3 Topic Documentation 4

3.1 Algorithms . . . 4
3.1.1 Detailed Description . . . 4
3.1.2 Generalized Numeric operations . . . 5
3.1.3 Mutating . . . 21
3.1.4 Non-Mutating . . . 43
3.1.5 Sorting . . . 62
3.2 Atomics . . . 104
3.2.1 Detailed Description . . . 109
3.2.2 Macro Definition Documentation . . . 109
3.2.3 Typedef Documentation . . . 109
3.2.4 Enumeration Type Documentation . . . 116
3.2.5 Function Documentation . . . 116
3.3 Concurrency . . . 116
3.3.1 Detailed Description . . . 117
3.3.2 Condition Variables . . . 117
3.3.3 Futures . . . 118
3.3.4 Mutexes . . . 121
3.3.5 Threads . . . 124
3.4 Containers . . . 125
3.4.1 Detailed Description . . . 126
3.4.2 Associative . . . 126
3.4.3 Sequences . . . 127
3.4.4 Unordered Associative . . . 128
3.5 Diagnostics . . . 129
3.5.1 Detailed Description . . . 130
3.5.2 Function Documentation . . . 130
3.5.3 Exceptions . . . 133
3.6 Extensions . . . 138
3.6.1 Detailed Description . . . 138
3.6.2 Dynamic Bitset. . . . 139
3.6.3 Policy-Based Data Structures . . . 143
3.6.4 SGI . . . 152
3.7 Filesystem . . . 161
3.7.1 Detailed Description . . . 166
3.7.2 Typedef Documentation . . . 166

3.7.3 Enumeration Type Documentation . . . 166
3.7.4 Function Documentation . . . 166
3.8 I/O . . . 167
3.8.1 Detailed Description . . . 169
3.8.2 Typedef Documentation . . . 169
3.9 Iterators . . . 171
3.9.1 Detailed Description . . . 175
3.9.2 Function Documentation . . . 175
3.9.3 Iterator Tags . . . 177
3.10 Locales . . . 177
3.10.1 Detailed Description . . . 178
3.10.2 Function Documentation . . . 178
3.11 Numerics . . . 180
3.11.1 Detailed Description . . . 180
3.11.2 Bit manipulation . . . 181
3.11.3 Complex Numbers . . . 181
3.11.4 Decimal Floating-Point Arithmetic . . . 190
3.11.5 Mathematical Special Functions . . . 191
3.11.6 Numeric Arrays . . . 220
3.11.7 Random Number Generation . . . 236
3.11.8 TR1 Mathematical Special Functions . . . 250
3.12 Ranges . . . 255
3.12.1 Detailed Description . . . 255
3.13 Regular Expressions . . . 256
3.13.1 Detailed Description . . . 259
3.13.2 Typedef Documentation . . . 259
3.13.3 Function Documentation . . . 260
3.13.4 Base and Implementation Classes . . . 277
3.14 Strings . . . 278
3.14.1 Detailed Description . . . 278
3.14.2 Typedef Documentation . . . 278
3.15 Technical Specifications . . . 279
3.15.1 Detailed Description . . . 279
3.15.2 Filesystem TS . . . 280
3.15.3 Library Fundamentals TS . . . 285
3.15.4 Parallelism TS . . . 300
3.16 Utilities . . . 301
3.16.1 Detailed Description . . . 304
3.16.2 Function Documentation . . . 304

3.16.3 Variable Documentation . . . 313
3.16.4 Concepts . . . 314
3.16.5 Function Objects . . . 315
3.16.6 Memory . . . 325
3.16.7 Metaprogramming . . . 354
3.16.8 Rational Arithmetic . . . 363
3.16.9 Time . . . 365

4 Namespace Documentation **386**

4.1 __gnu_cxx Namespace Reference . . . 386
4.1.1 Detailed Description . . . 403
4.1.2 Typedef Documentation . . . 403
4.1.3 Function Documentation . . . 403
4.2 __gnu_cxx::__detail Namespace Reference . . . 413
4.2.1 Detailed Description . . . 413
4.2.2 Function Documentation . . . 414
4.3 __gnu_cxx::typelist Namespace Reference . . . 414
4.3.1 Detailed Description . . . 414
4.3.2 Function Documentation . . . 415
4.4 __gnu_debug Namespace Reference . . . 415
4.4.1 Detailed Description . . . 420
4.4.2 Typedef Documentation . . . 421
4.4.3 Enumeration Type Documentation . . . 421
4.4.4 Function Documentation . . . 421
4.5 __gnu_internal Namespace Reference . . . 423
4.5.1 Detailed Description . . . 423
4.6 __gnu_parallel Namespace Reference . . . 423
4.6.1 Detailed Description . . . 430
4.6.2 Typedef Documentation . . . 431
4.6.3 Enumeration Type Documentation . . . 431
4.6.4 Function Documentation . . . 432
4.6.5 Variable Documentation . . . 472
4.7 __gnu_pbds Namespace Reference . . . 473
4.7.1 Detailed Description . . . 475
4.8 __gnu_sequential Namespace Reference . . . 475
4.8.1 Detailed Description . . . 475
4.9 abi Namespace Reference . . . 475
4.9.1 Detailed Description . . . 475
4.10 std Namespace Reference . . . 475

4.10.1 Detailed Description . . . 587
4.10.2 Typedef Documentation . . . 587
4.10.3 Enumeration Type Documentation . . . 589
4.10.4 Function Documentation . . . 590
4.10.5 Variable Documentation . . . 649
4.11 std::__debug Namespace Reference . . . 650
4.11.1 Detailed Description . . . 657
4.11.2 Function Documentation . . . 657
4.12 std::__detail Namespace Reference . . . 657
4.12.1 Detailed Description . . . 660
4.12.2 Function Documentation . . . 660
4.13 std::__parallel Namespace Reference . . . 661
4.13.1 Detailed Description . . . 678
4.13.2 Function Documentation . . . 678
4.14 std::chrono Namespace Reference . . . 679
4.14.1 Detailed Description . . . 686
4.15 std::decimal Namespace Reference . . . 686
4.15.1 Detailed Description . . . 695
4.15.2 Function Documentation . . . 695
4.16 std::experimental Namespace Reference . . . 695
4.16.1 Detailed Description . . . 706
4.16.2 Function Documentation . . . 706
4.16.3 Variable Documentation . . . 707
4.17 std::filesystem Namespace Reference . . . 708
4.17.1 Detailed Description . . . 711
4.18 std::literals Namespace Reference . . . 711
4.18.1 Detailed Description . . . 712
4.19 std::literals::chrono_literals Namespace Reference . . . 712
4.19.1 Detailed Description . . . 712
4.20 std::placeholders Namespace Reference . . . 713
4.20.1 Detailed Description . . . 713
4.21 std::regex_constants Namespace Reference . . . 713
4.21.1 Detailed Description . . . 715
4.21.2 Enumeration Type Documentation . . . 715
4.21.3 Function Documentation . . . 715
4.21.4 Variable Documentation . . . 719
4.22 std::rel_ops Namespace Reference . . . 723
4.22.1 Detailed Description . . . 723
4.22.2 Function Documentation . . . 723

4.23 std::this_thread Namespace Reference . . . 725
4.23.1 Detailed Description . . . 725
4.23.2 Function Documentation . . . 725
4.24 std::tr1 Namespace Reference . . . 726
4.24.1 Detailed Description . . . 729
4.24.2 Function Documentation . . . 729
4.25 std::tr1::__detail Namespace Reference . . . 731
4.25.1 Detailed Description . . . 731
4.26 std::tr2 Namespace Reference . . . 731
4.26.1 Detailed Description . . . 733
4.27 std::tr2::__detail Namespace Reference . . . 733
4.27.1 Detailed Description . . . 733

5 Concept Documentation **733**

5.1 std::assignable_from Concept Reference . . . 733
5.1.1 Concept definition . . . 733
5.1.2 Detailed Description . . . 733
5.2 std::common_reference_with Concept Reference . . . 733
5.2.1 Concept definition . . . 734
5.2.2 Detailed Description . . . 734
5.3 std::common_with Concept Reference . . . 734
5.3.1 Concept definition . . . 734
5.3.2 Detailed Description . . . 734
5.4 std::constructible_from Concept Reference . . . 734
5.4.1 Concept definition . . . 734
5.4.2 Detailed Description . . . 734
5.5 std::convertible_to Concept Reference . . . 734
5.5.1 Concept definition . . . 734
5.5.2 Detailed Description . . . 734
5.6 std::copy_constructible Concept Reference . . . 735
5.6.1 Concept definition . . . 735
5.6.2 Detailed Description . . . 735
5.7 std::default_initializable Concept Reference . . . 735
5.7.1 Concept definition . . . 735
5.7.2 Detailed Description . . . 735
5.8 std::derived_from Concept Reference . . . 735
5.8.1 Concept definition . . . 735
5.8.2 Detailed Description . . . 735
5.9 std::destructible Concept Reference . . . 735

5.9.1 Concept definition . . . 735
5.9.2 Detailed Description . . . 735
5.10 std::equivalence_relation Concept Reference . . . 736
5.10.1 Concept definition . . . 736
5.10.2 Detailed Description . . . 736
5.11 std::indirectly_comparable Concept Reference . . . 736
5.11.1 Concept definition . . . 736
5.11.2 Detailed Description . . . 736
5.12 std::indirectly_copyable Concept Reference . . . 736
5.12.1 Concept definition . . . 736
5.12.2 Detailed Description . . . 736
5.13 std::indirectly_movable Concept Reference . . . 736
5.13.1 Concept definition . . . 736
5.13.2 Detailed Description . . . 736
5.14 std::indirectly_readable Concept Reference . . . 736
5.14.1 Concept definition . . . 737
5.14.2 Detailed Description . . . 737
5.15 std::indirectly_swappable Concept Reference . . . 737
5.15.1 Concept definition . . . 737
5.15.2 Detailed Description . . . 737
5.16 std::indirectly_writable Concept Reference . . . 737
5.16.1 Concept definition . . . 737
5.16.2 Detailed Description . . . 737
5.17 std::invocable Concept Reference . . . 737
5.17.1 Concept definition . . . 737
5.17.2 Detailed Description . . . 737
5.18 std::mergeable Concept Reference . . . 738
5.18.1 Concept definition . . . 738
5.18.2 Detailed Description . . . 738
5.19 std::move_constructible Concept Reference . . . 738
5.19.1 Concept definition . . . 738
5.19.2 Detailed Description . . . 738
5.20 std::permutable Concept Reference . . . 738
5.20.1 Concept definition . . . 738
5.20.2 Detailed Description . . . 738
5.21 std::predicate Concept Reference . . . 738
5.21.1 Concept definition . . . 738
5.21.2 Detailed Description . . . 738
5.22 std::ranges::bidirectional_range Concept Reference . . . 739

5.22.1 Concept definition . . . 739
5.22.2 Detailed Description . . . 739
5.23 std::ranges::borrowed_range Concept Reference . . . 739
5.23.1 Concept definition . . . 739
5.23.2 Detailed Description . . . 739
5.24 std::ranges::common_range Concept Reference . . . 739
5.24.1 Concept definition . . . 739
5.24.2 Detailed Description . . . 739
5.25 std::ranges::contiguous_range Concept Reference . . . 739
5.25.1 Concept definition . . . 739
5.25.2 Detailed Description . . . 739
5.26 std::ranges::forward_range Concept Reference . . . 739
5.26.1 Concept definition . . . 740
5.26.2 Detailed Description . . . 740
5.27 std::ranges::input_range Concept Reference . . . 740
5.27.1 Concept definition . . . 740
5.27.2 Detailed Description . . . 740
5.28 std::ranges::output_range Concept Reference . . . 740
5.28.1 Concept definition . . . 740
5.28.2 Detailed Description . . . 740
5.29 std::ranges::random_access_range Concept Reference . . . 740
5.29.1 Concept definition . . . 740
5.29.2 Detailed Description . . . 740
5.30 std::ranges::range Concept Reference . . . 740
5.30.1 Concept definition . . . 741
5.30.2 Detailed Description . . . 741
5.31 std::ranges::sized_range Concept Reference . . . 741
5.31.1 Concept definition . . . 741
5.31.2 Detailed Description . . . 741
5.32 std::ranges::view Concept Reference . . . 741
5.32.1 Concept definition . . . 741
5.32.2 Detailed Description . . . 741
5.33 std::ranges::viewable_range Concept Reference . . . 741
5.33.1 Concept definition . . . 741
5.33.2 Detailed Description . . . 741
5.34 std::regular_invocable Concept Reference . . . 741
5.34.1 Concept definition . . . 742
5.34.2 Detailed Description . . . 742
5.35 std::relation Concept Reference . . . 742

5.35.1 Concept definition . . . 742
5.35.2 Detailed Description . . . 742
5.36 std::same_as Concept Reference . . . 742
5.36.1 Concept definition . . . 742
5.36.2 Detailed Description . . . 742
5.37 std::simd::__vec_builtin Concept Reference . . . 742
5.37.1 Concept definition . . . 742
5.37.2 Detailed Description . . . 742
5.38 std::simd::__vec_builtin_of Concept Reference . . . 742
5.38.1 Concept definition . . . 743
5.38.2 Detailed Description . . . 743
5.39 std::sortable Concept Reference . . . 743
5.39.1 Concept definition . . . 743
5.39.2 Detailed Description . . . 743
5.40 std::strict_weak_order Concept Reference . . . 743
5.40.1 Concept definition . . . 743
5.40.2 Detailed Description . . . 743
5.41 std::uniform_random_bit_generator Concept Reference . . . 743
5.41.1 Concept definition . . . 743
5.41.2 Detailed Description . . . 743
5.42 std::weakly_incrementable Concept Reference . . . 744
5.42.1 Concept definition . . . 744
5.42.2 Detailed Description . . . 744

6 Class Documentation **744**

6.1 __gnu_parallel::__accumulate_binop_reduct< _BinOp > Struct Template Reference . . . 744
6.1.1 Detailed Description . . . 744
6.2 __gnu_parallel::__accumulate_selector< _It > Struct Template Reference . . . 744
6.2.1 Detailed Description . . . 745
6.2.2 Member Function Documentation . . . 745
6.2.3 Member Data Documentation . . . 746
6.3 __gnu_parallel::__adjacent_difference_selector< _It > Struct Template Reference . . . 746
6.3.1 Detailed Description . . . 747
6.3.2 Member Data Documentation . . . 747
6.4 __gnu_parallel::__adjacent_find_selector Struct Reference . . . 747
6.4.1 Detailed Description . . . 747
6.4.2 Member Function Documentation . . . 748
6.5 __gnu_cxx::__alloc_traits< _Alloc, typename > Struct Template Reference . . . 748
6.5.1 Detailed Description . . . 750

6.5.2 Member Typedef Documentation . . . 750
6.5.3 Member Function Documentation . . . 751
6.6 std::__basic_future< _Res > Class Template Reference . . . 755
6.6.1 Detailed Description . . . 756
6.6.2 Member Function Documentation . . . 757
6.7 __gnu_parallel::__binder1st< _Operation, _FirstArgumentType, _SecondArgumentType, _ResultType > Class Template Reference . . . 757
6.7.1 Detailed Description . . . 758
6.7.2 Member Typedef Documentation . . . 758
6.8 __gnu_parallel::__binder2nd< _Operation, _FirstArgumentType, _SecondArgumentType, _ResultType > Class Template Reference . . . 758
6.8.1 Detailed Description . . . 759
6.8.2 Member Typedef Documentation . . . 759
6.9 std::__codecvt_abstract_base< _InternT, _ExternT, _StateT > Class Template Reference . . . 759
6.9.1 Detailed Description . . . 760
6.9.2 Member Function Documentation . . . 760
6.10 __gnu_cxx::__common_pool_policy< _PoolTp, _Thread > Struct Template Reference . . . 763
6.10.1 Detailed Description . . . 763
6.11 __gnu_parallel::__count_if_selector< _It, _Diff > Struct Template Reference . . . 763
6.11.1 Detailed Description . . . 764
6.11.2 Member Function Documentation . . . 764
6.11.3 Member Data Documentation . . . 765
6.12 __gnu_parallel::__count_selector< _It, _Diff > Struct Template Reference . . . 765
6.12.1 Detailed Description . . . 766
6.12.2 Member Function Documentation . . . 766
6.12.3 Member Data Documentation . . . 766
6.13 std::__ctype_abstract_base< _CharT > Class Template Reference . . . 766
6.13.1 Detailed Description . . . 768
6.13.2 Member Typedef Documentation . . . 768
6.13.3 Member Function Documentation . . . 769
6.14 std::tr2::__dynamic_bitset_base< _WordT, _Alloc > Struct Template Reference . . . 780
6.14.1 Detailed Description . . . 782
6.14.2 Member Data Documentation . . . 782
6.15 __gnu_parallel::__fill_selector< _It > Struct Template Reference . . . 782
6.15.1 Detailed Description . . . 782
6.15.2 Member Function Documentation . . . 783
6.15.3 Member Data Documentation . . . 783
6.16 __gnu_parallel::__find_first_of_selector< _FIterator > Struct Template Reference . . . 783
6.16.1 Detailed Description . . . 784
6.16.2 Member Function Documentation . . . 784

6.17 __gnu_parallel::__find_if_selector Struct Reference . . . 785
6.17.1 Detailed Description . . . 785
6.17.2 Member Function Documentation . . . 785
6.18 __gnu_parallel::__for_each_selector< _It > Struct Template Reference . . . 786
6.18.1 Detailed Description . . . 787
6.18.2 Member Function Documentation . . . 787
6.18.3 Member Data Documentation . . . 788
6.19 __cxxabiv1::__forced_unwind Class Reference . . . 788
6.19.1 Detailed Description . . . 788
6.20 __gnu_parallel::__generate_selector< _It > Struct Template Reference . . . 788
6.20.1 Detailed Description . . . 789
6.20.2 Member Function Documentation . . . 789
6.20.3 Member Data Documentation . . . 789
6.21 __gnu_parallel::__generic_find_selector Struct Reference . . . 789
6.21.1 Detailed Description . . . 790
6.22 __gnu_parallel::__generic_for_each_selector< _It > Struct Template Reference . . . 790
6.22.1 Detailed Description . . . 792
6.22.2 Member Data Documentation . . . 792
6.23 __gnu_parallel::__identity_selector< _It > Struct Template Reference . . . 792
6.23.1 Detailed Description . . . 792
6.23.2 Member Function Documentation . . . 793
6.23.3 Member Data Documentation . . . 793
6.24 __gnu_parallel::__inner_product_selector< _It, _It2, _Tp > Struct Template Reference . . . 793
6.24.1 Detailed Description . . . 794
6.24.2 Constructor & Destructor Documentation . . . 794
6.24.3 Member Function Documentation . . . 795
6.24.4 Member Data Documentation . . . 795
6.25 std::__is_fast_hash< _Hash > Struct Template Reference . . . 795
6.25.1 Detailed Description . . . 796
6.26 std::__is_location_invariant< _Tp > Struct Template Reference . . . 796
6.26.1 Detailed Description . . . 796
6.27 __gnu_parallel::__max_element_reduct< _Compare, _It > Struct Template Reference . . . 796
6.27.1 Detailed Description . . . 796
6.28 __gnu_parallel::__min_element_reduct< _Compare, _It > Struct Template Reference . . . 796
6.28.1 Detailed Description . . . 797
6.29 __gnu_cxx::__detail::__mini_vector< _Tp > Class Template Reference . . . 797
6.29.1 Detailed Description . . . 797
6.30 __gnu_parallel::__mismatch_selector Struct Reference . . . 798
6.30.1 Detailed Description . . . 798

6.30.2 Member Function Documentation 798
6.31 __gnu_cxx::__mt_alloc< _Tp, _Poolp > Class Template Reference 799
6.31.1 Detailed Description 800
6.32 __gnu_cxx::__mt_alloc_base< _Tp > Class Template Reference 800
6.32.1 Detailed Description 801
6.33 __gnu_parallel::__multiway_merge_3_variant_sentinel_switch< __sentinels, _RAIterIterator, _RAIter3, _DifferenceTp, _Compare > Struct Template Reference 801
6.33.1 Detailed Description 802
6.34 __gnu_parallel::__multiway_merge_3_variant_sentinel_switch< true, _RAIterIterator, _RAIter3, _DifferenceTp, _Compare > Struct Template Reference 802
6.34.1 Detailed Description 802
6.35 __gnu_parallel::__multiway_merge_4_variant_sentinel_switch< __sentinels, _RAIterIterator, _RAIter3, _DifferenceTp, _Compare > Struct Template Reference 802
6.35.1 Detailed Description 802
6.36 __gnu_parallel::__multiway_merge_4_variant_sentinel_switch< true, _RAIterIterator, _RAIter3, _DifferenceTp, _Compare > Struct Template Reference 803
6.36.1 Detailed Description 803
6.37 __gnu_parallel::__multiway_merge_k_variant_sentinel_switch< __sentinels, __stable, _RAIterIterator, _RAIter3, _DifferenceTp, _Compare > Struct Template Reference 803
6.37.1 Detailed Description 803
6.38 __gnu_parallel::__multiway_merge_k_variant_sentinel_switch< false, __stable, _RAIterIterator, _RAIter3, _DifferenceTp, _Compare > Struct Template Reference 803
6.38.1 Detailed Description 804
6.39 std::__new_allocator< _Tp > Class Template Reference 804
6.39.1 Detailed Description 805
6.40 std::__numeric_limits_base Struct Reference 805
6.40.1 Detailed Description 807
6.40.2 Member Data Documentation 807
6.41 __gnu_cxx::__per_type_pool_policy< _Tp, _PoolTp, _Thread > Struct Template Reference 810
6.41.1 Detailed Description 810
6.42 __gnu_cxx::__pool< _Thread > Class Template Reference 810
6.42.1 Detailed Description 810
6.43 __gnu_cxx::__pool< false > Class Reference 810
6.43.1 Detailed Description 811
6.44 __gnu_cxx::__pool< true > Class Reference 811

6.895.2 Member Typedef Documentation . . . 2865
6.895.3 Constructor & Destructor Documentation . . . 2865
6.895.4 Member Function Documentation . . . 2865
6.896 __gnu_pbds::sample_tree_node_update< Const_Node_Iter, Node_Iter, Cmp_Fn, _Alloc > Class Template Reference . . . 2866
6.896.1 Detailed Description . . . 2866

6.897 __gnu_pbds::sample_trie_access_traits Struct Reference 2866
6.897.1 Detailed Description 2866
6.897.2 Member Typedef Documentation 2866
6.897.3 Member Function Documentation 2866
6.898 __gnu_pbds::sample_trie_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc > Class Template Reference 2867
6.898.1 Detailed Description 2867
6.898.2 Constructor & Destructor Documentation 2867
6.898.3 Member Function Documentation 2867
6.899 __gnu_pbds::sample_update_policy Struct Reference 2868
6.899.1 Detailed Description 2868
6.899.2 Member Typedef Documentation 2868
6.899.3 Constructor & Destructor Documentation 2868
6.899.4 Member Function Documentation 2868
6.900 __gnu_parallel::sampling_tag Struct Reference 2869
6.900.1 Detailed Description 2869
6.900.2 Member Function Documentation 2869
6.901 std::scoped_allocator_adaptor< _OuterAlloc, _InnerAllocs > Class Template Reference 2870
6.901.1 Detailed Description 2871
6.902 std::seed_seq Class Reference 2871
6.902.1 Detailed Description 2872
6.902.2 Member Typedef Documentation 2872
6.902.3 Constructor & Destructor Documentation 2872
6.903 __gnu_cxx::select1st< _Pair > Struct Template Reference 2872
6.903.1 Detailed Description 2873
6.903.2 Member Typedef Documentation 2873
6.904 __gnu_cxx::select2nd< _Pair > Struct Template Reference 2873
6.904.1 Detailed Description 2873
6.904.2 Member Typedef Documentation 2873
6.905 __gnu_pbds::detail::select_value_type< Key, Mapped > Struct Template Reference 2874
6.905.1 Detailed Description 2874
6.906 __gnu_pbds::detail::select_value_type< Key, null_type > Struct Template Reference 2874
6.906.1 Detailed Description 2874
6.907 std::basic_istream< _CharT, _Traits >::sentry Class Reference 2874
6.907.1 Detailed Description 2875
6.907.2 Member Typedef Documentation 2875
6.907.3 Constructor & Destructor Documentation 2875
6.907.4 Member Function Documentation 2875
6.908 std::basic_ostream< _CharT, _Traits >::sentry Class Reference 2876

6.908.1 Detailed Description . . . 2876
6.908.2 Constructor & Destructor Documentation . . . 2876
6.908.3 Member Function Documentation . . . 2877
6.909 __gnu_pbds::sequence_tag Struct Reference . . . 2877
6.909.1 Detailed Description . . . 2877
6.910 __gnu_parallel::sequential_tag Struct Reference . . . 2877
6.910.1 Detailed Description . . . 2878
6.911 std::__debug::set< _Key, _Compare, _Allocator > Class Template Reference . . . 2878
6.911.1 Detailed Description . . . 2880
6.912 std::set< _Key, _Compare, _Alloc > Class Template Reference . . . 2880
6.912.1 Detailed Description . . . 2882
6.912.2 Member Typedef Documentation . . . 2883
6.912.3 Constructor & Destructor Documentation . . . 2885
6.912.4 Member Function Documentation . . . 2888
6.913 std::shared_future< _Res > Class Template Reference . . . 2899
6.913.1 Detailed Description . . . 2900
6.913.2 Constructor & Destructor Documentation . . . 2900
6.913.3 Member Function Documentation . . . 2901
6.914 std::shared_future< _Res & > Class Template Reference . . . 2901

Index **3733**

1 Deprecated List

Module negators

Deprecated in C++17, no longer in the standard since C++20. Use `not_fn` instead.

Module pointer_adaptors

Deprecated in C++11, no longer in the standard since C++17.

Module ptrmem_adaptors

Deprecated in C++11, no longer in the standard since C++17. Use `mem_fn` instead.

Struct std::aligned_storage< _Len, _Align >

Deprecated in C++23. Uses can be replaced by an array `std::byte[_Len]` declared with `alignas(↩ _Align)`.

Struct std::aligned_union< _Len, _Types >

Deprecated in C++23.

Class std::auto_ptr< _Tp >

Deprecated in C++11, no longer in the standard since C++17. Use `unique_ptr` instead.

Struct std::binary_function< _Arg1, _Arg2, _Result >

Deprecated in C++11, no longer in the standard since C++17.

Struct std::is_literal_type< _Tp >

Deprecated in C++17, removed in C++20. The idea of a literal type isn't useful.

Struct std::is_pod< _Tp >

Deprecated in C++20. Use `is_standard_layout && is_trivial` instead.

Struct std::is_trivial< _Tp >

Deprecated in C++26. Use a combination of one or more more specialized type traits instead, such as `is_trivially_default_constructible`, `is_trivially_copy_constructible`, `is_trivially_copy_assignable`, etc., depending on the exact check(s) needed.

Struct std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >

Deprecated since C++17. The recommended alternative is to simply define the typedefs directly in your iterator class.

Member std::random_shuffle (_RandomAccessIterator __first, _RandomAccessIterator __last)

Since C++17, `std::random_shuffle` is not part of the C++ standard. Use `std::shuffle` instead, which was introduced in C++11.

Member std::random_shuffle (_RandomAccessIterator __first, _RandomAccessIterator __last, _RandomNumberGenerator &&__rand)

Since C++17, `std::random_shuffle` is not part of the C++ standard. Use `std::shuffle` instead, which was introduced in C++11.

Struct std::unary_function< _Arg, _Result >

Deprecated in C++11, no longer in the standard since C++17.

2 Todo List

Member __gnu_cxx::distance (_InputIterator __first, _InputIterator __last, _Distance &__n)

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

Class __gnu_cxx::hash_map< _Key, _Tp, _HashFn, _EqualKey, _Alloc >

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

Class __gnu_cxx::hash_multimap< _Key, _Tp, _HashFn, _EqualKey, _Alloc >

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

Class __gnu_cxx::hash_multiset< _Value, _HashFcn, _EqualKey, _Alloc >

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

Class __gnu_cxx::hash_set< _Value, _HashFcn, _EqualKey, _Alloc >

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

Member __gnu_cxx::power (_Tp __x, _Integer __n, _MonoidOperation __monoid_op)

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

Member __gnu_cxx::power (_Tp __x, _Integer __n)

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

Member __gnu_cxx::random_sample (_InputIterator __first, _InputIterator __last, _RandomAccessIterator __out_first, _RandomAccessIterator __out_last)

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

Member __gnu_cxx::random_sample (_InputIterator __first, _InputIterator __last, _RandomAccessIterator __out_first, _RandomAccessIterator __out_last, _RandomNumberGenerator &__rand)

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

Member __gnu_cxx::random_sample_n (_ForwardIterator __first, _ForwardIterator __last, _OutputIterator __out, const _Distance __n)

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

Member __gnu_cxx::random_sample_n (_ForwardIterator __first, _ForwardIterator __last, _OutputIterator __out, const _Distance __n, _RandomNumberGenerator &__rand)

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

Struct __gnu_cxx::rb_tree< _Key, _Value, _KeyOfValue, _Compare, _Alloc >

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

Class __gnu_cxx::rope< _CharT, _Alloc >

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

Class __gnu_cxx::slist< _Tp, _Alloc >

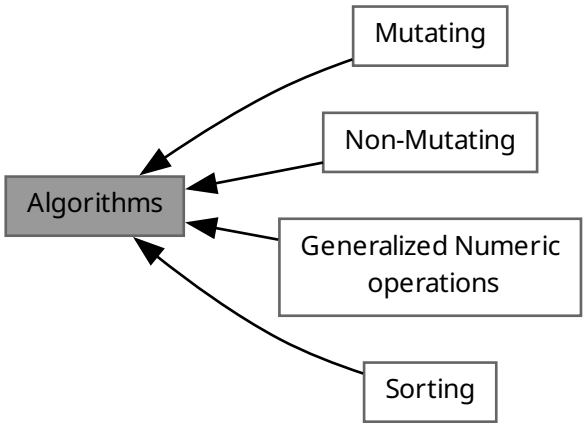
Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

Module mathsf

Provide accuracy comparisons on a per-function basis for a small number of targets.

Class std::basic_string< _CharT, _Traits, _Alloc >

Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html



Member std::regex_traits< _Ch_type >::transform_primary (_Fwd_iter __first, _Fwd_iter __last) const

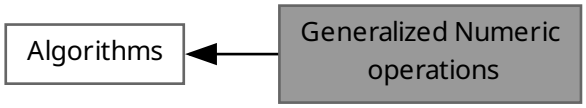
Implement this function correctly.

3 Topic Documentation

3.1 Algorithms

Collaboration diagram for Algorithms:

Topics



- Generalized Numeric operations
- Mutating
- Non-Mutating
- Sorting

3.1.1 Detailed Description

Components for performing algorithmic operations. Includes non-modifying sequence, modifying (mutating) sequence, sorting, searching, merge, partition, heap, set, minima, maxima, and permutation operations.

3.1.2 Generalized Numeric operations

Collaboration diagram for Generalized Numeric operations:

Functions

3.1.2.1 Detailed Description

3.1.2.2 Function Documentation

accumulate() [1/2]

```
template<typename _InputIterator, typename _Tp>
_Tp std::accumulate (
            _InputIterator __first,
            _InputIterator __last,
            _Tp __init)  [inline], [constexpr]
```

Accumulate values in a range.

Accumulates the values in the range [first,last) using operator+(). The initial value is *init*. The values are processed in order.

Parameters

__first	Start of range.
__last	End of range.
__init	Starting value to add other values to.

Returns

The final sum.

accumulate() [2/2]

```
template<typename _InputIterator, typename _Tp, typename _BinaryOperation>
_Tp std::accumulate (
            _InputIterator __first,
            _InputIterator __last,
            _Tp __init,
            _BinaryOperation __binary_op)  [inline], [constexpr]
```

Accumulate values in a range with operation.

Accumulates the values in the range `[first,last)` using the function object `__binary_op`. The initial value is `__init`. The values are processed in order.

Parameters

__first	Start of range.
__last	End of range.
__init	Starting value to add other values to.
__binary_op	Function object to accumulate with.

Returns

The final sum.

adjacent_difference() [1/2]

```
template<typename _InputIterator, typename _OutputIterator>
_OutputIterator std::adjacent_difference (
            _InputIterator __first,
            _InputIterator __last,
            _OutputIterator __result)  [constexpr]
```

Return differences between adjacent values.

Computes the difference between adjacent values in the range [first,last) using operator-() and writes the result to __result.

Parameters

__first	Start of input range.
__last	End of input range.
__result	Output sums.

Returns

Iterator pointing just beyond the values written to result.

adjacent_difference() [2/2]

```
template<typename _InputIterator, typename _OutputIterator, typename _BinaryOperation>
_OutputIterator std::adjacent_difference (
            _InputIterator __first,
            _InputIterator __last,
            _OutputIterator __result,
            _BinaryOperation __binary_op)  [constexpr]
```

Return differences between adjacent values.

Computes the difference between adjacent values in the range [__first,__last) using the function object __binary_op and writes the result to __result.

Parameters

__first	Start of input range.
__last	End of input range.
__result	Output sum.
__binary_op	Function object.

Returns

Iterator pointing just beyond the values written to result.

exclusive_scan() [1/2]

```
template<typename _InputIterator, typename _OutputIterator, typename _Tp>
_OutputIterator std::exclusive_scan (
            _InputIterator __first,
            _InputIterator __last,
```

```
            _OutputIterator __result,
            _Tp __init)  [inline], [constexpr]
```

Output the cumulative sum of one range to a second range.

Parameters

__first	Start of input range.
__last	End of input range.
__result	Start of output range.
__init	Initial value.

Returns

The end of the output range.

Write the cumulative sum (aka prefix sum, aka scan) of the input range to the output range. Each element of the output range contains the running total of all earlier elements (and the initial value), using `std::plus<>` for summation.

This function generates an "exclusive" scan, meaning the Nth element of the output range is the sum of the first N-1 input elements, so the Nth input element is not included.

References exclusive_scan(), and move().

exclusive_scan() [2/2]

```
template<typename _InputIterator, typename _OutputIterator, typename _Tp, typename _Binary↩
Operation>
_OutputIterator std::exclusive_scan (
            _InputIterator __first,
            _InputIterator __last,
            _OutputIterator __result,
            _Tp __init,
            _BinaryOperation __binary_op)  [constexpr]
```

Output the cumulative sum of one range to a second range.

Parameters

__first	Start of input range.
__last	End of input range.
__result	Start of output range.
__init	Initial value.
__binary_op	Function to perform summation.

Returns

The end of the output range.

Write the cumulative sum (aka prefix sum, aka scan) of the input range to the output range. Each element of the output range contains the running total of all earlier elements (and the initial value), using `binary_op` for summation.

This function generates an "exclusive" scan, meaning the Nth element of the output range is the sum of the first N-1 input elements, so the Nth input element is not included.

References move().

Referenced by exclusive_scan().

inclusive_scan() [1/3]

```
template<typename _InputIterator, typename _OutputIterator>
_OutputIterator std::inclusive_scan (
            _InputIterator __first,
            _InputIterator __last,
            _OutputIterator __result)  [inline], [constexpr]
```

Output the cumulative sum of one range to a second range.

Parameters

__first	Start of input range.
__last	End of input range.
__result	Start of output range.

Returns

The end of the output range.

Write the cumulative sum (aka prefix sum, aka scan) of the input range to the output range. Each element of the output range contains the running total of all earlier elements, using `std::plus<>` for summation.

This function generates an "inclusive" scan, meaning the Nth element of the output range is the sum of the first N input elements, so the Nth input element is included.

References inclusive_scan().

inclusive_scan() [2/3]

```
template<typename _InputIterator, typename _OutputIterator, typename _BinaryOperation>
_OutputIterator std::inclusive_scan (
             _InputIterator __first,
             _InputIterator __last,
             _OutputIterator __result,
             _BinaryOperation __binary_op)  [constexpr]
```

Output the cumulative sum of one range to a second range.

Parameters

__first	Start of input range.
__last	End of input range.
__result	Start of output range.
__binary_op	Function to perform summation.

Returns

The end of the output range.

Write the cumulative sum (aka prefix sum, aka scan) of the input range to the output range. Each element of the output range contains the running total of all earlier elements, using `binary_op` for summation.

This function generates an "inclusive" scan, meaning the Nth element of the output range is the sum of the first N input elements, so the Nth input element is included.

References inclusive_scan(), and move().

inclusive_scan() [3/3]

```
template<typename _InputIterator, typename _OutputIterator, typename _BinaryOperation, typename ↩
_Tp>
_OutputIterator std::inclusive_scan (
             _InputIterator __first,
             _InputIterator __last,
             _OutputIterator __result,
             _BinaryOperation __binary_op,
             _Tp __init)  [constexpr]
```

Output the cumulative sum of one range to a second range.

Parameters

__first	Start of input range.
__last	End of input range.

__result	Start of output range.
__binary_op	Function to perform summation.
__init	Initial value.

Returns

The end of the output range.

Write the cumulative sum (aka prefix sum, aka scan) of the input range to the output range. Each element of the output range contains the running total of all earlier elements (and the initial value), using `binary_op` for summation.

This function generates an "inclusive" scan, meaning the Nth element of the output range is the sum of the first N input elements, so the Nth input element is included.

Referenced by inclusive_scan(), and inclusive_scan().

inner_product() [1/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _Tp>
_Tp std::inner_product (
             _InputIterator1 __first1,
             _InputIterator1 __last1,
             _InputIterator2 __first2,
             _Tp __init)  [inline], [constexpr]
```

Compute inner product of two ranges.

Starting with an initial value of `__init`, multiplies successive elements from the two ranges and adds each product into the accumulated value using operator+(). The values in the ranges are processed in order.

Parameters

__first1	Start of range 1.
__last1	End of range 1.
__first2	Start of range 2.
__init	Starting value to add other values to.

Returns

The final inner product.

inner_product() [2/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _Tp, typename _Binary↩
Operation1, typename _BinaryOperation2>
_Tp std::inner_product (
             _InputIterator1 __first1,
             _InputIterator1 __last1,
             _InputIterator2 __first2,
             _Tp __init,
             _BinaryOperation1 __binary_op1,
             _BinaryOperation2 __binary_op2)  [inline], [constexpr]
```

Compute inner product of two ranges.

Starting with an initial value of `__init`, applies `__binary_op2` to successive elements from the two ranges and accumulates each result into the accumulated value using `__binary_op1`. The values in the ranges are processed in order.

Parameters

__first1	Start of range 1.
__last1	End of range 1.
__first2	Start of range 2.
__init	Starting value to add other values to.
__binary_op1	Function object to accumulate with.
__binary_op2	Function object to apply to pairs of input values.

Returns

The final inner product.

iota()

```
template<typename _ForwardIterator, typename _Tp>
void std::iota (
             _ForwardIterator __first,
             _ForwardIterator __last,
             _Tp __value)  [constexpr]
```

Create a range of sequentially increasing values.

For each element in the range [first,last) assigns `value` and increments `value` as if by `++value`.

Parameters

__first	Start of range.

__last	End of range.
__value	Starting value.

partial_sum() [1/2]

```
template<typename _InputIterator, typename _OutputIterator>
_OutputIterator std::partial_sum (
            _InputIterator __first,
            _InputIterator __last,
            _OutputIterator __result)  [constexpr]
```

Return list of partial sums.

Accumulates the values in the range [first,last) using the + operator. As each successive input value is added into the total, that partial sum is written to __result. Therefore, the first value in __result is the first value of the input, the second value in __result is the sum of the first and second input values, and so on.

Parameters

__first	Start of input range.
__last	End of input range.
__result	Output sum.

Returns

Iterator pointing just beyond the values written to __result.

Referenced by __gnu_parallel::__parallel_random_shuffle_drs_pu(), and __gnu_parallel::__sequential_random_shuffle().

partial_sum() [2/2]

```
template<typename _InputIterator, typename _OutputIterator, typename _BinaryOperation>
_OutputIterator std::partial_sum (
            _InputIterator __first,
            _InputIterator __last,
            _OutputIterator __result,
            _BinaryOperation __binary_op)  [constexpr]
```

Return list of partial sums.

Accumulates the values in the range [first,last) using __binary_op. As each successive input value is added into the total, that partial sum is written to __result. Therefore, the first value in __result is the first value of the input, the second value in __result is the sum of the first and second input values, and so on.

Parameters

__first	Start of input range.
__last	End of input range.
__result	Output sum.
__binary_op	Function object.

Returns

Iterator pointing just beyond the values written to __result.

reduce() [1/3]

```
template<typename _InputIterator>
iterator_traits< _InputIterator >::value_type std::reduce (
            _InputIterator __first,
            _InputIterator __last)  [inline], [constexpr]
```

Calculate reduction of values in a range.

Parameters

__first	Start of range.
__last	End of range.

Returns

The final sum.

Reduce the values in the range `[first,last)` using addition, with an initial value of `T{}`, where `T` is the iterator's value type. Equivalent to calling `std::reduce(first, last, T{}, std::plus<>())`.

References reduce().

reduce() [2/3]

```
template<typename _InputIterator, typename _Tp>
_Tp std::reduce (
            _InputIterator __first,
            _InputIterator __last,
            _Tp __init)  [inline], [constexpr]
```

Calculate reduction of values in a range.

Parameters

__first	Start of range.
__last	End of range.
__init	Starting value to add other values to.

Returns

The final sum.

Reduce the values in the range `[first,last)` using addition. Equivalent to calling `std::reduce(first, last, init, std::plus<>())`.

References move(), and reduce().

reduce() [3/3]

```
template<typename _InputIterator, typename _Tp, typename _BinaryOperation>
_Tp std::reduce (
             _InputIterator __first,
             _InputIterator __last,
             _Tp __init,
             _BinaryOperation __binary_op)  [constexpr]
```

Calculate reduction of values in a range.

Parameters

__first	Start of range.
__last	End of range.
__init	Starting value to add other values to.
__binary_op	A binary function object.

Returns

The final sum.

Reduce the values in the range `[first,last)` using a binary operation. The initial value is `init`. The values are not necessarily processed in order.

This algorithm is similar to `std::accumulate` but is not required to perform the operations in order from first to last. For operations that are commutative and associative the result will be the same as for `std::accumulate`, but for other operations (such as floating point arithmetic) the result can be different.

Referenced by reduce(), and reduce().

transform_exclusive_scan()

```
template<typename _InputIterator, typename _OutputIterator, typename _Tp, typename _Binary↩
Operation, typename _UnaryOperation>
_OutputIterator std::transform_exclusive_scan (
             _InputIterator __first,
             _InputIterator __last,
             _OutputIterator __result,
             _Tp __init,
             _BinaryOperation __binary_op,
             _UnaryOperation __unary_op)  [constexpr]
```

Output the cumulative sum of one range to a second range.

Parameters

__first	Start of input range.
__last	End of input range.
__result	Start of output range.
__init	Initial value.
__binary_op	Function to perform summation.
__unary_op	Function to transform elements of the input range.

Returns

The end of the output range.

Write the cumulative sum (aka prefix sum, aka scan) of the input range to the output range. Each element of the output range contains the running total of all earlier elements (and the initial value), using `__unary_op` to transform the input elements and using `__binary_op` for summation.

This function generates an "exclusive" scan, meaning the Nth element of the output range is the sum of the first N-1 input elements, so the Nth input element is not included.

References move().

transform_inclusive_scan() [1/2]

```
template<typename _InputIterator, typename _OutputIterator, typename _BinaryOperation, typename ↩
_UnaryOperation>
_OutputIterator std::transform_inclusive_scan (
             _InputIterator __first,
             _InputIterator __last,
             _OutputIterator __result,
             _BinaryOperation __binary_op,
             _UnaryOperation __unary_op)  [constexpr]
```

Output the cumulative sum of one range to a second range.

Parameters

__first	Start of input range.
__last	End of input range.
__result	Start of output range.
__binary_op	Function to perform summation.
__unary_op	Function to transform elements of the input range.

Returns

The end of the output range.

Write the cumulative sum (aka prefix sum, aka scan) of the input range to the output range. Each element of the output range contains the running total of all earlier elements, using `__unary_op` to transform the input elements and using `__binary_op` for summation.

This function generates an "inclusive" scan, meaning the Nth element of the output range is the sum of the first N input elements, so the Nth input element is included.

References move(), and transform_inclusive_scan().

transform_inclusive_scan() [2/2]

```
template<typename _InputIterator, typename _OutputIterator, typename _BinaryOperation, typename ↩
_UnaryOperation, typename _Tp>
_OutputIterator std::transform_inclusive_scan (
             _InputIterator __first,
             _InputIterator __last,
             _OutputIterator __result,
             _BinaryOperation __binary_op,
             _UnaryOperation __unary_op,
             _Tp __init)  [constexpr]
```

Output the cumulative sum of one range to a second range.

Parameters

__first	Start of input range.
__last	End of input range.
__result	Start of output range.
__binary_op	Function to perform summation.
__unary_op	Function to transform elements of the input range.
__init	Initial value.

Returns

The end of the output range.

Write the cumulative sum (aka prefix sum, aka scan) of the input range to the output range. Each element of the output range contains the running total of all earlier elements (and the initial value), using `__unary_op` to transform the input elements and using `__binary_op` for summation.

This function generates an "inclusive" scan, meaning the Nth element of the output range is the sum of the first N input elements, so the Nth input element is included.

Referenced by transform_inclusive_scan().

transform_reduce() [1/3]

```
template<typename _InputIterator, typename _Tp, typename _BinaryOperation, typename _Unary↩
Operation>
_Tp std::transform_reduce (
            _InputIterator __first,
            _InputIterator __last,
            _Tp __init,
            _BinaryOperation __binary_op,
            _UnaryOperation __unary_op)  [constexpr]
```

Transform the elements of a range and reduce.

Parameters

__first	Start of range.
__last	End of range.
__init	Starting value to add other values to.
__binary_op	The function used to perform reduction.
__unary_op	The function used to transform values from the range.

Returns

The final sum.

Call `unary_op(first[n])` for each `n` in `[0,last-first)` and then use `binary_op` to reduce the values returned by `unary_op` to a single value of type `T`.

transform_reduce() [2/3]

```
template<typename _InputIterator1, typename _InputIterator2, typename _Tp>
_Tp std::transform_reduce (
             _InputIterator1 __first1,
             _InputIterator1 __last1,
             _InputIterator2 __first2,
             _Tp __init)  [inline], [constexpr]
```

Combine elements from two ranges and reduce.

Parameters

__first1	Start of first range.
__last1	End of first range.
__first2	Start of second range.
__init	Starting value to add other values to.

Returns

The final sum.

Call `first1[n]*first2[n]` for each `n` in `[0,last1-first1)` and then use addition to sum those products to a single value of type `T`.

The range beginning at `first2` must contain at least `last1-first1` elements.

References move(), and transform_reduce().

transform_reduce() [3/3]

```
template<typename _InputIterator1, typename _InputIterator2, typename _Tp, typename _Binary↩
Operation1, typename _BinaryOperation2>
_Tp std::transform_reduce (
             _InputIterator1 __first1,
             _InputIterator1 __last1,
             _InputIterator2 __first2,
             _Tp __init,
             _BinaryOperation1 __binary_op1,
             _BinaryOperation2 __binary_op2)  [constexpr]
```

Combine elements from two ranges and reduce.

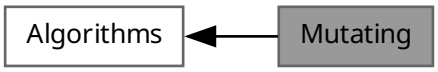
Parameters

__first1	Start of first range.
__last1	End of first range.

__first2	Start of second range.
__init	Starting value to add other values to.
__binary_op1	The function used to perform reduction.
__binary_op2	The function used to combine values from the ranges.

Returns

The final sum.



Call `binary_op2(first1[n],first2[n])` for each `n` in `[0,last1-first1)` and then use `binary_op1` to reduce the values returned by `binary_op2` to a single value of type `T`.

The range beginning at `first2` must contain at least `last1-first1` elements.

Referenced by transform_reduce().

3.1.3.1 Detailed Description

3.1.3.2 Function Documentation

copy()

```
template<typename _II, typename _OI>
_OI std::copy (
            _II __first,
            _II __last,
            _OI __result)  [inline], [constexpr]
```

Copies the range [first,last) into result.

Parameters

__first	An input iterator.
__last	An input iterator.
__result	An output iterator.

Returns

result + (last - first)

This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling). Result may not be contained within [first,last); the copy_backward function should be used instead.

Note that the end of the output range is permitted to be contained within [first,last).

copy_backward()

```
template<typename _BI1, typename _BI2>
_BI2 std::copy_backward (
            _BI1 __first,
            _BI1 __last,
            _BI2 __result)  [inline], [constexpr]
```

Copies the range [first,last) into result.

Parameters

__first	A bidirectional iterator.
__last	A bidirectional iterator.
__result	A bidirectional iterator.

Returns

result - (last - first)

The function has the same effect as copy, but starts at the end of the range and works its way to the start, returning the start of the result. This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling).

Result may not be in the range (first,last]. Use copy instead. Note that the start of the output range may overlap [first,last).

copy_if()

```
template<typename _InputIterator, typename _OutputIterator, typename _Predicate>
_OutputIterator std::copy_if (
            _InputIterator __first,
            _InputIterator __last,
            _OutputIterator __result,
            _Predicate __pred)  [constexpr]
```

Copy the elements of a sequence for which a predicate is true.

Parameters

__first	An input iterator.
__last	An input iterator.
__result	An output iterator.
__pred	A predicate.

Returns

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first, __last)` for which `__pred` returns true to the range beginning at `__result`.

`copy_if` is stable, so the relative order of elements that are copied is unchanged.

copy_n()

```
template<typename _InputIterator, typename _Size, typename _OutputIterator>
_OutputIterator std::copy_n (
            _InputIterator __first,
            _Size __n,
            _OutputIterator __result)  [inline], [constexpr]
```

Copies the range [first,first+n) into [result,result+n).

Parameters

__first	An input iterator.
__n	The number of elements to copy.
__result	An output iterator.

Returns

result+n.

This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling).

References move().

fill()

```
template<typename _ForwardIterator, typename _Tp>
void std::fill (
             _ForwardIterator __first,
             _ForwardIterator __last,
             const _Tp & __value)  [inline], [constexpr]
```

Fills the range [first,last) with copies of value.

Parameters

__first	A forward iterator.
__last	A forward iterator.
__value	A reference-to-const of arbitrary type.

This function fills a range with copies of the same value. For char types filling contiguous areas of memory, this becomes an inline call to `memset` or `wmemset`.

fill_n()

```
template<typename _OI, typename _Size, typename _Tp>
_OI std::fill_n (
             _OI __first,
             _Size __n,
             const _Tp & __value)  [inline], [constexpr]
```

Fills the range [first,first+n) with copies of value.

Parameters

__first	An output iterator.
__n	The count of copies to perform.
__value	A reference-to-const of arbitrary type.

Returns

The iterator at first+n.

This function fills a range with copies of the same value. For char types filling contiguous areas of memory, this becomes an inline call to `memset` or `wmemset`.

If `__n` is negative, the function does nothing.

generate()

```
template<typename _ForwardIterator, typename _Generator>
void std::generate (
             _ForwardIterator __first,
             _ForwardIterator __last,
             _Generator __gen)  [constexpr]
```

Assign the result of a function object to each value in a sequence.

Parameters

__first	A forward iterator.
__last	A forward iterator.
__gen	A function object callable with no arguments.

Performs the assignment `*i = __gen()` for each `i` in the range `[__first, __last)`.

generate_n()

```
template<typename _OutputIterator, typename _Size, typename _Generator>
_OutputIterator std::generate_n (
             _OutputIterator __first,
             _Size __n,
             _Generator __gen)  [constexpr]
```

Assign the result of a function object to each value in a sequence.

Parameters

__first	A forward iterator.
__n	The length of the sequence.
__gen	A function object callable with no arguments.

Returns

The end of the sequence, i.e., `__first + __n`

Performs the assignment `*i = __gen()` for each `i` in the range `[__first, __first + __n)`.

If `__n` is negative, the function does nothing and returns `__first`.

is_partitioned()

```
template<typename _InputIterator, typename _Predicate>
bool std::is_partitioned (
            _InputIterator __first,
            _InputIterator __last,
            _Predicate __pred)  [inline], [nodiscard], [constexpr]
```

Checks whether the sequence is partitioned.

