multiset() [6/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
            multiset< _Key, _Compare, _Alloc > && )  [default]
```

Multiset move constructor.

The newly-created multiset contains the exact contents of the moved instance. The moved instance is a valid, but unspecified multiset.

multiset() [7/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
            initializer_list< value_type > __l,
            const _Compare & __comp = _Compare(),
            const allocator_type & __a = allocator_type())  [inline]
```

Builds a multiset from an initializer_list.

Parameters

__l	An initializer_list.
__comp	A comparison functor.
__a	An allocator object.

Create a multiset consisting of copies of the elements from the list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is *__l.size()*).

multiset() [8/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
            const allocator_type & __a)  [inline], [explicit]
```

Allocator-extended default constructor.

multiset() [9/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
            const multiset< _Key, _Compare, _Alloc > & __m,
            const __type_identity_t< allocator_type > & __a)  [inline]
```

Allocator-extended copy constructor.

multiset() [10/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
            multiset< _Key, _Compare, _Alloc > && __m,
            const __type_identity_t< allocator_type > & __a)  [inline], [noexcept]
```

Allocator-extended move constructor.

multiset() [11/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
            initializer_list< value_type > __l,
            const allocator_type & __a)  [inline]
```

Allocator-extended initializer-list constructor.

multiset() [12/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
template<typename _InputIterator>
std::multiset< _Key, _Compare, _Alloc >::multiset (
            _InputIterator __first,
            _InputIterator __last,
            const allocator_type & __a)  [inline]
```

Allocator-extended range constructor.

~multiset()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::multiset< _Key, _Compare, _Alloc >::~multiset ()  [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

6.710.3 Member Function Documentation

begin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::begin () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

cbegin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::cbegin () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

cend()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::cend () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

clear()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
void std::multiset< _Key, _Compare, _Alloc >::clear ()  [inline], [noexcept]
```

Erases all elements in a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

contains() [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
template<typename _Kt>
auto std::multiset< _Key, _Compare, _Alloc >::contains (
            const _Kt & __x) const -> decltype(_M_t._M_find_tr(__x), void(), true)  [inline]
```

Finds whether an element with the given key exists.

Parameters

_↩ _x	Key of elements to be located.

Returns

True if there is any element with the specified key.

contains() [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
bool std::multiset< _Key, _Compare, _Alloc >::contains (
            const key_type & __x) const  [inline]
```

Finds whether an element with the given key exists.

Parameters

_↩ _x	Key of elements to be located.

Returns

True if there is any element with the specified key.

count()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::count (
            const key_type & __x) const  [inline]
```

Finds the number of elements with given key.

Parameters

_↩ _x	Key of elements to be located.

Returns

Number of elements with specified key.

crbegin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::crbegin () const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

crend()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::crend () const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

emplace()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
template<typename... _Args>
iterator std::multiset< _Key, _Compare, _Alloc >::emplace (
            _Args &&... __args)  [inline]
```

Builds and inserts an element into the multiset.

Parameters

__args	Arguments used to generate the element instance to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a std::set the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.
Insertion requires logarithmic time.

emplace_hint()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
template<typename... _Args>
iterator std::multiset< _Key, _Compare, _Alloc >::emplace_hint (
            const_iterator __pos,
            _Args &&... __args)  [inline]
```

Builds and inserts an element into the multiset.

Parameters

__pos	An iterator that serves as a hint as to where the element should be inserted.
__args	Arguments used to generate the element instance to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a std::set the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.
Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires logarithmic time (if the hint is not taken).

empty()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
bool std::multiset< _Key, _Compare, _Alloc >::empty () const  [inline], [nodiscard], [noexcept]
```

Returns true if the set is empty.

end()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::end () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

equal_range() [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair< iterator, iterator > std::multiset< _Key, _Compare, _Alloc >::equal_range (
            const key_type & __x)  [inline]
```

Finds a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).
This function probably only makes sense for multisets.

equal_range() [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::pair< const_iterator, const_iterator > std::multiset< _Key, _Compare, _Alloc >::equal_range
(
            const key_type & __x) const  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).
This function probably only makes sense for multisets.

erase() [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::erase (
            const key_type & __x)  [inline]
```

Erases elements according to the provided key.

Parameters

_↩ _x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all elements located by the given key from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last)  [inline]
```

Erases a [first,last) range of elements from a multiset.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *last*.

This function erases a sequence of elements from a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::erase (
            const_iterator __position)  [inline]
```

Erases an element from a multiset.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

find() [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::find (
            const key_type & __x)  [inline]
```

Tries to locate an element in a set.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::find (
            const key_type & __x) const  [inline]
```

Tries to locate an element in a set.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

get_allocator()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
allocator_type std::multiset< _Key, _Compare, _Alloc >::get_allocator () const  [inline], [noexcept]
```

Returns the memory allocation object.

insert() [1/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
template<typename _InputIterator>
void std::multiset< _Key, _Compare, _Alloc >::insert (
            _InputIterator __first,
            _InputIterator __last)  [inline]
```

A template function that tries to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::insert (
            const value_type & __x)  [inline]
```

Inserts an element into the multiset.

Parameters

_↩ _x	Element to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a std::set the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.
Insertion requires logarithmic time.
Referenced by std::multiset< _Key, _Cmp, polymorphic_allocator< _Key > >::insert().

insert() [3/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::insert (
            const_iterator __position,
            const value_type & __x)  [inline]
```

Inserts an element into the multiset.

Parameters

__position	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a std::set the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.
Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↩associative.insert_hints for more on *hinting*.
Insertion requires logarithmic time (if the hint is not taken).

insert() [4/4]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
void std::multiset< _Key, _Compare, _Alloc >::insert (
            initializer_list< value_type > __l)  [inline]
```

Attempts to insert a list of elements into the multiset.

Parameters

↩ _↩ ↩ _↩ *l*	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.

key_comp()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
key_compare std::multiset< _Key, _Compare, _Alloc >::key_comp () const  [inline]
```

Returns the comparison object.

lower_bound() [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound (
            const key_type & __x)  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ *_x*	Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

lower_bound() [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound (
            const key_type & __x) const  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ *_x*	Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

max_size()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::max_size () const  [inline], [noexcept]
```

Returns the maximum size of the set.

operator=() [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
multiset & std::multiset< _Key, _Compare, _Alloc >::operator= (
            const multiset< _Key, _Compare, _Alloc > & )  [default]
```

Multiset assignment operator.
Whether the allocator is copied depends on the allocator traits.

operator=() [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
multiset & std::multiset< _Key, _Compare, _Alloc >::operator= (
            initializer_list< value_type > __l)  [inline]
```

Multiset list assignment operator.

Parameters

↩ _↩ ↩ _↩ *l*	An initializer_list.

This function fills a multiset with copies of the elements in the initializer list *__l*.
Note that the assignment completely changes the multiset and that the resulting multiset's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
multiset & std::multiset< _Key, _Compare, _Alloc >::operator= (
            multiset< _Key, _Compare, _Alloc > && )  [default]
```

Move assignment operator.

rbegin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
```

```
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rbegin () const  [inline], [noexcept]
```
Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

rend()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rend () const  [inline], [noexcept]
```
Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

size()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::size () const  [inline], [noexcept]
```
Returns the size of the set.

swap()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
void std::multiset< _Key, _Compare, _Alloc >::swap (
            multiset< _Key, _Compare, _Alloc > & __x)  [inline], [noexcept]
```
Swaps data with another multiset.

Parameters

_↩ _x	A multiset of the same element and allocator types.

This exchanges the elements between two multisets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.
Whether the allocators are swapped depends on the allocator traits.
Referenced by std::swap().

upper_bound() [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::upper_bound (
            const key_type & __x)  [inline]
```
Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to the first element greater than key, or end().

upper_bound() [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::upper_bound (
            const key_type & __x) const  [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to the first element greater than key, or end().

value_comp()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
value_compare std::multiset< _Key, _Compare, _Alloc >::value_comp () const  [inline]
```

Returns the comparison object.

6.714 std::mutex Class Reference

`#include <mutex>`

Public Types

- typedef __native_type * **native_handle_type**

Public Member Functions

- **mutex** (const mutex &)=delete
- void **lock** ()
- native_handle_type **native_handle** () noexcept
- mutex & **operator=** (const mutex &)=delete
- bool **try_lock** () noexcept
- void **unlock** ()

6.714.1 Detailed Description

The standard mutex type.
A simple, non-recursive, non-timed mutex.
Do not call `lock()` and `unlock()` directly, use a scoped lock type such as `std::unique_lock`, `std::lock_guard`, or (since C++17) `std::scoped_lock`.

Since

C++11

6.717.1 Detailed Description

template<typename _IntType = int>
class std::negative_binomial_distribution< _IntType >

A negative_binomial_distribution random number distribution.
The formula for the negative binomial probability mass function is $p(i) = \binom{n}{i} p^i (1-p)^{t-i}$ where t and p are the parameters of the distribution.

Since

C++11

6.717.2 Member Typedef Documentation

result_type

```
template<typename _IntType = int>
typedef _IntType std::negative_binomial_distribution< _IntType >::result_type
```

The type of the range of the distribution.

6.717.3 Member Function Documentation

k()

```
template<typename _IntType = int>
_IntType std::negative_binomial_distribution< _IntType >::k () const  [inline]
```

Return the k parameter of the distribution.

max()

```
template<typename _IntType = int>
result_type std::negative_binomial_distribution< _IntType >::max () const  [inline]
```

Returns the least upper bound value of the distribution.

min()

```
template<typename _IntType = int>
result_type std::negative_binomial_distribution< _IntType >::min () const  [inline]
```

Returns the greatest lower bound value of the distribution.

operator()()

```
template<typename _IntType>
template<typename _UniformRandomNumberGenerator>
negative_binomial_distribution< _IntType >::result_type std::negative_binomial_distribution< _↩
IntType >::operator() (
            _UniformRandomNumberGenerator & __urng)
```

Generating functions.

p()

```
template<typename _IntType = int>
double std::negative_binomial_distribution< _IntType >::p () const  [inline]
```

Return the p parameter of the distribution.

param() [1/2]

```
template<typename _IntType = int>
param_type std::negative_binomial_distribution< _IntType >::param () const  [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _IntType = int>
void std::negative_binomial_distribution< _IntType >::param (
            const param_type & __param)  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

reset()

```
template<typename _IntType = int>
void std::negative_binomial_distribution< _IntType >::reset ()  [inline]
```

Resets the distribution state.

6.717.4 Friends And Related Symbol Documentation

operator<<

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::negative_binomial_distribution< _IntType1 > & __x)  [friend]
```

Inserts a negative_binomial_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.

__x	A negative_binomial_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _IntType = int>
bool operator== (
             const negative_binomial_distribution< _IntType > & __d1,
             const negative_binomial_distribution< _IntType > & __d2)  [friend]
```

Return true if two negative binomial distributions have the same parameters and the sequences that would be generated are equal.

operator>>

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
             std::basic_istream< _CharT, _Traits > & __is,
             std::negative_binomial_distribution< _IntType1 > & __x)  [friend]
```

Extracts a negative_binomial_distribution random number distribution __x from the input stream __is.

Parameters

_is	An input stream.
_x	A negative_binomial_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

6.718 std::nested_exception Class Reference

```
#include <exception>
```

Public Member Functions

- nested_exception () noexcept
- **nested_exception** (const nested_exception &) noexcept=default
- exception_ptr nested_ptr () const noexcept
- nested_exception & **operator=** (const nested_exception &) noexcept=default
- void rethrow_nested () const

6.718.1 Detailed Description

Mixin class that stores the current exception.
This type can be used via `std::throw_with_nested` to store the current exception nested within another exception.

Since

C++11

See also

std::throw_with_nested

6.718.2 Constructor & Destructor Documentation

nested_exception()

`std::nested_exception::nested_exception () [inline], [noexcept]`
The default constructor stores the current exception (if any).
References std::current_exception().

6.718.3 Member Function Documentation

nested_ptr()

`exception_ptr std::nested_exception::nested_ptr () const [inline], [noexcept]`
Access the stored exception.

rethrow_nested()

`void std::nested_exception::rethrow_nested () const [inline]`
Rethrow the stored exception, or terminate if none was stored.
References std::rethrow_exception(), rethrow_nested(), and std::terminate().
Referenced by rethrow_nested().
The documentation for this class was generated from the following file:

- nested_exception.h

Static Public Member Functions

- static constexpr void **_S_check_allocation_limit** (size_t __n)

6.721.1 Detailed Description

template<typename _Tp>
class __gnu_cxx::new_allocator< _Tp >

An allocator that uses global `new`, as per C++03 [20.4.1].
This is precisely the allocator defined in the C++ Standard.

- all allocation calls `operator new`
- all deallocation calls `operator delete`

This is a non-standard extension that can be used to guarantee allocation from `new` even if the library has been configured to use a different implementation for `std::allocator`.

Template Parameters

_Tp	Type of allocated object.

The documentation for this class was generated from the following file:

- ext/new_allocator.h

6.724.1 Detailed Description

template<typename _RealType = double>
class std::normal_distribution< _RealType >

A normal continuous distribution for random numbers.
The formula for the normal probability density function is

$$p(x|\mu,\sigma) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{x-\mu^2}{2\sigma^2}}$$

Since

C++11

6.724.2 Member Typedef Documentation

result_type

```
template<typename _RealType = double>
typedef _RealType std::normal_distribution< _RealType >::result_type
```

The type of the range of the distribution.

6.724.3 Constructor & Destructor Documentation

normal_distribution()

```
template<typename _RealType = double>
std::normal_distribution< _RealType >::normal_distribution (
            result_type __mean,
            result_type __stddev = result_type(1))  [inline], [explicit]
```

Constructs a normal distribution with parameters $mean$ and standard deviation.

6.724.4 Member Function Documentation

max()

```
template<typename _RealType = double>
result_type std::normal_distribution< _RealType >::max () const  [inline]
```

Returns the least upper bound value of the distribution.

mean()

```
template<typename _RealType = double>
_RealType std::normal_distribution< _RealType >::mean () const  [inline]
```

Returns the mean of the distribution.

min()

```
template<typename _RealType = double>
result_type std::normal_distribution< _RealType >::min () const  [inline]
```

Returns the greatest lower bound value of the distribution.

operator()() [1/2]

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::normal_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng)  [inline]
```

Generating functions.
Referenced by operator()().

operator()() [2/2]

```
template<typename _RealType>
template<typename _UniformRandomNumberGenerator>
normal_distribution< _RealType >::result_type std::normal_distribution< _RealType >::operator()
```

```
(
            _UniformRandomNumberGenerator & __urng,
            const param_type & __param)
```

Polar method due to Marsaglia.
Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. V, Sect. 4.4.
References std::log(), and std::sqrt().

param() [1/2]

```
template<typename _RealType = double>
param_type std::normal_distribution< _RealType >::param () const  [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _RealType = double>
void std::normal_distribution< _RealType >::param (
            const param_type & __param)  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

reset()

```
template<typename _RealType = double>
void std::normal_distribution< _RealType >::reset ()  [inline]
```

Resets the distribution state.

stddev()

```
template<typename _RealType = double>
_RealType std::normal_distribution< _RealType >::stddev () const  [inline]
```

Returns the standard deviation of the distribution.

6.724.5 Friends And Related Symbol Documentation

operator<<

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::normal_distribution< _RealType1 > & __x)  [friend]
```

Inserts a normal_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A normal_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _RealType = double>
template<typename _RealType1>
bool operator== (
             const std::normal_distribution< _RealType1 > & __d1,
             const std::normal_distribution< _RealType1 > & __d2)  [friend]
```

Return true if two normal distributions have the same parameters and the sequences that would be generated are equal.

operator>>

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
             std::basic_istream< _CharT, _Traits > & __is,
             std::normal_distribution< _RealType1 > & __x)  [friend]
```

Extracts a normal_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A normal_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

6.731.1 Detailed Description

template<typename _CharT, typename _InIter>
class std::num_get< _CharT, _InIter >

Primary class template num_get.
This facet encapsulates the code to parse and return a number from a string. It is used by the istream numeric extraction operators.
The num_get template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the num_get facet.

6.731.2 Member Typedef Documentation

char_type

```
template<typename _CharT, typename _InIter>
typedef _CharT std::num_get< _CharT, _InIter >::char_type
```

Public typedefs.

iter_type

```
template<typename _CharT, typename _InIter>
typedef _InIter std::num_get< _CharT, _InIter >::iter_type
```

Public typedefs.

6.731.3 Constructor & Destructor Documentation

num_get()

```
template<typename _CharT, typename _InIter>
std::num_get< _CharT, _InIter >::num_get (
            size_t __refs = 0)  [inline], [explicit]
```

Constructor performs initialization.
This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

~num_get()

```
template<typename _CharT, typename _InIter>
virtual std::num_get< _CharT, _InIter >::~num_get ()  [inline], [protected], [virtual]
```

Destructor.

6.731.4 Member Function Documentation

do_get() [1/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
```

```
            ios_base::iostate & __err,
            long & __v) const  [inline], [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

do_get() [2/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            long long & __v) const  [inline], [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

do_get() [3/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            unsigned int & __v) const  [inline], [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

do_get() [4/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            unsigned long & __v) const  [inline], [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

do_get() [5/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            unsigned long long & __v) const  [inline], [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

do_get() [6/11]

```
template<typename _CharT, typename _InIter>
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            unsigned short & __v) const  [inline], [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

do_get() [7/11]

```
template<typename _CharT, typename _InIter>
_InIter std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            bool & __v) const  [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.

__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

```
template<typename _CharT, typename _InIter>
_InIter std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            double & __v) const  [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

References std::basic_string< _CharT, _Traits, _Alloc >::c_str(), std::ios_base::eofbit, and std::basic_string< _CharT, _Traits, _Alloc >::r

do_get() [9/11]

```
template<typename _CharT, typename _InIter>
_InIter std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            float & __v) const  [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

References std::basic_string< _CharT, _Traits, _Alloc >::c_str(), std::ios_base::eofbit, and std::basic_string< _CharT, _Traits, _Alloc >::r

do_get() [10/11]

```
template<typename _CharT, typename _InIter>
_InIter std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            long double & __v) const  [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.

__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

References std::basic_string< _CharT, _Traits, _Alloc >::c_str(), std::ios_base::eofbit, and std::basic_string< _CharT, _Traits, _Alloc >::r

do_get() [11/11]

```
template<typename _CharT, typename _InIter>
_InIter std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            void *& __v) const  [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

References std::ios_base::basefield, std::ios_base::flags(), and std::ios_base::hex.

get() [1/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
            iter_type __in,
            iter_type __end,
            ios_base & __io,
```

```
            ios_base::iostate & __err,
            bool & __v) const  [inline]
```

Numeric parsing.
Parses the input stream into the bool *v*. It does so by calling num_get::do_get().
If ios_base::boolalpha is set, attempts to read ctype<CharT>::truename() or ctype<CharT>::falsename(). Sets *v* to true or false if successful. Sets err to ios_base::failbit if reading the string fails. Sets err to ios_base::eofbit if the stream is emptied.
If ios_base::boolalpha is not set, proceeds as with reading a long, except if the value is 1, sets *v* to true, if the value is 0, sets *v* to false, and otherwise set err to ios_base::failbit.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Referenced by std::basic_iostream< char_type, traits_type >::operator>>(), and std::basic_istream< _CharT, _Traits >::operator>>().

get() [2/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
            iter_type __in,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            double & __v) const  [inline]
```

Numeric parsing.
Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().
The input characters are parsed like the scanf g specifier. The matching type length modifier is also used.
The decimal point character used is numpunct::decimal_point(). Digit grouping is interpreted according to numpunct::↩ grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.
If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.

__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

get() [3/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
            iter_type __in,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            float & __v) const  [inline]
```

Numeric parsing.
Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().
The input characters are parsed like the scanf g specifier. The matching type length modifier is also used.
The decimal point character used is numpunct::decimal_point(). Digit grouping is interpreted according to numpunct::↩ grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.
If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered.
Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

get() [4/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
            iter_type __in,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            long & __v) const  [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().
Parsing is affected by the flag settings in *io*.
The basic parse is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, parses like the scanf o specifier. Else if equal to ios_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used.
Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.
If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

get() [5/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
            iter_type __in,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            long double & __v) const  [inline]
```

Numeric parsing.
Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().
The input characters are parsed like the scanf g specifier. The matching type length modifier is also used.
The decimal point character used is numpunct::decimal_point(). Digit grouping is interpreted according to numpunct::↩ grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.
If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.

__v	Value to format and insert.

Returns

Iterator after reading.

get() [6/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
            iter_type __in,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            long long & __v) const  [inline]
```

Numeric parsing.
Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().
Parsing is affected by the flag settings in *io*.
The basic parse is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, parses like the scanf o specifier. Else if equal to ios_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used.
Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.
If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

get() [7/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
            iter_type __in,
            iter_type __end,
            ios_base & __io,
```

```
            ios_base::iostate & __err,
            unsigned int & __v) const  [inline]
```

Numeric parsing.
Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().
Parsing is affected by the flag settings in *io*.
The basic parse is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, parses like the scanf o specifier. Else if equal to ios_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used.
Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.
If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

get() [8/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
            iter_type __in,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            unsigned long & __v) const  [inline]
```

Numeric parsing.
Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().
Parsing is affected by the flag settings in *io*.
The basic parse is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, parses like the scanf o specifier. Else if equal to ios_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used.
Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.
If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

get() [9/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
            iter_type __in,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            unsigned long long & __v) const  [inline]
```

Numeric parsing.
Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().
Parsing is affected by the flag settings in *io*.
The basic parse is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, parses like the scanf o specifier. Else if equal to ios_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used.
Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.
If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

get() [10/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
            iter_type __in,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            unsigned short & __v) const  [inline]
```

Numeric parsing.
Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().
Parsing is affected by the flag settings in *io*.
The basic parse is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, parses like the scanf o specifier. Else if equal to ios_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used.
Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.
If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered.
Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

get() [11/11]

```
template<typename _CharT, typename _InIter>
iter_type std::num_get< _CharT, _InIter >::get (
            iter_type __in,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            void *& __v) const  [inline]
```

Numeric parsing.
Parses the input stream into the pointer variable *v*. It does so by calling num_get::do_get().
The input characters are parsed like the scanf p specifier.
Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.
Note that the digit grouping effect for pointers is a bit ambiguous in the standard and shouldn't be relied on. See DR 344.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

6.732.1 Detailed Description

template<typename _CharT, typename _OutIter>
class std::num_put< _CharT, _OutIter >

Primary class template num_put.
This facet encapsulates the code to convert a number to a string. It is used by the ostream numeric insertion operators. The num_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the num_put facet.

6.732.2 Member Typedef Documentation

char_type

```
template<typename _CharT, typename _OutIter>
typedef _CharT std::num_put< _CharT, _OutIter >::char_type
```

Public typedefs.

iter_type

```
template<typename _CharT, typename _OutIter>
typedef _OutIter std::num_put< _CharT, _OutIter >::iter_type
```

Public typedefs.

6.732.3 Constructor & Destructor Documentation

num_put()

```
template<typename _CharT, typename _OutIter>
std::num_put< _CharT, _OutIter >::num_put (
            size_t __refs = 0)  [inline], [explicit]
```

Constructor performs initialization.
This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

~num_put()

```
template<typename _CharT, typename _OutIter>
virtual std::num_put< _CharT, _OutIter >::~num_put ()  [inline], [protected], [virtual]
```

Destructor.

6.732.4 Member Function Documentation

do_put() [1/8]

```
template<typename _CharT, typename _OutIter>
_OutIter std::num_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            bool __v) const  [protected], [virtual]
```

Numeric formatting.
These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

References std::ios_base::_M_getloc(), std::ios_base::adjustfield, std::ios_base::boolalpha, std::ios_base::flags(), std::ios_base::left, and std::ios_base::width().
Referenced by std::num_put< _CharT, ostreambuf_iterator< _CharT, _Traits > >::put(), std::num_put< _CharT, ostreambuf_iterator< _C
std::num_put< _CharT, ostreambuf_iterator< _CharT, _Traits > >::put(), std::num_put< _CharT, ostreambuf_iterator< _CharT, _Traits >
std::num_put< _CharT, ostreambuf_iterator< _CharT, _Traits > >::put(), std::num_put< _CharT, ostreambuf_iterator< _CharT, _Traits >
std::num_put< _CharT, ostreambuf_iterator< _CharT, _Traits > >::put(), and std::num_put< _CharT, ostreambuf_iterator< _CharT, _Tra

do_put() [2/8]

```
template<typename _CharT, typename _OutIter>
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            long __v) const  [inline], [protected], [virtual]
```

Numeric formatting.
These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

_↩ _s	Stream to write to.

_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

do_put() [3/8]

```
template<typename _CharT, typename _OutIter>
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            long long __v) const  [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

do_put() [4/8]

```
template<typename _CharT, typename _OutIter>
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            unsigned long __v) const  [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

do_put() [5/8]

```
template<typename _CharT, typename _OutIter>
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            unsigned long long __v) const  [inline], [protected], [virtual]
```

Numeric formatting.
These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

do_put() [6/8]

```
template<typename _CharT, typename _OutIter>
_OutIter std::num_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            const void * __v) const  [protected], [virtual]
```

Numeric formatting.
These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

References std::ios_base::basefield, std::ios_base::flags(), std::ios_base::hex, std::ios_base::showbase, and std::ios_base::uppercase.

do_put() [7/8]

```
template<typename _CharT, typename _OutIter>
_OutIter std::num_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            double __v) const  [protected], [virtual]
```

Numeric formatting.
These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

do_put() [8/8]

```
template<typename _CharT, typename _OutIter>
_OutIter std::num_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            long double __v) const  [protected], [virtual]
```

Numeric formatting.
These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

_↩ _*s*	Stream to write to.
_↩ _*io*	Source of locale and flags.
_↩ _*fill*	Char_type to use for filling.
_↩ _*v*	Value to format and insert.

Returns

Iterator after writing.

put() [1/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            bool __v) const  [inline]
```

Numeric formatting.
Formats the boolean *v* and inserts it into a stream. It does so by calling num_put::do_put().
If ios_base::boolalpha is set, writes ctype<CharT>::truename() or ctype<CharT>::falsename(). Otherwise formats *v* as an int.

Parameters

_↩ _*s*	Stream to write to.
_↩ _*io*	Source of locale and flags.
_↩ _*fill*	Char_type to use for filling.
_↩ _*v*	Value to format and insert.

Returns

Iterator after writing.

Referenced by std::basic_ostream< _CharT, _Traits >::operator<<().

put() [2/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            const void * __v) const  [inline]
```

Numeric formatting.
Formats the pointer value *v* and inserts it into a stream. It does so by calling num_put::do_put().
This function formats *v* as an unsigned long with ios_base::hex and ios_base::showbase set.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

put() [3/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            double __v) const  [inline]
```

Numeric formatting.
Formats the floating point value *v* and inserts it into a stream. It does so by calling num_put::do_put().
Formatting is affected by the flag settings in *io*.
The basic format is affected by the value of io.flags() & ios_base::floatfield. If equal to ios_base::fixed, formats like the printf f specifier. Else if equal to ios_base::scientific, formats like e or E with ios_base::uppercase unset or set respectively. Otherwise, formats like g or G depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like g or G.
The output precision is given by io.precision(). This precision is capped at numeric_limits::digits10 + 2 (different for double and long double). The default precision is 6.
If ios_base::showpos is set, '+' is output before positive values. If ios_base::showpoint is set, a decimal point will always be output.

The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().
If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_↩ base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

_↩ _*s*	Stream to write to.
_↩ _*io*	Source of locale and flags.
_↩ _*fill*	Char_type to use for filling.
_↩ _*v*	Value to format and insert.

Returns

Iterator after writing.

put() [4/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            long __v) const  [inline]
```

Numeric formatting.
Formats the integral value *v* and inserts it into a stream. It does so by calling num_put::do_put().
Formatting is affected by the flag settings in *io*.
The basic format is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, formats like the printf o specifier. Else if equal to ios_base::hex, formats like x or X with ios_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.
If ios_base::showpos is set, '+' is output before positive values. If ios_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.
The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().
If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_↩ base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

_↩ _*s*	Stream to write to.
_↩ _*io*	Source of locale and flags.

_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

put() [5/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            long double __v) const  [inline]
```

Numeric formatting.
Formats the floating point value *v* and inserts it into a stream. It does so by calling num_put::do_put().
Formatting is affected by the flag settings in *io*.
The basic format is affected by the value of io.flags() & ios_base::floatfield. If equal to ios_base::fixed, formats like the printf f specifier. Else if equal to ios_base::scientific, formats like e or E with ios_base::uppercase unset or set respectively. Otherwise, formats like g or G depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like g or G.
The output precision is given by io.precision(). This precision is capped at numeric_limits::digits10 + 2 (different for double and long double). The default precision is 6.
If ios_base::showpos is set, '+' is output before positive values. If ios_base::showpoint is set, a decimal point will always be output.
The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().
If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_↩ base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

put() [6/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            long long __v) const  [inline]
```

Numeric formatting.
Formats the integral value *v* and inserts it into a stream. It does so by calling num_put::do_put().
Formatting is affected by the flag settings in *io*.
The basic format is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, formats like the printf o specifier. Else if equal to ios_base::hex, formats like x or X with ios_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.
If ios_base::showpos is set, '+' is output before positive values. If ios_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.
The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().
If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_↩ base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

_↩ _*s*	Stream to write to.
_↩ _*io*	Source of locale and flags.
_↩ _*fill*	Char_type to use for filling.
_↩ _*v*	Value to format and insert.

Returns

Iterator after writing.

put() [7/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            unsigned long __v) const  [inline]
```

Numeric formatting.
Formats the integral value *v* and inserts it into a stream. It does so by calling num_put::do_put().
Formatting is affected by the flag settings in *io*.
The basic format is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, formats like the printf o specifier. Else if equal to ios_base::hex, formats like x or X with ios_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.

If ios_base::showpos is set, '+' is output before positive values. If ios_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.
The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().
If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_↩ base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

_↩ _*s*	Stream to write to.
_↩ _*io*	Source of locale and flags.
_↩ _*fill*	Char_type to use for filling.
_↩ _*v*	Value to format and insert.

Returns

Iterator after writing.

put() [8/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            unsigned long long __v) const  [inline]
```

Numeric formatting.
Formats the integral value *v* and inserts it into a stream. It does so by calling num_put::do_put().
Formatting is affected by the flag settings in *io*.
The basic format is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, formats like the printf o specifier. Else if equal to ios_base::hex, formats like x or X with ios_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.
If ios_base::showpos is set, '+' is output before positive values. If ios_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.
The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().
If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_↩ base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

_↩ _*s*	Stream to write to.

_↩ _*io*	Source of locale and flags.
_↩ _*fill*	Char_type to use for filling.
_↩ _*v*	Value to format and insert.

Returns

Iterator after writing.

6.733.1 Detailed Description

template<typename _Tp>
struct std::numeric_limits< _Tp >

Properties of fundamental types.
This class allows a program to obtain information about the representation of a fundamental type on a given platform. For non-fundamental types, the functions will return 0 and the data members will all be `false`.

6.733.2 Member Function Documentation

denorm_min()

```
template<typename _Tp>
constexpr _Tp std::numeric_limits< _Tp >::denorm_min ()  [inline], [static], [constexpr], [noexcept]
```

The minimum positive denormalized value. For types where `has_denorm` is false, this is the minimum positive normalized value.

epsilon()

```
template<typename _Tp>
constexpr _Tp std::numeric_limits< _Tp >::epsilon ()  [inline], [static], [constexpr], [noexcept]
```

The *machine epsilon:* the difference between 1 and the least value greater than 1 that is representable.
Referenced by std::binomial_distribution< _IntType >::operator()(), std::poisson_distribution< _IntType >::operator()(), and std::operator<<().

infinity()

```
template<typename _Tp>
constexpr _Tp std::numeric_limits< _Tp >::infinity () [inline], [static], [constexpr], [noexcept]
```

The representation of positive infinity, if `has_infinity`.

lowest()

```
template<typename _Tp>
constexpr _Tp std::numeric_limits< _Tp >::lowest () [inline], [static], [constexpr], [noexcept]
```

A finite value x such that there is no other finite value y where y < x.

Referenced by std::cauchy_distribution< _RealType >::min(), std::extreme_value_distribution< _RealType >::min(), std::normal_distribution< _RealType >::min(), and std::student_t_distribution< _RealType >::min().

max()

```
template<typename _Tp>
constexpr _Tp std::numeric_limits< _Tp >::max () [inline], [static], [constexpr], [noexcept]
```

The maximum finite value.

Referenced by __gnu_parallel::__parallel_random_shuffle_drs(), std::bernoulli_distribution::max(), std::cauchy_distribution< _RealType >
std::chi_squared_distribution< _RealType >::max(), std::exponential_distribution< _RealType >::max(), std::extreme_value_distribution<
std::fisher_f_distribution< _RealType >::max(), std::gamma_distribution< _RealType >::max(), std::geometric_distribution< _IntType >:
std::lognormal_distribution< _RealType >::max(), std::negative_binomial_distribution< _IntType >::max(), std::normal_distribution< _Re
std::poisson_distribution< _IntType >::max(), std::student_t_distribution< _RealType >::max(), std::weibull_distribution< _RealType >::
std::tr2::dynamic_bitset< _WordT, _Alloc >::max_size(), std::binomial_distribution< _IntType >::operator()(), std::independent_bits_engi
std::poisson_distribution< _IntType >::operator()(), and std::operator<<().

min()

```
template<typename _Tp>
constexpr _Tp std::numeric_limits< _Tp >::min () [inline], [static], [constexpr], [noexcept]
```

The minimum finite value, or for floating types with denormalization, the minimum positive normalized value.

Referenced by std::bernoulli_distribution::min().

quiet_NaN()

```
template<typename _Tp>
constexpr _Tp std::numeric_limits< _Tp >::quiet_NaN () [inline], [static], [constexpr], [noexcept]
```

The representation of a quiet Not a Number, if `has_quiet_NaN`.

round_error()

```
template<typename _Tp>
constexpr _Tp std::numeric_limits< _Tp >::round_error () [inline], [static], [constexpr], [noexcept]
```

The maximum rounding error measurement (see LIA-1).

signaling_NaN()

```
template<typename _Tp>
constexpr _Tp std::numeric_limits< _Tp >::signaling_NaN () [inline], [static], [constexpr],
[noexcept]
```

The representation of a signaling Not a Number, if `has_signaling_NaN`.

6.733.3 Member Data Documentation

digits

```
int std::__numeric_limits_base::digits  [static], [constexpr], [inherited]
```

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.
Referenced by std::generate_canonical(), std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::operator()(), and std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed().

digits10

```
int std::__numeric_limits_base::digits10  [static], [constexpr], [inherited]
```

The number of base 10 digits that can be represented without change.

has_denorm

```
float_denorm_style std::__numeric_limits_base::has_denorm  [static], [constexpr], [inherited]
```

See std::float_denorm_style for more information.

has_denorm_loss

```
bool std::__numeric_limits_base::has_denorm_loss  [static], [constexpr], [inherited]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

has_infinity

```
bool std::__numeric_limits_base::has_infinity  [static], [constexpr], [inherited]
```

True if the type has a representation for positive infinity.

has_quiet_NaN

```
bool std::__numeric_limits_base::has_quiet_NaN  [static], [constexpr], [inherited]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

has_signaling_NaN

```
bool std::__numeric_limits_base::has_signaling_NaN  [static], [constexpr], [inherited]
```

True if the type has a representation for a signaling Not a Number.

is_bounded

```
bool std::__numeric_limits_base::is_bounded  [static], [constexpr], [inherited]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

is_exact

```
bool std::__numeric_limits_base::is_exact  [static], [constexpr], [inherited]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

is_iec559

```
bool std::__numeric_limits_base::is_iec559  [static], [constexpr], [inherited]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

is_integer

`bool std::__numeric_limits_base::is_integer [static], [constexpr], [inherited]`
True if the type is integer.

is_modulo

`bool std::__numeric_limits_base::is_modulo [static], [constexpr], [inherited]`
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or $*$ on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

is_signed

`bool std::__numeric_limits_base::is_signed [static], [constexpr], [inherited]`
True if the type is signed.

is_specialized

`bool std::__numeric_limits_base::is_specialized [static], [constexpr], [inherited]`
This will be true for all fundamental types (which have specializations), and false for everything else.

max_digits10

`int std::__numeric_limits_base::max_digits10 [static], [constexpr], [inherited]`
The number of base 10 digits required to ensure that values which differ are always differentiated.

max_exponent

`int std::__numeric_limits_base::max_exponent [static], [constexpr], [inherited]`
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

max_exponent10

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr], [inherited]`
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

min_exponent

`int std::__numeric_limits_base::min_exponent [static], [constexpr], [inherited]`
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

min_exponent10

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr], [inherited]`
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

radix

`int std::__numeric_limits_base::radix [static], [constexpr], [inherited]`
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

Referenced by std::generate_canonical().

round_style

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr], [inherited]
```

See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

tinyness_before

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr], [inherited]
```

True if tininess is detected before rounding. (see IEC 559)

traps

```
bool std::__numeric_limits_base::traps [static], [constexpr], [inherited]
```

True if trapping is implemented for this type.
The documentation for this struct was generated from the following file:

- limits

6.734 std::numeric_limits< bool > Struct Reference

```
#include <limits>
```

6.734.1 Detailed Description

numeric_limits<bool> specialization.

6.734.2 Member Data Documentation

digits

int std::__numeric_limits_base::digits [static], [constexpr]
The number of radix digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of radix digits in the mantissa.

digits10

int std::__numeric_limits_base::digits10 [static], [constexpr]
The number of base 10 digits that can be represented without change.

has_denorm

float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
See std::float_denorm_style for more information.

has_denorm_loss

bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

has_infinity

bool std::__numeric_limits_base::has_infinity [static], [constexpr]
True if the type has a representation for positive infinity.

has_quiet_NaN

bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
True if the type has a representation for a quiet (non-signaling) Not a Number.

has_signaling_NaN

bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
True if the type has a representation for a signaling Not a Number.

is_bounded

bool std::__numeric_limits_base::is_bounded [static], [constexpr]
True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

is_exact

bool std::__numeric_limits_base::is_exact [static], [constexpr]
True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

is_iec559

bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

is_integer

bool std::__numeric_limits_base::is_integer [static], [constexpr]
True if the type is integer.

is_modulo

bool std::__numeric_limits_base::is_modulo [static], [constexpr]
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or * on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

is_signed

bool std::__numeric_limits_base::is_signed [static], [constexpr]
True if the type is signed.

is_specialized

bool std::__numeric_limits_base::is_specialized [static], [constexpr]
This will be true for all fundamental types (which have specializations), and false for everything else.

max_digits10

int std::__numeric_limits_base::max_digits10 [static], [constexpr]
The number of base 10 digits required to ensure that values which differ are always differentiated.

max_exponent

int std::__numeric_limits_base::max_exponent [static], [constexpr]
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

max_exponent10

int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

min_exponent

int std::__numeric_limits_base::min_exponent [static], [constexpr]
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

min_exponent10

int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

radix

int std::__numeric_limits_base::radix [static], [constexpr]
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

round_style

`float_round_style std::__numeric_limits_base::round_style [static], [constexpr]`
See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

tinyness_before

`bool std::__numeric_limits_base::tinyness_before [static], [constexpr]`
True if tininess is detected before rounding. (see IEC 559)

traps

`bool std::__numeric_limits_base::traps [static], [constexpr]`
True if trapping is implemented for this type.

6.736.1 Detailed Description

numeric_limits<char16_t> specialization.

6.736.2 Member Data Documentation

digits

int std::__numeric_limits_base::digits [static], [constexpr]
The number of radix digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of radix digits in the mantissa.

digits10

int std::__numeric_limits_base::digits10 [static], [constexpr]
The number of base 10 digits that can be represented without change.

has_denorm

float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
See std::float_denorm_style for more information.

has_denorm_loss

bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

has_infinity

bool std::__numeric_limits_base::has_infinity [static], [constexpr]
True if the type has a representation for positive infinity.

has_quiet_NaN

bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
True if the type has a representation for a quiet (non-signaling) Not a Number.

has_signaling_NaN

bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
True if the type has a representation for a signaling Not a Number.

is_bounded

bool std::__numeric_limits_base::is_bounded [static], [constexpr]
True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

is_exact

bool std::__numeric_limits_base::is_exact [static], [constexpr]
True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

is_iec559

bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

is_integer

bool std::__numeric_limits_base::is_integer [static], [constexpr]
True if the type is integer.

is_modulo

bool std::__numeric_limits_base::is_modulo [static], [constexpr]
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or $*$ on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

is_signed

bool std::__numeric_limits_base::is_signed [static], [constexpr]
True if the type is signed.

is_specialized

bool std::__numeric_limits_base::is_specialized [static], [constexpr]
This will be true for all fundamental types (which have specializations), and false for everything else.

max_digits10

int std::__numeric_limits_base::max_digits10 [static], [constexpr]
The number of base 10 digits required to ensure that values which differ are always differentiated.

max_exponent

int std::__numeric_limits_base::max_exponent [static], [constexpr]
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

max_exponent10

int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

min_exponent

int std::__numeric_limits_base::min_exponent [static], [constexpr]
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

min_exponent10

int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

radix

int std::__numeric_limits_base::radix [static], [constexpr]
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

round_style

float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

tinyness_before

bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
True if tininess is detected before rounding. (see IEC 559)

traps

bool std::__numeric_limits_base::traps [static], [constexpr]
True if trapping is implemented for this type.

6.737.1 Detailed Description

numeric_limits<char32_t> specialization.

6.737.2 Member Data Documentation

digits

int std::__numeric_limits_base::digits [static], [constexpr]
The number of radix digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of radix digits in the mantissa.

digits10

int std::__numeric_limits_base::digits10 [static], [constexpr]
The number of base 10 digits that can be represented without change.

has_denorm

float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
See std::float_denorm_style for more information.

has_denorm_loss

bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

has_infinity

bool std::__numeric_limits_base::has_infinity [static], [constexpr]
True if the type has a representation for positive infinity.

has_quiet_NaN

bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
True if the type has a representation for a quiet (non-signaling) Not a Number.

has_signaling_NaN

bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
True if the type has a representation for a signaling Not a Number.

is_bounded

bool std::__numeric_limits_base::is_bounded [static], [constexpr]
True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

is_exact

bool std::__numeric_limits_base::is_exact [static], [constexpr]
True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

is_iec559

bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

is_integer

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`
True if the type is integer.

is_modulo

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or $*$ on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

is_signed

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`
True if the type is signed.

is_specialized

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`
This will be true for all fundamental types (which have specializations), and false for everything else.

max_digits10

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`
The number of base 10 digits required to ensure that values which differ are always differentiated.

max_exponent

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

max_exponent10

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

min_exponent

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

min_exponent10

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

radix

`int std::__numeric_limits_base::radix [static], [constexpr]`
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

round_style

```
float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
```
See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

tinyness_before

```
bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
```
True if tininess is detected before rounding. (see IEC 559)

traps

```
bool std::__numeric_limits_base::traps [static], [constexpr]
```
True if trapping is implemented for this type.
The documentation for this struct was generated from the following file:

6.738.1 Detailed Description

numeric_limits<double> specialization.

6.738.2 Member Data Documentation

digits

int std::__numeric_limits_base::digits [static], [constexpr]
The number of radix digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of radix digits in the mantissa.

digits10

int std::__numeric_limits_base::digits10 [static], [constexpr]
The number of base 10 digits that can be represented without change.

has_denorm

float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
See std::float_denorm_style for more information.

has_denorm_loss

bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

has_infinity

bool std::__numeric_limits_base::has_infinity [static], [constexpr]
True if the type has a representation for positive infinity.

has_quiet_NaN

bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
True if the type has a representation for a quiet (non-signaling) Not a Number.

has_signaling_NaN

bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
True if the type has a representation for a signaling Not a Number.

is_bounded

bool std::__numeric_limits_base::is_bounded [static], [constexpr]
True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

is_exact

bool std::__numeric_limits_base::is_exact [static], [constexpr]
True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

is_iec559

bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

is_integer

bool std::__numeric_limits_base::is_integer [static], [constexpr]
True if the type is integer.

is_modulo

bool std::__numeric_limits_base::is_modulo [static], [constexpr]
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or $*$ on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

is_signed

bool std::__numeric_limits_base::is_signed [static], [constexpr]
True if the type is signed.

is_specialized

bool std::__numeric_limits_base::is_specialized [static], [constexpr]
This will be true for all fundamental types (which have specializations), and false for everything else.

max_digits10

int std::__numeric_limits_base::max_digits10 [static], [constexpr]
The number of base 10 digits required to ensure that values which differ are always differentiated.

max_exponent

int std::__numeric_limits_base::max_exponent [static], [constexpr]
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

max_exponent10

int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

min_exponent

int std::__numeric_limits_base::min_exponent [static], [constexpr]
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

min_exponent10

int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

radix

int std::__numeric_limits_base::radix [static], [constexpr]
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

round_style

float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

tinyness_before

bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
True if tininess is detected before rounding. (see IEC 559)

traps

bool std::__numeric_limits_base::traps [static], [constexpr]
True if trapping is implemented for this type.

6.739.1 Detailed Description

numeric_limits<float> specialization.

6.739.2 Member Data Documentation

digits

int std::__numeric_limits_base::digits [static], [constexpr]
The number of radix digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of radix digits in the mantissa.

digits10

int std::__numeric_limits_base::digits10 [static], [constexpr]
The number of base 10 digits that can be represented without change.

has_denorm

float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
See std::float_denorm_style for more information.

has_denorm_loss

bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

has_infinity

bool std::__numeric_limits_base::has_infinity [static], [constexpr]
True if the type has a representation for positive infinity.

has_quiet_NaN

bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
True if the type has a representation for a quiet (non-signaling) Not a Number.

has_signaling_NaN

bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
True if the type has a representation for a signaling Not a Number.

is_bounded

bool std::__numeric_limits_base::is_bounded [static], [constexpr]
True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

is_exact

bool std::__numeric_limits_base::is_exact [static], [constexpr]
True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

is_iec559

bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

is_integer

bool std::__numeric_limits_base::is_integer [static], [constexpr]
True if the type is integer.

is_modulo

bool std::__numeric_limits_base::is_modulo [static], [constexpr]
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or * on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

is_signed

bool std::__numeric_limits_base::is_signed [static], [constexpr]
True if the type is signed.

is_specialized

bool std::__numeric_limits_base::is_specialized [static], [constexpr]
This will be true for all fundamental types (which have specializations), and false for everything else.

max_digits10

int std::__numeric_limits_base::max_digits10 [static], [constexpr]
The number of base 10 digits required to ensure that values which differ are always differentiated.

max_exponent

int std::__numeric_limits_base::max_exponent [static], [constexpr]
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

max_exponent10

int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

min_exponent

int std::__numeric_limits_base::min_exponent [static], [constexpr]
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

min_exponent10

int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

radix

int std::__numeric_limits_base::radix [static], [constexpr]
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

round_style

`float_round_style std::__numeric_limits_base::round_style [static], [constexpr]`
See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

tinyness_before

`bool std::__numeric_limits_base::tinyness_before [static], [constexpr]`
True if tininess is detected before rounding. (see IEC 559)

traps

`bool std::__numeric_limits_base::traps [static], [constexpr]`
True if trapping is implemented for this type.

digits

int std::__numeric_limits_base::digits [static], [constexpr]
The number of radix digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of radix digits in the mantissa.

digits10

int std::__numeric_limits_base::digits10 [static], [constexpr]
The number of base 10 digits that can be represented without change.

has_denorm

float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
See std::float_denorm_style for more information.

has_denorm_loss

bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

has_infinity

bool std::__numeric_limits_base::has_infinity [static], [constexpr]
True if the type has a representation for positive infinity.

has_quiet_NaN

bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
True if the type has a representation for a quiet (non-signaling) Not a Number.

has_signaling_NaN

bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
True if the type has a representation for a signaling Not a Number.

is_bounded

bool std::__numeric_limits_base::is_bounded [static], [constexpr]
True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

is_exact

bool std::__numeric_limits_base::is_exact [static], [constexpr]
True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

is_iec559

bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

is_integer

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`
True if the type is integer.

is_modulo

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or $*$ on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

is_signed

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`
True if the type is signed.

is_specialized

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`
This will be true for all fundamental types (which have specializations), and false for everything else.

max_digits10

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`
The number of base 10 digits required to ensure that values which differ are always differentiated.

max_exponent

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

max_exponent10

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

min_exponent

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

min_exponent10

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

radix

`int std::__numeric_limits_base::radix [static], [constexpr]`
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

round_style

`float_round_style std::__numeric_limits_base::round_style [static], [constexpr]`
See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

tinyness_before

`bool std::__numeric_limits_base::tinyness_before [static], [constexpr]`
True if tininess is detected before rounding. (see IEC 559)

traps

`bool std::__numeric_limits_base::traps [static], [constexpr]`
True if trapping is implemented for this type.

digits

int std::__numeric_limits_base::digits [static], [constexpr]
The number of radix digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of radix digits in the mantissa.

digits10

int std::__numeric_limits_base::digits10 [static], [constexpr]
The number of base 10 digits that can be represented without change.

has_denorm

float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
See std::float_denorm_style for more information.

has_denorm_loss

bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

has_infinity

bool std::__numeric_limits_base::has_infinity [static], [constexpr]
True if the type has a representation for positive infinity.

has_quiet_NaN

bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
True if the type has a representation for a quiet (non-signaling) Not a Number.

has_signaling_NaN

bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
True if the type has a representation for a signaling Not a Number.

is_bounded

bool std::__numeric_limits_base::is_bounded [static], [constexpr]
True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

is_exact

bool std::__numeric_limits_base::is_exact [static], [constexpr]
True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

is_iec559

bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

is_integer

bool std::__numeric_limits_base::is_integer [static], [constexpr]
True if the type is integer.

is_modulo

bool std::__numeric_limits_base::is_modulo [static], [constexpr]
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or $*$ on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

is_signed

bool std::__numeric_limits_base::is_signed [static], [constexpr]
True if the type is signed.

is_specialized

bool std::__numeric_limits_base::is_specialized [static], [constexpr]
This will be true for all fundamental types (which have specializations), and false for everything else.

max_digits10

int std::__numeric_limits_base::max_digits10 [static], [constexpr]
The number of base 10 digits required to ensure that values which differ are always differentiated.

max_exponent

int std::__numeric_limits_base::max_exponent [static], [constexpr]
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

max_exponent10

int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

min_exponent

int std::__numeric_limits_base::min_exponent [static], [constexpr]
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

min_exponent10

int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

radix

int std::__numeric_limits_base::radix [static], [constexpr]
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

round_style

`float_round_style std::__numeric_limits_base::round_style [static], [constexpr]`
See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

tinyness_before

`bool std::__numeric_limits_base::tinyness_before [static], [constexpr]`
True if tininess is detected before rounding. (see IEC 559)

traps

`bool std::__numeric_limits_base::traps [static], [constexpr]`
True if trapping is implemented for this type.
The documentation for this struct was generated from the following file:

6.742.1 Detailed Description

numeric_limits<long double> specialization.

6.742.2 Member Data Documentation

digits

int std::__numeric_limits_base::digits [static], [constexpr]
The number of radix digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of radix digits in the mantissa.

digits10

int std::__numeric_limits_base::digits10 [static], [constexpr]
The number of base 10 digits that can be represented without change.

has_denorm

float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
See std::float_denorm_style for more information.

has_denorm_loss

bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

has_infinity

bool std::__numeric_limits_base::has_infinity [static], [constexpr]
True if the type has a representation for positive infinity.

has_quiet_NaN

bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
True if the type has a representation for a quiet (non-signaling) Not a Number.

has_signaling_NaN

bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
True if the type has a representation for a signaling Not a Number.

is_bounded

bool std::__numeric_limits_base::is_bounded [static], [constexpr]
True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

is_exact

bool std::__numeric_limits_base::is_exact [static], [constexpr]
True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

is_iec559

bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

is_integer

bool std::__numeric_limits_base::is_integer [static], [constexpr]
True if the type is integer.

is_modulo

bool std::__numeric_limits_base::is_modulo [static], [constexpr]
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or $*$ on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

is_signed

bool std::__numeric_limits_base::is_signed [static], [constexpr]
True if the type is signed.

is_specialized

bool std::__numeric_limits_base::is_specialized [static], [constexpr]
This will be true for all fundamental types (which have specializations), and false for everything else.

max_digits10

int std::__numeric_limits_base::max_digits10 [static], [constexpr]
The number of base 10 digits required to ensure that values which differ are always differentiated.

max_exponent

int std::__numeric_limits_base::max_exponent [static], [constexpr]
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

max_exponent10

int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

min_exponent

int std::__numeric_limits_base::min_exponent [static], [constexpr]
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

min_exponent10

int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

radix

int std::__numeric_limits_base::radix [static], [constexpr]
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

round_style

`float_round_style std::__numeric_limits_base::round_style [static], [constexpr]`
See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

tinyness_before

`bool std::__numeric_limits_base::tinyness_before [static], [constexpr]`
True if tininess is detected before rounding. (see IEC 559)

traps

`bool std::__numeric_limits_base::traps [static], [constexpr]`
True if trapping is implemented for this type.

6.745.1 Detailed Description

numeric_limits<signed char> specialization.

6.745.2 Member Data Documentation

digits

int std::__numeric_limits_base::digits [static], [constexpr]
The number of radix digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of radix digits in the mantissa.

digits10

int std::__numeric_limits_base::digits10 [static], [constexpr]
The number of base 10 digits that can be represented without change.

has_denorm

float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
See std::float_denorm_style for more information.

has_denorm_loss

bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

has_infinity

bool std::__numeric_limits_base::has_infinity [static], [constexpr]
True if the type has a representation for positive infinity.

has_quiet_NaN

bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
True if the type has a representation for a quiet (non-signaling) Not a Number.

has_signaling_NaN

bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
True if the type has a representation for a signaling Not a Number.

is_bounded

bool std::__numeric_limits_base::is_bounded [static], [constexpr]
True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

is_exact

bool std::__numeric_limits_base::is_exact [static], [constexpr]
True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

is_iec559

bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

is_integer

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`
True if the type is integer.

is_modulo

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or $*$ on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

is_signed

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`
True if the type is signed.

is_specialized

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`
This will be true for all fundamental types (which have specializations), and false for everything else.

max_digits10

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`
The number of base 10 digits required to ensure that values which differ are always differentiated.

max_exponent

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

max_exponent10

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

min_exponent

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

min_exponent10

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

radix

`int std::__numeric_limits_base::radix [static], [constexpr]`
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

round_style

float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

tinyness_before

bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
True if tininess is detected before rounding. (see IEC 559)

traps

bool std::__numeric_limits_base::traps [static], [constexpr]
True if trapping is implemented for this type.
The documentation for this struct was generated from the following file:

6.746.1 Detailed Description

numeric_limits<unsigned char> specialization.

6.746.2 Member Data Documentation

digits

int std::__numeric_limits_base::digits [static], [constexpr]
The number of radix digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of radix digits in the mantissa.

digits10

int std::__numeric_limits_base::digits10 [static], [constexpr]
The number of base 10 digits that can be represented without change.

has_denorm

float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
See std::float_denorm_style for more information.

has_denorm_loss

bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

has_infinity

bool std::__numeric_limits_base::has_infinity [static], [constexpr]
True if the type has a representation for positive infinity.

has_quiet_NaN

bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
True if the type has a representation for a quiet (non-signaling) Not a Number.

has_signaling_NaN

bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
True if the type has a representation for a signaling Not a Number.

is_bounded

bool std::__numeric_limits_base::is_bounded [static], [constexpr]
True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

is_exact

bool std::__numeric_limits_base::is_exact [static], [constexpr]
True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

is_iec559

bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

is_integer

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`
True if the type is integer.

is_modulo

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or $*$ on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

is_signed

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`
True if the type is signed.

is_specialized

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`
This will be true for all fundamental types (which have specializations), and false for everything else.

max_digits10

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`
The number of base 10 digits required to ensure that values which differ are always differentiated.

max_exponent

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

max_exponent10

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

min_exponent

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

min_exponent10

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

radix

`int std::__numeric_limits_base::radix [static], [constexpr]`
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

round_style

float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

tinyness_before

bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
True if tininess is detected before rounding. (see IEC 559)

traps

bool std::__numeric_limits_base::traps [static], [constexpr]
True if trapping is implemented for this type.

6.749.1 Detailed Description

numeric_limits<unsigned long long> specialization.

6.749.2 Member Data Documentation

digits

int std::__numeric_limits_base::digits [static], [constexpr]
The number of radix digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of radix digits in the mantissa.

digits10

int std::__numeric_limits_base::digits10 [static], [constexpr]
The number of base 10 digits that can be represented without change.

has_denorm

float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
See std::float_denorm_style for more information.

has_denorm_loss

bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

has_infinity

bool std::__numeric_limits_base::has_infinity [static], [constexpr]
True if the type has a representation for positive infinity.

has_quiet_NaN

bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
True if the type has a representation for a quiet (non-signaling) Not a Number.

has_signaling_NaN

bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
True if the type has a representation for a signaling Not a Number.

is_bounded

bool std::__numeric_limits_base::is_bounded [static], [constexpr]
True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

is_exact

bool std::__numeric_limits_base::is_exact [static], [constexpr]
True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

is_iec559

bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

is_integer

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`
True if the type is integer.

is_modulo

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or $*$ on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

is_signed

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`
True if the type is signed.

is_specialized

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`
This will be true for all fundamental types (which have specializations), and false for everything else.

max_digits10

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`
The number of base 10 digits required to ensure that values which differ are always differentiated.

max_exponent

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

max_exponent10

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

min_exponent

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

min_exponent10

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

radix

`int std::__numeric_limits_base::radix [static], [constexpr]`
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

round_style

float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

tinyness_before

bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
True if tininess is detected before rounding. (see IEC 559)

traps

bool std::__numeric_limits_base::traps [static], [constexpr]
True if trapping is implemented for this type.
The documentation for this struct was generated from the following file:

6.750.1 Detailed Description

numeric_limits<unsigned short> specialization.

6.750.2 Member Data Documentation

digits

int std::__numeric_limits_base::digits [static], [constexpr]
The number of radix digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of radix digits in the mantissa.

digits10

int std::__numeric_limits_base::digits10 [static], [constexpr]
The number of base 10 digits that can be represented without change.

has_denorm

float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
See std::float_denorm_style for more information.

has_denorm_loss

bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

has_infinity

bool std::__numeric_limits_base::has_infinity [static], [constexpr]
True if the type has a representation for positive infinity.

has_quiet_NaN

bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
True if the type has a representation for a quiet (non-signaling) Not a Number.

has_signaling_NaN

bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
True if the type has a representation for a signaling Not a Number.

is_bounded

bool std::__numeric_limits_base::is_bounded [static], [constexpr]
True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

is_exact

bool std::__numeric_limits_base::is_exact [static], [constexpr]
True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

is_iec559

bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

is_integer

bool std::__numeric_limits_base::is_integer [static], [constexpr]
True if the type is integer.

is_modulo

bool std::__numeric_limits_base::is_modulo [static], [constexpr]
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or * on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

is_signed

bool std::__numeric_limits_base::is_signed [static], [constexpr]
True if the type is signed.

is_specialized

bool std::__numeric_limits_base::is_specialized [static], [constexpr]
This will be true for all fundamental types (which have specializations), and false for everything else.

max_digits10

int std::__numeric_limits_base::max_digits10 [static], [constexpr]
The number of base 10 digits required to ensure that values which differ are always differentiated.

max_exponent

int std::__numeric_limits_base::max_exponent [static], [constexpr]
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

max_exponent10

int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

min_exponent

int std::__numeric_limits_base::min_exponent [static], [constexpr]
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

min_exponent10

int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

radix

int std::__numeric_limits_base::radix [static], [constexpr]
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

round_style

`float_round_style std::__numeric_limits_base::round_style [static], [constexpr]`
See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

tinyness_before

`bool std::__numeric_limits_base::tinyness_before [static], [constexpr]`
True if tininess is detected before rounding. (see IEC 559)

traps

`bool std::__numeric_limits_base::traps [static], [constexpr]`
True if trapping is implemented for this type.
The documentation for this struct was generated from the following file:

6.751.1 Detailed Description

numeric_limits<wchar_t> specialization.

6.751.2 Member Data Documentation

digits

int std::__numeric_limits_base::digits [static], [constexpr]
The number of radix digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of radix digits in the mantissa.

digits10

int std::__numeric_limits_base::digits10 [static], [constexpr]
The number of base 10 digits that can be represented without change.

has_denorm

float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]
See std::float_denorm_style for more information.

has_denorm_loss

bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]
True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

has_infinity

bool std::__numeric_limits_base::has_infinity [static], [constexpr]
True if the type has a representation for positive infinity.

has_quiet_NaN

bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]
True if the type has a representation for a quiet (non-signaling) Not a Number.

has_signaling_NaN

bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]
True if the type has a representation for a signaling Not a Number.

is_bounded

bool std::__numeric_limits_base::is_bounded [static], [constexpr]
True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

is_exact

bool std::__numeric_limits_base::is_exact [static], [constexpr]
True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

is_iec559

bool std::__numeric_limits_base::is_iec559 [static], [constexpr]
True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

is_integer

bool std::__numeric_limits_base::is_integer [static], [constexpr]
True if the type is integer.

is_modulo

bool std::__numeric_limits_base::is_modulo [static], [constexpr]
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or $*$ on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

is_signed

bool std::__numeric_limits_base::is_signed [static], [constexpr]
True if the type is signed.

is_specialized

bool std::__numeric_limits_base::is_specialized [static], [constexpr]
This will be true for all fundamental types (which have specializations), and false for everything else.

max_digits10

int std::__numeric_limits_base::max_digits10 [static], [constexpr]
The number of base 10 digits required to ensure that values which differ are always differentiated.

max_exponent

int std::__numeric_limits_base::max_exponent [static], [constexpr]
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

max_exponent10

int std::__numeric_limits_base::max_exponent10 [static], [constexpr]
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

min_exponent

int std::__numeric_limits_base::min_exponent [static], [constexpr]
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

min_exponent10

int std::__numeric_limits_base::min_exponent10 [static], [constexpr]
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

radix

int std::__numeric_limits_base::radix [static], [constexpr]
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

round_style

float_round_style std::__numeric_limits_base::round_style [static], [constexpr]
See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

tinyness_before

bool std::__numeric_limits_base::tinyness_before [static], [constexpr]
True if tininess is detected before rounding. (see IEC 559)

traps

bool std::__numeric_limits_base::traps [static], [constexpr]
True if trapping is implemented for this type.

6.752.1 Detailed Description

template<typename _CharT>
class std::numpunct< _CharT >

Primary class template numpunct.
This facet stores several pieces of information related to printing and scanning numbers, such as the decimal point character. It takes a template parameter specifying the char type. The numpunct facet is used by streams for many I/O operations involving numbers.
The numpunct template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from a numpunct facet.

6.752.2 Member Typedef Documentation

char_type

```
template<typename _CharT>
typedef _CharT std::numpunct< _CharT >::char_type
```

Public typedefs.

string_type

```
template<typename _CharT>
typedef basic_string<_CharT> std::numpunct< _CharT >::string_type
```

Public typedefs.

6.752.3 Constructor & Destructor Documentation

numpunct() [1/3]

```
template<typename _CharT>
std::numpunct< _CharT >::numpunct (
            size_t __refs = 0)  [inline], [explicit]
```

Numpunct constructor.

Parameters

__refs	Refcount to pass to the base class.

References std::locale::facet::facet().

numpunct() [2/3]

```
template<typename _CharT>
std::numpunct< _CharT >::numpunct (
            __cache_type * __cache,
            size_t __refs = 0)  [inline], [explicit]
```

Internal constructor. Not for general use.
This is a constructor for use by the library itself to set up the predefined locale facets.

Parameters

__cache	__numpunct_cache object.
__refs	Refcount to pass to the base class.

References std::locale::facet::facet().

numpunct() [3/3]

```
template<typename _CharT>
std::numpunct< _CharT >::numpunct (
            __c_locale __cloc,
            size_t __refs = 0)  [inline], [explicit]
```

Internal constructor. Not for general use.
This is a constructor for use by the library itself to set up new locales.

Parameters

__cloc	The C locale.
__refs	Refcount to pass to the base class.

References std::locale::facet::facet().

~numpunct()

```
template<typename _CharT>
virtual std::numpunct< _CharT >::~numpunct ()  [protected], [virtual]
```

Destructor.

6.752.4 Member Function Documentation

decimal_point()

```
template<typename _CharT>
char_type std::numpunct< _CharT >::decimal_point () const  [inline]
```

Return decimal point character.

This function returns a char_type to use as a decimal point. It does so by returning returning numpunct<char_type>::↩ do_decimal_point().

Returns

char_type representing a decimal point.

References do_decimal_point().

do_decimal_point()

```
template<typename _CharT>
virtual char_type std::numpunct< _CharT >::do_decimal_point () const  [inline], [protected],
[virtual]
```

Return decimal point character.

Returns a char_type to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Referenced by decimal_point().

do_falsename()

```
template<typename _CharT>
virtual string_type std::numpunct< _CharT >::do_falsename () const  [inline], [protected], [virtual]
```

Return string representation of bool false.

Returns a string_type containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

Returns

string_type representing printed form of false.

Referenced by falsename().

do_grouping()

```
template<typename _CharT>
virtual string std::numpunct< _CharT >::do_grouping () const  [inline], [protected], [virtual]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

grouping() for details.

Returns

String representing grouping specification.

Referenced by grouping().

do_thousands_sep()

```
template<typename _CharT>
virtual char_type std::numpunct< _CharT >::do_thousands_sep () const  [inline], [protected],
[virtual]
```

Return thousands separator character.

Returns a char_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Referenced by thousands_sep().

do_truename()

```
template<typename _CharT>
virtual string_type std::numpunct< _CharT >::do_truename () const  [inline], [protected], [virtual]
```

Return string representation of bool true.

Returns a string_type containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

Returns

string_type representing printed form of true.

Referenced by truename().

falsename()

```
template<typename _CharT>
string_type std::numpunct< _CharT >::falsename () const  [inline]
```

Return string representation of bool false.

This function returns a string_type containing the text representation for false bool variables. It does so by calling numpunct<char_type>::do_falsename().

Returns

string_type representing printed form of false.

References do_falsename().

grouping()

```
template<typename _CharT>
string std::numpunct< _CharT >::grouping () const  [inline]
```

Return grouping specification.
This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.
Each char in the return string is interpret as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.
For example, if the grouping() returns "\003\002" and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was "32", this would put more than 50 digits into the least significant group if the character set is ASCII.
The string is returned by calling numpunct<char_type>::do_grouping().

Returns

string representing grouping specification.

References do_grouping().

thousands_sep()

```
template<typename _CharT>
char_type std::numpunct< _CharT >::thousands_sep () const  [inline]
```

Return thousands separator character.
This function returns a char_type to use as a thousands separator. It does so by returning returning numpunct<char_type>::do_thousands_sep().

Returns

char_type representing a thousands separator.

References do_thousands_sep().

truename()

```
template<typename _CharT>
string_type std::numpunct< _CharT >::truename () const  [inline]
```

Return string representation of bool true.
This function returns a string_type containing the text representation for true bool variables. It does so by calling numpunct<char_type>::do_truename().

Returns

string_type representing printed form of true.

References do_truename().

6.752.5 Member Data Documentation

class numpunct_byname [22.2.3.2].

6.753.2 Member Function Documentation

decimal_point()

```
template<typename _CharT>
char_type std::numpunct< _CharT >::decimal_point () const  [inline], [inherited]
```

Return decimal point character.
This function returns a char_type to use as a decimal point. It does so by returning returning numpunct<char_type>::↩ do_decimal_point().

Returns

char_type representing a decimal point.

References do_decimal_point().

do_decimal_point()

```
template<typename _CharT>
virtual char_type std::numpunct< _CharT >::do_decimal_point () const  [inline], [protected],
[virtual], [inherited]
```

Return decimal point character.
Returns a char_type to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Referenced by decimal_point().

do_falsename()

```
template<typename _CharT>
virtual string_type std::numpunct< _CharT >::do_falsename () const  [inline], [protected], [virtual],
[inherited]
```

Return string representation of bool false.
Returns a string_type containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

Returns

string_type representing printed form of false.

Referenced by falsename().

do_grouping()

```
template<typename _CharT>
virtual string std::numpunct< _CharT >::do_grouping () const  [inline], [protected], [virtual],
[inherited]
```

Return grouping specification.
Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

grouping() for details.

Returns

String representing grouping specification.

Referenced by grouping().

do_thousands_sep()

```
template<typename _CharT>
virtual char_type std::numpunct< _CharT >::do_thousands_sep () const  [inline], [protected],
[virtual], [inherited]
```

Return thousands separator character.
Returns a char_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Referenced by thousands_sep().

do_truename()

```
template<typename _CharT>
virtual string_type std::numpunct< _CharT >::do_truename () const  [inline], [protected], [virtual],
[inherited]
```

Return string representation of bool true.
Returns a string_type containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

Returns

string_type representing printed form of true.

Referenced by truename().

falsename()

```
template<typename _CharT>
string_type std::numpunct< _CharT >::falsename () const  [inline], [inherited]
```

Return string representation of bool false.

This function returns a string_type containing the text representation for false bool variables. It does so by calling numpunct<char_type>::do_falsename().

Returns

string_type representing printed form of false.

References do_falsename().

grouping()

```
template<typename _CharT>
string std::numpunct< _CharT >::grouping () const  [inline], [inherited]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpret as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns "\003\002" and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was "32", this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling numpunct<char_type>::do_grouping().

Returns

string representing grouping specification.

References do_grouping().

thousands_sep()

```
template<typename _CharT>
char_type std::numpunct< _CharT >::thousands_sep () const  [inline], [inherited]
```

Return thousands separator character.

This function returns a char_type to use as a thousands separator. It does so by returning returning numpunct<char↩ _type>::do_thousands_sep().

Returns

char_type representing a thousands separator.

References do_thousands_sep().

truename()

```
template<typename _CharT>
string_type std::numpunct< _CharT >::truename () const  [inline], [inherited]
```

Return string representation of bool true.

This function returns a string_type containing the text representation for true bool variables. It does so by calling numpunct<char_type>::do_truename().

Returns

string_type representing printed form of true.

References do_truename().

6.753.3 Member Data Documentation

id

```
template<typename _CharT>
locale::id std::numpunct< _CharT >::id  [static], [inherited]
```

Numpunct facet id.

The documentation for this class was generated from the following file:

6.758.1 Detailed Description

template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
class std::ostream_iterator< _Tp, _CharT, _Traits >

Provides output iterator semantics for streams.
This class provides an iterator to write to an ostream. The type Tp is the only type written by this iterator and there must be an operator<<(Tp) defined.

Template Parameters

_Tp	The type to write to the ostream.
_CharT	The ostream char_type.
_Traits	The ostream char_traits.

6.758.2 Member Typedef Documentation

char_type

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef _CharT std::ostream_iterator< _Tp, _CharT, _Traits >::char_type
```

Public typedef.

difference_type

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
using std::ostream_iterator< _Tp, _CharT, _Traits >::difference_type
```

Public typedef.

iterator_category

```
typedef output_iterator_tag std::iterator< output_iterator_tag, void, void, void, void >::↩
iterator_category  [inherited]
```

One of the tag types.

ostream_type

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef basic_ostream<_CharT, _Traits> std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_↩
type
```
Public typedef.

pointer

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::pointer  [inherited]
```
This type represents a pointer-to-value_type.

reference

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::reference  [inherited]
```
This type represents a reference-to-value_type.

traits_type

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef _Traits std::ostream_iterator< _Tp, _CharT, _Traits >::traits_type
```
Public typedef.

value_type

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type  [inherited]
```
The type "pointed to" by the iterator.

6.758.3 Constructor & Destructor Documentation

ostream_iterator() [1/3]

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
            ostream_type & __s)  [inline], [noexcept]
```
Construct from an ostream.
References std::__addressof().
Referenced by ostream_iterator().

ostream_iterator() [2/3]

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
            ostream_type & __s,
            const _CharT * __c)  [inline], [noexcept]
```
Construct from an ostream.
The delimiter string *c* is written to the stream after every Tp written to the stream. The delimiter is not copied, and thus must not be destroyed while this iterator is in use.

Parameters

_↩ _s	Underlying ostream to write to.
_↩ _c	CharT delimiter string to insert.

References std::__addressof().

ostream_iterator() [3/3]

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
            const ostream_iterator< _Tp, _CharT, _Traits > & __obj)  [inline], [noexcept]
```

Copy constructor.
References ostream_iterator().

6.758.4 Member Function Documentation

operator=()

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
ostream_iterator & std::ostream_iterator< _Tp, _CharT, _Traits >::operator= (
            const _Tp & __value)  [inline]
```

Writes *value* to underlying ostream using operator<<. If constructed with delimiter string, writes delimiter to ostream.
The documentation for this class was generated from the following file:

- stream_iterator.h

6.759 std::experimental::fundamentals_v2::ostream_joiner< _DelimT, _CharT, _Traits > Class Template Reference

typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type  [inherited]
```
The type "pointed to" by the iterator.

6.760.3 Constructor & Destructor Documentation

ostreambuf_iterator() [1/2]

```
template<typename _CharT, typename _Traits>
std::ostreambuf_iterator< _CharT, _Traits >::ostreambuf_iterator (
            ostream_type & __s)  [inline], [noexcept]
```
Construct output iterator from ostream.

ostreambuf_iterator() [2/2]

```
template<typename _CharT, typename _Traits>
std::ostreambuf_iterator< _CharT, _Traits >::ostreambuf_iterator (
            streambuf_type * __s)  [inline], [noexcept]
```
Construct output iterator from streambuf.

6.760.4 Member Function Documentation

failed()

```
template<typename _CharT, typename _Traits>
bool std::ostreambuf_iterator< _CharT, _Traits >::failed () const  [inline], [nodiscard], [noexcept]
```
Return true if previous operator=() failed.
Referenced by std::basic_ostream< _CharT, _Traits >::operator<<().

operator*()

```
template<typename _CharT, typename _Traits>
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator* ()  [inline], [nodiscard]
```
Return *this.

operator++() [1/2]

```
template<typename _CharT, typename _Traits>
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator++ ()  [inline]
```
Return *this.

operator++() [2/2]

```
template<typename _CharT, typename _Traits>
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator++ (
            int )  [inline]
```

Return ∗this.

operator=()

```
template<typename _CharT, typename _Traits>
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator= (
            _CharT __c)  [inline]
```

Write character to streambuf. Calls streambuf.sputc().
The documentation for this class was generated from the following files:

- iosfwd.h
- streambuf_iterator.h

6.761 std::out_of_range Class Reference

`#include <stdexcept_except.h>`

6.764.1 Detailed Description

template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↩ Alloc>
class __gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >

Ordered-vector tree associative-container.

6.764.2 Member Function Documentation

node_begin() [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↩
Alloc>
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::ov_tree_map<
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin ()  [inline]
```

Returns a node_iterator corresponding to the node at the root of the tree.

node_begin() [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↩
Alloc>
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::ov_tree_m
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin () const  [inline]
```

Returns a const node_iterator corresponding to the node at the root of the tree.

node_end() [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↩
Alloc>
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::ov_tree_map<
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end ()  [inline]
```

Returns a node_iterator corresponding to a node just after a leaf of the tree.

node_end() [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↩
Alloc>
ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::ov_tree_n
Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end () const  [inline]
```

Returns a const node_iterator corresponding to a node just after a leaf of the tree.
The documentation for this class was generated from the following file:

- ov_tree_map_.hpp

6.765 __gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc > Class Template Reference

6.765.1 Detailed Description

template<typename Value_Type, typename Metadata_Type, typename _Alloc>
class __gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc >

Const node reference.

6.765.2 Member Function Documentation

get_l_child()

```
template<typename Value_Type, typename Metadata_Type, typename _Alloc>
this_type __gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc >::get_↩
l_child () const  [inline]
```

Returns the node iterator associated with the left node.

get_r_child()

```
template<typename Value_Type, typename Metadata_Type, typename _Alloc>
this_type __gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc >::get_↩
r_child () const  [inline]
```

Returns the node iterator associated with the right node.
The documentation for this class was generated from the following file:

- overflow_error & **operator=** (const overflow_error &)=default
- overflow_error & **operator=** (overflow_error &&)=default
- virtual const char * what () const noexcept

6.768.1 Detailed Description

Thrown to indicate arithmetic overflow.

6.768.2 Member Function Documentation

what()

```
virtual const char * std::runtime_error::what () const  [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).
Reimplemented from std::exception.
Reimplemented in std::experimental::filesystem::v1::filesystem_error, std::filesystem::filesystem_error, and std::ios_base::failure.
References what().
Referenced by what().
The documentation for this class was generated from the following file:

- stdexcept_except.h

6.769 std::owner_less< _Tp > Struct Template Reference

6.769.1 Detailed Description

template<typename _Tp = void>
struct std::owner_less< _Tp >

Primary template owner_less.
The documentation for this struct was generated from the following file:

- bits/shared_ptr.h

6.770 std::experimental::fundamentals_v2::owner_less< shared_ptr< _Tp > > Struct Template Reference

`#include <shared_ptr.h>`

Public Types

6.776.1 Detailed Description

template<typename _T1, typename _T2>
struct __gnu_cxx::pair< _T1, _T2 >

Struct holding two objects (or references) of arbitrary type.

Template Parameters

_T1	Type of the `first` member.
_T2	Type of the `second` member.

https://gcc.gnu.org/onlinedocs/libstdc++/manual/utilities.html

6.776.2 Member Typedef Documentation

first_type

```
template<typename _T1, typename _T2>
typedef _T1 std::pair< _T1, _T2 >::first_type
```

The type of the `first` member.

second_type

```
template<typename _T1, typename _T2>
typedef _T2 std::pair< _T1, _T2 >::second_type
```

The type of the `second` member.

6.776.3 Constructor & Destructor Documentation

pair() [1/2]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::pair (
            const pair< _T1, _T2 > & )  [constexpr], [default]
```

Copy constructor.

pair() [2/2]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::pair (
            pair< _T1, _T2 > && )  [constexpr], [default]
```

Move constructor.

6.776.4 Member Function Documentation

explicit() [1/7]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
_U2 &&constexpr std::pair< _T1, _T2 >::explicit (
            !_S_convertible< _U1 &, _U2 & > ())  [constexpr]
```

Converting constructor from a non-const `pair<U1, U2>` lvalue.

explicit() [2/7]

```
template<typename _T1, typename _T2>
template<typename _U1 = _T1, typename _U2 = _T2>
std::pair< _T1, _T2 >::explicit (
            !_S_convertible< _U1, _U2 > ()) &&  [constexpr]
```

Constructor accepting two values of arbitrary types.

explicit() [3/7]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
_U2 &constexpr std::pair< _T1, _T2 >::explicit (
            !_S_convertible< _U1, _U2 > ())  [constexpr]
```

Converting constructor from a non-const `pair<U1, U2>` rvalue.

explicit() [4/7]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::explicit (
            !_S_convertible< const _T1 &, const _T2 & > ()) const &  [constexpr]
```

Constructor accepting lvalues of `first_type` and `second_type`.

explicit() [5/7]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
_U2 &&constexpr std::pair< _T1, _T2 >::explicit (
            !_S_convertible< const _U1 &, const _U2 & > ()) const  [constexpr]
```

Converting constructor from a const `pair<U1, U2>` lvalue.

explicit() [6/7]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
_U2 &constexpr std::pair< _T1, _T2 >::explicit (
            !_S_convertible< const _U1, const _U2 > ()) const  [constexpr]
```

Converting constructor from a const `pair<U1, U2>` rvalue.

explicit() [7/7]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::explicit (
            __not_< __and_< __is_implicitly_default_constructible< _T1 >, __is_implicitly_↩
default_constructible< _T2 > > > ())  [inline], [constexpr], [noexcept]
```

Default constructor.

operator=() [1/8]

```
template<typename _T1, typename _T2>
const pair & std::pair< _T1, _T2 >::operator= (
            const pair< _T1, _T2 > & __p) const  [inline], [constexpr]
```

Copy assignment operator (const).

operator=() [2/8]

```
template<typename _T1, typename _T2>
pair & std::pair< _T1, _T2 >::operator= (
            const pair< _T1, _T2 > & __p)  [inline], [constexpr], [noexcept]
```

Copy assignment operator.

operator=() [3/8]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_const_assignable<const _U1&, const _U2&>())
const pair & std::pair< _T1, _T2 >::operator= (
            const pair< _U1, _U2 > & __p) const  [inline], [constexpr]
```

Converting assignment from a const `pair<U1, U2>` lvalue.

operator=() [4/8]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_assignable<const _U1&, const _U2&>())
pair & std::pair< _T1, _T2 >::operator= (
            const pair< _U1, _U2 > & __p)  [inline], [constexpr], [noexcept]
```

Converting assignment from a const `pair<U1, U2>` lvalue.

operator=() [5/8]

```
template<typename _T1, typename _T2>
const pair & std::pair< _T1, _T2 >::operator= (
            pair< _T1, _T2 > && __p) const  [inline], [constexpr]
```

Move assignment operator (const).

operator=() [6/8]

```
template<typename _T1, typename _T2>
pair & std::pair< _T1, _T2 >::operator= (
            pair< _T1, _T2 > && __p)  [inline], [constexpr], [noexcept]
```

Move assignment operator.

operator=() [7/8]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_const_assignable<_U1, _U2>())
const pair & std::pair< _T1, _T2 >::operator= (
            pair< _U1, _U2 > && __p) const  [inline], [constexpr]
```

Converting assignment from a non-const `pair<U1, U2>` rvalue.

operator=() [8/8]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_assignable<_U1, _U2>())
pair & std::pair< _T1, _T2 >::operator= (
            pair< _U1, _U2 > && __p)  [inline], [constexpr], [noexcept]
```

Converting assignment from a non-const `pair<U1, U2>` rvalue.

swap()

```
template<typename _T1, typename _T2>
void std::pair< _T1, _T2 >::swap (
            pair< _T1, _T2 > & __p)  [inline], [constexpr], [noexcept]
```

Swap the first members and then the second members.

6.776.5 Member Data Documentation

first

```
template<typename _T1, typename _T2>
_T1 std::pair< _T1, _T2 >::first
```

The first member.

second

```
template<typename _T1, typename _T2>
_T2 std::pair< _T1, _T2 >::second
```

The second member.

The documentation for this struct was generated from the following files:

- bits/stl_iterator.h
- stl_pair.h
- tuple

6.777 std::pair< _T1, _T2 > Struct Template Reference

6.777.1 Detailed Description

template<typename _T1, typename _T2>
struct std::pair< _T1, _T2 >

Struct holding two objects (or references) of arbitrary type.

Template Parameters

_T1	Type of the `first` member.
_T2	Type of the `second` member.

https://gcc.gnu.org/onlinedocs/libstdc++/manual/utilities.html

6.777.2 Member Typedef Documentation

first_type

```
template<typename _T1, typename _T2>
typedef _T1 std::pair< _T1, _T2 >::first_type
```

The type of the `first` member.

second_type

```
template<typename _T1, typename _T2>
typedef _T2 std::pair< _T1, _T2 >::second_type
```

The type of the `second` member.

6.777.3 Constructor & Destructor Documentation

pair() [1/2]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::pair (
            const pair< _T1, _T2 > & )  [constexpr], [default]
```

Copy constructor.
Referenced by pair().

pair() [2/2]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::pair (
            pair< _T1, _T2 > && )  [constexpr], [default]
```

Move constructor.

6.777.4 Member Function Documentation

explicit() [1/7]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
_U2 &&constexpr std::pair< _T1, _T2 >::explicit (
            !_S_convertible< _U1 &, _U2 & > ())  [constexpr]
```

Converting constructor from a non-const `pair<U1, U2>` lvalue.

explicit() [2/7]

```
template<typename _T1, typename _T2>
template<typename _U1 = _T1, typename _U2 = _T2>
std::pair< _T1, _T2 >::explicit (
            !_S_convertible< _U1, _U2 > ()) &&  [constexpr]
```

Constructor accepting two values of arbitrary types.

explicit() [3/7]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
_U2 &constexpr std::pair< _T1, _T2 >::explicit (
            !_S_convertible< _U1, _U2 > ())  [constexpr]
```

Converting constructor from a non-const `pair<U1, U2>` rvalue.

explicit() [4/7]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::explicit (
            !_S_convertible< const _T1 &, const _T2 & > ()) const &  [constexpr]
```

Constructor accepting lvalues of `first_type` and `second_type`.

explicit() [5/7]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
_U2 &&constexpr std::pair< _T1, _T2 >::explicit (
            !_S_convertible< const _U1 &, const _U2 & > ()) const  [constexpr]
```

Converting constructor from a const `pair<U1, U2>` lvalue.

explicit() [6/7]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
_U2 &constexpr std::pair< _T1, _T2 >::explicit (
            !_S_convertible< const _U1, const _U2 > ()) const  [constexpr]
```

Converting constructor from a const `pair<U1, U2>` rvalue.

explicit() [7/7]

```
template<typename _T1, typename _T2>
std::pair< _T1, _T2 >::explicit (
            __not_< __and_< __is_implicitly_default_constructible< _T1 >, __is_implicitly_↩
default_constructible< _T2 > > > ())  [inline], [constexpr], [noexcept]
```

Default constructor.

operator=() [1/8]

```
template<typename _T1, typename _T2>
const pair & std::pair< _T1, _T2 >::operator= (
            const pair< _T1, _T2 > & __p) const  [inline], [constexpr]
```

Copy assignment operator (const).

operator=() [2/8]

```
template<typename _T1, typename _T2>
pair & std::pair< _T1, _T2 >::operator= (
            const pair< _T1, _T2 > & __p)  [inline], [constexpr], [noexcept]
```

Copy assignment operator.

operator=() [3/8]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_const_assignable<const _U1&, const _U2&>())
const pair & std::pair< _T1, _T2 >::operator= (
            const pair< _U1, _U2 > & __p) const  [inline], [constexpr]
```

Converting assignment from a const `pair<U1, U2>` lvalue.

operator=() [4/8]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_assignable<const _U1&, const _U2&>())
pair & std::pair< _T1, _T2 >::operator= (
            const pair< _U1, _U2 > & __p)  [inline], [constexpr], [noexcept]
```

Converting assignment from a const pair<U1, U2> lvalue.

operator=() [5/8]

```
template<typename _T1, typename _T2>
const pair & std::pair< _T1, _T2 >::operator= (
            pair< _T1, _T2 > && __p) const  [inline], [constexpr]
```

Move assignment operator (const).

operator=() [6/8]

```
template<typename _T1, typename _T2>
pair & std::pair< _T1, _T2 >::operator= (
            pair< _T1, _T2 > && __p)  [inline], [constexpr], [noexcept]
```

Move assignment operator.

operator=() [7/8]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_const_assignable<_U1, _U2>())
const pair & std::pair< _T1, _T2 >::operator= (
            pair< _U1, _U2 > && __p) const  [inline], [constexpr]
```

Converting assignment from a non-const pair<U1, U2> rvalue.

operator=() [8/8]

```
template<typename _T1, typename _T2>
template<typename _U1, typename _U2>
requires (_S_assignable<_U1, _U2>())
pair & std::pair< _T1, _T2 >::operator= (
            pair< _U1, _U2 > && __p)  [inline], [constexpr], [noexcept]
```

Converting assignment from a non-const pair<U1, U2> rvalue.

swap()

```
template<typename _T1, typename _T2>
void std::pair< _T1, _T2 >::swap (
            pair< _T1, _T2 > & __p)  [inline], [constexpr], [noexcept]
```

Swap the first members and then the second members.
Referenced by std::pair< const __iter_key_t< _InputIterator >, __iter_val_t< _InputIterator > >::swap(), std::sub_match< const char * and std::swap().