Parameters

__first	An input iterator.
__last	An input iterator.
__pred	A predicate.

Returns

True if the range `[__first, __last)` is partitioned by `__pred`, i.e. if all elements that satisfy `__pred` appear before those that do not.

iter_swap()

```
template<typename _ForwardIterator1, typename _ForwardIterator2>
void std::iter_swap (
            _ForwardIterator1 __a,
            _ForwardIterator2 __b)  [inline], [constexpr]
```

Swaps the contents of two iterators.

Parameters

_a	An iterator.
_b	Another iterator.

This function swaps the values pointed to by two iterators, not the iterators themselves.

move()

```
template<typename _II, typename _OI>
_OI std::move (
            _II __first,
            _II __last,
            _OI __result)  [inline], [constexpr]
```

Moves the range [first,last) into result.

Parameters

__first	An input iterator.
__last	An input iterator.
__result	An output iterator.

Returns

result + (last - first)

This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling). Result may not be contained within [first,last); the move_backward function should be used instead.

Note that the end of the output range is permitted to be contained within [first,last).

move_backward()

```
template<typename _BI1, typename _BI2>
_BI2 std::move_backward (
            _BI1 __first,
            _BI1 __last,
            _BI2 __result)  [inline], [constexpr]
```

Moves the range [first,last) into result.

Parameters

__first	A bidirectional iterator.
__last	A bidirectional iterator.
__result	A bidirectional iterator.

Returns

result - (last - first)

The function has the same effect as move, but starts at the end of the range and works its way to the start, returning the start of the result. This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling).

Result may not be in the range (first,last]. Use move instead. Note that the start of the output range may overlap [first,last).

partition()

```
template<typename _ForwardIterator, typename _Predicate>
_ForwardIterator std::partition (
            _ForwardIterator __first,
            _ForwardIterator __last,
            _Predicate __pred)  [inline], [constexpr]
```

Move elements for which a predicate is true to the beginning of a sequence.

Parameters

__first	A forward iterator.
__last	A forward iterator.
__pred	A predicate function object.

Returns

An iterator `middle` such that `__pred(i)` is true for each iterator `i` in the range `[__first, middle)` and false for each `i` in the range `[middle, __last)`.

`__pred` must not modify its operand. `partition()` does not preserve the relative ordering of elements in each group, use `stable_partition()` if this is needed.

partition_copy()

```
template<typename _InputIterator, typename _OutputIterator1, typename _OutputIterator2, typename
_Predicate>
pair< _OutputIterator1, _OutputIterator2 > std::partition_copy (
            _InputIterator __first,
            _InputIterator __last,
            _OutputIterator1 __out_true,
            _OutputIterator2 __out_false,
            _Predicate __pred)  [constexpr]
```

Copy the elements of a sequence to separate output sequences depending on the truth value of a predicate.

Parameters

__first	An input iterator.
__last	An input iterator.
__out_true	An output iterator.
__out_false	An output iterator.
__pred	A predicate.

Returns

A pair designating the ends of the resulting sequences.

Copies each element in the range `[__first, __last)` for which `__pred` returns true to the range beginning at `__out_true` and each element for which `__pred` returns false to `__out_false`.

partition_point()

```
template<typename _ForwardIterator, typename _Predicate>
_ForwardIterator std::partition_point (
            _ForwardIterator __first,
            _ForwardIterator __last,
            _Predicate __pred)  [nodiscard], [constexpr]
```

Find the partition point of a partitioned range.

Parameters

__first	An iterator.
__last	Another iterator.
__pred	A predicate.

Returns

An iterator `mid` such that `all_of(__first, mid, __pred)` and `none_of(mid, __last, __pred)` are both true.

References advance(), and distance().

random_shuffle() [1/2]

```
template<typename _RandomAccessIterator>
void std::random_shuffle (
            _RandomAccessIterator __first,
            _RandomAccessIterator __last)  [inline]
```

Randomly shuffle the elements of a sequence.

Parameters

__first	A forward iterator.
__last	A forward iterator.

Reorder the elements in the range `[__first, __last)` using a random distribution, so that every possible ordering of the sequence is equally likely.

Deprecated Since C++17, `std::random_shuffle` is not part of the C++ standard. Use `std::shuffle` instead, which was introduced in C++11.

random_shuffle() [2/2]

```
template<typename _RandomAccessIterator, typename _RandomNumberGenerator>
void std::random_shuffle (
             _RandomAccessIterator __first,
             _RandomAccessIterator __last,
             _RandomNumberGenerator && __rand)
```

Shuffle the elements of a sequence using a random number generator.

Parameters

__first	A forward iterator.
__last	A forward iterator.
__rand	The RNG function object.

Reorders the elements in the range `[__first, __last)` using `__rand` to provide a random distribution. Calling `__rand(N)` for a positive integer `N` should return a randomly chosen integer from the range `[0, N)`.

Deprecated Since C++17, `std::random_shuffle` is not part of the C++ standard. Use `std::shuffle` instead, which was introduced in C++11.

remove()

```
template<typename _ForwardIterator, typename _Tp>
_ForwardIterator std::remove (
             _ForwardIterator __first,
             _ForwardIterator __last,
             const _Tp & __value)  [inline], [nodiscard], [constexpr]
```

Remove elements from a sequence.

Parameters

__first	An input iterator.
__last	An input iterator.
__value	The value to be removed.

Returns

An iterator designating the end of the resulting sequence.

All elements equal to `__value` are removed from the range `[__first, __last)`.

`remove` is stable, so the relative order of elements that are not removed is unchanged.

Elements between the end of the resulting sequence and `__last` are still present, but their value is unspecified.

remove_copy()

```
template<typename _InputIterator, typename _OutputIterator, typename _Tp>
_OutputIterator std::remove_copy (
            _InputIterator __first,
            _InputIterator __last,
            _OutputIterator __result,
            const _Tp & __value)  [inline], [constexpr]
```

Copy a sequence, removing elements of a given value.

Parameters

__first	An input iterator.
__last	An input iterator.
__result	An output iterator.
__value	The value to be removed.

Returns

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first, __last)` not equal to `__value` to the range beginning at `__result`. `remove_copy` is stable, so the relative order of elements that are copied is unchanged.

remove_copy_if()

```
template<typename _InputIterator, typename _OutputIterator, typename _Predicate>
_OutputIterator std::remove_copy_if (
            _InputIterator __first,
            _InputIterator __last,
            _OutputIterator __result,
            _Predicate __pred)  [inline], [constexpr]
```

Copy a sequence, removing elements for which a predicate is true.

Parameters

__first	An input iterator.
__last	An input iterator.
__result	An output iterator.
__pred	A predicate.

Returns

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first, __last)` for which `__pred` returns false to the range beginning at `__result`.

`remove_copy_if` is stable, so the relative order of elements that are copied is unchanged.

remove_if()

```
template<typename _ForwardIterator, typename _Predicate>
_ForwardIterator std::remove_if (
            _ForwardIterator __first,
            _ForwardIterator __last,
            _Predicate __pred)  [inline], [nodiscard], [constexpr]
```

Remove elements from a sequence using a predicate.

Parameters

__first	A forward iterator.
__last	A forward iterator.
__pred	A predicate.

Returns

An iterator designating the end of the resulting sequence.

All elements for which `__pred` returns true are removed from the range `[__first, __last)`.

`remove_if` is stable, so the relative order of elements that are not removed is unchanged.

Elements between the end of the resulting sequence and `__last` are still present, but their value is unspecified.

replace()

```
template<typename _ForwardIterator, typename _Tp>
void std::replace (
            _ForwardIterator __first,
            _ForwardIterator __last,
            const _Tp & __old_value,
            const _Tp & __new_value)  [constexpr]
```

Replace each occurrence of one value in a sequence with another value.

Parameters

__first	A forward iterator.
__last	A forward iterator.
__old_value	The value to be replaced.
__new_value	The replacement value.

For each iterator `i` in the range `[__first,__last)` if `*i == __old_value` then the assignment `*i = __new_value` is performed.

replace_copy_if()

```
template<typename _InputIterator, typename _OutputIterator, typename _Predicate, typename _Tp>
_OutputIterator std::replace_copy_if (
            _InputIterator __first,
            _InputIterator __last,
            _OutputIterator __result,
            _Predicate __pred,
            const _Tp & __new_value)  [inline], [constexpr]
```

Copy a sequence, replacing each value for which a predicate returns true with another value.

Parameters

__first	An input iterator.
__last	An input iterator.
__result	An output iterator.
__pred	A predicate.
__new_value	The replacement value.

Returns

The end of the output sequence, __result+(__last-__first).

Copies each element in the range [__first,__last) to the range [__result,__result+(__last-__first)) replacing elements for which __pred returns true with __new_value.

replace_if()

```
template<typename _ForwardIterator, typename _Predicate, typename _Tp>
void std::replace_if (
            _ForwardIterator __first,
            _ForwardIterator __last,
            _Predicate __pred,
            const _Tp & __new_value)  [constexpr]
```

Replace each value in a sequence for which a predicate returns true with another value.

Parameters

__first	A forward iterator.
__last	A forward iterator.
__pred	A predicate.
__new_value	The replacement value.

For each iterator i in the range [__first,__last) if __pred(*i) is true then the assignment *i = __new↩ _value is performed.

reverse()

```
template<typename _BidirectionalIterator>
void std::reverse (
            _BidirectionalIterator __first,
            _BidirectionalIterator __last)  [inline], [constexpr]
```

Reverse a sequence.

Parameters

__first	A bidirectional iterator.
__last	A bidirectional iterator.

Reverses the order of the elements in the range `[__first, __last)`, so that the first element becomes the last etc. For every `i` such that `0<=i<=(__last-__first)/2)`, reverse() swaps `*(__first+i)` and `*(__last-(i+1))`.

reverse_copy()

```
template<typename _BidirectionalIterator, typename _OutputIterator>
_OutputIterator std::reverse_copy (
            _BidirectionalIterator __first,
            _BidirectionalIterator __last,
            _OutputIterator __result)  [constexpr]
```

Copy a sequence, reversing its elements.

Parameters

__first	A bidirectional iterator.
__last	A bidirectional iterator.
__result	An output iterator.

Returns

An iterator designating the end of the resulting sequence.

Copies the elements in the range `[__first, __last)` to the range `[__result, __result + (__last - __first))` such that the order of the elements is reversed. For every `i` such that `0 <= i <= (__last - __first)`, `reverse_copy` performs the assignment `*(__result + (__last - __first) - 1 - i) = *(__first + i)`. The ranges `[__first, __last)` and `[__result, __result + (__last - __first))` must not overlap.

rotate()

```
template<typename _ForwardIterator>
_ForwardIterator std::rotate (
             _ForwardIterator __first,
             _ForwardIterator __middle,
             _ForwardIterator __last)  [inline], [constexpr]
```

Rotate the elements of a sequence.

Parameters

__first	A forward iterator.
__middle	A forward iterator.
__last	A forward iterator.

Returns

first + (last - middle).

Rotates the elements of the range `[__first, __last)` by `(__middle - __first)` positions so that the element at `__middle` is moved to `__first`, the element at `__middle+1` is moved to `__first+1` and so on for each element in the range `[__first, __last)`.

This effectively swaps the ranges `[__first, __middle)` and `[__middle, __last)`.

Performs `*(__first+(n+(__last - __middle)) % (__last - __first)) = *(__first+n)` for each `n` in the range `[0, __last - __first)`.

rotate_copy()

```
template<typename _ForwardIterator, typename _OutputIterator>
_OutputIterator std::rotate_copy (
             _ForwardIterator __first,
             _ForwardIterator __middle,
             _ForwardIterator __last,
             _OutputIterator __result)  [inline], [constexpr]
```

Copy a sequence, rotating its elements.

Parameters

__first	A forward iterator.
__middle	A forward iterator.
__last	A forward iterator.
__result	An output iterator.

Returns

An iterator designating the end of the resulting sequence.

Copies the elements of the range `[__first, __last)` to the range beginning at `result`, rotating the copied elements by `(__middle-__first)` positions so that the element at `__middle` is moved to `__result`, the element at `__middle+1` is moved to `__result+1` and so on for each element in the range `[__first, __last)`.

Performs `*(__result+(n+(__last - __middle)) % (__last - __first)) = *(__first+n)` for each `n` in the range `[0, __last - __first)`.

shuffle()

```
template<typename _RandomAccessIterator, typename _UniformRandomNumberGenerator>
void std::shuffle (
            _RandomAccessIterator __first,
            _RandomAccessIterator __last,
            _UniformRandomNumberGenerator && __g)
```

Shuffle the elements of a sequence using a uniform random number generator.

Parameters

__first	A forward iterator.
__last	A forward iterator.
__g	A UniformRandomNumberGenerator (C++11 26.5.1.3).

Reorders the elements in the range `[__first, __last)` using `__g` to provide random numbers.

References __gen_two_uniform_ints(), std::pair< _T1, _T2 >::first, and std::pair< _T1, _T2 >::second.

stable_partition()

```
template<typename _ForwardIterator, typename _Predicate>
_ForwardIterator std::stable_partition (
            _ForwardIterator __first,
            _ForwardIterator __last,
            _Predicate __pred)  [inline], [constexpr]
```

Move elements for which a predicate is true to the beginning of a sequence, preserving relative ordering.

Parameters

__first	A forward iterator.
__last	A forward iterator.

__pred	A predicate function object.

Returns

An iterator `middle` such that `__pred(i)` is true for each iterator `i` in the range `[__first, middle)` and false for each `i` in the range `[middle, __last)`.

Performs the same function as `partition` with the additional guarantee that the relative ordering of elements in each group is preserved, so any two elements `x` and `y` in the range `[__first, __last)` such that `__pred(x) == __pred(y)` will have the same relative ordering after calling stable_partition().

swap_ranges()

```
template<typename _ForwardIterator1, typename _ForwardIterator2>
_ForwardIterator2 std::swap_ranges (
            _ForwardIterator1 __first1,
            _ForwardIterator1 __last1,
            _ForwardIterator2 __first2)  [constexpr]
```

Swap the elements of two sequences.

Parameters

__first1	A forward iterator.
__last1	A forward iterator.
__first2	A forward iterator.

Returns

An iterator equal to `first2`+(last1-first1).

Swaps each element in the range [first1,last1) with the corresponding element in the range [first2,(last1-first1)). The ranges must not overlap.

transform() [1/2]

```
template<typename _InputIterator, typename _OutputIterator, typename _UnaryOperation>
_OutputIterator std::transform (
            _InputIterator __first,
            _InputIterator __last,
            _OutputIterator __result,
            _UnaryOperation __unary_op)  [constexpr]
```

Perform an operation on a sequence.

Parameters

__first	An input iterator.
__last	An input iterator.
__result	An output iterator.
__unary_op	A unary operator.

Returns

An output iterator equal to `__result + (__last - __first)`.

Applies the operator to each element in the input range and assigns the results to successive elements of the output sequence. Evaluates `*(__result+N) = unary_op(*(__first+N))` for each `N` in the range `[0, __last - __first)`.

`__unary_op` must not alter its argument.

transform() [2/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename ↩
_BinaryOperation>
_OutputIterator std::transform (
            _InputIterator1 __first1,
            _InputIterator1 __last1,
            _InputIterator2 __first2,
            _OutputIterator __result,
            _BinaryOperation __binary_op)  [constexpr]
```

Perform an operation on corresponding elements of two sequences.

Parameters

__first1	An input iterator.
__last1	An input iterator.
__first2	An input iterator.
__result	An output iterator.
__binary_op	A binary operator.

Returns

An output iterator equal to `__result+(__last1-__first1)`.

Applies the operator to the corresponding elements in the two input ranges and assigns the results to successive elements of the output sequence. Evaluates `*(__result+N) = __binary_op(*(__first1+N), *(__↩ first2+N))` for each `N` in the range `[0, __last1-__first1)`.

`__binary_op` must not alter either of its arguments.

unique() [1/2]

```
template<typename _ForwardIterator>
_ForwardIterator std::unique (
            _ForwardIterator __first,
            _ForwardIterator __last)  [inline], [nodiscard], [constexpr]
```

Remove consecutive duplicate values from a sequence.

Parameters

__first	A forward iterator.
__last	A forward iterator.

Returns

An iterator designating the end of the resulting sequence.

Removes all but the first element from each group of consecutive values that compare equal. `unique` is stable, so the relative order of elements that are not removed is unchanged. Elements between the end of the resulting sequence and `__last` are still present, but their value is unspecified.

unique() [2/2]

```
template<typename _ForwardIterator, typename _BinaryPredicate>
_ForwardIterator std::unique (
            _ForwardIterator __first,
            _ForwardIterator __last,
            _BinaryPredicate __binary_pred)  [inline], [nodiscard], [constexpr]
```

Remove consecutive values from a sequence using a predicate.

Parameters

__first	A forward iterator.
__last	A forward iterator.
__binary_pred	A binary predicate.

Returns

An iterator designating the end of the resulting sequence.

Removes all but the first element from each group of consecutive values for which `__binary_pred` returns true. `unique` is stable, so the relative order of elements that are not removed is unchanged. Elements between the end of the resulting sequence and `__last` are still present, but their value is unspecified.

unique_copy() [1/2]

```
template<typename _InputIterator, typename _OutputIterator>
_OutputIterator std::unique_copy (
            _InputIterator __first,
            _InputIterator __last,
            _OutputIterator __result)  [inline], [constexpr]
```

Copy a sequence, removing consecutive duplicate values.

Parameters

__first	An input iterator.
__last	An input iterator.
__result	An output iterator.

Returns

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first, __last)` to the range beginning at `__result`, except that only the first element is copied from groups of consecutive elements that compare equal. `unique_copy()` is stable, so the relative order of elements that are copied is unchanged.

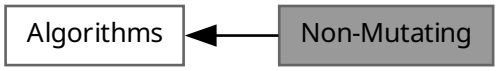
unique_copy() [2/2]

```
template<typename _InputIterator, typename _OutputIterator, typename _BinaryPredicate>
_OutputIterator std::unique_copy (
            _InputIterator __first,
            _InputIterator __last,
            _OutputIterator __result,
            _BinaryPredicate __binary_pred)  [inline], [constexpr]
```

Copy a sequence, removing consecutive values using a predicate.

Parameters

__first	An input iterator.
__last	An input iterator.
__result	An output iterator.
__binary_pred	A binary predicate.



Returns

An iterator designating the end of the resulting sequence.

Copies each element in the range `[__first, __last)` to the range beginning at `__result`, except that only the first element is copied from groups of consecutive elements for which `__binary_pred` returns true. `unique_copy()` is stable, so the relative order of elements that are copied is unchanged.

3.1.4.1 Detailed Description

3.1.4.2 Function Documentation

adjacent_find() [1/2]

```
template<typename _ForwardIterator>
_ForwardIterator std::adjacent_find (
            _ForwardIterator __first,
            _ForwardIterator __last)  [inline], [nodiscard], [constexpr]
```

Find two adjacent values in a sequence that are equal.

Parameters

__first	A forward iterator.
__last	A forward iterator.

Returns

The first iterator `i` such that `i` and `i+1` are both valid iterators in `[__first, __last)` and such that `*i == *(i+1)`, or `__last` if no such iterator exists.

adjacent_find() [2/2]

```
template<typename _ForwardIterator, typename _BinaryPredicate>
_ForwardIterator std::adjacent_find (
            _ForwardIterator __first,
            _ForwardIterator __last,
            _BinaryPredicate __binary_pred)  [inline], [nodiscard], [constexpr]
```

Find two adjacent values in a sequence using a predicate.

Parameters

__first	A forward iterator.
__last	A forward iterator.
__binary_pred	A binary predicate.

Returns

The first iterator `i` such that `i` and `i+1` are both valid iterators in `[__first, __last)` and such that `__binary_pred(*i,*(i+1))` is true, or `__last` if no such iterator exists.

all_of()

```
template<typename _InputIterator, typename _Predicate>
bool std::all_of (
             _InputIterator __first,
             _InputIterator __last,
             _Predicate __pred)  [inline], [nodiscard], [constexpr]
```

Checks that a predicate is true for all the elements of a sequence.

Parameters

__first	An input iterator.
__last	An input iterator.
__pred	A predicate.

Returns

True if the check is true, false otherwise.

Returns true if `__pred` is true for each element in the range `[__first, __last)`, and false otherwise.

any_of()

```
template<typename _InputIterator, typename _Predicate>
bool std::any_of (
             _InputIterator __first,
             _InputIterator __last,
             _Predicate __pred)  [inline], [nodiscard], [constexpr]
```

Checks that a predicate is true for at least one element of a sequence.

Parameters

__first	An input iterator.
__last	An input iterator.
__pred	A predicate.

Returns

True if the check is true, false otherwise.

Returns true if an element exists in the range `[__first, __last)` such that `__pred` is true, and false otherwise.

count()

```
template<typename _InputIterator, typename _Tp>
iterator_traits< _InputIterator >::difference_type std::count (
            _InputIterator __first,
            _InputIterator __last,
            const _Tp & __value)  [inline], [nodiscard], [constexpr]
```

Count the number of copies of a value in a sequence.

Parameters

__first	An input iterator.
__last	An input iterator.
__value	The value to be counted.

Returns

The number of iterators `i` in the range `[__first, __last)` for which `*i == __value`

count_if()

```
template<typename _InputIterator, typename _Predicate>
iterator_traits< _InputIterator >::difference_type std::count_if (
            _InputIterator __first,
            _InputIterator __last,
            _Predicate __pred)  [inline], [nodiscard], [constexpr]
```

Count the elements of a sequence for which a predicate is true.

Parameters

__first	An input iterator.
__last	An input iterator.
__pred	A predicate.

Returns

The number of iterators `i` in the range `[__first, __last)` for which `__pred(*i)` is true.

equal() [1/4]

```
template<typename _II1, typename _II2>
bool std::equal (
            _II1 __first1,
            _II1 __last1,
            _II2 __first2)  [inline], [nodiscard], [constexpr]
```

Tests a range for element-wise equality.

Parameters

__first1	An input iterator.
__last1	An input iterator.
__first2	An input iterator.

Returns

A boolean true or false.

This compares the elements of two ranges using == and returns true or false depending on whether all of the corresponding elements of the ranges are equal.

equal() [2/4]

```
template<typename _II1, typename _II2>
bool std::equal (
            _II1 __first1,
            _II1 __last1,
            _II2 __first2,
            _II2 __last2)  [inline], [nodiscard], [constexpr]
```

Tests a range for element-wise equality.

Parameters

__first1	An input iterator.
__last1	An input iterator.
__first2	An input iterator.
__last2	An input iterator.

Returns

A boolean true or false.

This compares the elements of two ranges using == and returns true or false depending on whether all of the corresponding elements of the ranges are equal.

equal() [3/4]

```
template<typename _IIter1, typename _IIter2, typename _BinaryPredicate>
bool std::equal (
            _IIter1 __first1,
            _IIter1 __last1,
            _IIter2 __first2,
            _BinaryPredicate __binary_pred)  [inline], [nodiscard], [constexpr]
```

Tests a range for element-wise equality.

Parameters

__first1	An input iterator.
__last1	An input iterator.
__first2	An input iterator.
__binary_pred	A binary predicate functor.

Returns

A boolean true or false.

This compares the elements of two ranges using the binary_pred parameter, and returns true or false depending on whether all of the corresponding elements of the ranges are equal.

equal() [4/4]

```
template<typename _IIter1, typename _IIter2, typename _BinaryPredicate>
bool std::equal (
            _IIter1 __first1,
            _IIter1 __last1,
            _IIter2 __first2,
            _IIter2 __last2,
            _BinaryPredicate __binary_pred)  [inline], [nodiscard], [constexpr]
```

Tests a range for element-wise equality.

Parameters

__first1	An input iterator.
__last1	An input iterator.
__first2	An input iterator.
__last2	An input iterator.
__binary_pred	A binary predicate functor.

Returns

A boolean true or false.

This compares the elements of two ranges using the binary_pred parameter, and returns true or false depending on whether all of the corresponding elements of the ranges are equal.

find()

```
template<typename _InputIterator, typename _Tp>
_InputIterator std::find (
             _InputIterator __first,
             _InputIterator __last,
             const _Tp & __val)  [inline], [nodiscard], [constexpr]
```

Find the first occurrence of a value in a sequence.

Parameters

__first	An input iterator.
__last	An input iterator.
__val	The value to find.

Returns

The first iterator `i` in the range `[__first, __last)` such that `*i == __val`, or `__last` if no such iterator exists.

References to_address().

find_end() [1/2]

```
template<typename _ForwardIterator1, typename _ForwardIterator2>
_ForwardIterator1 std::find_end (
             _ForwardIterator1 __first1,
             _ForwardIterator1 __last1,
             _ForwardIterator2 __first2,
             _ForwardIterator2 __last2)  [inline], [nodiscard], [constexpr]
```

Find last matching subsequence in a sequence.

Parameters

__first1	Start of range to search.
__last1	End of range to search.
__first2	Start of sequence to match.
__last2	End of sequence to match.

Returns

The last iterator `i` in the range `[__first1, __last1 - (__last2 - __first2))` such that `*(i + N) == *(__first2 + N)` for each `N` in the range `[0, __last2 - __first2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for a sub-sequence that compares equal value-by-value with the sequence given by `[__first2, __last2)` and returns an iterator to the first element of the sub-sequence, or `__last1` if the sub-sequence is not found. The sub-sequence will be the last such subsequence contained in `[__first1, __last1)`.

Because the sub-sequence must lie completely within the range `[__first1, __last1)` it must start at a position less than `__last1 - (__last2 - __first2)` where `__last2 - __first2` is the length of the sub-sequence. This means that the returned iterator `i` will be in the range `[__first1, __last1 - (__last2 - __first2))`

find_end() [2/2]

```
template<typename _ForwardIterator1, typename _ForwardIterator2, typename _BinaryPredicate>
_ForwardIterator1 std::find_end (
            _ForwardIterator1 __first1,
            _ForwardIterator1 __last1,
            _ForwardIterator2 __first2,
            _ForwardIterator2 __last2,
            _BinaryPredicate __comp)  [inline], [nodiscard], [constexpr]
```

Find last matching subsequence in a sequence using a predicate.

Parameters

__first1	Start of range to search.
__last1	End of range to search.
__first2	Start of sequence to match.
__last2	End of sequence to match.
__comp	The predicate to use.

Returns

The last iterator `i` in the range `[__first1, __last1-(__last2 - __first2))` such that `__comp(*(i + N), (__first2 + N))` is true for each `N` in the range `[0, __last2 - __first2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for a sub-sequence that compares equal value-by-value with the sequence given by `[__first2, __last2)` using `__comp` as a predicate and returns an iterator to the first element of the sub-sequence, or `__last1` if the sub-sequence is not found. The sub-sequence will be the last such subsequence contained in `[__first, __last1)`.

Because the sub-sequence must lie completely within the range `[__first1, __last1)` it must start at a position less than `__last1 - (__last2 - __first2)` where `__last2 - __first2` is the length of the sub-sequence. This means that the returned iterator `i` will be in the range `[__first1, __last1 - (__last2 - __first2))`

find_first_of() [1/2]

```
template<typename _InputIterator, typename _ForwardIterator>
_InputIterator std::find_first_of (
            _InputIterator __first1,
            _InputIterator __last1,
            _ForwardIterator __first2,
            _ForwardIterator __last2)  [nodiscard], [constexpr]
```

Find element from a set in a sequence.

Parameters

__first1	Start of range to search.
__last1	End of range to search.
__first2	Start of match candidates.
__last2	End of match candidates.

Returns

The first iterator `i` in the range `[__first1, __last1)` such that `*i == *(i2)` such that `i2` is an iterator in `[__first2, __last2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for an element that is equal to some element in the range `[_↩ _first2, __last2)`. If found, returns an iterator in the range `[__first1, __last1)`, otherwise returns `__last1`.

find_first_of() [2/2]

```
template<typename _InputIterator, typename _ForwardIterator, typename _BinaryPredicate>
_InputIterator std::find_first_of (
            _InputIterator __first1,
            _InputIterator __last1,
            _ForwardIterator __first2,
            _ForwardIterator __last2,
            _BinaryPredicate __comp)  [nodiscard], [constexpr]
```

Find element from a set in a sequence using a predicate.

Parameters

__first1	Start of range to search.
__last1	End of range to search.
__first2	Start of match candidates.
__last2	End of match candidates.

__comp	Predicate to use.

Returns

The first iterator `i` in the range `[__first1, __last1)` such that `comp(*i, *(i2))` is true and `i2` is an iterator in `[__first2, __last2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for an element that is equal to some element in the range `[__first2, __last2)`. If found, returns an iterator in the range `[__first1, __last1)`, otherwise returns `__last1`.

find_if()

```
template<typename _InputIterator, typename _Predicate>
_InputIterator std::find_if (
            _InputIterator __first,
            _InputIterator __last,
            _Predicate __pred)  [inline], [nodiscard], [constexpr]
```

Find the first element in a sequence for which a predicate is true.

Parameters

__first	An input iterator.
__last	An input iterator.
__pred	A predicate.

Returns

The first iterator `i` in the range `[__first, __last)` such that `__pred(*i)` is true, or `__last` if no such iterator exists.

find_if_not()

```
template<typename _InputIterator, typename _Predicate>
_InputIterator std::find_if_not (
            _InputIterator __first,
            _InputIterator __last,
            _Predicate __pred)  [inline], [nodiscard], [constexpr]
```

Find the first element in a sequence for which a predicate is false.

Parameters

__first	An input iterator.
__last	An input iterator.
__pred	A predicate.

Returns

The first iterator `i` in the range `[__first, __last)` such that `__pred(*i)` is false, or `__last` if no such iterator exists.

for_each()

```
template<typename _InputIterator, typename _Function>
_Function std::for_each (
             _InputIterator __first,
             _InputIterator __last,
             _Function __f)  [constexpr]
```

Apply a function to every element of a sequence.

Parameters

__first	An input iterator.
__last	An input iterator.
__f	A unary function object.

Returns

`__f`

Applies the function object `__f` to each element in the range `[__first, __last)`. `__f` must not modify the order of the sequence. If `__f` has a return value it is ignored.

for_each_n()

```
template<typename _InputIterator, typename _Size, typename _Function>
_InputIterator std::for_each_n (
             _InputIterator __first,
             _Size __n,
             _Function __f)  [constexpr]
```

Apply a function to every element of a sequence.

Parameters

__first	An input iterator.
__n	A value convertible to an integer.
__f	A unary function object.

Returns

`__first+__n`

Applies the function object `__f` to each element in the range `[first, first+n)`. `__f` must not modify the order of the sequence. If `__f` has a return value it is ignored.

References move().

is_permutation() [1/4]

```
template<typename _ForwardIterator1, typename _ForwardIterator2>
bool std::is_permutation (
             _ForwardIterator1 __first1,
             _ForwardIterator1 __last1,
             _ForwardIterator2 __first2)  [inline], [constexpr]
```

Checks whether a permutation of the second sequence is equal to the first sequence.

Parameters

__first1	Start of first range.
__last1	End of first range.
__first2	Start of second range.

Returns

true if there exists a permutation of the elements in the range [__first2, __first2 + (__last1 - __first1)), beginning with ForwardIterator2 begin, such that equal(__first1, __last1, begin) returns true; otherwise, returns false.

is_permutation() [2/4]

```
template<typename _ForwardIterator1, typename _ForwardIterator2, typename _BinaryPredicate>
bool std::is_permutation (
            _ForwardIterator1 __first1,
            _ForwardIterator1 __last1,
            _ForwardIterator2 __first2,
            _BinaryPredicate __pred)  [inline], [nodiscard], [constexpr]
```

Checks whether a permutation of the second sequence is equal to the first sequence.

Parameters

__first1	Start of first range.
__last1	End of first range.
__first2	Start of second range.
__pred	A binary predicate.

Returns

true if there exists a permutation of the elements in the range [__first2, __first2 + (__last1 - __first1)), beginning with ForwardIterator2 begin, such that equal(__first1, __last1, __begin, __pred) returns true; otherwise, returns false.

is_permutation() [3/4]

```
template<typename _ForwardIterator1, typename _ForwardIterator2>
bool std::is_permutation (
            _ForwardIterator1 __first1,
            _ForwardIterator1 __last1,
            _ForwardIterator2 __first2,
            _ForwardIterator2 __last2)  [inline], [nodiscard], [constexpr]
```

Checks whether a permutation of the second sequence is equal to the first sequence.

Parameters

__first1	Start of first range.
__last1	End of first range.
__first2	Start of second range.
__last2	End of first range.

Returns

true if there exists a permutation of the elements in the range [__first2, __last2), beginning with ForwardIterator2 begin, such that equal(__first1, __last1, begin) returns true; otherwise, returns false.

is_permutation() [4/4]

```
template<typename _ForwardIterator1, typename _ForwardIterator2, typename _BinaryPredicate>
bool std::is_permutation (
            _ForwardIterator1 __first1,
            _ForwardIterator1 __last1,
            _ForwardIterator2 __first2,
            _ForwardIterator2 __last2,
            _BinaryPredicate __pred)  [inline], [nodiscard], [constexpr]
```

Checks whether a permutation of the second sequence is equal to the first sequence.

Parameters

__first1	Start of first range.
__last1	End of first range.
__first2	Start of second range.
__last2	End of first range.
__pred	A binary predicate.

Returns

true if there exists a permutation of the elements in the range [__first2, __last2), beginning with ForwardIterator2 begin, such that equal(__first1, __last1, __begin, __pred) returns true; otherwise, returns false.

mismatch() [1/4]

```
template<typename _InputIterator1, typename _InputIterator2>
pair< _InputIterator1, _InputIterator2 > std::mismatch (
            _InputIterator1 __first1,
            _InputIterator1 __last1,
            _InputIterator2 __first2)  [inline], [nodiscard], [constexpr]
```

Finds the places in ranges which don't match.

Parameters

__first1	An input iterator.
__last1	An input iterator.
__first2	An input iterator.

Returns

A pair of iterators pointing to the first mismatch.

This compares the elements of two ranges using == and returns a pair of iterators. The first iterator points into the first range, the second iterator points into the second range, and the elements pointed to by the iterators are not equal.

mismatch() [2/4]

```
template<typename _InputIterator1, typename _InputIterator2, typename _BinaryPredicate>
pair< _InputIterator1, _InputIterator2 > std::mismatch (
            _InputIterator1 __first1,
            _InputIterator1 __last1,
            _InputIterator2 __first2,
            _BinaryPredicate __binary_pred)  [inline], [nodiscard], [constexpr]
```

Finds the places in ranges which don't match.

Parameters

__first1	An input iterator.
__last1	An input iterator.
__first2	An input iterator.
__binary_pred	A binary predicate functor.

Returns

A pair of iterators pointing to the first mismatch.

This compares the elements of two ranges using the binary_pred parameter, and returns a pair of iterators. The first iterator points into the first range, the second iterator points into the second range, and the elements pointed to by the iterators are not equal.

mismatch() [3/4]

```
template<typename _InputIterator1, typename _InputIterator2>
pair< _InputIterator1, _InputIterator2 > std::mismatch (
            _InputIterator1 __first1,
            _InputIterator1 __last1,
            _InputIterator2 __first2,
            _InputIterator2 __last2)  [inline], [nodiscard], [constexpr]
```

Finds the places in ranges which don't match.

Parameters

__first1	An input iterator.
__last1	An input iterator.
__first2	An input iterator.
__last2	An input iterator.

Returns

A pair of iterators pointing to the first mismatch.

This compares the elements of two ranges using == and returns a pair of iterators. The first iterator points into the first range, the second iterator points into the second range, and the elements pointed to by the iterators are not equal.

mismatch() [4/4]

```
template<typename _InputIterator1, typename _InputIterator2, typename _BinaryPredicate>
pair< _InputIterator1, _InputIterator2 > std::mismatch (
            _InputIterator1 __first1,
            _InputIterator1 __last1,
            _InputIterator2 __first2,
            _InputIterator2 __last2,
            _BinaryPredicate __binary_pred)  [inline], [nodiscard], [constexpr]
```

Finds the places in ranges which don't match.

Parameters

__first1	An input iterator.
__last1	An input iterator.
__first2	An input iterator.
__last2	An input iterator.
__binary_pred	A binary predicate functor.

Returns

A pair of iterators pointing to the first mismatch.

This compares the elements of two ranges using the binary_pred parameter, and returns a pair of iterators. The first iterator points into the first range, the second iterator points into the second range, and the elements pointed to by the iterators are not equal.

none_of()

```
template<typename _InputIterator, typename _Predicate>
bool std::none_of (
            _InputIterator __first,
            _InputIterator __last,
            _Predicate __pred)  [inline], [nodiscard], [constexpr]
```

Checks that a predicate is false for all the elements of a sequence.

Parameters

__first	An input iterator.
__last	An input iterator.
__pred	A predicate.

Returns

True if the check is true, false otherwise.

Returns true if `__pred` is false for each element in the range `[__first, __last)`, and false otherwise.

search() [1/2]

```
template<typename _ForwardIterator1, typename _ForwardIterator2>
_ForwardIterator1 std::search (
            _ForwardIterator1 __first1,
            _ForwardIterator1 __last1,
            _ForwardIterator2 __first2,
            _ForwardIterator2 __last2)  [inline], [nodiscard], [constexpr]
```

Search a sequence for a matching sub-sequence.

Parameters

__first1	A forward iterator.
__last1	A forward iterator.
__first2	A forward iterator.
__last2	A forward iterator.

Returns

The first iterator `i` in the range `[__first1, __last1 - (__last2 - __first2))` such that `*(i+N) == *(__first2+N)` for each `N` in the range `[0, __last2 - __first2)`, or `__last1` if no such iterator exists.

Searches the range `[__first1, __last1)` for a sub-sequence that compares equal value-by-value with the sequence given by `[__first2, __last2)` and returns an iterator to the first element of the sub-sequence, or `__last1` if the sub-sequence is not found.

Because the sub-sequence must lie completely within the range `[__first1, __last1)` it must start at a position less than `__last1 - (__last2 - __first2)` where `__last2 - __first2` is the length of the sub-sequence.

This means that the returned iterator `i` will be in the range `[__first1, __last1 - (__last2 - __first2))`.

search() [2/2]

```
template<typename _ForwardIterator1, typename _ForwardIterator2, typename _BinaryPredicate>
_ForwardIterator1 std::search (
            _ForwardIterator1 __first1,
            _ForwardIterator1 __last1,
            _ForwardIterator2 __first2,
            _ForwardIterator2 __last2,
            _BinaryPredicate __predicate)  [inline], [constexpr]
```

Search a sequence for a matching sub-sequence using a predicate.

Parameters

__first1	A forward iterator.
__last1	A forward iterator.
__first2	A forward iterator.
__last2	A forward iterator.
__predicate	A binary predicate.

Returns

The first iterator `i` in the range [__first1,__last1-(__last2-__first2)) such that `__predicate(*(i+N),*(__first2+N))` is true for each `N` in the range [0,__last2-__first2), or `__last1` if no such iterator exists.

Searches the range [__first1,__last1) for a sub-sequence that compares equal value-by-value with the sequence given by [__first2,__last2), using `__predicate` to determine equality, and returns an iterator to the first element of the sub-sequence, or `__last1` if no such iterator exists.

See also

search(_ForwardIter1, _ForwardIter1, _ForwardIter2, _ForwardIter2)

search_n() [1/2]

```
template<typename _ForwardIterator, typename _Integer, typename _Tp>
_ForwardIterator std::search_n (
             _ForwardIterator __first,
             _ForwardIterator __last,
             _Integer __count,
             const _Tp & __val)  [inline], [nodiscard], [constexpr]
```

Search a sequence for a number of consecutive values.

Parameters

__first	A forward iterator.
__last	A forward iterator.
__count	The number of consecutive values.
__val	The value to find.

Returns

The first iterator `i` in the range `[__first, __last - __count)` such that `*(i+N) == __val` for each `N` in the range `[0, __count)`, or `__last` if no such iterator exists.

Searches the range `[__first, __last)` for `__count` consecutive elements equal to `__val`.

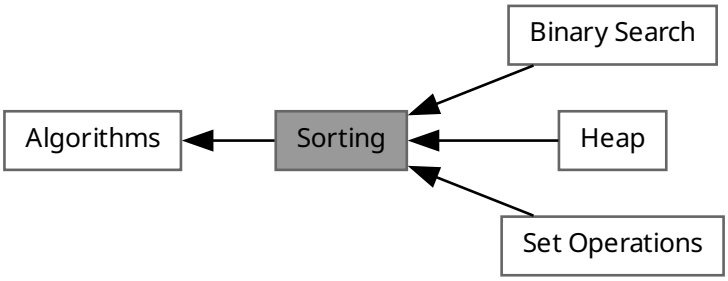
search_n() [2/2]

```
template<typename _ForwardIterator, typename _Integer, typename _Tp, typename _BinaryPredicate>
_ForwardIterator std::search_n (
             _ForwardIterator __first,
             _ForwardIterator __last,
             _Integer __count,
             const _Tp & __val,
             _BinaryPredicate __binary_pred)  [inline], [nodiscard], [constexpr]
```

Search a sequence for a number of consecutive values using a predicate.

Parameters

__first	A forward iterator.
__last	A forward iterator.
__count	The number of consecutive values.
__val	The value to find.
__binary_pred	A binary predicate.



Returns

The first iterator `i` in the range `[__first, __last - __count)` such that `__binary_pred(*(i+N), __val)` is true for each `N` in the range `[0, __count)`, or `__last` if no such iterator exists.

Searches the range `[__first, __last)` for `__count` consecutive elements for which the predicate returns true.

3.1.5.1 Detailed Description

3.1.5.2 Function Documentation

clamp() [1/2]

```
template<typename _Tp>
const _Tp & std::clamp (
             const _Tp & __val,
             const _Tp & __lo,
             const _Tp & __hi)  [nodiscard], [constexpr]
```

Returns the value clamped between lo and hi.

Parameters

__val	A value of arbitrary type.
__lo	A lower limit of arbitrary type.
__hi	An upper limit of arbitrary type.

Return values

`__lo`	if `__val < __lo`
`__hi`	if `__hi < __val`
`__val`	otherwise.

Precondition

`_Tp` is LessThanComparable and `(__hi < __lo)` is false.

References max(), and min().

clamp() [2/2]

```
template<typename _Tp, typename _Compare>
const _Tp & std::clamp (
             const _Tp & __val,
             const _Tp & __lo,
             const _Tp & __hi,
             _Compare __comp)  [nodiscard], [constexpr]
```

Returns the value clamped between lo and hi.

Parameters

__val	A value of arbitrary type.
__lo	A lower limit of arbitrary type.
__hi	An upper limit of arbitrary type.
__comp	A comparison function object.

Return values

`__lo`	if `__comp(__val, __lo)`
`__hi`	if `__comp(__hi, __val)`
`__val`	otherwise.

Precondition

`__comp(__hi, __lo)` is false.

References max(), and min().

inplace_merge() [1/2]

```
template<typename _BidirectionalIterator>
void std::inplace_merge (
             _BidirectionalIterator __first,
             _BidirectionalIterator __middle,
             _BidirectionalIterator __last)  [inline], [constexpr]
```

Merges two sorted ranges in place.

Parameters

__first	An iterator.
__middle	Another iterator.
__last	Another iterator.

Merges two sorted and consecutive ranges, `[__first, __middle)` and `[__middle, __last)`, and puts the result in `[__first, __last)`. The output will be sorted. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

If enough additional memory is available, this takes `(__last-__first)-1` comparisons. Otherwise an NlogN algorithm is used, where N is `distance(__first,__last)`.

inplace_merge() [2/2]

```
template<typename _BidirectionalIterator, typename _Compare>
void std::inplace_merge (
            _BidirectionalIterator __first,
            _BidirectionalIterator __middle,
            _BidirectionalIterator __last,
            _Compare __comp)  [inline], [constexpr]
```

Merges two sorted ranges in place.

Parameters

__first	An iterator.
__middle	Another iterator.
__last	Another iterator.
__comp	A function object to use for comparisons.

Merges two sorted and consecutive ranges, [__first,__middle) and [middle,last), and puts the result in [__first,__last). The output will be sorted. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

If enough additional memory is available, this takes `(__last-__first)-1` comparisons. Otherwise an NlogN algorithm is used, where N is `distance(__first,__last)`.

The comparison function should have the same effects on ordering as the function used for the initial sort.

is_sorted() [1/2]

```
template<typename _ForwardIterator>
bool std::is_sorted (
            _ForwardIterator __first,
            _ForwardIterator __last)  [inline], [nodiscard], [constexpr]
```

Determines whether the elements of a sequence are sorted.

Parameters

__first	An iterator.
__last	Another iterator.

Returns

True if the elements are sorted, false otherwise.

is_sorted() [2/2]

```
template<typename _ForwardIterator, typename _Compare>
bool std::is_sorted (
            _ForwardIterator __first,
            _ForwardIterator __last,
            _Compare __comp)  [inline], [nodiscard], [constexpr]
```

Determines whether the elements of a sequence are sorted according to a comparison function.

Parameters

__first	An iterator.
__last	Another iterator.
__comp	A comparison function object.

Returns

True if the elements are sorted, false otherwise.

is_sorted_until() [1/2]

```
template<typename _ForwardIterator>
_ForwardIterator std::is_sorted_until (
            _ForwardIterator __first,
            _ForwardIterator __last)  [inline], [nodiscard], [constexpr]
```

Determines the end of a sorted sequence.

Parameters

__first	An iterator.
__last	Another iterator.

Returns

An iterator pointing to the last iterator i in [__first, __last) for which the range [__first, i) is sorted.

is_sorted_until() [2/2]

```
template<typename _ForwardIterator, typename _Compare>
_ForwardIterator std::is_sorted_until (
            _ForwardIterator __first,
            _ForwardIterator __last,
            _Compare __comp)  [inline], [nodiscard], [constexpr]
```

Determines the end of a sorted sequence using comparison function.

Parameters

__first	An iterator.
__last	Another iterator.
__comp	A comparison function object.

Returns

An iterator pointing to the last iterator i in [__first, __last) for which the range [__first, i) is sorted.

lexicographical_compare() [1/2]

```
template<typename _II1, typename _II2>
bool std::lexicographical_compare (
            _II1 __first1,
            _II1 __last1,
            _II2 __first2,
            _II2 __last2)  [inline], [nodiscard], [constexpr]
```

Performs **dictionary** comparison on ranges.

Parameters

__first1	An input iterator.
__last1	An input iterator.
__first2	An input iterator.
__last2	An input iterator.

Returns

A boolean true or false.

Returns true if the sequence of elements defined by the range [first1,last1) is lexicographically less than the sequence of elements defined by the range [first2,last2). Returns false otherwise. (Quoted from [25.3.8]/1.) If the iterators are all character pointers, then this is an inline call to `memcmp`.

lexicographical_compare() [2/2]

```
template<typename _II1, typename _II2, typename _Compare>
bool std::lexicographical_compare (
            _II1 __first1,
            _II1 __last1,
            _II2 __first2,
            _II2 __last2,
            _Compare __comp)  [inline], [nodiscard], [constexpr]
```

Performs **dictionary** comparison on ranges.

Parameters

__first1	An input iterator.
__last1	An input iterator.
__first2	An input iterator.
__last2	An input iterator.
__comp	A comparison functor.

Returns

A boolean true or false.

The same as the four-parameter `lexicographical_compare`, but uses the comp parameter instead of <.

lexicographical_compare_three_way()

```
template<typename _InputIter1, typename _InputIter2, typename _Comp>
auto std::lexicographical_compare_three_way (
            _InputIter1 __first1,
            _InputIter1 __last1,
            _InputIter2 __first2,
            _InputIter2 __last2,
            _Comp __comp) -> decltype(__comp(*__first1, *__first2))  [nodiscard], [constexpr]
```

Performs dictionary comparison on ranges.

Parameters

__first1	An input iterator.
__last1	An input iterator.
__first2	An input iterator.
__last2	An input iterator.
__comp	A comparison functor.

Returns

The comparison category that `__comp(*__first1, *__first2)` returns.

Referenced by operator<=>().

max() [1/2]

```
template<typename _Tp>
const _Tp & std::max (
            const _Tp & __a,
            const _Tp & __b)  [inline], [nodiscard], [constexpr]
```

This does what you think it does.

Parameters

_↩ _a	A thing of arbitrary type.
_↩ _b	Another thing of arbitrary type.

Returns

The greater of the parameters.

This is the simple classic generic implementation. It will work on temporary expressions, since they are only evaluated once, unlike a preprocessor macro.

Referenced by __gnu_parallel::__find_template(), __gnu_parallel::__parallel_nth_element(), __gnu_parallel::__parallel_partial_sum_linea __gnu_parallel::__parallel_partition(), __gnu_parallel::__parallel_random_shuffle_drs(), __gnu_parallel::__qsb_conquer(), __gnu_parallel::__search_template(), __gnu_parallel::__sequential_random_shuffle(), std::_Deque_base< _Tp, _Alloc >::_M_initialize_ std::deque< _Tp, _Alloc >::_M_reallocate_map(), clamp(), clamp(), __gnu_parallel::multiseq_partition(), __gnu_parallel::multiseq_selecti std::shuffle_order_engine< _RandomNumberEngine, __k >::operator()(), std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow(), and std::philox_engine< _UIntType, __w, __n, __r, __consts >::seed().

max() [2/2]

```
template<typename _Tp, typename _Compare>
const _Tp & std::max (
            const _Tp & __a,
            const _Tp & __b,
            _Compare __comp)  [inline], [nodiscard], [constexpr]
```

This does what you think it does.

Parameters

__a	A thing of arbitrary type.
__b	Another thing of arbitrary type.
__comp	A comparison functor.

Returns

The greater of the parameters.

This will work on temporary expressions, since they are only evaluated once, unlike a preprocessor macro.

max_element() [1/2]

```
template<typename _ForwardIterator>
_ForwardIterator std::max_element (
            _ForwardIterator __first,
            _ForwardIterator __last)  [inline], [nodiscard], [constexpr]
```

Return the maximum element in a range.

Parameters

__first	Start of range.
__last	End of range.

Returns

Iterator referencing the first instance of the largest value.

max_element() [2/2]

```
template<typename _ForwardIterator, typename _Compare>
_ForwardIterator std::max_element (
            _ForwardIterator __first,
            _ForwardIterator __last,
            _Compare __comp)  [inline], [nodiscard], [constexpr]
```

Return the maximum element in a range using comparison function.

Parameters

__first	Start of range.
__last	End of range.
__comp	Comparison function object.

Returns

Iterator referencing the first instance of the largest value according to __comp.

merge() [1/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator>
_OutputIterator std::merge (
            _InputIterator1 __first1,
            _InputIterator1 __last1,
            _InputIterator2 __first2,
            _InputIterator2 __last2,
            _OutputIterator __result)  [inline], [constexpr]
```

Merges two sorted ranges.

Parameters

__first1	An iterator.
__first2	Another iterator.
__last1	Another iterator.
__last2	Another iterator.
__result	An iterator pointing to the end of the merged range.

Returns

An output iterator equal to `__result + (__last1 - __first1) + (__last2 - __first2)`.