6.777.5 Member Data Documentation

first

```
template<typename _T1, typename _T2>
_T1 std::pair< _T1, _T2 >::first
```

The first member.
Referenced by __gnu_parallel::__find_template(), __gnu_parallel::__find_template(), std::set< _Key, _Cmp, polymorphic_allocator< _Key
std::pair< const __iter_key_t< _InputIterator >, __iter_val_t< _InputIterator > >::operator<=>(), std::pair< const __iter_key_t< _Input
and std::shuffle().

second

```
template<typename _T1, typename _T2>
_T2 std::pair< _T1, _T2 >::second
```

The second member.
Referenced by std::set< _Key, _Cmp, polymorphic_allocator< _Key > >::insert(), std::pair< const __iter_key_t< _InputIterator >, __iter
std::pair< const __iter_key_t< _InputIterator >, __iter_val_t< _InputIterator > >::operator==(), and std::shuffle().

6.778.1 Detailed Description

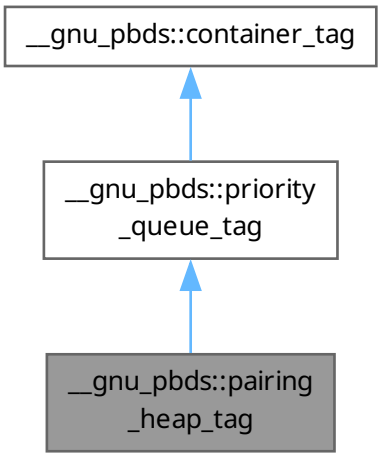
template<typename Value_Type, typename Cmp_Fn, typename _Alloc>
class __gnu_pbds::detail::pairing_heap< Value_Type, Cmp_Fn, _Alloc >

Pairing heap.
The documentation for this class was generated from the following file:

- pairing_heap_.hpp

6.779 __gnu_pbds::pairing_heap_tag Struct Reference

`#include <tag_and_trait.hpp>`
Inheritance diagram for __gnu_pbds::pairing_heap_tag:



6.779.1 Detailed Description

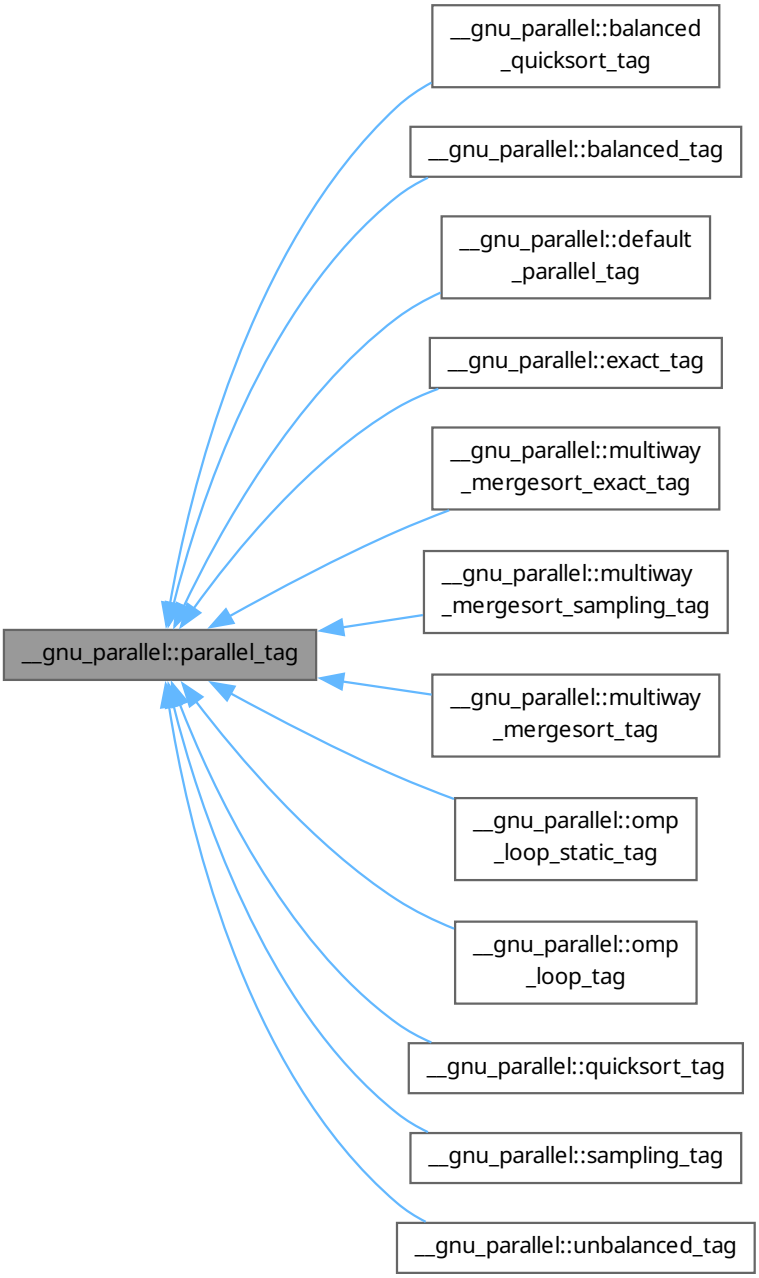
Pairing-heap.
The documentation for this struct was generated from the following file:

- tag_and_trait.hpp

6.780 __gnu_parallel::parallel_tag Struct Reference

`#include <tags.h>`

Inheritance diagram for __gnu_parallel::parallel_tag:



Public Member Functions

- parallel_tag ()
- parallel_tag (_ThreadIndex __num_threads)
- _ThreadIndex __get_num_threads ()

- void set_num_threads (_ThreadIndex __num_threads)

6.780.1 Detailed Description

Recommends parallel execution at compile time, optionally using a user-specified number of threads.

6.780.2 Constructor & Destructor Documentation

parallel_tag() [1/2]

```
__gnu_parallel::parallel_tag::parallel_tag ()  [inline]
```
Default constructor. Use default number of threads.

parallel_tag() [2/2]

```
__gnu_parallel::parallel_tag::parallel_tag (
            _ThreadIndex __num_threads)  [inline]
```
Default constructor. Recommend number of threads to use.

Parameters

__num_threads	Desired number of threads.

6.780.3 Member Function Documentation

__get_num_threads()

```
_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads ()  [inline]
```
Find out desired number of threads.

Returns

Desired number of threads.

Referenced by __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), and __gnu_parallel::__parallel_sort(

set_num_threads()

```
void __gnu_parallel::parallel_tag::set_num_threads (
            _ThreadIndex __num_threads)  [inline]
```
Set the desired number of threads.

Parameters

__num_threads	Desired number of threads.

The documentation for this struct was generated from the following file:

- tags.h

6.781 std::bernoulli_distribution::param_type Struct Reference

6.802.1 Detailed Description

template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
class __gnu_pbds::detail::pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >

PATRICIA trie.
This implementation loosely borrows ideas from: 1) Fast Mergeable Integer Maps, Okasaki, Gill 1998 2) Ptset: Sets of integers implemented as Patricia trees, Jean-Christophe Filliatr, 2000

6.802.2 Member Enumeration Documentation

node_type

```
enum __gnu_pbds::detail::pat_trie_base::node_type  [inherited]
```

Three types of nodes.
i_node is used by _Inode, leaf_node by _Leaf, and head_node by _Head.

6.802.3 Member Function Documentation

node_begin() [1/2]

```
template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_begin ()  [inline]
```

Returns a node_iterator corresponding to the node at the root of the tree.

node_begin() [2/2]

```
template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_begin () const  [inline]
```

Returns a const node_iterator corresponding to the node at the root of the tree.

node_end() [1/2]

```
template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_end ()  [inline]
```

Returns a node_iterator corresponding to a node just after a leaf of the tree.

node_end() [2/2]

```
template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::pat_trie_map<
Key, Mapped, Node_And_It_Traits, _Alloc >::node_end () const  [inline]
```

Returns a const node_iterator corresponding to a node just after a leaf of the tree.

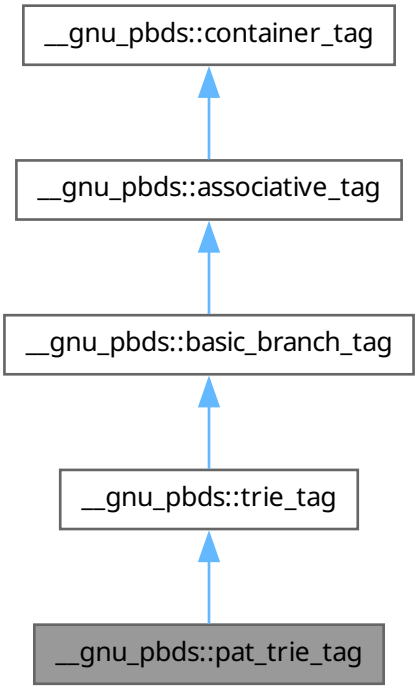
The documentation for this class was generated from the following file:

- pat_trie_.hpp

6.803 __gnu_pbds::pat_trie_tag Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for __gnu_pbds::pat_trie_tag:



6.803.1 Detailed Description

PATRICIA trie.
The documentation for this struct was generated from the following file:

6.806.1 Detailed Description

template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType... __consts>
class std::philox_engine< _UIntType, __w, __n, __r, __consts >

A discrete pseudorandom number generator with weak cryptographic properties.
This algorithm was designed to be used for highly parallel random number generation, and is capable of immensely long periods. It provides "Crush-resistance", denoting an ability to pass the TestU01 Suite's "Big Crush" test, demonstrating significant apparent entropy.
It is not intended for cryptographic use and should not be used for such, despite being based on cryptographic primitives. The typedefs `philox4x32` and `philox4x64` are provided as suitable defaults for most use cases, providing high-quality random numbers with reasonable performance.
This algorithm was created by John Salmon, Mark Moraes, Ron Dror, and David Shaw as a product of D.E. Shaw Research.

Template Parameters

__w	Word size
__n	Buffer size

__r	Rounds
__consts	Multiplication and round constant pack, ordered as M_{0}, C_{0}, M_{1}, C_{1}, ... , M_{N/2-1}, C_{N/2-1}

Since

C++26

6.806.2 Constructor & Destructor Documentation

philox_engine()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType...  __consts>
template<typename _Sseq>
std::philox_engine< _UIntType, __w, __n, __r, __consts >::philox_engine (
            _Sseq & __q)  [inline], [explicit]
```

seed sequence constructor for philox_engine

Parameters

_↩ _q	the seed sequence

6.806.3 Member Function Documentation

discard()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType...  __consts>
void std::philox_engine< _UIntType, __w, __n, __r, __consts >::discard (
            unsigned long long __z)  [inline]
```

discards __z numbers

Parameters

_↩ _z	number of iterations to discard

max()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType...  __consts>
constexpr result_type std::philox_engine< _UIntType, __w, __n, __r, __consts >::max ()  [inline],
[static], [constexpr]
```

The maximum value that this engine can return.

Referenced by std::philox_engine< uint_fast32_t, 32, 4, 10, 0xCD9E8D57, 0x9E3779B9, 0xD2511F53, 0xBB67AE85 >::operator>>, and std::philox_engine< uint_fast32_t, 32, 4, 10, 0xCD9E8D57, 0x9E3779B9, 0xD2511F53, 0xBB67AE85 >::set_↩ counter().

min()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType...  __consts>
constexpr result_type std::philox_engine< _UIntType, __w, __n, __r, __consts >::min ()  [inline],
[static], [constexpr]
```

The minimum value that this engine can return.

operator()()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType...  __consts>
result_type std::philox_engine< _UIntType, __w, __n, __r, __consts >::operator() ()  [inline]
```

outputs a single w-bit number and handles state advancement

Returns

return_type

seed()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType...  __consts>
requires __is_seed_seq<_Sseq>
template<typename _Sseq>
requires __is_seed_seq<_Sseq>
void std::philox_engine< _UIntType, __w, __n, __r, __consts >::seed (
            _Sseq & __q)
```

seeds philox_engine by seed sequence

Parameters

_↩ _q	the seed sequence

References std::max().

set_counter()

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType...  __consts>
void std::philox_engine< _UIntType, __w, __n, __r, __consts >::set_counter (
            const array< result_type, __n > & __counter)  [inline]
```

sets the internal counter "cleartext"

Parameters

__counter	std::array of len N

6.806.4 Friends And Related Symbol Documentation

operator<<

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType...  __consts>
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & operator<< (
            basic_ostream< _CharT, _Traits > & __os,
            const philox_engine< _UIntType, __w, __n, __r, __consts > & __x)  [friend]
```

outputs the state of the generator

Parameters

__os	An output stream.
__x	A philox_engine object reference

Returns

the state of the Philox Engine in __os

operator==

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType...  __consts>
bool operator== (
             const philox_engine< _UIntType, __w, __n, __r, __consts > & ,
             const philox_engine< _UIntType, __w, __n, __r, __consts > & )  [friend]
```

compares two philox_engine objects

Returns

true if the objects will produce an identical stream, false otherwise

operator>>

```
template<typename _UIntType, size_t __w, size_t __n, size_t __r, _UIntType...  __consts>
template<typename _CharT, typename _Traits>
basic_istream< _CharT, _Traits > & operator>> (
             basic_istream< _CharT, _Traits > & __is,
             philox_engine< _UIntType, __w, __n, __r, __consts > & __x)  [friend]
```

takes input to set the state of the philox_engine object

Parameters

_↩ _is	An input stream.
_↩ _x	A philox_engine object reference

Returns

philox_engine object is set with values from instream

6.807.1 Detailed Description

template<typename _RealType = double>
class std::piecewise_constant_distribution< _RealType >

A piecewise_constant_distribution random number distribution.

This distribution produces random numbers $x, b_0 \leq x < b_n$, uniformly distributed over each subinterval $[b_i, b_{i+1})$ according to the probability mass function

$$p(x|b_0, ..., b_n, \rho_0, ..., \rho_{n-1}) = \rho_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}$$

for $b_i \leq x < b_{i+1}$.

Since

C++11

6.807.2 Member Typedef Documentation

result_type

```
template<typename _RealType = double>
typedef _RealType std::piecewise_constant_distribution< _RealType >::result_type
```

The type of the range of the distribution.

6.807.3 Member Function Documentation

densities()

```
template<typename _RealType = double>
std::vector< result_type > std::piecewise_constant_distribution< _RealType >::densities () const
[inline]
```

Returns a vector of the probability densities.

intervals()

```
template<typename _RealType = double>
std::vector< result_type > std::piecewise_constant_distribution< _RealType >::intervals () const
[inline]
```

Returns a vector of the intervals.

max()

```
template<typename _RealType = double>
result_type std::piecewise_constant_distribution< _RealType >::max () const  [inline]
```

Returns the least upper bound value of the distribution.

min()

```
template<typename _RealType = double>
result_type std::piecewise_constant_distribution< _RealType >::min () const  [inline]
```

Returns the greatest lower bound value of the distribution.

operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::piecewise_constant_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng)  [inline]
```

Generating functions.

Referenced by operator()().

param() [1/2]

```
template<typename _RealType = double>
param_type std::piecewise_constant_distribution< _RealType >::param () const  [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _RealType = double>
void std::piecewise_constant_distribution< _RealType >::param (
            const param_type & __param)  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

reset()

```
template<typename _RealType = double>
void std::piecewise_constant_distribution< _RealType >::reset ()  [inline]
```

Resets the distribution state.

6.807.4 Friends And Related Symbol Documentation

operator<<

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::piecewise_constant_distribution< _RealType1 > & __x)  [friend]
```

Inserts a piecewise_constant_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A piecewise_constant_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _RealType = double>
bool operator== (
            const piecewise_constant_distribution< _RealType > & __d1,
            const piecewise_constant_distribution< _RealType > & __d2)  [friend]
```

Return true if two piecewise constant distributions have the same parameters.

operator>>

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::piecewise_constant_distribution< _RealType1 > & __x)  [friend]
```

Extracts a piecewise_constant_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A piecewise_constant_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

6.809.1 Detailed Description

template<typename _RealType = double>
class std::piecewise_linear_distribution< _RealType >

A piecewise_linear_distribution random number distribution.
This distribution produces random numbers $x, b_0 \leq x < b_n$, distributed over each subinterval $[b_i, b_{i+1})$ according to the probability mass function $p(x|b_0, ..., b_n, \rho_0, ..., \rho_n) = \rho_i$, for $b_i \leq x < b_{i+1}$.

Since

C++11

6.809.2 Member Typedef Documentation

result_type

```
template<typename _RealType = double>
typedef _RealType std::piecewise_linear_distribution< _RealType >::result_type
```

The type of the range of the distribution.

6.809.3 Member Function Documentation

densities()

```
template<typename _RealType = double>
std::vector< result_type > std::piecewise_linear_distribution< _RealType >::densities () const
[inline]
```

Return a vector of the probability densities of the distribution.

intervals()

```
template<typename _RealType = double>
std::vector< result_type > std::piecewise_linear_distribution< _RealType >::intervals () const
[inline]
```

Return the intervals of the distribution.

max()

```
template<typename _RealType = double>
result_type std::piecewise_linear_distribution< _RealType >::max () const  [inline]
```

Returns the least upper bound value of the distribution.

min()

```
template<typename _RealType = double>
result_type std::piecewise_linear_distribution< _RealType >::min () const  [inline]
```

Returns the greatest lower bound value of the distribution.

operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::piecewise_linear_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng)  [inline]
```

Generating functions.
Referenced by operator()().

param() [1/2]

```
template<typename _RealType = double>
param_type std::piecewise_linear_distribution< _RealType >::param () const  [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _RealType = double>
void std::piecewise_linear_distribution< _RealType >::param (
            const param_type & __param)  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

reset()

```
template<typename _RealType = double>
void std::piecewise_linear_distribution< _RealType >::reset ()  [inline]
```

Resets the distribution state.

6.809.4 Friends And Related Symbol Documentation

operator<<

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::piecewise_linear_distribution< _RealType1 > & __x)  [friend]
```

Inserts a piecewise_linear_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A piecewise_linear_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _RealType = double>
bool operator== (
            const piecewise_linear_distribution< _RealType > & __d1,
            const piecewise_linear_distribution< _RealType > & __d2)  [friend]
```

Return true if two piecewise linear distributions have the same parameters.

operator>>

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::piecewise_linear_distribution< _RealType1 > & __x)  [friend]
```

Extracts a piecewise_linear_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A piecewise_linear_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

6.814 std::pointer_traits< _Ptr > Struct Template Reference

`#include <memory>`

Public Types

- using difference_type
- using element_type
- using pointer
- template<typename _Up>
  using rebind

Static Public Member Functions

- static constexpr pointer pointer_to (element_type &__r)

6.814.1 Detailed Description

template<typename _Ptr>
struct std::pointer_traits< _Ptr >

Uniform interface to all pointer-like types.

Since

C++11

6.814.2 Member Typedef Documentation

difference_type

```
template<typename _Ptr, typename _Elt>
using std::__ptr_traits_impl< _Ptr, _Elt >::difference_type  [inherited]
```

The type used to represent the difference between two pointers.

element_type

```
template<typename _Ptr, typename _Elt>
using std::__ptr_traits_impl< _Ptr, _Elt >::element_type  [inherited]
```

The type pointed to.

pointer

```
template<typename _Ptr, typename _Elt>
using std::__ptr_traits_impl< _Ptr, _Elt >::pointer  [inherited]
```

The pointer type.

rebind

```
template<typename _Ptr, typename _Elt>
template<typename _Up>
using std::__ptr_traits_impl< _Ptr, _Elt >::rebind  [inherited]
```

A pointer to a different type.

6.814.3 Member Function Documentation

pointer_to()

```
template<typename _Ptr, typename _Elt, bool = is_void<_Elt>::value>
constexpr pointer std::__ptr_traits_ptr_to< _Ptr, _Elt, bool >::pointer_to (
            element_type & __r)  [inline], [static], [constexpr], [inherited]
```

Obtain a pointer to an object.

Parameters

↩ _↩ ↩ _↩ *r*	A reference to an object of type `element_type`

Returns

`pointer::pointer_to(__r)`

Precondition

`pointer::pointer_to(__r)` is a valid expression.

The documentation for this struct was generated from the following file:

- ptr_traits.h

6.815.1 Detailed Description

template<typename _Tp>
struct std::pointer_traits< _Tp * >

Partial specialization for built-in pointers.

Since

C++11

6.815.2 Member Typedef Documentation

difference_type [1/2]

```
template<typename _Tp>
typedef ptrdiff_t std::pointer_traits< _Tp * >::difference_type
```

Type used to represent the difference between two pointers.

difference_type [2/2]

```
using std::__ptr_traits_impl< _Tp *, _Elt >::difference_type
```

The type used to represent the difference between two pointers.

element_type [1/2]

```
template<typename _Tp>
typedef _Tp std::pointer_traits< _Tp * >::element_type
```

The type pointed to.

element_type [2/2]

```
using std::__ptr_traits_impl< _Tp *, _Elt >::element_type
```

The type pointed to.

pointer [1/2]

```
template<typename _Tp>
typedef _Tp* std::pointer_traits< _Tp * >::pointer
```

The pointer type.

pointer [2/2]

```
using std::__ptr_traits_impl< _Tp *, _Elt >::pointer
```

The pointer type.

rebind [1/2]

```
template<typename _Tp>
template<typename _Up>
using std::pointer_traits< _Tp * >::rebind
```

A pointer to a different type.

rebind [2/2]

```
using std::__ptr_traits_impl< _Tp *, _Elt >::rebind
```

A pointer to a different type.

6.815.3 Member Function Documentation

pointer_to() [1/3]

```
template<typename _Ptr, typename _Elt, bool = is_void<_Elt>::value>
constexpr pointer std::__ptr_traits_ptr_to< _Ptr, _Elt, bool >::pointer_to (
            element_type & __r)  [inline], [static], [constexpr], [inherited]
```

Obtain a pointer to an object.

Parameters

↩ _↩ ↩ _↩ *r*	A reference to an object of type `element_type`

Returns

`pointer::pointer_to(__r)`

Precondition

`pointer::pointer_to(__r)` is a valid expression.

pointer_to() [2/3]

```
template<typename _Ptr, typename _Elt, bool = is_void<_Elt>::value>
constexpr pointer std::__ptr_traits_ptr_to< _Ptr, _Elt, bool >::pointer_to (
            element_type & __r)  [inline], [static], [constexpr], [inherited]
```

Obtain a pointer to an object.

Parameters

↩ _↩ ↩ _↩ *r*	A reference to an object of type `element_type`

Returns

`pointer::pointer_to(__r)`

Precondition

`pointer::pointer_to(__r)` is a valid expression.

pointer_to() [3/3]

```
constexpr pointer std::__ptr_traits_ptr_to< _Tp *, _Elt, bool >::pointer_to (
            element_type & __r)  [inline], [static], [constexpr]
```

Obtain a pointer to an object.

Parameters

↩ _↩ ↩ _↩ *r*	A reference to an object of type `element_type`

Returns

`pointer::pointer_to(__r)`

Precondition

`pointer::pointer_to(__r)` is a valid expression.

6.816.1 Detailed Description

template<typename _IntType = int>
class std::poisson_distribution< _IntType >

A discrete Poisson random number distribution.
The formula for the Poisson probability density function is $p(i|\mu) = \frac{\mu^i}{i!}e^{-\mu}$ where μ is the parameter of the distribution.

Since

C++11

6.816.2 Member Typedef Documentation

result_type

```
template<typename _IntType = int>
typedef _IntType std::poisson_distribution< _IntType >::result_type
```

The type of the range of the distribution.

6.816.3 Member Function Documentation

max()

```
template<typename _IntType = int>
result_type std::poisson_distribution< _IntType >::max () const  [inline]
```

Returns the least upper bound value of the distribution.

mean()

```
template<typename _IntType = int>
double std::poisson_distribution< _IntType >::mean () const  [inline]
```

Returns the distribution parameter mean.

min()

```
template<typename _IntType = int>
result_type std::poisson_distribution< _IntType >::min () const  [inline]
```

Returns the greatest lower bound value of the distribution.

operator()() [1/2]

```
template<typename _IntType = int>
template<typename _UniformRandomNumberGenerator>
result_type std::poisson_distribution< _IntType >::operator() (
            _UniformRandomNumberGenerator & __urng)  [inline]
```

Generating functions.
Referenced by operator()().

operator()() [2/2]

```
template<typename _IntType>
template<typename _UniformRandomNumberGenerator>
poisson_distribution< _IntType >::result_type std::poisson_distribution< _IntType >::operator()
(
            _UniformRandomNumberGenerator & __urng,
            const param_type & __param)
```

A rejection algorithm when mean >= 12 and a simple method based upon the multiplication of uniform random variates otherwise. NB: The former is available only if _GLIBCXX_USE_C99_MATH_FUNCS is defined.
Reference: Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. X, Sects. 3.3 & 3.4 (+ Errata!).
References std::abs(), std::numeric_limits< _Tp >::epsilon(), std::log(), and std::numeric_limits< _Tp >::max().

param() [1/2]

```
template<typename _IntType = int>
param_type std::poisson_distribution< _IntType >::param () const  [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _IntType = int>
void std::poisson_distribution< _IntType >::param (
            const param_type & __param)  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

reset()

```
template<typename _IntType = int>
void std::poisson_distribution< _IntType >::reset ()  [inline]
```

Resets the distribution state.

6.816.4 Friends And Related Symbol Documentation

operator<<

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::poisson_distribution< _IntType1 > & __x)  [friend]
```

Inserts a poisson_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A poisson_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _IntType = int>
bool operator== (
            const poisson_distribution< _IntType > & __d1,
            const poisson_distribution< _IntType > & __d2)  [friend]
```

Return true if two Poisson distributions have the same parameters and the sequences that would be generated are equal.

operator>>

```
template<typename _IntType = int>
template<typename _IntType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::poisson_distribution< _IntType1 > & __x)  [friend]
```

Extracts a poisson_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _*is*	An input stream.
_↩ _*x*	A poisson_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

6.817.1 Detailed Description

template<typename _Tp>
class std::pmr::polymorphic_allocator< _Tp >

Class template polymorphic_allocator.

Since

C++17

The documentation for this class was generated from the following file:

- memory_resource.h

6.818 std::pmr::pool_options Struct Reference

`#include <memory_resource>`

Public Attributes

- size_t **largest_required_pool_block**
- size_t max_blocks_per_chunk

6.818.1 Detailed Description

Parameters for tuning a pool resource's behaviour.

Since

C++17

6.818.2 Member Data Documentation

max_blocks_per_chunk

`size_t std::pmr::pool_options::max_blocks_per_chunk`
Upper limit on number of blocks in a chunk.
A lower value prevents allocating huge chunks that could remain mostly unused, but means pools will need to replenished more frequently.
The documentation for this struct was generated from the following file:

- memory_resource

6.819.1 Detailed Description

template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename _Alloc = std::allocator<char>>
class __gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >

A priority queue composed of one specific heap policy.

Template Parameters

_Tv	Value type.
Cmp_Fn	Comparison functor.
Tag	Instantiating data structure type, see container_tag.
_Alloc	Allocator type.

Base is dispatched at compile time via Tag, from the following choices: binary_heap_tag, binomial_heap_tag, pairing↩
_heap_tag, rc_binomial_heap_tag, thin_heap_tag
Base choices are: detail::binary_heap, detail::binomial_heap, detail::pairing_heap, detail::rc_binomial_heap, detail::↩
thin_heap.

6.819.2 Constructor & Destructor Documentation

priority_queue() [1/3]

```
template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>
__gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >::priority_queue (
            const cmp_fn & r_cmp_fn)  [inline]
```

Constructor taking some policy objects. r_cmp_fn will be copied by the Cmp_Fn object of the container object.

priority_queue() [2/3]

```
template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >::priority_queue (
            It first_it,
            It last_it)  [inline]
```

Constructor taking __iterators to a range of value_types. The value_types between first_it and last_it will be inserted into the container object.

priority_queue() [3/3]

```
template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >::priority_queue (
            It first_it,
            It last_it,
            const cmp_fn & r_cmp_fn)  [inline]
```

Constructor taking __iterators to a range of value_types and some policy objects The value_types between first_it and last_it will be inserted into the container object. r_cmp_fn will be copied by the cmp_fn object of the container object.

6.820.1 Detailed Description

template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>
class std::priority_queue< _Tp, _Sequence, _Compare >

A standard container automatically sorting its contents.

Template Parameters

_Tp	Type of element.
_Sequence	Type of underlying sequence, defaults to vector<_Tp>.
_Compare	Comparison function object type, defaults to less<_Sequence::value_type>.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces priority-based sorting and queue behavior. Very few of the standard container/sequence interface requirements are met (e.g., iterators).
The second template parameter defines the type of the underlying sequence/container. It defaults to std::vector, but it can be any type that supports `front()`, `push_back`, `pop_back`, and random-access iterators, such as std::deque or an appropriate user-defined type.
The third template parameter supplies the means of making priority comparisons. It defaults to `less<value_type>` but can be anything defining a strict weak ordering.
Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push`, `pop`, and `top`, which are standard queue operations.

Note

No equality/comparison operators are provided for priority_queue.

Sorting of the elements takes place as they are added to, and removed from, the priority_queue using the priority_queue's member functions. If you access the elements by other means, and change their data such that the sorting order would be different, the priority_queue will not re-sort the elements for you. (How could it know to do so?)

6.820.2 Constructor & Destructor Documentation

priority_queue() [1/4]

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↩
Sequence::value_type>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<__and_<is_default_↩
constructible<_Compare>, is_default_constructible<_Seq>>::value>::type>
std::priority_queue< _Tp, _Sequence, _Compare >::priority_queue ()  [inline], [constexpr]
```

Default constructor creates no elements.

priority_queue() [2/4]

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↩
Sequence::value_type>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
std::priority_queue< _Tp, _Sequence, _Compare >::priority_queue (
            _InputIterator __first,
            _InputIterator __last,
            const _Compare & __x = _Compare())  [inline], [constexpr]
```

Builds a queue from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__x	A comparison functor describing a strict weak ordering.
__s	An initial sequence with which to start.

Begins by copying *__s*, inserting a copy of the elements from [first,last) into the copy of *__s*, then ordering the copy according to *__x*.
For more information on function objects, see the documentation on functor base classes.

priority_queue() [3/4]

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↩
Sequence::value_type>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
std::priority_queue< _Tp, _Sequence, _Compare >::priority_queue (
            _InputIterator __first,
            _InputIterator __last,
            const _Compare & __x,
            const _Sequence & __s)  [inline], [constexpr]
```

Builds a queue from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__x	A comparison functor describing a strict weak ordering.
__s	An initial sequence with which to start.

Begins by copying *__s*, inserting a copy of the elements from [first,last) into the copy of *__s*, then ordering the copy according to *__x*.
For more information on function objects, see the documentation on functor base classes.

priority_queue() [4/4]

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↩
Sequence::value_type>>
template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
std::priority_queue< _Tp, _Sequence, _Compare >::priority_queue (
            _InputIterator __first,
            _InputIterator __last,
            const _Compare & __x,
            _Sequence && __s)  [inline], [constexpr]
```

Builds a queue from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__x	A comparison functor describing a strict weak ordering.
__s	An initial sequence with which to start.

Begins by copying *__s*, inserting a copy of the elements from [first,last) into the copy of *__s*, then ordering the copy according to *__x*.
For more information on function objects, see the documentation on functor base classes.
References std::move().

6.820.3 Member Function Documentation

empty()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↩
Sequence::value_type>>
bool std::priority_queue< _Tp, _Sequence, _Compare >::empty () const  [inline], [nodiscard],
[constexpr]
```

Returns true if the queue is empty.
Referenced by __gnu_parallel::multiseq_partition(), and __gnu_parallel::multiseq_selection().

pop()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↩
Sequence::value_type>>
void std::priority_queue< _Tp, _Sequence, _Compare >::pop ()  [inline], [constexpr]
```

Removes first element.
This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.
Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.
Referenced by __gnu_parallel::multiseq_partition(), and __gnu_parallel::multiseq_selection().

push()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↩
Sequence::value_type>>
void std::priority_queue< _Tp, _Sequence, _Compare >::push (
            const value_type & __x)  [inline], [constexpr]
```

Add data to the queue.

Parameters

_↩ _x	Data to be added.

This is a typical queue operation. The time complexity of the operation depends on the underlying sequence.
Referenced by __gnu_parallel::multiseq_partition(), and __gnu_parallel::multiseq_selection().

size()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↩
Sequence::value_type>>
size_type std::priority_queue< _Tp, _Sequence, _Compare >::size () const  [inline], [nodiscard],
[constexpr]
```

Returns the number of elements in the queue.

top()

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↩
Sequence::value_type>>
const_reference std::priority_queue< _Tp, _Sequence, _Compare >::top () const  [inline], [nodiscard],
[constexpr]
```

Returns a read-only (constant) reference to the data at the first element of the queue.
Referenced by __gnu_parallel::multiseq_partition(), and __gnu_parallel::multiseq_selection().

6.830.1 Detailed Description

template<typename _Tp, typename _Sequence = deque<_Tp>>
class std::queue< _Tp, _Sequence >

A standard container giving FIFO behavior.

Template Parameters

_Tp	Type of element.

_Sequence	Type of underlying sequence, defaults to deque<_Tp>.

Meets many of the requirements of a container, but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.
This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-first-out queue behavior.
The second template parameter defines the type of the underlying sequence/container. It defaults to std::deque, but it can be any type that supports `front`, `back`, `push_back`, and `pop_front`, such as std::list or an appropriate user-defined type.
Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push` and `pop`, which are standard queue/FIFO operations.

6.830.2 Constructor & Destructor Documentation

queue()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<is_default_constructible<↩
_Seq>::value>::type>
std::queue< _Tp, _Sequence >::queue ()  [inline]
```

Default constructor creates no elements.
References c.

6.830.3 Member Function Documentation

back() [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::queue< _Tp, _Sequence >::back ()  [inline], [nodiscard]
```

Returns a read/write reference to the data at the last element of the queue.
References c.

back() [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::queue< _Tp, _Sequence >::back () const  [inline], [nodiscard]
```

Returns a read-only (constant) reference to the data at the last element of the queue.
References c.

empty()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
bool std::queue< _Tp, _Sequence >::empty () const  [inline], [nodiscard]
```

Returns true if the queue is empty.
References c.

front() [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::queue< _Tp, _Sequence >::front ()  [inline], [nodiscard]
```

Returns a read/write reference to the data at the first element of the queue.
References c.

front() [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::queue< _Tp, _Sequence >::front () const  [inline], [nodiscard]
```

Returns a read-only (constant) reference to the data at the first element of the queue.
References c.

pop()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::queue< _Tp, _Sequence >::pop ()  [inline]
```

Removes first element.
This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.
Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.
References c.

push()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::queue< _Tp, _Sequence >::push (
            const value_type & __x)  [inline]
```

Add data to the end of the queue.

Parameters

_↩ _x	Data to be added.

This is a typical queue operation. The function creates an element at the end of the queue and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.
References c.

size()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
size_type std::queue< _Tp, _Sequence >::size () const  [inline], [nodiscard]
```

Returns the number of elements in the queue.
References c.

6.830.4 Member Data Documentation

c

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
_Sequence std::queue< _Tp, _Sequence >::c  [protected]
```

c is the underlying container.
Referenced by queue(), back(), back(), empty(), front(), front(), std::operator<(), std::operator==(), pop(), push(), and size().

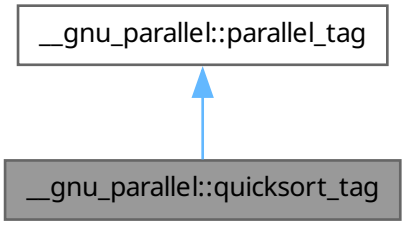
6.831 __gnu_parallel::quicksort_tag Struct Reference

```
#include <tags.h>
```

Inheritance diagram for __gnu_parallel::quicksort_tag:



Public Member Functions

- **quicksort_tag** (_ThreadIndex __num_threads)
- _ThreadIndex __get_num_threads ()
- void set_num_threads (_ThreadIndex __num_threads)

6.831.1 Detailed Description

Forces parallel sorting using unbalanced quicksort at compile time.

6.831.2 Member Function Documentation

__get_num_threads()

```
_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads ()  [inline], [inherited]
```

Find out desired number of threads.

Returns

Desired number of threads.

Referenced by __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), and __gnu_parallel::__parallel_sort(

set_num_threads()

```
void __gnu_parallel::parallel_tag::set_num_threads (
            _ThreadIndex __num_threads)  [inline], [inherited]
```

Set the desired number of threads.

Parameters

__num_threads	Desired number of threads.

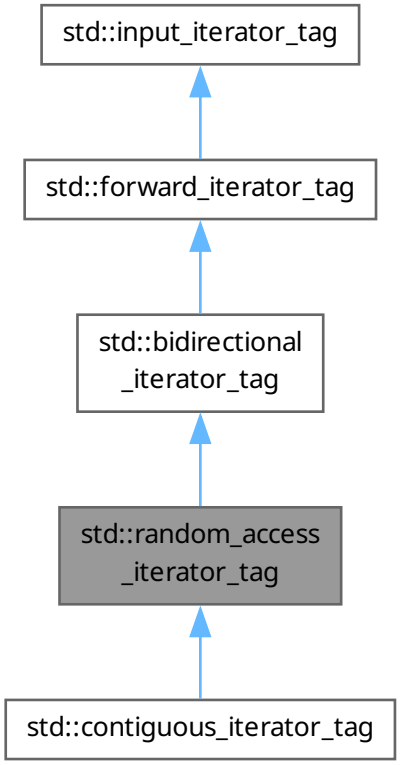
- tags.h

6.832 std::random_access_iterator_tag Struct Reference

`#include <stl_iterator_base_types.h>`
Inheritance diagram for std::random_access_iterator_tag:



6.832.1 Detailed Description

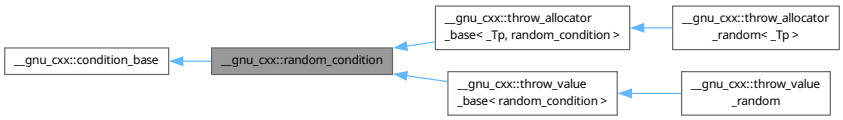
Random-access iterators support a superset of bidirectional iterator operations.
The documentation for this struct was generated from the following file:

- stl_iterator_base_types.h

6.833 __gnu_cxx::random_condition Struct Reference

`#include <throw_allocator.h>`

Inheritance diagram for __gnu_cxx::random_condition:



Classes

- struct always_adjustor
- struct group_adjustor
- struct never_adjustor

Public Member Functions

- void **seed** (unsigned long __s)

Static Public Member Functions

- static void **set_probability** (double __p)
- static void **throw_conditionally** ()

6.833.1 Detailed Description

Base class for random probability control and throw.
The documentation for this struct was generated from the following file:

- throw_allocator.h

6.834 std::random_device Class Reference

`#include <random>`

Public Types

- typedef unsigned int result_type

Public Member Functions

- **random_device** (const random_device &)=delete
- **random_device** (const std::string &__token)
- double **entropy** () const noexcept
- result_type **operator()** ()
- void **operator=** (const random_device &)=delete

Static Public Member Functions

- static constexpr result_type **max** ()
- static constexpr result_type **min** ()

6.834.1 Detailed Description

A standard interface to a platform-specific non-deterministic random number generator (if any are available).

Since

C++11

6.834.2 Member Typedef Documentation

result_type

```
typedef unsigned int std::random_device::result_type
```

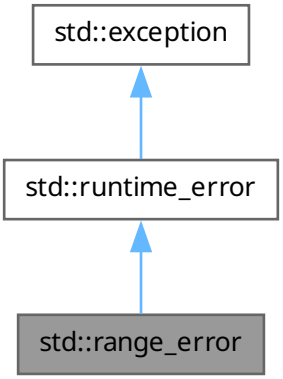
The type of the generated random value.
The documentation for this class was generated from the following file:

- random.h

6.835 std::range_error Class Reference

```
#include <stdexcept>
```

Inheritance diagram for std::range_error:



Public Member Functions

- **range_error** (const char *)
- **range_error** (const range_error &)=default
- **range_error** (const string &__arg)
- **range_error** (range_error &&)=default
- range_error & **operator=** (const range_error &)=default
- range_error & **operator=** (range_error &&)=default
- virtual const char * what () const noexcept

6.835.1 Detailed Description

Thrown to indicate range errors in internal computations.

6.835.2 Member Function Documentation

what()

```
virtual const char * std::runtime_error::what () const  [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).
Reimplemented from std::exception.
Reimplemented in std::experimental::filesystem::v1::filesystem_error, std::filesystem::filesystem_error, and std::ios_base::failure.
References what().
Referenced by what().