Merges the ranges `[__first1, __last1)` and `[__first2, __last2)` into the sorted range `[__result, __result + (__last1-__first1) + (__last2-__first2))`. Both input ranges must be sorted, and the output range must not overlap with either of the input ranges. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

merge() [2/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename ↩
_Compare>
_OutputIterator std::merge (
            _InputIterator1 __first1,
            _InputIterator1 __last1,
            _InputIterator2 __first2,
            _InputIterator2 __last2,
            _OutputIterator __result,
            _Compare __comp)  [inline], [constexpr]
```

Merges two sorted ranges.

Parameters

__first1	An iterator.
__first2	Another iterator.

__last1	Another iterator.
__last2	Another iterator.
__result	An iterator pointing to the end of the merged range.
__comp	A function object to use for comparisons.

Returns

An output iterator equal to `__result + (__last1 - __first1) + (__last2 - __first2)`.

Merges the ranges `[__first1, __last1)` and `[__first2, __last2)` into the sorted range `[__result, __result + (__last1-__first1) + (__last2-__first2))`. Both input ranges must be sorted, and the output range must not overlap with either of the input ranges. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

The comparison function should have the same effects on ordering as the function used for the initial sort.

min() [1/2]

```
template<typename _Tp>
const _Tp & std::min (
            const _Tp & __a,
            const _Tp & __b)  [inline], [nodiscard], [constexpr]
```

This does what you think it does.

Parameters

_↩ _a	A thing of arbitrary type.
_↩ _b	Another thing of arbitrary type.

Returns

The lesser of the parameters.

This is the simple classic generic implementation. It will work on temporary expressions, since they are only evaluated once, unlike a preprocessor macro.

std::basic_streambuf< _CharT, _Traits >::xsgetn(), and std::basic_streambuf< _CharT, _Traits >::xsputn().

min() [2/2]

```
template<typename _Tp, typename _Compare>
const _Tp & std::min (
             const _Tp & __a,
             const _Tp & __b,
             _Compare __comp)  [inline], [nodiscard], [constexpr]
```

This does what you think it does.

Parameters

__a	A thing of arbitrary type.
__b	Another thing of arbitrary type.
__comp	A comparison functor.

Returns

The lesser of the parameters.

This will work on temporary expressions, since they are only evaluated once, unlike a preprocessor macro.

min_element() [1/2]

```
template<typename _ForwardIterator>
_ForwardIterator std::min_element (
             _ForwardIterator __first,
             _ForwardIterator __last)  [inline], [nodiscard], [constexpr]
```

Return the minimum element in a range.

Parameters

__first	Start of range.
__last	End of range.

Returns

Iterator referencing the first instance of the smallest value.

min_element() [2/2]

```
template<typename _ForwardIterator, typename _Compare>
_ForwardIterator std::min_element (
             _ForwardIterator __first,
             _ForwardIterator __last,
             _Compare __comp)  [inline], [nodiscard], [constexpr]
```

Return the minimum element in a range using comparison function.

Parameters

__first	Start of range.
__last	End of range.
__comp	Comparison function object.

Returns

Iterator referencing the first instance of the smallest value according to __comp.

minmax() [1/2]

```
template<typename _Tp>
pair< const _Tp &, const _Tp & > std::minmax (
             const _Tp & __a,
             const _Tp & __b)  [inline], [nodiscard], [constexpr]
```

Determines min and max at once as an ordered pair.

Parameters

_↩ _a	A thing of arbitrary type.
_↩ _b	Another thing of arbitrary type.

Returns

A pair(__b, __a) if __b is smaller than __a, pair(__a, __b) otherwise.

minmax() [2/2]

```
template<typename _Tp, typename _Compare>
pair< const _Tp &, const _Tp & > std::minmax (
            const _Tp & __a,
            const _Tp & __b,
            _Compare __comp)  [inline], [nodiscard], [constexpr]
```

Determines min and max at once as an ordered pair.

Parameters

__a	A thing of arbitrary type.
__b	Another thing of arbitrary type.
__comp	A comparison function .

Returns

A pair(__b, __a) if __b is smaller than __a, pair(__a, __b) otherwise.

minmax_element() [1/2]

```
template<typename _ForwardIterator>
pair< _ForwardIterator, _ForwardIterator > std::minmax_element (
            _ForwardIterator __first,
            _ForwardIterator __last)  [inline], [nodiscard], [constexpr]
```

Return a pair of iterators pointing to the minimum and maximum elements in a range.

Parameters

__first	Start of range.
__last	End of range.

Returns

make_pair(m, M), where m is the first iterator i in [__first, __last) such that no other element in the range is smaller, and where M is the last iterator i in [__first, __last) such that no other element in the range is larger.

minmax_element() [2/2]

```
template<typename _ForwardIterator, typename _Compare>
pair< _ForwardIterator, _ForwardIterator > std::minmax_element (
            _ForwardIterator __first,
            _ForwardIterator __last,
            _Compare __comp)  [inline], [nodiscard], [constexpr]
```

Return a pair of iterators pointing to the minimum and maximum elements in a range.

Parameters

__first	Start of range.
__last	End of range.
__comp	Comparison function object.

Returns

make_pair(m, M), where m is the first iterator i in [__first, __last) such that no other element in the range is smaller, and where M is the last iterator i in [__first, __last) such that no other element in the range is larger.

next_permutation() [1/2]

```
template<typename _BidirectionalIterator>
bool std::next_permutation (
            _BidirectionalIterator __first,
            _BidirectionalIterator __last)  [inline], [constexpr]
```

Permute range into the next dictionary ordering.

Parameters

__first	Start of range.
__last	End of range.

Returns

False if wrapped to first permutation, true otherwise.

Treats all permutations of the range as a set of *dictionary* sorted sequences. Permutes the current sequence into the next one of this set. Returns true if there are more sequences to generate. If the sequence is the largest of the set, the smallest is generated and false returned.

next_permutation() [2/2]

```
template<typename _BidirectionalIterator, typename _Compare>
bool std::next_permutation (
             _BidirectionalIterator __first,
             _BidirectionalIterator __last,
             _Compare __comp)  [inline], [constexpr]
```

Permute range into the next dictionary ordering using a comparison function.

Parameters

__first	Start of range.
__last	End of range.
__comp	A comparison function object.

Returns

False if wrapped to first permutation, true otherwise.

Treats all permutations of the range [__first, __last) as a set of *dictionary* sorted sequences ordered by ↩ __comp. Permutes the current sequence into the next one of this set. Returns true if there are more sequences to generate. If the sequence is the largest of the set, the smallest is generated and false returned.

nth_element() [1/2]

```
template<typename _RandomAccessIterator>
void std::nth_element (
             _RandomAccessIterator __first,
             _RandomAccessIterator __nth,
             _RandomAccessIterator __last)  [inline], [constexpr]
```

Sort a sequence just enough to find a particular position.

Parameters

__first	An iterator.
__nth	Another iterator.
__last	Another iterator.

Rearranges the elements in the range [__first, __last) so that *__nth is the same element that would have been in that position had the whole sequence been sorted. The elements either side of *__nth are not completely sorted, but for any iterator i in the range [__first, __nth) and any iterator j in the range [__nth, __last) it holds that *j < *i is false.

References __lg().

nth_element() [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
void std::nth_element (
            _RandomAccessIterator __first,
            _RandomAccessIterator __nth,
            _RandomAccessIterator __last,
            _Compare __comp)  [inline], [constexpr]
```

Sort a sequence just enough to find a particular position using a predicate for comparison.

Parameters

__first	An iterator.
__nth	Another iterator.
__last	Another iterator.
__comp	A comparison function object.

Rearranges the elements in the range `[__first, __last)` so that `*__nth` is the same element that would have been in that position had the whole sequence been sorted. The elements either side of `*__nth` are not completely sorted, but for any iterator `i` in the range `[__first, __nth)` and any iterator `j` in the range `[__nth, __last)` it holds that `__comp(*j, *i)` is false.

References __lg().

partial_sort() [1/2]

```
template<typename _RandomAccessIterator>
void std::partial_sort (
            _RandomAccessIterator __first,
            _RandomAccessIterator __middle,
            _RandomAccessIterator __last)  [inline], [constexpr]
```

Sort the smallest elements of a sequence.

Parameters

__first	An iterator.
__middle	Another iterator.
__last	Another iterator.

Sorts the smallest `(__middle - __first)` elements in the range `[first, last)` and moves them to the range `[__first, __middle)`. The order of the remaining elements in the range `[__middle, __last)` is unspecified. After the sort if `i` and `j` are iterators in the range `[__first, __middle)` such that `i` precedes `j` and `k` is an iterator in the range `[__middle, __last)` then `*j < *i` and `*k < *i` are both false.

partial_sort() [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
void std::partial_sort (
            _RandomAccessIterator __first,
            _RandomAccessIterator __middle,
            _RandomAccessIterator __last,
            _Compare __comp)  [inline], [constexpr]
```

Sort the smallest elements of a sequence using a predicate for comparison.

Parameters

__first	An iterator.
__middle	Another iterator.
__last	Another iterator.
__comp	A comparison function object.

Sorts the smallest `(__middle - __first)` elements in the range `[__first, __last)` and moves them to the range `[__first, __middle)`. The order of the remaining elements in the range `[__middle, __last)` is unspecified. After the sort if `i` and `j` are iterators in the range `[__first, __middle)` such that `i` precedes `j` and `k` is an iterator in the range `[__middle, __last)` then `*__comp(j, *i)` and `__comp(*k, *i)` are both false.

partial_sort_copy() [1/2]

```
template<typename _InputIterator, typename _RandomAccessIterator>
_RandomAccessIterator std::partial_sort_copy (
            _InputIterator __first,
            _InputIterator __last,
            _RandomAccessIterator __result_first,
            _RandomAccessIterator __result_last)  [inline], [constexpr]
```

Copy the smallest elements of a sequence.

Parameters

__first	An iterator.
__last	Another iterator.
__result_first	A random-access iterator.
__result_last	Another random-access iterator.

Returns

An iterator indicating the end of the resulting sequence.

Copies and sorts the smallest `N` values from the range `[__first, __last)` to the range beginning at `__result_first`, where the number of elements to be copied, `N`, is the smaller of `(__last - __first)` and `(__result_last - __result_first)`. After the sort if `i` and `j` are iterators in the range `[__result_first,__result_first + N)` such that `i` precedes `j` then `*j < *i` is false. The value returned is `__result_first + N`.

partial_sort_copy() [2/2]

```
template<typename _InputIterator, typename _RandomAccessIterator, typename _Compare>
_RandomAccessIterator std::partial_sort_copy (
            _InputIterator __first,
            _InputIterator __last,
            _RandomAccessIterator __result_first,
            _RandomAccessIterator __result_last,
            _Compare __comp)  [inline], [constexpr]
```

Copy the smallest elements of a sequence using a predicate for comparison.

Parameters

__first	An input iterator.
__last	Another input iterator.
__result_first	A random-access iterator.
__result_last	Another random-access iterator.
__comp	A comparison function object.

Returns

An iterator indicating the end of the resulting sequence.

Copies and sorts the smallest `N` values from the range `[__first, __last)` to the range beginning at `result_first`, where the number of elements to be copied, `N`, is the smaller of `(__last - __first)` and `(__result_last - __result_first)`. After the sort if `i` and `j` are iterators in the range `[__result_first, __result_first + N)` such that `i` precedes `j` then `__comp(*j, *i)` is false. The value returned is `__result_first + N`.

prev_permutation() [1/2]

```
template<typename _BidirectionalIterator>
bool std::prev_permutation (
            _BidirectionalIterator __first,
            _BidirectionalIterator __last)  [inline], [constexpr]
```

Permute range into the previous *dictionary* ordering.

Parameters

__first	Start of range.
__last	End of range.

Returns

False if wrapped to last permutation, true otherwise.

Treats all permutations of the range as a set of *dictionary* sorted sequences. Permutes the current sequence into the previous one of this set. Returns true if there are more sequences to generate. If the sequence is the smallest of the set, the largest is generated and false returned.

prev_permutation() [2/2]

```
template<typename _BidirectionalIterator, typename _Compare>
bool std::prev_permutation (
            _BidirectionalIterator __first,
            _BidirectionalIterator __last,
            _Compare __comp)  [inline], [constexpr]
```

Permute range into the previous *dictionary* ordering using a comparison function.

Parameters

__first	Start of range.
__last	End of range.
__comp	A comparison function object.

Returns

False if wrapped to last permutation, true otherwise.

Treats all permutations of the range [__first,__last) as a set of *dictionary* sorted sequences ordered by `__comp`. Permutes the current sequence into the previous one of this set. Returns true if there are more sequences to generate. If the sequence is the smallest of the set, the largest is generated and false returned.

sort() [1/2]

```
template<typename _RandomAccessIterator>
void std::sort (
            _RandomAccessIterator __first,
            _RandomAccessIterator __last)  [inline], [constexpr]
```

Sort the elements of a sequence.

Parameters

__first	An iterator.
__last	Another iterator.

Sorts the elements in the range `[__first, __last)` in ascending order, such that for each iterator `i` in the range `[__first, __last - 1),*(i+1) < *i` is false.

The relative ordering of equivalent elements is not preserved, use `stable_sort()` if this is needed.

sort() [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
void std::sort (
             _RandomAccessIterator __first,
             _RandomAccessIterator __last,
             _Compare __comp)  [inline], [constexpr]
```

Sort the elements of a sequence using a predicate for comparison.

Parameters

__first	An iterator.
__last	Another iterator.
__comp	A comparison function object.

Sorts the elements in the range `[__first, __last)` in ascending order, such that `__comp(*(i+1), *i)` is false for every iterator `i` in the range `[__first, __last - 1)`.

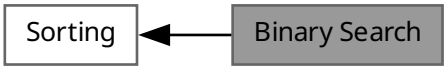
The relative ordering of equivalent elements is not preserved, use `stable_sort()` if this is needed.

stable_sort()

```
template<typename _RandomAccessIterator>
void std::stable_sort (
             _RandomAccessIterator __first,
             _RandomAccessIterator __last)  [inline], [constexpr]
```

Sort the elements of a sequence, preserving the relative order of equivalent elements.

Parameters



__first	An iterator.
__last	Another iterator.

Sorts the elements in the range `[__first, __last)` in ascending order, such that for each iterator `i` in the range `[__first, __last-1),*(i+1) < *i` is false.

The relative ordering of equivalent elements is preserved, so any two elements `x` and `y` in the range `[__first, __last)` such that `x < y` is false and `y < x` is false will have the same relative ordering after calling `stable_sort`.

3.1.5.3 Binary Search

Collaboration diagram for Binary Search:

Functions

3.1.5.3.1 Detailed Description

These algorithms are variations of a classic binary search, and all assume that the sequence being searched is already sorted.

The number of comparisons will be logarithmic (and as few as possible). The number of steps through the sequence will be logarithmic for random-access iterators (e.g., pointers), and linear otherwise.

The LWG has passed Defect Report 270, which notes: *The proposed resolution reinterprets binary search. Instead of thinking about searching for a value in a sorted range, we view that as an important special case of a more general algorithm: searching for the partition point in a partitioned range. We also add a guarantee that the old wording did not: we ensure that the upper bound is no earlier than the lower bound, that the pair returned by equal_range is a valid range, and that the first part of that pair is the lower bound.*

The actual effect of the first sentence is that a comparison functor passed by the user doesn't necessarily need to induce a strict weak ordering relation. Rather, it partitions the range.

3.1.5.3.2 Function Documentation

binary_search() [1/2]

```
template<typename _ForwardIterator, typename _Tp>
bool std::binary_search (
            _ForwardIterator __first,
            _ForwardIterator __last,
            const _Tp & __val)  [nodiscard], [constexpr]
```

Determines whether an element exists in a range.

Parameters

__first	An iterator.
__last	Another iterator.
__val	The search term.

Returns

True if __val (or its equivalent) is in [__first, __last).

Note that this does not actually return an iterator to __val. For that, use std::find or a container's specialized find member functions.

binary_search() [2/2]

```
template<typename _ForwardIterator, typename _Tp, typename _Compare>
bool std::binary_search (
            _ForwardIterator __first,
            _ForwardIterator __last,
            const _Tp & __val,
            _Compare __comp)  [nodiscard], [constexpr]
```

Determines whether an element exists in a range.

Parameters

__first	An iterator.
__last	Another iterator.
__val	The search term.
__comp	A function object to use for comparisons.

Returns

True if __val (or its equivalent) is in [__first, __last).

Note that this does not actually return an iterator to __val. For that, use std::find or a container's specialized find member functions.

The comparison function should have the same effects on ordering as the function used for the initial sort.

equal_range() [1/2]

```
template<typename _ForwardIterator, typename _Tp>
pair< _ForwardIterator, _ForwardIterator > std::equal_range (
            _ForwardIterator __first,
            _ForwardIterator __last,
            const _Tp & __val)  [inline], [nodiscard], [constexpr]
```

Finds the largest subrange in which __val could be inserted at any place in it without changing the ordering.

Parameters

__first	An iterator.
__last	Another iterator.
__val	The search term.

Returns

An pair of iterators defining the subrange.

This is equivalent to

```
std::make_pair(lower_bound(__first, __last, __val),
               upper_bound(__first, __last, __val))
```

but does not actually call those functions.

equal_range() [2/2]

```
template<typename _ForwardIterator, typename _Tp, typename _Compare>
pair< _ForwardIterator, _ForwardIterator > std::equal_range (
            _ForwardIterator __first,
            _ForwardIterator __last,
            const _Tp & __val,
            _Compare __comp)  [inline], [nodiscard], [constexpr]
```

Finds the largest subrange in which __val could be inserted at any place in it without changing the ordering.

Parameters

__first	An iterator.
__last	Another iterator.
__val	The search term.
__comp	A function object to use for comparisons.

Returns

An pair of iterators defining the subrange.

This is equivalent to

```
std::make_pair(lower_bound(__first, __last, __val, __comp),
               upper_bound(__first, __last, __val, __comp))
```

but does not actually call those functions.

lower_bound() [1/2]

```
template<typename _ForwardIterator, typename _Tp>
_ForwardIterator std::lower_bound (
             _ForwardIterator __first,
             _ForwardIterator __last,
             const _Tp & __val)  [inline], [nodiscard], [constexpr]
```

Finds the first position in which *val* could be inserted without changing the ordering.

Parameters

__first	An iterator.
__last	Another iterator.
__val	The search term.

Returns

An iterator pointing to the first element *not less than val*, or end() if every element is less than *val*.

lower_bound() [2/2]

```
template<typename _ForwardIterator, typename _Tp, typename _Compare>
_ForwardIterator std::lower_bound (
             _ForwardIterator __first,
             _ForwardIterator __last,
             const _Tp & __val,
             _Compare __comp)  [inline], [nodiscard], [constexpr]
```

Finds the first position in which `__val` could be inserted without changing the ordering.

Parameters

__first	An iterator to the start of a sorted range.
__last	A past-the-end iterator for the sorted range.
__val	The search term.
__comp	A function object to use for comparisons.

Returns

An iterator pointing to the first element *not less than* `__val`, or `__last` if every element is less than `__val`.

The comparison function should have the same effects on ordering as the function used for the initial sort.

upper_bound() [1/2]

```
template<typename _ForwardIterator, typename _Tp>
_ForwardIterator std::upper_bound (
             _ForwardIterator __first,
             _ForwardIterator __last,
             const _Tp & __val)  [inline], [nodiscard], [constexpr]
```

Finds the last position in which __val could be inserted without changing the ordering.

Parameters

__first	An iterator.
__last	Another iterator.
__val	The search term.

Returns

An iterator pointing to the first element greater than __val, or __last if no elements are greater than __val.

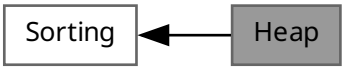
upper_bound() [2/2]

```
template<typename _ForwardIterator, typename _Tp, typename _Compare>
_ForwardIterator std::upper_bound (
             _ForwardIterator __first,
             _ForwardIterator __last,
             const _Tp & __val,
             _Compare __comp)  [inline], [nodiscard], [constexpr]
```

Finds the last position in which __val could be inserted without changing the ordering.

Parameters

__first	An iterator.
__last	Another iterator.
__val	The search term.
__comp	A function object to use for comparisons.



Returns

An iterator pointing to the first element greater than __val, or __last if no elements are greater than __val.

The comparison function should have the same effects on ordering as the function used for the initial sort.

3.1.5.4 Heap

3.1.5.4.1 Detailed Description

3.1.5.4.2 Function Documentation

is_heap() [1/2]

```
template<typename _RandomAccessIterator>
bool std::is_heap (
            _RandomAccessIterator __first,
            _RandomAccessIterator __last)  [inline], [nodiscard], [constexpr]
```

Determines whether a range is a heap.

Parameters

__first	Start of range.
__last	End of range.

Returns

True if range is a heap, false otherwise.

is_heap() [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
bool std::is_heap (
            _RandomAccessIterator __first,
            _RandomAccessIterator __last,
            _Compare __comp)  [inline], [nodiscard], [constexpr]
```

Determines whether a range is a heap using comparison functor.

Parameters

__first	Start of range.
__last	End of range.
__comp	Comparison functor to use.

Returns

True if range is a heap, false otherwise.

References distance().

is_heap_until() [1/2]

```
template<typename _RandomAccessIterator>
_RandomAccessIterator std::is_heap_until (
            _RandomAccessIterator __first,
            _RandomAccessIterator __last)  [inline], [nodiscard], [constexpr]
```

Search the end of a heap.

Parameters

__first	Start of range.
__last	End of range.

Returns

An iterator pointing to the first element not in the heap.

This operation returns the last iterator i in [__first, __last) for which the range [__first, i) is a heap.

References distance().

is_heap_until() [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
_RandomAccessIterator std::is_heap_until (
            _RandomAccessIterator __first,
            _RandomAccessIterator __last,
            _Compare __comp)  [inline], [nodiscard], [constexpr]
```

Search the end of a heap using comparison functor.

Parameters

__first	Start of range.
__last	End of range.
__comp	Comparison functor to use.

Returns

An iterator pointing to the first element not in the heap.

This operation returns the last iterator i in [__first, __last) for which the range [__first, i) is a heap. Comparisons are made using __comp.

References distance().

make_heap() [1/2]

```
template<typename _RandomAccessIterator>
void std::make_heap (
            _RandomAccessIterator __first,
            _RandomAccessIterator __last)  [inline], [constexpr]
```

Construct a heap over a range.

Parameters

__first	Start of heap.
__last	End of heap.

This operation makes the elements in [__first,__last) into a heap.

make_heap() [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
void std::make_heap (
            _RandomAccessIterator __first,
            _RandomAccessIterator __last,
            _Compare __comp)  [inline], [constexpr]
```

Construct a heap over a range using comparison functor.

Parameters

__first	Start of heap.
__last	End of heap.
__comp	Comparison functor to use.

This operation makes the elements in [__first,__last) into a heap. Comparisons are made using __comp.

pop_heap() [1/2]

```
template<typename _RandomAccessIterator>
void std::pop_heap (
            _RandomAccessIterator __first,
            _RandomAccessIterator __last)  [inline], [constexpr]
```

Pop an element off a heap.

Parameters

__first	Start of heap.
__last	End of heap.

Precondition

[__first, __last) is a valid, non-empty range.

This operation pops the top of the heap. The elements __first and __last-1 are swapped and [__first,__last-1) is made into a heap.

pop_heap() [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
void std::pop_heap (
            _RandomAccessIterator __first,
            _RandomAccessIterator __last,
            _Compare __comp)  [inline], [constexpr]
```

Pop an element off a heap using comparison functor.

Parameters

__first	Start of heap.
__last	End of heap.
__comp	Comparison functor to use.

This operation pops the top of the heap. The elements __first and __last-1 are swapped and [__first,__last-1) is made into a heap. Comparisons are made using comp.

push_heap() [1/2]

```
template<typename _RandomAccessIterator>
void std::push_heap (
            _RandomAccessIterator __first,
            _RandomAccessIterator __last)  [inline], [constexpr]
```

Push an element onto a heap.

Parameters

__first	Start of heap.
__last	End of heap + element.

This operation pushes the element at last-1 onto the valid heap over the range [__first,__last-1). After completion, [__first,__last) is a valid heap.

push_heap() [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
void std::push_heap (
            _RandomAccessIterator __first,
            _RandomAccessIterator __last,
            _Compare __comp)  [inline], [constexpr]
```

Push an element onto a heap using comparison functor.

Parameters

__first	Start of heap.
__last	End of heap + element.
__comp	Comparison functor.

This operation pushes the element at __last-1 onto the valid heap over the range [__first,__last-1). After completion, [__first,__last) is a valid heap. Compare operations are performed using comp.

sort_heap() [1/2]

```
template<typename _RandomAccessIterator>
void std::sort_heap (
            _RandomAccessIterator __first,
            _RandomAccessIterator __last)  [inline], [constexpr]
```

Sort a heap.

Parameters

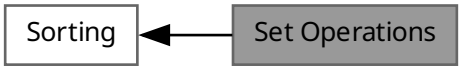
__first	Start of heap.
__last	End of heap.

This operation sorts the valid heap in the range [__first,__last).

sort_heap() [2/2]

```
template<typename _RandomAccessIterator, typename _Compare>
void std::sort_heap (
            _RandomAccessIterator __first,
            _RandomAccessIterator __last,
            _Compare __comp)  [inline], [constexpr]
```

Sort a heap using comparison functor.



Parameters

__first	Start of heap.
__last	End of heap.
__comp	Comparison functor to use.

This operation sorts the valid heap in the range [__first,__last). Comparisons are made using __comp.

3.1.5.5 Set Operations

- template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename _Compare>
  constexpr _OutputIterator std::set_union (_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2, _OutputIterator __result, _Compare __comp)

3.1.5.5.1 Detailed Description

These algorithms are common set operations performed on sequences that are already sorted. The number of comparisons will be linear.

3.1.5.5.2 Function Documentation

includes() [1/2]

```
template<typename _InputIterator1, typename _InputIterator2>
bool std::includes (
            _InputIterator1 __first1,
            _InputIterator1 __last1,
            _InputIterator2 __first2,
            _InputIterator2 __last2)  [inline], [nodiscard], [constexpr]
```

Determines whether all elements of a sequence exists in a range.

Parameters

__first1	Start of search range.
__last1	End of search range.
__first2	Start of sequence
__last2	End of sequence.

Returns

True if each element in `[__first2, __last2)` is contained in order within `[__first1, __last1)`. False otherwise.

This operation expects both `[__first1, __last1)` and `[__first2, __last2)` to be sorted. Searches for the presence of each element in `[__first2, __last2)` within `[__first1, __last1)`. The iterators over each range only move forward, so this is a linear algorithm. If an element in `[__first2, __last2)` is not found before the search iterator reaches `__last2`, false is returned.

includes() [2/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _Compare>
bool std::includes (
            _InputIterator1 __first1,
            _InputIterator1 __last1,
            _InputIterator2 __first2,
            _InputIterator2 __last2,
            _Compare __comp)  [inline], [nodiscard], [constexpr]
```

Determines whether all elements of a sequence exists in a range using comparison.

Parameters

__first1	Start of search range.
__last1	End of search range.
__first2	Start of sequence
__last2	End of sequence.
__comp	Comparison function to use.

Returns

True if each element in [__first2, __last2) is contained in order within [__first1, __last1) according to comp. False otherwise.

This operation expects both [__first1, __last1) and [__first2, __last2) to be sorted. Searches for the presence of each element in [__first2, __last2) within [__first1, __last1), using comp to decide. The iterators over each range only move forward, so this is a linear algorithm. If an element in [__first2, __last2) is not found before the search iterator reaches __last2, false is returned.

set_difference() [1/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator>
_OutputIterator std::set_difference (
            _InputIterator1 __first1,
            _InputIterator1 __last1,
            _InputIterator2 __first2,
            _InputIterator2 __last2,
            _OutputIterator __result)  [inline], [constexpr]
```

Return the difference of two sorted ranges.

Parameters

__first1	Start of first range.
__last1	End of first range.

__first2	Start of second range.
__last2	End of second range.
__result	Start of output range.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in the first range but not the second in order to the output range. Iterators increment for each range. When the current element of the first range is less than the second, that element is copied and the iterator advances. If the current element of the second range is less, the iterator advances, but no element is copied. If an element is contained in both ranges, no elements are copied and both ranges advance. The output range may not overlap either input range.

set_difference() [2/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename ↩
_Compare>
_OutputIterator std::set_difference (
             _InputIterator1 __first1,
             _InputIterator1 __last1,
             _InputIterator2 __first2,
             _InputIterator2 __last2,
             _OutputIterator __result,
             _Compare __comp)  [inline], [constexpr]
```

Return the difference of two sorted ranges using comparison function.

Parameters

__first1	Start of first range.
__last1	End of first range.
__first2	Start of second range.
__last2	End of second range.
__result	Start of output range.
__comp	The comparison function object.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in the first range but not the second in order to the output range. Iterators increment for each range. When the current element of the first range is less than the second according to __comp, that element is copied and the iterator advances. If the current element of the second range is less, no element is copied and the iterator advances. If an element is contained in both ranges according to __comp, no elements are copied and both ranges advance. The output range may not overlap either input range.

set_intersection() [1/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator>
_OutputIterator std::set_intersection (
             _InputIterator1 __first1,
             _InputIterator1 __last1,
             _InputIterator2 __first2,
             _InputIterator2 __last2,
             _OutputIterator __result)  [inline], [constexpr]
```

Return the intersection of two sorted ranges.

Parameters

__first1	Start of first range.
__last1	End of first range.
__first2	Start of second range.
__last2	End of second range.
__result	Start of output range.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in both ranges in order to the output range. Iterators increment for each range. When the current element of one range is less than the other, that iterator advances. If an element is contained in both ranges, the element from the first range is copied and both ranges advance. The output range may not overlap either input range.

set_intersection() [2/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename ↩
_Compare>
_OutputIterator std::set_intersection (
             _InputIterator1 __first1,
             _InputIterator1 __last1,
             _InputIterator2 __first2,
             _InputIterator2 __last2,
             _OutputIterator __result,
             _Compare __comp)  [inline], [constexpr]
```

Return the intersection of two sorted ranges using comparison function.

Parameters

__first1	Start of first range.

__last1	End of first range.
__first2	Start of second range.
__last2	End of second range.
__result	Start of output range.
__comp	The comparison function object.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in both ranges in order to the output range. Iterators increment for each range. When the current element of one range is less than the other according to __comp, that iterator advances. If an element is contained in both ranges according to __comp, the element from the first range is copied and both ranges advance. The output range may not overlap either input range.

set_symmetric_difference() [1/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator>
_OutputIterator std::set_symmetric_difference (
             _InputIterator1 __first1,
             _InputIterator1 __last1,
             _InputIterator2 __first2,
             _InputIterator2 __last2,
             _OutputIterator __result)  [inline], [constexpr]
```

Return the symmetric difference of two sorted ranges.

Parameters

__first1	Start of first range.
__last1	End of first range.
__first2	Start of second range.
__last2	End of second range.
__result	Start of output range.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in one range but not the other in order to the output range. Iterators increment for each range. When the current element of one range is less than the other, that element is copied and the iterator advances. If an element is contained in both ranges, no elements are copied and both ranges advance. The output range may not overlap either input range.

set_symmetric_difference() [2/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename ↩
_Compare>
_OutputIterator std::set_symmetric_difference (
            _InputIterator1 __first1,
            _InputIterator1 __last1,
            _InputIterator2 __first2,
            _InputIterator2 __last2,
            _OutputIterator __result,
            _Compare __comp)  [inline], [constexpr]
```

Return the symmetric difference of two sorted ranges using comparison function.

Parameters

__first1	Start of first range.
__last1	End of first range.
__first2	Start of second range.
__last2	End of second range.
__result	Start of output range.
__comp	The comparison function object.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in one range but not the other in order to the output range. Iterators increment for each range. When the current element of one range is less than the other according to __comp, that element is copied and the iterator advances. If an element is contained in both ranges according to __comp, no elements are copied and both ranges advance. The output range may not overlap either input range.

set_union() [1/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator>
_OutputIterator std::set_union (
            _InputIterator1 __first1,
            _InputIterator1 __last1,
            _InputIterator2 __first2,
            _InputIterator2 __last2,
            _OutputIterator __result)  [inline], [constexpr]
```

Sort the elements of a sequence using a predicate for comparison, preserving the relative order of equivalent elements.

Parameters

__first	An iterator.
__last	Another iterator.
__comp	A comparison function object.

Sorts the elements in the range `[__first, __last)` in ascending order, such that for each iterator `i in the range [__first,__last-1), __comp(*(i+1), *i)` is false.

The relative ordering of equivalent elements is preserved, so any two elements `x` and `y` in the range `[__first, __last)` such that `__comp(x, y)` is false and `__comp(y, x)` is false will have the same relative ordering after calling `stable_sort.` */ template<typename _RandomAccessIterator, typename _Compare> constexpr inline void stable_sort(_RandomAccessIterator __first, _RandomAccessIterator __last, _Compare __comp) { concept requirements (_Mutable_RandomAccessIteratorConcept< _RandomAccessIterator>) (_BinaryPredicateConcept<_Compare, typename iterator_traits<_RandomAccessIterator>::value_type, typename iterator_traits<_RandomAccessIterator>::value_type>) ; ;

__stable_sort(__first, __last, __comp); }

template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename _Compare> constexpr _OutputIterator __set_union(_InputIterator1 __first1, _InputIterator1 __last1, _InputIterator2 __first2, _InputIterator2 __last2, _OutputIterator __result, _Compare __comp) { while (__first1 != __last1 && __first2 != __last2) { if (__comp(*__first1, *__first2)) { __result = *__first1; ++__first1; } else if (__comp(*__first2, *__first1)) { __result = *__first2; ++__first2; } else { __result = *__first1; ++__first1; ++__first2; } ++__result; } return std::copy(__first2, __last2, std::copy(__first1, __last1, __result)); }

/**

Return the union of two sorted ranges.

Parameters

__first1	Start of first range.
__last1	End of first range.
__first2	Start of second range.
__last2	End of second range.
__result	Start of output range.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in each range in order to the output range. Iterators increment for each range. When the current element of one range is less than the other, that element is copied and the iterator advanced. If an element is contained in both ranges, the element from the first range is copied and both ranges advance. The output range may not overlap either input range.

set_union() [2/2]

```
template<typename _InputIterator1, typename _InputIterator2, typename _OutputIterator, typename ↩
_Compare>
_OutputIterator std::set_union (
             _InputIterator1 __first1,
             _InputIterator1 __last1,
             _InputIterator2 __first2,
             _InputIterator2 __last2,
             _OutputIterator __result,
             _Compare __comp)  [inline], [constexpr]
```

Return the union of two sorted ranges using a comparison function.

Parameters

__first1	Start of first range.
__last1	End of first range.
__first2	Start of second range.
__last2	End of second range.
__result	Start of output range.
__comp	The comparison function object.

Returns

End of the output range.

This operation iterates over both ranges, copying elements present in each range in order to the output range. Iterators increment for each range. When the current element of one range is less than the other according to __comp, that element is copied and the iterator advanced. If an equivalent element according to __comp is contained in both ranges, the element from the first range is copied and both ranges advance. The output range may not overlap either input range.

3.2.1 Detailed Description

Components for performing atomic operations.

3.2.2 Macro Definition Documentation

ATOMIC_BOOL_LOCK_FREE

```
#define ATOMIC_BOOL_LOCK_FREE
```

Lock-free property.

0 indicates that the types are never lock-free. 1 indicates that the types are sometimes lock-free. 2 indicates that the types are always lock-free.

3.2.3 Typedef Documentation

atomic_bool

```
typedef atomic<bool> std::atomic_bool
```

atomic_bool

atomic_char

```
typedef atomic<char> std::atomic_char
```

atomic_char

atomic_char16_t

```
typedef atomic<char16_t> std::atomic_char16_t
```

atomic_char16_t

atomic_char32_t

```
typedef atomic<char32_t> std::atomic_char32_t
```

atomic_char32_t

atomic_int

```
typedef atomic<int> std::atomic_int
```

atomic_int

atomic_int16_t

```
typedef atomic<int16_t> std::atomic_int16_t
```

atomic_int16_t

atomic_int32_t

```
typedef atomic<int32_t> std::atomic_int32_t
```

atomic_int32_t

atomic_int64_t

```
typedef atomic<int64_t> std::atomic_int64_t
```

atomic_int64_t

atomic_int8_t

```
typedef atomic<int8_t> std::atomic_int8_t
```

atomic_int8_t

atomic_int_fast16_t

```
typedef atomic<int_fast16_t> std::atomic_int_fast16_t
```

atomic_int_fast16_t

atomic_int_fast32_t

```
typedef atomic<int_fast32_t> std::atomic_int_fast32_t
```

atomic_int_fast32_t

atomic_int_fast64_t

```
typedef atomic<int_fast64_t> std::atomic_int_fast64_t
```

```
typedef atomic<wchar_t> std::atomic_wchar_t
```

atomic_wchar_t

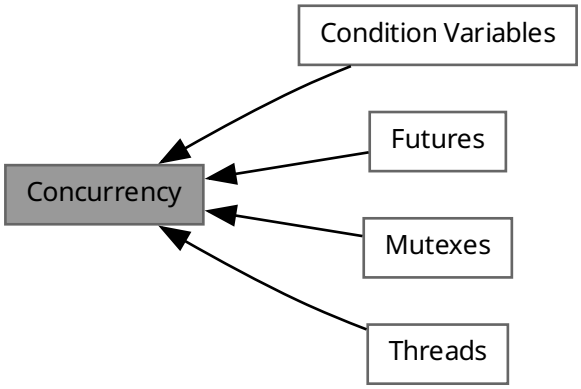
3.2.4 Enumeration Type Documentation

memory_order

```
enum class std::memory_order :  int  [strong]
```

Enumeration for memory_order.

3.2.5 Function Documentation



kill_dependency()

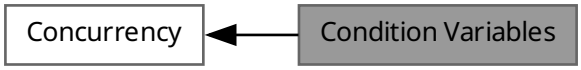
```
template<typename _Tp>
_Tp std::kill_dependency (
             _Tp __y)  [inline], [noexcept]
```

kill_dependency

3.3 Concurrency

Collaboration diagram for Concurrency:

Topics



- Condition Variables
- Futures
- Mutexes
- Threads

3.3.1 Detailed Description

Components for concurrent operations, including threads, mutexes, and condition variables.

3.3.2 Condition Variables

Collaboration diagram for Condition Variables:

Classes

- class std::condition_variable
- class std::condition_variable_any

Enumerations

- enum class std::cv_status { **no_timeout** , **timeout** }

Functions

- void **std::notify_all_at_thread_exit** (condition_variable &, unique_lock< mutex >)

3.3.2.1 Detailed Description

Classes for condition_variable support.

3.3.2.2 Enumeration Type Documentation

cv_status

```
enum class std::cv_status  [strong]
```

cv_status

3.3.3 Futures

Collaboration diagram for Futures:

Classes

- class std::__basic_future< _Res >
- class std::future< _Res >
- class std::future< _Res & >
- class std::future< void >
- class std::future_error

- constexpr launch & **std::operator^=** (launch &__x, launch __y) noexcept
- constexpr launch **std::operator|** (launch __x, launch __y) noexcept
- constexpr launch & **std::operator|=** (launch &__x, launch __y) noexcept
- constexpr launch **std::operator~** (launch __x) noexcept
- template<typename _Fun, typename _Signature = __function_guide_t<_Fun, decltype(&_Fun::operator())>>
  std::packaged_task (_Fun) -> packaged_task< _Signature >
- template<typename _Res, typename... _ArgTypes>
  std::packaged_task (_Res(*)(_ArgTypes...)) -> packaged_task< _Res(_ArgTypes...)>
- shared_future< _Res > **std::future< _Res >::share** () noexcept
- shared_future< _Res & > **std::future< _Res & >::share** () noexcept
- shared_future< void > **std::future< void >::share** () noexcept
- template<typename _Res, typename... _ArgTypes>
  void std::swap (packaged_task< _Res(_ArgTypes...)> &__x, packaged_task< _Res(_ArgTypes...)> &__y) noexcept
- template<typename _Res>
  void **std::swap** (promise< _Res > &__x, promise< _Res > &__y) noexcept

3.3.3.1 Detailed Description

Futures and promises provide support for retrieving the result from an asynchronous function, e.g. one that is running in another thread. A `std::future` represents an asynchronous result that will become ready at some later time. A consumer can wait on a future until the result is ready to be accessed.

Since

C++11

3.3.3.2 Enumeration Type Documentation

future_errc

```
enum class std::future_errc  [strong]
```

Error code for futures.

future_status

```
enum class std::future_status  [strong]
```

Status code for futures.

launch

```
enum class std::launch  [strong]
```

Launch code for futures.

3.3.3.3 Function Documentation

async() [1/2]

```
template<typename _Fn, typename...  _Args>
future< __async_result_of< _Fn, _Args...  > > std::async (
            _Fn && __fn,
            _Args &&...  __args)  [inline], [nodiscard]
```

async, potential overload

References async(), and forward().

async() [2/2]

```
template<typename _Fn, typename...  _Args>
future< __async_result_of< _Fn, _Args...  > > std::async (
            launch __policy,
            _Fn && __fn,
            _Args &&...  __args)  [nodiscard]
```

async

References async(), forward(), and move().

Referenced by async(), and async().

future_category()

```
const error_category & std::future_category ()  [noexcept]
```

Points to a statically-allocated object derived from error_category.

Referenced by make_error_code(), and make_error_condition().

make_error_code()

```
error_code std::make_error_code (
            future_errc __errc)  [inline], [noexcept]
```

Overload of make_error_code for `future_errc`.

References future_category(), and make_error_code().

Referenced by make_error_code(), system_category(), and std::filesystem::filesystem_error::what().

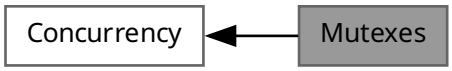
make_error_condition()

```
error_condition std::make_error_condition (
            future_errc __errc)  [inline], [noexcept]
```

Overload of make_error_condition for `future_errc`.

References future_category().

Referenced by system_category().



swap()

```
template<typename _Res, typename...  _ArgTypes>
void std::swap (
            packaged_task< _Res(_ArgTypes...)> & __x,
            packaged_task< _Res(_ArgTypes...)> & __y)  [inline], [noexcept]
```

swap

3.3.4 Mutexes

Collaboration diagram for Mutexes:

Classes

- struct std::adopt_lock_t
- struct std::defer_lock_t
- class std::lock_guard< _Mutex >
- class std::mutex
- struct std::once_flag
- class std::recursive_mutex
- class std::recursive_timed_mutex
- class std::shared_lock< _Mutex >
- class std::shared_timed_mutex
- class std::timed_mutex
- struct std::try_to_lock_t
- class std::unique_lock< _Mutex >

Functions

- void **std::__once_proxy** (void)
- template<typename _Callable, typename... _Args>
  void std::call_once (once_flag &__once, _Callable &&__f, _Args &&... __args)
- template<typename _L1, typename _L2, typename... _L3>
  void std::lock (_L1 &__l1, _L2 &__l2, _L3 &... __l3)
- template<typename _L1, typename _L2, typename... _L3>
  int std::try_lock (_L1 &__l1, _L2 &__l2, _L3 &... __l3)

Variables

- constexpr adopt_lock_t std::adopt_lock
- constexpr defer_lock_t std::defer_lock
- constexpr try_to_lock_t std::try_to_lock

3.3.4.1 Detailed Description

Classes for mutex support.

3.3.4.2 Function Documentation

call_once()

```
template<typename _Callable, typename...  _Args>
void std::call_once (
            once_flag & __once,
            _Callable && __f,
            _Args &&...  __args)
```

Invoke a callable and synchronize with other calls using the same flag.

lock()

```
template<typename _L1, typename _L2, typename...  _L3>
void std::lock (
            _L1 & __l1,
            _L2 & __l2,
            _L3 &...  __l3)
```

Generic lock.

Parameters

_↩ _l1	Meets Lockable requirements (try_lock() may throw).
_↩ _l2	Meets Lockable requirements (try_lock() may throw).
_↩ _l3	Meets Lockable requirements (try_lock() may throw).

Exceptions

An	exception thrown by an argument's lock() or try_lock() member.

Postcondition

All arguments are locked.

All arguments are locked via a sequence of calls to lock(), try_lock() and unlock(). If this function exits via an exception any locks that were obtained will be released.

References defer_lock, and try_lock().

try_lock()

```
template<typename _L1, typename _L2, typename...  _L3>
int std::try_lock (
             _L1 & __l1,
             _L2 & __l2,
             _L3 &...  __l3)  [inline], [nodiscard]
```

Generic try_lock.

Parameters

_↩ _l1	Meets Lockable requirements (try_lock() may throw).
_↩ _l2	Meets Lockable requirements (try_lock() may throw).
_↩ _l3	Meets Lockable requirements (try_lock() may throw).

Returns

Returns -1 if all try_lock() calls return true. Otherwise returns a 0-based index corresponding to the argument that returned false.

Postcondition

Either all arguments are locked, or none will be.

Sequentially calls try_lock() on each argument.

Referenced by lock().

3.3.4.3 Variable Documentation

adopt_lock

```
adopt_lock_t std::adopt_lock  [inline], [constexpr]
```

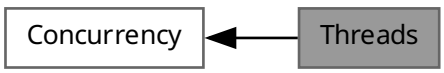
Tag used to make a scoped lock take ownership of a locked mutex.

defer_lock

```
defer_lock_t std::defer_lock  [inline], [constexpr]
```

Tag used to prevent a scoped lock from acquiring ownership of a mutex.

Referenced by lock().



try_to_lock

```
try_to_lock_t std::try_to_lock  [inline], [constexpr]
```

Tag used to prevent a scoped lock from blocking if a mutex is locked.

3.3.5 Threads

Collaboration diagram for Threads:

Namespaces

- namespace std::this_thread

Classes

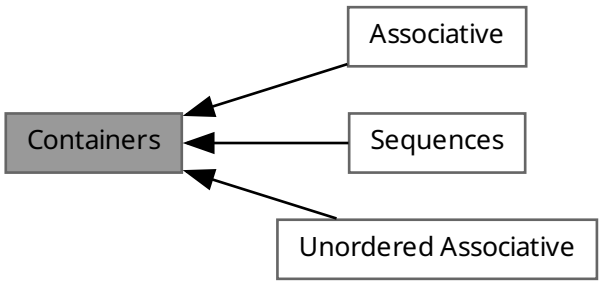
- struct std::hash< thread::id >
- class std::thread

Functions

- bool **operator==** (thread::id __x, thread::id __y) noexcept
- void **swap** (thread &__x, thread &__y) noexcept

- strong_ordering **operator**<=> (thread::id __x, thread::id __y) noexcept
- template<class _CharT, class _Traits>
  basic_ostream< _CharT, _Traits > & **operator**<< (basic_ostream< _CharT, _Traits > &__out, thread::id __id)

3.3.5.1 Detailed Description



Since

C++11

Classes for thread support.

3.4 Containers

Collaboration diagram for Containers:

Topics

- Associative
- Sequences
- Unordered Associative

3.4.1 Detailed Description

Containers are collections of objects.

A container may hold any type which meets certain requirements, but the type of contained object is chosen at compile time, and all objects in a given container must be of the same type. (Polymorphism is possible by declaring a container of pointers to a base class and then populating it with pointers to instances of derived classes. Variant value types such as the `any` class from `Boost` can also be used.

All contained types must be `Assignable` and `CopyConstructible`. Specific containers may place additional requirements on the types of their contained objects.

Containers manage memory allocation and deallocation themselves when storing your objects. The objects are destroyed when the container is itself destroyed. Note that if you are storing pointers in a container, `delete` is *not* automatically called on the pointers before destroying them.

All containers must meet certain requirements, summarized in `tables`.

The standard containers are further refined into Sequences and Associative Containers. Unordered Associative Containers.

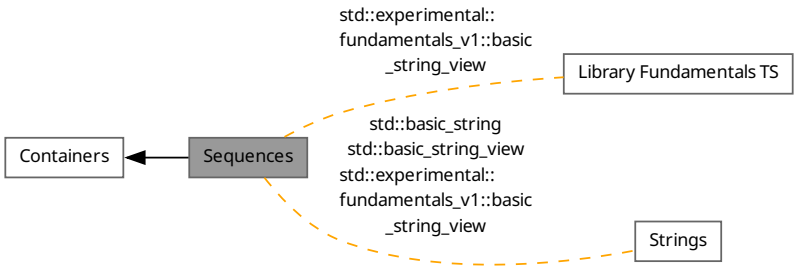
3.4.2 Associative

Collaboration diagram for Associative:

Classes

- class std::map< _Key, _Tp, _Compare, _Alloc >
- class std::multimap< _Key, _Tp, _Compare, _Alloc >
- class std::multiset< _Key, _Compare, _Alloc >
- class std::set< _Key, _Compare, _Alloc >

3.4.2.1 Detailed Description



Associative containers allow fast retrieval of data based on keys.

Each container type is parameterized on a `Key` type, and an ordering relation used to sort the elements of the container.

All associative containers must meet certain requirements, summarized in `tables`.

3.4.3 Sequences

Collaboration diagram for Sequences:

Files

- file inplace_vector

Classes

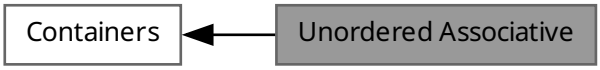
- struct std::array< _Tp, _Nm >
- class std::basic_string< _CharT, _Traits, _Alloc >
- class std::basic_string_view< _CharT, _Traits >
- class std::experimental::fundamentals_v1::basic_string_view< _CharT, _Traits >
- class std::deque< _Tp, _Alloc >
- class std::forward_list< _Tp, _Alloc >
- class std::list< _Tp, _Alloc >
- class std::priority_queue< _Tp, _Sequence, _Compare >
- class std::queue< _Tp, _Sequence >
- class std::stack< _Tp, _Sequence >
- class std::vector< _Tp, _Alloc >
- class std::vector< bool, _Alloc >

3.4.3.1 Detailed Description

Sequences arrange a collection of objects into a strictly linear order.

The differences between sequences are usually due to one or both of the following:

- memory management
- algorithmic complexity



As an example of the first case, `vector` is required to use a contiguous memory layout, while other sequences such as `deque` are not.

The prime reason for choosing one sequence over another should be based on the second category of differences, algorithmic complexity. For example, if you need to perform many inserts and removals from the middle of a sequence, `list` would be ideal. But if you need to perform constant-time access to random elements of the sequence, then `list` should not be used.

All sequences must meet certain requirements, summarized in `tables`.

3.4.4 Unordered Associative

Collaboration diagram for Unordered Associative:

Classes

- class std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >
- class std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >
- class std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >
- class std::unordered_set< _Value, _Hash, _Pred, _Alloc >

3.4.4.1 Detailed Description

Unordered associative containers allow fast retrieval of data based on keys.

Each container type is parameterized on a `Key` type, a `Hash` type providing a hashing functor, and an ordering relation used to sort the elements of the container.

All unordered associative containers must meet certain requirements, summarized in `tables`.

3.5 Diagnostics

Collaboration diagram for Diagnostics:

Topics

- Exceptions

Classes

- class std::error_category
- class std::error_code
- class std::error_condition
- struct std::is_error_code_enum< _Tp >
- struct std::is_error_condition_enum< _Tp >

Functions

- const error_category & std::generic_category () noexcept
- error_code make_error_code (errc __e) noexcept
- error_condition make_error_condition (errc __e) noexcept
- template<typename _CharT, typename _Traits>
  basic_ostream< _CharT, _Traits > & operator<< (basic_ostream< _CharT, _Traits > &__os, const error_code &__e)
- strong_ordering operator<=> (const error_code &__lhs, const error_code &__rhs) noexcept
- strong_ordering operator<=> (const error_condition &__lhs, const error_condition &__rhs) noexcept
- bool operator== (const error_code &__lhs, const error_code &__rhs) noexcept
- bool operator== (const error_code &__lhs, const error_condition &__rhs) noexcept
- bool operator== (const error_condition &__lhs, const error_condition &__rhs) noexcept
- const error_category & std::system_category () noexcept

Variables

- template<typename _Tp>
  constexpr bool **std::is_error_code_enum_v**
- template<typename _Tp>
  constexpr bool **std::is_error_condition_enum_v**

3.5.1 Detailed Description

Components for error handling, reporting, and diagnostic operations.

3.5.2 Function Documentation

generic_category()

```
const error_category & std::generic_category ()  [noexcept]
```

Error category for `errno` error codes.

Referenced by std::error_condition::error_condition(), std::error_condition::clear(), std::error_code::make_error_code(), and std::error_condition::make_error_condition().

make_error_code()

```
error_code make_error_code (
            errc __e)  [related]
```

Create an `error_code` representing a standard `errc` condition.

The `std::errc` constants correspond to `errno` macros and so use the generic category.

Since

C++11

References std::generic_category().

Referenced by error_code().

make_error_condition()

```
error_condition make_error_condition (
            errc __e)  [related]
```

Create an `error_condition` representing a standard `errc` condition.

The `std::errc` constants correspond to `errno` macros and so use the generic category.

Since

C++11

References error_condition(), and std::generic_category().

Referenced by error_condition().

operator<<()

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & operator<< (
            basic_ostream< _CharT, _Traits > & __os,
            const error_code & __e)  [related]
```

Write a std::error_code to an ostream.

Since

C++11

References operator<=>().

operator<=>() [1/2]

```
strong_ordering operator<=> (
            const error_code & __lhs,
            const error_code & __rhs)  [related]
```

Ordered comparison for std::error_code.

This defines a total order by comparing the categories, and then if they are equal comparing the values.

Since

C++11

Referenced by operator<<().

operator<=>() [2/2]

```
strong_ordering operator<=> (
            const error_condition & __lhs,
            const error_condition & __rhs)  [related]
```

Ordered comparison for std::error_condition.

This defines a total order by comparing the categories, and then if they are equal comparing the values.

Since

C++11

References error_condition(), and operator<=>().

Referenced by operator<=>().

operator==() [1/3]

```
bool operator== (
            const error_code & __lhs,
            const error_code & __rhs)  [related]
```

Equality comparison for std::error_code.

Returns true only if they have the same category and the same value.