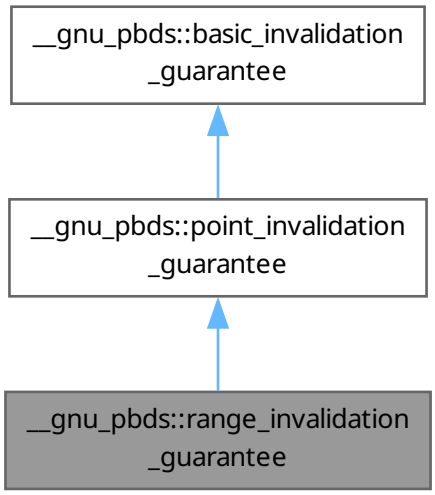
6.836 __gnu_pbds::range_invalidation_guarantee Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for __gnu_pbds::range_invalidation_guarantee:



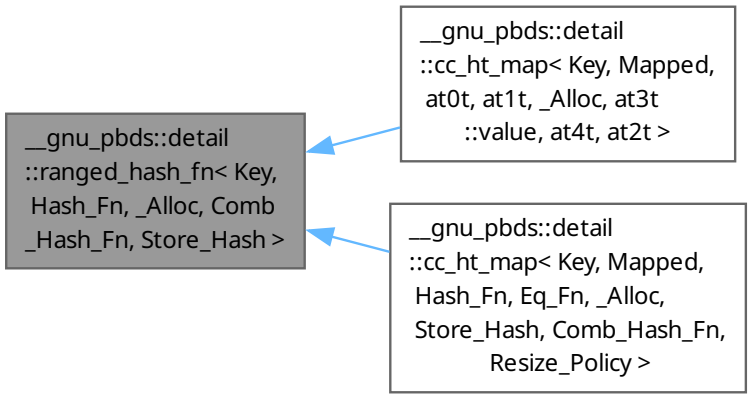
6.836.1 Detailed Description

Signifies an invalidation guarantee that includes all those of its base, and additionally, that any range-type iterator (including the returns of begin() and end()) is in the correct relative positions to other range-type iterators as long as its corresponding entry has not be erased, regardless of modifications to the container object.
The documentation for this struct was generated from the following file:

- tag_and_trait.hpp

6.837 __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash > Class Template Reference

Inheritance diagram for __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >:



6.837.1 Detailed Description

template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Hash_Fn, bool Store_Hash>
class __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >

Primary template.
The documentation for this class was generated from the following file:

- ranged_hash_fn.hpp

6.838 __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, false > Class Template Reference

`#include <ranged_hash_fn.hpp>`

`#include <ratio>`

Public Types

- typedef ratio< num, den > **type**

Static Public Attributes

- static constexpr intmax_t **den**
- static constexpr intmax_t **num**

6.847.1 Detailed Description

template<**intmax_t _Num, intmax_t _Den = 1**>
struct std::ratio< **_Num, _Den** >

Provides compile-time rational arithmetic.
This class template represents any finite rational number with a numerator and denominator representable by compile-time constants of type intmax_t. The ratio is simplified when instantiated.
For example:

```
std::ratio<7,-21>::num == -1;
std::ratio<7,-21>::den == 3;
```

The documentation for this struct was generated from the following file:

Protected Attributes

- _OutputIterator **_M_iter**

6.854.1 Detailed Description

template<class _OutputIterator, class _Tp>
class std::raw_storage_iterator< _OutputIterator, _Tp >

This iterator class lets algorithms store their results into uninitialized memory.

6.854.2 Member Typedef Documentation

difference_type

```
typedef void std::iterator< output_iterator_tag, void, void, void, void >::difference_type  [inherited]
```

Distance between iterators is represented as this type.

iterator_category

typedef output_iterator_tag std::iterator< output_iterator_tag, void, void, void, void >::↩
iterator_category [inherited]
One of the tag types.

pointer

typedef void std::iterator< output_iterator_tag, void, void, void, void >::pointer [inherited]
This type represents a pointer-to-value_type.

reference

typedef void std::iterator< output_iterator_tag, void, void, void, void >::reference [inherited]
This type represents a reference-to-value_type.

value_type

typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type [inherited]
The type "pointed to" by the iterator.
The documentation for this class was generated from the following file:

- stl_raw_storage_iter.h

6.856.1 Detailed Description

template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
class __gnu_pbds::detail::rb_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >

Red-Black tree.
This implementation uses an idea from the SGI STL (using a *header* node which is needed for efficient iteration).

6.856.2 Member Function Documentation

node_begin() [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin () [inline], [inherited]
```

Returns a node_iterator corresponding to the node at the root of the tree.

node_begin() [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin () const [inline], [inherited]
```

Returns a const node_iterator corresponding to the node at the root of the tree.

node_end() [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end () [inline], [inherited]
```

Returns a node_iterator corresponding to a node just after a leaf of the tree.

node_end() [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
```

bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __↩ gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_↩ end () const [inline], [inherited]

Returns a const node_iterator corresponding to a node just after a leaf of the tree.

The documentation for this class was generated from the following file:

- rb_tree_.hpp

6.857 __gnu_pbds::detail::rb_tree_node_< Value_Type, Metadata, _Alloc > Struct Template Reference

6.866.1 Detailed Description

Exception thrown by __cxa_guard_acquire.
C++ 2011 6.7 [stmt.dcl]/4: If control re-enters the declaration recursively while the variable is being initialized, the behavior is undefined.
Since we already have a library function to handle locking, we might as well check for this situation and throw an exception. We use the second byte of the guard variable to remember that we're in the middle of an initialization.

6.866.2 Member Function Documentation

what()

`virtual constexpr const char * std::exception::what () const [inline], [constexpr], [virtual], [noexcept], [inherited]`
Returns a C-style character string describing the general cause of the current error.
Reimplemented in std::bad_alloc, std::bad_cast, std::bad_exception, std::bad_function_call, std::bad_typeid, std::bad_weak_ptr, std::experimental::filesystem::v1::filesystem_error, std::experimental::fundamentals_v1::bad_any_cast, std::filesystem::filesystem_error, std::future_error, std::ios_base::failure, std::logic_error, and std::runtime_error.

- constexpr friend void **swap** (bool &__x, reference __y) noexcept
- constexpr friend void **swap** (reference __x, bool &__y) noexcept
- constexpr friend void **swap** (reference __x, reference __y) noexcept

6.869.1 Detailed Description

template<size_t _Nb>
class std::bitset< _Nb >::reference

This encapsulates the concept of a single bit. An instance of this class is a proxy for an actual bit; this way the individual bit operations are done as faster word-size bitwise instructions.
Most users will never need to use this class directly; conversions to and from bool are automatic and should be transparent. Overloaded operators help to preserve the illusion.
(On a typical system, this *bit reference* is 64 times the size of an actual bit. Ha.)
The documentation for this class was generated from the following file:

- bitset

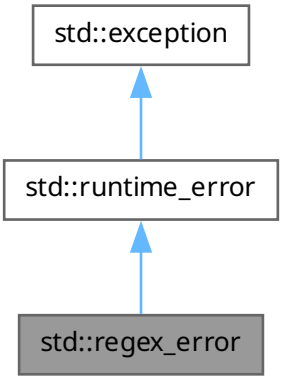
#include <regex>
```

Inheritance diagram for std::regex_error:



Public Member Functions

- regex_error (error_type __ecode)
- regex_constants::error_type code () const noexcept
- virtual const char * what () const noexcept

6.872.1 Detailed Description

A regular expression exception class.
The regular expression library throws objects of this class on error.

Since

C++11

6.872.2 Constructor & Destructor Documentation

regex_error()

```
std::regex_error::regex_error (
            error_type __ecode)  [explicit]
```

Constructs a regex_error object.

Parameters

__ecode	the regex error code.

References regex_error().
Referenced by regex_error().

6.872.3 Member Function Documentation

code()

```
regex_constants::error_type std::regex_error::code () const  [inline], [noexcept]
```

Gets the regex error code.

Returns

the regex error code.

References code().
Referenced by code().

what()

```
virtual const char * std::runtime_error::what () const  [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).
Reimplemented from std::exception.
Reimplemented in std::experimental::filesystem::v1::filesystem_error, std::filesystem::filesystem_error, and std::ios_base::failure.
References what().
Referenced by what().
The documentation for this class was generated from the following file:

- regex_error.h

6.873.1 Detailed Description

template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
class std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >

An iterator adaptor that will provide repeated calls of regex_search over a range until no more matches remain.

Since

C++11

6.873.2 Constructor & Destructor Documentation

regex_iterator() [1/3]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator ()  [default]
```

Provides a singular iterator, useful for indicating one-past-the-end of a range.
Referenced by std::regex_iterator< const char * >::regex_iterator(), and operator==().

regex_iterator() [2/3]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator (
             _Bi_iter __a,
             _Bi_iter __b,
             const regex_type & __re,
             regex_constants::match_flag_type __m = regex_constants::match_default)  [inline]
```

Constructs a regex_iterator...

Parameters

_a	[IN] The start of a text range to search.
_b	[IN] One-past-the-end of the text range to search.
_re	[IN] The regular expression to match.
_m	[IN] Policy flags for match rules.

regex_iterator() [3/3]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator (
             const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & )  [default]
```

Copy constructs a regex_iterator.

6.873.3 Member Function Documentation

operator*()

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type & std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator* () const
[inline], [noexcept]
```

Dereferences a regex_iterator.

operator++() [1/2]

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & std::regex_iterator< _Bi_iter, _Ch_type, _Rx↩
_traits >::operator++ ()
```

Increments a regex_iterator.

References std::regex_constants::match_continuous, std::regex_constants::match_not_null, std::regex_constants::match_prev_avail, and std::regex_search().

operator++() [2/2]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ (
            int )  [inline]
```

Postincrements a regex_iterator.

operator->()

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type * std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator-> () const
[inline], [noexcept]
```

Selects a regex_iterator member.

operator=()

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator & std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator= (
            const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & )  [default]
```

Copy assigns one regex_iterator to another.

operator==()

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
bool std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator== (
            const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs) const  [noexcept]
```

Tests the equivalence of two regex iterators.

References regex_iterator().

6.874.1 Detailed Description

template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
class std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >

Iterates over submatches in a range (or *splits* a text string).
The purpose of this iterator is to enumerate all, or all specified, matches of a regular expression within a text range. The dereferenced value of an iterator of this class is a std::sub_match object.

Since

C++11

6.874.2 Constructor & Destructor Documentation

regex_token_iterator() [1/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator ()  [inline]
```

Default constructs a regex_token_iterator.

A default-constructed regex_token_iterator is a singular iterator that will compare equal to the one-past-the-end value for any iterator of the same type.

Referenced by operator++(), operator=(), and operator==().

regex_token_iterator() [2/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
            _Bi_iter __a,
            _Bi_iter __b,
            const regex_type & __re,
            int __submatch = 0,
            regex_constants::match_flag_type __m = regex_constants::match_default)  [inline]
```

Constructs a regex_token_iterator...

Parameters

__a	[IN] The start of the text to search.
__b	[IN] One-past-the-end of the text to search.
__re	[IN] The regular expression to search for.
__submatch	[IN] Which submatch to return. There are some special values for this parameter: • -1 each enumerated subexpression does NOT match the regular expression (aka field splitting) • 0 the entire string matching the subexpression is returned for each match within the text. • >0 enumerates only the indicated subexpression from a match within the text.
__m	[IN] Policy flags for match rules.

regex_token_iterator() [3/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
            _Bi_iter __a,
            _Bi_iter __b,
            const regex_type & __re,
            const std::vector< int > & __submatches,
            regex_constants::match_flag_type __m = regex_constants::match_default)  [inline]
```

Constructs a regex_token_iterator...

Parameters

__a	[IN] The start of the text to search.
__b	[IN] One-past-the-end of the text to search.
__re	[IN] The regular expression to search for.
__submatches	[IN] A list of subexpressions to return for each regular expression match within the text.
__m	[IN] Policy flags for match rules.

regex_token_iterator() [4/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
            _Bi_iter __a,
            _Bi_iter __b,
            const regex_type & __re,
            initializer_list< int > __submatches,
            regex_constants::match_flag_type __m = regex_constants::match_default)  [inline]
```

Constructs a regex_token_iterator...

Parameters

__a	[IN] The start of the text to search.
__b	[IN] One-past-the-end of the text to search.
__re	[IN] The regular expression to search for.
__submatches	[IN] A list of subexpressions to return for each regular expression match within the text.
__m	[IN] Policy flags for match rules.

regex_token_iterator() [5/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
template<std::size_t _Nm>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
            _Bi_iter __a,
            _Bi_iter __b,
            const regex_type & __re,
            const int(&) __submatches[_Nm],
            regex_constants::match_flag_type __m = regex_constants::match_default)  [inline]
```

Constructs a regex_token_iterator...

Parameters

__a	[IN] The start of the text to search.
__b	[IN] One-past-the-end of the text to search.
__re	[IN] The regular expression to search for.
__submatches	[IN] A list of subexpressions to return for each regular expression match within the text.
__m	[IN] Policy flags for match rules.

regex_token_iterator() [6/6]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
            const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs)  [inline]
```

Copy constructs a regex_token_iterator.

Parameters

__rhs	[IN] A regex_token_iterator to copy.

6.874.3 Member Function Documentation

operator*()

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type & std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator* ()
const  [inline]
```

Dereferences a regex_token_iterator.

operator++() [1/2]

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & std::regex_token_iterator< _Bi_iter, _↩
Ch_type, _Rx_traits >::operator++ ()
```

Increments a regex_token_iterator.
References regex_token_iterator().

operator++() [2/2]

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_token_iterator std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ (
            int )  [inline]
```

Postincrements a regex_token_iterator.

operator->()

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type * std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator-> ()
const  [inline]
```

Selects a regex_token_iterator member.

operator=()

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & std::regex_token_iterator< _Bi_iter, _↩
Ch_type, _Rx_traits >::operator= (
            const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs)
```

Assigns a regex_token_iterator to another.

Parameters

__rhs	[IN] A regex_token_iterator to copy.

References regex_token_iterator().

operator==()

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
bool std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator== (
            const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs) const
```

Compares a regex_token_iterator to another for equality.
References regex_token_iterator().

6.875.1 Detailed Description

template<typename _Ch_type>
class std::regex_traits< _Ch_type >

Describes aspects of a regular expression.
A regular expression traits class that satisfies the requirements of section [28.7].
The class regex is parameterized around a set of related types and functions used to complete the definition of its semantics. This class satisfies the requirements of such a traits class.

Since

C++11

6.875.2 Constructor & Destructor Documentation

regex_traits()

```
template<typename _Ch_type>
std::regex_traits< _Ch_type >::regex_traits ()  [inline]
```

Constructs a default traits object.
Referenced by value().

6.875.3 Member Function Documentation

getloc()

```
template<typename _Ch_type>
locale_type std::regex_traits< _Ch_type >::getloc () const  [inline]
```

Gets a copy of the current locale in use by the regex_traits object.

imbue()

```
template<typename _Ch_type>
locale_type std::regex_traits< _Ch_type >::imbue (
            locale_type __loc)  [inline]
```

Imbues the regex_traits object with a copy of a new locale.

Parameters

__loc	A locale.

Returns

a copy of the previous locale in use by the regex_traits object.

Note

Calling imbue with a different locale than the one currently in use invalidates all cached data held by ∗this.

isctype()

```
template<typename _Ch_type>
bool std::regex_traits< _Ch_type >::isctype (
             _Ch_type __c,
             char_class_type __f) const
```

Determines if c is a member of an identified class.

Parameters

_↩ _c	a character.
_↩ _f	a class type (as returned from lookup_classname).

Returns

true if the character __c is a member of the classification represented by __f, false otherwise.

Exceptions

std::bad_cast	if the current locale does not have a ctype facet.

References std::use_facet().

length()

```
template<typename _Ch_type>
std::size_t std::regex_traits< _Ch_type >::length (
             const char_type * __p)  [inline], [static]
```

Gives the length of a C-style string starting at __p.

Parameters

_↩ _p	a pointer to the start of a character sequence.

Returns

the number of characters between *__p and the first default-initialized value of type char_type. In other words, uses the C-string algorithm for determining the length of a sequence of characters.

lookup_classname()

```
template<typename _Ch_type>
template<typename _Fwd_iter>
regex_traits< _Ch_type >::char_class_type std::regex_traits< _Ch_type >::lookup_classname (
             _Fwd_iter __first,
             _Fwd_iter __last,
             bool __icase = false) const
```

Maps one or more characters to a named character classification.

Parameters

__first	beginning of the character sequence.
__last	one-past-the-end of the character sequence.
__icase	ignores the case of the classification name.

Returns

an unspecified value that represents the character classification named by the character sequence designated by the iterator range [__first, __last). If icase is true, the returned mask identifies the classification regardless of the case of the characters to be matched (for example, [[:lower:]] is the same as [[:alpha:]]), otherwise a case-dependent classification is returned. The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns a value that compares equal to 0.

At least the following names (or their wide-character equivalent) are supported.

- d
- w
- s
- alnum
- alpha
- blank
- cntrl
- digit
- graph
- lower

- print
- punct
- space
- upper
- xdigit

References std::use_facet().

lookup_collatename()

```
template<typename _Ch_type>
template<typename _Fwd_iter>
regex_traits< _Ch_type >::string_type std::regex_traits< _Ch_type >::lookup_collatename (
            _Fwd_iter __first,
            _Fwd_iter __last) const
```

Gets a collation element by name.

Parameters

__first	beginning of the collation element name.
__last	one-past-the-end of the collation element name.

Returns

a sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range [__first, __last). Returns an empty string if the character sequence is not a valid collating element.

References std::basic_string< _CharT, _Traits, _Alloc >::empty(), and std::use_facet().

transform()

```
template<typename _Ch_type>
template<typename _Fwd_iter>
string_type std::regex_traits< _Ch_type >::transform (
            _Fwd_iter __first,
            _Fwd_iter __last) const  [inline]
```

Gets a sort key for a character sequence.

Parameters

__first	beginning of the character sequence.
__last	one-past-the-end of the character sequence.

Returns a sort key for the character sequence designated by the iterator range [F1, F2) such that if the character sequence [G1, G2) sorts before the character sequence [H1, H2) then v.transform(G1, G2) < v.transform(H1, H2).
What this really does is provide a more efficient way to compare a string to multiple other strings in locales with fancy collation rules and equivalence classes.

Returns

a locale-specific sort key equivalent to the input range.

Exceptions

std::bad_cast	if the current locale does not have a collate facet.

transform_primary()

```
template<typename _Ch_type>
template<typename _Fwd_iter>
string_type std::regex_traits< _Ch_type >::transform_primary (
            _Fwd_iter __first,
            _Fwd_iter __last) const  [inline]
```

Gets a sort key for a character sequence, independent of case.

Parameters

__first	beginning of the character sequence.
__last	one-past-the-end of the character sequence.

Effects: if `typeid(use_facet<collate<_Ch_type>>(getloc())) == typeid(collate_byname<_Ch_type>)` and the form of the sort key returned by `collate_byname<_Ch_type>::transform(__first, __last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

Todo Implement this function correctly.

translate()

```
template<typename _Ch_type>
char_type std::regex_traits< _Ch_type >::translate (
            char_type __c) const  [inline]
```

Performs the identity translation.

Parameters

__c	A character to the locale-specific character set.

Returns

__c.

translate_nocase()

```
template<typename _Ch_type>
char_type std::regex_traits< _Ch_type >::translate_nocase (
            char_type __c) const  [inline]
```

Translates a character into a case-insensitive equivalent.

Parameters

_↩ _c	A character to the locale-specific character set.

Returns

the locale-specific lower-case equivalent of __c.

Exceptions

std::bad_cast	if the imbued locale does not support the ctype facet.

value()

```
template<typename _Ch_type>
int std::regex_traits< _Ch_type >::value (
             _Ch_type __ch,
             int __radix) const
```

Converts a digit to an int.

Parameters

__ch	a character representing a digit.
__radix	the radix if the numeric conversion (limited to 8, 10, or 16).

Returns

the value represented by the digit __ch in base radix if the character __ch is a valid digit in base radix; otherwise returns -1.

6.886.1 Detailed Description

template<typename _Iterator>
class std::reverse_iterator< _Iterator >

Bidirectional and random access iterators have corresponding reverse iterator adaptors that iterate through the data structure in the opposite direction. They have the same signatures as the corresponding iterators. The fundamental relation between a reverse iterator and its corresponding iterator `i` is established by the identity:

```
&*(reverse_iterator(i)) == &*(i - 1)
```

This mapping is dictated by the fact that while there is always a pointer past the end of an array, there might not be a valid pointer before the beginning of an array. [24.4.1]/1,2

Reverse iterators can be tricky and surprising at first. Their semantics make sense, however, and the trickiness is a side effect of the requirement that the iterators must be safe.

6.886.2 Constructor & Destructor Documentation

reverse_iterator() [1/4]

```
template<typename _Iterator>
std::reverse_iterator< _Iterator >::reverse_iterator ()  [inline], [constexpr], [noexcept]
```

The default constructor value-initializes member `current`. If it is a pointer, that means it is zero-initialized.

Referenced by std::reverse_iterator< iterator >::operator+(), and std::reverse_iterator< iterator >::operator-().

reverse_iterator() [2/4]

```
template<typename _Iterator>
std::reverse_iterator< _Iterator >::reverse_iterator (
            iterator_type __x)  [inline], [explicit], [constexpr], [noexcept]
```

This iterator will move in the opposite direction that `x` does.

reverse_iterator() [3/4]

```
template<typename _Iterator>
std::reverse_iterator< _Iterator >::reverse_iterator (
            const reverse_iterator< _Iterator > & __x)  [inline], [constexpr], [noexcept]
```

The copy constructor is normal.

reverse_iterator() [4/4]

```
template<typename _Iterator>
template<typename _Iter>
std::reverse_iterator< _Iterator >::reverse_iterator (
            const reverse_iterator< _Iter > & __x)  [inline], [constexpr], [noexcept]
```

A reverse_iterator across other types can be copied if the underlying iterator can be converted to the type of `current`.

6.886.3 Member Function Documentation

base()

```
template<typename _Iterator>
iterator_type std::reverse_iterator< _Iterator >::base () const  [inline], [nodiscard], [constexpr],
[noexcept]
```

Returns

`current`, the iterator used for underlying work.

Referenced by std::operator==().

operator*()

```
template<typename _Iterator>
reference std::reverse_iterator< _Iterator >::operator* () const  [inline], [nodiscard], [constexpr]
```

Returns

A reference to the value at `--current`

This requires that `--current` is dereferenceable.

Warning

This implementation requires that for an iterator of the underlying iterator type, `x`, a reference obtained by `*x` remains valid after `x` has been modified or destroyed. This is a bug: http://gcc.gnu.org/PR51823

operator+()

```
template<typename _Iterator>
reverse_iterator std::reverse_iterator< _Iterator >::operator+ (
            difference_type __n) const  [inline], [nodiscard], [constexpr]
```

Returns

A reverse_iterator that refers to `current` - *__n*

The underlying iterator must be a Random Access Iterator.

operator++() [1/2]

```
template<typename _Iterator>
reverse_iterator & std::reverse_iterator< _Iterator >::operator++ ()  [inline], [constexpr]
```

Returns

`*this`

Decrements the underlying iterator.

operator++() [2/2]

```
template<typename _Iterator>
reverse_iterator std::reverse_iterator< _Iterator >::operator++ (
            int )  [inline], [constexpr]
```

Returns

The original value of `*this`

Decrements the underlying iterator.

operator+=()

```
template<typename _Iterator>
reverse_iterator & std::reverse_iterator< _Iterator >::operator+= (
            difference_type __n)  [inline], [constexpr]
```

Returns

*this

Moves the underlying iterator backwards *__n* steps. The underlying iterator must be a Random Access Iterator.

operator-()

```
template<typename _Iterator>
reverse_iterator std::reverse_iterator< _Iterator >::operator- (
            difference_type __n) const  [inline], [nodiscard], [constexpr]
```

Returns

A reverse_iterator that refers to `current` - *__n*

The underlying iterator must be a Random Access Iterator.

operator--() [1/2]

```
template<typename _Iterator>
reverse_iterator & std::reverse_iterator< _Iterator >::operator-- ()  [inline], [constexpr]
```

Returns

`*this`

Increments the underlying iterator.

operator--() [2/2]

```
template<typename _Iterator>
reverse_iterator std::reverse_iterator< _Iterator >::operator-- (
            int )  [inline], [constexpr]
```

Returns

A reverse_iterator with the previous value of `*this`

Increments the underlying iterator.

operator-=()

```
template<typename _Iterator>
reverse_iterator & std::reverse_iterator< _Iterator >::operator-= (
            difference_type __n)  [inline], [constexpr]
```

Returns

∗this

Moves the underlying iterator forwards __*n* steps. The underlying iterator must be a Random Access Iterator.

operator->()

```
template<typename _Iterator>
pointer std::reverse_iterator< _Iterator >::operator-> () const  [inline], [nodiscard], [constexpr]
```

Returns

A pointer to the value at `--current`

This requires that `--current` is dereferenceable.

operator[]()

```
template<typename _Iterator>
reference std::reverse_iterator< _Iterator >::operator[] (
            difference_type __n) const  [inline], [nodiscard], [constexpr]
```

Returns

The value at `current` - __*n* - 1

The underlying iterator must be a Random Access Iterator.

6.887.1 Detailed Description

template<class _CharT, class _Alloc>
class __gnu_cxx::rope< **_CharT, _Alloc** >

This is an SGI extension.

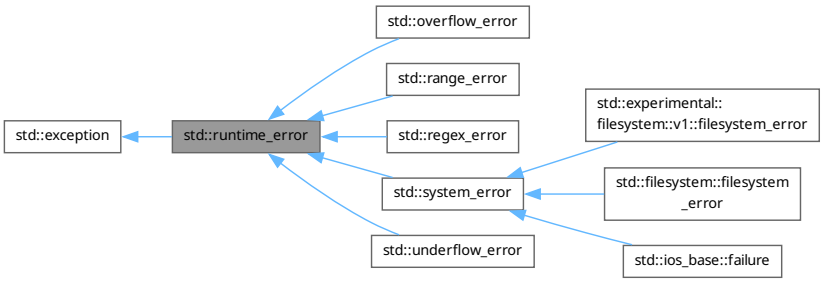
Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

The documentation for this class was generated from the following files:

- rope
- ropeimpl.h

6.888 std::runtime_error Class Reference

`#include <stdexcept_except.h>`
Inheritance diagram for std::runtime_error:



Public Member Functions

- **runtime_error** (const char *)
- **runtime_error** (const runtime_error &) noexcept

- runtime_error (const string &__arg)
- **runtime_error** (runtime_error &&) noexcept
- runtime_error & **operator=** (const runtime_error &) noexcept
- runtime_error & **operator=** (runtime_error &&) noexcept
- virtual const char * what () const noexcept

6.888.1 Detailed Description

One of two subclasses of exception.
Runtime errors represent problems outside the scope of a program; they cannot be easily predicted and can generally only be caught as the program executes.

6.888.2 Constructor & Destructor Documentation

runtime_error()

```
std::runtime_error::runtime_error (
            const string & __arg)  [explicit]
```

Takes a character string describing the error.
References runtime_error().
Referenced by runtime_error().

6.888.3 Member Function Documentation

what()

```
virtual const char * std::runtime_error::what () const  [virtual], [noexcept]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).
Reimplemented from std::exception.
Reimplemented in std::experimental::filesystem::v1::filesystem_error, std::filesystem::filesystem_error, and std::ios_base::failure.
References what().
Referenced by what().
The documentation for this class was generated from the following file:

- stdexcept_except.h

6.889 __gnu_pbds::sample_probe_fn Class Reference

```
#include <sample_probe_fn.hpp>
```

Public Types

- typedef std::size_t **size_type**

Public Member Functions

- sample_probe_fn ()
- sample_probe_fn (const sample_probe_fn &)
- void swap (sample_probe_fn &)

Protected Member Functions

- size_type operator() (key_const_reference r_key, size_type i) const

6.889.1 Detailed Description

A sample probe policy.

6.889.2 Constructor & Destructor Documentation

sample_probe_fn() [1/2]

```
__gnu_pbds::sample_probe_fn::sample_probe_fn ()
```

Default constructor.
Referenced by sample_probe_fn(), and swap().

sample_probe_fn() [2/2]

```
__gnu_pbds::sample_probe_fn::sample_probe_fn (
            const sample_probe_fn & )
```

Copy constructor.
References sample_probe_fn().

6.889.3 Member Function Documentation

operator()()

```
size_type __gnu_pbds::sample_probe_fn::operator() (
            key_const_reference r_key,
            size_type i) const  [inline], [protected]
```

Returns the i-th offset from the hash value of some key r_key.

swap()

```
void __gnu_pbds::sample_probe_fn::swap (
            sample_probe_fn & )  [inline]
```

Swaps content.
References sample_probe_fn().
The documentation for this class was generated from the following file:

- sample_probe_fn.hpp

6.890 __gnu_pbds::sample_range_hashing Class Reference

```
#include <sample_range_hashing.hpp>
```

Public Types

- typedef std::size_t size_type

Public Member Functions

- sample_range_hashing ()
- sample_range_hashing (const sample_range_hashing &other)
- void swap (sample_range_hashing &other)

Protected Member Functions

- void notify_resized (size_type)
- size_type operator() (size_type) const

6.890.1 Detailed Description

A sample range-hashing functor.

6.890.2 Member Typedef Documentation

size_type

```
typedef std::size_t __gnu_pbds::sample_range_hashing::size_type
```
Size type.

6.890.3 Constructor & Destructor Documentation

sample_range_hashing() [1/2]

```
__gnu_pbds::sample_range_hashing::sample_range_hashing ()
```
Default constructor.
Referenced by sample_range_hashing(), and swap().

sample_range_hashing() [2/2]

```
__gnu_pbds::sample_range_hashing::sample_range_hashing (
            const sample_range_hashing & other)
```
Copy constructor.
References sample_range_hashing().

6.890.4 Member Function Documentation

notify_resized()

```
void __gnu_pbds::sample_range_hashing::notify_resized (
            size_type )  [protected]
```
Notifies the policy object that the container's size has changed to argument's size.

operator()()

```
size_type __gnu_pbds::sample_range_hashing::operator() (
            size_type ) const  [inline], [protected]
```
Transforms the __hash value hash into a ranged-hash value.

swap()

```
void __gnu_pbds::sample_range_hashing::swap (
            sample_range_hashing & other)  [inline]
```
Swaps content.
References sample_range_hashing().
The documentation for this class was generated from the following file:

- sample_range_hashing.hpp

6.891 __gnu_pbds::sample_ranged_hash_fn Class Reference

```
#include <sample_ranged_hash_fn.hpp>
```

Public Types

- typedef std::size_t **size_type**

Public Member Functions

- sample_ranged_hash_fn ()
- sample_ranged_hash_fn (const sample_ranged_hash_fn &)
- void swap (sample_ranged_hash_fn &)

Protected Member Functions

- void notify_resized (size_type)
- size_type operator() (key_const_reference) const

6.891.1 Detailed Description

A sample ranged-hash functor.

6.891.2 Constructor & Destructor Documentation

sample_ranged_hash_fn() [1/2]

```
__gnu_pbds::sample_ranged_hash_fn::sample_ranged_hash_fn ()
```

Default constructor.
Referenced by sample_ranged_hash_fn(), and swap().

sample_ranged_hash_fn() [2/2]

```
__gnu_pbds::sample_ranged_hash_fn::sample_ranged_hash_fn (
            const sample_ranged_hash_fn & )
```

Copy constructor.
References sample_ranged_hash_fn().

6.891.3 Member Function Documentation

notify_resized()

```
void __gnu_pbds::sample_ranged_hash_fn::notify_resized (
            size_type )  [protected]
```

Notifies the policy object that the container's __size has changed to size.

operator()()

```
size_type __gnu_pbds::sample_ranged_hash_fn::operator() (
            key_const_reference ) const  [inline], [protected]
```

Transforms key_const_reference into a position within the table.

swap()

```
void __gnu_pbds::sample_ranged_hash_fn::swap (
            sample_ranged_hash_fn & )  [inline]
```

Swaps content.
References sample_ranged_hash_fn().
The documentation for this class was generated from the following file:

- sample_ranged_hash_fn.hpp

6.892 __gnu_pbds::sample_ranged_probe_fn Class Reference

```
#include <sample_ranged_probe_fn.hpp>
```

Public Types

- typedef std::size_t **size_type**

Public Member Functions

- **sample_ranged_probe_fn** (const sample_ranged_probe_fn &)
- void **swap** (sample_ranged_probe_fn &)

Protected Member Functions

- void **notify_resized** (size_type)
- size_type **operator()** (key_const_reference, std::size_t, size_type) const

6.892.1 Detailed Description

A sample ranged-probe functor.
The documentation for this class was generated from the following file:

- sample_ranged_probe_fn.hpp

6.893 __gnu_pbds::sample_resize_policy Class Reference

`#include <sample_resize_policy.hpp>`

Public Types

- typedef std::size_t size_type

Public Member Functions

- sample_resize_policy ()
- sample_range_hashing (const sample_resize_policy &other)
- void swap (sample_resize_policy &other)

Protected Member Functions

- size_type get_new_size (size_type size, size_type num_used_e) const
- bool is_resize_needed () const
- void notify_cleared ()

- void notify_insert_search_start ()
- void notify_inserted (size_type num_e)
- void notify_resized (size_type new_size)

6.893.1 Detailed Description

A sample resize policy.

6.893.2 Member Typedef Documentation

size_type

```
typedef std::size_t __gnu_pbds::sample_resize_policy::size_type
```
Size type.

6.893.3 Constructor & Destructor Documentation

sample_resize_policy()

```
__gnu_pbds::sample_resize_policy::sample_resize_policy ()
```
Default constructor.
Referenced by sample_range_hashing(), and swap().

6.893.4 Member Function Documentation

get_new_size()

```
size_type __gnu_pbds::sample_resize_policy::get_new_size (
            size_type size,
            size_type num_used_e) const  [protected]
```
Queries what the new size should be.

is_resize_needed()

```
bool __gnu_pbds::sample_resize_policy::is_resize_needed () const  [inline], [protected]
```
Queries whether a resize is needed.

notify_cleared()

```
void __gnu_pbds::sample_resize_policy::notify_cleared ()  [protected]
```
Notifies the table was cleared.

notify_erase_search_collision()

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_collision ()  [inline], [protected]
```
Notifies a search encountered a collision.

notify_erase_search_end()

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_end ()  [inline], [protected]
```
Notifies a search ended.

notify_erase_search_start()

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_start ()  [inline], [protected]
```
Notifies a search started.

notify_erased()

```
void __gnu_pbds::sample_resize_policy::notify_erased (
            size_type num_e)  [inline], [protected]
```
Notifies an element was erased.

notify_find_search_collision()

```
void __gnu_pbds::sample_resize_policy::notify_find_search_collision ()  [inline], [protected]
```
Notifies a search encountered a collision.

notify_find_search_end()

```
void __gnu_pbds::sample_resize_policy::notify_find_search_end ()  [inline], [protected]
```
Notifies a search ended.

notify_find_search_start()

```
void __gnu_pbds::sample_resize_policy::notify_find_search_start ()  [inline], [protected]
```
Notifies a search started.

notify_insert_search_collision()

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_collision ()  [inline], [protected]
```
Notifies a search encountered a collision.

notify_insert_search_end()

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_end ()  [inline], [protected]
```
Notifies a search ended.

notify_insert_search_start()

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_start ()  [inline], [protected]
```
Notifies a search started.

notify_inserted()

```
void __gnu_pbds::sample_resize_policy::notify_inserted (
            size_type num_e)  [inline], [protected]
```
Notifies an element was inserted.

notify_resized()

```
void __gnu_pbds::sample_resize_policy::notify_resized (
            size_type new_size)  [protected]
```
Notifies the table was resized to new_size.

sample_range_hashing()

```
__gnu_pbds::sample_resize_policy::sample_range_hashing (
            const sample_resize_policy & other)
```
Copy constructor.
References sample_resize_policy().

swap()

```
void __gnu_pbds::sample_resize_policy::swap (
            sample_resize_policy & other)  [inline]
```
Swaps content.
References sample_resize_policy().
The documentation for this class was generated from the following file:

- sample_resize_policy.hpp

6.894 __gnu_pbds::sample_resize_trigger Class Reference

`#include <sample_resize_trigger.hpp>`

Public Types

- typedef std::size_t size_type

Public Member Functions

- sample_resize_trigger ()
- sample_range_hashing (const sample_resize_trigger &)
- void swap (sample_resize_trigger &)

Protected Member Functions

- void notify_resized (size_type new_size)

6.894.1 Detailed Description

A sample resize trigger policy.

6.894.2 Member Typedef Documentation

size_type

`typedef std::size_t __gnu_pbds::sample_resize_trigger::size_type`
Size type.

6.894.3 Constructor & Destructor Documentation

sample_resize_trigger()

`__gnu_pbds::sample_resize_trigger::sample_resize_trigger ()`
Default constructor.
Referenced by sample_range_hashing(), and swap().

6.894.4 Member Function Documentation

is_grow_needed()

```
bool __gnu_pbds::sample_resize_trigger::is_grow_needed (
            size_type size,
            size_type num_entries) const  [inline], [protected]
```

Queries whether a grow is needed.

is_resize_needed()

```
bool __gnu_pbds::sample_resize_trigger::is_resize_needed () const  [inline], [protected]
```

Queries whether a resize is needed.

notify_cleared()

```
void __gnu_pbds::sample_resize_trigger::notify_cleared ()  [protected]
```

Notifies the table was cleared.

notify_erase_search_collision()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_collision ()  [inline], [protected]
```

Notifies a search encountered a collision.

notify_erase_search_end()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_end ()  [inline], [protected]
```

Notifies a search ended.

notify_erase_search_start()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_start ()  [inline], [protected]
```

Notifies a search started.

notify_erased()

```
void __gnu_pbds::sample_resize_trigger::notify_erased (
            size_type num_entries)  [inline], [protected]
```

Notifies an element was erased.

notify_externally_resized()

```
void __gnu_pbds::sample_resize_trigger::notify_externally_resized (
            size_type new_size)  [protected]
```

Notifies the table was resized externally.

notify_find_search_collision()

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_collision ()  [inline], [protected]
```

Notifies a search encountered a collision.

notify_find_search_end()

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_end ()  [inline], [protected]
```

Notifies a search ended.

notify_find_search_start()

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_start ()  [inline], [protected]
```
Notifies a search started.

notify_insert_search_collision()

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_collision ()  [inline], [protected]
```
Notifies a search encountered a collision.

notify_insert_search_end()

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_end ()  [inline], [protected]
```
Notifies a search ended.

notify_insert_search_start()

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_start ()  [inline], [protected]
```
Notifies a search started.

notify_inserted()

```
void __gnu_pbds::sample_resize_trigger::notify_inserted (
            size_type num_entries)  [inline], [protected]
```
Notifies an element was inserted. the total number of entries in the table is num_entries.

notify_resized()

```
void __gnu_pbds::sample_resize_trigger::notify_resized (
            size_type new_size)  [protected]
```
Notifies the table was resized as a result of this object's signifying that a resize is needed.

sample_range_hashing()

```
__gnu_pbds::sample_resize_trigger::sample_range_hashing (
            const sample_resize_trigger & )
```
Copy constructor.
References sample_resize_trigger().

swap()

```
void __gnu_pbds::sample_resize_trigger::swap (
            sample_resize_trigger & )  [inline]
```
Swaps content.
References sample_resize_trigger().
The documentation for this class was generated from the following file:

- sample_resize_trigger.hpp

6.895 __gnu_pbds::sample_size_policy Class Reference

```
#include <sample_size_policy.hpp>
```

Public Types

- typedef std::size_t size_type

Public Member Functions

- sample_size_policy ()
- sample_range_hashing (const sample_size_policy &)
- void swap (sample_size_policy &other)

Protected Member Functions

- size_type get_nearest_larger_size (size_type size) const
- size_type get_nearest_smaller_size (size_type size) const

6.895.1 Detailed Description

A sample size policy.

6.895.2 Member Typedef Documentation

size_type

```
typedef std::size_t __gnu_pbds::sample_size_policy::size_type
```

Size type.

6.895.3 Constructor & Destructor Documentation

sample_size_policy()

```
__gnu_pbds::sample_size_policy::sample_size_policy ()
```

Default constructor.
Referenced by sample_range_hashing(), and swap().

6.895.4 Member Function Documentation

get_nearest_larger_size()

```
size_type __gnu_pbds::sample_size_policy::get_nearest_larger_size (
            size_type size) const  [inline], [protected]
```

Given a __size size, returns a __size that is larger.

get_nearest_smaller_size()

```
size_type __gnu_pbds::sample_size_policy::get_nearest_smaller_size (
            size_type size) const  [inline], [protected]
```

Given a __size size, returns a __size that is smaller.

sample_range_hashing()

```
__gnu_pbds::sample_size_policy::sample_range_hashing (
            const sample_size_policy & )
```

Copy constructor.
References sample_size_policy().

swap()

```
void __gnu_pbds::sample_size_policy::swap (
            sample_size_policy & other)  [inline]
```

Swaps content.
References sample_size_policy().

The documentation for this class was generated from the following file:

- sample_size_policy.hpp

6.896 __gnu_pbds::sample_tree_node_update< Const_Node_Iter, Node_Iter, Cmp_Fn, _Alloc > Class Template Reference

`#include <sample_tree_node_update.hpp>`

6.896.1 Detailed Description

template<typename Const_Node_Iter, typename Node_Iter, typename Cmp_Fn, typename _Alloc>
class __gnu_pbds::sample_tree_node_update< Const_Node_Iter, Node_Iter, Cmp_Fn, _Alloc >

A sample node updator.
The documentation for this class was generated from the following file:

- sample_tree_node_update.hpp

6.897 __gnu_pbds::sample_trie_access_traits Struct Reference

`#include <sample_trie_access_traits.hpp>`

Public Types

- enum { **max_size** }
- typedef std::string::const_iterator **const_iterator**
- typedef char e_type
- typedef rebind_traits< _Alloc, key_type >::const_reference **key_const_reference**
- typedef std::string **key_type**
- typedef std::size_t **size_type**

Static Public Member Functions

- static const_iterator begin (key_const_reference)
- static size_type e_pos (e_type)
- static const_iterator end (key_const_reference)

6.897.1 Detailed Description

A sample trie element access traits.

6.897.2 Member Typedef Documentation

e_type

```
typedef char __gnu_pbds::sample_trie_access_traits::e_type
```
Element type.

6.897.3 Member Function Documentation

begin()

```
const_iterator __gnu_pbds::sample_trie_access_traits::begin (
            key_const_reference )  [inline], [static]
```
Returns a const_iterator to the first element of r_key.

e_pos()

```
size_type __gnu_pbds::sample_trie_access_traits::e_pos (
            e_type )  [inline], [static]
```

Maps an element to a position.

end()

```
const_iterator __gnu_pbds::sample_trie_access_traits::end (
            key_const_reference )  [inline], [static]
```

Returns a const_iterator to the after-last element of r_key.
The documentation for this struct was generated from the following file:

- sample_trie_access_traits.hpp

6.898 __gnu_pbds::sample_trie_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc > Class Template Reference

```
#include <sample_trie_node_update.hpp>
```

Public Types

- typedef std::size_t **metadata_type**

Protected Member Functions

- sample_trie_node_update ()
- void operator() (node_iterator, node_const_iterator) const

6.898.1 Detailed Description

template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::sample_trie_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >

A sample node updator.

6.898.2 Constructor & Destructor Documentation

sample_trie_node_update()

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
__gnu_pbds::sample_trie_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::sample_trie_node_↩
update ()  [protected]
```

Default constructor.

6.898.3 Member Function Documentation

operator()()

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
void __gnu_pbds::sample_trie_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::operator() (
            node_iterator ,
            node_const_iterator ) const  [inline], [protected]
```

Updates the rank of a node through a node_iterator node_it; end_nd_it is the end node iterator.
The documentation for this class was generated from the following file:

- sample_trie_node_update.hpp

6.899 __gnu_pbds::sample_update_policy Struct Reference

`#include <sample_update_policy.hpp>`

Public Member Functions

- sample_update_policy ()
- sample_update_policy (const sample_update_policy &)
- void swap (sample_update_policy &other)

Protected Types

- typedef some_metadata_type metadata_type

Protected Member Functions

- metadata_type operator() () const
- bool operator() (metadata_reference) const

6.899.1 Detailed Description

A sample list-update policy.

6.899.2 Member Typedef Documentation

metadata_type

```
typedef some_metadata_type __gnu_pbds::sample_update_policy::metadata_type  [protected]
```

Metadata on which this functor operates.

6.899.3 Constructor & Destructor Documentation

sample_update_policy() [1/2]

```
__gnu_pbds::sample_update_policy::sample_update_policy ()
```

Default constructor.
Referenced by sample_update_policy(), and swap().

sample_update_policy() [2/2]

```
__gnu_pbds::sample_update_policy::sample_update_policy (
            const sample_update_policy & )
```

Copy constructor.
References sample_update_policy().

6.899.4 Member Function Documentation

operator()() [1/2]

```
metadata_type __gnu_pbds::sample_update_policy::operator() () const  [protected]
```

Creates a metadata object.

operator()() [2/2]

```
bool __gnu_pbds::sample_update_policy::operator() (
            metadata_reference ) const  [protected]
```

Decides whether a metadata object should be moved to the front of the list. A list-update based containers object will call this method to decide whether to move a node to the front of the list. The method should return true if the node should be moved to the front of the list.

swap()

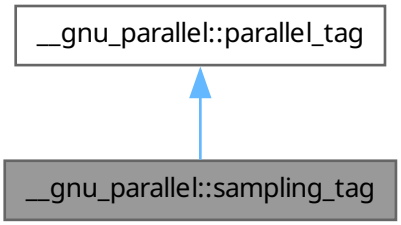
```
void __gnu_pbds::sample_update_policy::swap (
            sample_update_policy & other)  [inline]
```

Swaps content.
References sample_update_policy().
The documentation for this struct was generated from the following file:

- sample_update_policy.hpp

6.900 __gnu_parallel::sampling_tag Struct Reference

`#include <tags.h>`
Inheritance diagram for __gnu_parallel::sampling_tag:



Public Member Functions

- **sampling_tag** (_ThreadIndex __num_threads)
- _ThreadIndex __get_num_threads ()
- void set_num_threads (_ThreadIndex __num_threads)

6.900.1 Detailed Description

Forces parallel merging with exact splitting, at compile time.

6.900.2 Member Function Documentation

__get_num_threads()

```
_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads ()  [inline], [inherited]
```

Find out desired number of threads.

Returns

Desired number of threads.

Referenced by __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), and __gnu_parallel::__parallel_sort(

set_num_threads()

```
void __gnu_parallel::parallel_tag::set_num_threads (
            _ThreadIndex __num_threads)  [inline], [inherited]
```

Set the desired number of threads.

Parameters

__num_threads	Desired number of threads.

The documentation for this struct was generated from the following file:

- tags.h

6.905 __gnu_pbds::detail::select_value_type< Key, Mapped > Struct Template Reference

`#include <types_traits.hpp>`

Public Types

- typedef std::pair< const Key, Mapped > **type**

6.905.1 Detailed Description

template<typename Key, typename Mapped>
struct __gnu_pbds::detail::select_value_type< Key, Mapped >

Choose value_type to be a key/value pair or just a key.
The documentation for this struct was generated from the following file:

- types_traits.hpp

6.906 __gnu_pbds::detail::select_value_type< Key, null_type > Struct Template Reference

`#include <types_traits.hpp>`

Public Types

- typedef Key **type**

6.906.1 Detailed Description

template<typename Key>
struct __gnu_pbds::detail::select_value_type< Key, null_type >

Specialization for sets where the key is the value_type.
The documentation for this struct was generated from the following file:

- types_traits.hpp

6.907 std::basic_istream< _CharT, _Traits >::sentry Class Reference

`#include <istream>`

Public Types

- typedef __istream_type::__ctype_type **__ctype_type**
- typedef _Traits::int_type **__int_type**
- typedef basic_istream< _CharT, _Traits > **__istream_type**
- typedef basic_streambuf< _CharT, _Traits > **__streambuf_type**
- typedef _Traits traits_type

Public Member Functions

- sentry (basic_istream< _CharT, _Traits > &__is, bool __noskipws=false)
- operator bool () const

6.907.1 Detailed Description

template<typename _CharT, typename _Traits>
class std::basic_istream< _CharT, _Traits >::sentry

Performs setup work for input streams.
Objects of this class are created before all of the standard extractors are run. It is responsible for *exception-safe prefix and suffix operations,* although only prefix actions are currently required by the standard.

6.907.2 Member Typedef Documentation

traits_type

```
template<typename _CharT, typename _Traits>
typedef _Traits std::basic_istream< _CharT, _Traits >::sentry::traits_type
```

Easy access to dependent types.

6.907.3 Constructor & Destructor Documentation

sentry()

```
template<typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits >::sentry::sentry (
            basic_istream< _CharT, _Traits > & __is,
            bool __noskipws = false)  [explicit]
```

The constructor performs all the work.

Parameters

__is	The input stream to guard.
__noskipws	Whether to consume whitespace or not.

If the stream state is good (*__is.good()* is true), then the following actions are performed, otherwise the sentry state is false (*not okay*) and failbit is set in the stream state.
The sentry's preparatory actions are:

1. if the stream is tied to an output stream, `is.tie()->flush()` is called to synchronize the output sequence
2. if *__noskipws* is false, and `ios_base::skipws` is set in `is.flags()`, the sentry extracts and discards whitespace characters from the stream. The currently imbued locale is used to determine whether each character is whitespace.

If the stream state is still good, then the sentry state becomes true (*okay*).
References std::basic_istream< _CharT, _Traits >::basic_istream(), std::ios_base::badbit, std::basic_ios< _CharT, _Traits >::good(), and std::ios_base::goodbit.

6.907.4 Member Function Documentation

operator bool()

```
template<typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits >::sentry::operator bool () const  [inline], [explicit]
```

Quick status checking.

Returns

The sentry state.

For ease of use, sentries may be converted to booleans. The return value is that of the sentry state (true == okay).
The documentation for this class was generated from the following files:

- istream
- istream.tcc

6.908 std::basic_ostream< _CharT, _Traits >::sentry Class Reference

`#include <ostream.h>`

Public Member Functions

- sentry (basic_ostream< _CharT, _Traits > &__os)
- ~sentry ()
- operator bool () const

6.908.1 Detailed Description

template<typename _CharT, typename _Traits>
class std::basic_ostream< _CharT, _Traits >::sentry

Performs setup work for output streams.
Objects of this class are created before all of the standard inserters are run. It is responsible for *exception-safe prefix and suffix operations*.

6.908.2 Constructor & Destructor Documentation

sentry()

```
template<typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits >::sentry::sentry (
            basic_ostream< _CharT, _Traits > & __os)  [explicit]
```

The constructor performs preparatory work.

Parameters

__os	The output stream to guard.

If the stream state is good (*__os.good()* is true), then if the stream is tied to another output stream, `is.tie()->flush()` is called to synchronize the output sequences.
If the stream state is still good, then the sentry state becomes true (*okay*).
References std::basic_ostream< _CharT, _Traits >::basic_ostream(), std::basic_ios< _CharT, _Traits >::bad(), std::ios_base::failbit, std::basic_ios< _CharT, _Traits >::good(), std::basic_ios< _CharT, _Traits >::setstate(), and std::basic_ios< _CharT, _Traits >::tie().

~sentry()

```
template<typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits >::sentry::~sentry ()  [inline]
```

Possibly flushes the stream.
If `ios_base::unitbuf` is set in `os.flags()`, and `std::uncaught_exception()` is true, the sentry destructor flushes the output stream.
References std::ios_base::badbit, std::uncaught_exception(), and std::ios_base::unitbuf.

6.908.3 Member Function Documentation

operator bool()

```
template<typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits >::sentry::operator bool () const  [inline], [explicit]
```

Quick status checking.

Returns

The sentry state.

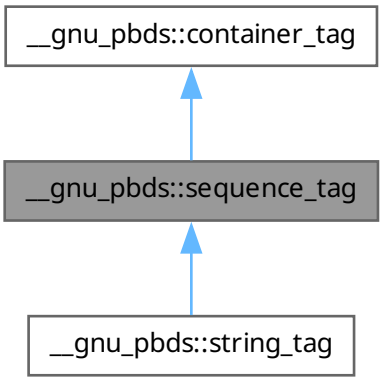
For ease of use, sentries may be converted to booleans. The return value is that of the sentry state (true == okay).
The documentation for this class was generated from the following files:

- ostream.h
- ostream.tcc

6.909 __gnu_pbds::sequence_tag Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for __gnu_pbds::sequence_tag:



6.909.1 Detailed Description

Basic sequence.
The documentation for this struct was generated from the following file:

- tag_and_trait.hpp

6.910 __gnu_parallel::sequential_tag Struct Reference

```
#include <tags.h>
```

6.910.1 Detailed Description

Forces sequential execution at compile time.
The documentation for this struct was generated from the following file:

6.912.1 Detailed Description

template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
class std::set< _Key, _Compare, _Alloc >

A standard container made up of unique keys, which can be retrieved in logarithmic time.

Since

C++98

Template Parameters

_Key	Type of key objects.
_Compare	Comparison function object type, defaults to less<_Key>.
_Alloc	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a container, a reversible container, and an associative container (using unique keys).
Sets support bidirectional iterators.
The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (*_unique versus *_equal, same as the standard).

6.912.2 Member Typedef Documentation

allocator_type

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
typedef _Alloc std::set< _Key, _Compare, _Alloc >::allocator_type
```

Public typedefs.

const_iterator

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
typedef _Rep_type::const_iterator std::set< _Key, _Compare, _Alloc >::const_iterator
```

Iterator-related typedefs.

const_pointer

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
typedef _Alloc_traits::const_pointer std::set< _Key, _Compare, _Alloc >::const_pointer

```
Iterator-related typedefs.

value_compare

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
typedef _Compare std::set< _Key, _Compare, _Alloc >::value_compare
```
Public typedefs.

value_type

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
typedef _Key std::set< _Key, _Compare, _Alloc >::value_type
```
Public typedefs.

6.912.3 Constructor & Destructor Documentation

set() [1/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::set< _Key, _Compare, _Alloc >::set ()  [default]
```

Default constructor creates no elements.

set() [2/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::set< _Key, _Compare, _Alloc >::set (
            const _Compare & __comp,
            const allocator_type & __a = allocator_type())  [inline], [explicit]
```

Creates a set with no elements.

Parameters

__comp	Comparator to use.
__a	An allocator object.

set() [3/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
template<typename _InputIterator>
std::set< _Key, _Compare, _Alloc >::set (
            _InputIterator __first,
            _InputIterator __last)  [inline]
```

Builds a set from a range.

Parameters

__first	An input iterator.
__last	An input iterator.

Create a set consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

set() [4/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
template<typename _InputIterator>
std::set< _Key, _Compare, _Alloc >::set (
            _InputIterator __first,
            _InputIterator __last,
            const _Compare & __comp,
            const allocator_type & __a = allocator_type())  [inline]
```

Builds a set from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__comp	A comparison functor.
__a	An allocator object.

Create a set consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

set() [5/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::set< _Key, _Compare, _Alloc >::set (
            const set< _Key, _Compare, _Alloc > & )  [default]
```

Set copy constructor.
Whether the allocator is copied depends on the allocator traits.

set() [6/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::set< _Key, _Compare, _Alloc >::set (
            set< _Key, _Compare, _Alloc > && )  [default]
```

Set move constructor
The newly-created set contains the exact contents of the moved instance. The moved instance is a valid, but unspecified, set.

set() [7/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::set< _Key, _Compare, _Alloc >::set (
            initializer_list< value_type > __l,
            const _Compare & __comp = _Compare(),
            const allocator_type & __a = allocator_type())  [inline]
```

Builds a set from an initializer_list.

Parameters

__l	An initializer_list.
__comp	A comparison functor.
__a	An allocator object.

Create a set consisting of copies of the elements in the list. This is linear in N if the list is already sorted, and NlogN

otherwise (where N is *__l.size()*).

set() [8/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::set< _Key, _Compare, _Alloc >::set (
            const allocator_type & __a)  [inline], [explicit]
```

Allocator-extended default constructor.

set() [9/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::set< _Key, _Compare, _Alloc >::set (
            const set< _Key, _Compare, _Alloc > & __x,
            const __type_identity_t< allocator_type > & __a)  [inline]
```

Allocator-extended copy constructor.

set() [10/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::set< _Key, _Compare, _Alloc >::set (
            set< _Key, _Compare, _Alloc > && __x,
            const __type_identity_t< allocator_type > & __a)  [inline], [noexcept]
```

Allocator-extended move constructor.

set() [11/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::set< _Key, _Compare, _Alloc >::set (
            initializer_list< value_type > __l,
            const allocator_type & __a)  [inline]
```

Allocator-extended initializer-list constructor.

set() [12/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
template<typename _InputIterator>
std::set< _Key, _Compare, _Alloc >::set (
            _InputIterator __first,
            _InputIterator __last,
            const allocator_type & __a)  [inline]
```

Allocator-extended range constructor.

~set()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::set< _Key, _Compare, _Alloc >::~set ()  [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

6.912.4 Member Function Documentation

begin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::begin () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

cbegin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::cbegin () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

cend()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::cend () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

clear()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
void std::set< _Key, _Compare, _Alloc >::clear ()  [inline], [noexcept]
```

Erases all elements in a set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

contains() [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
template<typename _Kt>
auto std::set< _Key, _Compare, _Alloc >::contains (
            const _Kt & __x) const -> decltype(_M_t._M_find_tr(__x), void(), true)  [inline]
```

Finds whether an element with the given key exists.

Parameters

_↩ _*x*	Key of elements to be located.

Returns

True if there is an element with the specified key.

contains() [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
bool std::set< _Key, _Compare, _Alloc >::contains (
            const key_type & __x) const  [inline]
```

Finds whether an element with the given key exists.

Parameters

_↩ _x	Key of elements to be located.

Returns

True if there is an element with the specified key.

count()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
size_type std::set< _Key, _Compare, _Alloc >::count (
            const key_type & __x) const  [inline]
```

Finds the number of elements.

Parameters

_↩ _x	Element to located.

Returns

Number of elements with specified key.

This function only makes sense for multisets; for set the result will either be 0 (not present) or 1 (present).

crbegin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
reverse_iterator std::set< _Key, _Compare, _Alloc >::crbegin () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

crend()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
reverse_iterator std::set< _Key, _Compare, _Alloc >::crend () const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

emplace()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
template<typename... _Args>
std::pair< iterator, bool > std::set< _Key, _Compare, _Alloc >::emplace (
            _Args &&... __args) [inline]
```

Attempts to build and insert an element into the set.

Parameters

__args	Arguments used to generate an element.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.
Insertion requires logarithmic time.

emplace_hint()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
template<typename... _Args>
iterator std::set< _Key, _Compare, _Alloc >::emplace_hint (
            const_iterator __pos,
            _Args &&... __args) [inline]
```

Attempts to insert an element into the set.

Parameters

__pos	An iterator that serves as a hint as to where the element should be inserted.
__args	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the element with key equivalent to the one generated from *__args* (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument emplace() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↩html#containers.associative.insert_hints
Insertion requires logarithmic time (if the hint is not taken).

empty()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
bool std::set< _Key, _Compare, _Alloc >::empty () const [inline], [nodiscard], [noexcept]
```

Returns true if the set is empty.

end()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::end () const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

equal_range() [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::pair< iterator, iterator > std::set< _Key, _Compare, _Alloc >::equal_range (
            const key_type & __x)  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).
This function probably only makes sense for multisets.

equal_range() [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::pair< const_iterator, const_iterator > std::set< _Key, _Compare, _Alloc >::equal_range (
            const key_type & __x) const  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).
This function probably only makes sense for multisets.

erase() [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
size_type std::set< _Key, _Compare, _Alloc >::erase (
            const key_type & __x)  [inline]
```

Erases elements according to the provided key.

Parameters

_↩ _x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last)  [inline]
```

Erases a [__first,__last) range of elements from a set.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::erase (
            const_iterator __position)  [inline]
```

Erases an element from a set.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

find() [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::find (
            const key_type & __x)  [inline]
```

Tries to locate an element in a set.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
const_iterator std::set< _Key, _Compare, _Alloc >::find (
            const key_type & __x) const  [inline]
```

Tries to locate an element in a set.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

get_allocator()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
allocator_type std::set< _Key, _Compare, _Alloc >::get_allocator () const  [inline], [noexcept]
```

Returns the allocator object with which the set was constructed.

insert() [1/5]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
template<typename _InputIterator>
void std::set< _Key, _Compare, _Alloc >::insert (
            _InputIterator __first,
            _InputIterator __last)  [inline]
```

A template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/5]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
std::pair< iterator, bool > std::set< _Key, _Compare, _Alloc >::insert (
            const value_type & __x)  [inline]
```

Attempts to insert an element into the set.

Parameters

_↩ *_x*	Element to be inserted.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.
Insertion requires logarithmic time.
Referenced by std::set< _Key, _Cmp, polymorphic_allocator< _Key > >::insert().

insert() [3/5]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::insert (
            const_iterator __position,
            const value_type & __x)  [inline]
```

Attempts to insert an element into the set.

Parameters

__position	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the element with key of *__x* (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
If a heterogeneous key __k matches a range of elements, an iterator to the first is returned.
Insertion requires logarithmic time (if the hint is not taken).

insert() [4/5]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set< _Key, _Compare, _Alloc >::insert (
            const_iterator __position,
            value_type && __x)  [inline]
```

Attempts to insert an element into the set.

Parameters

__position	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the element with key of *__x* (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
If a heterogeneous key __k matches a range of elements, an iterator to the first is returned.
Insertion requires logarithmic time (if the hint is not taken).

insert() [5/5]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
void std::set< _Key, _Compare, _Alloc >::insert (
            initializer_list< value_type > __l)  [inline]
```

Attempts to insert a list of elements into the set.

Parameters

↩ _↩ ↩ _↩ *l*	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.

key_comp()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
key_compare std::set< _Key, _Compare, _Alloc >::key_comp () const  [inline]
```

Returns the comparison object with which the set was constructed.

lower_bound() [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::lower_bound (
            const key_type & __x)  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ *_x*	Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

lower_bound() [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
const_iterator std::set< _Key, _Compare, _Alloc >::lower_bound (
            const key_type & __x) const  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ *_x*	Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

max_size()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
size_type std::set< _Key, _Compare, _Alloc >::max_size () const  [inline], [noexcept]
```

Returns the maximum size of the set.

operator=() [1/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
set & std::set< _Key, _Compare, _Alloc >::operator= (
            const set< _Key, _Compare, _Alloc > & )  [default]
```

Set assignment operator.
Whether the allocator is copied depends on the allocator traits.

operator=() [2/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
set & std::set< _Key, _Compare, _Alloc >::operator= (
            initializer_list< value_type > __l)  [inline]
```

Set list assignment operator.

Parameters

↩ _↩ ↩ _↩ *l*	An initializer_list.

This function fills a set with copies of the elements in the initializer list *__l*.
Note that the assignment completely changes the set and that the resulting set's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
set & std::set< _Key, _Compare, _Alloc >::operator= (
            set< _Key, _Compare, _Alloc > && )  [default]
```

Move assignment operator.

rbegin()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
```

```
reverse_iterator std::set< _Key, _Compare, _Alloc >::rbegin () const  [inline], [noexcept]
```
Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

rend()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
reverse_iterator std::set< _Key, _Compare, _Alloc >::rend () const  [inline], [noexcept]
```
Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

size()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
size_type std::set< _Key, _Compare, _Alloc >::size () const  [inline], [noexcept]
```
Returns the size of the set.

swap()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
void std::set< _Key, _Compare, _Alloc >::swap (
            set< _Key, _Compare, _Alloc > & __x)  [inline], [noexcept]
```
Swaps data with another set.

Parameters

_↩ _x	A set of the same element and allocator types.

This exchanges the elements between two sets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.
Whether the allocators are swapped depends on the allocator traits.
Referenced by std::swap().

upper_bound() [1/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::upper_bound (
            const key_type & __x)  [inline]
```
Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to the first element greater than key, or end().

upper_bound() [2/2]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
const_iterator std::set< _Key, _Compare, _Alloc >::upper_bound (
            const key_type & __x) const  [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to the first element greater than key, or end().

value_comp()

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↩
_Key>>
value_compare std::set< _Key, _Compare, _Alloc >::value_comp () const  [inline]
```

Returns the comparison object with which the set was constructed.

6.917.1 Detailed Description

template<typename _Tp>
class std::shared_ptr< _Tp >

A smart pointer with reference-counted copy semantics.

Since

C++11

A `shared_ptr` object is either empty or *owns* a pointer passed to the constructor. Copies of a `shared_ptr` share ownership of the same pointer. When the last `shared_ptr` that owns the pointer is destroyed or reset, the owned pointer is freed (either by `delete` or by invoking a custom deleter that was passed to the constructor).
A `shared_ptr` also stores another pointer, which is usually (but not always) the same pointer as it owns. The stored pointer can be retrieved by calling the `get()` member function.
The equality and relational operators for `shared_ptr` only compare the stored pointer returned by `get()`, not the owned pointer. To test whether two `shared_ptr` objects share ownership of the same pointer see `std::shared_ptr::owner_before` and `std::owner_less`.

6.917.2 Member Typedef Documentation

element_type

```
template<typename _Tp>
using std::shared_ptr< _Tp >::element_type
```

The type pointed to by the stored pointer, remove_extent_t<_Tp>.

6.917.3 Constructor & Destructor Documentation

shared_ptr() [1/14]

```
template<typename _Tp>
std::shared_ptr< _Tp >::shared_ptr ()  [inline], [constexpr], [noexcept]
```

Construct an empty shared_ptr.

Postcondition

use_count()==0 && get()==0

shared_ptr() [2/14]

```
template<typename _Tp>
std::shared_ptr< _Tp >::shared_ptr (
            const shared_ptr< _Tp > & )  [default], [noexcept]
```

Copy constructor.

shared_ptr() [3/14]

```
template<typename _Tp>
template<typename _Yp, typename = _Constructible<_Yp*>>
std::shared_ptr< _Tp >::shared_ptr (
            _Yp * __p)  [inline], [explicit]
```

Construct a shared_ptr that owns the pointer *__p*.

Parameters

_↩ _p	A pointer that is convertible to element_type*.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc,in	which case `delete` *__p* is called.

shared_ptr() [4/14]

```
template<typename _Tp>
template<typename _Yp, typename _Deleter, typename = _Constructible<_Yp*, _Deleter>>
std::shared_ptr< _Tp >::shared_ptr (
```

```
            _Yp * __p,
            _Deleter __d)  [inline]
```

Construct a shared_ptr that owns the pointer __p and the deleter __d.

Parameters

_↩ _p	A pointer.
_↩ _d	A deleter.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc,in	which case *__d(__p)* is called.

Requirements: _Deleter's copy constructor and destructor must not throw
__shared_ptr will release __p by calling __d(__p)

shared_ptr() [5/14]

```
template<typename _Tp>
template<typename _Deleter>
std::shared_ptr< _Tp >::shared_ptr (
            nullptr_t __p,
            _Deleter __d)  [inline]
```

Construct a shared_ptr that owns a null pointer and the deleter __d.

Parameters

_↩ _p	A null pointer constant.
_↩ _d	A deleter.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc,in	which case *__d(__p)* is called.

Requirements: _Deleter's copy constructor and destructor must not throw
The last owner will call __d(__p)

shared_ptr() [6/14]

```
template<typename _Tp>
template<typename _Yp, typename _Deleter, typename _Alloc, typename = _Constructible<_Yp*, _↩
Deleter, _Alloc>>
std::shared_ptr< _Tp >::shared_ptr (
            _Yp * __p,
            _Deleter __d,
            _Alloc __a)  [inline]
```

Construct a shared_ptr that owns the pointer *__p* and the deleter *__d*.

Parameters

_↩ _*p*	A pointer.
_↩ _*d*	A deleter.
_↩ _*a*	An allocator.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc,in	which case *__d(__p)* is called.

Requirements: _Deleter's copy constructor and destructor must not throw _Alloc's copy constructor and destructor must not throw.
__shared_ptr will release __p by calling __d(__p)

shared_ptr() [7/14]

```
template<typename _Tp>
template<typename _Deleter, typename _Alloc>
std::shared_ptr< _Tp >::shared_ptr (
            nullptr_t __p,
            _Deleter __d,
            _Alloc __a)  [inline]
```

Construct a shared_ptr that owns a null pointer and the deleter *__d*.

Parameters

_↩ _*p*	A null pointer constant.
_↩ _*d*	A deleter.
_↩ _*a*	An allocator.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc,in	which case *__d(__p)* is called.

Requirements: _Deleter's copy constructor and destructor must not throw _Alloc's copy constructor and destructor must not throw.
The last owner will call __d(__p)

shared_ptr() [8/14]

```
template<typename _Tp>
template<typename _Yp>
std::shared_ptr< _Tp >::shared_ptr (
            const shared_ptr< _Yp > & __r,
            element_type * __p)  [inline], [noexcept]
```

Constructs a `shared_ptr` instance that stores `__p` and shares ownership with `__r`.

Parameters

__r	A `shared_ptr`.
__p	A pointer that will remain valid while `*__r` is valid.

Postcondition

`get() == __p && use_count() == __r.use_count()`

This can be used to construct a `shared_ptr` to a sub-object of an object managed by an existing `shared_ptr`. The complete object will remain valid while any `shared_ptr` owns it, even if they don't store a pointer to the complete object.

```
shared_ptr<pair<int,int>> pii(new pair<int,int>());
shared_ptr<int> pi(pii, &pii->first);
assert(pii.use_count() == 2);
```

shared_ptr() [9/14]

```
template<typename _Tp>
template<typename _Yp>
std::shared_ptr< _Tp >::shared_ptr (
            shared_ptr< _Yp > && __r,
            element_type * __p)  [inline], [noexcept]
```

Constructs a `shared_ptr` instance that stores `__p` and shares ownership with `__r`.

Parameters

_↩ _r	A shared_ptr.
_↩ _p	A pointer that will remain valid while *__r is valid.

Postcondition

```
get() == __p && !__r.use_count() && !__r.get()
```

Since

C++17

This can be used to construct a shared_ptr to a sub-object of an object managed by an existing shared_ptr. The complete object will remain valid while any shared_ptr owns it, even if they don't store a pointer to the complete object.

```
shared_ptr<pair<int,int>> pii(new pair<int,int>());
shared_ptr<int> pi1(pii, &pii->first);
assert(pii.use_count() == 2);
shared_ptr<int> pi2(std::move(pii), &pii->second);
assert(pii.use_count() == 0);
```

shared_ptr() [10/14]

```
template<typename _Tp>
template<typename _Yp, typename = _Constructible<const shared_ptr<_Yp>&>>
std::shared_ptr< _Tp >::shared_ptr (
            const shared_ptr< _Yp > & __r)  [inline], [noexcept]
```

If __r is empty, constructs an empty shared_ptr; otherwise construct a shared_ptr that shares ownership with __r.

Parameters

↩ _↩ ↩ _↩ r	A shared_ptr.

Postcondition

get() == __r.get() && use_count() == __r.use_count()

shared_ptr() [11/14]

```
template<typename _Tp>
std::shared_ptr< _Tp >::shared_ptr (
            shared_ptr< _Tp > && __r)  [inline], [noexcept]
```

Move-constructs a shared_ptr instance from __r.

Parameters

↩ _↩ ↩ _↩ *r*	A shared_ptr rvalue.

Postcondition

∗this contains the old value of *__r*, *__r* is empty.

shared_ptr() [12/14]

```
template<typename _Tp>
template<typename _Yp, typename = _Constructible<shared_ptr<_Yp>>>
std::shared_ptr< _Tp >::shared_ptr (
            shared_ptr< _Yp > && __r)  [inline], [noexcept]
```

Move-constructs a shared_ptr instance from *__r*.

Parameters

↩ _↩ ↩ _↩ *r*	A shared_ptr rvalue.

Postcondition

∗this contains the old value of *__r*, *__r* is empty.

shared_ptr() [13/14]

```
template<typename _Tp>
template<typename _Yp, typename = _Constructible<const weak_ptr<_Yp>&>>
std::shared_ptr< _Tp >::shared_ptr (
            const weak_ptr< _Yp > & __r)  [inline], [explicit]
```

Constructs a shared_ptr that shares ownership with *__r* and stores a copy of the pointer stored in *__r*.

Parameters

↩ _↩ ↩ _↩ *r*	A weak_ptr.

Postcondition

use_count() == __r.use_count()

Exceptions

bad_weak_ptr	when __r.expired(), in which case the constructor has no effect.

shared_ptr() [14/14]

```
template<typename _Tp>
std::shared_ptr< _Tp >::shared_ptr (
            nullptr_t )  [inline], [constexpr], [noexcept]
```

Construct an empty shared_ptr.

Postcondition

use_count() == 0 && get() == nullptr

6.917.4 Member Function Documentation

get()

```
template<typename _Tp, _Lock_policy _Lp>
element_type * std::__shared_ptr< _Tp, _Lp >::get () const  [inline], [noexcept], [inherited]
```

Return the stored pointer.

operator bool()

```
template<typename _Tp, _Lock_policy _Lp>
std::__shared_ptr< _Tp, _Lp >::operator bool () const  [inline], [explicit], [noexcept], [inherited]
```

Return true if the stored pointer is not null.

owner_before() [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
template<typename _Tp1>
bool std::__shared_ptr< _Tp, _Lp >::owner_before (
            __shared_ptr< _Tp1, _Lp > const & __rhs) const  [inline], [noexcept], [inherited]
```

Define an ordering based on ownership.

This function defines a strict weak ordering between two shared_ptr or weak_ptr objects, such that one object is less than the other unless they share ownership of the same pointer, or are both empty.

owner_before() [2/2]

```
template<typename _Tp, _Lock_policy _Lp>
template<typename _Tp1>
bool std::__shared_ptr< _Tp, _Lp >::owner_before (
            __weak_ptr< _Tp1, _Lp > const & __rhs) const  [inline], [noexcept], [inherited]
```

Define an ordering based on ownership.

This function defines a strict weak ordering between two shared_ptr or weak_ptr objects, such that one object is less than the other unless they share ownership of the same pointer, or are both empty.

swap()

```
template<typename _Tp, _Lock_policy _Lp>
void std::__shared_ptr< _Tp, _Lp >::swap (
             __shared_ptr< _Tp, _Lp > & __other)  [inline], [noexcept], [inherited]
```

Exchange both the owned pointer and the stored pointer.

unique()

```
template<typename _Tp, _Lock_policy _Lp>
bool std::__shared_ptr< _Tp, _Lp >::unique () const  [inline], [noexcept], [inherited]
```

Return true if use_count() == 1.

use_count()

```
template<typename _Tp, _Lock_policy _Lp>
long std::__shared_ptr< _Tp, _Lp >::use_count () const  [inline], [noexcept], [inherited]
```

If ∗this owns a pointer, return the number of owners, otherwise zero.

6.919.1 Detailed Description

template<typename _RandomNumberEngine, size_t __k>
class std::shuffle_order_engine< _RandomNumberEngine, __k >

Produces random numbers by reordering random numbers from some base engine.
The values from the base engine are stored in a sequence of size `__k` and shuffled by an algorithm that depends on those values.

Since

C++11

6.919.2 Member Typedef Documentation

result_type

```
template<typename _RandomNumberEngine, size_t __k>
typedef _RandomNumberEngine::result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::result_type
```

The type of the generated random value.

6.919.3 Constructor & Destructor Documentation

shuffle_order_engine() [1/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine ()  [inline]
```

Constructs a default shuffle_order_engine engine.
The underlying engine is default constructed as well.

shuffle_order_engine() [2/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
            const _RandomNumberEngine & __rng)  [inline], [explicit]
```

Copy constructs a shuffle_order_engine engine.
Copies an existing base class random number generator.

Parameters

__rng	An existing (base class) engine object.

shuffle_order_engine() [3/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
            _RandomNumberEngine && __rng)  [inline], [explicit]
```

Move constructs a shuffle_order_engine engine.
Copies an existing base class random number generator.

Parameters

__rng	An existing (base class) engine object.

shuffle_order_engine() [4/5]

```
template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
            result_type __s)  [inline], [explicit]
```

Seed constructs a shuffle_order_engine engine.
Constructs the underlying generator engine seeded with __s.

Parameters

_↩ _s	A seed value for the base class engine.

shuffle_order_engine() [5/5]

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
            _Sseq & __q)  [inline], [explicit]
```

Generator construct a shuffle_order_engine engine.

Parameters

_↩ _q	A seed sequence.

6.919.4 Member Function Documentation

base()

```
template<typename _RandomNumberEngine, size_t __k>
const _RandomNumberEngine & std::shuffle_order_engine< _RandomNumberEngine, __k >::base () const
[inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

discard()

```
template<typename _RandomNumberEngine, size_t __k>
void std::shuffle_order_engine< _RandomNumberEngine, __k >::discard (
            unsigned long long __z)  [inline]
```

Discard a sequence of random numbers.

max()

```
template<typename _RandomNumberEngine, size_t __k>
constexpr result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::max ()  [inline],
[static], [constexpr]
```

Gets the maximum value in the generated random number range.

min()

```
template<typename _RandomNumberEngine, size_t __k>
constexpr result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::min ()  [inline],
[static], [constexpr]
```

Gets the minimum value in the generated random number range.

operator()()

```
template<typename _RandomNumberEngine, size_t __k>
shuffle_order_engine< _RandomNumberEngine, __k >::result_type std::shuffle_order_engine< _↩
RandomNumberEngine, __k >::operator() ()
```

Gets the next value in the generated random number sequence.
References std::max(), and std::min().

seed() [1/3]

```
template<typename _RandomNumberEngine, size_t __k>
void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed ()  [inline]
```

Reseeds the shuffle_order_engine object with the default seed for the underlying base class generator engine.

seed() [2/3]

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _Sseq>
_If_seed_seq< _Sseq > std::shuffle_order_engine< _RandomNumberEngine, __k >::seed (
            _Sseq & __q)  [inline]
```

Reseeds the shuffle_order_engine object with the given seed sequence.

Parameters

_↩ _q	A seed generator function.

seed() [3/3]

```
template<typename _RandomNumberEngine, size_t __k>
void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed (
            result_type __s)  [inline]
```

Reseeds the shuffle_order_engine object with the default seed for the underlying base class generator engine.

6.919.5 Friends And Related Symbol Documentation

operator<<

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _RandomNumberEngine1, size_t __k1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::shuffle_order_engine< _RandomNumberEngine1, __k1 > & __x)  [friend]
```

Inserts the current state of a shuffle_order_engine random number generator engine __x into the output stream __os.

Parameters

__os	An output stream.
__x	A shuffle_order_engine random number generator engine.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _RandomNumberEngine, size_t __k>
bool operator== (
             const shuffle_order_engine< _RandomNumberEngine, __k > & __lhs,
             const shuffle_order_engine< _RandomNumberEngine, __k > & __rhs)  [friend]
```

Compares two shuffle_order_engine random number generator objects of the same type for equality.

Parameters

__lhs	A shuffle_order_engine random number generator object.
__rhs	Another shuffle_order_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

operator>>

```
template<typename _RandomNumberEngine, size_t __k>
template<typename _RandomNumberEngine1, size_t __k1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
             std::basic_istream< _CharT, _Traits > & __is,
             std::shuffle_order_engine< _RandomNumberEngine1, __k1 > & __x)  [friend]
```

Extracts the current state of a % subtract_with_carry_engine random number generator engine __x from the input stream __is.

Parameters

__is	An input stream.
__x	A shuffle_order_engine random number generator engine.

Returns

The input stream with the state of __x extracted or in an error state.

- size_t size () const
- size_t start () const
- size_t stride () const

Friends

- bool operator== (const slice &, const slice &)=default

6.921.1 Detailed Description

Class defining one-dimensional subset of an array.
The slice class represents a one-dimensional subset of an array, specified by three parameters: start offset, size, and stride. The start offset is the index of the first element of the array that is part of the subset. The size is the total number of elements in the subset. Stride is the distance between each successive array element to include in the subset.
For example, with an array of size 10, and a slice with offset 1, size 3 and stride 2, the subset consists of array elements 1, 3, and 5.

6.922.1 Detailed Description

template<typename _Tp>
class std::slice_array< _Tp >

Reference to one-dimensional subset of an array.
A slice_array is a reference to the actual elements of an array specified by a slice. The way to get a slice_array is to call operator[ ](slice) on a valarray. The returned slice_array then permits carrying operations out on the referenced subset of elements in the original valarray. For example, operator+=(valarray) will add values to the subset of elements in the underlying valarray this slice_array refers to.

Parameters

Tp	Element type.

6.922.2 Member Function Documentation

operator%=()

```
template<typename _Tp>
void std::slice_array< _Tp >::operator%= (
            const valarray< _Tp > & ) const
```

Modulo slice elements by corresponding elements of *v*.

operator&=()

```
template<typename _Tp>
void std::slice_array< _Tp >::operator&= (
            const valarray< _Tp > & ) const
```

Logical and slice elements with corresponding elements of *v*.

operator*=()

```
template<typename _Tp>
void std::slice_array< _Tp >::operator*= (
            const valarray< _Tp > & ) const
```

Multiply slice elements by corresponding elements of *v*.

operator+=()

```
template<typename _Tp>
void std::slice_array< _Tp >::operator+= (
            const valarray< _Tp > & ) const
```

Add corresponding elements of *v* to slice elements.

operator-=()

```
template<typename _Tp>
void std::slice_array< _Tp >::operator-= (
            const valarray< _Tp > & ) const
```

Subtract corresponding elements of *v* from slice elements.

operator/=()

```
template<typename _Tp>
void std::slice_array< _Tp >::operator/= (
            const valarray< _Tp > & ) const
```

Divide slice elements by corresponding elements of *v*.

operator<<=()

```
template<typename _Tp>
void std::slice_array< _Tp >::operator<<= (
            const valarray< _Tp > & ) const
```

Left shift slice elements by corresponding elements of *v*.

operator>>=()

```
template<typename _Tp>
void std::slice_array< _Tp >::operator>>= (
            const valarray< _Tp > & ) const
```

Right shift slice elements by corresponding elements of *v*.

operator^=()

```
template<typename _Tp>
void std::slice_array< _Tp >::operator^= (
            const valarray< _Tp > & ) const
```

Logical xor slice elements with corresponding elements of *v*.

operator"|=()

```
template<typename _Tp>
void std::slice_array< _Tp >::operator|= (
            const valarray< _Tp > & ) const
```

Logical or slice elements with corresponding elements of *v*.

6.926.1 Detailed Description

template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↩ Alloc>
class __gnu_pbds::detail::splay_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >

Splay tree.

6.926.2 Member Function Documentation

node_begin() [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↩
Alloc>
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_↩
pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_begin
() [inline], [inherited]
```

Returns a node_iterator corresponding to the node at the root of the tree.

node_begin() [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↩
Alloc>
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __↩
gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_↩
begin () const [inline], [inherited]
```

Returns a const node_iterator corresponding to the node at the root of the tree.

node_end() [1/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↩
Alloc>
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_iterator __gnu_↩
pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end ()
[inline], [inherited]
```

Returns a node_iterator corresponding to a node just after a leaf of the tree.

node_end() [2/2]

```
template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↩
Alloc>
bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_const_iterator __↩
gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_↩
end () const [inline], [inherited]
```

Returns a const node_iterator corresponding to a node just after a leaf of the tree.

6.929.1 Detailed Description

template<typename _Tp, typename _Sequence = deque<_Tp>>
class std::stack< _Tp, _Sequence >

A standard container giving FILO behavior.

Template Parameters

_Tp	Type of element.
_Sequence	Type of underlying sequence, defaults to deque<_Tp>.

Meets many of the requirements of a container, but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-last-out stack behavior.
The second template parameter defines the type of the underlying sequence/container. It defaults to std::deque, but it can be any type that supports `back`, `push_back`, and `pop_back`, such as std::list, std::vector, or an appropriate user-defined type.
Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push`, `pop`, and `top`, which are standard stack/FILO operations.

6.929.2 Constructor & Destructor Documentation

stack()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<is_default_constructible<↩
_Seq>::value>::type>
std::stack< _Tp, _Sequence >::stack ()  [inline]
```

Default constructor creates no elements.

6.929.3 Member Function Documentation

empty()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
bool std::stack< _Tp, _Sequence >::empty () const  [inline], [nodiscard]
```

Returns true if the stack is empty.

pop()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::stack< _Tp, _Sequence >::pop ()  [inline]
```

Removes first element.
This is a typical stack operation. It shrinks the stack by one. The time complexity of the operation depends on the underlying sequence.
Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.

push()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::stack< _Tp, _Sequence >::push (
            const value_type & __x)  [inline]
```

Add data to the top of the stack.

Parameters

_↩ _x	Data to be added.

This is a typical stack operation. The function creates an element at the top of the stack and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

size()

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
size_type std::stack< _Tp, _Sequence >::size () const  [inline], [nodiscard]
```

Returns the number of elements in the stack.

top() [1/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::stack< _Tp, _Sequence >::top () [inline], [nodiscard]
```

Returns a read/write reference to the data at the first element of the stack.

top() [2/2]

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::stack< _Tp, _Sequence >::top () const [inline], [nodiscard]
```

Returns a read-only (constant) reference to the data at the first element of the stack.
The documentation for this class was generated from the following file:

- stl_stack.h

6.930.1 Detailed Description

template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
class __gnu_cxx::stdio_filebuf< _CharT, _Traits >

Provides a layer of compatibility for C/POSIX.
This GNU extension provides extensions for working with standard C FILE*'s and POSIX file descriptors. It must be instantiated by the user with the type of character used in the file stream, e.g., stdio_filebuf<char>.