Since

C++11

operator==() [2/3]

```
bool operator== (
            const error_code & __lhs,
            const error_condition & __rhs)  [related]
```

Equality comparison for std::error_code and std::error_condition.

Uses each category's `equivalent` member function to check whether the values correspond to an equivalent error in that category.

Since

C++11

References error_condition().

operator==() [3/3]

```
bool operator== (
            const error_condition & __lhs,
            const error_condition & __rhs)  [related]
```

Equality comparison for std::error_condition.

Returns true only if they have the same category and the same value.

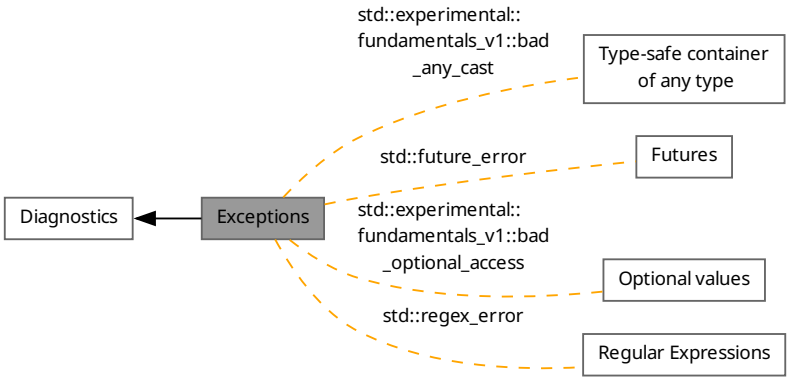
Since

C++11

References error_condition().

system_category()

```
const error_category & std::system_category ()  [noexcept]
```



Error category for other error codes defined by the OS.

References make_error_code(), make_error_condition(), and system_category().

Referenced by system_category().

3.5.3 Exceptions

Collaboration diagram for Exceptions:

Classes

- class __cxxabiv1::__forced_unwind
- class std::bad_alloc
- class std::experimental::fundamentals_v1::bad_any_cast
- class std::bad_cast
- class std::bad_exception
- class std::bad_function_call
- class std::experimental::fundamentals_v1::bad_optional_access
- class std::bad_typeid
- class std::bad_weak_ptr
- class std::domain_error
- class std::exception
- class std::__unspecified__::exception_ptr
- class std::ios_base::failure
- struct __gnu_cxx::forced_error
- class std::future_error

- class std::invalid_argument
- class std::length_error
- class std::logic_error
- class std::nested_exception
- class std::out_of_range
- class std::overflow_error
- class std::range_error
- class __gnu_cxx::recursive_init_error
- class std::regex_error
- class std::runtime_error
- class std::system_error
- class std::underflow_error

Typedefs

- typedef void(* std::terminate_handler) ()

Functions

- void __gnu_cxx::__verbose_terminate_handler ()
- exception_ptr std::current_exception () noexcept
- terminate_handler std::get_terminate () noexcept
- template<typename _Ex>
  constexpr exception_ptr std::make_exception_ptr (_Ex __ex) noexcept
- void std::rethrow_exception (exception_ptr)
- template<typename _Ex>
  void std::rethrow_if_nested (const _Ex &__ex)
- terminate_handler std::set_terminate (terminate_handler) noexcept
- void std::terminate () noexcept
- template<typename _Tp>
  void std::throw_with_nested (_Tp &&__t)
- bool std::uncaught_exception () noexcept

3.5.3.1 Detailed Description

Since

C++98

Classes and functions for reporting errors via exceptions.

3.5.3.2 Typedef Documentation

terminate_handler

```
typedef void(* std::terminate_handler) ()
```

If you write a replacement terminate handler, it must be of this type.

3.5.3.3 Function Documentation

__verbose_terminate_handler()

```
void __gnu_cxx::__verbose_terminate_handler ()
```

A replacement for the standard terminate_handler which prints more information about the terminating exception (if any) on stderr.

Call
`std::set_terminate(__gnu_cxx::__verbose_terminate_handler)`

to use. For more info, see http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt02ch06s02.↩
html

In 3.4 and later, this is on by default.

current_exception()

```
exception_ptr std::current_exception ()  [noexcept]
```

Obtain an exception_ptr to the currently handled exception.

If there is none, or the currently handled exception is foreign, return the null value.

Since

C++11

References make_exception_ptr().

Referenced by std::nested_exception::nested_exception(), and make_exception_ptr().

get_terminate()

```
terminate_handler std::get_terminate ()  [noexcept]
```

Return the current terminate handler.

make_exception_ptr()

```
template<typename _Ex>
exception_ptr std::make_exception_ptr (
            _Ex __ex)  [constexpr], [noexcept]
```

Obtain an exception_ptr pointing to a copy of the supplied object.

References current_exception().

Referenced by current_exception().

rethrow_exception()

```
void std::rethrow_exception (
            exception_ptr )
```

Throw the object pointed to by the exception_ptr.

References rethrow_exception().

Referenced by std::__basic_future< _Res & >::_M_get_result(), rethrow_exception(), and std::nested_exception::rethrow_nested().

rethrow_if_nested()

```
template<typename _Ex>
void std::rethrow_if_nested (
            const _Ex & __ex)  [inline]
```

Rethrow a nested exception

If __ex contains a `std::nested_exception` object, call its `rethrow_nested()` member to rethrow the stored exception.

After catching an exception thrown by a call to `std::throw_with_nested` this function can be used to rethrow the exception that was active when `std::throw_with_nested` was called.

Since

C++11

set_terminate()

```
terminate_handler std::set_terminate (
            terminate_handler )  [noexcept]
```

Takes a new handler function as an argument, returns the old function.

terminate()

```
void std::terminate ()  [noexcept]
```

The runtime will call this function if exception handling must be abandoned for any reason. It can also be called by the user.

Referenced by std::nested_exception::rethrow_nested().

throw_with_nested()

```
template<typename _Tp>
void std::throw_with_nested (
             _Tp && __t)  [inline]
```

Throw an exception that also stores the currently active exception.

If _Tp is derived from std::nested_exception or is not usable as a base-class, throws a copy of __t. Otherwise, throws an object of an implementation-defined type derived from both _Tp and std::nested_exception, containing a copy of __t and the result of std::current_exception().

In other words, throws the argument as a new exception that contains the currently active exception nested within it. This is intended for use in a catch handler to replace the caught exception with a different type, while still preserving the original exception. When the new exception is caught, the nested exception can be rethrown by using std::↩ rethrow_if_nested.

This can be used at API boundaries, for example to catch a library's internal exception type and rethrow it nested with a std::runtime_error, or vice versa.

Since

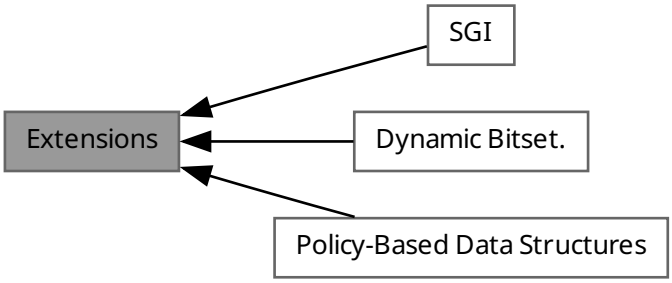
C++11

References forward().

uncaught_exception()

```
bool std::uncaught_exception ()  [noexcept]
```

[18.6.4]/1: 'Returns true after completing evaluation of a throw-expression until either completing initialization of the exception-declaration in the matching handler or entering unexpected() due to the throw; or after entering terminate() for any reason other than an explicit call to terminate(). [Note: This includes stack unwinding [15.2]. end note]'



2: 'When uncaught_exception() is true, throwing an exception can result in a call of terminate() (15.5.1).

References uncaught_exception().

Referenced by std::basic_ostream< _CharT, _Traits >::sentry::~sentry(), and uncaught_exception().

3.6 Extensions

Collaboration diagram for Extensions:

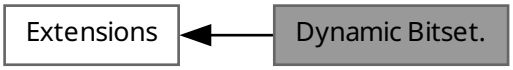
Topics

- Dynamic Bitset.
- Policy-Based Data Structures
- SGI

Namespaces

- namespace __gnu_cxx
- namespace std::tr2

Classes



- class __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >

3.6.1 Detailed Description

Components generally useful that are not part of any standard.

3.6.2 Dynamic Bitset.

Collaboration diagram for Dynamic Bitset.:

Classes

- struct std::tr2::__dynamic_bitset_base< _WordT, _Alloc >
- class std::tr2::dynamic_bitset< _WordT, _Alloc >

Functions

- template<typename _CharT, typename _Traits, typename _Alloc1>
  void **std::tr2::dynamic_bitset< _WordT, _Alloc >::_M_copy_to_string** (std::basic_string< _CharT, _Traits, ↩ _Alloc1 > &__str, _CharT __zero=_CharT('0'), _CharT __one=_CharT('1')) const
- template<typename _CharT, typename _Traits, typename _WordT, typename _Alloc>
  std::basic_ostream< _CharT, _Traits > & std::tr2::operator<< (std::basic_ostream< _CharT, _Traits > &__os, const dynamic_bitset< _WordT, _Alloc > &__x)
- template<typename _CharT, typename _Traits, typename _WordT, typename _Alloc>
  std::basic_istream< _CharT, _Traits > & std::tr2::operator>> (std::basic_istream< _CharT, _Traits > &__↩ is, dynamic_bitset< _WordT, _Alloc > &__x)

- template<typename _WordT, typename _Alloc>
  bool std::tr2::operator!= (const dynamic_bitset< _WordT, _Alloc > &__lhs, const dynamic_bitset< _WordT, _Alloc > &__rhs)
- template<typename _WordT, typename _Alloc>
  bool std::tr2::operator<= (const dynamic_bitset< _WordT, _Alloc > &__lhs, const dynamic_bitset< _WordT, _↩ Alloc > &__rhs)
- template<typename _WordT, typename _Alloc>
  bool std::tr2::operator> (const dynamic_bitset< _WordT, _Alloc > &__lhs, const dynamic_bitset< _WordT, _Alloc > &__rhs)
- template<typename _WordT, typename _Alloc>
  bool std::tr2::operator>= (const dynamic_bitset< _WordT, _Alloc > &__lhs, const dynamic_bitset< _WordT, _↩ Alloc > &__rhs)

- template<typename _WordT, typename _Alloc>
  dynamic_bitset< _WordT, _Alloc > std::tr2::operator& (const dynamic_bitset< _WordT, _Alloc > &__x, const dynamic_bitset< _WordT, _Alloc > &__y)

- template<typename _WordT, typename _Alloc>
  dynamic_bitset< _WordT, _Alloc > std::tr2::operator| (const dynamic_bitset< _WordT, _Alloc > &__x, const dynamic_bitset< _WordT, _Alloc > &__y)
- template<typename _WordT, typename _Alloc>
  dynamic_bitset< _WordT, _Alloc > std::tr2::operator^ (const dynamic_bitset< _WordT, _Alloc > &__x, const dynamic_bitset< _WordT, _Alloc > &__y)
- template<typename _WordT, typename _Alloc>
  dynamic_bitset< _WordT, _Alloc > std::tr2::operator- (const dynamic_bitset< _WordT, _Alloc > &__x, const dynamic_bitset< _WordT, _Alloc > &__y)

3.6.2.1 Detailed Description

3.6.2.2 Function Documentation

operator"!=()

```
template<typename _WordT, typename _Alloc>
bool std::tr2::operator!= (
            const dynamic_bitset< _WordT, _Alloc > & __lhs,
            const dynamic_bitset< _WordT, _Alloc > & __rhs)  [inline]
```

These comparisons for equality/inequality are, well, *bitwise*.

operator&()

```
template<typename _WordT, typename _Alloc>
dynamic_bitset< _WordT, _Alloc > std::tr2::operator& (
            const dynamic_bitset< _WordT, _Alloc > & __x,
            const dynamic_bitset< _WordT, _Alloc > & __y)  [inline]
```

Global bitwise operations on bitsets.

Parameters

_↩ _x	A bitset.
_↩ _y	A bitset of the same size as __x.

Returns

A new bitset.

These should be self-explanatory.

operator-()

```
template<typename _WordT, typename _Alloc>
dynamic_bitset< _WordT, _Alloc > std::tr2::operator- (
            const dynamic_bitset< _WordT, _Alloc > & __x,
            const dynamic_bitset< _WordT, _Alloc > & __y)  [inline]
```

Global bitwise operations on bitsets.

Parameters

_↩ _x	A bitset.
_↩ _y	A bitset of the same size as __x.

Returns

A new bitset.

These should be self-explanatory.

operator<<()

```
template<typename _CharT, typename _Traits, typename _WordT, typename _Alloc>
std::basic_ostream< _CharT, _Traits > & std::tr2::operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const dynamic_bitset< _WordT, _Alloc > & __x)  [inline]
```

Stream output operator for dynamic_bitset.

operator<=()

```
template<typename _WordT, typename _Alloc>
bool std::tr2::operator<= (
            const dynamic_bitset< _WordT, _Alloc > & __lhs,
            const dynamic_bitset< _WordT, _Alloc > & __rhs)  [inline]
```

These comparisons for equality/inequality are, well, *bitwise*.

operator>()

```
template<typename _WordT, typename _Alloc>
bool std::tr2::operator> (
            const dynamic_bitset< _WordT, _Alloc > & __lhs,
            const dynamic_bitset< _WordT, _Alloc > & __rhs)  [inline]
```

These comparisons for equality/inequality are, well, *bitwise*.

operator>=()

```
template<typename _WordT, typename _Alloc>
bool std::tr2::operator>= (
            const dynamic_bitset< _WordT, _Alloc > & __lhs,
            const dynamic_bitset< _WordT, _Alloc > & __rhs)  [inline]
```

These comparisons for equality/inequality are, well, *bitwise*.

operator>>()

```
template<typename _CharT, typename _Traits, typename _WordT, typename _Alloc>
std::basic_istream< _CharT, _Traits > & std::tr2::operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            dynamic_bitset< _WordT, _Alloc > & __x)
```

Stream input operator for dynamic_bitset.

Input will skip whitespace and only accept '0' and '1' characters. The dynamic_bitset will grow as necessary to hold the string of bits.

References std::basic_string< _CharT, _Traits, _Alloc >::empty(), std::basic_string< _CharT, _Traits, _Alloc >::push_back(), std::basic_ios< _CharT, _Traits >::rdbuf(), std::basic_string< _CharT, _Traits, _Alloc >::reserve(), std::tr2::dynamic_bitset< _WordT, _Al std::basic_ios< _CharT, _Traits >::setstate(), std::basic_string< _CharT, _Traits, _Alloc >::size(), std::tr2::dynamic_bitset< _WordT, _All and std::basic_ios< _CharT, _Traits >::widen().

operator^()

```
template<typename _WordT, typename _Alloc>
dynamic_bitset< _WordT, _Alloc > std::tr2::operator^ (
            const dynamic_bitset< _WordT, _Alloc > & __x,
            const dynamic_bitset< _WordT, _Alloc > & __y)  [inline]
```

Global bitwise operations on bitsets.

Parameters

_↩ _x	A bitset.
_↩ _y	A bitset of the same size as __x.

Returns

A new bitset.

These should be self-explanatory.

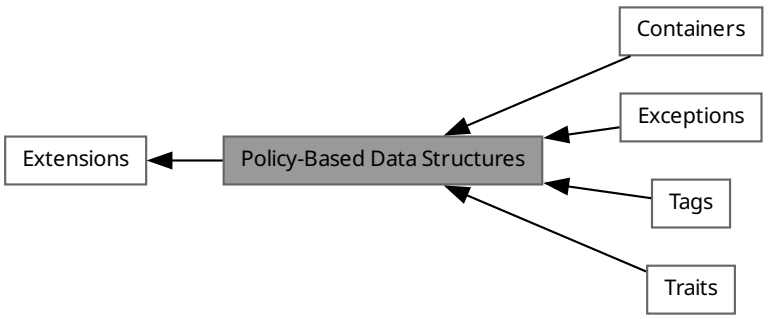
operator"" | ()

```
template<typename _WordT, typename _Alloc>
dynamic_bitset< _WordT, _Alloc > std::tr2::operator| (
            const dynamic_bitset< _WordT, _Alloc > & __x,
            const dynamic_bitset< _WordT, _Alloc > & __y)  [inline]
```

Global bitwise operations on bitsets.

Parameters

_↩ _x	A bitset.
_↩ _y	A bitset of the same size as __x.



Returns

A new bitset.

These should be self-explanatory.

3.6.3 Policy-Based Data Structures

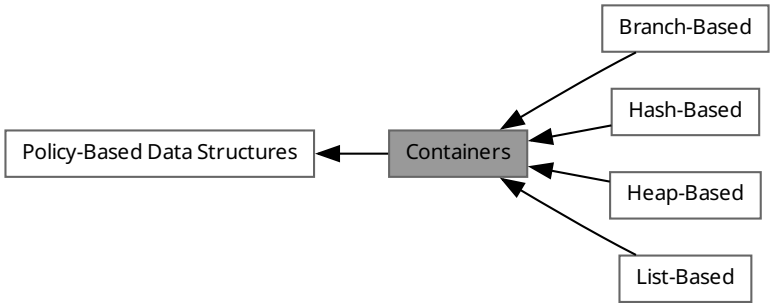
Collaboration diagram for Policy-Based Data Structures:

Topics

- Containers
- Exceptions
- Tags
- Traits

Classes

- struct __gnu_pbds::detail::container_base_dispatch< _VTp, Cmp_Fn, _Alloc, pairing_heap_tag, null_type >



3.6.3.1 Detailed Description

This is a library of policy-based elementary data structures: associative containers and priority queues. It is designed for high-performance, flexibility, semantic safety, and conformance to the corresponding containers in std (except for some points where it differs by design).

For details, see: http://gcc.gnu.org/onlinedocs/libstdc++/ext/pb_ds/index.html

3.6.3.2 Containers

Collaboration diagram for Containers:

Topics

- Branch-Based
- Hash-Based
- Heap-Based
- List-Based

3.6.3.2.1 Detailed Description

3.6.3.2.2 Branch-Based

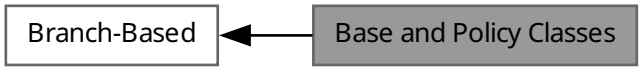
Collaboration diagram for Branch-Based:

Topics

- Base and Policy Classes

Classes

- class __gnu_pbds::basic_branch< Key, Mapped, Tag, Node_Update, Policy_Tl, _Alloc >
- class __gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >
- class __gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >



Macros

- #define **PB_DS_BRANCH_BASE**

3.6.4.1 Detailed Description

Because libstdc++ based its implementation of the STL subsections of the library on the SGI 3.3 implementation, we inherited their extensions as well.

They are additionally documented in the `online documentation`, a copy of which is also shipped with the library source code (in .../docs/html/documentation.html). You can also read the documentation `on SGI's site`, which is still running even though the code is not maintained.

NB that the following notes are pulled from various comments all over the place, so they may seem stilted.
The `identity_element` functions are not part of the C++ standard; SGI provided them as an extension. Its argument is an operation, and its return value is the identity element for that operation. It is overloaded for addition and multiplication, and you can overload it for your own nefarious operations.
As an extension to the binders, SGI provided composition functors and wrapper functions to aid in their creation. The `unary_compose` functor is constructed from two functions/functors, `f` and `g`. Calling `operator()` with a single argument `x` returns `f(g(x))`. The function `compose1` takes the two functions and constructs a `unary_compose` variable for you.
`binary_compose` is constructed from three functors, `f`, `g1`, and `g2`. Its `operator()` returns `f(g1(x),g2(x))`. The function compose2 takes f, g1, and g2, and constructs the `binary_compose` instance for you. For example, if `f` returns an int, then

```
int answer = (compose2(f,g1,g2))(x);
```

is equivalent to

```
int temp1 = g1(x);
int temp2 = g2(x);
int answer = f(temp1,temp2);
```

But the first form is more compact, and can be passed around as a functor to other algorithms.
As an extension, SGI provided a functor called `identity`. When a functor is required but no operations are desired, this can be used as a pass-through. Its `operator()` returns its argument unchanged.
`select1st` and `select2nd` are extensions provided by SGI. Their `operator()s` take a `std::pair` as an argument, and return either the first member or the second member, respectively. They can be used (especially with the composition functors) to *strip* data from a sequence before performing the remainder of an algorithm.
The `operator()` of the `project1st` functor takes two arbitrary arguments and returns the first one, while `project2nd` returns the second one. They are extensions provided by SGI.
These three functors are each constructed from a single arbitrary variable/value. Later, their `operator()s` completely ignore any arguments passed, and return the stored value.

- `constant_void_fun's` `operator()` takes no arguments
- `constant_unary_fun's` `operator()` takes one argument (ignored)
- `constant_binary_fun's` `operator()` takes two arguments (ignored)

The helper creator functions `constant0`, `constant1`, and `constant2` each take a *result* argument and construct variables of the appropriate functor type.

3.6.4.2 Function Documentation

__median() [1/2]

```
template<typename _Tp>
const _Tp & __gnu_cxx::__median (
             const _Tp & __a,
             const _Tp & __b,
             const _Tp & __c)
```

Find the median of three values.

Parameters

_↩ _*a*	A value.
_↩ _*b*	A value.
_↩ _*c*	A value.

Returns

One of `a`, `b` or `c`.

If `{l`,m,n} is some convolution of `{a`,b,c} such that `l<=m<=n` then the value returned will be `m`. This is an SGI extension.

__median() [2/2]

```
template<typename _Tp, typename _Compare>
const _Tp & __gnu_cxx::__median (
             const _Tp & __a,
             const _Tp & __b,
```

```
            const _Tp & __c,
            _Compare __comp)
```

Find the median of three values using a predicate for comparison.

Parameters

__a	A value.
__b	A value.
__c	A value.
__comp	A binary predicate.

Returns

One of `a`, `b` or `c`.

If `{l,m,n}` is some convolution of `{a,b,c}` such that `comp(l,m)` and `comp(m,n)` are both true then the value returned will be `m`. This is an SGI extension.

_Find_first()

```
template<size_t _Nb>
size_t std::bitset< _Nb >::_Find_first () const  [inline], [constexpr], [noexcept]
```

Finds the index of the first "on" bit.

Returns

The index of the first bit set, or size() if not found.

See also

_Find_next

_Find_next()

```
template<size_t _Nb>
size_t std::bitset< _Nb >::_Find_next (
            size_t __prev) const  [inline], [constexpr], [noexcept]
```

Finds the index of the next "on" bit after prev.

Returns

The index of the next bit set, or size() if not found.

Parameters

__prev	Where to start searching.

See also

_Find_first

_Unchecked_flip()

```
template<size_t _Nb>
bitset< _Nb > & std::bitset< _Nb >::_Unchecked_flip (
            size_t __pos)  [inline], [constexpr], [noexcept]
```

These versions of single-bit set, reset, flip, and test are extensions from the SGI version. They do no range checking. Referenced by flip().

_Unchecked_reset()

```
template<size_t _Nb>
bitset< _Nb > & std::bitset< _Nb >::_Unchecked_reset (
            size_t __pos)  [inline], [constexpr], [noexcept]
```

These versions of single-bit set, reset, flip, and test are extensions from the SGI version. They do no range checking. Referenced by reset().

_Unchecked_set() [1/2]

```
template<size_t _Nb>
bitset< _Nb > & std::bitset< _Nb >::_Unchecked_set (
            size_t __pos)  [inline], [constexpr], [noexcept]
```

These versions of single-bit set, reset, flip, and test are extensions from the SGI version. They do no range checking. Referenced by set().

_Unchecked_set() [2/2]

```
template<size_t _Nb>
bitset< _Nb > & std::bitset< _Nb >::_Unchecked_set (
            size_t __pos,
            int __val)  [inline], [constexpr], [noexcept]
```

These versions of single-bit set, reset, flip, and test are extensions from the SGI version. They do no range checking.

_Unchecked_test()

```
template<size_t _Nb>
bool std::bitset< _Nb >::_Unchecked_test (
            size_t __pos) const  [inline], [constexpr], [noexcept]
```

These versions of single-bit set, reset, flip, and test are extensions from the SGI version. They do no range checking. Referenced by operator[ ](), and test().

compose1()

```
template<class _Operation1, class _Operation2>
unary_compose< _Operation1, _Operation2 > __gnu_cxx::compose1 (
            const _Operation1 & __fn1,
            const _Operation2 & __fn2)  [inline]
```

An SGI extension .

compose2()

```
template<class _Operation1, class _Operation2, class _Operation3>
binary_compose< _Operation1, _Operation2, _Operation3 > __gnu_cxx::compose2 (
            const _Operation1 & __fn1,
            const _Operation2 & __fn2,
            const _Operation3 & __fn3)  [inline]
```

An SGI extension .

constant0()

```
template<class _Result>
constant_void_fun< _Result > __gnu_cxx::constant0 (
            const _Result & __val)  [inline]
```

An SGI extension .

constant1()

```
template<class _Result>
constant_unary_fun< _Result, _Result > __gnu_cxx::constant1 (
            const _Result & __val)  [inline]
```

An SGI extension .

constant2()

```
template<class _Result>
constant_binary_fun< _Result, _Result, _Result > __gnu_cxx::constant2 (
            const _Result & __val)  [inline]
```

An SGI extension .

copy_n()

```
template<typename _InputIterator, typename _Size, typename _OutputIterator>
std::pair< _InputIterator, _OutputIterator > __gnu_cxx::copy_n (
            _InputIterator __first,
            _Size __count,
            _OutputIterator __result)  [inline]
```

Copies the range [first,first+count) into [result,result+count).

Parameters

__first	An input iterator.
__count	The number of elements to copy.
__result	An output iterator.

Returns

A std::pair composed of first+count and result+count.

This is an SGI extension. This inline function will boil down to a call to `memmove` whenever possible. Failing that, if random access iterators are passed, then the loop count will be known (and therefore a candidate for compiler optimizations such as unrolling).

distance()

```
template<typename _InputIterator, typename _Distance>
void __gnu_cxx::distance (
            _InputIterator __first,
            _InputIterator __last,
            _Distance & __n)  [inline]
```

This is an SGI extension.

Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

References distance().
Referenced by __gnu_cxx::temporary_buffer< _ForwardIterator, _Tp >::temporary_buffer(), and distance().

identity_element() [1/2]

```
template<class _Tp>
_Tp __gnu_cxx::identity_element (
            std::multiplies< _Tp > )  [inline]
```

An SGI extension .

identity_element() [2/2]

```
template<class _Tp>
_Tp __gnu_cxx::identity_element (
            std::plus< _Tp > )  [inline]
```

An SGI extension .

lexicographical_compare_3way()

```
template<typename _InputIterator1, typename _InputIterator2>
int __gnu_cxx::lexicographical_compare_3way (
            _InputIterator1 __first1,
            _InputIterator1 __last1,
            _InputIterator2 __first2,
            _InputIterator2 __last2)
```

memcmp on steroids.

Parameters

__first1	An input iterator.
__last1	An input iterator.
__first2	An input iterator.
__last2	An input iterator.

Returns

An int, as with memcmp.

The return value will be less than zero if the first range is *lexigraphically less than* the second, greater than zero if the second range is *lexigraphically less than* the first, and zero otherwise. This is an SGI extension.

power() [1/2]

```
template<typename _Tp, typename _Integer>
_Tp __gnu_cxx::power (
            _Tp __x,
            _Integer __n)  [inline]
```

This is an SGI extension.

Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/↩ documentation_style.html

power() [2/2]

```
template<typename _Tp, typename _Integer, typename _MonoidOperation>
_Tp __gnu_cxx::power (
            _Tp __x,
            _Integer __n,
            _MonoidOperation __monoid_op)  [inline]
```

This is an SGI extension.

Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/↩ documentation_style.html

random_sample() [1/2]

```
template<typename _InputIterator, typename _RandomAccessIterator>
_RandomAccessIterator __gnu_cxx::random_sample (
            _InputIterator __first,
            _InputIterator __last,
            _RandomAccessIterator __out_first,
            _RandomAccessIterator __out_last)  [inline]
```

This is an SGI extension.

Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/↩ documentation_style.html

random_sample() [2/2]

```
template<typename _InputIterator, typename _RandomAccessIterator, typename _RandomNumberGenerator>
_RandomAccessIterator __gnu_cxx::random_sample (
            _InputIterator __first,
            _InputIterator __last,
            _RandomAccessIterator __out_first,
            _RandomAccessIterator __out_last,
            _RandomNumberGenerator & __rand)  [inline]
```

This is an SGI extension.

Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/↩ documentation_style.html

random_sample_n() [1/2]

```
template<typename _ForwardIterator, typename _OutputIterator, typename _Distance>
_OutputIterator __gnu_cxx::random_sample_n (
            _ForwardIterator __first,
            _ForwardIterator __last,
            _OutputIterator __out,
            const _Distance __n)
```

This is an SGI extension.

Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/↩ documentation_style.html

References std::distance(), std::min(), and random_sample_n().
Referenced by random_sample_n().

random_sample_n() [2/2]

```
template<typename _ForwardIterator, typename _OutputIterator, typename _Distance, typename _↩
RandomNumberGenerator>
_OutputIterator __gnu_cxx::random_sample_n (
            _ForwardIterator __first,
            _ForwardIterator __last,
            _OutputIterator __out,
            const _Distance __n,
            _RandomNumberGenerator & __rand)
```

This is an SGI extension.

Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/↩ documentation_style.html

References std::distance(), and std::min().

uninitialized_copy_n()

```
template<typename _InputIter, typename _Size, typename _ForwardIter>
std::pair< _InputIter, _ForwardIter > __gnu_cxx::uninitialized_copy_n (
            _InputIter __first,
            _Size __count,
            _ForwardIter __result)  [inline]
```

Copies the range [first,last) into result.

Parameters

__first	An input iterator.
__count	Length
__result	An output iterator.

Returns

__result + (__first + __count)

Like copy(), but does not require an initialized output range.

3.7 Filesystem

Files

- file filesystem

3.7.1 Detailed Description

3.7.2 Typedef Documentation

file_time_type

```
using std::filesystem::file_time_type
```
The type used for file timestamps.

3.7.3 Enumeration Type Documentation

copy_options

```
enum class std::filesystem::copy_options : unsigned short [strong]
```
Bitmask type controlling effects of `filesystem::copy`.

directory_options

```
enum class std::filesystem::directory_options : unsigned char [strong]
```
Bitmask type controlling directory iteration.

file_type

```
enum class std::filesystem::file_type : signed char [strong]
```
Enumerated type representing the type of a file.

perm_options

```
enum class std::filesystem::perm_options : unsigned [strong]
```
Bitmask type controlling changes to permissions.

perms

```
enum class std::filesystem::perms : unsigned [strong]
```
Bitmask type representing file access permissions.

3.7.4 Function Documentation

begin() [1/2]

```
directory_iterator begin (
            directory_iterator __iter) [related]
```
Enable range-based `for` using directory_iterator.

Since

C++17

e.g. `for (auto& entry : std::filesystem::directory_iterator(".")) ...`

begin() [2/2]

```
recursive_directory_iterator begin (
            recursive_directory_iterator __iter) [related]
```
Enable range-based `for` using recursive_directory_iterator.

Since

C++17

e.g. `for (auto& entry : recursive_directory_iterator(".")) ...`

end() [1/2]

```
directory_iterator end (
            directory_iterator )  [related]
```

Return a past-the-end directory_iterator.

end() [2/2]

```
recursive_directory_iterator end (
            recursive_directory_iterator )  [related]
```

Return a past-the-end recursive_directory_iterator.

u8path() [1/2]

```
template<typename _InputIterator, typename _Require = __detail::_Path2<_InputIterator>, typename
_CharT = __detail::__value_type_is_char_or_char8_t<_InputIterator>>
path u8path (
            _InputIterator __first,
            _InputIterator __last)  [related]
```

Create a path from a UTF-8-encoded sequence of char

Since

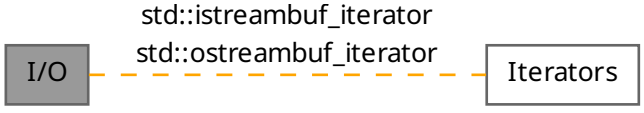
C++17

References u8path().
Referenced by u8path(), and u8path().

u8path() [2/2]

```
template<typename _Source, typename _Require = __detail::_Path<_Source>, typename _CharT = __↩
detail::__value_type_is_char_or_char8_t<_Source>>
path u8path (
            const _Source & __source)  [related]
```

Create a path from a UTF-8-encoded sequence of char



Since

C++17

References u8path().

3.8.1 Detailed Description

Nearly all of the I/O classes are parameterized on the type of characters they read and write. (The major exception is `ios_base` at the top of the hierarchy.) This is a change from pre-Standard streams, which were not templates.
For ease of use and compatibility, all of the `basic_*` I/O-related classes are given typedef names for both of the builtin character widths (wide and narrow). The typedefs are the same as the pre-Standard names, for example:

```
typedef basic_ifstream<char>  ifstream;
```

Because properly forward-declaring these classes can be difficult, you should not do it yourself. Instead, include the `<iosfwd>` header, which contains only declarations of all the I/O classes as well as the typedefs. Trying to forward-declare the typedefs themselves (e.g., `class ostream;`) is not valid ISO C++.
For more specific declarations, see https://gcc.gnu.org/onlinedocs/libstdc++/manual/io.↩html#std.io.objects

3.8.2 Typedef Documentation

filebuf

`typedef basic_filebuf<char> std::filebuf`
Class for `char` file buffers.

fstream

`typedef basic_fstream<char> std::fstream`
Class for `char` mixed input and output file streams.

ifstream

`typedef basic_ifstream<char> std::ifstream`
Class for `char` input file streams.

ios

`typedef basic_ios<char> std::ios`
Base class for `char` streams.

iostream

`typedef basic_iostream<char> std::iostream`
Base class for `char` mixed input and output streams.

istream

`typedef basic_istream<char> std::istream`
Base class for `char` input streams.

istringstream

`typedef basic_istringstream<char> std::istringstream`
Class for `char` input memory streams.

ofstream

`typedef basic_ofstream<char> std::ofstream`
Class for `char` output file streams.

ostream

```
typedef basic_ostream<char> std::ostream
```
Base class for `char` output streams.

ostringstream

```
typedef basic_ostringstream<char> std::ostringstream
```
Class for `char` output memory streams.

streambuf

```
typedef basic_streambuf<char> std::streambuf
```
Base class for `char` buffers.

stringbuf

```
typedef basic_stringbuf<char> std::stringbuf
```
Class for `char` memory buffers.

stringstream

```
typedef basic_stringstream<char> std::stringstream
```
Class for `char` mixed input and output memory streams.

wfilebuf

```
typedef basic_filebuf<wchar_t> std::wfilebuf
```
Class for `wchar_t` file buffers.

wfstream

```
typedef basic_fstream<wchar_t> std::wfstream
```
Class for `wchar_t` mixed input and output file streams.

wifstream

```
typedef basic_ifstream<wchar_t> std::wifstream
```
Class for `wchar_t` input file streams.

wios

```
typedef basic_ios<wchar_t> std::wios
```
Base class for `wchar_t` streams.

wiostream

```
typedef basic_iostream<wchar_t> std::wiostream
```
Base class for `wchar_t` mixed input and output streams.

wistream

```
typedef basic_istream<wchar_t> std::wistream
```
Base class for `wchar_t` input streams.

wistringstream

typedef basic_istringstream<wchar_t> std::wistringstream
Class for wchar_t input memory streams.

wofstream

typedef basic_ofstream<wchar_t> std::wofstream
Class for wchar_t output file streams.

wostream

typedef basic_ostream<wchar_t> std::wostream
Base class for wchar_t output streams.

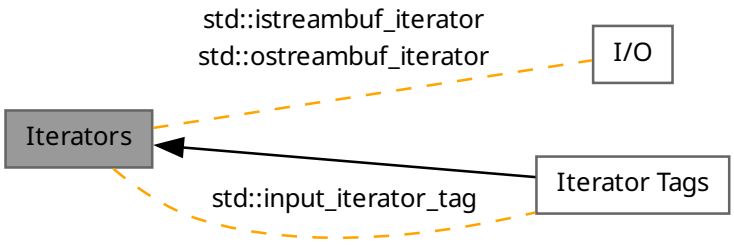
wostringstream

typedef basic_ostringstream<wchar_t> std::wostringstream
Class for wchar_t output memory streams.

wstreambuf

typedef basic_streambuf<wchar_t> std::wstreambuf
Base class for wchar_t buffers.

wstringbuf



typedef basic_stringbuf<wchar_t> std::wstringbuf
Class for wchar_t memory buffers.

wstringstream

typedef basic_stringstream<wchar_t> std::wstringstream
Class for wchar_t mixed input and output memory streams.

3.9 Iterators

3.9.1 Detailed Description

Abstractions for uniform iterating through various underlying types.

3.9.2 Function Documentation

back_inserter()

```
template<typename _Container>
back_insert_iterator< _Container > std::back_inserter (
            _Container & __x)  [inline], [nodiscard], [constexpr]
```

Parameters

_↩ _x	A container of arbitrary type.

Returns

An instance of back_insert_iterator working on __x.

This wrapper function helps in creating back_insert_iterator instances. Typing the name of the iterator requires knowing the precise full type of the container, which can be tedious and impedes generic programming. Using this function lets you take advantage of automatic template parameter deduction, making the compiler match the correct types for you.
Referenced by std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::format(), std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::format(), regex_replace(), regex_replace(), regex_replace(), and regex_replace().

front_inserter()

```
template<typename _Container>
front_insert_iterator< _Container > std::front_inserter (
            _Container & __x)  [inline], [nodiscard], [constexpr]
```

Parameters

_↩ _x	A container of arbitrary type.

Returns

An instance of front_insert_iterator working on `x`.

This wrapper function helps in creating front_insert_iterator instances. Typing the name of the iterator requires knowing the precise full type of the container, which can be tedious and impedes generic programming. Using this function lets you take advantage of automatic template parameter deduction, making the compiler match the correct types for you.

inserter()

```
template<typename _Container>
insert_iterator< _Container > std::inserter (
            _Container & __x,
            std::__detail::__range_iter_t< _Container > __i)  [nodiscard], [constexpr]
```

Parameters

_↩ _x	A container of arbitrary type.
_↩ _i	An iterator into the container.

Returns

An instance of insert_iterator working on `__x`.

This wrapper function helps in creating insert_iterator instances. Typing the name of the iterator requires knowing the precise full type of the container, which can be tedious and impedes generic programming. Using this function lets you take advantage of automatic template parameter deduction, making the compiler match the correct types for you.

make_reverse_iterator()

```
template<typename _Iterator>
reverse_iterator< _Iterator > std::make_reverse_iterator (
            _Iterator __i)  [inline], [constexpr]
```

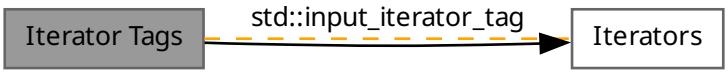
Generator function for reverse_iterator.

operator==()

```
template<typename _IteratorL, typename _IteratorR>
requires requires { { __x.base() == __y.base() } -> convertible_to<bool>; }
bool std::operator== (
            const reverse_iterator< _IteratorL > & __x,
            const reverse_iterator< _IteratorR > & __y)  [nodiscard], [constexpr]
```

Parameters

_↩ _x	A reverse_iterator.
_↩ _y	A reverse_iterator.



Returns

A simple bool.

Reverse iterators forward comparisons to their underlying base() iterators.
References std::reverse_iterator< _Iterator >::base().

3.9.3 Iterator Tags

Collaboration diagram for Iterator Tags:

Classes

- struct std::bidirectional_iterator_tag
- struct std::contiguous_iterator_tag
- struct std::forward_iterator_tag
- struct std::input_iterator_tag
- struct std::output_iterator_tag
- struct std::random_access_iterator_tag

3.9.3.1 Detailed Description

These are empty types, used to distinguish different iterators. The distinction is not made by what they contain, but simply by what they are. Different underlying algorithms can then be used based on the different operations supported by different iterator types.

3.10 Locales

Classes

- class std::codecvt< _InternT, _ExternT, _StateT >
- class std::ctype< _CharT >
- class std::ctype< char >
- class std::ctype< wchar_t >
- class std::locale::facet
- class std::locale::id
- class std::locale
- class std::messages< _CharT >
- struct std::messages_base
- class std::money_base
- class std::money_get< _CharT, _InIter >
- class std::money_put< _CharT, _OutIter >
- class std::moneypunct< _CharT, _Intl >
- class std::num_get< _CharT, _InIter >

- class std::num_put< _CharT, _OutIter >
- class std::numpunct< _CharT >
- class std::time_base
- class std::time_get< _CharT, _InIter >
- class std::time_put< _CharT, _OutIter >
- class std::wbuffer_convert< _Codecvt, _Elem, _Tr >
- class std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >

Functions

- template<typename _Facet>
  bool std::has_facet (const locale &__loc)
- template<typename _Facet>
  const _Facet & std::use_facet (const locale &__loc)

3.10.1 Detailed Description

Classes and functions for internationalization and localization.

3.10.2 Function Documentation

has_facet()

```
template<typename _Facet>
bool std::has_facet (
            const locale & __loc)  [inline], [nodiscard], [noexcept]
```

Test for the presence of a facet.
has_facet tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

Template Parameters

_Facet	The facet type to test the presence of.

Parameters

__loc	The locale to test.

Returns

true if __loc contains a facet of type _Facet, else false.

use_facet()

```
template<typename _Facet>
const _Facet & std::use_facet (
            const locale & __loc)  [inline], [nodiscard]
```

Return a facet.
use_facet looks for and returns a reference to a facet of type Facet where Facet is the template parameter. If has_facet(locale) is true, there is a suitable facet to return. It throws std::bad_cast if the locale doesn't contain a facet of type Facet.

Template Parameters

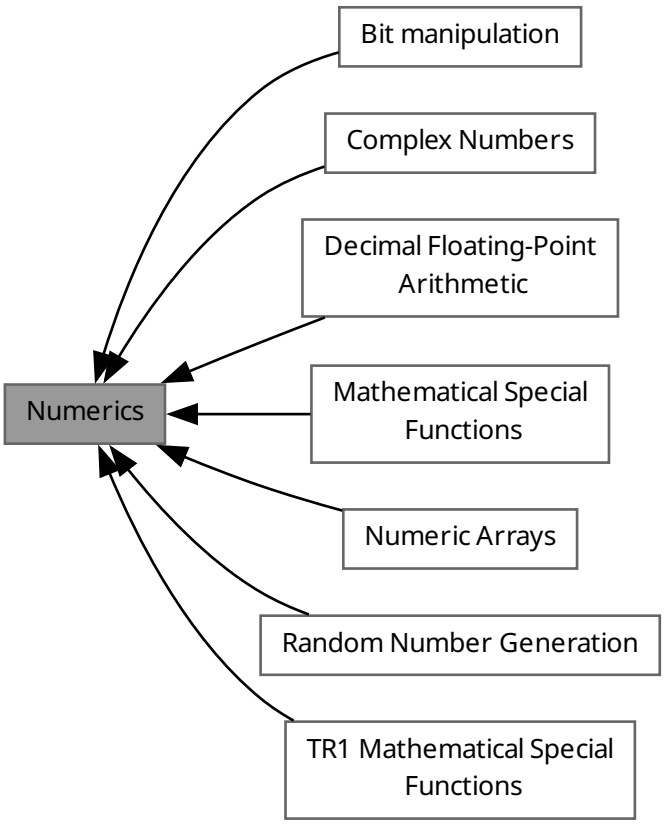
_Facet	The facet type to access.

Parameters

__loc	The locale to use.

Returns

Reference to facet of type Facet.



Exceptions

std::bad_cast	if `__loc` doesn't contain a facet of type _Facet.

3.11.3.1 Detailed Description

Classes and functions for complex numbers.

3.11.3.2 Function Documentation

abs()

```
template<typename _Tp>
_Tp std::abs (
            const complex< _Tp > & __z)  [inline]
```

Return magnitude of *z*.
Referenced by abs(), fabs(), std::tr1::fabs(), std::binomial_distribution< _IntType >::operator()(), and std::poisson_distribution< _IntType >

arg()

```
template<typename _Tp>
_Tp std::arg (
            const complex< _Tp > & __z)  [inline]
```

Return phase angle of *z*.
Referenced by abs().

conj()

```
template<typename _Tp>
complex< _Tp > std::conj (
            const complex< _Tp > & __z)  [inline], [constexpr]
```

Return complex conjugate of *z*.

cos()

```
template<typename _Tp>
complex< _Tp > std::cos (
            const complex< _Tp > & __z)  [inline]
```

Return complex cosine of *z*.
Referenced by polar().

cosh()

```
template<typename _Tp>
complex< _Tp > std::cosh (
            const complex< _Tp > & __z)  [inline]
```

Return complex hyperbolic cosine of *z*.

exp()

```
template<typename _Tp>
complex< _Tp > std::exp (
            const complex< _Tp > & __z)  [inline]
```

Return complex base e exponential of *z*.
Referenced by pow().

fabs()

```
template<typename _Tp>
std::complex< _Tp > std::tr1::fabs (
            const std::complex< _Tp > & __z)  [inline]
```

fabs(__z) [8.1.8].
References std::abs().

log()

```
template<typename _Tp>
complex< _Tp > std::log (
            const complex< _Tp > & __z)  [inline]
```

Return complex natural logarithm of *z*.

Referenced by log10(), std::binomial_distribution< _IntType >::operator()(), std::gamma_distribution< _RealType >::operator()(), std::normal_distribution< _RealType >::operator()(), std::poisson_distribution< _IntType >::operator()(), operator<<(), operator<<(), operator<<(), operator<<(), pow(), and pow().

log10()

```
template<typename _Tp>
complex< _Tp > std::log10 (
            const complex< _Tp > & __z)  [inline]
```

Return complex base 10 logarithm of *z*.

References log().

norm()

```
template<typename _Tp>
_Tp constexpr std::norm (
            const complex< _Tp > & __z)  [inline], [constexpr]
```

Return *z* magnitude squared.

operator*() [1/3]

```
template<typename _Tp>
complex< _Tp > std::operator* (
            const _Tp & __x,
            const complex< _Tp > & __y)  [inline], [constexpr]
```

Return new complex value *x* times *y*.

operator*() [2/3]

```
template<typename _Tp>
complex< _Tp > std::operator* (
            const complex< _Tp > & __x,
            const _Tp & __y)  [inline], [constexpr]
```

Return new complex value *x* times *y*.

operator*() [3/3]

```
template<typename _Tp>
complex< _Tp > std::operator* (
            const complex< _Tp > & __x,
            const complex< _Tp > & __y)  [inline], [constexpr]
```

Return new complex value *x* times *y*.

operator+() [1/4]

```
template<typename _Tp>
complex< _Tp > std::operator+ (
            const _Tp & __x,
            const complex< _Tp > & __y)  [inline], [constexpr]
```

Return new complex value *x* plus *y*.

operator+() [2/4]

```
template<typename _Tp>
complex< _Tp > std::operator+ (
            const complex< _Tp > & __x)  [inline], [constexpr]
```

Return *x*.

operator+() [3/4]

```
template<typename _Tp>
complex< _Tp > std::operator+ (
            const complex< _Tp > & __x,
            const _Tp & __y)  [inline], [constexpr]
```

Return new complex value *x* plus *y*.

operator+() [4/4]

```
template<typename _Tp>
complex< _Tp > std::operator+ (
            const complex< _Tp > & __x,
            const complex< _Tp > & __y)  [inline], [constexpr]
```

Return new complex value *x* plus *y*.

operator-() [1/4]

```
template<typename _Tp>
complex< _Tp > std::operator- (
            const _Tp & __x,
            const complex< _Tp > & __y)  [inline], [constexpr]
```

Return new complex value *x* minus *y*.

operator-() [2/4]

```
template<typename _Tp>
complex< _Tp > std::operator- (
            const complex< _Tp > & __x)  [inline], [constexpr]
```

Return complex negation of *x*.

operator-() [3/4]

```
template<typename _Tp>
complex< _Tp > std::operator- (
            const complex< _Tp > & __x,
            const _Tp & __y)  [inline], [constexpr]
```

Return new complex value *x* minus *y*.

operator-() [4/4]

```
template<typename _Tp>
complex< _Tp > std::operator- (
            const complex< _Tp > & __x,
            const complex< _Tp > & __y)  [inline], [constexpr]
```

Return new complex value *x* minus *y*.

operator/() [1/3]

```
template<typename _Tp>
complex< _Tp > std::operator/ (
            const _Tp & __x,
            const complex< _Tp > & __y)  [inline], [constexpr]
```

Return new complex value *x* divided by *y*.

operator/() [2/3]

```
template<typename _Tp>
complex< _Tp > std::operator/ (
            const complex< _Tp > & __x,
            const _Tp & __y)  [inline], [constexpr]
```

Return new complex value *x* divided by *y*.

operator/() [3/3]

```
template<typename _Tp>
complex< _Tp > std::operator/ (
            const complex< _Tp > & __x,
            const complex< _Tp > & __y)  [inline], [constexpr]
```

Return new complex value *x* divided by *y*.

operator<<()

```
template<typename _Tp, typename _CharT, class _Traits>
basic_ostream< _CharT, _Traits > & std::operator<< (
            basic_ostream< _CharT, _Traits > & __os,
            const complex< _Tp > & __x)
```

Insertion operator for complex values.
References std::ios_base::failbit, std::basic_istream< _CharT, _Traits >::putback(), std::basic_ios< _CharT, _Traits >::setstate(), and std::basic_ios< _CharT, _Traits >::widen().

operator==() [1/2]

```
template<typename _Tp>
bool std::operator== (
            const complex< _Tp > & __x,
            const _Tp & __y)  [inline], [constexpr]
```

Return true if *x* is equal to *y*.

operator==() [2/2]

```
template<typename _Tp>
bool std::operator== (
            const complex< _Tp > & __x,
            const complex< _Tp > & __y)  [inline], [constexpr]
```

Return true if *x* is equal to *y*.

operator>>()

```
template<typename _Tp, typename _CharT, class _Traits>
basic_istream< _CharT, _Traits > & std::operator>> (
            basic_istream< _CharT, _Traits > & __is,
            complex< _Tp > & __x)
```

Extraction operator for complex values.

polar()

```
template<typename _Tp>
complex< _Tp > std::polar (
            const _Tp & __rho,
            const _Tp & __theta = _Tp(0))  [inline]
```

Return complex with magnitude *rho* and angle *theta*.
References cos(), and sin().
Referenced by pow(), and pow().

pow() [1/5]

```
template<typename _Tp>
complex< _Tp > std::pow (
            const _Tp & __x,
            const complex< _Tp > & __y)  [inline]
```

Return *x* to the *y'th* power.
References log(), polar(), and pow().

pow() [2/5]

```
template<typename _Tp>
complex< _Tp > std::pow (
            const complex< _Tp > & __x,
            const _Tp & __y)
```

Return *x* to the *y'th* power.
References exp(), log(), polar(), and pow().

pow() [3/5]

```
template<typename _Tp>
complex< _Tp > std::pow (
            const complex< _Tp > & __x,
            const complex< _Tp > & __y)  [inline]
```

Return *x* to the *y'th* power.

pow() [4/5]

```
template<typename _Tp>
complex< _Tp > std::pow (
            const complex< _Tp > & __z,
            int __n)  [inline]
```

Return *x* to the *y'th* power.
Referenced by std::gamma_distribution< _RealType >::operator()(), operator<<(), pow(), pow(), and std::tr1::pow().

pow() [5/5]

```
template<typename _Tp, typename _Up>
std::complex< typename __gnu_cxx::__promote_2< _Tp, _Up >::__type > std::tr1::pow (
            const std::complex< _Tp > & __x,
            const _Up & __y)  [inline]
```

Additional overloads [8.1.9].
References std::pow().

sin()

```
template<typename _Tp>
complex< _Tp > std::sin (
            const complex< _Tp > & __z)  [inline]
```

Return complex sine of *z*.
Referenced by polar().

sinh()

```
template<typename _Tp>
complex< _Tp > std::sinh (
            const complex< _Tp > & __z)  [inline]
```

Return complex hyperbolic sine of *z*.

sqrt()

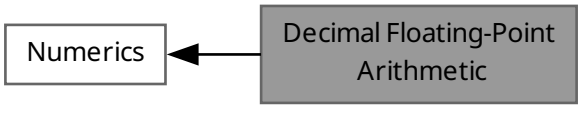
```
template<typename _Tp>
complex< _Tp > std::sqrt (
            const complex< _Tp > & __z)  [inline]
```

Return complex square root of *z*.
Referenced by std::normal_distribution< _RealType >::operator()(), and std::student_t_distribution< _RealType >::operator()().

tan()

```
template<typename _Tp>
complex< _Tp > std::tan (
            const complex< _Tp > & __z)  [inline]
```

Return complex tangent of *z*.
Referenced by operator<<().



tanh()

```
template<typename _Tp>
complex< _Tp > std::tanh (
            const complex< _Tp > & __z)  [inline]
```

Return complex hyperbolic tangent of *z*.