6.930.2 Constructor & Destructor Documentation

stdio_filebuf() [1/3]

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf ()  [inline]
```

deferred initialization
References std::basic_filebuf< _CharT, _Traits >::basic_filebuf().

stdio_filebuf() [2/3]

```
template<typename _CharT, typename _Traits>
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf (
            int __fd,
            std::ios_base::openmode __mode,
            size_t __size = static_cast<size_t>( BUFSIZ ))
```

Parameters

__fd	An open file descriptor.
__mode	Same meaning as in a standard filebuf.
__size	Optimal or preferred size of internal buffer, in chars.

This constructor associates a file stream buffer with an open POSIX file descriptor. The file descriptor will be automatically closed when the stdio_filebuf is closed/destroyed.
References std::basic_filebuf< _CharT, _Traits >::_M_buf_size, std::basic_filebuf< _CharT, _Traits >::_M_mode, std::basic_filebuf< _CharT, _Traits >::_M_reading, std::basic_filebuf< _CharT, _Traits >::_M_set_buffer(), and std::basic_filebuf< _CharT, _Traits >::is_open().

stdio_filebuf() [3/3]

```
template<typename _CharT, typename _Traits>
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf (
            std::__c_file * __f,
```

```
            std::ios_base::openmode __mode,
            size_t __size = static_cast<size_t>( BUFSIZ ))
```

Parameters

__f	An open FILE*.
__mode	Same meaning as in a standard filebuf.
__size	Optimal or preferred size of internal buffer, in chars. Defaults to system's BUFSIZ.

This constructor associates a file stream buffer with an open C FILE*. The FILE* will not be automatically closed when the stdio_filebuf is closed/destroyed.
References std::basic_filebuf< _CharT, _Traits >::_M_buf_size, std::basic_filebuf< _CharT, _Traits >::_M_mode, std::basic_filebuf< _CharT, _Traits >::_M_reading, std::basic_filebuf< _CharT, _Traits >::_M_set_buffer(), and std::basic_filebuf< _CharT, _Traits >::is_open().

~stdio_filebuf()

```
template<typename _CharT, typename _Traits>
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::~stdio_filebuf ()  [virtual]
```
Closes the external data stream if the file descriptor constructor was used.

6.930.3 Member Function Documentation

_M_create_pback()

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf< _CharT, _Traits >::_M_create_pback ()  [inline], [protected], [inherited]
```
Initializes pback buffers, and moves normal buffers to safety. Assumptions: _M_in_cur has already been moved back
Referenced by pbackfail().

_M_destroy_pback()

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf< _CharT, _Traits >::_M_destroy_pback () throw ( )   [inline], [protected],
[inherited]
```
Deactivates pback buffer contents, and restores normal buffer. Assumptions: The pback buffer has only moved forward.
Referenced by overflow(), seekoff(), seekpos(), underflow(), and xsgetn().

_M_set_buffer()

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf< _CharT, _Traits >::_M_set_buffer (
            streamsize __off)  [inline], [protected], [inherited]
```
This function sets the pointers of the internal buffer, both get and put areas. Typically:
__off == egptr() - eback() upon underflow/uflow (**read** mode); __off == 0 upon overflow (**write** mode); __off == -1 upon open, setbuf, seekoff/pos (**uncommitted** mode).
NB: epptr() - pbase() == _M_buf_size - 1, since _M_buf_size reflects the actual allocated memory and the last cell is reserved for the overflow char of a full put area.
Referenced by __gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf(), __gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf(), close(), imbue(), open(), overflow(), pbackfail(), underflow(), xsgetn(), and xsputn().

close()

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::__filebuf_type * std::basic_filebuf< _CharT, _Traits >::close
() [inherited]
```

Closes the currently associated file.

Returns

`this` on success, NULL on failure

If no file is currently open, this function immediately fails.
If a *put buffer area* exists, `overflow(eof)` is called to flush all the characters. The file is then closed.
If any operations fail, this function also fails.
References basic_filebuf(), _M_mode, _M_pback_init, _M_reading, _M_set_buffer(), and is_open().
Referenced by std::basic_filebuf< char_type, traits_type >::~basic_filebuf(), and open().

eback()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::eback () const [inline], [protected], [inherited]
```

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Referenced by std::basic_filebuf< char_type, traits_type >::_M_destroy_pback(), std::basic_filebuf< _CharT, _Traits >::imbue(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_filebuf< _CharT, _Traits >::pbackfail(), std::basic_stringbuf< _Cha std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos(), std::basic_streambuf< char_type, traits_type >::sputbackc(), std::basic_streambuf< char_type, traits_type >::sungetc(), std::basic_filebuf< _CharT, _Traits >::underflow(), and std::basic_filebuf< _CharT, _Traits >::xsgetn().

egptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::egptr () const [inline], [protected], [inherited]
```

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Referenced by std::basic_filebuf< char_type, traits_type >::_M_create_pback(), std::basic_streambuf< char_type, traits_type >::in_avail std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_streambuf< char_type, traits_type >::sbumpc(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos(), std::basic_streambuf< char_type, traits_type >::sgetc(), std::basic_filebuf< _CharT, _Traits >::showmanyc(), std::basic_stringbuf< char std::basic_filebuf< _CharT, _Traits >::underflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::underflow(), std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow(), std::basic_filebuf< _CharT, _Traits >::xsgetn(), and xsgetn().

epptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::epptr () const  [inline], [protected], [inherited]
```

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Referenced by std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos(), std::basic_streambuf< char_type, traits_type >::sputc(), std::basic_filebuf< _CharT, _Traits >::xsputn(), and xsputn().

fd()

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
int __gnu_cxx::stdio_filebuf< _CharT, _Traits >::fd ()  [inline]
```

Returns

The underlying file descriptor.

Once associated with an external data stream, this function can be used to access the underlying POSIX file descriptor. Note that there is no way for the library to track what you do with the descriptor, so be careful.

file()

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
std::__c_file * __gnu_cxx::stdio_filebuf< _CharT, _Traits >::file ()  [inline]
```

Returns

The underlying FILE*.

This function can be used to access the underlying "C" file pointer. Note that there is no way for the library to track what you do with the file, so be careful.

gbump()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::gbump (
            int __n)  [inline], [protected], [inherited]
```

Moving the read position.

Parameters

_↩ _n	The delta by which to move.

This just advances the read position without returning any data.
Referenced by std::basic_filebuf< _CharT, _Traits >::pbackfail(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::pbackfail(), std::basic_streambuf< char_type, traits_type >::sbumpc(), std::basic_streambuf< char_type, traits_type >::sputbackc(), std::basic_streambuf< char_type, traits_type >::sungetc(), std::basic_streambuf< char_type, traits_type >::uflow(), and std::basic_filebuf< _CharT, _Traits >::xsgetn().

getloc()

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::getloc () const  [inline], [inherited]
```

Locale access.

Returns

The current locale in effect.

If pubimbue(loc) has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.
Referenced by std::basic_streambuf< char_type, traits_type >::pubimbue().

gptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::gptr () const  [inline], [protected], [inherited]
```

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Referenced by std::basic_filebuf< char_type, traits_type >::_M_create_pback(), std::basic_filebuf< char_type, traits_type >::_M_destroy
std::basic_filebuf< _CharT, _Traits >::imbue(), std::basic_streambuf< char_type, traits_type >::in_avail(), std::basic_stringbuf< _CharT,
std::basic_filebuf< _CharT, _Traits >::pbackfail(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::pbackfail(), std::basic_streambuf< cha
std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_streambuf< char_type, traits_type >::sgetc(),
std::basic_filebuf< _CharT, _Traits >::showmanyc(), std::basic_stringbuf< char >::showmanyc(), std::basic_streambuf< char_type, traits
std::basic_streambuf< char_type, traits_type >::sungetc(), std::basic_streambuf< char_type, traits_type >::uflow(),
std::basic_filebuf< _CharT, _Traits >::underflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::underflow(),
std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow(), std::basic_filebuf< _CharT, _Traits >::xsgetn(), and
xsgetn().

imbue()

```
template<typename _CharT, typename _Traits>
void std::basic_filebuf< _CharT, _Traits >::imbue (
             const locale & __loc)  [protected], [virtual], [inherited]
```

Changes translations.

Parameters

__loc	A new locale.

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

Note

Base class version does nothing.

Reimplemented from std::basic_streambuf< _CharT, _Traits >.
References _M_ext_buf, _M_ext_next, _M_mode, _M_reading, _M_set_buffer(), std::ios_base::cur, std::basic_streambuf< _CharT, _Trait
std::basic_streambuf< _CharT, _Traits >::gptr(), is_open(), and seekoff().

in_avail()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::in_avail ()  [inline], [inherited]
```

Looking ahead into the stream.

Returns

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

is_open()

```
template<typename _CharT, typename _Traits>
bool std::basic_filebuf< _CharT, _Traits >::is_open () const throw ( )   [inline], [nodiscard],
[inherited]
```

Returns true if the external file is open.

Referenced by __gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf(), __gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf(), close(), imbue(), open(), seekoff(), seekpos(), setbuf(), and showmanyc().

open() [1/3]

```
template<typename _CharT, typename _Traits>
template<typename _Path>
_If_fs_path< _Path, __filebuf_type * > std::basic_filebuf< _CharT, _Traits >::open (
            const _Path & __s,
            ios_base::openmode __mode)  [inline], [inherited]
```

Opens an external file.

Parameters

__s	The name of the file, as a filesystem::path.
__mode	The open mode flags.

Returns

`this` on success, NULL on failure

open() [2/3]

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::__filebuf_type * std::basic_filebuf< _CharT, _Traits >::open (
            const char * __s,
            ios_base::openmode __mode)  [inherited]
```

Opens an external file.

Parameters

__s	The name of the file.

__mode	The open mode flags.

Returns

`this` on success, NULL on failure

If a file is already open, this function immediately fails. Otherwise it tries to open the file named *__s* using the flags given in *__mode*.
Table 92, adapted here, gives the relation between openmode combinations and the equivalent `fopen()` flags. (NB: lines app, in|out|app, in|app, binary|app, binary|in|out|app, and binary|in|app per DR 596)

```
+-------------------------------------------------------+
| ios_base Flag combination            stdio equivalent |
|binary  in  out  trunc  app                            |
+-------------------------------------------------------+
|             +                        w                |
|             +           +            a                |
|                         +            a                |
|             +     +                  w                |
|          +                           r                |
|          +   +                       r+               |
|          +   +     +                 w+               |
|          +   +           +           a+               |
|          +               +           a+               |
+-------------------------------------------------------+
|    +        +                        wb               |
|    +        +           +            ab               |
|    +                    +            ab               |
|    +        +     +                  wb               |
|    +     +                           rb               |
|    +     +   +                       r+b              |
|    +     +   +     +                 w+b              |
|    +     +   +           +           a+b              |
|    +     +               +           a+b              |
+-------------------------------------------------------+
```

References _M_mode, _M_reading, _M_set_buffer(), std::ios_base::ate, close(), std::ios_base::end, is_open(), and seekoff().
Referenced by std::basic_filebuf< char_type, traits_type >::open(), and std::basic_filebuf< char_type, traits_type >::open().

open() [3/3]

```
template<typename _CharT, typename _Traits>
__filebuf_type * std::basic_filebuf< _CharT, _Traits >::open (
            const std::string & __s,
            ios_base::openmode __mode)  [inline], [inherited]
```

Opens an external file.

Parameters

__s	The name of the file.
__mode	The open mode flags.

Returns

`this` on success, NULL on failure

overflow()

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::int_type std::basic_filebuf< _CharT, _Traits >::overflow (
            int_type __c = _Traits::eof())  [protected], [virtual], [inherited]
```

Consumes data from the buffer; writes to the controlled sequence.

Parameters

_↩ _c	An additional character to consume.

Returns

eof() to indicate failure, something else (usually __c, or not_eof())

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character *c* is also written out, if __c is not `eof()`.
For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.
A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

Note

Base class version does nothing, returns eof().

Reimplemented from std::basic_streambuf< _CharT, _Traits >.
References _M_buf_size, _M_destroy_pback(), _M_mode, _M_reading, _M_set_buffer(), std::ios_base::app, std::ios_base::cur, std::ios_base::out, std::basic_streambuf< _CharT, _Traits >::pbase(), std::basic_streambuf< _CharT, _Traits >::pbum and std::basic_streambuf< _CharT, _Traits >::pptr().
Referenced by pbackfail(), sync(), underflow(), and xsgetn().

pbackfail()

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::int_type std::basic_filebuf< _CharT, _Traits >::pbackfail (
            int_type __c = _Traits::eof())  [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

Parameters

_↩ _c	The character to be inserted back into the sequence.

Returns

eof() on failure, *some other value* on success

Postcondition

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

Note

Base class version does nothing, returns eof().

Reimplemented from std::basic_streambuf< _CharT, _Traits >.
References _M_create_pback(), _M_mode, _M_pback_init, _M_reading, _M_set_buffer(), std::ios_base::cur, std::basic_streambuf< _CharT, _Traits >::eback(), std::basic_streambuf< _CharT, _Traits >::gbump(), std::basic_streambuf< _CharT, _
std::ios_base::in, overflow(), seekoff(), and underflow().

pbase()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::pbase () const  [inline], [protected], [inherited]
```

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Referenced by std::basic_filebuf< _CharT, _Traits >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_filebuf< _CharT, _Traits >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_stringbuf< _CharT, std::basic_stringbuf< char >::str(), std::basic_filebuf< _CharT, _Traits >::sync(), and std::basic_filebuf< _CharT, _Traits >::xsputn().

pbump()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::pbump (
            int __n)  [inline], [protected], [inherited]
```

Moving the write position.

Parameters

_↩ _n	The delta by which to move.

This just advances the write position without returning any data.
Referenced by std::basic_filebuf< _CharT, _Traits >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), and std::basic_streambuf< char_type, traits_type >::sputc().

pptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::pptr () const  [inline], [protected], [inherited]
```

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Referenced by std::basic_filebuf< _CharT, _Traits >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_filebuf< _CharT, _Traits >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_streambuf< char_t std::basic_filebuf< _CharT, _Traits >::sync(), std::basic_filebuf< _CharT, _Traits >::xsputn(), and xsputn().

pubimbue()

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::pubimbue (
            const locale & __loc)  [inline], [inherited]
```

Entry point for imbue().

Parameters

__loc	The new locale.

Returns

The previous locale.

Calls the derived imbue(__loc).

pubseekoff()

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
            off_type __off,
            ios_base::seekdir __way,
            ios_base::openmode __mode = ios_base::in | ios_base::out)  [inline], [inherited]
```

Alters the stream position.

Parameters

__off	Offset.
__way	Value for ios_base::seekdir.
__mode	Value for ios_base::openmode.

Calls virtual seekoff function.

pubseekpos()

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
            pos_type __sp,
            ios_base::openmode __mode = ios_base::in | ios_base::out)  [inline], [inherited]
```

Alters the stream position.

Parameters

__sp	Position
__mode	Value for ios_base::openmode.

Calls virtual seekpos function.

pubsetbuf()

```
template<typename _CharT, typename _Traits>
basic_streambuf * std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
```

```
            char_type * __s,
            streamsize __n)  [inline], [inherited]
```

Entry points for derived buffer functions.
The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

pubsync()

```
template<typename _CharT, typename _Traits>
int std::basic_streambuf< _CharT, _Traits >::pubsync ()  [inline], [inherited]
```

Calls virtual sync function.
Referenced by std::basic_istream< _CharT, _Traits >::sync().

sbumpc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sbumpc ()  [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.
Referenced by std::basic_iostream< char_type, traits_type >::get(), std::basic_istream< _CharT, _Traits >::ignore(), and std::basic_streambuf< char_type, traits_type >::snextc().

seekoff()

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::pos_type std::basic_filebuf< _CharT, _Traits >::seekoff (
            off_type ,
            ios_base::seekdir ,
            ios_base::openmode  = ios_base::in | ios_base::out)  [protected], [virtual], [inherited]
```

Alters the stream positions.
Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from std::basic_streambuf< _CharT, _Traits >.
References _M_destroy_pback(), _M_reading, std::ios_base::cur, is_open(), std::basic_streambuf< _CharT, _Traits >::pbase(), and std::basic_streambuf< _CharT, _Traits >::pptr().
Referenced by imbue(), open(), and pbackfail().

seekpos()

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::pos_type std::basic_filebuf< _CharT, _Traits >::seekpos (
            pos_type ,
            ios_base::openmode  = ios_base::in | ios_base::out)  [protected], [virtual], [inherited]
```

Alters the stream positions.
Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from std::basic_streambuf< _CharT, _Traits >.
References _M_destroy_pback(), std::ios_base::beg, and is_open().

setbuf()

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::__streambuf_type * std::basic_filebuf< _CharT, _Traits >::↩
setbuf (
            char_type * __s,
            streamsize __n)  [protected], [virtual], [inherited]
```

Manipulates the buffer.

Parameters

_↩ _s	Pointer to a buffer area.
_↩ _n	Size of __s.

Returns

`this`

If no file has been opened, and both __s and __n are zero, then the stream becomes unbuffered. Otherwise, __s is used as a buffer; see https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html↩ #io.streambuf.buffering for more.
Reimplemented from std::basic_streambuf< _CharT, _Traits >.
References _M_buf, _M_buf_size, and is_open().

setg()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setg (
            char_type * __gbeg,
            char_type * __gnext,
            char_type * __gend)  [inline], [protected], [inherited]
```

Setting the three read area pointers.

Parameters

__gbeg	A pointer.
__gnext	A pointer.
__gend	A pointer.

Postcondition

__gbeg == `eback()`, *__gnext* == `gptr()`, and *__gend* == `egptr()`

Referenced by std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert(), std::basic_filebuf< char_type, traits_type >::_M_create
std::basic_filebuf< char_type, traits_type >::_M_destroy_pback(), std::basic_filebuf< char_type, traits_type >::_M_set_buffer(),
std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(),
std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos(), and std::basic_filebuf< _CharT, _Traits >::xsgetn().

setp()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setp (
            char_type * __pbeg,
            char_type * __pend)  [inline], [protected], [inherited]
```

Setting the three write area pointers.

Parameters

__pbeg	A pointer.
__pend	A pointer.

Postcondition

__pbeg == `pbase()`, *__pbeg* == `pptr()`, and *__pend* == `epptr()`

Referenced by std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert(), and std::basic_filebuf< char_type, traits_type >::_M_s

sgetc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sgetc ()  [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.
Referenced by std::basic_iostream< char_type, traits_type >::get(), std::basic_istream< _CharT, _Traits >::get(),
std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _Traits >::ignore(), std::basic_istream< _CharT, _Traits >::ig
and std::basic_streambuf< char_type, traits_type >::snextc().

sgetn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::sgetn (
            char_type * __s,
            streamsize __n)  [inline], [inherited]
```

Entry point for xsgetn.

Parameters

_↩ _s	A buffer area.
_↩ _n	A count.

Returns xsgetn(__s,__n). The effect is to fill __*s*[0] through __*s*[__n-1] with characters from the input sequence, if possible.

showmanyc()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_filebuf< _CharT, _Traits >::showmanyc ()  [protected], [virtual], [inherited]
```

Investigating the data available.

Returns

An estimate of the number of characters available in the input sequence, or -1.

If it returns a positive value, then successive calls to `underflow()` *will not return* `traits::eof()` *until at least that number of characters have been supplied. If* `showmanyc()` *returns -1, then calls to* `underflow()` *or* `uflow()` *will fail.* [27.5.2.4.3]/1

Note

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to underflow or uflow] will not return* `eof()` *but that they will return immediately.*

The standard adds that *the morphemes of* `showmanyc` *are* ***es-how-many-see****, not* ***show-manic****.*

Reimplemented from std::basic_streambuf< _CharT, _Traits >.
References _M_mode, std::ios_base::binary, std::basic_streambuf< _CharT, _Traits >::egptr(), std::basic_streambuf< _CharT, _Traits > std::ios_base::in, and is_open().

snextc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::snextc ()  [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.
Referenced by std::basic_iostream< char_type, traits_type >::get(), std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, char_traits< _CharT > >::get(), and std::basic_istream< _CharT, char_traits< _CharT > >::readsome().

sputbackc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sputbackc (
            char_type __c)  [inline], [inherited]
```

Pushing characters back into the input stream.

Parameters

_↩ _c	The character to push back.

Returns

The previous character, if possible.

Similar to sungetc(), but __c is pushed onto the stream instead of *the previous character.* If successful, the next character fetched from the input stream will be __c.
Referenced by std::basic_istream< _CharT, _Traits >::putback().

sputc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sputc (
            char_type __c)  [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

_↩ _c	A character to output.

Returns

__c, if possible.

One of two public output functions.
If a write position is available for the output sequence (i.e., the buffer is not full), stores __c in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(↩ __c)`.
Referenced by std::wbuffer_convert< _Codecvt, _Elem, _Tr >::overflow().

sputn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::sputn (
            const char_type * __s,
            streamsize __n)  [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

_↩ _s	A buffer read area.
_↩ _n	A count.

One of two public output functions.
Returns xsputn(__s,__n). The effect is to write __s[0] through __s[__n-1] to the output sequence, if possible.

sungetc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sungetc ()  [inline], [inherited]
```
Moving backwards in the input stream.

Returns

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns pbackfail(). The effect is to *unget* the last character *gotten*.
Referenced by std::basic_istream< _CharT, _Traits >::unget().

sync()

```
template<typename _CharT, typename _Traits>
int std::basic_filebuf< _CharT, _Traits >::sync ()  [protected], [virtual], [inherited]
```
Synchronizes the buffer arrays with the controlled sequences.

Returns

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

Note

Base class version does nothing, returns zero.

Reimplemented from std::basic_streambuf< _CharT, _Traits >.
References overflow(), std::basic_streambuf< _CharT, _Traits >::pbase(), and std::basic_streambuf< _CharT, _Traits >::pptr().

uflow()

```
template<typename _CharT, typename _Traits>
virtual int_type std::basic_streambuf< _CharT, _Traits >::uflow ()  [inline], [protected], [virtual],
[inherited]
```
Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.
Reimplemented in __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >.
Referenced by std::basic_streambuf< char_type, traits_type >::sbumpc(), and xsgetn().

underflow()

```
template<typename _CharT, typename _Traits>
basic_filebuf< _CharT, _Traits >::int_type std::basic_filebuf< _CharT, _Traits >::underflow ()
[protected], [virtual], [inherited]
```
Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.
For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.
A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html

Note

Base class version does nothing, returns eof().

Reimplemented from std::basic_streambuf< _CharT, _Traits >.
References _M_buf_size, _M_destroy_pback(), _M_mode, _M_set_buffer(), std::basic_streambuf< _CharT, _Traits >::eback(), std::basic_streambuf< _CharT, _Traits >::egptr(), std::basic_streambuf< _CharT, _Traits >::gptr(), std::ios_base::in, and overflow().
Referenced by pbackfail().

xsgetn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_filebuf< _CharT, _Traits >::xsgetn (
            char_type * __s,
            streamsize __n)  [protected], [virtual], [inherited]
```

Multiple character extraction.

Parameters

_↩ _s	A buffer area.
_↩ _n	Maximum number of characters to assign.

Returns

The number of characters assigned.

Fills __s[0] through __s[__n-1] with characters from the input sequence, as if by `sbumpc()`. Stops when either __n characters have been copied, or when `traits::eof()` would be copied.
It is expected that derived classes provide a more efficient implementation by overriding this definition.
Reimplemented from std::basic_streambuf< _CharT, _Traits >.
References _M_buf_size, _M_destroy_pback(), _M_mode, _M_pback_init, _M_reading, _M_set_buffer(), std::basic_streambuf< _CharT, _
std::basic_streambuf< _CharT, _Traits >::egptr(), std::basic_streambuf< _CharT, _Traits >::gbump(), std::basic_streambuf< _CharT, _T
std::ios_base::in, overflow(), std::basic_streambuf< _CharT, _Traits >::setg(), and std::basic_streambuf< char_type, traits_type >::xsgetn

xsputn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_filebuf< _CharT, _Traits >::xsputn (
            const char_type * __s,
            streamsize __n)  [protected], [virtual], [inherited]
```

Multiple character insertion.

Parameters

_↩ _s	A buffer area.
_↩ _n	Maximum number of characters to write.

Returns

The number of characters written.

Writes __s[0] through __s[__n-1] to the output sequence, as if by `sputc()`. Stops when either *n* characters have been copied, or when `sputc()` would return `traits::eof()`.
It is expected that derived classes provide a more efficient implementation by overriding this definition.
Reimplemented from std::basic_streambuf< _CharT, _Traits >.
References _M_buf_size, _M_mode, _M_reading, _M_set_buffer(), std::ios_base::app, std::basic_streambuf< _CharT, _Traits >::epptr(), std::ios_base::out, std::basic_streambuf< _CharT, _Traits >::pbase(), std::basic_streambuf< _CharT, _Traits >::pptr(), and std::basic_streambuf< char_type, traits_type >::xsputn().

6.930.4 Member Data Documentation

_M_buf

```
template<typename _CharT, typename _Traits>
char_type* std::basic_filebuf< _CharT, _Traits >::_M_buf  [protected], [inherited]
```

Pointer to the beginning of internal buffer.
Referenced by basic_filebuf(), and setbuf().

_M_buf_locale

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::_M_buf_locale  [protected], [inherited]
```

Current locale setting.
Referenced by std::basic_filebuf< _CharT, _Traits >::basic_filebuf().

_M_buf_size

```
template<typename _CharT, typename _Traits>
size_t std::basic_filebuf< _CharT, _Traits >::_M_buf_size  [protected], [inherited]
```

Actual size of internal buffer. This number is equal to the size of the put area + 1 position, reserved for the overflow char of a full area.
Referenced by basic_filebuf(), __gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf(), __gnu_cxx::stdio_filebuf< _CharT, _Traits >::
overflow(), setbuf(), underflow(), xsgetn(), and xsputn().

_M_ext_buf

```
template<typename _CharT, typename _Traits>
char* std::basic_filebuf< _CharT, _Traits >::_M_ext_buf  [protected], [inherited]
```

Buffer for external characters. Used for input when codecvt::always_noconv() == false. When valid, this corresponds to eback().
Referenced by basic_filebuf(), and imbue().

_M_ext_buf_size

```
template<typename _CharT, typename _Traits>
streamsize std::basic_filebuf< _CharT, _Traits >::_M_ext_buf_size  [protected], [inherited]
```

Size of buffer held by _M_ext_buf.
Referenced by basic_filebuf().

_M_ext_next

```
template<typename _CharT, typename _Traits>
const char* std::basic_filebuf< _CharT, _Traits >::_M_ext_next  [protected], [inherited]
```

Pointers into the buffer held by _M_ext_buf that delimit a subsequence of bytes that have been read but not yet converted. When valid, _M_ext_next corresponds to egptr().
Referenced by basic_filebuf(), and imbue().

_M_in_beg

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_in_beg  [protected], [inherited]
```

Start of get area.

_M_in_cur

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_in_cur  [protected], [inherited]
```

Current read area.

_M_in_end

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_in_end  [protected], [inherited]
```

End of get area.

_M_mode

```
template<typename _CharT, typename _Traits>
ios_base::openmode std::basic_filebuf< _CharT, _Traits >::_M_mode  [protected], [inherited]
```

Place to stash in || out || in | out settings for current filebuf.
Referenced by basic_filebuf(), __gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf(), __gnu_cxx::stdio_filebuf< _CharT, _Traits >::
close(), imbue(), open(), overflow(), pbackfail(), showmanyc(), underflow(), xsgetn(), and xsputn().

_M_out_beg

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_out_beg  [protected], [inherited]
```

Start of put area.

_M_out_cur

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_out_cur  [protected], [inherited]
```

Current put area.

_M_out_end

```
template<typename _CharT, typename _Traits>
char_type* std::basic_streambuf< _CharT, _Traits >::_M_out_end  [protected], [inherited]
```

End of put area.

_M_pback

```
template<typename _CharT, typename _Traits>
char_type std::basic_filebuf< _CharT, _Traits >::_M_pback  [protected], [inherited]
```

Necessary bits for putback buffer management.

Note

pbacks of over one character are not currently supported.

Referenced by basic_filebuf().

_M_pback_cur_save

```
template<typename _CharT, typename _Traits>
char_type* std::basic_filebuf< _CharT, _Traits >::_M_pback_cur_save  [protected], [inherited]
```

Necessary bits for putback buffer management.

Note

pbacks of over one character are not currently supported.

Referenced by basic_filebuf().

_M_pback_end_save

```
template<typename _CharT, typename _Traits>
char_type* std::basic_filebuf< _CharT, _Traits >::_M_pback_end_save  [protected], [inherited]
```

Necessary bits for putback buffer management.

Note

pbacks of over one character are not currently supported.

Referenced by basic_filebuf().

_M_pback_init

```
template<typename _CharT, typename _Traits>
bool std::basic_filebuf< _CharT, _Traits >::_M_pback_init  [protected], [inherited]
```

Necessary bits for putback buffer management.

Note

pbacks of over one character are not currently supported.

Referenced by basic_filebuf(), close(), pbackfail(), and xsgetn().

_M_reading

```
template<typename _CharT, typename _Traits>
bool std::basic_filebuf< _CharT, _Traits >::_M_reading  [protected], [inherited]
```

_M_reading == false && _M_writing == false for **uncommitted** mode; _M_reading == true for **read** mode; _M_writing == true for **write** mode;
NB: _M_reading == true && _M_writing == true is unused.
Referenced by basic_filebuf(), __gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf(), __gnu_cxx::stdio_filebuf< _CharT, _Traits >::
close(), imbue(), open(), overflow(), pbackfail(), seekoff(), xsgetn(), and xsputn().
The documentation for this class was generated from the following file:

- stdio_filebuf.h

6.931 __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits > Class Template Reference

6.931.1 Detailed Description

template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
class __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >

Provides a layer of compatibility for C.
This GNU extension provides extensions for working with standard C FILE*'s. It must be instantiated by the user with the type of character used in the file stream, e.g., stdio_filebuf<char>.

6.931.2 Member Function Documentation

eback()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::eback () const  [inline], [protected], [inherited]
```

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Referenced by std::basic_filebuf< char_type, traits_type >::_M_destroy_pback(), std::basic_filebuf< _CharT, _Traits >::imbue(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_filebuf< _CharT, _Traits >::pbackfail(), std::basic_stringbuf< _Cha std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos(), std::basic_streambuf< char_type, traits_type >::sputbackc(), std::basic_streambuf< char_type, traits_type >::sungetc(), std::basic_filebuf< _CharT, _Traits >::underflow(), and std::basic_filebuf< _CharT, _Traits >::xsgetn().

egptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::egptr () const  [inline], [protected], [inherited]
```

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Referenced by std::basic_filebuf< char_type, traits_type >::_M_create_pback(), std::basic_streambuf< char_type, traits_type >::in_avail std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_streambuf< char_type, traits_type >::sbumpc(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos(), std::basic_streambuf< char_type, traits_type >::sgetc(), std::basic_filebuf< _CharT, _Traits >::showmanyc(), std::basic_stringbuf< char std::basic_filebuf< _CharT, _Traits >::underflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::underflow(), std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow(), std::basic_filebuf< _CharT, _Traits >::xsgetn(), and xsgetn().

epptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::epptr () const  [inline], [protected], [inherited]
```

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Referenced by std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos(), std::basic_streambuf< char_type, traits_type >::sputc(), std::basic_filebuf< _CharT, _Traits >::xsputn(), and xsputn().

file()

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
std::__c_file * __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::file ()  [inline]
```

Returns

The underlying FILE*.

This function can be used to access the underlying C file pointer. Note that there is no way for the library to track what you do with the file, so be careful.

gbump()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::gbump (
            int __n)  [inline], [protected], [inherited]
```

Moving the read position.

Parameters

_↩ _n	The delta by which to move.

This just advances the read position without returning any data.
Referenced by std::basic_filebuf< _CharT, _Traits >::pbackfail(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::pbackfail(), std::basic_streambuf< char_type, traits_type >::sbumpc(), std::basic_streambuf< char_type, traits_type >::sputbackc(), std::basic_streambuf< char_type, traits_type >::sungetc(), std::basic_streambuf< char_type, traits_type >::uflow(), and std::basic_filebuf< _CharT, _Traits >::xsgetn().

getloc()

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::getloc () const  [inline], [inherited]
```

Locale access.

Returns

The current locale in effect.

If pubimbue(loc) has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.
Referenced by std::basic_streambuf< char_type, traits_type >::pubimbue().

gptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::gptr () const  [inline], [protected], [inherited]
```

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Referenced by std::basic_filebuf< char_type, traits_type >::_M_create_pback(), std::basic_filebuf< char_type, traits_type >::_M_destroy
std::basic_filebuf< _CharT, _Traits >::imbue(), std::basic_streambuf< char_type, traits_type >::in_avail(), std::basic_stringbuf< _CharT,
std::basic_filebuf< _CharT, _Traits >::pbackfail(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::pbackfail(), std::basic_streambuf< cha
std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_streambuf< char_type, traits_type >::sgetc(),
std::basic_filebuf< _CharT, _Traits >::showmanyc(), std::basic_stringbuf< char >::showmanyc(), std::basic_streambuf< char_type, traits
std::basic_streambuf< char_type, traits_type >::sungetc(), std::basic_streambuf< char_type, traits_type >::uflow(),
std::basic_filebuf< _CharT, _Traits >::underflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::underflow(),
std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow(), std::basic_filebuf< _CharT, _Traits >::xsgetn(), and
xsgetn().

imbue()

```
template<typename _CharT, typename _Traits>
virtual void std::basic_streambuf< _CharT, _Traits >::imbue (
            const locale & __loc)  [inline], [protected], [virtual], [inherited]
```

Changes translations.

Parameters

__loc	A new locale.

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

Note

Base class version does nothing.

Reimplemented in std::basic_filebuf< _CharT, _Traits >, std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >, std::basic_filebuf< _CharT, std::char_traits< _CharT > >, std::basic_filebuf< char >, std::basic_filebuf< char_type, traits_type >, and std::basic_filebuf< wchar_t >.
Referenced by std::basic_streambuf< char_type, traits_type >::pubimbue().

in_avail()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::in_avail ()  [inline], [inherited]
```

Looking ahead into the stream.

Returns

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

overflow()

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::overflow (
            int_type __c = traits_type::eof())  [inline], [protected], [virtual]
```

Consumes data from the buffer; writes to the controlled sequence.

Parameters

_↩ _c	An additional character to consume.

Returns

eof() to indicate failure, something else (usually __c, or not_eof())

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character *c* is also written out, if __c is not `eof()`.
For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.
A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

Note

Base class version does nothing, returns eof().

Reimplemented from std::basic_streambuf< _CharT, _Traits >.

pbackfail()

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::pbackfail (
            int_type __c = traits_type::eof())  [inline], [protected], [virtual]
```

Tries to back up the input sequence.

Parameters

_↩ _c	The character to be inserted back into the sequence.

Returns

eof() on failure, *some other value* on success

Postcondition

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

Note

Base class version does nothing, returns eof().

Reimplemented from std::basic_streambuf< _CharT, _Traits >.

pbase()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::pbase () const  [inline], [protected], [inherited]
```

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Referenced by std::basic_filebuf< _CharT, _Traits >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_filebuf< _CharT, _Traits >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_stringbuf< _CharT, std::basic_stringbuf< char >::str(), std::basic_filebuf< _CharT, _Traits >::sync(), and std::basic_filebuf< _CharT, _Traits >::xsputn().

pbump()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::pbump (
            int __n)  [inline], [protected], [inherited]
```

Moving the write position.

Parameters

_↩ _n	The delta by which to move.

This just advances the write position without returning any data.
Referenced by std::basic_filebuf< _CharT, _Traits >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), and std::basic_streambuf< char_type, traits_type >::sputc().

pptr()

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf< _CharT, _Traits >::pptr () const  [inline], [protected], [inherited]
```

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Referenced by std::basic_filebuf< _CharT, _Traits >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_filebuf< _CharT, _Traits >::seekoff(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(), std::basic_streambuf< char_t std::basic_filebuf< _CharT, _Traits >::sync(), std::basic_filebuf< _CharT, _Traits >::xsputn(), and xsputn().

pubimbue()

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf< _CharT, _Traits >::pubimbue (
            const locale & __loc)  [inline], [inherited]
```

Entry point for imbue().

Parameters

__loc	The new locale.

Returns

The previous locale.

Calls the derived imbue(__loc).

pubseekoff()

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
            off_type __off,
            ios_base::seekdir __way,
            ios_base::openmode __mode = ios_base::in | ios_base::out)  [inline], [inherited]
```

Alters the stream position.

Parameters

__off	Offset.
__way	Value for ios_base::seekdir.
__mode	Value for ios_base::openmode.

Calls virtual seekoff function.

pubseekpos()

```
template<typename _CharT, typename _Traits>
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
            pos_type __sp,
            ios_base::openmode __mode = ios_base::in | ios_base::out)  [inline], [inherited]
```

Alters the stream position.

Parameters

__sp	Position
__mode	Value for ios_base::openmode.

Calls virtual seekpos function.

pubsetbuf()

```
template<typename _CharT, typename _Traits>
basic_streambuf * std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
            char_type * __s,
            streamsize __n)  [inline], [inherited]
```

Entry points for derived buffer functions.
The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

pubsync()

```
template<typename _CharT, typename _Traits>
int std::basic_streambuf< _CharT, _Traits >::pubsync ()  [inline], [inherited]
```

Calls virtual sync function.
Referenced by std::basic_istream< _CharT, _Traits >::sync().

sbumpc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sbumpc ()  [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.
Referenced by std::basic_iostream< char_type, traits_type >::get(), std::basic_istream< _CharT, _Traits >::ignore(), and std::basic_streambuf< char_type, traits_type >::snextc().

seekoff()

```
template<typename _CharT, typename _Traits>
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekoff (
            off_type ,
            ios_base::seekdir ,
            ios_base::openmode  = ios_base::in | ios_base::out)  [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.
Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in std::basic_filebuf< _CharT, _Traits >, std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >, std::basic_filebuf< char >, std::basic_filebuf< char_type, traits_type >, std::basic_filebuf< wchar_t >, std::basic_stringbuf< _CharT, _Ti std::basic_stringbuf< char >, and std::basic_stringbuf< wchar_t >.
Referenced by std::basic_streambuf< char_type, traits_type >::pubseekoff().

seekpos()

```
template<typename _CharT, typename _Traits>
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekpos (
            pos_type ,
            ios_base::openmode  = ios_base::in | ios_base::out)  [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.
Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in std::basic_filebuf< _CharT, _Traits >, std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >, std::basic_filebuf< char >, std::basic_filebuf< char_type, traits_type >, std::basic_filebuf< wchar_t >, std::basic_stringbuf< _CharT, _Ti std::basic_stringbuf< char >, and std::basic_stringbuf< wchar_t >.
Referenced by std::basic_streambuf< char_type, traits_type >::pubseekpos().

setbuf()

```
template<typename _CharT, typename _Traits>
virtual basic_streambuf< char_type, _Traits > * std::basic_streambuf< _CharT, _Traits >::setbuf
(
            char_type * ,
            streamsize )  [inline], [protected], [virtual], [inherited]
```

Manipulates the buffer.
Each derived class provides its own appropriate behavior. See the next-to-last paragraph of https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering for more on this function.

Note

Base class version does nothing, returns `this`.

Reimplemented in std::basic_filebuf< _CharT, _Traits >, std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >, std::basic_filebuf< _CharT, std::char_traits< _CharT > >, std::basic_filebuf< char >, std::basic_filebuf< char_type, traits_type >, std::basic_stringbuf< _CharT, _Traits, _Alloc >, and std::basic_stringbuf< char >.
Referenced by std::basic_streambuf< char_type, traits_type >::pubsetbuf().

setg()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setg (
            char_type * __gbeg,
            char_type * __gnext,
            char_type * __gend)  [inline], [protected], [inherited]
```

Setting the three read area pointers.

Parameters

__gbeg	A pointer.
__gnext	A pointer.
__gend	A pointer.

Postcondition

__gbeg == `eback()`, *__gnext* == `gptr()`, and *__gend* == `egptr()`

Referenced by std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert(), std::basic_filebuf< char_type, traits_type >::_M_create
std::basic_filebuf< char_type, traits_type >::_M_destroy_pback(), std::basic_filebuf< char_type, traits_type >::_M_set_buffer(),
std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff(),
std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos(), and std::basic_filebuf< _CharT, _Traits >::xsgetn().

setp()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf< _CharT, _Traits >::setp (
            char_type * __pbeg,
            char_type * __pend)  [inline], [protected], [inherited]
```

Setting the three write area pointers.

Parameters

__pbeg	A pointer.
__pend	A pointer.

Postcondition

__pbeg == `pbase()`, *__pbeg* == `pptr()`, and *__pend* == `epptr()`

Referenced by std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert(), and std::basic_filebuf< char_type, traits_type >::_M_s

sgetc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sgetc ()  [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.
Referenced by std::basic_iostream< char_type, traits_type >::get(), std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _Traits >::ignore(), std::basic_istream< _CharT, _Traits >::igr and std::basic_streambuf< char_type, traits_type >::snextc().

sgetn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::sgetn (
             char_type * __s,
             streamsize __n)  [inline], [inherited]
```

Entry point for xsgetn.

Parameters

__s	A buffer area.
__n	A count.

Returns xsgetn(__s,__n). The effect is to fill __*s*[0] through __*s*[__n-1] with characters from the input sequence, if possible.

showmanyc()

```
template<typename _CharT, typename _Traits>
virtual streamsize std::basic_streambuf< _CharT, _Traits >::showmanyc ()  [inline], [protected],
[virtual], [inherited]
```

Investigating the data available.

Returns

An estimate of the number of characters available in the input sequence, or -1.

If it returns a positive value, then successive calls to `underflow()` *will not return* `traits::eof()` *until at least that number of characters have been supplied. If* `showmanyc()` *returns -1, then calls to* `underflow()` *or* `uflow()` *will fail.* [27.5.2.4.3]/1

Note

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to underflow or uflow] will not return* `eof()` *but that they will return immediately.*

The standard adds that *the morphemes of* `showmanyc` *are* ***es-how-many-see****, not* ***show-manic****.*

Reimplemented in std::basic_filebuf< _CharT, _Traits >, std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >, std::basic_filebuf< _CharT, std::char_traits< _CharT > >, std::basic_filebuf< char >, std::basic_filebuf< char_type, traits_type >, std::basic_filebuf< wchar_t >, std::basic_stringbuf< _CharT, _Traits, _Alloc >, std::basic_stringbuf< char >, and std::basic_stringbuf< wchar_t >.
Referenced by std::basic_streambuf< char_type, traits_type >::in_avail().

snextc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::snextc ()  [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.
Referenced by std::basic_iostream< char_type, traits_type >::get(), std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, char_traits< _CharT > >::get(), and std::basic_istream< _CharT, char_traits< _CharT > >::readsome().

sputbackc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sputbackc (
            char_type __c)  [inline], [inherited]
```

Pushing characters back into the input stream.

Parameters

__c	The character to push back.

Returns

The previous character, if possible.

Similar to sungetc(), but *__c* is pushed onto the stream instead of *the previous character.* If successful, the next character fetched from the input stream will be *__c*.
Referenced by std::basic_istream< _CharT, _Traits >::putback().

sputc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sputc (
            char_type __c)  [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

_↩ _c	A character to output.

Returns

__c, if possible.

One of two public output functions.
If a write position is available for the output sequence (i.e., the buffer is not full), stores __c in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(↩ __c)`.
Referenced by std::wbuffer_convert< _Codecvt, _Elem, _Tr >::overflow().

sputn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::sputn (
            const char_type * __s,
            streamsize __n)  [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

_↩ _s	A buffer read area.
_↩ _n	A count.