3.11.4 Decimal Floating-Point Arithmetic

3.11.5.1 Detailed Description

3.11.5.2 Mathematical Special Functions

A collection of advanced mathematical special functions, defined by ISO/IEC IS 29124 and then added to ISO C++ 2017.

3.11.5.2.1 Introduction and History

The first significant library upgrade on the road to C++2011, TR1, included a set of 23 mathematical functions that significantly extended the standard transcendental functions inherited from C and declared in <cmath>.
Although most components from TR1 were eventually adopted for C++11 these math functions were left behind out of concern for implementability. The math functions were published as a separate international standard IS 29124 - Extensions to the C++ Library to Support Mathematical Special Functions.
For C++17 these functions were incorporated into the main standard.

3.11.5.2.2 Contents

The following functions are implemented in namespace `std`:

- assoc_laguerre - Associated Laguerre functions
- assoc_legendre - Associated Legendre functions
- beta - Beta functions
- comp_ellint_1 - Complete elliptic functions of the first kind
- comp_ellint_2 - Complete elliptic functions of the second kind
- comp_ellint_3 - Complete elliptic functions of the third kind
- cyl_bessel_i - Regular modified cylindrical Bessel functions
- cyl_bessel_j - Cylindrical Bessel functions of the first kind

- cyl_bessel_k - Irregular modified cylindrical Bessel functions
- cyl_neumann - Cylindrical Neumann functions or Cylindrical Bessel functions of the second kind
- ellint_1 - Incomplete elliptic functions of the first kind
- ellint_2 - Incomplete elliptic functions of the second kind
- ellint_3 - Incomplete elliptic functions of the third kind
- expint - The exponential integral
- hermite - Hermite polynomials
- laguerre - Laguerre functions
- legendre - Legendre polynomials
- riemann_zeta - The Riemann zeta function
- sph_bessel - Spherical Bessel functions
- sph_legendre - Spherical Legendre functions
- sph_neumann - Spherical Neumann functions

The hypergeometric functions were stricken from the TR29124 and C++17 versions of this math library because of implementation concerns. However, since they were in the TR1 version and since they are popular we kept them as an extension in namespace `__gnu_cxx`:

- conf_hyperg - Confluent hypergeometric functions
- hyperg - Hypergeometric functions

3.11.5.2.3 Argument Promotion

The arguments suppled to the non-suffixed functions will be promoted according to the following rules:

1. If any argument intended to be floating point is given an integral value That integral value is promoted to double.
2. All floating point arguments are promoted up to the largest floating point precision among them.

3.11.5.2.4 NaN Arguments

If any of the floating point arguments supplied to these functions is invalid or NaN (std::numeric_limits<Tp>::quiet_NaN), the value NaN is returned.

3.11.5.2.5 Implementation

We strive to implement the underlying math with type generic algorithms to the greatest extent possible. In practice, the functions are thin wrappers that dispatch to function templates. Type dependence is controlled with std::numeric_limits and functions thereof.
We don't promote `float` to `double` or `double` to `long double` reflexively. The goal is for `float` functions to operate more quickly, at the cost of `float` accuracy and possibly a smaller domain of validity. Similaryly, `long double` should give you more dynamic range and slightly more pecision than `double` on many systems.

3.11.5.2.6 Testing

These functions have been tested against equivalent implementations from the Gnu Scientific Library, GSL and Boost and the ratio

$$\frac{|f - f_{test}|}{|f_{test}|}$$

is generally found to be within 10^{-15} for 64-bit double on linux-x86_64 systems over most of the ranges of validity.

Todo Provide accuracy comparisons on a per-function basis for a small number of targets.

3.11.5.2.7 General Bibliography

3.11.5.3 Function Documentation

airy_ai()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type __gnu_cxx::airy_ai (
            _Tp __x)  [inline]
```

Return the Airy function $Ai(x)$ of real argument x.

airy_aif()

```
float __gnu_cxx::airy_aif (
            float __x)  [inline]
```

Return the Airy function $Ai(x)$ of `float` argument x.

airy_ail()

```
long double __gnu_cxx::airy_ail (
            long double __x)  [inline]
```

Return the Airy function $Ai(x)$ of `long double` argument x.

airy_bi()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type __gnu_cxx::airy_bi (
            _Tp __x)  [inline]
```

Return the Airy function $Bi(x)$ of real argument x.

airy_bif()

```
float __gnu_cxx::airy_bif (
            float __x)  [inline]
```

Return the Airy function $Bi(x)$ of `float` argument x.

airy_bil()

```
long double __gnu_cxx::airy_bil (
            long double __x)  [inline]
```

Return the Airy function $Bi(x)$ of `long double` argument x.

assoc_laguerre()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::assoc_laguerre (
            unsigned int __n,
            unsigned int __m,
            _Tp __x)  [inline]
```

Return the associated Laguerre polynomial of nonnegative order `n`, nonnegative degree `m` and real argument `x`: $L_n^m(x)$.

The associated Laguerre function of real degree α, $L_n^\alpha(x)$, is defined by

$$L_n^\alpha(x) = \frac{(\alpha+1)_n}{n!}\,{}_1F_1(-n;\alpha+1;x)$$

where $(\alpha)_n$ is the Pochhammer symbol and ${}_1F_1(a;c;x)$ is the confluent hypergeometric function.

The associated Laguerre polynomial is defined for integral degree $\alpha = m$ by:

$$L_n^m(x) = (-1)^m \frac{d^m}{dx^m} L_{n+m}(x)$$

where the Laguerre polynomial is defined by:

$$L_n(x) = \frac{e^x}{n!}\frac{d^n}{dx^n}(x^n e^{-x})$$

and $x >= 0$.

See also

laguerre for details of the Laguerre function of degree `n`

Template Parameters

_Tp	The floating-point type of the argument `__x`.

Parameters

_n	The order of the Laguerre function, `__n >= 0`.
_m	The degree of the Laguerre function, `__m >= 0`.

_↩ _x	The argument of the Laguerre function, __x >= 0.

Exceptions

std::domain_error	if __x < 0.

assoc_laguerref()

```
float std::assoc_laguerref (
            unsigned int __n,
            unsigned int __m,
            float __x)  [inline]
```

Return the associated Laguerre polynomial of order n, degree m: $L_n^m(x)$ for float argument.

See also

assoc_laguerre for more details.

assoc_laguerrel()

```
long double std::assoc_laguerrel (
            unsigned int __n,
            unsigned int __m,
            long double __x)  [inline]
```

Return the associated Laguerre polynomial of order n, degree m: $L_n^m(x)$.

See also

assoc_laguerre for more details.

assoc_legendre()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::assoc_legendre (
            unsigned int __l,
            unsigned int __m,
            _Tp __x)  [inline]
```

Return the associated Legendre function of degree l and order m.
The associated Legendre function is derived from the Legendre function $P_l(x)$ by the Rodrigues formula:

$$P_l^m(x) = (1 - x^2)^{m/2} \frac{d^m}{dx^m} P_l(x)$$

See also

legendre for details of the Legendre function of degree `l`

Template Parameters

_Tp	The floating-point type of the argument `__x`.

Parameters

_↩ _l	The degree `__l >= 0`.
_↩ _m	The order `__m <= l`.
_↩ _x	The argument, `abs(__x) <= 1`.

Exceptions

std::domain_error	if `abs(__x) > 1`.

assoc_legendref()

```
float std::assoc_legendref (
            unsigned int __l,
            unsigned int __m,
            float __x)  [inline]
```

Return the associated Legendre function of degree `l` and order `m` for `float` argument.

See also

assoc_legendre for more details.

assoc_legendrel()

```
long double std::assoc_legendrel (
            unsigned int __l,
            unsigned int __m,
            long double __x)  [inline]
```

Return the associated Legendre function of degree `l` and order `m`.

See also

assoc_legendre for more details.

beta()

```
template<typename _Tpa, typename _Tpb>
__gnu_cxx::__promote_2< _Tpa, _Tpb >::__type std::beta (
            _Tpa __a,
            _Tpb __b)  [inline]
```

Return the beta function, $B(a, b)$, for real parameters a, b.
The beta function is defined by

$$B(a,b) = \int_0^1 t^{a-1}(1-t)^{b-1}dt = \frac{\Gamma(a)\Gamma(b)}{\Gamma(a+b)}$$

where $a > 0$ and $b > 0$

Template Parameters

_Tpa	The floating-point type of the parameter __a.
_Tpb	The floating-point type of the parameter __b.

Parameters

_a	The first argument of the beta function, __a > 0 .
_b	The second argument of the beta function, __b > 0 .

Exceptions

std::domain_error	if __a < 0 or __b < 0 .

betaf()

```
float std::betaf (
            float __a,
            float __b)  [inline]
```

Return the beta function, $B(a, b)$, for float parameters a, b.

See also

beta for more details.

betal()

```
long double std::betal (
            long double __a,
            long double __b)  [inline]
```

Return the beta function, $B(a, b)$, for long double parameters a, b.

See also

beta for more details.

comp_ellint_1()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::comp_ellint_1 (
            _Tp __k)  [inline]
```

Return the complete elliptic integral of the first kind $K(k)$ for real modulus k.
The complete elliptic integral of the first kind is defined as

$$K(k) = F(k, \pi/2) = \int_0^{\pi/2} \frac{d\theta}{\sqrt{1 - k^2 sin^2\theta}}$$

where $F(k, \phi)$ is the incomplete elliptic integral of the first kind and the modulus $|k| <= 1$.

See also

ellint_1 for details of the incomplete elliptic function of the first kind.

Template Parameters

_Tp	The floating-point type of the modulus __k.

Parameters

_↩ _k	The modulus, abs(__k) <= 1

Exceptions

std::domain_error	if abs(__k) > 1 .

comp_ellint_1f()

```
float std::comp_ellint_1f (
            float __k)  [inline]
```

Return the complete elliptic integral of the first kind $E(k)$ for float modulus k.

See also

comp_ellint_1 for details.

comp_ellint_1l()

```
long double std::comp_ellint_1l (
            long double __k)  [inline]
```

Return the complete elliptic integral of the first kind $E(k)$ for long double modulus k.

See also

comp_ellint_1 for details.

comp_ellint_2()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::comp_ellint_2 (
            _Tp __k)  [inline]
```

Return the complete elliptic integral of the second kind $E(k)$ for real modulus k.
The complete elliptic integral of the second kind is defined as

$$E(k) = E(k, \pi/2) = \int_0^{\pi/2} \sqrt{1 - k^2 sin^2\theta}$$

where $E(k, \phi)$ is the incomplete elliptic integral of the second kind and the modulus $|k| <= 1$.

See also

ellint_2 for details of the incomplete elliptic function of the second kind.

Template Parameters

_Tp	The floating-point type of the modulus __k.

Parameters

_↩ _k	The modulus, abs(__k) <= 1

Exceptions

std::domain_error	if abs(__k) > 1.

comp_ellint_2f()

```
float std::comp_ellint_2f (
            float __k)  [inline]
```

Return the complete elliptic integral of the second kind $E(k)$ for float modulus k.

See also

comp_ellint_2 for details.

comp_ellint_2l()

```
long double std::comp_ellint_2l (
            long double __k)  [inline]
```

Return the complete elliptic integral of the second kind $E(k)$ for long double modulus k.

See also

comp_ellint_2 for details.

comp_ellint_3()

```
template<typename _Tp, typename _Tpn>
__gnu_cxx::__promote_2< _Tp, _Tpn >::__type std::comp_ellint_3 (
            _Tp __k,
            _Tpn __nu)  [inline]
```

Return the complete elliptic integral of the third kind $\Pi(k,\nu) = \Pi(k,\nu,\pi/2)$ for real modulus k.
The complete elliptic integral of the third kind is defined as

$$\Pi(k,\nu) = \Pi(k,\nu,\pi/2) = \int_0^{\pi/2} \frac{d\theta}{(1-\nu\sin^2\theta)\sqrt{1-k^2\sin^2\theta}}$$

where $\Pi(k,\nu,\phi)$ is the incomplete elliptic integral of the second kind and the modulus $|k| <= 1$.

See also

ellint_3 for details of the incomplete elliptic function of the third kind.

Template Parameters

_Tp	The floating-point type of the modulus __k.
_Tpn	The floating-point type of the argument __nu.

Parameters

__k	The modulus, abs(__k) <= 1
__nu	The argument

Exceptions

std::domain_error	if abs(__k) > 1.

comp_ellint_3f()

```
float std::comp_ellint_3f (
            float __k,
            float __nu)  [inline]
```

Return the complete elliptic integral of the third kind $\Pi(k,\nu)$ for float modulus k.

See also

comp_ellint_3 for details.

comp_ellint_3l()

```
long double std::comp_ellint_3l (
            long double __k,
            long double __nu)  [inline]
```

Return the complete elliptic integral of the third kind $\Pi(k,\nu)$ for long double modulus k.

See also

comp_ellint_3 for details.

conf_hyperg()

```
template<typename _Tpa, typename _Tpc, typename _Tp>
__gnu_cxx::__promote_3< _Tpa, _Tpc, _Tp >::__type __gnu_cxx::conf_hyperg (
            _Tpa __a,
            _Tpc __c,
            _Tp __x)  [inline]
```

Return the confluent hypergeometric function ${}_1F_1(a;c;x)$ of real numeratorial parameter `a`, denominatorial parameter `c`, and argument `x`.
The confluent hypergeometric function is defined by

$$ {}_1F_1(a;c;x) = \sum_{n=0}^{\infty} \frac{(a)_n x^n}{(c)_n n!} $$

where the Pochhammer symbol is $(x)_k = (x)(x+1)...(x+k-1)$, $(x)_0 = 1$

Parameters

_↩ _a	The numeratorial parameter
_↩ _c	The denominatorial parameter
_↩ _x	The argument

conf_hypergf()

```
float __gnu_cxx::conf_hypergf (
            float __a,
            float __c,
            float __x)  [inline]
```

Return the confluent hypergeometric function ${}_1F_1(a;c;x)$ of `float` numeratorial parameter `a`, denominatorial parameter `c`, and argument `x`.

See also

conf_hyperg for details.

conf_hypergl()

```
long double __gnu_cxx::conf_hypergl (
            long double __a,
            long double __c,
            long double __x)  [inline]
```

Return the confluent hypergeometric function ${}_1F_1(a;c;x)$ of `long double` numeratorial parameter `a`, denominatorial parameter `c`, and argument `x`.

See also

conf_hyperg for details.

cyl_bessel_i()

```
template<typename _Tpnu, typename _Tp>
__gnu_cxx::__promote_2< _Tpnu, _Tp >::__type std::cyl_bessel_i (
            _Tpnu __nu,
            _Tp __x)  [inline]
```

Return the regular modified Bessel function $I_\nu(x)$ for real order ν and argument $x >= 0$.
The regular modified cylindrical Bessel function is:

$$I_\nu(x) = i^{-\nu} J_\nu(ix) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k!\Gamma(\nu+k+1)}$$

Template Parameters

_Tpnu	The floating-point type of the order __nu.
_Tp	The floating-point type of the argument __x.

Parameters

__nu	The order
__x	The argument, __x >= 0

Exceptions

std::domain_error	if __x < 0 .

cyl_bessel_if()

```
float std::cyl_bessel_if (
            float __nu,
            float __x)  [inline]
```

Return the regular modified Bessel function $I_\nu(x)$ for `float` order ν and argument $x >= 0$.

See also

cyl_bessel_i for setails.

cyl_bessel_il()

```
long double std::cyl_bessel_il (
            long double __nu,
            long double __x)  [inline]
```

Return the regular modified Bessel function $I_\nu(x)$ for `long double` order ν and argument $x >= 0$.

See also

cyl_bessel_i for setails.

cyl_bessel_j()

```
template<typename _Tpnu, typename _Tp>
__gnu_cxx::__promote_2< _Tpnu, _Tp >::__type std::cyl_bessel_j (
            _Tpnu __nu,
            _Tp __x)  [inline]
```

Return the Bessel function $J_\nu(x)$ of real order ν and argument $x >= 0$.
The cylindrical Bessel function is:

$$J_\nu(x) = \sum_{k=0}^{\infty} \frac{(-1)^k (x/2)^{\nu+2k}}{k!\Gamma(\nu+k+1)}$$

Template Parameters

_Tpnu	The floating-point type of the order __nu.
_Tp	The floating-point type of the argument __x.

Parameters

__nu	The order
__x	The argument, __x >= 0

Exceptions

std::domain_error	if __x < 0 .

cyl_bessel_jf()

```
float std::cyl_bessel_jf (
            float __nu,
            float __x)  [inline]
```

Return the Bessel function of the first kind $J_\nu(x)$ for `float` order ν and argument $x >= 0$.

See also

cyl_bessel_j for setails.

cyl_bessel_jl()

```
long double std::cyl_bessel_jl (
            long double __nu,
            long double __x)  [inline]
```

Return the Bessel function of the first kind $J_\nu(x)$ for `long double` order ν and argument $x >= 0$.

See also

cyl_bessel_j for setails.

cyl_bessel_k()

```
template<typename _Tpnu, typename _Tp>
__gnu_cxx::__promote_2< _Tpnu, _Tp >::__type std::cyl_bessel_k (
            _Tpnu __nu,
            _Tp __x)  [inline]
```

Return the irregular modified Bessel function $K_\nu(x)$ of real order ν and argument x.
The irregular modified Bessel function is defined by:

$$K_\nu(x) = \frac{\pi}{2}\frac{I_{-\nu}(x) - I_\nu(x)}{\sin \nu\pi}$$

where for integral $\nu = n$ a limit is taken: $lim_{\nu \to n}$. For negative argument we have simply:

$$K_{-\nu}(x) = K_\nu(x)$$

Template Parameters

_Tpnu	The floating-point type of the order __nu.
_Tp	The floating-point type of the argument __x.

Parameters

__nu	The order
__x	The argument, __x >= 0

Exceptions

std::domain_error	if __x < 0 .

cyl_bessel_kf()

```
float std::cyl_bessel_kf (
            float __nu,
            float __x)  [inline]
```

Return the irregular modified Bessel function $K_\nu(x)$ for `float` order ν and argument $x >= 0$.

See also

cyl_bessel_k for setails.

cyl_bessel_kl()

```
long double std::cyl_bessel_kl (
            long double __nu,
            long double __x)  [inline]
```

Return the irregular modified Bessel function $K_\nu(x)$ for `long double` order ν and argument $x >= 0$.

See also

cyl_bessel_k for setails.

cyl_neumann()

```
template<typename _Tpnu, typename _Tp>
__gnu_cxx::__promote_2< _Tpnu, _Tp >::__type std::cyl_neumann (
            _Tpnu __nu,
            _Tp __x)  [inline]
```

Return the Neumann function $N_\nu(x)$ of real order ν and argument $x >= 0$.
The Neumann function is defined by:

$$N_\nu(x) = \frac{J_\nu(x)\cos\nu\pi - J_{-\nu}(x)}{\sin\nu\pi}$$

where $x >= 0$ and for integral order $\nu = n$ a limit is taken: $lim_{\nu\to n}$.

Template Parameters

_Tpnu	The floating-point type of the order __nu.
_Tp	The floating-point type of the argument __x.

Parameters

__nu	The order
__x	The argument, __x >= 0

Exceptions

std::domain_error	if __x < 0 .

cyl_neumannf()

```
float std::cyl_neumannf (
            float __nu,
            float __x)  [inline]
```

Return the Neumann function $N_\nu(x)$ of `float` order ν and argument x.

See also

cyl_neumann for setails.

cyl_neumannl()

```
long double std::cyl_neumannl (
            long double __nu,
            long double __x)  [inline]
```

Return the Neumann function $N_\nu(x)$ of `long double` order ν and argument x.

See also

cyl_neumann for setails.

ellint_1()

```
template<typename _Tp, typename _Tpp>
__gnu_cxx::__promote_2< _Tp, _Tpp >::__type std::ellint_1 (
            _Tp __k,
            _Tpp __phi)  [inline]
```

Return the incomplete elliptic integral of the first kind $F(k,\phi)$ for `real` modulus k and angle ϕ.
The incomplete elliptic integral of the first kind is defined as

$$F(k,\phi) = \int_0^\phi \frac{d\theta}{\sqrt{1 - k^2 sin^2\theta}}$$

For $\phi = \pi/2$ this becomes the complete elliptic integral of the first kind, $K(k)$.

See also

comp_ellint_1.

Template Parameters

_Tp	The floating-point type of the modulus `__k`.
_Tpp	The floating-point type of the angle `__phi`.

Parameters

__k	The modulus, `abs(__k) <= 1`
__phi	The integral limit argument in radians

Exceptions

std::domain_error	if `abs(__k) > 1` .

ellint_1f()

```
float std::ellint_1f (
            float __k,
            float __phi)  [inline]
```

Return the incomplete elliptic integral of the first kind $E(k,\phi)$ for `float` modulus k and angle ϕ.

See also

ellint_1 for details.

ellint_1l()

```
long double std::ellint_1l (
            long double __k,
            long double __phi)  [inline]
```

Return the incomplete elliptic integral of the first kind $E(k, \phi)$ for `long double` modulus k and angle ϕ.

See also

ellint_1 for details.

ellint_2()

```
template<typename _Tp, typename _Tpp>
__gnu_cxx::__promote_2< _Tp, _Tpp >::__type std::ellint_2 (
            _Tp __k,
            _Tpp __phi)  [inline]
```

Return the incomplete elliptic integral of the second kind $E(k, \phi)$.
The incomplete elliptic integral of the second kind is defined as

$$E(k, \phi) = \int_0^\phi \sqrt{1 - k^2 sin^2\theta}$$

For $\phi = \pi/2$ this becomes the complete elliptic integral of the second kind, $E(k)$.

See also

comp_ellint_2.

Template Parameters

_Tp	The floating-point type of the modulus `__k`.
_Tpp	The floating-point type of the angle `__phi`.

Parameters

__k	The modulus, `abs(__k) <= 1`
__phi	The integral limit argument in radians

Returns

The elliptic function of the second kind.

Exceptions

std::domain_error	if `abs(__k) > 1` .

ellint_2f()

```
float std::ellint_2f (
            float __k,
            float __phi)  [inline]
```

Return the incomplete elliptic integral of the second kind $E(k, \phi)$ for `float` argument.

See also

ellint_2 for details.

ellint_2l()

```
long double std::ellint_2l (
            long double __k,
            long double __phi)  [inline]
```

Return the incomplete elliptic integral of the second kind $E(k, \phi)$.

See also

ellint_2 for details.

ellint_3()

```
template<typename _Tp, typename _Tpn, typename _Tpp>
__gnu_cxx::__promote_3< _Tp, _Tpn, _Tpp >::__type std::ellint_3 (
            _Tp __k,
            _Tpn __nu,
            _Tpp __phi)  [inline]
```

Return the incomplete elliptic integral of the third kind $\Pi(k, \nu, \phi)$.
The incomplete elliptic integral of the third kind is defined by:

$$\Pi(k, \nu, \phi) = \int_0^\phi \frac{d\theta}{(1 - \nu \sin^2\theta)\sqrt{1 - k^2 \sin^2\theta}}$$

For $\phi = \pi/2$ this becomes the complete elliptic integral of the third kind, $\Pi(k, \nu)$.

See also

comp_ellint_3.

Template Parameters

_Tp	The floating-point type of the modulus `__k`.
_Tpn	The floating-point type of the argument `__nu`.
_Tpp	The floating-point type of the angle `__phi`.

Parameters

__k	The modulus, `abs(__k) <= 1`

__nu	The second argument
__phi	The integral limit argument in radians

Returns

The elliptic function of the third kind.

Exceptions

std::domain_error	if `abs(__k) > 1 .`

ellint_3f()

```
float std::ellint_3f (
            float __k,
            float __nu,
            float __phi)  [inline]
```

Return the incomplete elliptic integral of the third kind $\Pi(k, \nu, \phi)$ for `float` argument.

See also

ellint_3 for details.

ellint_3l()

```
long double std::ellint_3l (
            long double __k,
            long double __nu,
            long double __phi)  [inline]
```

Return the incomplete elliptic integral of the third kind $\Pi(k, \nu, \phi)$.

See also

ellint_3 for details.

expint()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::expint (
            _Tp __x)  [inline]
```

Return the exponential integral $Ei(x)$ for `real` argument `x`.
The exponential integral is given by

$$Ei(x) = -\int_{-x}^{\infty} \frac{e^t}{t} dt$$

Template Parameters

_Tp	The floating-point type of the argument __x.

Parameters

_↩ _x	The argument of the exponential integral function.

expintf()

```
float std::expintf (
            float __x)  [inline]
```

Return the exponential integral $Ei(x)$ for `float` argument `x`.

See also

expint for details.

expintl()

```
long double std::expintl (
            long double __x)  [inline]
```

Return the exponential integral $Ei(x)$ for `long double` argument `x`.

See also

expint for details.

hermite()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::hermite (
            unsigned int __n,
            _Tp __x)  [inline]
```

Return the Hermite polynomial $H_n(x)$ of order n and `real` argument `x`.
The Hermite polynomial is defined by:

$$H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2}$$

The Hermite polynomial obeys a reflection formula:

$$H_n(-x) = (-1)^n H_n(x)$$

Template Parameters

_Tp	The floating-point type of the argument __x.

Parameters

_↩ _n	The order
_↩ _x	The argument

hermitef()

```
float std::hermitef (
            unsigned int __n,
            float __x)  [inline]
```

Return the Hermite polynomial $H_n(x)$ of nonnegative order n and float argument x.

See also

hermite for details.

hermitel()

```
long double std::hermitel (
            unsigned int __n,
            long double __x)  [inline]
```

Return the Hermite polynomial $H_n(x)$ of nonnegative order n and long double argument x.

See also

hermite for details.

hyperg()

```
template<typename _Tpa, typename _Tpb, typename _Tpc, typename _Tp>
__gnu_cxx::__promote_4< _Tpa, _Tpb, _Tpc, _Tp >::__type __gnu_cxx::hyperg (
            _Tpa __a,
            _Tpb __b,
            _Tpc __c,
            _Tp __x)  [inline]
```

Return the hypergeometric function ${}_2F_1(a,b;c;x)$ of real numeratorial parameters a and b, denominatorial parameter c, and argument x.
The hypergeometric function is defined by

$$ {}_2F_1(a;c;x) = \sum_{n=0}^{\infty} \frac{(a)_n (b)_n x^n}{(c)_n n!} $$

where the Pochhammer symbol is $(x)_k = (x)(x+1)...(x+k-1)$, $(x)_0 = 1$

Parameters

_↩ _a	The first numeratorial parameter
_↩ _b	The second numeratorial parameter
_↩ _c	The denominatorial parameter
_↩ _x	The argument

hypergf()

```
float __gnu_cxx::hypergf (
             float __a,
             float __b,
             float __c,
             float __x)  [inline]
```

Return the hypergeometric function ${}_2F_1(a, b; c; x)$ of @ float numeratorial parameters a and b, denominatorial parameter c, and argument x.

See also

hyperg for details.

hypergl()

```
long double __gnu_cxx::hypergl (
             long double __a,
             long double __b,
             long double __c,
             long double __x)  [inline]
```

Return the hypergeometric function ${}_2F_1(a, b; c; x)$ of long double numeratorial parameters a and b, denominatorial parameter c, and argument x.

See also

hyperg for details.

laguerre()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::laguerre (
             unsigned int __n,
             _Tp __x)  [inline]
```

Returns the Laguerre polynomial $L_n(x)$ of nonnegative degree n and real argument $x >= 0$.
The Laguerre polynomial is defined by:

$$L_n(x) = \frac{e^x}{n!}\frac{d^n}{dx^n}(x^n e^{-x})$$

Template Parameters

_Tp	The floating-point type of the argument __x.

Parameters

_n	The nonnegative order
_x	The argument __x >= 0

Exceptions

std::domain_error	if __x < 0 .

laguerref()

```
float std::laguerref (
            unsigned int __n,
            float __x)  [inline]
```

Returns the Laguerre polynomial $L_n(x)$ of nonnegative degree n and float argument $x >= 0$.

See also

laguerre for more details.

laguerrel()

```
long double std::laguerrel (
            unsigned int __n,
            long double __x)  [inline]
```

Returns the Laguerre polynomial $L_n(x)$ of nonnegative degree n and long double argument $x >= 0$.

See also

laguerre for more details.

legendre()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::legendre (
            unsigned int __l,
            _Tp __x)  [inline]
```

Return the Legendre polynomial $P_l(x)$ of nonnegative degree l and real argument $|x| <= 0$.
The Legendre function of order l and argument x, $P_l(x)$, is defined by:

$$P_l(x) = \frac{1}{2^l l!}\frac{d^l}{dx^l}(x^2 - 1)^l$$

Template Parameters

_Tp	The floating-point type of the argument __x.

Parameters

_↩ _l	The degree $l >= 0$

_↩ _x	The argument abs(__x) <= 1

Exceptions

std::domain_error	if abs(__x) > 1

legendref()

```
float std::legendref (
            unsigned int __l,
            float __x)  [inline]
```

Return the Legendre polynomial $P_l(x)$ of nonnegative degree l and float argument $|x| <= 0$.

See also

legendre for more details.

legendrel()

```
long double std::legendrel (
            unsigned int __l,
            long double __x)  [inline]
```

Return the Legendre polynomial $P_l(x)$ of nonnegative degree l and long double argument $|x| <= 0$.

See also

legendre for more details.

riemann_zeta()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::riemann_zeta (
            _Tp __s)  [inline]
```

Return the Riemann zeta function $\zeta(s)$ for real argument s.
The Riemann zeta function is defined by:

$$\zeta(s) = \sum_{k=1}^{\infty} k^{-s} \text{ for } s > 1$$

and

$$\zeta(s) = \frac{1}{1-2^{1-s}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-s} \text{ for } 0 <= s <= 1$$

For s < 1 use the reflection formula:

$$\zeta(s) = 2^s \pi^{s-1} \sin(\frac{\pi s}{2}) \Gamma(1-s) \zeta(1-s)$$

Template Parameters

_Tp	The floating-point type of the argument __s.

Parameters

_↩ _s	The argument s != 1

riemann_zetaf()

```
float std::riemann_zetaf (
            float __s)  [inline]
```

Return the Riemann zeta function $\zeta(s)$ for float argument s.

See also

riemann_zeta for more details.

riemann_zetal()

```
long double std::riemann_zetal (
            long double __s)  [inline]
```

Return the Riemann zeta function $\zeta(s)$ for long double argument s.

See also

riemann_zeta for more details.

sph_bessel()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::sph_bessel (
            unsigned int __n,
            _Tp __x)  [inline]
```

Return the spherical Bessel function $j_n(x)$ of nonnegative order n and real argument $x >= 0$.
The spherical Bessel function is defined by:

$$j_n(x) = \left(\frac{\pi}{2x}\right)^{1/2} J_{n+1/2}(x)$$

Template Parameters

_Tp	The floating-point type of the argument __x.

Parameters

_↩ _n	The integral order n >= 0
_↩ _x	The real argument x >= 0

Exceptions

std::domain_error	if __x < 0 .

sph_besself()

```
float std::sph_besself (
            unsigned int __n,
            float __x)  [inline]
```

Return the spherical Bessel function $j_n(x)$ of nonnegative order n and `float` argument $x >= 0$.

See also

sph_bessel for more details.

sph_bessell()

```
long double std::sph_bessell (
            unsigned int __n,
            long double __x)  [inline]
```

Return the spherical Bessel function $j_n(x)$ of nonnegative order n and `long double` argument $x >= 0$.

See also

sph_bessel for more details.

sph_legendre()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::sph_legendre (
            unsigned int __l,
            unsigned int __m,
            _Tp __theta)  [inline]
```

Return the spherical Legendre function of nonnegative integral degree `l` and order `m` and real angle θ in radians. The spherical Legendre function is defined by

$$Y_l^m(\theta,\phi) = (-1)^m[\frac{(2l+1)}{4\pi}\frac{(l-m)!}{(l+m)!}]P_l^m(\cos\theta)\exp^{im\phi}$$

Template Parameters

_Tp	The floating-point type of the angle __theta.

Parameters

__l	The order __l >= 0

__m	The degree __m >= 0 and __m <= __l
__theta	The radian polar angle argument

sph_legendref()

```
float std::sph_legendref (
            unsigned int __l,
            unsigned int __m,
            float __theta)  [inline]
```

Return the spherical Legendre function of nonnegative integral degree l and order m and float angle θ in radians.

See also

sph_legendre for details.

sph_legendrel()

```
long double std::sph_legendrel (
            unsigned int __l,
            unsigned int __m,
            long double __theta)  [inline]
```

Return the spherical Legendre function of nonnegative integral degree l and order m and long double angle θ in radians.

See also

sph_legendre for details.

sph_neumann()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::sph_neumann (
            unsigned int __n,
            _Tp __x)  [inline]
```

Return the spherical Neumann function of integral order $n >= 0$ and real argument $x >= 0$.
The spherical Neumann function is defined by

$$n_n(x) = \left(\frac{\pi}{2x}\right)^{1/2} N_{n+1/2}(x)$$

Template Parameters

_Tp	The floating-point type of the argument __x.

Parameters

_↩ _n	The integral order n >= 0

_↩ _x	The real argument __x >= 0

Exceptions

std::domain_error	if __x < 0 .

sph_neumannf()

```
float std::sph_neumannf (
            unsigned int __n,
            float __x)  [inline]
```

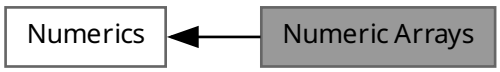
Return the spherical Neumann function of integral order $n >= 0$ and `float` argument $x >= 0$.

See also

sph_neumann for details.

sph_neumannl()

```
long double std::sph_neumannl (
            unsigned int __n,
            long double __x)  [inline]
```



Return the spherical Neumann function of integral order $n >= 0$ and `long double` $x >= 0$.

See also

sph_neumann for details.

3.11.6 Numeric Arrays

Collaboration diagram for Numeric Arrays:

Classes

- class std::gslice

3.11.6.1 Detailed Description

Classes and functions for representing and manipulating arrays of elements.

3.11.6.2 Function Documentation

gslice() [1/3]

```
std::gslice::gslice ()  [inline]
```

Construct an empty slice.
References gslice().
Referenced by gslice(), gslice(), gslice(), and operator=().

gslice() [2/3]

```
std::gslice::gslice (
            const gslice & __g)  [inline]
```

Copy constructor.
References gslice().

gslice() [3/3]

```
std::gslice::gslice (
            size_t __o,
            const valarray< size_t > & __l,
            const valarray< size_t > & __s)  [inline]
```

Construct a slice.
Constructs a slice with as many dimensions as the length of the *l* and *s* arrays.

Parameters

_↩ _*o*	Offset in array of first element.
_↩ _*l*	Array of dimension lengths.
_↩ _*s*	Array of dimension strides between array elements.

References gslice().

gslice_array()

```
template<typename _Tp>
std::gslice_array< _Tp >::gslice_array (
            const gslice_array< _Tp > & __a)  [inline]
```

Copy constructor. Both slices refer to the same underlying array.
References gslice_array().
Referenced by gslice_array(), and operator=().

indirect_array()

```
template<typename _Tp>
std::indirect_array< _Tp >::indirect_array (
            const indirect_array< _Tp > & __a)  [inline]
```

Copy constructor. Both slices refer to the same underlying array.
References indirect_array().
Referenced by indirect_array(), and operator=().

mask_array()

```
template<typename _Tp>
std::mask_array< _Tp >::mask_array (
            const mask_array< _Tp > & __a)  [inline]
```

Copy constructor. Both slices refer to the same underlying array.
References mask_array().
Referenced by mask_array(), and operator=().

slice() [1/2]

```
std::slice::slice ()  [inline]
```

Construct an empty slice.

Referenced by operator==.

slice() [2/2]

```
std::slice::slice (
            size_t __o,
            size_t __d,
            size_t __s)  [inline]
```

Construct a slice.

Parameters

_↩ _o	Offset in array of first element.
_↩ _d	Number of elements in slice.
_↩ _s	Stride between array elements.

slice_array()

```
template<typename _Tp>
std::slice_array< _Tp >::slice_array (
            const slice_array< _Tp > & __a)  [inline]
```

Copy constructor. Both slices refer to the same underlying array.
References slice_array().
Referenced by slice_array(), and operator=().

valarray() [1/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray ()  [inline], [noexcept]
```

Construct an empty array.
Referenced by valarray(), valarray(), valarray(), cshift(), operator%=(), operator%=(), operator&=(), operator&=(), operator*=(), operator*=(), operator+=(), operator+=(), operator-=(), operator-=(), operator/=(), operator/=(), operator<<=(), operator=(), operator=(), operator>>=(), operator>>=(), operator[](), operator[](), operator[]() const, operator[]() const, operator^=(), operator^=(), operator|=(), shift(), and swap().

valarray() [2/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
            const _Tp & __t,
            size_t __n)  [inline]
```

Construct an array with *n* elements initialized to *t*.

valarray() [3/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
            const gslice_array< _Tp > & __ga)  [inline]
```

Construct an array with the same size and values in *ga*.
References size().

valarray() [4/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
            const indirect_array< _Tp > & __ia)  [inline]
```

Construct an array with the same size and values in *ia*.

valarray() [5/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
            const mask_array< _Tp > & __ma)  [inline]
```

Construct an array with the same size and values in *ma*.

valarray() [6/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
            const slice_array< _Tp > & __sa)  [inline]
```

Construct an array with the same size and values in *sa*.

valarray() [7/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
            const valarray< _Tp > & __v)  [inline]
```

Copy constructor.
References valarray().

valarray() [8/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
            initializer_list< _Tp > __l)  [inline]
```

Construct an array with an initializer_list of values.
References size().

valarray() [9/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
            size_t __n)  [inline], [explicit]
```

Construct an array with *n* elements.

valarray() [10/10]

```
template<typename _Tp>
std::valarray< _Tp >::valarray (
            valarray< _Tp > && __v)  [inline], [noexcept]
```

Move constructor.
References valarray().

~gslice()

```
std::gslice::~gslice ()  [inline]
```

Destructor.

apply() [1/2]

```
template<class _Tp>
_Expr< _ValFunClos< _ValArray, _Tp >, _Tp > std::valarray< _Tp >::apply (
            _Tp  __func_Tp) const  [inline]
```

Apply a function to the array.
Returns a new valarray with elements assigned to the result of applying __func to the corresponding element of this array. The new array has the same size as this one.

Parameters

__func	Function of Tp returning Tp to apply.

Returns

New valarray with transformed elements.

apply() [2/2]

```
template<class _Tp>
_Expr< _RefFunClos< _ValArray, _Tp >, _Tp > std::valarray< _Tp >::apply (
            _Tp  __funcconst _Tp &) const  [inline]
```

Apply a function to the array.
Returns a new valarray with elements assigned to the result of applying __func to the corresponding element of this array. The new array has the same size as this one.

Parameters

__func	Function of const Tp& returning Tp to apply.

Returns

New valarray with transformed elements.

cshift()

```
template<class _Tp>
valarray< _Tp > std::valarray< _Tp >::cshift (
            int __n) const  [inline]
```

Return a rotated array.
A new valarray is constructed as a copy of this array with elements in shifted positions. For an element with index i, the new position is (i - n) % size(). The new valarray has the same size as the current one. Elements that are shifted beyond the array bounds are shifted into the other end of the array. No elements are lost.
Positive arguments shift toward index 0, wrapping around the top. Negative arguments shift towards the top, wrapping around to 0.

Parameters

_↩ _n	Number of element positions to rotate.

Returns

New valarray with elements in shifted positions.

References valarray().

max()

```
template<typename _Tp>
_Tp std::valarray< _Tp >::max () const  [inline]
```

Return the maximum element using operator<().

min()

```
template<typename _Tp>
_Tp std::valarray< _Tp >::min () const  [inline]
```

Return the minimum element using operator<().

operator=() [1/20]

```
gslice & std::gslice::operator= (
            const gslice & __g)  [inline]
```

Assignment operator.
References gslice().

operator=() [2/20]

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator= (
            const _Tp & __t) const  [inline]
```

Assign all slice elements to *t*.

operator=() [3/20]

```
template<typename _Tp>
gslice_array< _Tp > & std::gslice_array< _Tp >::operator= (
            const gslice_array< _Tp > & __a)  [inline]
```

Assignment operator. Assigns slice elements to corresponding elements of *a*.
References gslice_array().

operator=() [4/20]

```
template<typename _Tp>
void std::gslice_array< _Tp >::operator= (
            const valarray< _Tp > & __v) const  [inline]
```

Assign slice elements to corresponding elements of *v*.
References std::valarray< _Tp >::size().

operator=() [5/20]

```
template<typename _Tp>
void std::indirect_array< _Tp >::operator= (
            const _Tp & __t) const  [inline]
```

Assign all slice elements to *t*.

operator=() [6/20]

```
template<typename _Tp>
indirect_array< _Tp > & std::indirect_array< _Tp >::operator= (
            const indirect_array< _Tp > & __a)  [inline]
```

Assignment operator. Assigns elements to corresponding elements of *a*.
References indirect_array().

operator=() [7/20]

```
template<typename _Tp>
void std::indirect_array< _Tp >::operator= (
            const valarray< _Tp > & __v) const  [inline]
```

Assign slice elements to corresponding elements of *v*.

operator=() [8/20]

```
template<typename _Tp>
void std::mask_array< _Tp >::operator= (
            const _Tp & __t) const  [inline]
```

Assign all slice elements to *t*.

operator=() [9/20]

```
template<typename _Tp>
mask_array< _Tp > & std::mask_array< _Tp >::operator= (
            const mask_array< _Tp > & __a)  [inline]
```

Assignment operator. Assigns elements to corresponding elements of *a*.
References mask_array().

operator=() [10/20]

```
template<typename _Tp>
void std::slice_array< _Tp >::operator= (
            const _Tp & __t) const  [inline]
```

Assign all slice elements to *t*.

operator=() [11/20]

```
template<typename _Tp>
slice_array< _Tp > & std::slice_array< _Tp >::operator= (
            const slice_array< _Tp > & __a)  [inline]
```

Assignment operator. Assigns slice elements to corresponding elements of *a*.
References slice_array().

operator=() [12/20]

```
template<typename _Tp>
void std::slice_array< _Tp >::operator= (
            const valarray< _Tp > & __v) const  [inline]
```

Assign slice elements to corresponding elements of *v*.

operator=() [13/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
            const _Tp & __t)  [inline]
```

Assign elements to a value.
Assign all elements of array to *t*.

Parameters

↩ _↩ ↩ _↩ *t*	Value for elements.

operator=() [14/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
            const gslice_array< _Tp > & __ga)  [inline]
```

Assign elements to an array subset.
Assign elements of array to values in *ga*. Results are undefined if *ga* does not have the same size as this array.

Parameters

__ga	Array slice to get values from.

References size().

operator=() [15/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
            const indirect_array< _Tp > & __ia)  [inline]
```

Assign elements to an array subset.
Assign elements of array to values in *ia*. Results are undefined if *ia* does not have the same size as this array.

Parameters

_↩ *_ia*	Array slice to get values from.

operator=() [16/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
            const mask_array< _Tp > & __ma)  [inline]
```

Assign elements to an array subset.
Assign elements of array to values in *ma*. Results are undefined if *ma* does not have the same size as this array.

Parameters

__ma	Array slice to get values from.

operator=() [17/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
            const slice_array< _Tp > & __sa)  [inline]
```

Assign elements to an array subset.
Assign elements of array to values in *sa*. Results are undefined if *sa* does not have the same size as this array.

Parameters

__sa	Array slice to get values from.

operator=() [18/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
            const valarray< _Tp > & __v)  [inline]
```

Assign elements to an array.
Assign elements of array to values in *v*.

Parameters

_↩ _v	Valarray to get values from.

References valarray().

operator=() [19/20]

```
template<typename _Tp>
valarray< _Tp > & std::valarray< _Tp >::operator= (
            initializer_list< _Tp > __l)  [inline]
```

Assign elements to an initializer_list.
Assign elements of array to values in *__l*. Results are undefined if *__l* does not have the same size as this array.

Parameters

↩ _↩ ↩ _↩ l	initializer_list to get values from.

operator=() [20/20]

```
template<typename _Tp>
```

```
valarray< _Tp > & std::valarray< _Tp >::operator= (
            valarray< _Tp > && __v)  [inline], [noexcept]
```

Move assign elements to an array.
Move assign elements of array to values in *v*.

Parameters

_↩ _v	Valarray to get values from.

References valarray().

operator[]() [1/9]

```
template<typename _Tp>
gslice_array< _Tp > std::valarray< _Tp >::operator[] (
            const gslice & __s)  [inline]
```

Return a reference to an array subset.
Returns a new valarray containing the elements of the array indicated by the gslice argument. The new valarray has the same size as the input gslice.

See also

gslice.

Parameters

_↩ _s	The source gslice.

Returns

New valarray containing elements in __s.

operator[]() [2/9]

```
template<typename _Tp>
_Expr< _GClos< _ValArray, _Tp >, _Tp > std::valarray< _Tp >::operator[] (
            const gslice & __s) const  [inline]
```

Return an array subset.
Returns a slice_array referencing the elements of the array indicated by the slice argument.

See also

gslice.

Parameters

_↩ _s	The source slice.

Returns

Slice_array referencing elements indicated by __*s*.

operator[]() [3/9]

```
template<typename _Tp>
mask_array< _Tp > std::valarray< _Tp >::operator[] (
            const valarray< bool > & __m)  [inline]
```

Return a reference to an array subset.
Returns a new mask_array referencing the elements of the array indicated by the argument. The input is a valarray of bool which represents a bitmask indicating which elements are part of the subset. Elements of the array are part of the subset if the corresponding element of the argument is true.

Parameters

_↩ _*m*	The valarray bitmask.

Returns

New valarray containing elements indicated by __*m*.

References valarray(), and size().

operator[]() [4/9]

```
template<typename _Tp>
valarray< _Tp > std::valarray< _Tp >::operator[] (
            const valarray< bool > & __m) const  [inline]
```

Return an array subset.
Returns a new valarray containing the elements of the array indicated by the argument. The input is a valarray of bool which represents a bitmask indicating which elements should be copied into the new valarray. Each element of the array is added to the return valarray if the corresponding element of the argument is true.

Parameters

_↩ _*m*	The valarray bitmask.

Returns

New valarray containing elements indicated by __*m*.

References valarray(), and size().

operator[]() [5/9]

```
template<typename _Tp>
indirect_array< _Tp > std::valarray< _Tp >::operator[] (
            const valarray< size_t > & __i)  [inline]
```

Return a reference to an array subset.
Returns an indirect_array referencing the elements of the array indicated by the argument. The elements in the argument are interpreted as the indices of elements of this valarray to include in the subset. The returned indirect_array refers to these elements.

Parameters

↩ _↩ ↩ _↩ *i*	The valarray element index list.

Returns

Indirect_array referencing elements in *__i*.

References valarray(), and size().

operator[]() [6/9]

```
template<typename _Tp>
_Expr< _IClos< _ValArray, _Tp >, _Tp > std::valarray< _Tp >::operator[] (
            const valarray< size_t > & __i) const  [inline]
```

Return an array subset.
Returns a new valarray containing the elements of the array indicated by the argument. The elements in the argument are interpreted as the indices of elements of this valarray to copy to the return valarray.

Parameters

↩ _↩ ↩ _↩ *i*	The valarray element index list.

Returns

New valarray containing elements in *__s*.

References valarray().

operator[]() [7/9]

```
template<typename _Tp>
_Tp & std::valarray< _Tp >::operator[] (
            size_t __i)  [inline], [noexcept]
```

Return a reference to the i'th array element.

Parameters

↩ _↩ ↩ _↩ *i*	Index of element to return.

Returns

Reference to the i'th element.

operator[]() [8/9]

```
template<typename _Tp>
slice_array< _Tp > std::valarray< _Tp >::operator[] (
            slice __s)  [inline]
```

Return a reference to an array subset.
Returns a new valarray containing the elements of the array indicated by the slice argument. The new valarray has the same size as the input slice.

See also

slice.

Parameters

_↩ _s	The source slice.

Returns

New valarray containing elements in __s.

operator[]() [9/9]

```
template<typename _Tp>
_Expr< _SClos< _ValArray, _Tp >, _Tp > std::valarray< _Tp >::operator[] (
            slice __s) const  [inline]
```

Return an array subset.
Returns a new valarray containing the elements of the array indicated by the slice argument. The new valarray has the same size as the input slice.

See also

slice.

Parameters

_↩ _s	The source slice.

Returns

New valarray containing elements in __s.

resize()

```
template<class _Tp>
void std::valarray< _Tp >::resize (
```

```
            size_t __size,
            _Tp __c = _Tp())  [inline]
```

Resize array.

Resize this array to *size* and set all elements to *c*. All references and iterators are invalidated.

Parameters

__size	New array size.
__c	New value for all elements.

shift()

```
template<class _Tp>
valarray< _Tp > std::valarray< _Tp >::shift (
            int __n) const  [inline]
```

Return a shifted array.

A new valarray is constructed as a copy of this array with elements in shifted positions. For an element with index i, the new position is i - n. The new valarray has the same size as the current one. New elements without a value are set to 0. Elements whose new position is outside the bounds of the array are discarded.

Positive arguments shift toward index 0, discarding elements [0, n). Negative arguments discard elements from the top of the array.

Parameters

_↩ _n	Number of element positions to shift.

Returns

New valarray with elements in shifted positions.

References valarray().

size() [1/3]

```
valarray< size_t > std::gslice::size () const  [inline]
```

Return array of sizes of slice dimensions.

size() [2/3]

```
size_t std::slice::size () const  [inline]
```

Return size of slice.

size() [3/3]

```
template<class _Tp>
size_t std::valarray< _Tp >::size () const  [inline]
```

Return the number of elements in array.

Referenced by valarray(), valarray(), std::gslice_array< _Tp >::operator=(), operator=(), operator[](), operator[](), and operator[]().

start() [1/2]

```
size_t std::gslice::start () const  [inline]
```
Return array offset of first slice element.

start() [2/2]

```
size_t std::slice::start () const  [inline]
```
Return array offset of first slice element.

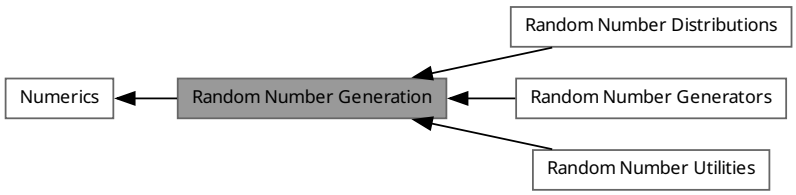
stride() [1/2]

```
valarray< size_t > std::gslice::stride () const  [inline]
```
Return array of array strides for each dimension.

stride() [2/2]

```
size_t std::slice::stride () const  [inline]
```
Return array stride of slice.

sum()



```
template<class _Tp>
_Tp std::valarray< _Tp >::sum () const  [inline]
```
Return the sum of all elements in the array.
Accumulates the sum of all elements into a Tp using +=. The order of adding the elements is unspecified.

swap()

```
template<class _Tp>
void std::valarray< _Tp >::swap (
            valarray< _Tp > & __v)  [inline], [noexcept]
```
Swap.
References valarray().

3.11.7 Random Number Generation

Collaboration diagram for Random Number Generation:

Topics

- Random Number Distributions
- Random Number Generators
- Random Number Utilities

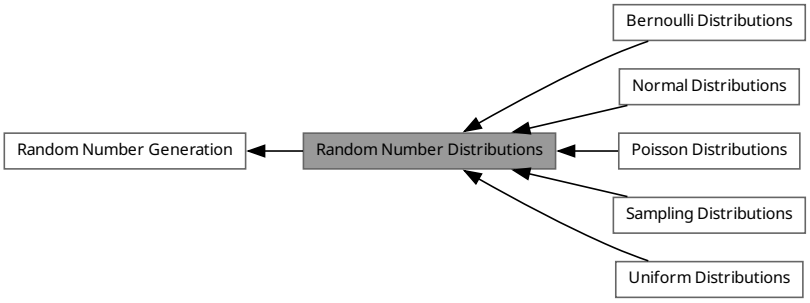
Functions

- template<typename _RealType, size_t __bits, typename _UniformRandomNumberGenerator>
  _RealType std::generate_canonical (_UniformRandomNumberGenerator &__g)

3.11.7.1 Detailed Description

A facility for generating random numbers on selected distributions.