One of two public output functions.
Returns xsputn(__s,__n). The effect is to write __s[0] through __s[__n-1] to the output sequence, if possible.

sungetc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf< _CharT, _Traits >::sungetc ()  [inline], [inherited]
```

Moving backwards in the input stream.

Returns

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns pbackfail(). The effect is to *unget* the last character *gotten*.
Referenced by std::basic_istream< _CharT, _Traits >::unget().

sync()

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::sync ()  [inline], [protected],
[virtual]
```

Synchronizes the buffer arrays with the controlled sequences.

Returns

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

Note

Base class version does nothing, returns zero.

Reimplemented from std::basic_streambuf< _CharT, _Traits >.

uflow()

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::uflow ()  [inline], [protected],
[virtual]
```

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.
Reimplemented from std::basic_streambuf< _CharT, _Traits >.

underflow()

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::underflow ()  [inline], [protected],
[virtual]
```

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.
For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.
A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html

Note

Base class version does nothing, returns eof().

Reimplemented from std::basic_streambuf< _CharT, _Traits >.

xsgetn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::xsgetn (
            char_type * __s,
            streamsize __n)  [protected], [virtual], [inherited]
```

Multiple character extraction.

Parameters

_↩ _s	A buffer area.
_↩ _n	Maximum number of characters to assign.

Returns

The number of characters assigned.

Fills __s[0] through __s[__n-1] with characters from the input sequence, as if by `sbumpc()`. Stops when either __n characters have been copied, or when `traits::eof()` would be copied.
It is expected that derived classes provide a more efficient implementation by overriding this definition.
Reimplemented in std::basic_filebuf< _CharT, _Traits >, std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >, std::basic_filebuf< _CharT, std::char_traits< _CharT > >, std::basic_filebuf< char >, and std::basic_filebuf< char_type, traits_type >.
References egptr(), gptr(), std::min(), and uflow().
Referenced by std::basic_streambuf< char_type, traits_type >::sgetn().

xsputn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf< _CharT, _Traits >::xsputn (
            const char_type * __s,
            streamsize __n)  [protected], [virtual], [inherited]
```

Multiple character insertion.

Parameters

_↩ _s	A buffer area.
_↩ _n	Maximum number of characters to write.

Returns

The number of characters written.

Writes __s[0] through __s[__n-1] to the output sequence, as if by `sputc()`. Stops when either *n* characters have been copied, or when `sputc()` would return `traits::eof()`.
It is expected that derived classes provide a more efficient implementation by overriding this definition.
Reimplemented in std::basic_filebuf< _CharT, _Traits >, std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >, std::basic_filebuf< _CharT, std::char_traits< _CharT > >, std::basic_filebuf< char >, and std::basic_filebuf< char_type, traits_type >.
References epptr(), std::min(), overflow(), and pptr().
Referenced by std::basic_streambuf< char_type, traits_type >::sputn().

6.938.1 Detailed Description

template<typename _RealType = double>
class std::student_t_distribution< _RealType >

A student_t_distribution random number distribution.
The formula for the normal probability mass function is:

$$p(x|n) = \frac{1}{\sqrt{(n\pi)}} \frac{\Gamma((n+1)/2)}{\Gamma(n/2)} (1 + \frac{x^2}{n})^{-(n+1)/2}$$

Since

C++11

6.938.2 Member Typedef Documentation

result_type

```
template<typename _RealType = double>
typedef _RealType std::student_t_distribution< _RealType >::result_type
```

The type of the range of the distribution.

6.938.3 Member Function Documentation

max()

```
template<typename _RealType = double>
result_type std::student_t_distribution< _RealType >::max () const  [inline]
```

Returns the least upper bound value of the distribution.

min()

```
template<typename _RealType = double>
result_type std::student_t_distribution< _RealType >::min () const  [inline]
```

Returns the greatest lower bound value of the distribution.

operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::student_t_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng)  [inline]
```

Generating functions.

param() [1/2]

```
template<typename _RealType = double>
param_type std::student_t_distribution< _RealType >::param () const  [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _RealType = double>
void std::student_t_distribution< _RealType >::param (
            const param_type & __param)  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

reset()

```
template<typename _RealType = double>
void std::student_t_distribution< _RealType >::reset ()  [inline]
```

Resets the distribution state.

6.938.4 Friends And Related Symbol Documentation

operator<<

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::student_t_distribution< _RealType1 > & __x)  [friend]
```

Inserts a student_t_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A student_t_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _RealType = double>
bool operator== (
             const student_t_distribution< _RealType > & __d1,
             const student_t_distribution< _RealType > & __d2)  [friend]
```

Return true if two Student t distributions have the same parameters and the sequences that would be generated are equal.

operator>>

```
template<typename _RealType = double>
template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
             std::basic_istream< _CharT, _Traits > & __is,
             std::student_t_distribution< _RealType1 > & __x)  [friend]
```

Extracts a student_t_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A student_t_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

6.939.1 Detailed Description

template<typename _BiIter>
class std::sub_match< _BiIter >

A sequence of characters matched by a particular marked sub-expression.
An object of this class is essentially a pair of iterators marking a matched subexpression within a regular expression pattern match. Such objects can be converted to and compared with std::basic_string objects of the same character type as the pattern matched by the regular expression.
A `sub_match<Iter>` has a public base class of type `pair<Iter, Iter>`, so inherits pair's data members named `first` and `second`. The iterators that make up the pair are the usual half-open interval referencing the actual original pattern matched.

Since

C++11

6.939.2 Member Function Documentation

compare() [1/3]

```
template<typename _BiIter>
int std::sub_match< _BiIter >::compare (
            const string_type & __s) const  [inline]
```

Compares this sub_match to a string.

Parameters

_↩ _s	A string to compare to this sub_match.

Return values

negative	This matched sequence will collate before __s.
zero	This matched sequence is equivalent to __s.
positive	This matched sequence will collate after __s.

compare() [2/3]

```
template<typename _BiIter>
int std::sub_match< _BiIter >::compare (
            const sub_match< _BiIter > & __s) const  [inline]
```

Compares this and another matched sequence.

Parameters

_↩ _s	Another matched sequence to compare to this one.

Return values

negative	This matched sequence will collate before __s.
zero	This matched sequence is equivalent to __s.
positive	This matched sequence will collate after __s.

Referenced by std::sub_match< const char * >::operator==(), and std::sub_match< const char * >::operator==().

compare() [3/3]

```
template<typename _BiIter>
int std::sub_match< _BiIter >::compare (
            const value_type * __s) const  [inline]
```

Compares this sub_match to a string.

Parameters

_↩ _s	A string to compare to this sub_match.

Return values

negative	This matched sequence will collate before __s.
zero	This matched sequence is equivalent to __s.
positive	This matched sequence will collate after __s.

length()

```
template<typename _BiIter>
difference_type std::sub_match< _BiIter >::length () const  [inline], [noexcept]
```

Gets the length of the matching sequence.

operator string_type()

```
template<typename _BiIter>
std::sub_match< _BiIter >::operator string_type () const  [inline]
```

Gets the matching sequence as a string.

Returns

the matching sequence as a string.

This is the implicit conversion operator. It is identical to the str() member function except that it will want to pop up in unexpected places and cause a great deal of confusion and cursing from the unwary.

str()

```
template<typename _BiIter>
string_type std::sub_match< _BiIter >::str () const  [inline]
```

Gets the matching sequence as a string.

Returns

the matching sequence as a string.

Referenced by std::sub_match< const char * >::operator string_type().

swap()

```
template<typename _BiIter>
void std::sub_match< _BiIter >::swap (
            sub_match< _BiIter > & __s)  [inline], [noexcept]
```

Swap the values of two sub_match objects.

6.941.1 Detailed Description

template<typename _UIntType, size_t __w, size_t __s, size_t __r>
class std::subtract_with_carry_engine< _UIntType, __w, __s, __r >

The Marsaglia-Zaman generator.
This is a model of a Generalized Fibonacci discrete random number generator, sometimes referred to as the SWC generator.
A discrete random number generator that produces pseudorandom numbers using:

$$x_i \leftarrow (x_{i-s} - x_{i-r} - carry_{i-1}) \bmod m$$

The size of the state is r and the maximum period of the generator is $(m^r - m^s - 1)$.

Since

C++11

6.941.2 Member Typedef Documentation

result_type

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
typedef _UIntType std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::result_type
```

The type of the generated random value.

6.941.3 Constructor & Destructor Documentation

subtract_with_carry_engine() [1/2]

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::subtract_with_carry_engine (
            result_type __sd)  [inline], [explicit]
```

Constructs an explicitly seeded subtract_with_carry_engine random number generator.

subtract_with_carry_engine() [2/2]

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::subtract_with_carry_engine (
            _Sseq & __q)  [inline], [explicit]
```

Constructs a subtract_with_carry_engine random number engine seeded from the seed sequence __q.

Parameters

_↩ _q	the seed sequence.

6.941.4 Member Function Documentation

discard()

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
void std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::discard (
            unsigned long long __z)  [inline]
```

Discard a sequence of random numbers.

max()

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
constexpr result_type std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::max ()  [inline],
[static], [constexpr]
```

Gets the inclusive maximum value of the range of random integers returned by this generator.

min()

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
constexpr result_type std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::min ()  [inline],
[static], [constexpr]
```

Gets the inclusive minimum value of the range of random integers returned by this generator.

operator()()

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
subtract_with_carry_engine< _UIntType, __w, __s, __r >::result_type std::subtract_with_carry_engine<
_UIntType, __w, __s, __r >::operator() ()
```

Gets the next random number in the sequence.

seed() [1/2]

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
template<typename _Sseq>
auto std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::seed (
            _Sseq & __q) -> _If_seed_seq< _Sseq >
```

Seeds the initial state x_0 of the % subtract_with_carry_engine random number generator.

seed() [2/2]

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
```

```
void std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::seed (
            result_type __sd = 0u)
```

Seeds the initial state x_0 of the random number generator.
N1688[4.19] modifies this as follows. If __value == 0, sets value to 19780503. In any case, with a linear congruential generator lcg(i) having parameters $m_{lcg} = 2147483563, a_{lcg} = 40014, c_{lcg} = 0, and lcg(0) = value$, sets $x_{-r} \dots x_{-1}$ to $lcg(1) \bmod m \dots lcg(r) \bmod m$ respectively. If $x_{-1} = 0$ set carry to 1, otherwise sets carry to 0.
Referenced by std::subtract_with_carry_engine< uint_fast32_t, 24, 10, 24 >::subtract_with_carry_engine(), and std::subtract_with_carry_engine< uint_fast32_t, 24, 10, 24 >::subtract_with_carry_engine().

6.941.5 Friends And Related Symbol Documentation

operator<<

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
template<typename _UIntType1, size_t __w1, size_t __s1, size_t __r1, typename _CharT, typename _↩
Traits>
std::basic_ostream< _CharT, _Traits > & operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::subtract_with_carry_engine< _UIntType1, __w1, __s1, __r1 > & __x)  [friend]
```

Inserts the current state of a % subtract_with_carry_engine random number generator engine __x into the output stream __os.

Parameters

__os	An output stream.
__x	A % subtract_with_carry_engine random number generator engine.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
bool operator== (
            const subtract_with_carry_engine< _UIntType, __w, __s, __r > & __lhs,
            const subtract_with_carry_engine< _UIntType, __w, __s, __r > & __rhs)  [friend]
```

Compares two % subtract_with_carry_engine random number generator objects of the same type for equality.

Parameters

__lhs	A % subtract_with_carry_engine random number generator object.
__rhs	Another % subtract_with_carry_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

operator>>

```
template<typename _UIntType, size_t __w, size_t __s, size_t __r>
template<typename _UIntType1, size_t __w1, size_t __s1, size_t __r1, typename _CharT, typename _↩
Traits>
std::basic_istream< _CharT, _Traits > & operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::subtract_with_carry_engine< _UIntType1, __w1, __s1, __r1 > & __x)  [friend]
```

Extracts the current state of a % subtract_with_carry_engine random number generator engine __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A % subtract_with_carry_engine random number generator engine.

Returns

The input stream with the state of __x extracted or in an error state.

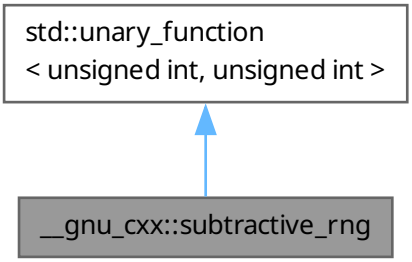
6.942 __gnu_cxx::subtractive_rng Class Reference

`#include <functional>`

Inheritance diagram for __gnu_cxx::subtractive_rng:



Public Types

- typedef unsigned int argument_type
- typedef unsigned int result_type

Public Member Functions

- subtractive_rng ()
- subtractive_rng (unsigned int __seed)
- void **_M_initialize** (unsigned int __seed)
- unsigned int operator() (unsigned int __limit)

6.942.1 Detailed Description

The `subtractive_rng` class is documented on `SGI's site`. Note that this code assumes that `int` is 32 bits.

6.942.2 Member Typedef Documentation

argument_type

```
typedef unsigned int std::unary_function< unsigned int, unsigned int >::argument_type  [inherited]
```

`argument_type` is the type of the argument

result_type

```
typedef unsigned int std::unary_function< unsigned int, unsigned int >::result_type  [inherited]
```

`result_type` is the return type

6.942.3 Constructor & Destructor Documentation

subtractive_rng() [1/2]

```
__gnu_cxx::subtractive_rng::subtractive_rng (
            unsigned int __seed)  [inline]
```

Ctor allowing you to initialize the seed.

subtractive_rng() [2/2]

```
__gnu_cxx::subtractive_rng::subtractive_rng ()  [inline]
```

Default ctor; initializes its state with some number you don't see.

6.942.4 Member Function Documentation

operator()()

```
unsigned int __gnu_cxx::subtractive_rng::operator() (
            unsigned int __limit)  [inline]
```

Returns a number less than the argument.

- ~temporary_buffer ()
- size_type _M_requested_size () const
- iterator begin ()
- iterator end ()
- size_type size () const

Protected Attributes

- struct std::_Temporary_buffer::_Impl **_M_impl**
- size_type **_M_original_len**

6.947.1 Detailed Description

template<class _ForwardIterator, class _Tp = typename std::iterator_traits<_ForwardIterator>::value_type>
struct __gnu_cxx::temporary_buffer< _ForwardIterator, _Tp >

This class provides similar behavior and semantics of the standard functions get_temporary_buffer() and return_↩ temporary_buffer(), but encapsulated in a type vaguely resembling a standard container.
By default, a temporary_buffer<Iter> stores space for objects of whatever type the Iter iterator points to. It is constructed from a typical [first,last) range, and provides the begin(), end(), size() functions, as well as requested_size(). For non-trivial types, copies of *first will be used to initialize the storage.
`malloc` is used to obtain underlying storage.
Like get_temporary_buffer(), not all the requested memory may be available. Ideally, the created buffer will be large enough to hold a copy of [first,last), but if size() is less than requested_size(), then this didn't happen.

6.947.2 Constructor & Destructor Documentation

temporary_buffer()

```
template<class _ForwardIterator, class _Tp = typename std::iterator_traits<_ForwardIterator>::↩
value_type>
__gnu_cxx::temporary_buffer< _ForwardIterator, _Tp >::temporary_buffer (
            _ForwardIterator __first,
            _ForwardIterator __last)  [inline]
```

Requests storage large enough to hold a copy of [first,last).
References std::_Temporary_buffer< _ForwardIterator, _Tp >::_Temporary_buffer(), and __gnu_cxx::distance().

~temporary_buffer()

```
template<class _ForwardIterator, class _Tp = typename std::iterator_traits<_ForwardIterator>::↩
value_type>
__gnu_cxx::temporary_buffer< _ForwardIterator, _Tp >::~temporary_buffer ()  [inline]
```

Destroys objects and frees storage.

6.947.3 Member Function Documentation

_M_requested_size()

```
template<typename _ForwardIterator, typename _Tp>
size_type std::_Temporary_buffer< _ForwardIterator, _Tp >::_M_requested_size () const  [inline],
[inherited]
```

Returns the size requested by the constructor; may be >size().

begin()

```
template<typename _ForwardIterator, typename _Tp>
iterator std::_Temporary_buffer< _ForwardIterator, _Tp >::begin ()  [inline], [inherited]
```

As per Table mumble.
Referenced by _Temporary_buffer().

end()

```
template<typename _ForwardIterator, typename _Tp>
iterator std::_Temporary_buffer< _ForwardIterator, _Tp >::end ()  [inline], [inherited]
```

As per Table mumble.
Referenced by _Temporary_buffer().

size()

```
template<typename _ForwardIterator, typename _Tp>
size_type std::_Temporary_buffer< _ForwardIterator, _Tp >::size () const  [inline], [inherited]
```

As per Table mumble.

6.950.1 Detailed Description

A std::thread represents a new thread of execution.
The default constructor creates an object that does not own a thread. The `thread(F&&, Args&&...)` constructor invokes a callable in a new thread, and owns that new thread. A `std::thread` that owns a thread is *joinable*. Joining a thread waits for it to finish executing, which happens when the callable running in that thread returns.
A `std::thread` cannot be copied, but can be moved. Moving a joinable object transfers ownership of its thread to another object.
A joinable `std::thread` must be explicitly joined (or detached) before it is destroyed or assigned to. Attempting to destroy a joinable thread will terminate the whole process.

Since

C++11

6.958.1 Detailed Description

template<typename _CharT, typename _InIter>
class std::time_get< _CharT, _InIter >

Primary class template time_get.
This facet encapsulates the code to parse and return a date or time from a string. It is used by the istream numeric extraction operators.
The time_get template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the time_get facet.

6.958.2 Member Typedef Documentation

char_type

```
template<typename _CharT, typename _InIter>
typedef _CharT std::time_get< _CharT, _InIter >::char_type
```

Public typedefs.

iter_type

```
template<typename _CharT, typename _InIter>
typedef _InIter std::time_get< _CharT, _InIter >::iter_type
```

Public typedefs.

6.958.3 Constructor & Destructor Documentation

time_get()

```
template<typename _CharT, typename _InIter>
std::time_get< _CharT, _InIter >::time_get (
            size_t __refs = 0)  [inline], [explicit]
```

Constructor performs initialization.
This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

References std::locale::facet::facet().

~time_get()

```
template<typename _CharT, typename _InIter>
virtual std::time_get< _CharT, _InIter >::~time_get ()  [inline], [protected], [virtual]
```

Destructor.

6.958.4 Member Function Documentation

date_order()

```
template<typename _CharT, typename _InIter>
dateorder std::time_get< _CharT, _InIter >::date_order () const  [inline]
```

Return preferred order of month, day, and year.

This function returns an enum from time_base::dateorder giving the preferred ordering if the format *x* given to time_put::put() only uses month, day, and year. If the format *x* for the associated locale uses other fields, this function returns time_base::dateorder::noorder.
NOTE: The library always returns noorder at the moment.

Returns

A member of time_base::dateorder.

References do_date_order().

do_date_order()

```
template<typename _CharT, typename _InIter>
_GLIBCXX_END_NAMESPACE_LDBL_OR_CXX11 time_base::dateorder std::time_get< _CharT, _InIter >::do_date_order () const  [protected], [virtual]
```

Return preferred order of month, day, and year.
This function returns an enum from time_base::dateorder giving the preferred ordering if the format *x* given to time_put::put() only uses month, day, and year. This function is a hook for derived classes to change the value returned.

Returns

A member of time_base::dateorder.

Referenced by date_order().

do_get()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get (
            iter_type __s,
            iter_type __end,
            ios_base & __f,
            ios_base::iostate & __err,
            tm * __tm,
            char __format,
            char __modifier) const  [inline], [protected]
```

Parse input string according to format.
This function parses the string according to the provided format and optional modifier. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__s	Start of string to parse.
__end	End of string to parse.
__f	Source of the locale.

__err	Error flags to set.
__tm	Pointer to struct tm to fill in.
__format	Format specifier.
__modifier	Format modifier.

Returns

Iterator to first char not parsed.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::goodbit, std::use_facet(), and std::__ctype_abstract_base< _
Referenced by get(), and get().

do_get_date()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_date (
             iter_type __beg,
             iter_type __end,
             ios_base & __io,
             ios_base::iostate & __err,
             tm * __tm) const  [protected], [virtual]
```

Parse input date string.
This function parses a date according to the format *X* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_date() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, and std::use_facet().
Referenced by get_date().

do_get_monthname()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_monthname (
             iter_type __beg,
             iter_type __end,
```

```
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm) const  [protected], [virtual]
```

Parse input month string.
This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_monthname() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, std::ios_base::goodbit, and std::use_facet().
Referenced by get_monthname().

do_get_time()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_time (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm) const  [protected], [virtual]
```

Parse input time string.
This function parses a time according to the format *x* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_time() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.

__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, and std::use_facet().
Referenced by get_time().

do_get_weekday()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_weekday (
             iter_type __beg,
             iter_type __end,
             ios_base & __io,
             ios_base::iostate & __err,
             tm * __tm) const  [protected], [virtual]
```

Parse input weekday string.
This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_weekday() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, std::ios_base::goodbit, and std::use_facet().
Referenced by get_weekday().

do_get_year()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_year (
             iter_type __beg,
             iter_type __end,
             ios_base & __io,
```

```
            ios_base::iostate & __err,
            tm * __tm) const  [protected], [virtual]
```

Parse input year string.
This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_year() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, std::ios_base::goodbit, std::__ctype_abstract_base< _
and std::use_facet().
Referenced by get_year().

get() [1/2]

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get (
            iter_type __s,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm,
            char __format,
            char __modifier = 0) const  [inline]
```

Parse input string according to format.
This function calls time_get::do_get with the provided parameters.

See also

do_get() and get().

Parameters

__s	Start of string to parse.
__end	End of string to parse.

__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.
__format	Format specifier.
__modifier	Format modifier.

Returns

Iterator to first char not parsed.

References do_get().

get() [2/2]

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::get (
            iter_type __s,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm,
            const char_type * __fmt,
            const char_type * __fmtend) const  [inline]
```

Parse input string according to format.
This function parses the input string according to a provided format string. It does the inverse of time_put::put. The format string follows the format specified for strftime(3)/strptime(3). The actual parsing is done by time_get::do_get.

Parameters

__s	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.
__fmt	Start of the format string.
__fmtend	End of the format string.

Returns

Iterator to first char not parsed.

References std::ios_base::_M_getloc(), do_get(), std::ios_base::eofbit, std::ios_base::failbit, std::ios_base::goodbit, std::__ctype_abstract_base< _CharT >::is(), std::__ctype_abstract_base< _CharT >::narrow(), std::__ctype_abstract_base< _CharT > std::__ctype_abstract_base< _CharT >::toupper(), and std::use_facet().

get_date()

```
template<typename _CharT, typename _InIter>
```

```
iter_type std::time_get< _CharT, _InIter >::get_date (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm) const  [inline]
```

Parse input date string.
This function parses a date according to the format *x* and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_date().
If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

References do_get_date().

get_monthname()

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_monthname (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm) const  [inline]
```

Parse input month string.
This function parses a month name and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_monthname().
Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.
If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.

__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

References do_get_monthname().

get_time()

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_time (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm) const  [inline]
```

Parse input time string.
This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_time().
If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

References do_get_time().

get_weekday()

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_weekday (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm) const  [inline]
```

Parse input weekday string.
This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_weekday().

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.
If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

References do_get_weekday().

get_year()

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_year (
             iter_type __beg,
             iter_type __end,
             ios_base & __io,
             ios_base::iostate & __err,
             tm * __tm) const  [inline]
```

Parse input year string.
This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_year().
4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.
If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

References do_get_year().

6.959.1 Detailed Description

template<typename _CharT, typename _InIter>
class std::time_get_byname< _CharT, _InIter >

class time_get_byname [22.2.5.2].

6.959.2 Member Function Documentation

date_order()

```
template<typename _CharT, typename _InIter>
dateorder std::time_get< _CharT, _InIter >::date_order () const  [inline], [inherited]
```

Return preferred order of month, day, and year.
This function returns an enum from time_base::dateorder giving the preferred ordering if the format *x* given to time_put::put() only uses month, day, and year. If the format *x* for the associated locale uses other fields, this function returns time_base::dateorder::noorder.
NOTE: The library always returns noorder at the moment.

Returns

A member of time_base::dateorder.

References do_date_order().

do_date_order()

```
template<typename _CharT, typename _InIter>
_GLIBCXX_END_NAMESPACE_LDBL_OR_CXX11 time_base::dateorder std::time_get< _CharT, _InIter >::do_date_order () const  [protected], [virtual], [inherited]
```

Return preferred order of month, day, and year.
This function returns an enum from time_base::dateorder giving the preferred ordering if the format *x* given to time_put::put() only uses month, day, and year. This function is a hook for derived classes to change the value returned.

Returns

A member of time_base::dateorder.

Referenced by date_order().

do_get()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get (
            iter_type __s,
            iter_type __end,
            ios_base & __f,
            ios_base::iostate & __err,
            tm * __tm,
            char __format,
            char __modifier) const  [inline], [protected], [inherited]
```

Parse input string according to format.
This function parses the string according to the provided format and optional modifier. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__s	Start of string to parse.

__end	End of string to parse.
__f	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.
__format	Format specifier.
__modifier	Format modifier.

Returns

Iterator to first char not parsed.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::goodbit, std::use_facet(), and std::__ctype_abstract_base< _
Referenced by get(), and get().

do_get_date()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_date (
             iter_type __beg,
             iter_type __end,
             ios_base & __io,
             ios_base::iostate & __err,
             tm * __tm) const  [protected], [virtual], [inherited]
```

Parse input date string.
This function parses a date according to the format *X* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_date() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, and std::use_facet().
Referenced by get_date().

do_get_monthname()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_monthname (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm) const  [protected], [virtual], [inherited]
```

Parse input month string.
This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_monthname() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, std::ios_base::goodbit, and std::use_facet().
Referenced by get_monthname().

do_get_time()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_time (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm) const  [protected], [virtual], [inherited]
```

Parse input time string.
This function parses a time according to the format *x* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_time() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, and std::use_facet().
Referenced by get_time().

do_get_weekday()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_weekday (
             iter_type __beg,
             iter_type __end,
             ios_base & __io,
             ios_base::iostate & __err,
             tm * __tm) const  [protected], [virtual], [inherited]
```

Parse input weekday string.
This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_weekday() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, std::ios_base::goodbit, and std::use_facet().
Referenced by get_weekday().

do_get_year()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::do_get_year (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm) const  [protected], [virtual], [inherited]
```

Parse input year string.
This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_year() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, std::ios_base::goodbit, std::__ctype_abstract_base< _
and std::use_facet().
Referenced by get_year().

get() [1/2]

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get (
            iter_type __s,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm,
            char __format,
            char __modifier = 0) const  [inline], [inherited]
```

Parse input string according to format.
This function calls time_get::do_get with the provided parameters.

See also

do_get() and get().

Parameters

__s	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.
__format	Format specifier.
__modifier	Format modifier.

Returns

Iterator to first char not parsed.

References do_get().

get() [2/2]

```
template<typename _CharT, typename _InIter>
_InIter std::time_get< _CharT, _InIter >::get (
             iter_type __s,
             iter_type __end,
             ios_base & __io,
             ios_base::iostate & __err,
             tm * __tm,
             const char_type * __fmt,
             const char_type * __fmtend) const  [inline], [inherited]
```

Parse input string according to format.

This function parses the input string according to a provided format string. It does the inverse of time_put::put. The format string follows the format specified for strftime(3)/strptime(3). The actual parsing is done by time_get::do_get.

Parameters

__s	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.
__fmt	Start of the format string.
__fmtend	End of the format string.

Returns

Iterator to first char not parsed.

References std::ios_base::_M_getloc(), do_get(), std::ios_base::eofbit, std::ios_base::failbit, std::ios_base::goodbit, std::__ctype_abstract_base< _CharT >::is(), std::__ctype_abstract_base< _CharT >::narrow(), std::__ctype_abstract_base< _CharT >::toupper(), and std::use_facet().

get_date()

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_date (
             iter_type __beg,
             iter_type __end,
             ios_base & __io,
             ios_base::iostate & __err,
             tm * __tm) const  [inline], [inherited]
```

Parse input date string.
This function parses a date according to the format *x* and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_date().
If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

References do_get_date().

get_monthname()

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_monthname (
             iter_type __beg,
             iter_type __end,
             ios_base & __io,
             ios_base::iostate & __err,
             tm * __tm) const  [inline], [inherited]
```

Parse input month string.
This function parses a month name and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_monthname().
Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

References do_get_monthname().

get_time()

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_time (
             iter_type __beg,
             iter_type __end,
             ios_base & __io,
             ios_base::iostate & __err,
             tm * __tm) const  [inline], [inherited]
```

Parse input time string.
This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_time().
If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

References do_get_time().

get_weekday()

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_weekday (
```

```
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm) const  [inline], [inherited]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_weekday().

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

References do_get_weekday().

get_year()

```
template<typename _CharT, typename _InIter>
iter_type std::time_get< _CharT, _InIter >::get_year (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm) const  [inline], [inherited]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_year().

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.

__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

References do_get_year().

6.961.1 Detailed Description

template<typename _CharT, typename _OutIter>
class std::time_put< _CharT, _OutIter >

Primary class template time_put.
This facet encapsulates the code to format and output dates and times according to formats used by strftime().
The time_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the time_put facet.

6.961.2 Member Typedef Documentation

char_type

```
template<typename _CharT, typename _OutIter>
typedef _CharT std::time_put< _CharT, _OutIter >::char_type
```

Public typedefs.

iter_type

```
template<typename _CharT, typename _OutIter>
typedef _OutIter std::time_put< _CharT, _OutIter >::iter_type
```

Public typedefs.

6.961.3 Constructor & Destructor Documentation

time_put()

```
template<typename _CharT, typename _OutIter>
std::time_put< _CharT, _OutIter >::time_put (
            size_t __refs = 0)  [inline], [explicit]
```

Constructor performs initialization.
This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

References std::locale::facet::facet().

~time_put()

```
template<typename _CharT, typename _OutIter>
virtual std::time_put< _CharT, _OutIter >::~time_put ()  [inline], [protected], [virtual]
```

Destructor.

6.961.4 Member Function Documentation

do_put()

```
template<typename _CharT, typename _OutIter>
_OutIter std::time_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            const tm * __tm,
            char __format,
            char __mod) const  [protected], [virtual]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

See also

put() for more details.

Parameters

__s	The stream to write to.
__io	Source of locale.
__fill	char_type to use for padding.
__tm	Struct tm with date and time info to format.
__format	Format char.
__mod	Optional modifier char.

Returns

Iterator after writing.

References std::ios_base::_M_getloc(), std::use_facet(), and std::__ctype_abstract_base< _CharT >::widen().
Referenced by put(), and put().

put() [1/2]

```
template<typename _CharT, typename _OutIter>
iter_type std::time_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            const tm * __tm,
```

```
            char __format,
            char __mod = 0) const  [inline]
```

Format and output a time or date.
This function formats the data in struct tm according to the provided format char and optional modifier. The format and modifier are interpreted as by strftime(). It does so by returning time_put::do_put().

Parameters

__s	The stream to write to.
__io	Source of locale.
__fill	char_type to use for padding.
__tm	Struct tm with date and time info to format.
__format	Format char.
__mod	Optional modifier char.

Returns

Iterator after writing.

References do_put().

put() [2/2]

```
template<typename _CharT, typename _OutIter>
_OutIter std::time_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            const tm * __tm,
            const _CharT * __beg,
            const _CharT * __end) const
```

Format and output a time or date.
This function formats the data in struct tm according to the provided format string. The format string is interpreted as by strftime().

Parameters

__s	The stream to write to.
__io	Source of locale.
__fill	char_type to use for padding.
__tm	Struct tm with date and time info to format.
__beg	Start of format string.
__end	End of format string.

Returns

Iterator after writing.

References std::ios_base::_M_getloc(), do_put(), std::__ctype_abstract_base< _CharT >::narrow(), and std::use_facet().

6.961.5 Member Data Documentation

id

6.962.1 Detailed Description

template<typename _CharT, typename _OutIter>
class std::time_put_byname< _CharT, _OutIter >

class time_put_byname [22.2.5.4].

6.962.2 Member Function Documentation

do_put()

```
template<typename _CharT, typename _OutIter>
_OutIter std::time_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            const tm * __tm,
            char __format,
            char __mod) const  [protected], [virtual], [inherited]
```

Format and output a time or date.
This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

See also

put() for more details.

Parameters

__s	The stream to write to.
__io	Source of locale.

__fill	char_type to use for padding.
__tm	Struct tm with date and time info to format.
__format	Format char.
__mod	Optional modifier char.

Returns

Iterator after writing.

References std::ios_base::_M_getloc(), std::use_facet(), and std::__ctype_abstract_base< _CharT >::widen().
Referenced by put(), and put().

put() [1/2]

```
template<typename _CharT, typename _OutIter>
iter_type std::time_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            const tm * __tm,
            char __format,
            char __mod = 0) const  [inline], [inherited]
```

Format and output a time or date.
This function formats the data in struct tm according to the provided format char and optional modifier. The format and modifier are interpreted as by strftime(). It does so by returning time_put::do_put().

Parameters

__s	The stream to write to.
__io	Source of locale.
__fill	char_type to use for padding.
__tm	Struct tm with date and time info to format.
__format	Format char.
__mod	Optional modifier char.

Returns

Iterator after writing.

References do_put().

put() [2/2]

```
template<typename _CharT, typename _OutIter>
_OutIter std::time_put< _CharT, _OutIter >::put (
            iter_type __s,
```

```
        ios_base & __io,

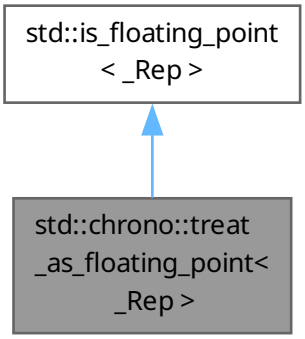
6.965 std::chrono::treat_as_floating_point< _Rep > Struct Template Reference

`#include <chrono.h>`

Inheritance diagram for std::chrono::treat_as_floating_point< _Rep >:



6.965.1 Detailed Description

template<typename _Rep>
struct std::chrono::treat_as_floating_point< _Rep >

Trait indicating whether to treat a type as a floating-point type.
The chrono library uses this trait to tell whether a `duration` can represent fractional values of the given precision, or only integral values.
You should specialize this trait for your own numeric types that are used with `duration` and can represent non-integral values.

Since

C++11

The documentation for this struct was generated from the following file:

- chrono.h

6.966 __gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc > Class Template Reference

- void **swap** (tree &other)

6.966.1 Detailed Description

template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
class __gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >

A tree-based container.

Template Parameters

Key	Key type.
Mapped	Map type.
Cmp_Fn	Comparison functor.
Tag	Instantiating data structure type, see container_tag.
Node_Update	Updates tree internal-nodes, restores invariants when invalidated. XXX See design::tree-based-containersnode invariants.
_Alloc	Allocator type.

Base tag choices are: ov_tree_tag, rb_tree_tag, splay_tree_tag.
Base is basic_branch.

6.966.2 Member Typedef Documentation

cmp_fn

```
template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_↩
tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
typedef Cmp_Fn __gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::cmp_fn
```

Comparison functor type.

6.966.3 Constructor & Destructor Documentation

tree() [1/3]

```
template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_↩
tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
            const cmp_fn & c)  [inline]
```

Constructor taking some policy objects. r_cmp_fn will be copied by the Cmp_Fn object of the container object.

tree() [2/3]

```
template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_↩
tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
            It first,
            It last)  [inline]
```

Constructor taking __iterators to a range of value_types. The value_types between first_it and last_it will be inserted into the container object.

tree() [3/3]

```
template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_↩
tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
template<typename It>
__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
            It first,
```

```
It last,
const cmp_fn & c)  [inline]
```

Constructor taking __iterators to a range of value_types and some policy objects The value_types between first_it and last_it will be inserted into the container object. r_cmp_fn will be copied by the cmp_fn object of the container object.

- size_type order_of_key (key_const_reference) const

Protected Member Functions

- void operator() (node_iterator, node_const_iterator) const

6.971.1 Detailed Description

template<typename Node_CItr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>
class __gnu_pbds::tree_order_statistics_node_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >

Functor updating ranks of entrees.

6.971.2 Member Function Documentation

find_by_order() [1/2]

```
template<typename Node_CItr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>
tree_order_statistics_node_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::iterator __gnu_pbds::tree_order_statist
Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::find_by_order (
            size_type order)  [inline]
```

Finds an entry by __order. Returns an iterator to the entry with the __order order, or an iterator to the container object's end if order is at least the size of the container object.

find_by_order() [2/2]

```
template<typename Node_CItr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>
tree_order_statistics_node_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::const_iterator __gnu_pbds::tree_order_s
Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::find_by_order (
            size_type order) const  [inline]
```

Finds an entry by __order. Returns a const_iterator to the entry with the __order order, or a const_iterator to the container object's end if order is at least the size of the container object.

operator()()

```
template<typename Node_CItr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>
void __gnu_pbds::tree_order_statistics_node_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::↩
operator() (
            node_iterator node_it,
            node_const_iterator end_nd_it) const  [inline], [protected]
```

Updates the rank of a node through a node_iterator node_it; end_nd_it is the end node iterator.

order_of_key()

```
template<typename Node_CItr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>
tree_order_statistics_node_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::size_type __gnu_pbds::tree_order_statis
```

```
Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::order_of_key (
            key_const_reference r_key) const  [inline]
```

Returns the order of a key within a sequence. For example, if r_key is the smallest key, this method will return 0; if r_key is a key between the smallest and next key, this method will return 1; if r_key is a key larger than the largest key, this method will return the size of r_c.
The documentation for this class was generated from the following file:

- tree_policy.hpp

6.972.1 Detailed Description

Basic tree structure.
The documentation for this struct was generated from the following file:

- tag_and_trait.hpp

6.973 __gnu_pbds::detail::tree_traits< Key, Data, Cmp_Fn, Node_Update, Tag, _Alloc > Struct Template Reference

6.973.1 Detailed Description

template<typename Key, typename Data, typename Cmp_Fn, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc > class Node_Update, typename Tag, typename _Alloc> struct __gnu_pbds::detail::tree_traits< Key, Data, Cmp_Fn, Node_Update, Tag, _Alloc >

Tree traits class, primary template.
The documentation for this struct was generated from the following file:

- branch_policy/traits.hpp

6.974 __gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc > Struct Template Reference

`#include <traits.hpp>`

Public Types

- typedef tree_node_metadata_dispatch< Key, Mapped, Cmp_Fn, Node_Update, _Alloc >::type **metadata_type**
- typedef ov_tree_node_const_it_< value_type, metadata_type, _Alloc > node_const_iterator
- typedef ov_tree_node_it_< value_type, metadata_type, _Alloc > **node_iterator**
- typedef Node_Update< node_const_iterator, node_iterator, Cmp_Fn, _Alloc > **node_update**
- typedef __gnu_pbds::null_node_update< node_const_iterator, node_iterator, Cmp_Fn, _Alloc > * **null_node_update_pointer**

6.974.1 Detailed Description

template<typename Key, typename Mapped, class Cmp_Fn, template< typename Node_CItr, class Node_Itr, class Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >

Tree traits.

6.974.2 Member Typedef Documentation

node_const_iterator

```
template<typename Key, typename Mapped, class Cmp_Fn, template< typename Node_CItr, class Node_Itr, class Cmp_Fn_, typename _Alloc_ > class Node_Update, typename _Alloc>
typedef ov_tree_node_const_it_< value_type, metadata_type, _Alloc> __gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >::node_const_iterator
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.
The documentation for this struct was generated from the following file:

- ov_tree_map_/traits.hpp

6.975 __gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, rb_tree_tag, _Alloc > Struct Template Reference

6.980.1 Detailed Description

template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
class __gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >

A trie-based container.

Template Parameters

Key	Key type.
Mapped	Map type.
_ATraits	Element access traits.
Tag	Instantiating data structure type, see container_tag.
Node_Update	Updates trie internal-nodes, restores invariants when invalidated. XXX See design::tree-based-containersnode invariants.
_Alloc	Allocator type.

Base tag choice is pat_trie_tag.
Base is basic_branch.

6.980.2 Member Typedef Documentation

access_traits

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access↩
_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename Node_↩
Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc
= std::allocator<char>>
typedef _ATraits __gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::access_↩
traits
```

Element access traits type.

6.980.3 Constructor & Destructor Documentation

trie() [1/3]

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access↩
_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename Node_↩
Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc
= std::allocator<char>>
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
            const access_traits & t)  [inline]
```

Constructor taking some policy objects. r_access_traits will be copied by the _ATraits object of the container object.

trie() [2/3]

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access↩
_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename Node_↩
Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc
= std::allocator<char>>
template<typename It>
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
            It first,
            It last)  [inline]
```

Constructor taking __iterators to a range of value_types. The value_types between first_it and last_it will be inserted into the container object.

trie() [3/3]

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access↩
_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename Node_↩
```

```
Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc
= std::allocator<char>>
template<typename It>
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
            It first,
            It last,
            const access_traits & t)  [inline]
```

Constructor taking __iterators to a range of value_types and some policy objects. The value_types between first_it and last_it will be inserted into the container object.
The documentation for this class was generated from the following file:

- assoc_container.hpp

6.985.1 Detailed Description

template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >

Functor updating ranks of entrees.

6.985.2 Member Function Documentation

find_by_order() [1/2]

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::iterator __gnu_pbds::trie_order_stati
Node_CItr, Node_Itr, _ATraits, _Alloc >::find_by_order (
            size_type order)  [inline]
```

Finds an entry by __order. Returns an iterator to the entry with the __order order, or an iterator to the container object's end if order is at least the size of the container object.

find_by_order() [2/2]

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::const_iterator __gnu_pbds::trie_order
Node_CItr, Node_Itr, _ATraits, _Alloc >::find_by_order (
            size_type order) const  [inline]
```

Finds an entry by __order. Returns a const_iterator to the entry with the __order order, or a const_iterator to the container object's end if order is at least the size of the container object.

operator()()

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
void __gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::↩
operator() (
            node_iterator nd_it,
            node_const_iterator ) const  [inline], [protected]
```

Updates the rank of a node through a node_iterator node_it; end_nd_it is the end node iterator.

order_of_key()

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::size_type __gnu_pbds::trie_order_stat
Node_CItr, Node_Itr, _ATraits, _Alloc >::order_of_key (
            key_const_reference r_key) const  [inline]
```

Returns the order of a key within a sequence. For example, if r_key is the smallest key, this method will return 0; if r_key is a key between the smallest and next key, this method will return 1; if r_key is a key larger than the largest key, this method will return the size of r_c.

order_of_prefix()

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::size_type __gnu_pbds::trie_order_stat
Node_CItr, Node_Itr, _ATraits, _Alloc >::order_of_prefix (
            a_const_iterator b,
            a_const_iterator e) const  [inline]
```

Returns the order of a prefix within a sequence. For example, if [b, e] is the smallest prefix, this method will return 0; if r_key is a key between the smallest and next key, this method will return 1; if r_key is a key larger than the largest key, this method will return the size of r_c.
The documentation for this class was generated from the following file:

6.987.1 Detailed Description

template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >

A node updator that allows tries to be searched for the range of values that match a certain prefix.

6.987.2 Member Typedef Documentation

a_const_iterator

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
typedef access_traits::const_iterator __gnu_pbds::trie_prefix_search_node_update< Node_CItr,
Node_Itr, _ATraits, _Alloc >::a_const_iterator
```

Const element iterator.

access_traits

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
typedef _ATraits __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _↩
Alloc >::access_traits
```

Element access traits.

allocator_type

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
typedef _Alloc __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc
>::allocator_type
```

_Alloc type.

size_type

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
typedef allocator_type::size_type __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_↩
Itr, _ATraits, _Alloc >::size_type
```

Size type.

6.987.3 Member Function Documentation

operator()()

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
void __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::↩
operator() (
            node_iterator node_it,
            node_const_iterator end_nd_it) const  [inline], [protected]
```

Called to update a node's metadata.

prefix_range() [1/4]

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
std::pair< typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::↩
iterator, typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::↩
```

```
iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc
>::prefix_range (
              a_const_iterator b,
              a_const_iterator e)
```

Finds the iterator range corresponding to all values whose prefixes match [b, e).

prefix_range() [2/4]

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
std::pair< typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::↩
const_iterator, typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc
>::const_iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, ↩
_Alloc >::prefix_range (
              a_const_iterator b,
              a_const_iterator e) const
```

Finds the const iterator range corresponding to all values whose prefixes match [b, e).

prefix_range() [3/4]

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
std::pair< typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::↩
iterator, typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::↩
iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc
>::prefix_range (
              key_const_reference r_key)
```

Finds the iterator range corresponding to all values whose prefixes match r_key.

prefix_range() [4/4]

```
template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
std::pair< typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::↩
const_iterator, typename trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc
>::const_iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, ↩
_Alloc >::prefix_range (
              key_const_reference r_key) const
```

Finds the const iterator range corresponding to all values whose prefixes match r_key.
The documentation for this class was generated from the following file:

- trie_policy.hpp

6.988.1 Detailed Description

template<typename String = std::string, typename String::value_type Min_E_Val = detail::__numeric_traits<typename String::value_type>::__min, typename String::value_type Max_E_Val = detail::__numeric_traits<typename String::value_type>::__max, bool Reverse = false, typename _Alloc = std::allocator<char>> struct __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >

Element access traits for string types.

Template Parameters

String	String type.
Min_E_Val	Minimal element value.
Max_E_Val	Maximum element value.
Reverse	Reverse iteration should be used. Default: false.
_Alloc	Allocator type.

6.988.2 Member Typedef Documentation

const_iterator

```
template<typename String = std::string, typename String::value_type Min_E_Val = detail::__numeric_traits<typename String::value_type>::__min, typename String::value_type Max_E_Val = detail::__numeric_traits<typename String::value_type>::__max, bool Reverse = false, typename _Alloc = std::allocator<char>>
typedef detail::__conditional_type<Reverse,typenameString::const_reverse_iterator,typename String::const_iterator>::__type __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::const_iterator
```

Element const iterator type.

e_type

```
template<typename String = std::string, typename String::value_type Min_E_Val = detail::__numeric_traits<typename String::value_type>::__min, typename String::value_type Max_E_Val = detail::__numeric_traits<typename String::value_type>::__max, bool Reverse = false, typename _Alloc = std::allocator<char>>
typedef std::iterator_traits<const_iterator>::value_type __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::e_type
```

Element type.

6.988.3 Member Function Documentation

begin()

```
template<typename String, typename String::value_type Min_E_Val, typename String::value_type Max_E_Val, bool Reverse, typename _Alloc>
trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::const_iterator __gnu_pbds::trie_strin
```

```
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::begin (
            key_const_reference r_key)  [inline], [static]
```

Returns a const_iterator to the first element of key_const_reference agumnet.

e_pos()

```
template<typename String, typename String::value_type Min_E_Val, typename String::value_type Max↩
_E_Val, bool Reverse, typename _Alloc>
trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::size_type __gnu_pbds::trie_string_acc
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::e_pos (
            e_type e)  [inline], [static]
```

Maps an element to a position.

end()

```
template<typename String, typename String::value_type Min_E_Val, typename String::value_type Max↩
_E_Val, bool Reverse, typename _Alloc>
trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::const_iterator __gnu_pbds::trie_strin
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::end (
            key_const_reference r_key)  [inline], [static]
```

Returns a const_iterator to the after-last element of key_const_reference argument.
The documentation for this struct was generated from the following file:

6.996.1 Detailed Description

template<typename _T1, typename _T2>
class std::tuple< _T1, _T2 >

Partial specialization, 2-element tuple. Includes construction and assignment from a pair.
The documentation for this class was generated from the following file:

- tuple

6.997 std::tuple_element< __i, _Tp > Struct Template Reference

6.997.1 Detailed Description

template<size_t __i, typename _Tp>
struct std::tuple_element< __i, _Tp >

Gives the type of the ith element of a given tuple type.
The documentation for this struct was generated from the following file:

- utility.h

6.998 std::tuple_element< 0, pair< _Tp1, _Tp2 > > Struct Template Reference

`#include <stl_pair.h>`

Public Types

- typedef _Tp1 **type**

6.998.1 Detailed Description

template<class _Tp1, class _Tp2>
struct std::tuple_element< 0, pair< _Tp1, _Tp2 > >

Partial specialization for std::pair.
The documentation for this struct was generated from the following file:

- stl_pair.h

6.999 std::tuple_element< 1, pair< _Tp1, _Tp2 > > Struct Template Reference

`#include <stl_pair.h>`

Public Types

- typedef _Tp2 **type**

6.999.1 Detailed Description

template<class _Tp1, class _Tp2>
struct std::tuple_element< 1, pair< _Tp1, _Tp2 > >

Partial specialization for std::pair.
The documentation for this struct was generated from the following file:

- stl_pair.h

6.1000 std::tuple_element< __i, tuple< _Types... > > Struct Template Reference

`#include <tuple>`

Public Types

- using **type**

6.1000.1 Detailed Description

template<size_t __i, typename... _Types>
struct std::tuple_element< __i, tuple< _Types... > >

Trait to get the Ith element type from a tuple.
The documentation for this struct was generated from the following file:

- tuple

6.1001 std::tuple_element< _Ind, array< _Tp, _Nm > > Struct Template Reference

`#include <array>`

Public Types

- using **type**

6.1001.1 Detailed Description

template<size_t _Ind, typename _Tp, size_t _Nm>
struct std::tuple_element< _Ind, array< _Tp, _Nm > >

Partial specialization for std::array.
The documentation for this struct was generated from the following file:

- array

6.1002 std::tuple_size< _Tp > Struct Template Reference

Inherited by std::tuple_size< const __enable_if_has_tuple_size< _Tp > >, std::tuple_size< const volatile __enable↩ _if_has_tuple_size< _Tp > >, and std::tuple_size< volatile __enable_if_has_tuple_size< _Tp > >.

6.1002.1 Detailed Description

template<typename _Tp>
struct std::tuple_size< _Tp >

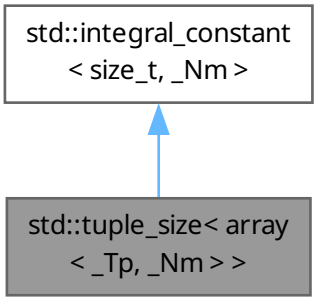
Finds the size of a given tuple type.
The documentation for this struct was generated from the following file:

- utility.h

6.1003 std::tuple_size< array< _Tp, _Nm > > Struct Template Reference

`#include <array>`

Inheritance diagram for std::tuple_size< array< _Tp, _Nm > >:



Public Types

- virtual bool **__is_function_p** () const
- virtual bool **__is_pointer_p** () const
- bool before (const type_info &__arg) const noexcept
- size_t **hash_code** () const noexcept
- const char * name () const noexcept
- constexpr bool **operator==** (const type_info &__arg) const noexcept

Protected Member Functions

- **type_info** (const char *__n)

Protected Attributes

- const char * **__name**

6.1008.1 Detailed Description

Part of RTTI.
The `type_info` class describes type information generated by an implementation.

6.1008.2 Constructor & Destructor Documentation

~type_info()

```
virtual std::type_info::~type_info () [virtual]
```

Destructor first. Being the first non-inline virtual function, this controls in which translation unit the vtable is emitted. The compiler makes use of that information to know where to emit the runtime-mandated type_info structures in the new-abi.

6.1008.3 Member Function Documentation

before()

```
bool std::type_info::before (
            const type_info & __arg) const [noexcept]
```

Returns true if `*this` precedes `__arg` in the implementation's collation order.

name()

```
const char * std::type_info::name () const [inline], [noexcept]
```

Returns an *implementation-defined* byte string; this is not portable between compilers!
The documentation for this class was generated from the following file:

- typeinfo

6.1009 std::type_info Class Reference

`#include <typeinfo>`

Public Member Functions

- virtual ~type_info ()
- virtual bool **__do_catch** (const type_info *__thr_type, void **__thr_obj, unsigned __outer) const
- virtual bool **__do_upcast** (const __cxxabiv1::__class_type_info *__target, void **__obj_ptr) const
- virtual bool **__is_function_p** () const
- virtual bool **__is_pointer_p** () const
- bool before (const type_info &__arg) const noexcept
- size_t **hash_code** () const noexcept
- const char * name () const noexcept
- constexpr bool **operator==** (const type_info &__arg) const noexcept

Protected Member Functions

Protected Attributes

- const char * **__name**

6.1009.1 Detailed Description

Part of RTTI.
The `type_info` class describes type information generated by an implementation.

6.1009.2 Constructor & Destructor Documentation

~type_info()

```
virtual std::type_info::~type_info ()  [virtual]
```
Destructor first. Being the first non-inline virtual function, this controls in which translation unit the vtable is emitted. The compiler makes use of that information to know where to emit the runtime-mandated type_info structures in the new-abi.

6.1009.3 Member Function Documentation

before()

```
bool std::type_info::before (
            const type_info & __arg) const  [noexcept]
```
Returns true if `*this` precedes `__arg` in the implementation's collation order.

name()

```
const char * std::type_info::name () const  [inline], [noexcept]
```
Returns an *implementation-defined* byte string; this is not portable between compilers!
The documentation for this class was generated from the following file:

- typeinfo

6.1010 std::type_order< _Tp, _Up > Struct Template Reference

`#include <compare>`

Public Types

- using **value_type**

Public Member Functions

- constexpr **operator value_type** () const noexcept
- constexpr value_type **operator()** () const noexcept

Static Public Attributes

- class **leap_second**
- const tzdb & **reload_tzdb** ()
- struct **time_zone::_Impl**
- class **time_zone_link**
- struct **tzdb**

6.1012.1 Detailed Description

The list of `chrono::tzdb` objects
A single object of this type is constructed by the C++ runtime, and can be accessed by calling `chrono::get_tzdb_list()`.
The front of the list is the current `tzdb` object and can be accessed via `chrono::get_tzdb_list().front()` or `chrono::get_tzdb()` or `*chronoget_tzdb_list().begin()`.
The `chrono::reload_tzdb()` function will check for a newer version and if found, insert it at the front of the list.

Since

C++20

6.1012.2 Member Function Documentation

erase_after()

```
const_iterator std::chrono::tzdb_list::erase_after (
            const_iterator __p)
```

Remove the tzdb object *after* the one the iterator refers to.
Calling this function concurrently with any of `front()`, `begin()`, or `end()` does not cause a data race, but in general this function is not thread-safe. The behaviour may be undefined if erasing an element from the list while another thread is calling the same function, or incrementing an iterator into the list, or accessing the element being erased (unless it is accessed through an iterator).

Parameters

_↩ _p	A dereferenceable iterator.

Returns

An iterator the element after the one that was erased (or `end()` if there is no such element).

Since

C++20

References erase_after().
Referenced by erase_after().

front()

```
const tzdb & std::chrono::tzdb_list::front () const  [noexcept]
```

Access the current `tzdb` at the front of the list.
This returns a reference to the same object as `chrono::get_tzdb()`.

Returns

A reference to the current tzdb object.

Since

C++20

The documentation for this class was generated from the following file:

- chrono

6.1013 __gnu_cxx::unary_compose< _Operation1, _Operation2 > Class Template Reference

```
#include <functional>

- _Operation2 **_M_fn2**

6.1013.1 Detailed Description

template<class _Operation1, class _Operation2>
class __gnu_cxx::unary_compose< _Operation1, _Operation2 >

An SGI extension .

6.1013.2 Member Typedef Documentation

argument_type

```
typedef _Operation2::argument_type std::unary_function< _Operation2::argument_type, _Operation1::↩
result_type >::argument_type  [inherited]
```

`argument_type` is the type of the argument

result_type

```
typedef _Operation1::result_type std::unary_function< _Operation2::argument_type, _Operation1::↩
result_type >::result_type  [inherited]
```

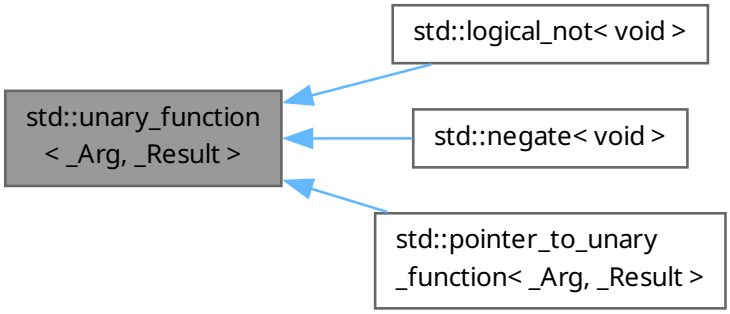
`result_type` is the return type

The documentation for this class was generated from the following file:

- ext/functional

6.1014 std::unary_function< _Arg, _Result > Struct Template Reference

`#include <stl_function.h>`
Inheritance diagram for std::unary_function< _Arg, _Result >:



Public Types

- typedef _Arg argument_type
- typedef _Result result_type

6.1014.1 Detailed Description

template<typename _Arg, typename _Result>
struct std::unary_function< _Arg, _Result >

Helper for defining adaptable unary function objects.

Deprecated Deprecated in C++11, no longer in the standard since C++17.

6.1014.2 Member Typedef Documentation

argument_type

```
template<typename _Arg, typename _Result>
typedef _Arg std::unary_function< _Arg, _Result >::argument_type
```

`argument_type` is the type of the argument

result_type

```
template<typename _Arg, typename _Result>
typedef _Result std::unary_function< _Arg, _Result >::result_type
```

`result_type` is the return type
The documentation for this struct was generated from the following file:

```

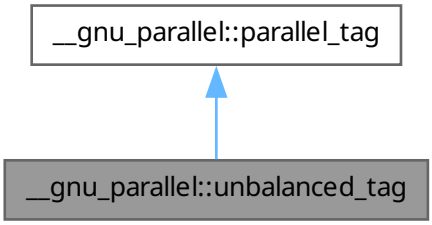
Inheritance diagram for __gnu_parallel::unbalanced_tag:



Public Member Functions

- _ThreadIndex __get_num_threads ()
- void set_num_threads (_ThreadIndex __num_threads)

6.1016.1 Detailed Description

Recommends parallel execution using static load-balancing at compile time.

6.1016.2 Member Function Documentation

__get_num_threads()

```
_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads ()  [inline], [inherited]
```

Find out desired number of threads.

Returns

Desired number of threads.

Referenced by __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), __gnu_parallel::__parallel_sort(), and __gnu_parallel::__parallel_sort(

set_num_threads()

```
void __gnu_parallel::parallel_tag::set_num_threads (
            _ThreadIndex __num_threads)  [inline], [inherited]
```

Set the desired number of threads.

Parameters

__num_threads	Desired number of threads.

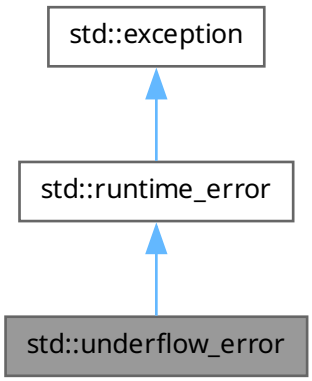
6.1017 std::underflow_error Class Reference

`#include <stdexcept_except.h>`
Inheritance diagram for std::underflow_error:



Public Member Functions

- **underflow_error** (const char *)
- **underflow_error** (const string &__arg)
- **underflow_error** (const underflow_error &)=default
- **underflow_error** (underflow_error &&)=default
- underflow_error & **operator=** (const underflow_error &)=default
- underflow_error & **operator=** (underflow_error &&)=default
- virtual const char * what () const noexcept

6.1017.1 Detailed Description

Thrown to indicate arithmetic underflow.

6.1017.2 Member Function Documentation

what()

`virtual const char * std::runtime_error::what () const [virtual], [noexcept], [inherited]`
Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).
Reimplemented from std::exception.
Reimplemented in std::experimental::filesystem::v1::filesystem_error, std::filesystem::filesystem_error, and std::ios_base::failure.

References what().
Referenced by what().

6.1019.1 Detailed Description

template<typename _IntType = int>
class std::uniform_int_distribution< _IntType >

Uniform discrete distribution for random numbers. A discrete random distribution on the range $[min, max]$ with equal probability throughout the range.

Since

C++11

6.1019.2 Member Typedef Documentation

result_type

```
template<typename _IntType = int>
typedef _IntType std::uniform_int_distribution< _IntType >::result_type
```

The type of the range of the distribution.

6.1019.3 Constructor & Destructor Documentation

uniform_int_distribution() [1/2]

```
template<typename _IntType = int>
std::uniform_int_distribution< _IntType >::uniform_int_distribution ()  [inline]
```

Constructs a uniform distribution object.

uniform_int_distribution() [2/2]

```
template<typename _IntType = int>
std::uniform_int_distribution< _IntType >::uniform_int_distribution (
            _IntType __a,
            _IntType __b = __gnu_cxx::__int_traits<_IntType>::__max)  [inline], [explicit]
```

Constructs a uniform distribution object.

6.1019.4 Member Function Documentation

max()

```
template<typename _IntType = int>
result_type std::uniform_int_distribution< _IntType >::max () const  [inline]
```

Returns the inclusive upper bound of the distribution range.

min()

```
template<typename _IntType = int>
result_type std::uniform_int_distribution< _IntType >::min () const  [inline]
```

Returns the inclusive lower bound of the distribution range.

operator()()

```
template<typename _IntType = int>
template<typename _UniformRandomBitGenerator>
result_type std::uniform_int_distribution< _IntType >::operator() (
            _UniformRandomBitGenerator & __urng)  [inline]
```

Generating functions.
Referenced by operator()().

param() [1/2]

```
template<typename _IntType = int>
param_type std::uniform_int_distribution< _IntType >::param () const  [inline]
```

Returns the parameter set of the distribution.
Referenced by std::operator>>().

param() [2/2]

```
template<typename _IntType = int>
void std::uniform_int_distribution< _IntType >::param (
            const param_type & __param)  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

reset()

```
template<typename _IntType = int>
void std::uniform_int_distribution< _IntType >::reset ()  [inline]
```

Resets the distribution state.
Does nothing for the uniform integer distribution.

6.1019.5 Friends And Related Symbol Documentation

operator==

```
template<typename _IntType = int>
bool operator== (
            const uniform_int_distribution< _IntType > & __d1,
            const uniform_int_distribution< _IntType > & __d2)  [friend]
```

Return true if two uniform integer distributions have the same parameters.
The documentation for this class was generated from the following file:

- uniform_int_dist.h

6.1020.1 Detailed Description

template<typename _RealType = double>
class std::uniform_real_distribution< _RealType >

Uniform continuous distribution for random numbers.
A continuous random distribution on the range [min, max) with equal probability throughout the range. The URNG should be real-valued and deliver number in the range [0, 1).

Since

C++11

6.1020.2 Member Typedef Documentation

result_type

```
template<typename _RealType = double>
typedef _RealType std::uniform_real_distribution< _RealType >::result_type
```

The type of the range of the distribution.

6.1020.3 Constructor & Destructor Documentation

uniform_real_distribution() [1/2]

```
template<typename _RealType = double>
std::uniform_real_distribution< _RealType >::uniform_real_distribution ()  [inline]
```

Constructs a uniform_real_distribution object.
The lower bound is set to 0.0 and the upper bound to 1.0

uniform_real_distribution() [2/2]

```
template<typename _RealType = double>
std::uniform_real_distribution< _RealType >::uniform_real_distribution (
            _RealType __a,
            _RealType __b = _RealType(1))  [inline], [explicit]
```

Constructs a uniform_real_distribution object.

Parameters

_↩ _a	[IN] The lower bound of the distribution.
_↩ _b	[IN] The upper bound of the distribution.

6.1020.4 Member Function Documentation

max()

```
template<typename _RealType = double>
result_type std::uniform_real_distribution< _RealType >::max () const  [inline]
```

Returns the inclusive upper bound of the distribution range.

min()

```
template<typename _RealType = double>
result_type std::uniform_real_distribution< _RealType >::min () const  [inline]
```

Returns the inclusive lower bound of the distribution range.

operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator>
result_type std::uniform_real_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng)  [inline]
```

Generating functions.
Referenced by operator()().

param() [1/2]

```
template<typename _RealType = double>
param_type std::uniform_real_distribution< _RealType >::param () const  [inline]
```

Returns the parameter set of the distribution.
Referenced by std::operator>>().

param() [2/2]

```
template<typename _RealType = double>
void std::uniform_real_distribution< _RealType >::param (
            const param_type & __param)  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

reset()

```
template<typename _RealType = double>
void std::uniform_real_distribution< _RealType >::reset ()  [inline]
```

Resets the distribution state.
Does nothing for the uniform real distribution.

6.1020.5 Friends And Related Symbol Documentation

operator==

```
template<typename _RealType = double>
bool operator== (
            const uniform_real_distribution< _RealType > & __d1,
            const uniform_real_distribution< _RealType > & __d2)  [friend]
```

Return true if two uniform real distributions have the same parameters.
The documentation for this class was generated from the following files:

- random.h
- bits/random.tcc

Related Symbols

(Note that these are not member symbols.)

- template<typename _Mutex>
  void swap (unique_lock< _Mutex > &__x, unique_lock< _Mutex > &__y) noexcept

6.1021.1 Detailed Description

template<typename _Mutex>
class std::unique_lock< _Mutex >

A movable scoped lock type.
A unique_lock controls mutex ownership within a scope. Ownership of the mutex can be delayed until after construction and can be transferred to another unique_lock by move construction or move assignment. If a mutex lock is owned when the destructor runs ownership will be released.

Since

C++11

6.1021.2 Friends And Related Symbol Documentation

swap()

```
template<typename _Mutex>
void swap (
            unique_lock< _Mutex > & __x,
            unique_lock< _Mutex > & __y)  [related]
```

Swap overload for unique_lock objects.
The documentation for this class was generated from the following file:

6.1022.1 Detailed Description

template<typename _Tp, typename _Dp = default_delete<_Tp>>
class std::unique_ptr< _Tp, _Dp >

A move-only smart pointer that manages unique ownership of a resource.

Since

C++11

6.1022.2 Constructor & Destructor Documentation

unique_ptr() [1/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp, _Dp >::unique_ptr ()  [inline], [constexpr], [noexcept]
```

Default constructor, creates a unique_ptr that owns nothing.

unique_ptr() [2/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
            pointer __p)  [inline], [explicit], [constexpr], [noexcept]
```

Takes ownership of a pointer.

Parameters

_↩ _p	A pointer to an object of `element_type`

The deleter will be value-initialized.

unique_ptr() [3/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = deleter_type, typename = _Require<is_copy_constructible<_Del>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
            pointer __p,
            const deleter_type & __d)  [inline], [constexpr], [noexcept]
```

Takes ownership of a pointer.

Parameters

_↩ _p	A pointer to an object of `element_type`
_↩ _d	A reference to a deleter.

The deleter will be initialized with __d

unique_ptr() [4/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = deleter_type, typename = _Require<is_move_constructible<_Del>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
            pointer __p,
            __enable_if_t<!is_lvalue_reference< _Del >::value, _Del && > __d)  [inline], [constexpr],
[noexcept]
```

Takes ownership of a pointer.

Parameters

_↩ _p	A pointer to an object of element_type
_↩ _d	An rvalue reference to a (non-reference) deleter.

The deleter will be initialized with std::move(__d)

unique_ptr() [5/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
            nullptr_t )  [inline], [constexpr], [noexcept]
```

Creates a unique_ptr that owns nothing.

unique_ptr() [6/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
            unique_ptr< _Tp, _Dp > && )  [default]
```

Move constructor.

unique_ptr() [7/8]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Up, typename _Ep, typename = _Require< __safe_conversion_up<_Up, _Ep>, __↩
conditional_t<is_reference<_Dp>::value, is_same<_Ep, _Dp>, is_convertible<_Ep, _Dp>>>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
            unique_ptr< _Up, _Ep > && __u)  [inline], [constexpr], [noexcept]
```

Converting constructor from another type.
Requires that the pointer owned by __u is convertible to the type of pointer owned by this object, __u does not own an array, and __u has a compatible deleter type.

unique_ptr() [8/8]

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
            auto_ptr< _Up > && __u)  [inline], [noexcept]
```

Converting constructor from auto_ptr.

~unique_ptr()

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::~unique_ptr ()  [inline], [constexpr], [noexcept]
```

Destructor, invokes the deleter if the stored pointer is not null.

6.1022.3 Member Function Documentation

get()

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr< _Tp, _Dp >::get () const  [inline], [constexpr], [noexcept]
```

Return the stored pointer.

Referenced by std::unique_ptr< _State >::operator bool(), std::unique_ptr< _State >::operator->(), std::operator<(), std::operator<(), std::operator<(), std::unique_ptr< _State >::operator<<(), std::operator==(), std::operator>(), and std::operator>().

get_deleter() [1/2]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
const deleter_type & std::unique_ptr< _Tp, _Dp >::get_deleter () const  [inline], [constexpr],
[noexcept]
```

Return a reference to the stored deleter.

get_deleter() [2/2]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
deleter_type & std::unique_ptr< _Tp, _Dp >::get_deleter ()  [inline], [constexpr], [noexcept]
```

Return a reference to the stored deleter.

Referenced by std::unique_ptr< _State >::~unique_ptr(), and std::unique_ptr< _State >::operator=().

operator bool()

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::operator bool () const  [inline], [explicit], [constexpr], [noexcept]
```

Return `true` if the stored pointer is not null.

operator*()

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
add_lvalue_reference< element_type >::type std::unique_ptr< _Tp, _Dp >::operator* () const  [inline],
[constexpr], [noexcept]
```

Dereference the stored pointer.

operator->()

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr< _Tp, _Dp >::operator-> () const  [inline], [constexpr], [noexcept]
```

Return the stored pointer.

operator=() [1/3]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
unique_ptr & std::unique_ptr< _Tp, _Dp >::operator= (
            nullptr_t )  [inline], [constexpr], [noexcept]
```

Reset the unique_ptr to empty, invoking the deleter if necessary.

operator=() [2/3]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
unique_ptr & std::unique_ptr< _Tp, _Dp >::operator= (
            unique_ptr< _Tp, _Dp > && )  [default]
```

Move assignment operator.
Invokes the deleter if this object owns a pointer.

operator=() [3/3]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Up, typename _Ep>
enable_if< __and_< __safe_conversion_up< _Up, _Ep >, is_assignable< deleter_type &, _Ep && >
>::value, unique_ptr & >::type std::unique_ptr< _Tp, _Dp >::operator= (
            unique_ptr< _Up, _Ep > && __u)  [inline], [constexpr], [noexcept]
```

Assignment from another type.

Parameters

_↩ _u	The object to transfer ownership from, which owns a convertible pointer to a non-array object.

Invokes the deleter if this object owns a pointer.

release()

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr< _Tp, _Dp >::release ()  [inline], [constexpr], [noexcept]
```

Release ownership of any stored pointer.

reset()

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
void std::unique_ptr< _Tp, _Dp >::reset (
            pointer __p = pointer())  [inline], [constexpr], [noexcept]
```

Replace the stored pointer.

Parameters

_↩ _p	The new pointer to store.

The deleter will be invoked if a pointer is already owned.
Referenced by std::unique_ptr< _State >::operator=(), and std::unique_ptr< _State >::operator=().

swap()

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
void std::unique_ptr< _Tp, _Dp >::swap (
            unique_ptr< _Tp, _Dp > & __u)  [inline], [constexpr], [noexcept]
```

Exchange the pointer and deleter with another object.
The documentation for this class was generated from the following files:

6.1023.1 Detailed Description

template<typename _Tp, typename _Dp>
class std::unique_ptr< _Tp[ ], _Dp >

A move-only smart pointer that manages unique ownership of an array.

Since

C++11

6.1023.2 Constructor & Destructor Documentation

unique_ptr() [1/6]

```
template<typename _Tp, typename _Dp>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr ()  [inline], [constexpr], [noexcept]
```

Default constructor, creates a unique_ptr that owns nothing.
References unique_ptr().
Referenced by unique_ptr(), unique_ptr(), unique_ptr(), unique_ptr(), unique_ptr(), unique_ptr(), ~unique_ptr(), operator=(), operator=(), operator=(), and swap().

unique_ptr() [2/6]

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename _Vp = _Dp, typename = _DeleterConstraint<_Vp>, typename = typename
enable_if< __safe_conversion_raw<_Up>::value, bool>::type>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
            _Up __p)  [inline], [explicit], [constexpr], [noexcept]
```

Takes ownership of a pointer.

Parameters

_↩ _p	A pointer to an array of a type safely convertible to an array of `element_type`

The deleter will be value-initialized.
References unique_ptr().

unique_ptr() [3/6]

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename _Del = deleter_type, typename = _Require<__safe_conversion_raw<↩
_Up>, is_copy_constructible<_Del>>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
            _Up __p,
            const deleter_type & __d)  [inline], [constexpr], [noexcept]
```

Takes ownership of a pointer.

Parameters

_↩ _p	A pointer to an array of a type safely convertible to an array of `element_type`
_↩ _d	A reference to a deleter.

The deleter will be initialized with `__d`
References unique_ptr().

unique_ptr() [4/6]

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename _Del = deleter_type, typename = _Require<__safe_conversion_raw<↩
_Up>, is_move_constructible<_Del>>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
            _Up __p,
            __enable_if_t<!is_lvalue_reference< _Del >::value, _Del && > __d)  [inline], [constexpr],
[noexcept]
```

Takes ownership of a pointer.

Parameters

_↩ _p	A pointer to an array of a type safely convertible to an array of `element_type`
_↩ _d	A reference to a deleter.

The deleter will be initialized with `std::move(__d)`
References unique_ptr(), and std::move().

unique_ptr() [5/6]

```
template<typename _Tp, typename _Dp>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
```

```
            unique_ptr< _Tp[], _Dp > && )  [default]
```

Move constructor.
References unique_ptr().

unique_ptr() [6/6]

```
template<typename _Tp, typename _Dp>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
            nullptr_t )  [inline], [constexpr], [noexcept]
```

Creates a unique_ptr that owns nothing.
References unique_ptr().

~unique_ptr()

```
template<typename _Tp, typename _Dp>
std::unique_ptr< _Tp[], _Dp >::~unique_ptr ()  [inline], [constexpr]
```

Destructor, invokes the deleter if the stored pointer is not null.
References unique_ptr(), and get_deleter().

6.1023.3 Member Function Documentation

get()

```
template<typename _Tp, typename _Dp>
pointer std::unique_ptr< _Tp[], _Dp >::get () const  [inline], [constexpr], [noexcept]
```

Return the stored pointer.
References get().
Referenced by get(), operator bool(), and operator[]().

get_deleter() [1/2]

```
template<typename _Tp, typename _Dp>
const deleter_type & std::unique_ptr< _Tp[], _Dp >::get_deleter () const  [inline], [constexpr],
[noexcept]
```

Return a reference to the stored deleter.
References get_deleter().

get_deleter() [2/2]

```
template<typename _Tp, typename _Dp>
deleter_type & std::unique_ptr< _Tp[], _Dp >::get_deleter ()  [inline], [constexpr], [noexcept]
```

Return a reference to the stored deleter.
References get_deleter().
Referenced by ~unique_ptr(), get_deleter(), get_deleter(), and operator=().

operator bool()

```
template<typename _Tp, typename _Dp>
std::unique_ptr< _Tp[], _Dp >::operator bool () const  [inline], [explicit], [constexpr], [noexcept]
```

Return `true` if the stored pointer is not null.
References get().

operator*()

```
add_lvalue_reference< element_type >::type std::unique_ptr< _Tp, _Dp >::operator* () const  [inline],
[constexpr], [noexcept]
```

Dereference the stored pointer.

operator->()

```
pointer std::unique_ptr< _Tp, _Dp >::operator-> () const  [inline], [constexpr], [noexcept]
```

Return the stored pointer.

operator=() [1/3]

```
template<typename _Tp, typename _Dp>
unique_ptr & std::unique_ptr< _Tp[], _Dp >::operator= (
            nullptr_t )  [inline], [constexpr], [noexcept]
```

Reset the unique_ptr to empty, invoking the deleter if necessary.
References unique_ptr(), operator=(), and reset().

operator=() [2/3]

```
template<typename _Tp, typename _Dp>
unique_ptr & std::unique_ptr< _Tp[], _Dp >::operator= (
            unique_ptr< _Tp[], _Dp > && )  [default]
```

Move assignment operator.
Invokes the deleter if this object owns a pointer.
References unique_ptr(), and operator=().
Referenced by operator=(), operator=(), and operator=().

operator=() [3/3]

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename _Ep>
enable_if< __and_< __safe_conversion_up< _Up, _Ep >, is_assignable< deleter_type &, _Ep && >
>::value, unique_ptr & >::type std::unique_ptr< _Tp[], _Dp >::operator= (
            unique_ptr< _Up, _Ep > && __u)  [inline], [constexpr], [noexcept]
```

Assignment from another type.

Parameters

_↩ _u	The object to transfer ownership from, which owns a convertible pointer to an array object.

Invokes the deleter if this object owns a pointer.
References unique_ptr(), std::forward(), get_deleter(), operator=(), and reset().

operator[]()

```
template<typename _Tp, typename _Dp>
std::add_lvalue_reference< element_type >::type std::unique_ptr< _Tp[], _Dp >::operator[] (
            size_t __i) const  [inline], [constexpr]
```

Access an element of owned array.
References get(), and operator[]().
Referenced by operator[]().

release()

```
template<typename _Tp, typename _Dp>
pointer std::unique_ptr< _Tp[], _Dp >::release ()  [inline], [constexpr], [noexcept]
```

Release ownership of any stored pointer.
References release().
Referenced by release().

reset()

```
template<typename _Tp, typename _Dp>
template<typename _Up, typename = _Require< __or_<is_same<_Up, pointer>, __and_<is_same<pointer,
element_type*>, is_pointer<_Up>, is_convertible< typename remove_pointer<_Up>::type(*)[], element↩
_type(*)[] > > > >>
void std::unique_ptr< _Tp[], _Dp >::reset (
            _Up __p)  [inline], [constexpr], [noexcept]
```

Replace the stored pointer.

Parameters

_↩ _p	The new pointer to store.

The deleter will be invoked if a pointer is already owned.
References std::move(), and reset().
Referenced by operator=(), operator=(), and reset().

swap()

```
template<typename _Tp, typename _Dp>
void std::unique_ptr< _Tp[], _Dp >::swap (
            unique_ptr< _Tp[], _Dp > & __u)  [inline], [constexpr], [noexcept]
```

Exchange the pointer and deleter with another object.
References unique_ptr(), and swap().
Referenced by swap().

6.1023.4 Friends And Related Symbol Documentation

operator<<()

```
basic_ostream< _CharT, _Traits > & operator<< (
            basic_ostream< _CharT, _Traits > & __os,
            const unique_ptr< _Tp, _Dp > & __p)  [related]
```

Stream output operator for unique_ptr.

Since

C++20

swap()

```
enable_if< __is_swappable< _Dp >::value >::type swap (
            unique_ptr< _Tp, _Dp > & __x,
            unique_ptr< _Tp, _Dp > & __y)  [related]
```

Swap overload for unique_ptr.
The documentation for this class was generated from the following files:

6.1025.1 Detailed Description

template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
class std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >

A standard container composed of unique keys (containing at most one of each key value) that associates values of another type with the keys.

Since

C++11

Template Parameters

_Key	Type of key objects.
_Tp	Type of mapped objects.
_Hash	Hashing function object type, defaults to hash<_Key>.
_Pred	Predicate function object type, defaults to equal_to<_Key>.
_Alloc	Allocator type, defaults to std::allocator<std::pair<const _Key, _Tp>>.

Meets the requirements of a container, and unordered associative container
The resulting value type of the container is std::pair<const _Key, _Tp>.
Base is _Hashtable, dispatched at compile time via template alias __umap_hashtable.

6.1025.2 Member Typedef Documentation

allocator_type

```

6.1025.3 Constructor & Destructor Documentation

unordered_map() [1/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map ()  [default]
```

Default constructor.

unordered_map() [2/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
            size_type __n,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type())  [inline], [explicit]
```

Default constructor creates no elements.

Parameters

__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

unordered_map() [3/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
            _InputIterator __first,
            _InputIterator __last,
            size_type __n = 0,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type())  [inline]
```

Builds an unordered_map from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_map consisting of copies of the elements from [__first,__last). This is linear in N (where N is distance(__first,__last)).

unordered_map() [4/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
            const unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > & )  [default]
```

Copy constructor.

unordered_map() [5/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
```

```
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
            unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > && )  [default]
```

Move constructor.

unordered_map() [6/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
            const allocator_type & __a)  [inline], [explicit]
```

Creates an unordered_map with no elements.

Parameters

_↩ _a	An allocator object.

unordered_map() [7/7]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
            initializer_list< value_type > __l,
            size_type __n = 0,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type())  [inline]
```

Builds an unordered_map from an initializer_list.

Parameters

__l	An initializer_list.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_map consisting of copies of the elements in the list. This is linear in N (where N is *__l.size()*).

6.1025.4 Member Function Documentation

at() [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
```

```
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<__heterogeneous_hash_key< unordered_map > _Kt>
mapped_type & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::at (
            const _Kt & __k)  [inline]
```

Access to unordered_map data.

Parameters

_↩ _k	The key for which data should be retrieved.

Returns

A reference to the data whose key is equal to __k, if such a data is present in the unordered_map.

Exceptions

std::out_of_range	If no such data is present.

at() [2/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<__heterogeneous_hash_key< unordered_map > _Kt>
const mapped_type & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::at (
            const _Kt & __k) const  [inline]
```

Access to unordered_map data.

Parameters

_↩ _k	The key for which data should be retrieved.

Returns

A reference to the data whose key is equal to __k, if such a data is present in the unordered_map.

Exceptions

std::out_of_range	If no such data is present.

at() [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
mapped_type & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::at (
            const key_type & __k)  [inline]
```

Access to unordered_map data.

Parameters

_↩ _k	The key for which data should be retrieved.

Returns

A reference to the data whose key is equal to __k, if such a data is present in the unordered_map.

Exceptions

std::out_of_range	If no such data is present.

at() [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const mapped_type & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::at (
            const key_type & __k) const  [inline]
```

Access to unordered_map data.

Parameters

_↩ _k	The key for which data should be retrieved.

Returns

A reference to the data whose key is equal to __k, if such a data is present in the unordered_map.

Exceptions

std::out_of_range	If no such data is present.

begin() [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin () const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_map.

begin() [2/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin ()  [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the unordered_map.

begin() [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (
            size_type __n)  [inline]
```

Returns a read/write iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read/write local iterator.

begin() [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (
            size_type __n) const  [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

bucket_count()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::bucket_count () const  [inline],
[noexcept]
```

Returns the number of buckets of the unordered_map.

cbegin() [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin () const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_map.

cbegin() [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin (
            size_type __n) const  [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

cend() [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cend () const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_map.

cend() [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cend (
            size_type __n) const  [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

clear()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::clear ()  [inline], [noexcept]
```

Erases all elements in an unordered_map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

contains() [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Kt>
auto std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::contains (
            const _Kt & __x) const -> decltype(_M_h._M_find_tr(__x), void(), true)  [inline]
```

Finds whether an element with the given key exists.

Parameters

_↩ _x	Key of elements to be located.

Returns

True if there is any element with the specified key.

contains() [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
bool std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::contains (
            const key_type & __x) const  [inline]
```

Finds whether an element with the given key exists.

Parameters

_↩ _x	Key of elements to be located.

Returns

True if there is any element with the specified key.

count()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::count (
            const key_type & __x) const  [inline]
```

Finds the number of elements.

Parameters

_↩ _x	Key to count.

Returns

Number of elements with specified key.

This function only makes sense for unordered_multimap; for unordered_map the result will either be 0 (not present) or 1 (present).

emplace()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename...  _Args>
std::pair< iterator, bool > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace (
            _Args &&...  __args)  [inline]
```

Attempts to build and insert a std::pair into the unordered_map.

Parameters

__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the unordered_map. An unordered_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered_map.
Insertion requires amortized constant time.

emplace_hint()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename...  _Args>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (
            const_iterator __pos,
            _Args &&...  __args)  [inline]
```

Attempts to build and insert a std::pair into the unordered_map.

Parameters

__pos	An iterator that serves as a hint as to where the pair should be inserted.
__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the std::pair built from *__args* (may or may not be that std::pair).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument emplace() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↩associative.insert_hints for more on *hinting*.
Insertion requires amortized constant time.

empty()

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

```
bool std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::empty () const  [inline], [nodiscard],
[noexcept]
```
Returns true if the unordered_map is empty.

end() [1/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end () const  [inline],
[noexcept]
```
Returns a read-only (constant) iterator that points one past the last element in the unordered_map.

end() [2/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end ()  [inline], [noexcept]
```
Returns a read/write iterator that points one past the last element in the unordered_map.

end() [3/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
            size_type __n)  [inline]
```
Returns a read/write iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read/write local iterator.

end() [4/4]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
            size_type __n) const  [inline]
```
Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

equal_range() [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair< iterator, iterator > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_↩
range (
            const key_type & __x)  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for unordered_multimap.

equal_range() [2/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair< const_iterator, const_iterator > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc
>::equal_range (
            const key_type & __x) const  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for unordered_multimap.

erase() [1/5]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<__heterogeneous_hash_key< unordered_map > _Kt>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            _Kt && __x)  [inline]
```

Erases elements according to the provided key.

Parameters

_↩ _x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered_map. For an unordered_map the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/5]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            const key_type & __x)  [inline]
```

Erases elements according to the provided key.

Parameters

_↩ _x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered_map. For an unordered_map the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/5]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last)  [inline]
```

Erases a [__first,__last) range of elements from an unordered_map.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from an unordered_map. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [4/5]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            const_iterator __position)  [inline]
```

Erases an element from an unordered_map.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [5/5]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            iterator __position)  [inline]
```

Erases an element from an unordered_map.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

find() [1/2]

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_↩
Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
            const key_type & __x)  [inline]
```

Tries to locate an element in an unordered_map.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.