3.11.7.2 Function Documentation



generate_canonical()

```
template<typename _RealType, size_t __bits, typename _UniformRandomNumberGenerator>
_RealType std::generate_canonical (
            _UniformRandomNumberGenerator & __g)
```

A function template for converting the output of a (integral) uniform random number generator to a floatng point result in the range [0-1).
Referenced by generate_canonical().

  std::basic_istream< _CharT, _Traits > & std::operator>> (std::basic_istream< _CharT, _Traits > &__is, std::geometric_distribution< _IntType > &__x)

Detailed Description

Function Documentation

operator<<() [1/2]

```
template<typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::bernoulli_distribution & __x)
```

Inserts a bernoulli_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A bernoulli_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

operator<<() [2/2]

```
template<typename _IntType, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::geometric_distribution< _IntType > & __x)
```

Inserts a geometric_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A geometric_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

References std::numeric_limits< _Tp >::epsilon(), log(), and std::numeric_limits< _Tp >::max().

operator>>() [1/2]

```
template<typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & std::operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::bernoulli_distribution & __x)  [inline]
```

Extracts a bernoulli_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A bernoulli_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

References std::bernoulli_distribution::param().

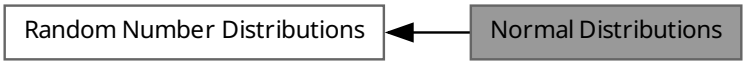
operator>>() [2/2]

```
template<typename _IntType, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & std::operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::geometric_distribution< _IntType > & __x)
```

Extracts a geometric_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _*is*	An input stream.
_↩ _*x*	A geometric_distribution random number generator engine.



Returns

The input stream with __x extracted or in an error state.

References std::ios_base::flags(), and std::geometric_distribution< _IntType >::param().

3.11.7.3.3 Normal Distributions

Collaboration diagram for Normal Distributions:

Classes

- class std::cauchy_distribution< _RealType >

  std::basic_istream< _CharT, _Traits > & std::operator>> (std::basic_istream< _CharT, _Traits > &__is, std::cauchy_distribution< _RealType > &__x)

Detailed Description

Function Documentation

operator<<()

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::cauchy_distribution< _RealType > & __x)
```

Inserts a cauchy_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A cauchy_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

References tan().

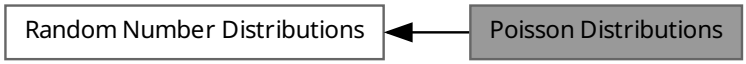
operator>>()

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & std::operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::cauchy_distribution< _RealType > & __x)
```

Extracts a cauchy_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A cauchy_distribution random number generator engine.



Returns

The input stream with __x extracted or in an error state.

References std::ios_base::flags(), and std::cauchy_distribution< _RealType >::param().

3.11.7.3.4 Poisson Distributions

Collaboration diagram for Poisson Distributions:

  std::basic_istream< _CharT, _Traits > & std::operator>> (std::basic_istream< _CharT, _Traits > &__is, std::extreme_value_distribution< _RealType > &__x)
- template<typename _RealType, typename _CharT, typename _Traits>
  std::basic_istream< _CharT, _Traits > & std::operator>> (std::basic_istream< _CharT, _Traits > &__is, std::weibull_distribution< _RealType > &__x)

Detailed Description

Function Documentation

operator<<() [1/3]

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::exponential_distribution< _RealType > & __x)
```

Inserts a exponential_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A exponential_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

References log().

operator<<() [2/3]

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::extreme_value_distribution< _RealType > & __x)
```

Inserts a extreme_value_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A extreme_value_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

References log().

operator<<() [3/3]

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::weibull_distribution< _RealType > & __x)
```

Inserts a weibull_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A weibull_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

References log(), and pow().

operator>>() [1/3]

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & std::operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::exponential_distribution< _RealType > & __x)
```

Extracts a exponential_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A exponential_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

References std::ios_base::flags(), and std::exponential_distribution< _RealType >::param().

operator>>() [2/3]

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & std::operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::extreme_value_distribution< _RealType > & __x)
```

Extracts a extreme_value_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A extreme_value_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

References std::ios_base::flags(), and std::extreme_value_distribution< _RealType >::param().

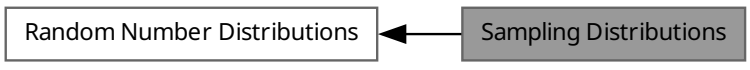
operator>>() [3/3]

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & std::operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::weibull_distribution< _RealType > & __x)
```

Extracts a weibull_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A weibull_distribution random number generator engine.



Returns

The input stream with __x extracted or in an error state.

References std::ios_base::flags(), and std::weibull_distribution< _RealType >::param().

- template<typename _RealType, typename _CharT, typename _Traits>
  std::basic_istream< _CharT, _Traits > & std::operator>> (std::basic_istream< _CharT, _Traits > &, std::uniform_real_distribution< _RealType > &)

Detailed Description

Function Documentation

operator<<() [1/2]

```
template<typename _IntType, typename _CharT, typename _Traits>
```

```
std::basic_ostream< _CharT, _Traits > & std::operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::uniform_int_distribution< _IntType > & __x)
```

Inserts a uniform_int_distribution random number distribution __x into the output stream os.

Parameters

__os	An output stream.
__x	A uniform_int_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

operator<<() [2/2]

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::uniform_real_distribution< _RealType > & __x)
```

Inserts a uniform_real_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A uniform_real_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

operator>>() [1/2]

```
template<typename _IntType, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & std::operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::uniform_int_distribution< _IntType > & __x)
```

Extracts a uniform_int_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A uniform_int_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

References std::ios_base::flags(), and std::uniform_int_distribution< _IntType >::param().

operator>>() [2/2]

```
template<typename _RealType, typename _CharT, typename _Traits>
std::basic_istream< _CharT, _Traits > & std::operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::uniform_real_distribution< _RealType > & __x)
```

Extracts a uniform_real_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A uniform_real_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

References std::ios_base::flags(), and std::uniform_real_distribution< _RealType >::param().

3.11.7.4 Random Number Generators

3.11.7.4.1 Detailed Description

These classes define objects which provide random or pseudorandom numbers, either from a discrete or a continuous interval. The random number generator supplied as a part of this library are all uniform random number generators which provide a sequence of random number uniformly distributed over their range.
A number generator is a function object with an operator() that takes zero arguments and returns a number.
A compliant random number generator must satisfy the following requirements.

Table 287: Random Number Generator Requirements

To be documented.

3.11.7.4.2 Typedef Documentation

minstd_rand

```
typedef linear_congruential_engine<uint_fast32_t, 48271UL, 0UL, 2147483647UL> std::minstd_rand
```

An alternative LCR (Lehmer Generator function).

minstd_rand0

```
typedef linear_congruential_engine<uint_fast32_t, 16807UL, 0UL, 2147483647UL> std::minstd_rand0
```

The classic Minimum Standard rand0 of Lewis, Goodman, and Miller.

mt19937

```
typedef mersenne_twister_engine< uint_fast32_t, 32, 624, 397, 31, 0x9908b0dfUL, 11, 0xffffffffUL,
7, 0x9d2c5680UL, 15, 0xefc60000UL, 18, 1812433253UL> std::mt19937
```

The classic Mersenne Twister.
Reference: M. Matsumoto and T. Nishimura, Mersenne Twister: A 623-Dimensionally Equidistributed Uniform Pseudo-Random Number Generator, ACM Transactions on Modeling and Computer Simulation, Vol. 8, No. 1, January 1998, pp 3-30.

mt19937_64

```
typedef mersenne_twister_engine< uint_fast64_t, 64, 312, 156, 31, 0xb5026f5aa96619e9ULL, 29,
0x5555555555555555ULL, 17, 0x71d67fffeda60000ULL, 37, 0xfff7eee000000000ULL, 43, 6364136223846793005ULL>
std::mt19937_64
```

An alternative Mersenne Twister.

philox4x32

```
typedef philox_engine< uint_fast32_t, 32, 4, 10, 0xCD9E8D57, 0x9E3779B9, 0xD2511F53, 0xBB67AE85>
std::philox4x32
```

32-bit four-word Philox engine.

philox4x64

```
typedef philox_engine< uint_fast64_t, 64, 4, 10, 0xCA5A826395121157, 0x9E3779B97F4A7C15, 0xD2↩
E7470EE14C6C93, 0xBB67AE8584CAA73B> std::philox4x64
```

64-bit four-word Philox engine.

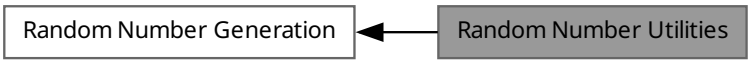
3.11.7.4.3 Function Documentation

operator<<()

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType, typename _CharT, typename
_Traits>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __x)
```

Inserts the current state of a independent_bits_engine random number generator engine __x into the output stream __os.

Parameters



__os	An output stream.
__x	A independent_bits_engine random number generator engine.

Returns

The output stream with the state of __x inserted or in an error state.

3.11.8.1 Detailed Description

A collection of advanced mathematical special functions.

3.11.8.2 Function Documentation

assoc_laguerre()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::tr1::assoc_laguerre (
            unsigned int __n,
            unsigned int __m,
            _Tp __x)  [inline]
```

5.2.1.1 Associated Laguerre polynomials.

assoc_legendre()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::tr1::assoc_legendre (
            unsigned int __l,
            unsigned int __m,
            _Tp __x)  [inline]
```

5.2.1.2 Associated Legendre functions.

beta()

```
template<typename _Tpx, typename _Tpy>
__gnu_cxx::__promote_2< _Tpx, _Tpy >::__type std::tr1::beta (
            _Tpx __x,
            _Tpy __y)  [inline]
```

5.2.1.3 Beta functions.

comp_ellint_1()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::tr1::comp_ellint_1 (
            _Tp __k)  [inline]
```

5.2.1.4 Complete elliptic integrals of the first kind.

comp_ellint_2()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::tr1::comp_ellint_2 (
            _Tp __k)  [inline]
```

5.2.1.5 Complete elliptic integrals of the second kind.

comp_ellint_3()

```
template<typename _Tp, typename _Tpn>
__gnu_cxx::__promote_2< _Tp, _Tpn >::__type std::tr1::comp_ellint_3 (
            _Tp __k,
            _Tpn __nu)  [inline]
```

5.2.1.6 Complete elliptic integrals of the third kind.

cyl_bessel_i()

```
template<typename _Tpnu, typename _Tp>
__gnu_cxx::__promote_2< _Tpnu, _Tp >::__type std::tr1::cyl_bessel_i (
            _Tpnu __nu,
            _Tp __x)  [inline]
```

5.2.1.8 Regular modified cylindrical Bessel functions.

cyl_bessel_j()

```
template<typename _Tpnu, typename _Tp>
__gnu_cxx::__promote_2< _Tpnu, _Tp >::__type std::tr1::cyl_bessel_j (
            _Tpnu __nu,
            _Tp __x)  [inline]
```

5.2.1.9 Cylindrical Bessel functions (of the first kind).

cyl_bessel_k()

```
template<typename _Tpnu, typename _Tp>
__gnu_cxx::__promote_2< _Tpnu, _Tp >::__type std::tr1::cyl_bessel_k (
            _Tpnu __nu,
            _Tp __x)  [inline]
```

5.2.1.10 Irregular modified cylindrical Bessel functions.

cyl_neumann()

```
template<typename _Tpnu, typename _Tp>
__gnu_cxx::__promote_2< _Tpnu, _Tp >::__type std::tr1::cyl_neumann (
            _Tpnu __nu,
            _Tp __x)  [inline]
```

5.2.1.11 Cylindrical Neumann functions.

ellint_1()

```
template<typename _Tp, typename _Tpp>
__gnu_cxx::__promote_2< _Tp, _Tpp >::__type std::tr1::ellint_1 (
             _Tp __k,
             _Tpp __phi)  [inline]
```

5.2.1.12 Incomplete elliptic integrals of the first kind.

ellint_2()

```
template<typename _Tp, typename _Tpp>
__gnu_cxx::__promote_2< _Tp, _Tpp >::__type std::tr1::ellint_2 (
             _Tp __k,
             _Tpp __phi)  [inline]
```

5.2.1.13 Incomplete elliptic integrals of the second kind.

ellint_3()

```
template<typename _Tp, typename _Tpn, typename _Tpp>
__gnu_cxx::__promote_3< _Tp, _Tpn, _Tpp >::__type std::tr1::ellint_3 (
             _Tp __k,
             _Tpn __nu,
             _Tpp __phi)  [inline]
```

5.2.1.14 Incomplete elliptic integrals of the third kind.

expint()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::tr1::expint (
             _Tp __x)  [inline]
```

5.2.1.15 Exponential integrals.

hermite()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::tr1::hermite (
             unsigned int __n,
             _Tp __x)  [inline]
```

5.2.1.16 Hermite polynomials.

laguerre()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::tr1::laguerre (
             unsigned int __n,
             _Tp __x)  [inline]
```

5.2.1.18 Laguerre polynomials.

legendre()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::tr1::legendre (
             unsigned int __n,
             _Tp __x)  [inline]
```

5.2.1.19 Legendre polynomials.

riemann_zeta()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::tr1::riemann_zeta (
            _Tp __x)  [inline]
```

5.2.1.20 Riemann zeta function.

sph_bessel()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::tr1::sph_bessel (
            unsigned int __n,
            _Tp __x)  [inline]
```

5.2.1.21 Spherical Bessel functions.

sph_legendre()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::tr1::sph_legendre (
            unsigned int __l,
            unsigned int __m,
            _Tp __theta)  [inline]
```

5.2.1.22 Spherical associated Legendre functions.

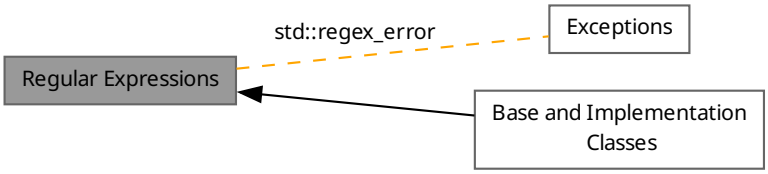
sph_neumann()

```
template<typename _Tp>
__gnu_cxx::__promote< _Tp >::__type std::tr1::sph_neumann (
            unsigned int __n,
            _Tp __x)  [inline]
```

5.2.1.23 Spherical Neumann functions.

3.12 Ranges

Classes



- struct std::ranges::elements_of< _Range, _Alloc >

3.12.1 Detailed Description

Components for dealing with ranges of elements.

3.13 Regular Expressions

Collaboration diagram for Regular Expressions:

Topics

- Base and Implementation Classes

Namespaces

- namespace std::regex_constants

Classes

- class std::basic_regex< _Ch_type, _Rx_traits >
- class std::match_results< _Bi_iter, _Alloc >
- class std::regex_error
- class std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >
- class std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >
- class std::regex_traits< _Ch_type >
- class std::sub_match< _BiIter >

Typedefs

- typedef match_results< const char * > **std::cmatch**

3.13.1 Detailed Description

A facility for performing regular expression pattern matching.

Since

C++11

3.13.2 Typedef Documentation

cregex_token_iterator

```
typedef regex_token_iterator<const char*> std::cregex_token_iterator
```

Token iterator for C-style NULL-terminated strings.

csub_match

```
typedef sub_match<const char*> std::csub_match
```

Standard regex submatch over a C-style null-terminated string.

regex

```
typedef basic_regex<char> std::regex
```

Standard regular expressions.

sregex_token_iterator

```
typedef regex_token_iterator<string::const_iterator> std::sregex_token_iterator
```

Token iterator for standard strings.

ssub_match

```
typedef sub_match<string::const_iterator> std::ssub_match
```

Standard regex submatch over a standard string.

wcregex_token_iterator

```
typedef regex_token_iterator<const wchar_t*> std::wcregex_token_iterator
```

Token iterator for C-style NULL-terminated wide strings.

wcsub_match

```
typedef sub_match<const wchar_t*> std::wcsub_match
```

Regex submatch over a C-style null-terminated wide string.

wregex

```
typedef basic_regex<wchar_t> std::wregex
```

Standard wide-character regular expressions.

wsregex_token_iterator

```
typedef regex_token_iterator<wstring::const_iterator> std::wsregex_token_iterator
```
Token iterator for standard wide-character strings.

wssub_match

```
typedef sub_match<wstring::const_iterator> std::wssub_match
```
Regex submatch over a standard wide string.

3.13.3 Function Documentation

operator<<()

```
template<typename _Ch_type, typename _Ch_traits, typename _Bi_iter>
basic_ostream< _Ch_type, _Ch_traits > & operator<< (
            basic_ostream< _Ch_type, _Ch_traits > & __os,
            const sub_match< _Bi_iter > & __m)  [related]
```
Inserts a matched string into an output stream.

Parameters

__os	The output stream.
__m	A submatch string.

Returns

the output stream with the submatch string inserted.

operator<=>() [1/4]

```
template<typename _Bi_iter, typename _Ch_traits, typename _Alloc>
auto operator<=> (
            const sub_match< _Bi_iter > & __lhs,
            const __sub_match_string< _Bi_iter, _Ch_traits, _Alloc > & __rhs)  [related]
```
Three-way comparison of a regular expression submatch and a string.

Parameters

__lhs	A regular expression submatch.
__rhs	A string.

Returns

A value indicating whether `__lhs` is less than, equal to, greater than, or incomparable with `__rhs`.

operator<=>() [2/4]

```
template<typename _Bi_iter>
auto operator<=> (
```

```
            const sub_match< _Bi_iter > & __lhs,
            typename iterator_traits< _Bi_iter >::value_type const & __rhs)  [related]
```

Three-way comparison of a regular expression submatch and a character.

Parameters

__lhs	A regular expression submatch.
__rhs	A character.

Returns

A value indicating whether __lhs is less than, equal to, greater than, or incomparable with __rhs.

operator<=>() [3/4]

```
template<typename _Bi_iter>
auto operator<=> (
            const sub_match< _Bi_iter > & __lhs,
            typename iterator_traits< _Bi_iter >::value_type const * __rhs)  [related]
```

Three-way comparison of a regular expression submatch and a C string.

Parameters

__lhs	A regular expression submatch.
__rhs	A null-terminated string.

Returns

A value indicating whether __lhs is less than, equal to, greater than, or incomparable with __rhs.

operator<=>() [4/4]

```
template<typename _BiIter>
auto operator<=> (
            const sub_match< _BiIter > & __lhs,
            const sub_match< _BiIter > & __rhs)  [related]
```

Three-way comparison of two regular expression submatches.

Parameters

__lhs	First regular expression submatch.
__rhs	Second regular expression submatch.

Returns

A value indicating whether __lhs is less than, equal to, greater than, or incomparable with __rhs.

operator==() [1/5]

```
template<typename _Bi_iter, typename _Alloc>
bool operator== (
            const match_results< _Bi_iter, _Alloc > & __m1,
            const match_results< _Bi_iter, _Alloc > & __m2)  [related]
```

Compares two match_results for equality.

Returns

true if the two objects refer to the same match, false otherwise.

operator==() [2/5]

```
template<typename _Bi_iter, typename _Ch_traits, typename _Ch_alloc>
bool operator== (
            const sub_match< _Bi_iter > & __lhs,
            const __sub_match_string< _Bi_iter, _Ch_traits, _Ch_alloc > & __rhs)  [related]
```

Tests the equivalence of a regular expression submatch and a string.

Parameters

__lhs	A regular expression submatch.
__rhs	A string.

Returns

true if *__lhs* is equivalent to *__rhs*, false otherwise.

operator==() [3/5]

```
template<typename _Bi_iter>
bool operator== (
            const sub_match< _Bi_iter > & __lhs,
            typename iterator_traits< _Bi_iter >::value_type const & __rhs)  [related]
```

Tests the equivalence of a regular expression submatch and a character.

Parameters

__lhs	A regular expression submatch.
__rhs	A character.

Returns

true if *__lhs* is equivalent to *__rhs*, false otherwise.

operator==() [4/5]

```
template<typename _Bi_iter>
bool operator== (
            const sub_match< _Bi_iter > & __lhs,
            typename iterator_traits< _Bi_iter >::value_type const * __rhs)  [related]
```

Tests the equivalence of a regular expression submatch and a C string.

Parameters

__lhs	A regular expression submatch.
__rhs	A null-terminated string.

Returns

true if *__lhs* is equivalent to *__rhs*, false otherwise.

operator==() [5/5]

```
template<typename _BiIter>
bool operator== (
            const sub_match< _BiIter > & __lhs,
            const sub_match< _BiIter > & __rhs)  [related]
```

Tests the equivalence of two regular expression submatches.

Parameters

__lhs	First regular expression submatch.
__rhs	Second regular expression submatch.

Returns

true if *__lhs* is equivalent to *__rhs*, false otherwise.

regex_match() [1/7]

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
bool std::regex_match (
            _Bi_iter __first,
            _Bi_iter __last,
            const basic_regex< _Ch_type, _Rx_traits > & __re,
            regex_constants::match_flag_type __flags = regex_constants::match_default)  [inline]
```

Indicates if there is a match between the regular expression `e` and all of the character sequence [first, last).

Parameters

__first	Beginning of the character sequence to match.
__last	One-past-the-end of the character sequence to match.
__re	The regular expression.
__flags	Controls how the regular expression is matched.

Return values

true	A match exists.
false	Otherwise.

Exceptions

an	exception of type regex_error.

References std::regex_constants::match_default, and regex_match().

regex_match() [2/7]

```
template<typename _Bi_iter, typename _Alloc, typename _Ch_type, typename _Rx_traits>
bool std::regex_match (
             _Bi_iter __s,
             _Bi_iter __e,
             match_results< _Bi_iter, _Alloc > & __m,
             const basic_regex< _Ch_type, _Rx_traits > & __re,
             regex_constants::match_flag_type __flags = regex_constants::match_default)  [inline]
```

Determines if there is a match between the regular expression e and all of the character sequence [first, last).

Parameters

__s	Start of the character sequence to match.
__e	One-past-the-end of the character sequence to match.
__m	The match results.
__re	The regular expression.
__flags	Controls how the regular expression is matched.

Return values

true	A match exists.
false	Otherwise.

Exceptions

an	exception of type regex_error.

References std::regex_constants::match_default.
Referenced by regex_match(), regex_match(), regex_match(), regex_match(), and regex_match().

regex_match() [3/7]

```
template<typename _Ch_type, class _Rx_traits>
bool std::regex_match (
            const _Ch_type * __s,
            const basic_regex< _Ch_type, _Rx_traits > & __re,
            regex_constants::match_flag_type __f = regex_constants::match_default)  [inline]
```

Indicates if there is a match between the regular expression e and a C-style null-terminated string.

Parameters

_↩ _s	The C-style null-terminated string to match.
_↩ _re	The regular expression.
_↩ _f	Controls how the regular expression is matched.

Return values

true	A match exists.
false	Otherwise.

Exceptions

an	exception of type regex_error.

References std::regex_constants::match_default, and regex_match().

regex_match() [4/7]

```
template<typename _Ch_type, typename _Alloc, typename _Rx_traits>
bool std::regex_match (
            const _Ch_type * __s,
            match_results< const _Ch_type *, _Alloc > & __m,
            const basic_regex< _Ch_type, _Rx_traits > & __re,
            regex_constants::match_flag_type __f = regex_constants::match_default)  [inline]
```

Determines if there is a match between the regular expression e and a C-style null-terminated string.

Parameters

_↩ _s	The C-style null-terminated string to match.
_↩ _m	The match results.

_↩ _re	The regular expression.
_↩ _f	Controls how the regular expression is matched.

Return values

true	A match exists.
false	Otherwise.

Exceptions

an	exception of type regex_error.

References std::regex_constants::match_default, and regex_match().

regex_match() [5/7]

```
template<typename _Ch_traits, typename _Ch_alloc, typename _Alloc, typename _Ch_type, typename _↩
Rx_traits>
bool std::regex_match (
             const basic_string< _Ch_type, _Ch_traits, _Ch_alloc > && ,
             match_results< typename basic_string< _Ch_type, _Ch_traits, _Ch_alloc >::const_↩
iterator, _Alloc > & ,
             const basic_regex< _Ch_type, _Rx_traits > & ,
             regex_constants::match_flag_type  = regex_constants::match_default)  [delete]
```

Prevent unsafe attempts to get match_results from a temporary string.
References std::regex_constants::match_default.

regex_match() [6/7]

```
template<typename _Ch_traits, typename _Ch_alloc, typename _Alloc, typename _Ch_type, typename _↩
Rx_traits>
bool std::regex_match (
             const basic_string< _Ch_type, _Ch_traits, _Ch_alloc > & __s,
             match_results< typename basic_string< _Ch_type, _Ch_traits, _Ch_alloc >::const_↩
iterator, _Alloc > & __m,
             const basic_regex< _Ch_type, _Rx_traits > & __re,
             regex_constants::match_flag_type __flags = regex_constants::match_default)  [inline]
```

Determines if there is a match between the regular expression e and a string.

Parameters

__s	The string to match.

__m	The match results.
__re	The regular expression.
__flags	Controls how the regular expression is matched.

Return values

true	A match exists.
false	Otherwise.

Exceptions

an	exception of type regex_error.

References std::basic_string< _CharT, _Traits, _Alloc >::begin(), std::basic_string< _CharT, _Traits, _Alloc >::end(), std::regex_constants::match_default, and regex_match().

regex_match() [7/7]

```
template<typename _Ch_traits, typename _Str_allocator, typename _Ch_type, typename _Rx_traits>
bool std::regex_match (
             const basic_string< _Ch_type, _Ch_traits, _Str_allocator > & __s,
             const basic_regex< _Ch_type, _Rx_traits > & __re,
             regex_constants::match_flag_type __flags = regex_constants::match_default)  [inline]
```

Indicates if there is a match between the regular expression e and a string.

Parameters

__s	[IN] The string to match.
__re	[IN] The regular expression.
__flags	[IN] Controls how the regular expression is matched.

Return values

true	A match exists.
false	Otherwise.

Exceptions

an	exception of type regex_error.

References std::basic_string< _CharT, _Traits, _Alloc >::begin(), std::basic_string< _CharT, _Traits, _Alloc >::end(), std::regex_constants::match_default, and regex_match().

regex_replace() [1/6]

```
template<typename _Out_iter, typename _Bi_iter, typename _Rx_traits, typename _Ch_type>
_Out_iter std::regex_replace (
            _Out_iter __out,
            _Bi_iter __first,
            _Bi_iter __last,
            const basic_regex< _Ch_type, _Rx_traits > & __e,
            const _Ch_type * __fmt,
            regex_constants::match_flag_type __flags = regex_constants::match_default)
```

Search for a regular expression within a range for multiple times, and replace the matched parts through filling a format C-string.

Parameters

__out	[OUT] The output iterator.
__first	[IN] The start of the string to search.
__last	[IN] One-past-the-end of the string to search.
__e	[IN] The regular expression to search for.
__fmt	[IN] The format C-string.
__flags	[IN] Search and replace policy flags.

Returns

__out

Exceptions

an	exception of type regex_error.

References std::regex_constants::match_default.

regex_replace() [2/6]

```
template<typename _Out_iter, typename _Bi_iter, typename _Rx_traits, typename _Ch_type, typename
_St, typename _Sa>
_Out_iter std::regex_replace (
            _Out_iter __out,
            _Bi_iter __first,
            _Bi_iter __last,
            const basic_regex< _Ch_type, _Rx_traits > & __e,
            const basic_string< _Ch_type, _St, _Sa > & __fmt,
            regex_constants::match_flag_type __flags = regex_constants::match_default)  [inline]
```

Search for a regular expression within a range for multiple times, and replace the matched parts through filling a format string.

Parameters

__out	[OUT] The output iterator.
__first	[IN] The start of the string to search.
__last	[IN] One-past-the-end of the string to search.
__e	[IN] The regular expression to search for.
__fmt	[IN] The format string.
__flags	[IN] Search and replace policy flags.

Returns

__out

Exceptions

an	exception of type regex_error.

References std::basic_string< _CharT, _Traits, _Alloc >::c_str(), std::basic_string< _CharT, _Traits, _Alloc >::length(), and std::regex_constants::match_default.
Referenced by regex_replace(), regex_replace(), regex_replace(), and regex_replace().

regex_replace() [3/6]

```
template<typename _Rx_traits, typename _Ch_type>
basic_string< _Ch_type > std::regex_replace (
             const _Ch_type * __s,
             const basic_regex< _Ch_type, _Rx_traits > & __e,
             const _Ch_type * __fmt,
             regex_constants::match_flag_type __flags = regex_constants::match_default)  [inline]
```

Search for a regular expression within a C-string for multiple times, and replace the matched parts through filling a format C-string.

Parameters

__s	[IN] The C-string to search and replace.
__e	[IN] The regular expression to search for.
__fmt	[IN] The format C-string.
__flags	[IN] Search and replace policy flags.

Returns

The string after replacing.

Exceptions

an	exception of type regex_error.

References back_inserter(), std::regex_constants::match_default, and regex_replace().

regex_replace() [4/6]

```
template<typename _Rx_traits, typename _Ch_type, typename _St, typename _Sa>
basic_string< _Ch_type > std::regex_replace (
            const _Ch_type * __s,
            const basic_regex< _Ch_type, _Rx_traits > & __e,
            const basic_string< _Ch_type, _St, _Sa > & __fmt,
            regex_constants::match_flag_type __flags = regex_constants::match_default)  [inline]
```

Search for a regular expression within a C-string for multiple times, and replace the matched parts through filling a format string.

Parameters

__s	[IN] The C-string to search and replace.
__e	[IN] The regular expression to search for.
__fmt	[IN] The format string.
__flags	[IN] Search and replace policy flags.

Returns

The string after replacing.

Exceptions

an	exception of type regex_error.

References back_inserter(), std::regex_constants::match_default, and regex_replace().

regex_replace() [5/6]

```
template<typename _Rx_traits, typename _Ch_type, typename _St, typename _Sa>
basic_string< _Ch_type, _St, _Sa > std::regex_replace (
            const basic_string< _Ch_type, _St, _Sa > & __s,
            const basic_regex< _Ch_type, _Rx_traits > & __e,
            const _Ch_type * __fmt,
            regex_constants::match_flag_type __flags = regex_constants::match_default)  [inline]
```

Search for a regular expression within a string for multiple times, and replace the matched parts through filling a format C-string.

Parameters

__s	[IN] The string to search and replace.
__e	[IN] The regular expression to search for.
__fmt	[IN] The format C-string.
__flags	[IN] Search and replace policy flags.

Returns

The string after replacing.

Exceptions

an	exception of type regex_error.

References back_inserter(), std::basic_string< _CharT, _Traits, _Alloc >::begin(), std::basic_string< _CharT, _Traits, _Alloc >::end(), std::regex_constants::match_default, and regex_replace().

regex_replace() [6/6]

```
template<typename _Rx_traits, typename _Ch_type, typename _St, typename _Sa, typename _Fst, typename
_Fsa>
basic_string< _Ch_type, _St, _Sa > std::regex_replace (
            const basic_string< _Ch_type, _St, _Sa > & __s,
            const basic_regex< _Ch_type, _Rx_traits > & __e,
            const basic_string< _Ch_type, _Fst, _Fsa > & __fmt,
            regex_constants::match_flag_type __flags = regex_constants::match_default)  [inline]
```

Search for a regular expression within a string for multiple times, and replace the matched parts through filling a format string.

Parameters

__s	[IN] The string to search and replace.
__e	[IN] The regular expression to search for.
__fmt	[IN] The format string.
__flags	[IN] Search and replace policy flags.

Returns

The string after replacing.

Exceptions

an	exception of type regex_error.

References back_inserter(), std::basic_string< _CharT, _Traits, _Alloc >::begin(), std::basic_string< _CharT, _Traits, _Alloc >::end(), std::regex_constants::match_default, and regex_replace().

regex_search() [1/7]

```
template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits>
bool std::regex_search (
            _Bi_iter __first,
            _Bi_iter __last,
            const basic_regex< _Ch_type, _Rx_traits > & __re,
            regex_constants::match_flag_type __flags = regex_constants::match_default)  [inline]
```

Searches for a regular expression within a range.

Parameters

__first	[IN] The start of the string to search.
__last	[IN] One-past-the-end of the string to search.
__re	[IN] The regular expression to search for.
__flags	[IN] Search policy flags.

Return values

true	A match was found within the string.
false	No match was found within the string.

Exceptions

an	exception of type regex_error.

References std::regex_constants::match_default, and regex_search().

regex_search() [2/7]

```
template<typename _Bi_iter, typename _Alloc, typename _Ch_type, typename _Rx_traits>
bool std::regex_search (
            _Bi_iter __s,
            _Bi_iter __e,
            match_results< _Bi_iter, _Alloc > & __m,
            const basic_regex< _Ch_type, _Rx_traits > & __re,
            regex_constants::match_flag_type __flags = regex_constants::match_default)  [inline]
```

Searches for a regular expression within a range.

Parameters

__s	[IN] The start of the string to search.

__e	[IN] One-past-the-end of the string to search.
__m	[OUT] The match results.
__re	[IN] The regular expression to search for.
__flags	[IN] Search policy flags.

Return values

true	A match was found within the string.
false	No match was found within the string, the content of m is undefined.

Exceptions

an	exception of type regex_error.

References std::regex_constants::match_default.
Referenced by std::regex_iterator< const char * >::regex_iterator(), std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++(), regex_search(), regex_search(), regex_search(), regex_search(), and regex_search().

regex_search() [3/7]

```
template<typename _Ch_type, typename _Rx_traits>
bool std::regex_search (
            const _Ch_type * __s,
            const basic_regex< _Ch_type, _Rx_traits > & __e,
            regex_constants::match_flag_type __f = regex_constants::match_default)  [inline]
```

Searches for a regular expression within a C-string.

Parameters

_↩ _s	[IN] The C-string to search.
_↩ _e	[IN] The regular expression to search for.
_↩ _f	[IN] Search policy flags.

Return values

true	A match was found within the string.

false	No match was found within the string.

Exceptions

an	exception of type regex_error.

References std::regex_constants::match_default, and regex_search().

regex_search() [4/7]

```
template<typename _Ch_type, class _Alloc, class _Rx_traits>
bool std::regex_search (
             const _Ch_type * __s,
             match_results< const _Ch_type *, _Alloc > & __m,
             const basic_regex< _Ch_type, _Rx_traits > & __e,
             regex_constants::match_flag_type __f = regex_constants::match_default)  [inline]
```

Searches for a regular expression within a C-string.

Parameters

_↩ _*s*	[IN] A C-string to search for the regex.
_↩ _*m*	[OUT] The set of regex matches.
_↩ _*e*	[IN] The regex to search for in `s`.
_↩ _*f*	[IN] The search flags.

Return values

true	A match was found within the string.
false	No match was found within the string, the content of m is undefined.

Exceptions

an	exception of type regex_error.

References std::regex_constants::match_default, and regex_search().

regex_search() [5/7]

```
template<typename _Ch_traits, typename _Ch_alloc, typename _Alloc, typename _Ch_type, typename _↩
Rx_traits>
```

```
bool std::regex_search (
            const basic_string< _Ch_type, _Ch_traits, _Ch_alloc > && ,
            match_results< typename basic_string< _Ch_type, _Ch_traits, _Ch_alloc >::const_↩
iterator, _Alloc > & ,
            const basic_regex< _Ch_type, _Rx_traits > & ,
            regex_constants::match_flag_type  = regex_constants::match_default)  [delete]
```

Prevent unsafe attempts to get match_results from a temporary string.
References std::regex_constants::match_default.

regex_search() [6/7]

```
template<typename _Ch_traits, typename _Ch_alloc, typename _Alloc, typename _Ch_type, typename _↩
Rx_traits>
bool std::regex_search (
            const basic_string< _Ch_type, _Ch_traits, _Ch_alloc > & __s,
            match_results< typename basic_string< _Ch_type, _Ch_traits, _Ch_alloc >::const_↩
iterator, _Alloc > & __m,
            const basic_regex< _Ch_type, _Rx_traits > & __e,
            regex_constants::match_flag_type __f = regex_constants::match_default)  [inline]
```

Searches for a regular expression within a string.

Parameters

_↩ _s	[IN] A C++ string to search for the regex.
_↩ _m	[OUT] The set of regex matches.
_↩ _e	[IN] The regex to search for in s.
_↩ _f	[IN] The search flags.

Return values

true	A match was found within the string.
false	No match was found within the string, the content of m is undefined.

Exceptions

an	exception of type regex_error.

References std::basic_string< _CharT, _Traits, _Alloc >::begin(), std::basic_string< _CharT, _Traits, _Alloc >::end(), std::regex_constants::match_default, and regex_search().

regex_search() [7/7]

```
template<typename _Ch_traits, typename _String_allocator, typename _Ch_type, typename _Rx_traits>
bool std::regex_search (
            const basic_string< _Ch_type, _Ch_traits, _String_allocator > & __s,
            const basic_regex< _Ch_type, _Rx_traits > & __e,
            regex_constants::match_flag_type __flags = regex_constants::match_default)  [inline]
```

Searches for a regular expression within a string.

Parameters

__s	[IN] The string to search.
__e	[IN] The regular expression to search for.
__flags	[IN] Search policy flags.

Return values

true	A match was found within the string.
false	No match was found within the string.

Exceptions

an	exception of type regex_error.

References std::regex_constants::match_default, and regex_search().

swap() [1/2]

```
template<typename _Ch_type, typename _Rx_traits>
void swap (
            basic_regex< _Ch_type, _Rx_traits > & __lhs,
            basic_regex< _Ch_type, _Rx_traits > & __rhs)  [related]
```

Swaps the contents of two regular expression objects.

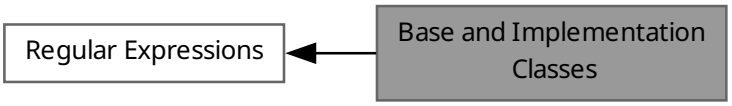
Parameters

__lhs	First regular expression.
__rhs	Second regular expression.

swap() [2/2]

```
template<typename _Bi_iter, typename _Alloc>
void swap (
            match_results< _Bi_iter, _Alloc > & __lhs,
            match_results< _Bi_iter, _Alloc > & __rhs)  [related]
```

Swaps two match results.



Parameters

__lhs	A match result.
__rhs	A match result.

The contents of the two match_results objects are swapped.

3.13.4 Base and Implementation Classes

Collaboration diagram for Base and Implementation Classes:

Classes

- struct std::__detail::_BracketMatcher< _TraitsT, __icase, __collate >
- class std::__detail::_Compiler< _TraitsT >
- class std::__detail::_Executor< _BiIter, _Alloc, _TraitsT >
- class std::__detail::_Scanner< _CharT >
- class std::__detail::_StateSeq< _TraitsT >

Typedefs

- template<typename _CharT>
  using **std::__detail::_Matcher**
- typedef long **std::__detail::_StateIdT**

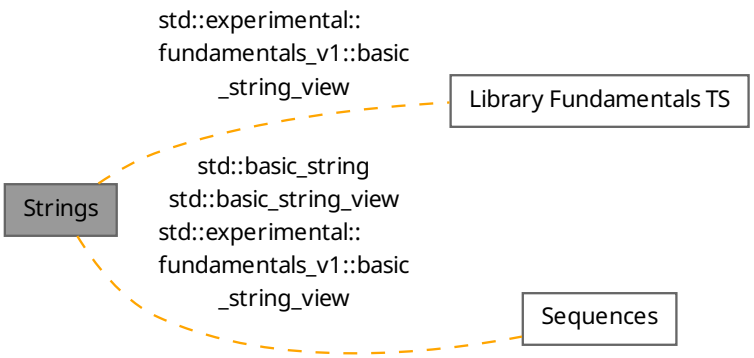
Enumerations

- enum std::__detail::_Opcode : int {
  _S_opcode_unknown , **_S_opcode_alternative** , **_S_opcode_repeat** , **_S_opcode_backref** ,
  _S_opcode_line_begin_assertion , **_S_opcode_line_end_assertion** , **_S_opcode_word_boundary** , **_S_↩opcode_subexpr_lookahead** ,
  _S_opcode_subexpr_begin , **_S_opcode_subexpr_end** , **_S_opcode_dummy** , **_S_opcode_match** ,
  _S_opcode_accept }

Variables

- constexpr _StateIdT **std::__detail::_S_invalid_state_id**

3.13.4.1 Detailed Description



3.13.4.2 Enumeration Type Documentation

_Opcode

`enum std::__detail::_Opcode : int`
Operation codes that define the type of transitions within the base NFA that represents the regular expression.

3.14 Strings

Collaboration diagram for Strings:

Classes

- class std::basic_string< _CharT, _Traits, _Alloc >
- class std::basic_string_view< _CharT, _Traits >
- class std::experimental::fundamentals_v1::basic_string_view< _CharT, _Traits >
- struct std::char_traits< _CharT >

Typedefs

- typedef basic_string< char > std::string
- typedef basic_string< char16_t > std::u16string
- typedef basic_string< char32_t > std::u32string
- typedef basic_string< wchar_t > std::wstring

3.14.1 Detailed Description

3.14.2 Typedef Documentation

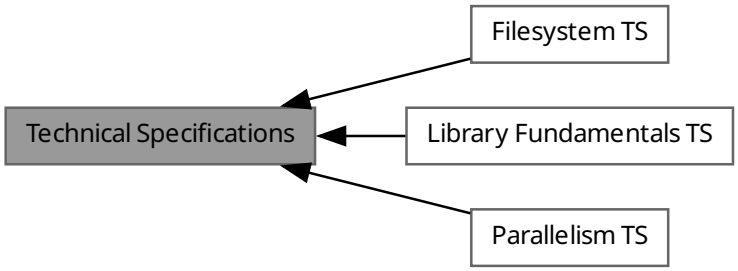
string

`typedef basic_string<char> std::string`
A string of `char`.

u16string

```
typedef basic_string<char16_t> std::u16string
```
A string of `char16_t`.

u32string



```
typedef basic_string<char32_t> std::u32string
```
A string of `char32_t`.

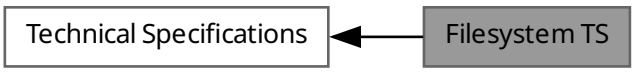
wstring

```
typedef basic_string<wchar_t> std::wstring
```
A string of `wchar_t`.

3.15 Technical Specifications

Collaboration diagram for Technical Specifications:

Topics



- Filesystem TS
- Library Fundamentals TS
- Parallelism TS

3.15.1 Detailed Description

Components specified by various Technical Specifications.
As indicated by the std::experimental namespace and the header paths, the contents of these Technical Specifications are experimental and not part of the C++ standard. As such the interfaces and implementations may change in the future, and there is **no guarantee of compatibility between different GCC releases** for these features.

3.15.2 Filesystem TS

Collaboration diagram for Filesystem TS:

Files

- file filesystem

Classes

- class std::experimental::filesystem::v1::filesystem_error
- class std::experimental::filesystem::v1::path::iterator
- class std::experimental::filesystem::v1::path
- struct std::experimental::filesystem::v1::space_info

Typedefs

- using std::experimental::filesystem::file_time_type

Enumerations

- enum class std::experimental::filesystem::copy_options : unsigned short {
  none , **skip_existing** , **overwrite_existing** , **update_existing** ,
  recursive , **copy_symlinks** , **skip_symlinks** , **directories_only** ,
  create_symlinks , **create_hard_links** }
- enum class std::experimental::filesystem::directory_options : unsigned char { **none** , **follow_directory_symlink** , **skip_permission_denied** }

3.15.2.1 Detailed Description

Utilities for performing operations on file systems and their components, such as paths, regular files, and directories. ISO/IEC TS 18822:2015 C++ File System Technical Specification

Since

C++11

Remarks

Link using `-lstdc++fs` to use these types and functions.

3.15.2.2 Typedef Documentation

file_time_type

```
using std::experimental::filesystem::v1::file_time_type
```

The type used for file timestamps.

3.15.2.3 Enumeration Type Documentation

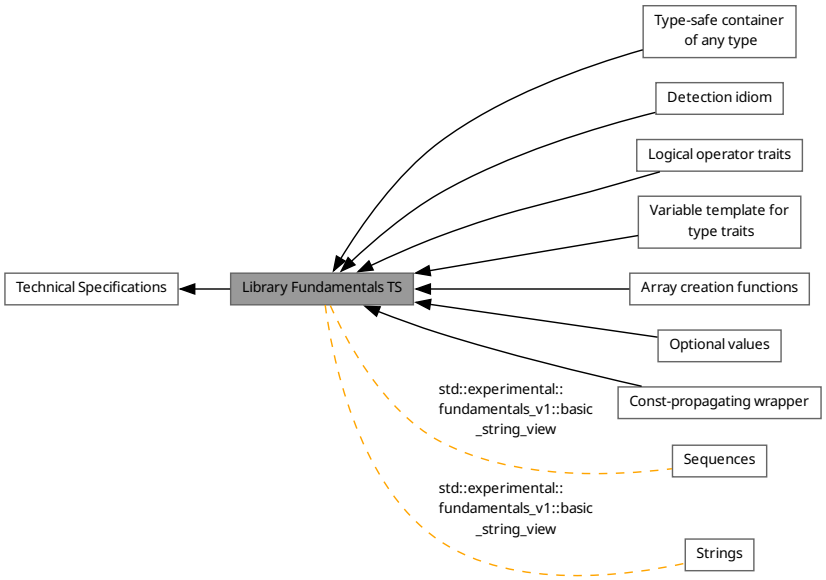
copy_options

`enum class std::experimental::filesystem::v1::copy_options : unsigned short [strong]`
Bitmask type controlling effects of `filesystem::copy`.

directory_options

`enum class std::experimental::filesystem::v1::directory_options : unsigned char [strong]`
Bitmask type controlling directory iteration.

file_type



`enum class std::experimental::filesystem::v1::file_type : signed char [strong]`
Enumerated type representing the type of a file.

perms

`enum class std::experimental::filesystem::v1::perms : unsigned [strong]`
Bitmask type representing file access permissions.

3.15.3 Library Fundamentals TS

Collaboration diagram for Library Fundamentals TS:

Topics

- Array creation functions
- Const-propagating wrapper
- Detection idiom
- Logical operator traits

- Optional values
- Type-safe container of any type
- Variable template for type traits

Files

- file algorithm
- file any
- file array
- file chrono
- file deque
- file forward_list
- file functional
- file iterator
- file list
- file map
- file memory
- file memory_resource
- file numeric
- file optional
- file random
- file ratio
- file regex
- file set
- file string
- file string_view
- file system_error
- file tuple
- file type_traits
- file unordered_map
- file unordered_set
- file utility
- file vector
- file propagate_const

Classes

- class std::experimental::fundamentals_v1::basic_string_view< _CharT, _Traits >

3.15.3.1 Detailed Description

Components defined by the *C++ Extensions for Library Fundamentals* Technical Specification, versions 1 and 2.

- ISO/IEC TS 19568:2015 C++ Extensions for Library Fundamentals
- ISO/IEC TS 19568:2017 C++ Extensions for Library Fundamentals, Version 2

3.15.3.2 Array creation functions

Collaboration diagram for Array creation functions:

Functions

- template<typename _Tp, size_t _Nm, size_t... _Idx>
  constexpr array< remove_cv_t< _Tp >, _Nm > **std::experimental::__to_array** (_Tp(&__a)[_Nm]↩
  , index_sequence< _Idx... >)
- template<typename _Dest = void, typename... _Types>
  constexpr array< typename __make_array_elem< _Dest, _Types... >::type, sizeof...(_Types)> std::experimental::make_array
  (_Types &&... __t)
- template<typename _Tp, size_t _Nm>
  constexpr array< remove_cv_t< _Tp >, _Nm > std::experimental::to_array (_Tp(&__a)[_Nm]) noexcept(is_nothrow_constructible<
  remove_cv_t< _Tp >, _Tp & >::value)

3.15.3.2.1 Detailed Description

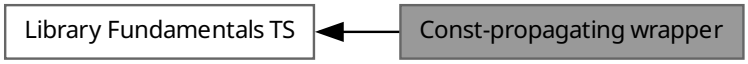
Array creation functions as described in N4529, Working Draft, C++ Extensions for Library Fundamentals, Version 2

3.15.3.2.2 Function Documentation

make_array()

```
template<typename _Dest = void, typename...  _Types>
array< typename __make_array_elem< _Dest, _Types...  >::type, sizeof...(_Types)> std::experimental::↩
fundamentals_v2::make_array (
            _Types &&...  __t)  [constexpr]
```

Create a std::array from a variable-length list of arguments.
References std::forward().



to_array()

```
template<typename _Tp, size_t _Nm>
array< remove_cv_t< _Tp >, _Nm > std::experimental::fundamentals_v2::to_array (
            _Tp(&) __a[_Nm])  [constexpr], [noexcept]
```

Create a std::array from an array.

3.15.3.3 Const-propagating wrapper

Collaboration diagram for Const-propagating wrapper:

Classes

- class std::experimental::fundamentals_v2::propagate_const< _Tp >

Functions

- template<typename _Tp>
  constexpr const _Tp & **std::experimental::get_underlying** (const propagate_const< _Tp > &__pt) noexcept

- template<typename _Tp, typename _Up>
  constexpr bool **std::experimental::operator>=** (const propagate_const< _Tp > &__pt, const _Up &__u)
- template<typename _Tp, typename _Up>
  constexpr bool **std::experimental::operator>=** (const propagate_const< _Tp > &__pt, const propagate_const< _Up > &__pu)
- template<typename _Tp>
  constexpr enable_if_t< __is_swappable< _Tp >::value, void > **std::experimental::swap** (propagate_const< _Tp > &__pt, propagate_const< _Tp > &__pt2) noexcept(__is_nothrow_swappable< _Tp >::value)

3.15.3.3.1 Detailed Description

A const-propagating wrapper that propagates const to pointer-like members, as described in n4388 "A Proposal to Add a Const-Propagating Wrapper to the Standard Library".

3.15.3.4 Detection idiom

Collaboration diagram for Detection idiom:

- #define __cpp_lib_experimental_detect

- template<typename...>
  using std::experimental::void_t
- template<typename _Default, template< typename... > class _Op, typename... _Args>
  using std::experimental::detected_or
- template<typename _Default, template< typename... > class _Op, typename... _Args>
  using std::experimental::detected_or_t
- template<template< typename... > class _Op, typename... _Args>
  using std::experimental::detected_t
- template<template< typename... > class _Op, typename... _Args>
  using std::experimental::is_detected
- template<typename _Expected, template< typename... > class _Op, typename... _Args>
  using std::experimental::is_detected_exact
- template<typename _To, template< typename... > class _Op, typename... _Args>
  using std::experimental::is_detected_convertible
- template<template< typename... > class _Op, typename... _Args>
  constexpr bool std::experimental::is_detected_v
- template<typename _Expected, template< typename... > class _Op, typename... _Args>
  constexpr bool std::experimental::is_detected_exact_v
- template<typename _To, template< typename... > class _Op, typename... _Args>
  constexpr bool std::experimental::is_detected_convertible_v

3.15.3.4.1 Detailed Description

Since

Library Fundamentals TS v2. C++14.

3.15.3.4.2 Macro Definition Documentation

__cpp_lib_experimental_detect

```
#define __cpp_lib_experimental_detect
```

A metafunction that always yields void, used for detecting valid types.

3.15.3.4.3 Typedef Documentation

detected_or

```
template<typename _Default, template< typename...  > class _Op, typename...  _Args>
using std::experimental::fundamentals_v2::detected_or
```

A metafunction that always yields void, used for detecting valid types.

detected_or_t

```
template<typename _Default, template< typename...  > class _Op, typename...  _Args>
using std::experimental::fundamentals_v2::detected_or_t
```

A metafunction that always yields void, used for detecting valid types.

detected_t

```
template<template< typename...  > class _Op, typename...  _Args>
using std::experimental::fundamentals_v2::detected_t
```

A metafunction that always yields void, used for detecting valid types.

is_detected

```
template<template< typename... > class _Op, typename... _Args>
using std::experimental::fundamentals_v2::is_detected
```
A metafunction that always yields void, used for detecting valid types.

is_detected_convertible

```
template<typename _To, template< typename... > class _Op, typename... _Args>
using std::experimental::fundamentals_v2::is_detected_convertible
```
A metafunction that always yields void, used for detecting valid types.

is_detected_exact

```
template<typename _Expected, template< typename... > class _Op, typename... _Args>
using std::experimental::fundamentals_v2::is_detected_exact
```
A metafunction that always yields void, used for detecting valid types.

void_t

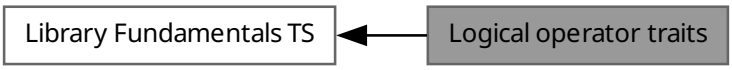
```
template<typename...>
using std::experimental::fundamentals_v2::void_t
```
A metafunction that always yields void, used for detecting valid types.

3.15.3.4.4 Variable Documentation

is_detected_convertible_v

```
template<typename _To, template< typename... > class _Op, typename... _Args>
bool std::experimental::fundamentals_v2::is_detected_convertible_v [constexpr]
```
A metafunction that always yields void, used for detecting valid types.

is_detected_exact_v



```
template<typename _Expected, template< typename... > class _Op, typename... _Args>
bool std::experimental::fundamentals_v2::is_detected_exact_v [constexpr]
```
A metafunction that always yields void, used for detecting valid types.

is_detected_v

```
template<template< typename... > class _Op, typename... _Args>
bool std::experimental::fundamentals_v2::is_detected_v [constexpr]
```
A metafunction that always yields void, used for detecting valid types.

3.15.3.5 Logical operator traits

Collaboration diagram for Logical operator traits:

- #define **__cpp_lib_experimental_logical_traits**
- template<typename... _Bn>
  constexpr bool **std::experimental::conjunction_v**
- template<typename... _Bn>
  constexpr bool **std::experimental::disjunction_v**
- template<typename _Pp>
  constexpr bool **std::experimental::negation_v**

3.15.3.5.1 Detailed Description

Since

Library Fundamentals TS v2. C++14.

3.15.3.6 Optional values

Collaboration diagram for Optional values:

Classes

- class std::experimental::fundamentals_v1::bad_optional_access
- struct std::experimental::fundamentals_v1::in_place_t
- struct std::experimental::fundamentals_v1::nullopt_t
- class std::experimental::fundamentals_v1::optional< _Tp >

Macros

- #define **__cpp_lib_experimental_optional**

Variables

- constexpr in_place_t std::experimental::in_place
- constexpr nullopt_t std::experimental::nullopt

3.15.3.6.1 Detailed Description

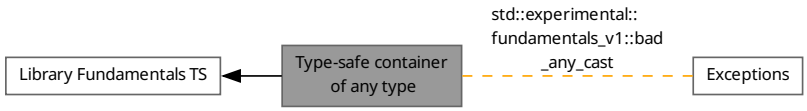
Class template for optional values and surrounding facilities, as described in n3793 "A proposal to add a utility class to represent optional objects (Revision 5)".

3.15.3.6.2 Variable Documentation

in_place

```
in_place_t std::experimental::fundamentals_v1::in_place  [constexpr]
```

Tag for in-place construction.



nullopt

```
nullopt_t std::experimental::fundamentals_v1::nullopt  [constexpr]
```

Tag to disengage optional objects.

3.15.3.7 Type-safe container of any type

Collaboration diagram for Type-safe container of any type:

Classes

- class std::experimental::fundamentals_v1::any
- class std::experimental::fundamentals_v1::bad_any_cast

Macros

- #define **__cpp_lib_experimental_any**

Functions

- static void **std::experimental::fundamentals_v1::any::_Manager_external< _Tp >::_S_manage** (_Op __↩ which, const any *__anyp, _Arg *__arg)
- static void **std::experimental::fundamentals_v1::any::_Manager_internal< _Tp >::_S_manage** (_Op __↩ which, const any *__anyp, _Arg *__arg)
- template<typename _ValueType>
  _ValueType std::experimental::any_cast (const any &__any)
- void std::experimental::swap (any &__x, any &__y) noexcept
- template<typename _ValueType>
  _ValueType std::experimental::any_cast (any &__any)
- template<typename _ValueType, typename enable_if<!is_move_constructible< _ValueType >::value||is_lvalue_reference< _ValueType >::value, bool >::type = true>
  _ValueType std::experimental::any_cast (any &&__any)

- template<typename _ValueType>
  const _ValueType * std::experimental::any_cast (const any *__any) noexcept
- template<typename _ValueType>
  _ValueType * std::experimental::any_cast (any *__any) noexcept

3.15.3.7.1 Detailed Description

A type-safe container for single values of value types, as described in n3804 "Any Library Proposal (Revision 3)".

3.15.3.7.2 Function Documentation

any_cast() [1/5]

```
template<typename _ValueType, typename enable_if<!is_move_constructible< _ValueType >::value||is_lvalue_reference
_ValueType >::value, bool >::type = true>
_ValueType std::experimental::fundamentals_v1::any_cast (
             any && __any)  [inline]
```

Access the contained object.

Template Parameters

_ValueType	A reference or CopyConstructible type.

Parameters

__any	The object to access.

Returns

The contained object.

Exceptions

bad_any_cast	If `__any.type() != typeid(remove_reference_t<_ValueType>)`

References any_cast().

any_cast() [2/5]

```
template<typename _ValueType>
_ValueType std::experimental::fundamentals_v1::any_cast (
             any & __any)  [inline]
```

Access the contained object.

Template Parameters

_ValueType	A reference or CopyConstructible type.

Parameters

__any	The object to access.

Returns

The contained object.

Exceptions

bad_any_cast	If `__any.type() != typeid(remove_reference_t<_ValueType>)`

References any_cast().

any_cast() [3/5]

```
template<typename _ValueType>
_ValueType * std::experimental::fundamentals_v1::any_cast (
             any * __any)  [inline], [noexcept]
```

Access the contained object.

Template Parameters

_ValueType	The type of the contained object.

Parameters

__any	A pointer to the object to access.

Returns

The address of the contained object if `__any != nullptr && __any.type() == typeid(_ValueType)` , otherwise a null pointer.

any_cast() [4/5]

```
template<typename _ValueType>
_ValueType std::experimental::fundamentals_v1::any_cast (
             const any & __any)  [inline]
```

Access the contained object.

Template Parameters

_ValueType	A const-reference or CopyConstructible type.

Parameters

__any	The object to access.

Returns

The contained object.

Exceptions

bad_any_cast	If `__any.type() != typeid(remove_reference_t<_ValueType>)`

References any_cast().
Referenced by any_cast(), any_cast(), and any_cast().

any_cast() [5/5]

```
template<typename _ValueType>
const _ValueType * std::experimental::fundamentals_v1::any_cast (
            const any * __any)  [inline], [noexcept]
```

Access the contained object.

Template Parameters

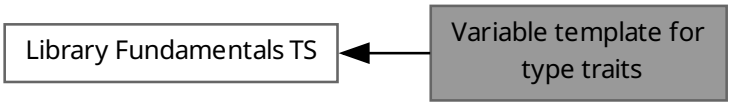
_ValueType	The type of the contained object.

Parameters

__any	A pointer to the object to access.

Returns

The address of the contained object if `__any != nullptr && __any.type() == typeid(_↩ ValueType)` , otherwise a null pointer.



swap()

```
void std::experimental::fundamentals_v1::swap (
            any & __x,
            any & __y)  [inline], [noexcept]
```

Exchange the states of two `any` objects.

3.15.3.8 Variable template for type traits

Collaboration diagram for Variable template for type traits:

- #define **__cpp_lib_experimental_type_trait_variable_templates**
- template<typename _Tp>
  constexpr bool **std::experimental::is_void_v**
- template<typename _Tp>
  constexpr bool **std::experimental::is_null_pointer_v**
- template<typename _Tp>
  constexpr bool **std::experimental::is_integral_v**
- template<typename _Tp>
  constexpr bool **std::experimental::is_floating_point_v**

3.16.1 Detailed Description

Basic function and class templates used with the rest of the library. Includes pair, swap, forward/move helpers, declval, integer_sequence.

3.16.2 Function Documentation

pair() [1/2]

```
template<typename _T1, typename _T2>
pair (
            _T1 ,
            _T2 ) -> pair< _T1, _T2 >  [related]
```

Two pairs are equal iff their members are equal.

pair() [2/2]

```
template<class _T1, class _T2>
template<typename...  _Args1, typename...  _Args2>
std::pair< _T1, _T2 >::pair (
            piecewise_construct_t ,
            tuple< _Args1...  > __first,
            tuple< _Args2...  > __second)  [inline], [constexpr]
```

"piecewise construction" using a tuple of arguments for each member.

Parameters

__first	Arguments for the first member of the pair.
__second	Arguments for the second member of the pair.

The elements of each tuple will be used as the constructor arguments for the data members of the pair.
References pair().

__addressof()

```
template<typename _Tp>
_Tp * std::__addressof (
            _Tp & __r)  [inline], [constexpr], [noexcept]
```

Same as C++11 std::addressof.
Referenced by std::back_insert_iterator< _Container >::back_insert_iterator(), std::basic_istringstream< char >::basic_istringstream(), std::basic_istringstream< char >::basic_istringstream(), std::basic_istringstream< char >::basic_istringstream(), std::basic_ostringstream< char >::basic_ostringstream(), std::basic_ostringstream< char >::basic_ostringstream(), std::basic_ostringstream< char >::basic_ostringstream(), std::basic_stringstream< char >::basic_stringstream(), std::basic_stringstream< char >::basic_stringstream(), std::basic_stringstream< char >::basic_stringstream(), std::front_insert_iterator< _Container >::front_insert_iterator(), std::insert_iterator< _Container >::insert_iterator(), std::istream_iterator< _Tp, _CharT, _Traits, _Dist >::istream_iterator(), std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator(), std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator(), __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if, std::basic_ios< _CharT, _Traits >::copyfmt(), std::forward_list< _Tp, _Alloc >::merge(), std::list< _Tp, _Alloc >::merge(), std::list< _Tp, _Alloc >::merge(), std::sub_match< const char * >::operator<<(), __gnu_debug::_Safe_iterator< _Base_iterator, map >, __gnu_debug::_Safe_local_iterator< _OtherIterator, _UContainer >::operator=(), std::basic_string< _CharT >::operator=(), std::deque< _Tp, _Alloc >::operator=(), std::forward_list< _Tp, _Alloc >::operator=(), std::list< _Tp, _Alloc >::operator=(), std::vector< _Tp, _Alloc >::operator=(), std::sub_match< const char * >::operator==(), std::basic_istringstream< char >::rdbuf(), std::basic_ostringstream< char >::rdbuf(), std::basic_stringstream< char >::rdbuf(), std::list< _Tp, polymorphic_allocator< _Tp > >::sp, and std::list< _Tp, polymorphic_allocator< _Tp > >::splice().

__invoke()

```
template<typename _Callable, typename...  _Args>
__invoke_result< _Callable, _Args...  >::type std::__invoke (
            _Callable && __fn,
            _Args &&...  __args)  [constexpr], [noexcept]
```

Invoke a callable object.
References forward().
Referenced by std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref(), and std::once_flag::call_once.

addressof()

```
template<typename _Tp>
_Tp * std::addressof (
            _Tp & __r)  [inline], [constexpr], [noexcept]
```

Returns the actual address of the object or function referenced by r, even in the presence of an overloaded operator&.

Parameters

↩ _↩ ↩ _↩ *r*	Reference to an object or function.

Returns

The actual address.

Since

C++11

Referenced by std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref(), std::function_ref< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::function_ref(), _Destroy(), _Destroy_n(), std::copyable_function< _Res(_ArgTypes...) _GLIBCXX_MOF_CV noexcept(_Noex)>::operator=(), and std::move_only_function< _Res

declval()

```
template<typename _Tp>
auto std::declval () -> decltype(__declval< _Tp >(0))  [noexcept]
```

Utility to simplify expressions used in unevaluated operands

Since

C++11

Referenced by std::vector< _Tp, polymorphic_allocator< _Tp > >::vector(), and std::unique_ptr< _State >::operator*().

forward() [1/2]

```
template<typename _Tp>
_Tp && std::forward (
            typename std::remove_reference< _Tp >::type && __t)  [constexpr], [noexcept]
```

Forward an rvalue.

Returns

The parameter cast to the specified type.

This function is used to implement "perfect forwarding".

Since

C++11

forward() [2/2]

```
template<typename _Tp>
_Tp && std::forward (
            typename std::remove_reference< _Tp >::type & __t)  [constexpr], [noexcept]
```

Forward an lvalue.

Returns

The parameter cast to the specified type.

This function is used to implement "perfect forwarding".

Since

C++11

forward_as_tuple()

```
template<typename...  _Elements>
tuple< _Elements &&...  > std::forward_as_tuple (
            _Elements &&...  __args)  [constexpr], [noexcept]
```

Create a tuple of lvalue or rvalue references to the arguments.
References forward().

forward_like()

```
template<typename _Tp, typename _Up>
__like_t< _Tp, _Up > std::forward_like (
            _Up && __x)  [nodiscard], [constexpr], [noexcept]
```

Forward with the cv-qualifiers and value category of another type.

Template Parameters

_Tp	An lvalue reference or rvalue reference.
_Up	An lvalue reference type deduced from the function argument.

Parameters

_↩ _x	An lvalue.

Returns

__x converted to match the qualifiers of _Tp.

Since

C++23

get() [1/4]

```
template<size_t __i, typename...  _Elements>
const __tuple_element_t< __i, tuple< _Elements...  > > && std::get (
            const tuple< _Elements...  > && __t)  [constexpr], [noexcept]
```

Return a const rvalue reference to the ith element of a const tuple rvalue.
References forward().

get() [2/4]

```
template<size_t __i, typename...  _Elements>
const __tuple_element_t< __i, tuple< _Elements...  > > & std::get (
            const tuple< _Elements...  > & __t)  [constexpr], [noexcept]
```

Return a const reference to the ith element of a const tuple.

get() [3/4]

```
template<size_t __i, typename...  _Elements>
__tuple_element_t< __i, tuple< _Elements...  > > && std::get (
            tuple< _Elements...  > && __t)  [constexpr], [noexcept]
```

Return an rvalue reference to the ith element of a tuple rvalue.
References forward().

get() [4/4]

```
template<size_t __i, typename... _Elements>
__tuple_element_t< __i, tuple< _Elements... > > & std::get (
            tuple< _Elements... > & __t) [constexpr], [noexcept]
```

Return a reference to the ith element of a tuple.

make_pair()

```
template<typename _T1, typename _T2>
pair< typename __decay_and_strip< _T1 >::__type, typename __decay_and_strip< _T2 >::__type >
std::make_pair (
            _T1 && __x,
            _T2 && __y) [constexpr]
```

A convenience wrapper for creating a pair from two objects.

Parameters

_↩ _x	The first object.
_↩ _y	The second object.

Returns

A newly-constructed pair<> object of the appropriate type.

The C++98 standard says the objects are passed by reference-to-const, but C++03 says they are passed by value (this was LWG issue #181).
Since C++11 they have been passed by forwarding reference and then forwarded to the new members of the pair. To create a pair with a member of reference type, pass a `reference_wrapper` to this function.
References forward().

make_tuple()

```
template<typename... _Elements>
tuple< typename __decay_and_strip< _Elements >::__type... > std::make_tuple (
            _Elements &&... __args) [constexpr]
```

Create a tuple containing copies of the arguments.
References forward().

move()

```
template<typename _Tp>
std::remove_reference< _Tp >::type && std::move (
            _Tp && __t) [constexpr], [noexcept]
```

Convert a value to an rvalue.

Parameters

↩ _↩ ↩ _↩ *t*	A thing of arbitrary type.

Returns

The parameter cast to an rvalue-reference to allow moving it.

Since

C++11

noexcept (
            _Tp & __x)  [constexpr], [noexcept]
```

Conditionally convert a value to an rvalue.

Parameters

_↩ _x	A thing of arbitrary type.

Returns

The parameter, possibly cast to an rvalue-reference.

Same as std::move unless the type's move constructor could throw and the type is copyable, in which case an lvalue-reference is returned instead.

Since

C++11

References move().

operator<=>() [1/2]

```
template<typename _T1, typename _T2, typename _U1, typename _U2>
common_comparison_category_t< __detail::__synth3way_t< _T1, _U1 >, __detail::__synth3way_t< _T2,
_U2 > > operator<=> (
            const pair< _T1, _T2 > & __x,
            const pair< _U1, _U2 > & __y)  [related]
```

Defines a lexicographical order for pairs.
For two pairs of comparable types, `P` is ordered before `Q` if `P.first` is less than `Q.first`, or if `P.first` and `Q.first` are equivalent (neither is less than the other) and `P.second` is less than `Q.second`.

operator<=>() [2/2]

```
template<typename _T1, typename _T2, typename _U1, typename _U2>
common_comparison_category_t< __detail::__synth3way_t< _T1, _U1 >, __detail::__synth3way_t< _T2,
_U2 > > operator<=> (
            const pair< _T1, _T2 > & __x,
            const pair< _U1, _U2 > & __y)  [related]
```

Defines a lexicographical order for pairs.
For two pairs of comparable types, `P` is ordered before `Q` if `P.first` is less than `Q.first`, or if `P.first` and `Q.first` are equivalent (neither is less than the other) and `P.second` is less than `Q.second`.

operator==() [1/2]

```
template<typename _T1, typename _T2, typename _U1, typename _U2>
bool operator== (
            const pair< _T1, _T2 > & __x,
            const pair< _U1, _U2 > & __y)  [related]
```

Two pairs are equal iff their members are equal.

operator==() [2/2]

```
template<typename _T1, typename _T2, typename _U1, typename _U2>
bool operator== (
            const pair< _T1, _T2 > & __x,
            const pair< _U1, _U2 > & __y)  [related]
```

Two pairs are equal iff their members are equal.

swap() [1/5]

```
template<typename _T1, typename _T2>
enable_if< __and_< __is_swappable< _T1 >, __is_swappable< _T2 > >::value >::type swap (
            pair< _T1, _T2 > & __x,
            pair< _T1, _T2 > & __y)  [related]
```

Swap overload for pairs. Calls std::pair::swap().

Note

This std::swap overload is not declared in C++03 mode, which has performance implications, e.g. see https://gcc.gnu.org/PR38466

swap() [2/5]

```
template<typename _T1, typename _T2>
enable_if< __and_< __is_swappable< _T1 >, __is_swappable< _T2 > >::value >::type swap (
            pair< _T1, _T2 > & __x,
            pair< _T1, _T2 > & __y)  [related]
```

Swap overload for pairs. Calls std::pair::swap().

Note

This std::swap overload is not declared in C++03 mode, which has performance implications, e.g. see https://gcc.gnu.org/PR38466

swap() [3/5]

```
template<typename _Tp>
void std::swap (
            _Tp & __a,
            _Tp & __b)  [inline], [constexpr], [noexcept]
```

Swaps two values.

Parameters

_↩ _a	A thing of arbitrary type.

_↩ _b	Another thing of arbitrary type.

swap() [4/5]

```
template<typename _Tp, size_t _Nm>
void std::swap (
            _Tp(&) __a[_Nm],
            _Tp(&) __b[_Nm])  [inline], [constexpr], [noexcept]
```

Swap the contents of two arrays.

swap() [5/5]

```
template<typename...  _Elements>
enable_if< __and_< __is_swappable< _Elements >...  >::value >::type std::swap (
            tuple< _Elements...  > & __x,
            tuple< _Elements...  > & __y)  [inline], [constexpr], [delete], [noexcept]
```

Exchange the values of two tuples.

tie()

```
template<typename...  _Elements>
tuple< _Elements &...  > std::tie (
            _Elements &...  __args)  [constexpr], [noexcept]
```

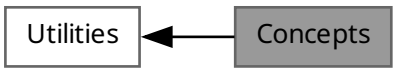
Return a tuple of lvalue references bound to the arguments.
Referenced by std::basic_ios< _CharT, _Traits >::copyfmt().

tuple_cat()

```
template<typename...  _Tpls, typename = typename enable_if<__and_<__is_tuple_like<_Tpls>...>::↩
value>::type>
auto std::tuple_cat (
            _Tpls &&...  __tpls) -> typename __tuple_cat_result< _Tpls...  >::__type  [constexpr]
```

Create a `tuple` containing all elements from multiple tuple-like objects.
References forward().

3.16.3 Variable Documentation



piecewise_construct

```
piecewise_construct_t std::piecewise_construct  [inline], [constexpr]
```

Tag for piecewise construction of std::pair objects.
Referenced by std::map< _Key, _Tp, _Cmp, polymorphic_allocator< pair< const _Key, _Tp > > >::operator[]().

  constexpr _Mem_fn< _Tp _Class::* > std::mem_fn (_Tp _Class::*__pm) noexcept

3.16.5.1 Detailed Description

Function objects, or *functors*, are objects with an `operator()` defined and accessible. They can be passed as arguments to algorithm templates and used in place of a function pointer. Not only is the resulting expressiveness of the library increased, but the generated code can be more efficient than what you might write by hand. When we refer to *functors*, then, generally we include function pointers in the description as well.
Often, functors are only created as temporaries passed to algorithm calls, rather than being created as named variables. Two examples taken from the standard itself follow. To perform a by-element addition of two vectors `a` and `b` containing `double`, and put the result in `a`, use

```
transform (a.begin(), a.end(), b.begin(), a.begin(), plus<double>());
```

To negate every element in `a`, use

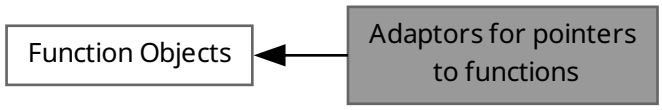
```
transform(a.begin(), a.end(), a.begin(), negate<double>());
```

The addition and negation functions will usually be inlined directly.
An *adaptable function object* is one which provides nested typedefs `result_type` and either `argument_type` (for a unary function) or `first_argument_type` and `second_argument_type` (for a binary function). Those typedefs are used by function object adaptors such as `bind2nd`. The standard library provides two class templates, `unary_function` and `binary_function`, which define those typedefs and so can be used as base classes of adaptable function objects.
Since C++11 the use of function object adaptors has been superseded by more powerful tools such as lambda expressions, `function<>`, and more powerful type deduction (using `auto` and `decltype`). The helpers for defining adaptable function objects are deprecated since C++11, and no longer part of the standard library since C++17. However, they are still defined and used by libstdc++ after C++17, as a conforming extension.

3.16.5.2 Function Documentation

mem_fn()

```
template<typename _Tp, typename _Class>
_Mem_fn< _Tp _Class::* > std::mem_fn (
            _Tp _Class::* __pm)  [inline], [constexpr], [noexcept]
```



Returns a function object that forwards to the member pointer pointer `pm`.
This allows a pointer-to-member to be transformed into a function object that can be called with an object expression as its first argument.
For a pointer-to-data-member the result must be called with exactly one argument, the object expression that would be used as the first operand in a `obj.*memptr` or `objp->*memptr` expression.
For a pointer-to-member-function the result must be called with an object expression and any additional arguments to pass to the member function, as in an expression like `(obj.*memfun)(args...)` or `(objp->*memfun)(args...)`.
The object expression can be a pointer, reference, `reference_wrapper`, or smart pointer, and the call wrapper will dereference it as needed to apply the pointer-to-member.

Since

C++11

3.16.5.3 Adaptors for pointers to functions

Collaboration diagram for Adaptors for pointers to functions:

Classes

- class std::pointer_to_binary_function< _Arg1, _Arg2, _Result >
- class std::pointer_to_unary_function< _Arg, _Result >

Functions

- template<typename _Arg, typename _Result>
  pointer_to_unary_function< _Arg, _Result > std::ptr_fun (_Result(*__x)(_Arg))
- template<typename _Arg1, typename _Arg2, typename _Result>
  pointer_to_binary_function< _Arg1, _Arg2, _Result > std::ptr_fun (_Result(*__x)(_Arg1, _Arg2))

3.16.5.3.1 Detailed Description

The advantage of function objects over pointers to functions is that the objects in the standard library declare nested typedefs describing their argument and result types with uniform names (e.g., `result_type` from the base classes `unary_function` and `binary_function`). Sometimes those typedefs are required, not just optional.
Adaptors are provided to turn pointers to unary (single-argument) and binary (double-argument) functions into function objects. The long-winded functor `pointer_to_unary_function` is constructed with a function pointer `f`, and its `operator()` called with argument `x` returns `f(x)`. The functor `pointer_to_binary_function` does the same thing, but with a double-argument `f` and `operator()`.
The function `ptr_fun` takes a pointer-to-function `f` and constructs an instance of the appropriate functor.

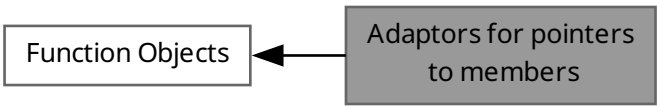
Deprecated Deprecated in C++11, no longer in the standard since C++17.

3.16.5.3.2 Function Documentation

ptr_fun() [1/2]

```
template<typename _Arg, typename _Result>
pointer_to_unary_function< _Arg, _Result > std::ptr_fun (
            _Result(* __x )(_Arg))  [inline]
```

One of the adaptors for function pointers.
References ptr_fun().
Referenced by ptr_fun(), and ptr_fun().



ptr_fun() [2/2]

```
template<typename _Arg1, typename _Arg2, typename _Result>
pointer_to_binary_function< _Arg1, _Arg2, _Result > std::ptr_fun (
            _Result(* __x )(_Arg1, _Arg2))  [inline]
```

One of the adaptors for function pointers.
References ptr_fun().

3.16.5.4 Adaptors for pointers to members

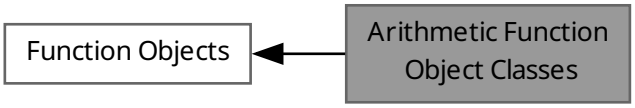
Collaboration diagram for Adaptors for pointers to members:

Classes

- class std::const_mem_fun1_ref_t< _Ret, _Tp, _Arg >
- class std::const_mem_fun1_t< _Ret, _Tp, _Arg >
- class std::const_mem_fun_ref_t< _Ret, _Tp >
- class std::const_mem_fun_t< _Ret, _Tp >
- class std::mem_fun1_ref_t< _Ret, _Tp, _Arg >
- class std::mem_fun1_t< _Ret, _Tp, _Arg >
- class std::mem_fun_ref_t< _Ret, _Tp >
- class std::mem_fun_t< _Ret, _Tp >

Functions

- template<typename _Ret, typename _Tp>
  mem_fun_t< _Ret, _Tp > **std::mem_fun** (_Ret(_Tp::*__f)())
- template<typename _Ret, typename _Tp, typename _Arg>
  mem_fun1_t< _Ret, _Tp, _Arg > **std::mem_fun** (_Ret(_Tp::*__f)(_Arg))
- template<typename _Ret, typename _Tp>
  mem_fun_ref_t< _Ret, _Tp > **std::mem_fun_ref** (_Ret(_Tp::*__f)())
- template<typename _Ret, typename _Tp, typename _Arg>
  mem_fun1_ref_t< _Ret, _Tp, _Arg > **std::mem_fun_ref** (_Ret(_Tp::*__f)(_Arg))



3.16.5.4.1 Detailed Description

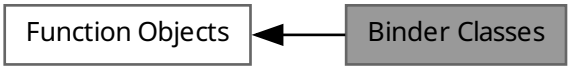
There are a total of 8 = 2^3 function objects in this family. (1) Member functions taking no arguments vs member functions taking one argument. (2) Call through pointer vs call through reference. (3) Const vs non-const member function.
All of this complexity is in the function objects themselves. You can ignore it by using the helper function `mem_fun` and `mem_fun_ref`, which create whichever type of adaptor is appropriate.

Deprecated Deprecated in C++11, no longer in the standard since C++17. Use `mem_fn` instead.

3.16.5.5 Arithmetic Function Object Classes

Collaboration diagram for Arithmetic Function Object Classes:

Classes



- struct std::divides< _Tp >
- struct std::divides< void >
- struct std::minus< _Tp >
- struct std::minus< void >

  constexpr _Bind_helper< __is_socketlike< _Func >::value, _Func, _BoundArgs... >::type std::bind (_Func &&↩ __f, _BoundArgs &&... __args)
- template<typename _Operation, typename _Tp>
  binder1st< _Operation > std::bind1st (const _Operation &__fn, const _Tp &__x)
- template<typename _Operation, typename _Tp>
  binder2nd< _Operation > std::bind2nd (const _Operation &__fn, const _Tp &__x)

3.16.5.6.1 Detailed Description

Binders turn functions/functors with two arguments into functors with a single argument, storing an argument to be applied later. For example, a variable `B` of type `binder1st` is constructed from a functor `f` and an argument `x`. Later, B's `operator()` is called with a single argument `y`. The return value is the value of `f(x,y)`. `B` can be *called* with various arguments (y1, y2, ...) and will in turn call `f(x,y1)`, `f(x,y2)`, ...

The function `bind1st` is provided to save some typing. It takes the function and an argument as parameters, and returns an instance of `binder1st`.

The type `binder2nd` and its creator function `bind2nd` do the same thing, but the stored argument is passed as the second parameter instead of the first, e.g., `bind2nd`(std::minus<float>(),1.3) will create a functor whose `operator()` accepts a floating-point number, subtracts 1.3 from it, and returns the result. (If `bind1st` had been used, the functor would perform *1.3 - x* instead.

Creator-wrapper functions like `bind1st` are intended to be used in calling algorithms. Their return values will be temporary objects. (The goal is to not require you to type names like `std::binder1st<std::plus<int>>` for declaring a variable to hold the return value from `bind1st(std::plus<int>(),5)`.

These become more useful when combined with the composition functions.

These functions are deprecated in C++11 and can be replaced by `std::bind` (or `std::tr1::bind`) which is more powerful and flexible, supporting functions with any number of arguments. Uses of `bind1st` can be replaced by `std::bind(f, x, std::placeholders::_1)` and `bind2nd` by `std::bind(f, std::↩ placeholders::_1, x)`.

3.16.5.6.2 Function Documentation

bind() [1/2]

```
template<typename _Result, typename _Func, typename...  _BoundArgs>
_Bindres_helper< _Result, _Func, _BoundArgs...  >::type std::bind (
            _Func && __f,
            _BoundArgs &&...  __args)  [inline], [constexpr]
```

Function template for std::bind<R>.

Since

C++11

References forward().

bind() [2/2]

```
template<typename _Func, typename...  _BoundArgs>
_Bind_helper< __is_socketlike< _Func >::value, _Func, _BoundArgs...  >::type std::bind (
            _Func && __f,
            _BoundArgs &&...  __args)  [inline], [constexpr]
```

Function template for std::bind.

Since

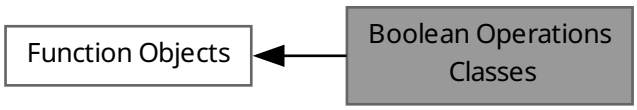
C++11

References forward().

bind1st()

```
template<typename _Operation, typename _Tp>
binder1st< _Operation > std::bind1st (
            const _Operation & __fn,
            const _Tp & __x)  [inline]
```

One of the binder functors.
References bind1st().
Referenced by bind1st().



bind2nd()

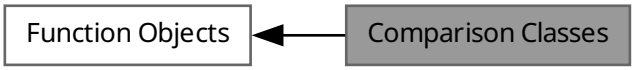
```
template<typename _Operation, typename _Tp>
binder2nd< _Operation > std::bind2nd (
            const _Operation & __fn,
            const _Tp & __x)  [inline]
```

One of the binder functors.
References bind2nd().
Referenced by bind2nd().

3.16.5.7 Boolean Operations Classes

Collaboration diagram for Boolean Operations Classes:

Classes



- struct std::logical_and< _Tp >
- struct std::logical_and< void >
- struct std::logical_not< _Tp >
- struct std::logical_not< void >
- struct std::logical_or< _Tp >
- struct std::logical_or< void >

3.16.5.7.1 Detailed Description

The library provides function objects for the logical operations: `&&`, ||, and `!`.

3.16.5.8 Comparison Classes

Collaboration diagram for Comparison Classes:

Classes

- struct std::equal_to< _Tp >
- struct std::equal_to< void >
- struct std::greater< _Tp >
- struct std::greater< void >
- struct std::greater_equal< _Tp >
- struct std::greater_equal< void >
- struct std::less< _Tp >
- struct std::less< void >
- struct std::less_equal< _Tp >

- struct std::less_equal< void >
- struct std::not_equal_to< _Tp >
- struct std::not_equal_to< void >

3.16.5.8.1 Detailed Description

The library provides six wrapper functors for all the basic comparisons in C++, like <.

3.16.5.9 Hashes

Collaboration diagram for Hashes:

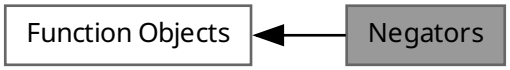
Classes

- struct std::hash< _Tp >
- struct std::hash< _Tp * >
- struct std::hash< bool >
- struct std::hash< char >
- struct std::hash< char16_t >
- struct std::hash< char32_t >
- struct std::hash< double >
- struct std::hash< float >
- struct std::hash< int >
- struct std::hash< long >
- struct std::hash< long double >
- struct std::hash< long long >
- struct std::hash< short >
- struct std::hash< signed char >
- struct std::hash< unsigned char >
- struct std::hash< unsigned int >
- struct std::hash< unsigned long >
- struct std::hash< unsigned long long >
- struct std::hash< unsigned short >
- struct std::hash< wchar_t >

Macros

- #define **_Cxx_hashtable_define_trivial_hash**(_Tp)

Variables



- template<typename _Tp, typename = void>
  constexpr bool **std::__is_hash_enabled_for**
- template<typename _Tp>
  constexpr bool **std::__is_hash_enabled_for**< **_Tp, __void_t**< **decltype(hash**< **_Tp** >()(**declval**< **_Tp** >()))> >

3.16.5.9.1 Detailed Description

Hashing functors taking a variable type and returning a `std::size_t`.

3.16.5.10 Negators

Collaboration diagram for Negators:

Classes

- class std::binary_negate< _Predicate >
- class std::unary_negate< _Predicate >

Functions

- template<typename _Predicate>
  constexpr unary_negate< _Predicate > std::not1 (const _Predicate &__pred)
- template<typename _Predicate>
  constexpr binary_negate< _Predicate > std::not2 (const _Predicate &__pred)

3.16.5.10.1 Detailed Description

The function templates `not1` and `not2` are function object adaptors, which each take a predicate functor and wrap it in an instance of `unary_negate` or `binary_negate`, respectively. Those classes are functors whose `operator()` evaluates the wrapped predicate function and then returns the negation of the result.
For example, given a vector of integers and a trivial predicate,

```
struct IntGreaterThanThree
  : public std::unary_function<int, bool>
{
    bool operator() (int x) const { return x > 3; }
};

std::find_if (v.begin(), v.end(), not1(IntGreaterThanThree()));
```

The call to `find_if` will locate the first index (i) of `v` for which `!(v[i] > 3)` is true.
The not1/unary_negate combination works on predicates taking a single argument. The not2/binary_negate combination works on predicates taking two arguments.

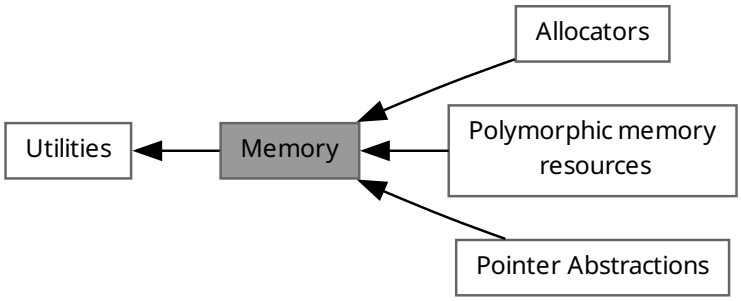
Deprecated Deprecated in C++17, no longer in the standard since C++20. Use `not_fn` instead.

3.16.5.10.2 Function Documentation

not1()

```
template<typename _Predicate>
unary_negate< _Predicate > std::not1 (
            const _Predicate & __pred)  [inline], [constexpr]
```

One of the negation functors.
References not1().
Referenced by not1().



not2()

```
template<typename _Predicate>
binary_negate< _Predicate > std::not2 (
            const _Predicate & __pred)  [inline], [constexpr]
```

One of the negation functors.
References not2().
Referenced by not2().

3.16.6 Memory

Collaboration diagram for Memory:

Topics

- Allocators
- Pointer Abstractions
- Polymorphic memory resources

Files

- file memory

Functions

- void * std::align (size_t __align, size_t __size, void *&__ptr, size_t &__space) noexcept

- template<size_t _Align, class _Tp>
  constexpr _Tp * std::assume_aligned (_Tp *__ptr) noexcept
- template<size_t _Align, class _Tp>
  bool std::is_sufficiently_aligned (_Tp *__ptr)
- template<typename _InputIterator, typename _ForwardIterator>
  constexpr _ForwardIterator std::uninitialized_copy (_InputIterator __first, _InputIterator __last, _ForwardIterator __result)
- template<typename _InputIterator, typename _Size, typename _ForwardIterator>
  constexpr _ForwardIterator std::uninitialized_copy_n (_InputIterator __first, _Size __n, _ForwardIterator __result)
- template<typename _ForwardIterator>
  constexpr void std::uninitialized_default_construct (_ForwardIterator __first, _ForwardIterator __last)
- template<typename _ForwardIterator, typename _Size>
  constexpr _ForwardIterator std::uninitialized_default_construct_n (_ForwardIterator __first, _Size __count)
- template<typename _ForwardIterator, typename _Tp = typename iterator_traits<_ForwardIterator>::value_type>
  constexpr void std::uninitialized_fill (_ForwardIterator __first, _ForwardIterator __last, const _Tp &__x)
- template<typename _ForwardIterator, typename _Size, typename _Tp = typename iterator_traits<_ForwardIterator>::value_type>
  constexpr _ForwardIterator std::uninitialized_fill_n (_ForwardIterator __first, _Size __n, const _Tp &__x)
- template<typename _InputIterator, typename _ForwardIterator>
  constexpr _ForwardIterator std::uninitialized_move (_InputIterator __first, _InputIterator __last, _ForwardIterator __result)
- template<typename _InputIterator, typename _Size, typename _ForwardIterator>
  constexpr pair< _InputIterator, _ForwardIterator > std::uninitialized_move_n (_InputIterator __first, _Size __count, _ForwardIterator __result)
- template<typename _ForwardIterator>
  constexpr void std::uninitialized_value_construct (_ForwardIterator __first, _ForwardIterator __last)
- template<typename _ForwardIterator, typename _Size>
  constexpr _ForwardIterator std::uninitialized_value_construct_n (_ForwardIterator __first, _Size __count)

3.16.6.1 Detailed Description

Components for memory allocation, deallocation, and management.

3.16.6.2 Function Documentation

align()

```
void * std::align (
            size_t __align,
            size_t __size,
            void *& __ptr,
            size_t & __space)  [inline], [noexcept]
```

Fit aligned storage in buffer.
This function tries to fit *__size* bytes of storage with alignment *__align* into the buffer *__ptr* of size *__space* bytes. If such a buffer fits then *__ptr* is changed to point to the first byte of the aligned storage and *__space* is reduced by the bytes used for alignment.
C++11 20.6.5 [ptr.align]

Parameters

__align	A fundamental or extended alignment value.
__size	Size of the aligned storage required.
__ptr	Pointer to a buffer of *__space* bytes.

__space	Size of the buffer pointed to by *__ptr*.

Returns

the updated pointer if the aligned storage fits, otherwise nullptr.

assume_aligned()

```
template<size_t _Align, class _Tp>
_Tp * std::assume_aligned (
            _Tp * __ptr)  [nodiscard], [constexpr], [noexcept]
```

Inform the compiler that a pointer is aligned.

Template Parameters

_Align	An alignment value (i.e. a power of two)
_Tp	An object type

Parameters

__ptr	A pointer that is aligned to _Align

C++20 20.10.6 [ptr.align]

is_sufficiently_aligned()

```
template<size_t _Align, class _Tp>
bool std::is_sufficiently_aligned (
            _Tp * __ptr)  [inline], [nodiscard]
```

Is `__ptr` aligned to an _Align byte boundary?

Template Parameters

_Align	An alignment value
_Tp	An object type

C++26 20.2.5 [ptr.align]

uninitialized_copy()

```
template<typename _InputIterator, typename _ForwardIterator>
_ForwardIterator std::uninitialized_copy (
            _InputIterator __first,
            _InputIterator __last,
            _ForwardIterator __result)  [inline], [constexpr]
```

Copies the range [first,last) into result.

Parameters

__first	An input iterator.
__last	An input iterator.
__result	A forward iterator.

Returns

__result + (__last - __first)

Like std::copy, but does not require an initialized output range.
References to_address().
Referenced by __gnu_parallel::parallel_sort_mwms_pu(), and uninitialized_move().

uninitialized_copy_n()

```
template<typename _InputIterator, typename _Size, typename _ForwardIterator>
_ForwardIterator std::uninitialized_copy_n (
            _InputIterator __first,
            _Size __n,
            _ForwardIterator __result)  [inline], [constexpr]
```

Copies the range [first,first+n) into result.

Parameters

__first	An input iterator.
__n	The number of elements to copy.
__result	An output iterator.

Returns

__result + __n

Since

C++11

Like copy_n(), but does not require an initialized output range.

uninitialized_default_construct()

```
template<typename _ForwardIterator>
void std::uninitialized_default_construct (
            _ForwardIterator __first,
            _ForwardIterator __last)  [inline], [constexpr]
```

Default-initializes objects in the range [first,last).

Parameters

__first	A forward iterator.

__last	A forward iterator.

Since

C++17

uninitialized_default_construct_n()

```
template<typename _ForwardIterator, typename _Size>
_ForwardIterator std::uninitialized_default_construct_n (
            _ForwardIterator __first,
            _Size __count)  [inline], [constexpr]
```

Default-initializes objects in the range [first,first+count).

Parameters

__first	A forward iterator.
__count	The number of objects to construct.

Returns

__first + __count

Since

C++17

uninitialized_fill()

```
template<typename _ForwardIterator, typename _Tp = typename iterator_traits<_ForwardIterator>::↩
value_type>
void std::uninitialized_fill (
            _ForwardIterator __first,
            _ForwardIterator __last,
            const _Tp & __x)  [inline], [constexpr]
```

Copies the value x into the range [first,last).

Parameters

__first	A forward iterator.
__last	A forward iterator.
__x	The source value.

Like std::fill, but does not require an initialized output range.
References to_address().

uninitialized_fill_n()

```
template<typename _ForwardIterator, typename _Size, typename _Tp = typename iterator_traits<_↩
ForwardIterator>::value_type>
```

```
_ForwardIterator std::uninitialized_fill_n (
            _ForwardIterator __first,
            _Size __n,
            const _Tp & __x)  [inline], [constexpr]
```

Copies the value x into the range [first,first+n).

Parameters

__first	A forward iterator.
__n	The number of copies to make.
__x	The source value.

Returns

__first + __n.

Like std::fill_n, but does not require an initialized output range.
References to_address().

uninitialized_move()

```
template<typename _InputIterator, typename _ForwardIterator>
_ForwardIterator std::uninitialized_move (
            _InputIterator __first,
            _InputIterator __last,
            _ForwardIterator __result)  [inline], [constexpr]
```

Move-construct from the range [first,last) into result.

Parameters

__first	An input iterator.
__last	An input iterator.
__result	An output iterator.

Returns

__result + (__first - __last)

Since

C++17

References uninitialized_copy().

uninitialized_move_n()

```
template<typename _InputIterator, typename _Size, typename _ForwardIterator>
pair< _InputIterator, _ForwardIterator > std::uninitialized_move_n (
            _InputIterator __first,
            _Size __count,
            _ForwardIterator __result)  [inline], [constexpr]
```

Move-construct from the range [first,first+count) into result.

Parameters

__first	An input iterator.
__count	The number of objects to initialize.
__result	An output iterator.

Returns

__result + __count

Since

C++17

uninitialized_value_construct()

```
template<typename _ForwardIterator>
void std::uninitialized_value_construct (
            _ForwardIterator __first,
            _ForwardIterator __last)  [inline], [constexpr]
```

Value-initializes objects in the range [first,last).

Parameters

__first	A forward iterator.
__last	A forward iterator.

Since

C++17

uninitialized_value_construct_n()

```
template<typename _ForwardIterator, typename _Size>
_ForwardIterator std::uninitialized_value_construct_n (
            _ForwardIterator __first,
            _Size __count)  [inline], [constexpr]
```

Value-initializes objects in the range [first,first+count).

Parameters

__first	A forward iterator.
__count	The number of objects to construct.

Returns

__result + __count

Since

C++17

3.16.6.3 Allocators

Collaboration diagram for Allocators:

3.16.6.3.1 Detailed Description

Classes encapsulating memory operations.

3.16.6.3.2 Typedef Documentation

__allocator_base

```
template<typename _Tp>
using std::__allocator_base
```

An alias to the base class for std::allocator.
Used to set the std::allocator base class to std::__new_allocator.

Template Parameters

_Tp	Type of allocated object.

3.16.6.3.3 Function Documentation

operator==()

```
template<typename _T1, typename _T2>
bool operator== (
            const allocator< _T1 > & ,
            const allocator< _T2 > & )  [related]
```

Equality comparison for std::allocator objects

Returns

true, for all std::allocator objects.

3.16.6.4 Pointer Abstractions

Collaboration diagram for Pointer Abstractions:

Classes

3.16.6.4.1 Detailed Description

Smart pointers, etc.

3.16.6.4.2 Function Documentation

allocate_shared()

```
template<typename _Tp, typename _Alloc, typename...  _Args>
shared_ptr< _NonArray< _Tp > > allocate_shared (
            const _Alloc & __a,
            _Args &&...  __args)  [related]
```

Create an object that is owned by a shared_ptr.

Parameters

__a	An allocator.
__args	Arguments for the *_Tp* object's constructor.

Returns

A shared_ptr that owns the newly created object.

Exceptions

An	exception thrown from *_Alloc::allocate* or from the constructor of *_Tp*.

A copy of *__a* will be used to allocate memory for the shared_ptr and the new object.

atomic_compare_exchange_strong() [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
bool std::atomic_compare_exchange_strong (
             __shared_ptr< _Tp, _Lp > * __p,
             __shared_ptr< _Tp, _Lp > * __v,
             __shared_ptr< _Tp, _Lp > __w)  [inline]
```

Atomic compare-and-swap for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.
_↩ _v	A non-null pointer to a shared_ptr object.
_↩ _w	A non-null pointer to a shared_ptr object.

Returns

True if `*__p` was equivalent to `*__v`, false otherwise.

The memory order for failure shall not be `memory_order_release` or `memory_order_acq_rel`.
References move().

atomic_compare_exchange_strong() [2/2]

```
template<typename _Tp>
bool std::atomic_compare_exchange_strong (
             shared_ptr< _Tp > * __p,
             shared_ptr< _Tp > * __v,
             shared_ptr< _Tp > __w)  [inline]
```

Atomic compare-and-swap for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.
_↩ _v	A non-null pointer to a shared_ptr object.
_↩ _w	A non-null pointer to a shared_ptr object.

Returns

True if ∗__p was equivalent to ∗__v, false otherwise.

The memory order for failure shall not be memory_order_release or memory_order_acq_rel.
References move().

atomic_compare_exchange_strong_explicit() [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
bool std::atomic_compare_exchange_strong_explicit (
             __shared_ptr< _Tp, _Lp > * __p,
             __shared_ptr< _Tp, _Lp > * __v,
             __shared_ptr< _Tp, _Lp > __w,
             memory_order ,
             memory_order )
```

Atomic compare-and-swap for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.
_↩ _v	A non-null pointer to a shared_ptr object.
_↩ _w	A non-null pointer to a shared_ptr object.

Returns

True if ∗__p was equivalent to ∗__v, false otherwise.

The memory order for failure shall not be memory_order_release or memory_order_acq_rel.
References move().

atomic_compare_exchange_strong_explicit() [2/2]

```
template<typename _Tp>
bool std::atomic_compare_exchange_strong_explicit (
             shared_ptr< _Tp > * __p,
             shared_ptr< _Tp > * __v,
             shared_ptr< _Tp > __w,
             memory_order ,
             memory_order )
```

Atomic compare-and-swap for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.
_↩ _v	A non-null pointer to a shared_ptr object.
_↩ _w	A non-null pointer to a shared_ptr object.

Returns

True if *__p was equivalent to *__v, false otherwise.

The memory order for failure shall not be memory_order_release or memory_order_acq_rel.
References move().

atomic_compare_exchange_weak() [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
bool std::atomic_compare_exchange_weak (
             __shared_ptr< _Tp, _Lp > * __p,
             __shared_ptr< _Tp, _Lp > * __v,
             __shared_ptr< _Tp, _Lp > __w)  [inline]
```

Atomic compare-and-swap for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.
_↩ _v	A non-null pointer to a shared_ptr object.
_↩ _w	A non-null pointer to a shared_ptr object.

Returns

True if *__p was equivalent to *__v, false otherwise.

The memory order for failure shall not be memory_order_release or memory_order_acq_rel.
References move().

atomic_compare_exchange_weak() [2/2]

```
template<typename _Tp>
bool std::atomic_compare_exchange_weak (
             shared_ptr< _Tp > * __p,
             shared_ptr< _Tp > * __v,
             shared_ptr< _Tp > __w)  [inline]
```

Atomic compare-and-swap for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.
_↩ _v	A non-null pointer to a shared_ptr object.
_↩ _w	A non-null pointer to a shared_ptr object.

Returns

True if *__p was equivalent to *__v, false otherwise.

The memory order for failure shall not be memory_order_release or memory_order_acq_rel.
References move().

atomic_compare_exchange_weak_explicit() [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
bool std::atomic_compare_exchange_weak_explicit (
             __shared_ptr< _Tp, _Lp > * __p,
             __shared_ptr< _Tp, _Lp > * __v,
             __shared_ptr< _Tp, _Lp > __w,
             memory_order __success,
             memory_order __failure)  [inline]
```

Atomic compare-and-swap for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.
_↩ _v	A non-null pointer to a shared_ptr object.
_↩ _w	A non-null pointer to a shared_ptr object.

Returns

True if *__p was equivalent to *__v, false otherwise.

The memory order for failure shall not be memory_order_release or memory_order_acq_rel.
References move().

atomic_compare_exchange_weak_explicit() [2/2]

```
template<typename _Tp>
bool std::atomic_compare_exchange_weak_explicit (
             shared_ptr< _Tp > * __p,
             shared_ptr< _Tp > * __v,
             shared_ptr< _Tp > __w,
             memory_order __success,
             memory_order __failure)  [inline]
```

Atomic compare-and-swap for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.
_↩ _v	A non-null pointer to a shared_ptr object.
_↩ _w	A non-null pointer to a shared_ptr object.

Returns

True if *__p was equivalent to *__v, false otherwise.

The memory order for failure shall not be memory_order_release or memory_order_acq_rel.
References move().

atomic_exchange() [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
__shared_ptr< _Tp, _Lp > std::atomic_exchange (
             __shared_ptr< _Tp, _Lp > * __p,
             __shared_ptr< _Tp, _Lp > __r)  [inline]
```

Atomic exchange for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.
_↩ _r	New value to store in *__p.

Returns

The original value of *__p

References move().

atomic_exchange() [2/2]

```
template<typename _Tp>
shared_ptr< _Tp > std::atomic_exchange (
             shared_ptr< _Tp > * __p,
             shared_ptr< _Tp > __r)  [inline]
```

Atomic exchange for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.
_↩ _r	New value to store in *__p.

Returns

The original value of *__p

References move().

atomic_exchange_explicit() [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
__shared_ptr< _Tp, _Lp > std::atomic_exchange_explicit (
             __shared_ptr< _Tp, _Lp > * __p,
             __shared_ptr< _Tp, _Lp > __r,
             memory_order )  [inline]
```

Atomic exchange for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.
_↩ _r	New value to store in *__p.

Returns

The original value of *__p

atomic_exchange_explicit() [2/2]

```
template<typename _Tp>
shared_ptr< _Tp > std::atomic_exchange_explicit (
             shared_ptr< _Tp > * __p,
             shared_ptr< _Tp > __r,
             memory_order )  [inline]
```

Atomic exchange for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.
_↩ _r	New value to store in *__p.

Returns

The original value of *__p

atomic_is_lock_free() [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
bool std::atomic_is_lock_free (
             const __shared_ptr< _Tp, _Lp > * )  [inline]
```

Report whether shared_ptr atomic operations are lock-free.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.

Returns

True if atomic access to *__p is lock-free, false otherwise.

atomic_is_lock_free() [2/2]

```
template<typename _Tp>
bool std::atomic_is_lock_free (
            const shared_ptr< _Tp > * __p)  [inline]
```

Report whether shared_ptr atomic operations are lock-free.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.

Returns

True if atomic access to *__p is lock-free, false otherwise.

atomic_load() [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
__shared_ptr< _Tp, _Lp > std::atomic_load (
            const __shared_ptr< _Tp, _Lp > * __p)  [inline]
```

Atomic load for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.

Returns

*__p

The memory order shall not be `memory_order_release` or `memory_order_acq_rel`.

atomic_load() [2/2]

```
template<typename _Tp>
shared_ptr< _Tp > std::atomic_load (
            const shared_ptr< _Tp > * __p)  [inline]
```

Atomic load for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.

Returns

*__p

The memory order shall not be memory_order_release or memory_order_acq_rel.

atomic_load_explicit() [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
__shared_ptr< _Tp, _Lp > std::atomic_load_explicit (
            const __shared_ptr< _Tp, _Lp > * __p,
            memory_order )  [inline]
```

Atomic load for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.

Returns

*__p

The memory order shall not be memory_order_release or memory_order_acq_rel.

atomic_load_explicit() [2/2]

```
template<typename _Tp>
shared_ptr< _Tp > std::atomic_load_explicit (
            const shared_ptr< _Tp > * __p,
            memory_order )  [inline]
```

Atomic load for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.

Returns

*__p

The memory order shall not be memory_order_release or memory_order_acq_rel.

atomic_store() [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
void std::atomic_store (
```

```
__shared_ptr< _Tp, _Lp > * __p,
__shared_ptr< _Tp, _Lp > __r)  [inline]
```

Atomic store for shared_ptr objects.

Parameters

_p	A non-null pointer to a shared_ptr object.
_r	The value to store.

The memory order shall not be `memory_order_acquire` or `memory_order_acq_rel`.
References move().

atomic_store() [2/2]

```
template<typename _Tp>
void std::atomic_store (
            shared_ptr< _Tp > * __p,
            shared_ptr< _Tp > __r)  [inline]
```

Atomic store for shared_ptr objects.

Parameters

_p	A non-null pointer to a shared_ptr object.
_r	The value to store.

The memory order shall not be `memory_order_acquire` or `memory_order_acq_rel`.
References move().

atomic_store_explicit() [1/2]

```
template<typename _Tp, _Lock_policy _Lp>
void std::atomic_store_explicit (
            __shared_ptr< _Tp, _Lp > * __p,
            __shared_ptr< _Tp, _Lp > __r,
            memory_order )  [inline]
```

Atomic store for shared_ptr objects.

Parameters

_p	A non-null pointer to a shared_ptr object.

_↩ _r	The value to store.

The memory order shall not be `memory_order_acquire` or `memory_order_acq_rel`.

atomic_store_explicit() [2/2]

```
template<typename _Tp>
void std::atomic_store_explicit (
             shared_ptr< _Tp > * __p,
             shared_ptr< _Tp > __r,
             memory_order )  [inline]
```

Atomic store for shared_ptr objects.

Parameters

_↩ _p	A non-null pointer to a shared_ptr object.
_↩ _r	The value to store.

The memory order shall not be `memory_order_acquire` or `memory_order_acq_rel`.

const_pointer_cast() [1/2]

```
template<typename _Tp, typename _Up>
shared_ptr< _Tp > const_pointer_cast (
             const shared_ptr< _Up > & __r)  [related]
```

Convert type of `shared_ptr`, via `const_cast`.

const_pointer_cast() [2/2]

```
template<typename _Tp, typename _Up>
shared_ptr< _Tp > const_pointer_cast (
             shared_ptr< _Up > && __r)  [related]
```

Convert type of `shared_ptr` rvalue, via `const_cast`.

Since

C++20

dynamic_pointer_cast() [1/2]

```
template<typename _Tp, typename _Up>
shared_ptr< _Tp > dynamic_pointer_cast (
             const shared_ptr< _Up > & __r)  [related]
```

Convert type of `shared_ptr`, via `dynamic_cast`.

dynamic_pointer_cast() [2/2]

```
template<typename _Tp, typename _Up>
shared_ptr< _Tp > dynamic_pointer_cast (
            shared_ptr< _Up > && __r)  [related]
```

Convert type of `shared_ptr` rvalue, via `dynamic_cast`.

Since

C++20

get_deleter()

```
template<typename _Del, typename _Tp>
_Del * get_deleter (
            const shared_ptr< _Tp > & __p)  [related]
```

20.7.2.2.10 shared_ptr get_deleter
If `__p` has a deleter of type `_Del`, return a pointer to it.

make_shared()

```
template<typename _Tp, typename... _Args>
shared_ptr< _NonArray< _Tp > > make_shared (
            _Args &&... __args)  [related]
```

Create an object that is owned by a shared_ptr.

Parameters

__args	Arguments for the *_Tp* object's constructor.

Returns

A shared_ptr that owns the newly created object.

Exceptions

std::bad_alloc,or	an exception thrown from the constructor of *_Tp*.

operator<() [1/3]

```
template<typename _Tp, typename _Dp, typename _Up, typename _Ep>
bool std::operator< (
            const unique_ptr< _Tp, _Dp > & __x,
            const unique_ptr< _Up, _Ep > & __y)  [inline], [nodiscard], [constexpr]
```

Relational operator for unique_ptr objects, compares the owned pointers.
References std::unique_ptr< _Tp, _Dp >::get().

operator<() [2/3]

```
template<typename _Tp, typename _Dp>
bool std::operator< (
            const unique_ptr< _Tp, _Dp > & __x,
            nullptr_t )  [inline], [nodiscard], [constexpr]
```

unique_ptr comparison with nullptr
References std::unique_ptr< _Tp, _Dp >::get().

operator<() [3/3]

```
template<typename _Tp, typename _Dp>
bool std::operator< (
            nullptr_t ,
            const unique_ptr< _Tp, _Dp > & __x)  [inline], [nodiscard], [constexpr]
```

unique_ptr comparison with nullptr
References std::unique_ptr< _Tp, _Dp >::get().

operator<<() [1/2]

```
template<typename _Ch, typename _Tr, typename _Tp, _Lock_policy _Lp>
std::basic_ostream< _Ch, _Tr > & operator<< (
            std::basic_ostream< _Ch, _Tr > & __os,
            const __shared_ptr< _Tp, _Lp > & __p)  [related]
```

Write the stored pointer to an ostream.

operator<<() [2/2]

```
template<typename _CharT, typename _Traits, typename _Tp, typename _Dp>
basic_ostream< _CharT, _Traits > & operator<< (
            basic_ostream< _CharT, _Traits > & __os,
            const unique_ptr< _Tp, _Dp > & __p)  [related]
```

Stream output operator for unique_ptr.

Since

C++20

operator<=() [1/3]

```
template<typename _Tp, typename _Dp, typename _Up, typename _Ep>
bool std::operator<= (
            const unique_ptr< _Tp, _Dp > & __x,
            const unique_ptr< _Up, _Ep > & __y)  [inline], [nodiscard], [constexpr]
```

Relational operator for unique_ptr objects, compares the owned pointers.

operator<=() [2/3]

```
template<typename _Tp, typename _Dp>
bool std::operator<= (
            const unique_ptr< _Tp, _Dp > & __x,
            nullptr_t )  [inline], [nodiscard], [constexpr]
```

unique_ptr comparison with nullptr

operator<=() [3/3]

```
template<typename _Tp, typename _Dp>
bool std::operator<= (
            nullptr_t ,
            const unique_ptr< _Tp, _Dp > & __x)  [inline], [nodiscard], [constexpr]
```

unique_ptr comparison with nullptr

operator==() [1/4]

```
template<typename _Tp, typename _Dp, typename _Up, typename _Ep>
bool std::operator== (
            const unique_ptr< _Tp, _Dp > & __x,
            const unique_ptr< _Up, _Ep > & __y)  [inline], [nodiscard], [constexpr]
```

Equality operator for unique_ptr objects, compares the owned pointers.
References std::unique_ptr< _Tp, _Dp >::get().

operator==() [2/4]

```
template<typename _Tp, typename _Dp>
bool std::operator== (
            const unique_ptr< _Tp, _Dp > & __x,
            nullptr_t )  [inline], [nodiscard], [constexpr], [noexcept]
```

unique_ptr comparison with nullptr

operator==() [3/4]

```
template<typename _Tp, typename _Up>
bool operator== (
            const shared_ptr< _Tp > & __a,
            const shared_ptr< _Up > & __b)  [related]
```

Equality operator for shared_ptr objects, compares the stored pointers.

operator==() [4/4]

```
template<typename _Tp>
bool operator== (
            const shared_ptr< _Tp > & __a,
            nullptr_t )  [related]
```

shared_ptr comparison with nullptr

operator>() [1/3]

```
template<typename _Tp, typename _Dp, typename _Up, typename _Ep>
bool std::operator> (
            const unique_ptr< _Tp, _Dp > & __x,
            const unique_ptr< _Up, _Ep > & __y)  [inline], [nodiscard], [constexpr]
```

Relational operator for unique_ptr objects, compares the owned pointers.

operator>() [2/3]

```
template<typename _Tp, typename _Dp>
bool std::operator> (
            const unique_ptr< _Tp, _Dp > & __x,
            nullptr_t )  [inline], [nodiscard], [constexpr]
```

unique_ptr comparison with nullptr
References std::unique_ptr< _Tp, _Dp >::get().

operator>() [3/3]

```
template<typename _Tp, typename _Dp>
bool std::operator> (
            nullptr_t ,
            const unique_ptr< _Tp, _Dp > & __x)  [inline], [nodiscard], [constexpr]
```

unique_ptr comparison with nullptr
References std::unique_ptr< _Tp, _Dp >::get().

operator>=() [1/3]

```
template<typename _Tp, typename _Dp, typename _Up, typename _Ep>
bool std::operator>= (
            const unique_ptr< _Tp, _Dp > & __x,
            const unique_ptr< _Up, _Ep > & __y)  [inline], [nodiscard], [constexpr]
```

Relational operator for unique_ptr objects, compares the owned pointers.

operator>=() [2/3]

```
template<typename _Tp, typename _Dp>
bool std::operator>= (
            const unique_ptr< _Tp, _Dp > & __x,
            nullptr_t )  [inline], [nodiscard], [constexpr]
```

unique_ptr comparison with nullptr

operator>=() [3/3]

```
template<typename _Tp, typename _Dp>
bool std::operator>= (
            nullptr_t ,
            const unique_ptr< _Tp, _Dp > & __x)  [inline], [nodiscard]
```

unique_ptr comparison with nullptr

reinterpret_pointer_cast() [1/2]

```
template<typename _Tp, typename _Up>
shared_ptr< _Tp > reinterpret_pointer_cast (
            const shared_ptr< _Up > & __r)  [related]
```

Convert type of `shared_ptr`, via `reinterpret_cast`.

Since

C++17

reinterpret_pointer_cast() [2/2]

```
template<typename _Tp, typename _Up>
shared_ptr< _Tp > reinterpret_pointer_cast (
            shared_ptr< _Up > && __r)  [related]
```

Convert type of `shared_ptr` rvalue, via `reinterpret_cast`.

Since

C++20

static_pointer_cast() [1/2]

```
template<typename _Tp, typename _Up>
shared_ptr< _Tp > static_pointer_cast (
            const shared_ptr< _Up > & __r)  [related]
```

Convert type of `shared_ptr`, via `static_cast`.

static_pointer_cast() [2/2]

```
template<typename _Tp, typename _Up>
shared_ptr< _Tp > static_pointer_cast (
            shared_ptr< _Up > && __r)  [related]
```

Convert type of `shared_ptr` rvalue, via `static_cast`.

Since

C++20

swap() [1/3]

```
template<typename _Tp>
void swap (
            shared_ptr< _Tp > & __a,
            shared_ptr< _Tp > & __b)  [related]
```

Swap overload for shared_ptr.

swap() [2/3]

```
template<typename _Tp, typename _Dp>
enable_if< __is_swappable< _Dp >::value >::type swap (
            unique_ptr< _Tp, _Dp > & __x,
            unique_ptr< _Tp, _Dp > & __y)  [related]
```

Swap overload for unique_ptr.

swap() [3/3]

```
template<typename _Tp>
void swap (
            weak_ptr< _Tp > & __a,
            weak_ptr< _Tp > & __b)  [related]
```

Swap overload for weak_ptr.

to_address() [1/2]

```
template<typename _Tp>
_Tp * std::to_address (
            _Tp * __ptr)  [constexpr], [noexcept]
```

Obtain address referenced by a pointer to an object.

Parameters

__ptr	A pointer to an object

Returns

`__ptr`

Referenced by std::basic_string< _CharT >::assign(), find(), to_address(), uninitialized_copy(), uninitialized_fill(), and uninitialized_fill_n().

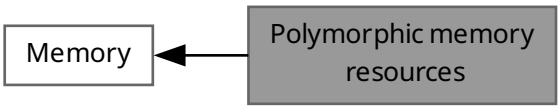
to_address() [2/2]

```
template<typename _Ptr>
auto std::to_address (
            const _Ptr & __ptr)  [constexpr], [noexcept]
```

Obtain address referenced by a pointer to an object.

Parameters

__ptr	A pointer to an object



Returns

`pointer_traits<_Ptr>::to_address(__ptr)` if that expression is well-formed, otherwise `to_address(__ptr.operator->())`.

References to_address().

3.16.6.5 Polymorphic memory resources

Collaboration diagram for Polymorphic memory resources:

Files

- file memory_resource

Classes

- class std::pmr::polymorphic_allocator< _Tp >
- struct std::pmr::pool_options
- class std::pmr::unsynchronized_pool_resource

Functions

- memory_resource * std::pmr::new_delete_resource () noexcept

3.16.6.5.1 Detailed Description

Since

C++17

Memory resources are classes that implement the `std::pmr::memory_resource` interface for allocating and deallocating memory. Unlike traditional C++ allocators, memory resources are not value types and are used via pointers to the abstract base class. They are only responsible for allocating and deallocating, not for construction and destruction of objects. As a result, memory resources just allocate raw memory as type `void*` and are not templates that allocate/deallocate and construct/destroy a specific type.
The class template `std::pmr::polymorphic_allocator` is an allocator that uses a memory resource for its allocations.

3.16.6.5.2 Function Documentation

new_delete_resource()

```
memory_resource * std::pmr::new_delete_resource ()  [nodiscard], [noexcept]
```

A pmr::memory_resource that uses `new` to allocate memory.

Since

C++17

3.16.7.1 Detailed Description

Template utilities for compile-time introspection and modification, including type classification traits, type property inspection traits and type transformation traits.

Since

C++11

3.16.7.2 Typedef Documentation

add_lvalue_reference_t

```
template<typename _Tp>
using std::add_lvalue_reference_t
```

Alias template for add_lvalue_reference.

add_pointer_t

```
template<typename _Tp>
using std::add_pointer_t
```

Alias template for add_pointer.

add_rvalue_reference_t

```
template<typename _Tp>
using std::add_rvalue_reference_t
```

Alias template for add_rvalue_reference.

aligned_storage_t

```
template<size_t _Len, size_t _Align = __aligned_storage_default_alignment(_Len)>
using std::aligned_storage_t
```

Alias template for aligned_storage.

common_reference_t

```
template<typename... _Tp>
using std::common_reference_t
```

Since

C++20

common_type_t

```
template<typename... _Tp>
using std::common_type_t
```

Alias template for common_type.

conditional_t

```
template<bool _Cond, typename _Iftrue, typename _Iffalse>
using std::conditional_t
```

Alias template for conditional.

decay_t

```
template<typename _Tp>
using std::decay_t
```

Alias template for decay.

enable_if_t

```
template<bool _Cond, typename _Tp = void>
using std::enable_if_t
```

Alias template for enable_if.

false_type

```
using std::false_type
```
The type used as a compile-time boolean with false value.

make_signed_t

```
template<typename _Tp>
using std::make_signed_t
```
Alias template for make_signed.

make_unsigned_t

```
template<typename _Tp>
using std::make_unsigned_t
```
Alias template for make_unsigned.

remove_all_extents_t

```
template<typename _Tp>
using std::remove_all_extents_t
```
Alias template for remove_all_extents.

remove_extent_t

```
template<typename _Tp>
using std::remove_extent_t
```
Alias template for remove_extent.

remove_pointer_t

```
template<typename _Tp>
using std::remove_pointer_t
```
Alias template for remove_pointer.

remove_reference_t

```
template<typename _Tp>
using std::remove_reference_t
```
Alias template for remove_reference.

result_of_t

```
template<typename _Tp>
using std::result_of_t
```
Alias template for result_of.

true_type

```
using std::true_type
```
The type used as a compile-time boolean with true value.

type

```
template<size_t _Len, typename...  _Types>
using std::aligned_union< _Len, _Types >::type
```
The storage.

underlying_type_t

```
template<typename _Tp>
using std::underlying_type_t
```
Alias template for underlying_type.

3.16.7.3 Function Documentation

is_corresponding_member()

```
template<typename _S1, typename _S2, typename _M1, typename _M2>
bool std::is_corresponding_member (
             _M1 _S1::* __m1,
             _M2 _S2::* __m2)  [constexpr], [noexcept]
```

Since

C++20

is_pointer_interconvertible_with_class()

```
template<typename _Tp, typename _Mem>
bool std::is_pointer_interconvertible_with_class (
             _Mem _Tp::* __mp)  [constexpr], [noexcept]
```
True if `__mp` points to the first member of a standard-layout type.

Returns

true if `s.*__mp` is pointer-interconvertible with `s`

Since

C++20

swap() [1/2]

```
template<typename _Tp>
_Require< __not_< __is_tuple_like< _Tp > >, is_move_constructible< _Tp >, is_move_assignable<
_Tp > > std::swap (
             _Tp & __a,
             _Tp & __b)  [inline], [constexpr], [noexcept]
```
Swaps two values.

Parameters

_↩ _a	A thing of arbitrary type.
_↩ _b	Another thing of arbitrary type.

swap() [2/2]

```
template<typename _Tp, size_t _Nm>
__enable_if_t< __is_swappable< _Tp >::value > std::swap (
            _Tp(&) __a[_Nm],
            _Tp(&) __b[_Nm])  [inline], [constexpr], [noexcept]
```

Swap the contents of two arrays.

3.16.7.4 Variable Documentation

alignment_value

```
template<size_t _Len, typename...  _Types>
const size_t std::aligned_union< _Len, _Types >::alignment_value  [static]
```

The value of the strictest alignment of _Types.

is_layout_compatible_v

```
template<typename _Tp, typename _Up>
bool std::is_layout_compatible_v  [constexpr]
```

Since

C++20

is_pointer_interconvertible_base_of_v

```
template<typename _Base, typename _Derived>
bool std::is_pointer_interconvertible_base_of_v  [constexpr]
```

Since

C++20

3.16.7.5 Variable Templates

Collaboration diagram for Variable Templates:

Variables

- template<typename _Tp, typename _Up>
  constexpr strong_ordering std::type_order_v
- template<typename _Tp, typename _Up>
  constexpr bool std::is_layout_compatible_v
- template<typename _Base, typename _Derived>
  constexpr bool std::is_pointer_interconvertible_base_of_v

3.16.7.5.1 Detailed Description

Since

C++17

Each trait in `<type_traits>` that has a `value` static data member is also available as a variable template, using the same name with a `_v` suffix. For example, `std::is_integral_v<T>` is a `bool` constant with the same value as `std::is_integral<T>::value`.
In some cases, using the variable template instead of the `value` member avoids instantiating the class template for the trait. This gives the compiler less work to do and can make your code compile a little faster.

3.16.7.5.2 Variable Documentation

is_layout_compatible_v

```
template<typename _Tp, typename _Up>
bool std::is_layout_compatible_v  [constexpr]
```

Since

C++20

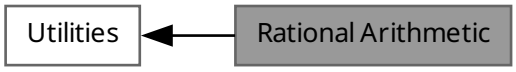
is_pointer_interconvertible_base_of_v

```
template<typename _Base, typename _Derived>
bool std::is_pointer_interconvertible_base_of_v  [constexpr]
```

Since

C++20

type_order_v



```
template<typename _Tp, typename _Up>
strong_ordering std::type_order_v  [inline], [constexpr]
```

3.16.9.1 Detailed Description

Classes and functions for time.

Since

C++11

3.16.9.2 Typedef Documentation

days

```
using std::chrono::days
```

days

high_resolution_clock

```
using std::chrono::high_resolution_clock
```

Highest-resolution clock.
This is the clock "with the shortest tick period." Alias to std::system_clock until higher-than-nanosecond definitions become feasible.

hours

```
using std::chrono::hours
```

hours

microseconds

```
using std::chrono::microseconds
```

microseconds

milliseconds

```
using std::chrono::milliseconds
```

3.16.9.3 Function Documentation

abs()

```
template<typename _Rep, typename _Period>
enable_if_t< numeric_limits< _Rep >::is_signed, duration< _Rep, _Period > > std::chrono::abs (
            duration< _Rep, _Period > __d)  [nodiscard], [constexpr]
```
The absolute (non-negative) value of a duration.

Parameters

_↩ _d	A duration with a signed `rep` type.

Returns

A duration of the same type as the argument, with value |d|.

Since

C++17

ceil() [1/2]

```
template<typename _ToDur, typename _Rep, typename _Period>
__enable_if_is_duration< _ToDur > std::chrono::ceil (
            const duration< _Rep, _Period > & __d)  [nodiscard], [constexpr]
```
Convert a `duration` to type `ToDur` and round up.
If the duration cannot be represented exactly in the result type, returns the closest value that is greater than the argument.

Template Parameters

_ToDur	The result type must be a `duration`.

Parameters

__d	A duration.

Returns

The value of `__d` converted to type `_ToDur`.

Since

C++17

References duration_cast().
Referenced by ceil().

ceil() [2/2]

```
template<typename _ToDur, typename _Clock, typename _Dur>
enable_if_t< __is_duration_v< _ToDur >, time_point< _Clock, _ToDur > > std::chrono::ceil (
            const time_point< _Clock, _Dur > & __tp)  [nodiscard], [constexpr]
```

Convert a `time_point` to type `ToDur` and round up.
The result is the same time point as measured by the same clock, but using the specified `duration` to represent the time. If the time point cannot be represented exactly in the result type, returns the closest value that is greater than the argument.

Template Parameters

_ToDur	The `duration` type to use for the result.

Parameters

__tp	A time point.

Returns

The value of `__tp` rounded up to the precision of `_ToDur`.

Since

C++17

References ceil().

clock_cast()

```
template<typename _DestClock, typename _SourceClock, typename _Duration>
requires __detail::__clock_convs<_DestClock, _SourceClock, _Duration> || __detail::__clock_convs↩
_sys<_DestClock, _SourceClock, _Duration> || __detail::__clock_convs_utc<_DestClock, _SourceClock,
_Duration> || __detail::__clock_convs_sys_utc<_DestClock, _SourceClock, _Duration> || __detail::_↩
_clock_convs_utc_sys<_DestClock, _SourceClock, _Duration>
auto std::chrono::clock_cast (
            const time_point< _SourceClock, _Duration > & __t)  [inline], [nodiscard]
```

Convert a time point to a different clock.

duration_cast()

```
template<typename _ToDur, typename _Rep, typename _Period>
__enable_if_is_duration< _ToDur > std::chrono::duration_cast (
            const duration< _Rep, _Period > & __d)  [nodiscard], [constexpr]
```

Convert a `duration` to type `ToDur`.
If the duration cannot be represented accurately in the result type, returns the result of integer truncation (i.e., rounded towards zero).

Template Parameters

_ToDur	The result type must be a `duration`.

Parameters

_↩ _d	A duration.

Returns

The value of `__d` converted to type `_ToDur`.

Since

C++11

Referenced by ceil(), floor(), and time_point_cast().

floor() [1/2]

```
template<typename _ToDur, typename _Rep, typename _Period>
__enable_if_is_duration< _ToDur > std::chrono::floor (
            const duration< _Rep, _Period > & __d)  [nodiscard], [constexpr]
```

Convert a `duration` to type `ToDur` and round down.
If the duration cannot be represented exactly in the result type, returns the closest value that is less than the argument.

Template Parameters

_ToDur	The result type must be a `duration`.

Parameters

_↩ _*d*	A duration.

Returns

The value of __d converted to type _ToDur.

Since

C++17

References duration_cast().
Referenced by floor(), and round().

floor() [2/2]

```
template<typename _ToDur, typename _Clock, typename _Dur>
enable_if_t< __is_duration_v< _ToDur >, time_point< _Clock, _ToDur > > std::chrono::floor (
            const time_point< _Clock, _Dur > & __tp)  [nodiscard], [constexpr]
```

Convert a time_point to type ToDur and round down.
The result is the same time point as measured by the same clock, but using the specified duration to represent the time. If the time point cannot be represented exactly in the result type, returns the closest value that is less than the argument.

Template Parameters

_ToDur	The duration type to use for the result.

Parameters

_↩ _*tp*	A time point.

Returns

The value of __tp rounded down to the precision of _ToDur.

Since

C++17

References floor().

is_am()

```
bool std::chrono::is_am (
            const hours & __h)  [constexpr], [noexcept]
```

True if a chrono::hours value represents a time before midday.
References is_am().
Referenced by is_am().

is_pm()

```
bool std::chrono::is_pm (
            const hours & __h)  [constexpr], [noexcept]
```

True if a `chrono::hours` value represents a time after midday.
References is_pm().
Referenced by is_pm().

local_time_format()

```
template<typename _Duration>
__detail::__local_time_fmt< _Duration > std::chrono::local_time_format (
            local_time< _Duration > __time,
            const string * __abbrev = nullptr,
            const seconds * __offset_sec = nullptr)  [inline]
```

Return an object that associates timezone info with a local time.
A `chrono::local_time` object has no timezone associated with it. This function creates an object that allows formatting a `local_time` as though it refers to a timezone with the given abbreviated name and offset from UTC.

Since

C++20

make12()

```
hours std::chrono::make12 (
            const hours & __h)  [constexpr], [noexcept]
```

Convert a 24-hour time into a 12-hour time.
References make12().
Referenced by make12().

make24()

```
hours std::chrono::make24 (
            const hours & __h,
            bool __is_pm)  [constexpr], [noexcept]
```

Convert a 12-hour time and p.m. flag into a 24-hour time.
References make24().
Referenced by make24().

operator"""d()

```
chrono::day std::literals::chrono_literals::operator""d (
            unsigned long long __d)  [constexpr], [noexcept]
```

Literal suffix for creating chrono::day objects.

Since

C++20

operator"""h() [1/2]

```
template<char...  _Digits>
chrono::hours std::literals::chrono_literals::operator""h ()  [constexpr]
```

Literal suffix for durations of type `std::chrono::hours`.

operator"""h() [2/2]

```
chrono::duration< long double, ratio< 3600, 1 > > std::literals::chrono_literals::operator""h (
            long double __hours)  [constexpr]
```

Literal suffix for durations representing non-integer hours.

operator"""min() [1/2]

```
template<char... _Digits>
chrono::minutes std::literals::chrono_literals::operator""min ()  [constexpr]
```

Literal suffix for durations of type `std::chrono::minutes`.

operator"""min() [2/2]

```
chrono::duration< long double, ratio< 60, 1 > > std::literals::chrono_literals::operator""min (
            long double __mins)  [constexpr]
```

Literal suffix for durations representing non-integer minutes.

operator"""ms() [1/2]

```
template<char... _Digits>
chrono::milliseconds std::literals::chrono_literals::operator""ms ()  [constexpr]
```

Literal suffix for durations of type `std::chrono::milliseconds`.

operator"""ms() [2/2]

```
chrono::duration< long double, milli > std::literals::chrono_literals::operator""ms (
            long double __msecs)  [constexpr]
```

Literal suffix for durations representing non-integer milliseconds.

operator"""ns() [1/2]

```
template<char... _Digits>
chrono::nanoseconds std::literals::chrono_literals::operator""ns ()  [constexpr]
```

Literal suffix for durations of type `std::chrono::nanoseconds`.

operator"""ns() [2/2]

```
chrono::duration< long double, nano > std::literals::chrono_literals::operator""ns (
            long double __nsecs)  [constexpr]
```

Literal suffix for durations representing non-integer nanoseconds.

operator"""s() [1/2]

```
template<char... _Digits>
chrono::seconds std::literals::chrono_literals::operator""s ()  [constexpr]
```

Literal suffix for durations of type `std::chrono::seconds`.

operator"""s() [2/2]

```
chrono::duration< long double > std::literals::chrono_literals::operator""s (
            long double __secs)  [constexpr]
```

Literal suffix for durations representing non-integer seconds.

operator"""us() [1/2]

```
template<char... _Digits>
chrono::microseconds std::literals::chrono_literals::operator""us () [constexpr]
```

Literal suffix for durations of type `std::chrono::microseconds`.

operator"""us() [2/2]

```
chrono::duration< long double, micro > std::literals::chrono_literals::operator""us (
            long double __usecs) [constexpr]
```

Literal suffix for durations representing non-integer microseconds.

operator"""y()

```
chrono::year std::literals::chrono_literals::operator""y (
            unsigned long long __y) [constexpr], [noexcept]
```

Literal suffix for creating chrono::year objects.

Since

C++20

operator%() [1/2]

```
template<typename _Rep1, typename _Period, typename _Rep2>
duration< __common_rep_t< _Rep1, __disable_if_is_duration< _Rep2 > >, _Period > std::chrono::↩
operator% (
            const duration< _Rep1, _Period > & __d,
            const _Rep2 & __s) [constexpr]
```

Arithmetic operators for chrono::duration

operator%() [2/2]

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
common_type< duration< _Rep1, _Period1 >, duration< _Rep2, _Period2 > >::type std::chrono::↩
operator% (
            const duration< _Rep1, _Period1 > & __lhs,
            const duration< _Rep2, _Period2 > & __rhs) [constexpr]
```

Arithmetic operators for chrono::duration

operator*() [1/2]

```
template<typename _Rep1, typename _Period, typename _Rep2>
duration< __common_rep_t< _Rep1, _Rep2 >, _Period > operator* (
            const duration< _Rep1, _Period > & __d,
            const _Rep2 & __s) [related]
```

Arithmetic operators for chrono::duration

operator*() [2/2]

```
template<typename _Rep1, typename _Rep2, typename _Period>
duration< __common_rep_t< _Rep2, _Rep1 >, _Period > std::chrono::operator* (
            const _Rep1 & __s,
            const duration< _Rep2, _Period > & __d) [constexpr]
```

Arithmetic operators for chrono::duration

operator+() [1/3]

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
common_type< duration< _Rep1, _Period1 >, duration< _Rep2, _Period2 > >::type operator+ (
            const duration< _Rep1, _Period1 > & __lhs,
            const duration< _Rep2, _Period2 > & __rhs)  [related]
```

The sum of two durations.

operator+() [2/3]

```
template<typename _Rep1, typename _Period1, typename _Clock, typename _Dur2>
time_point< _Clock, typename common_type< duration< _Rep1, _Period1 >, _Dur2 >::type > std::↩
chrono::operator+ (
            const duration< _Rep1, _Period1 > & __lhs,
            const time_point< _Clock, _Dur2 > & __rhs)  [constexpr]
```

Adjust a time point forwards by the given duration.

operator+() [3/3]

```
template<typename _Clock, typename _Dur1, typename _Rep2, typename _Period2>
time_point< _Clock, typename common_type< _Dur1, duration< _Rep2, _Period2 > >::type > operator+
(
            const time_point< _Clock, _Dur1 > & __lhs,
            const duration< _Rep2, _Period2 > & __rhs)  [related]
```

Adjust a time point forwards by the given duration.

operator-() [1/3]

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
common_type< duration< _Rep1, _Period1 >, duration< _Rep2, _Period2 > >::type std::chrono::↩
operator- (
            const duration< _Rep1, _Period1 > & __lhs,
            const duration< _Rep2, _Period2 > & __rhs)  [constexpr]
```

The difference between two durations.

operator-() [2/3]

```
template<typename _Clock, typename _Dur1, typename _Rep2, typename _Period2>
time_point< _Clock, typename common_type< _Dur1, duration< _Rep2, _Period2 > >::type > std::↩
chrono::operator- (
            const time_point< _Clock, _Dur1 > & __lhs,
            const duration< _Rep2, _Period2 > & __rhs)  [constexpr]
```

Adjust a time point backwards by the given duration.

operator-() [3/3]

```
template<typename _Clock, typename _Dur1, typename _Dur2>
common_type< _Dur1, _Dur2 >::type std::chrono::operator- (
            const time_point< _Clock, _Dur1 > & __lhs,
            const time_point< _Clock, _Dur2 > & __rhs)  [constexpr]
```

The difference between two time points (as a duration).

operator/() [1/2]

```
template<typename _Rep1, typename _Period, typename _Rep2>
duration< __common_rep_t< _Rep1, __disable_if_is_duration< _Rep2 > >, _Period > std::chrono::↩
```

```
operator/ (
            const duration< _Rep1, _Period > & __d,
            const _Rep2 & __s)  [constexpr]
```

Arithmetic operators for chrono::duration

operator/() [2/2]

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
common_type< _Rep1, _Rep2 >::type std::chrono::operator/ (
            const duration< _Rep1, _Period1 > & __lhs,
            const duration< _Rep2, _Period2 > & __rhs)  [constexpr]
```

Arithmetic operators for chrono::duration

operator<()

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
bool std::chrono::operator< (
            const duration< _Rep1, _Period1 > & __lhs,
            const duration< _Rep2, _Period2 > & __rhs)  [constexpr]
```

Comparisons for chrono::duration

operator<<() [1/3]

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & std::chrono::operator<< (
            basic_ostream< _CharT, _Traits > & __os,
            const local_info & __li)
```

Writes a local_info object to an ostream in an unspecified format.

operator<<() [2/3]

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & std::chrono::operator<< (
            basic_ostream< _CharT, _Traits > & __os,
            const sys_info & __i)
```

Writes a sys_info object to an ostream in an unspecified format.

operator<<() [3/3]

```
template<typename _CharT, typename _Traits, typename _Rep, typename _Period>
basic_ostream< _CharT, _Traits > & std::chrono::operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const duration< _Rep, _Period > & __d)  [inline]
```

Write a `chrono::duration` to an ostream.

Since

C++20

References std::ios_base::flags(), std::ios_base::getloc(), std::basic_ios< _CharT, _Traits >::imbue(), std::move(), operator<<(), and std::ios_base::precision().
Referenced by operator<<().

operator<=()

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
bool std::chrono::operator<= (
```

```
            const duration< _Rep1, _Period1 > & __lhs,
            const duration< _Rep2, _Period2 > & __rhs)  [constexpr]
```

Comparisons for chrono::duration

operator<=>()

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
auto std::chrono::operator<=> (
            const duration< _Rep1, _Period1 > & __lhs,
            const duration< _Rep2, _Period2 > & __rhs)  [constexpr]
```

Comparisons for chrono::duration

operator==()

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
bool operator== (
            const duration< _Rep1, _Period1 > & __lhs,
            const duration< _Rep2, _Period2 > & __rhs)  [related]
```

Comparisons for chrono::duration

operator>()

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
bool std::chrono::operator> (
            const duration< _Rep1, _Period1 > & __lhs,
            const duration< _Rep2, _Period2 > & __rhs)  [constexpr]
```

Comparisons for chrono::duration

operator>=()

```
template<typename _Rep1, typename _Period1, typename _Rep2, typename _Period2>
bool std::chrono::operator>= (

            const duration< _Rep2, _Period2 > & __rhs)  [constexpr]
```

Comparisons for chrono::duration

round() [1/2]

```
template<typename _ToDur, typename _Rep, typename _Period>
enable_if_t< __and_< __is_duration< _ToDur >, __not_< treat_as_floating_point< typename _To↩
Dur::rep > > >::value, _ToDur > std::chrono::round (
            const duration< _Rep, _Period > & __d)  [nodiscard], [constexpr]
```

Convert a `duration` to type `ToDur` and round to the closest value.
If the duration cannot be represented exactly in the result type, returns the closest value, rounding ties to even.

Template Parameters

_ToDur	The result type must be a `duration` with a non-floating-point `rep` type.

Parameters

_↩ _d	A duration.

Returns

The value of __d converted to type _ToDur.

Since

C++17

References floor().
Referenced by round().

round() [2/2]

```
template<typename _ToDur, typename _Clock, typename _Dur>
enable_if_t< __is_duration_v< _ToDur > &&!treat_as_floating_point_v< typename _ToDur::rep >,
time_point< _Clock, _ToDur > > std::chrono::round (
            const time_point< _Clock, _Dur > & __tp)  [nodiscard], [constexpr]
```

Convert a time_point to type ToDur and round to the closest value.
The result is the same time point as measured by the same clock, but using the specified duration to represent the time. If the time point cannot be represented exactly in the result type, returns the closest value, rounding ties to even.

Template Parameters

_ToDur	The duration type to use for the result, which must have a non-floating-point rep type.

Parameters

__tp	A time point.

Returns

The value of __tp rounded to the precision _ToDur.

Since

C++17

References round().

time_point_cast()

```
template<typename _ToDur, typename _Clock, typename _Dur>
__enable_if_t< __is_duration< _ToDur >::value, time_point< _Clock, _ToDur > > std::chrono::↩
time_point_cast (
            const time_point< _Clock, _Dur > & __t)  [nodiscard], [constexpr]
```

Convert a time_point to use duration type ToDur.
The result is the same time point as measured by the same clock, but using the specified duration to represent the time. If the time point cannot be represented accurately in the result type, returns the result of integer truncation (i.e., rounded towards zero).

Template Parameters

_ToDur	The `duration` type to use for the result.

Parameters

↩ _↩ ↩ _↩ *t*	A time point.

Returns

The value of `__t` converted to use type `_ToDur`.

Since

C++11

References duration_cast().

4.1.1 Detailed Description

GNU extensions for public use.

4.1.2 Typedef Documentation

__int_traits

```
template<typename _Tp>
using __gnu_cxx::__int_traits
```

Convenience alias for __numeric_traits<integer-type>.

4.1.3 Function Documentation

__static_pointer_cast() [1/2]

```
template<typename _ToType, typename _FromType>
_ToType __gnu_cxx::__static_pointer_cast (
            _FromType * __arg)  [inline]
```

Casting operations for cases where _FromType is a standard pointer. _ToType can be a standard or non-standard pointer.

__static_pointer_cast() [2/2]

```
template<typename _ToType, typename _FromType>
_ToType __gnu_cxx::__static_pointer_cast (
            const _FromType & __arg)  [inline]
```

Casting operations for cases where _FromType is not a standard pointer. _ToType can be a standard or non-standard pointer. Given that _FromType is not a pointer, it must have a get() method that returns the standard pointer equivalent of the address it points to, and must have an element_type typedef which names the type it points to.

_Bit_scan_forward()

```
std::size_t __gnu_cxx::_Bit_scan_forward (
            std::size_t __num)  [inline]
```

Generic Version of the bsf instruction.
Referenced by __gnu_cxx::bitmap_allocator< _Tp1 >::_M_allocate_single_object().

iota()

```
template<typename _ForwardIterator, typename _Tp>
void std::iota (
            _ForwardIterator __first,
            _ForwardIterator __last,
            _Tp __value)  [constexpr]
```

Create a range of sequentially increasing values.
For each element in the range [first,last) assigns `value` and increments `value` as if by `++value`.

Parameters

__first	Start of range.
__last	End of range.
__value	Starting value.

operator"!=() [1/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator!= (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)  [inline]
```

Test difference of two strings.

Parameters

__lhs	First string.
__rhs	Second string.

Returns

True if *__lhs.compare*(*__rhs*) != 0. False otherwise.

operator"!=() [2/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator!= (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
            const _CharT * __rhs)  [inline]
```

Test difference of string and C string.

Parameters

__lhs	String.
__rhs	C string.

Returns

True if *__lhs.compare*(*__rhs*) != 0. False otherwise.

operator"!=() [3/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator!= (
            const _CharT * __lhs,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)  [inline]
```

Test difference of C string and string.

Parameters

__lhs	C string.
__rhs	String.

Returns

True if *__rhs.compare*(*__lhs*) != 0. False otherwise.

operator+() [1/5]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base > __gnu_cxx::operator+ (
            _CharT __lhs,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)
```

Concatenate character and string.

Parameters

__lhs	First string.
__rhs	Last string.

Returns

New string with *__lhs* followed by *__rhs*.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append(), __gnu_cxx::__versa_string< _CharT, _Traits, _Allo
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::reserve(), and __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Bas

operator+() [2/5]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base > __gnu_cxx::operator+ (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
            _CharT __rhs)
```

Concatenate string and character.

Parameters

__lhs	First string.
__rhs	Last string.

Returns

New string with *__lhs* followed by *__rhs*.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append(), __gnu_cxx::__versa_string< _CharT, _Traits, _Allo
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::reserve(), and __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Bas

operator+() [3/5]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base > __gnu_cxx::operator+ (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)
```

Concatenate two strings.

Parameters

__lhs	First string.
__rhs	Last string.

Returns

New string with value of *__lhs* followed by *__rhs*.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append(), __gnu_cxx::__versa_string< _CharT, _Traits, _Allo
and __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::size().

operator+() [4/5]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base > __gnu_cxx::operator+ (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
            const _CharT * __rhs)
```

Concatenate string and C string.

Parameters

__lhs	First string.
__rhs	Last string.

Returns

New string with *__lhs* followed by *__rhs*.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::size().

operator+() [5/5]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base > __gnu_cxx::operator+ (
            const _CharT * __lhs,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)
```

Concatenate C string and string.

Parameters

__lhs	First string.
__rhs	Last string.

Returns

New string with value of *__lhs* followed by *__rhs*.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::size().

operator<() [1/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator< (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)  [inline]
```

Test if string precedes string.

Parameters

__lhs	First string.
__rhs	Second string.

Returns

True if *__lhs* precedes *__rhs*. False otherwise.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare().

operator<() [2/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator< (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
            const _CharT * __rhs)  [inline]
```

Test if string precedes C string.

Parameters

__lhs	String.
__rhs	C string.

Returns

True if *__lhs* precedes *__rhs*. False otherwise.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare().

operator<() [3/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator< (
            const _CharT * __lhs,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)  [inline]
```

Test if C string precedes string.

Parameters

__lhs	C string.
__rhs	String.

Returns

True if *__lhs* precedes *__rhs*. False otherwise.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare().

operator<=() [1/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator<= (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)  [inline]
```

Test if string doesn't follow string.

Parameters

__lhs	First string.
__rhs	Second string.

Returns

True if *__lhs* doesn't follow *__rhs*. False otherwise.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare().

operator<=() [2/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator<= (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
            const _CharT * __rhs)  [inline]
```

Test if string doesn't follow C string.

Parameters

__lhs	String.

__rhs	C string.

Returns

True if *__lhs* doesn't follow *__rhs*. False otherwise.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare().

operator<=() [3/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator<= (
            const _CharT * __lhs,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)  [inline]
```

Test if C string doesn't follow string.

Parameters

__lhs	C string.
__rhs	String.

Returns

True if *__lhs* doesn't follow *__rhs*. False otherwise.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare().

operator==() [1/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator== (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)  [inline]
```

Test equivalence of two strings.

Parameters

__lhs	First string.
__rhs	Second string.

Returns

True if *__lhs.compare*(*__rhs*) == 0. False otherwise.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::data(), and __gnu_cxx::__versa_string< _CharT, _Traits, _All

operator==() [2/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
```

```
bool __gnu_cxx::operator== (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
            const _CharT * __rhs)  [inline]
```

Test equivalence of string and C string.

Parameters

__lhs	String.
__rhs	C string.

Returns

True if *__lhs.compare*(*__rhs*) == 0. False otherwise.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::data(), and __gnu_cxx::__versa_string< _CharT, _Traits, _All

operator==() [3/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator== (
            const _CharT * __lhs,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)  [inline]
```

Test equivalence of C string and string.

Parameters

__lhs	C string.
__rhs	String.

Returns

True if *__rhs.compare*(*__lhs*) == 0. False otherwise.

operator==() [4/4]

```
template<typename _Tp>
bool __gnu_cxx::operator== (
            const _Pointer_adapter< _Tp > & __lhs,
            const _Pointer_adapter< _Tp > & __rhs)  [inline]
```

Comparison operators for _Pointer_adapter defer to the base class' comparison operators, when possible.

operator>() [1/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator> (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)  [inline]
```

Test if string follows string.

Parameters

__lhs	First string.
__rhs	Second string.

Returns

True if *__lhs* follows *__rhs*. False otherwise.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare().

operator>() [2/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator> (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
            const _CharT * __rhs)  [inline]
```

Test if string follows C string.

Parameters

__lhs	String.
__rhs	C string.

Returns

True if *__lhs* follows *__rhs*. False otherwise.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare().

operator>() [3/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator> (
            const _CharT * __lhs,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)  [inline]
```

Test if C string follows string.

Parameters

__lhs	C string.
__rhs	String.

Returns

True if *__lhs* follows *__rhs*. False otherwise.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare().

operator>=() [1/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator>= (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)  [inline]
```

Test if string doesn't precede string.

Parameters

__lhs	First string.
__rhs	Second string.

Returns

True if *__lhs* doesn't precede *__rhs*. False otherwise.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare().

operator>=() [2/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator>= (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
            const _CharT * __rhs)  [inline]
```

Test if string doesn't precede C string.

Parameters

__lhs	String.
__rhs	C string.

Returns

True if *__lhs* doesn't precede *__rhs*. False otherwise.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare().

operator>=() [3/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::operator>= (
            const _CharT * __lhs,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)  [inline]
```

Test if C string doesn't precede string.

Parameters

__lhs	C string.

__rhs	String.

Returns

True if *__lhs* doesn't precede *__rhs*. False otherwise.

References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare().

swap()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
void __gnu_cxx::swap (
             __versa_string< _CharT, _Traits, _Alloc, _Base > & __lhs,
             __versa_string< _CharT, _Traits, _Alloc, _Base > & __rhs)  [inline]
```

Swap contents of two strings.

Parameters

__lhs	First string.
__rhs	Second string.

Exchanges the contents of *__lhs* and *__rhs* in constant time.
References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::swap().

4.2 __gnu_cxx::__detail Namespace Reference

Classes

- class __mini_vector
- class _Bitmap_counter
- class _Ffit_finder

Enumerations

- enum { **_S_max_rope_depth** }
- enum { **bits_per_byte** , **bits_per_block** }
- enum **_Tag** { **_S_leaf** , **_S_concat** , **_S_substringfn** , **_S_function** }

Functions

- void __bit_allocate (std::size_t *__pbmap, std::size_t __pos) throw ()
- void __bit_free (std::size_t *__pbmap, std::size_t __pos) throw ()
- template<typename _ForwardIterator, typename _Tp, typename _Compare>
  _ForwardIterator **__lower_bound** (_ForwardIterator __first, _ForwardIterator __last, const _Tp &__val, _Compare __comp)
- template<typename _AddrPair>
  std::size_t __num_bitmaps (_AddrPair __ap)
- template<typename _AddrPair>
  std::size_t __num_blocks (_AddrPair __ap)

4.2.1 Detailed Description

Implementation details not part of the namespace __gnu_cxx interface.

4.2.2 Function Documentation

__bit_allocate()

```
void __gnu_cxx::__detail::__bit_allocate (
             std::size_t * __pbmap,
             std::size_t __pos) throw ( )   [inline]
```

Mark a memory address as allocated by re-setting the corresponding bit in the bit-map.
Referenced by __gnu_cxx::bitmap_allocator< _Tp1 >::_M_allocate_single_object().

__bit_free()

```
void __gnu_cxx::__detail::__bit_free (
             std::size_t * __pbmap,
             std::size_t __pos) throw ( )   [inline]
```

Mark a memory address as free by setting the corresponding bit in the bit-map.
Referenced by __gnu_cxx::bitmap_allocator< _Tp1 >::_M_deallocate_single_object().

__num_bitmaps()

```
template<typename _AddrPair>
std::size_t __gnu_cxx::__detail::__num_bitmaps (
             _AddrPair __ap)  [inline]
```

The number of Bit-maps pointed to by the address pair passed to the function.
References __num_blocks().
Referenced by __gnu_cxx::bitmap_allocator< _Tp1 >::_M_allocate_single_object(), and __gnu_cxx::bitmap_allocator< _Tp1 >::_M_dea

__num_blocks()

```
template<typename _AddrPair>
std::size_t __gnu_cxx::__detail::__num_blocks (
             _AddrPair __ap)  [inline]
```

The number of Blocks pointed to by the address pair passed to the function.
Referenced by __num_bitmaps().

4.3 __gnu_cxx::typelist Namespace Reference

Functions

- template<typename Fn, typename Typelist>
  void **apply** (Fn &, Typelist)
- template<typename Fn, typename Typelist>
  void **apply_generator** (Fn &fn, Typelist)
- template<typename Fn, typename TypelistT, typename TypelistV>
  void **apply_generator** (Fn &fn, TypelistT, TypelistV)
- template<typename Gn, typename Typelist>
  void apply_generator (Gn &, Typelist)
- template<typename Gn, typename TypelistT, typename TypelistV>
  void **apply_generator** (Gn &, TypelistT, TypelistV)

4.3.1 Detailed Description

GNU typelist extensions for public compile-time use.

4.3.2 Function Documentation

apply_generator()

```
template<typename Gn, typename Typelist>
void __gnu_cxx::typelist::apply_generator (
            Gn & ,
            Typelist )
```

Apply all typelist types to generator functor.

4.4.1 Detailed Description

GNU debug classes for public use.

4.4.2 Typedef Documentation

u16string

```
typedef basic_string<char16_t> __gnu_debug::u16string
```
A string of `char16_t`.

u32string

```
typedef basic_string<char32_t> __gnu_debug::u32string
```
A string of `char32_t`.

4.4.3 Enumeration Type Documentation

_Distance_precision

```
enum __gnu_debug::_Distance_precision
```
The precision to which we can calculate the distance between two iterators.

4.4.4 Function Documentation

__base()

```
template<typename _Iterator>
_Iterator __gnu_debug::__base (
            _Iterator __it)  [inline], [constexpr]
```
Helper function to extract base iterator of random access safe iterator in order to reduce performance impact of debug mode. Limited to random access iterator because it is the only category for which it is possible to check for correct iterators order in the __valid_range function thanks to the < operator.
Referenced by __gnu_debug::_Safe_iterator< _Base_iterator, map >::_M_before_dereferenceable().

__check_singular()

```
template<typename _Tp>
bool __gnu_debug::__check_singular (
            _Tp *const & __ptr)  [inline], [constexpr]
```
Non-NULL pointers are nonsingular.

__check_singular_aux()

```
bool __gnu_debug::__check_singular_aux (
            const _Safe_iterator_base * __x)  [inline]
```
Iterators that derive from _Safe_iterator_base can be determined singular or non-singular.
References __gnu_debug::_Safe_iterator_base::_M_singular().

__check_string() [1/2]

```
template<typename _CharT, typename _Integer>
const _CharT * __gnu_debug::__check_string (
            const _CharT * __s,
            _Integer __n,
            const char * __file,
            unsigned int __line,
            const char * __function)  [inline]
```
Checks that __s is non-NULL or __n == 0, and then returns __s.

__check_string() [2/2]

```
template<typename _CharT>
const _CharT * __gnu_debug::__check_string (
            const _CharT * __s,
            const char * __file,
            unsigned int __line,
            const char * __function)  [inline]
```

Checks that __s is non-NULL and then returns __s.

__foreign_iterator_aux2() [1/2]

```
template<typename _Iterator, typename _Sequence, typename _Category, typename _OtherIterator,
typename _OtherSequence, typename _OtherCategory>
bool __gnu_debug::__foreign_iterator_aux2 (
            const _Safe_iterator< _Iterator, _Sequence, _Category > & ,
            const _Safe_iterator< _OtherIterator, _OtherSequence, _OtherCategory > & ,
            const _Safe_iterator< _OtherIterator, _OtherSequence, _OtherCategory > & )  [inline]
```

Handle debug iterators from different types of container.

__foreign_iterator_aux2() [2/2]

```
template<typename _Iterator, typename _Sequence, typename _Category, typename _OtherIterator>
bool __gnu_debug::__foreign_iterator_aux2 (
            const _Safe_iterator< _Iterator, _Sequence, _Category > & __it,
            const _Safe_iterator< _OtherIterator, _Sequence, _Category > & __other,
            const _Safe_iterator< _OtherIterator, _Sequence, _Category > & )  [inline]
```

Handle debug iterators from the same type of container.

__get_distance()

```
template<typename _Iterator>
_Distance_traits< _Iterator >::__type __gnu_debug::__get_distance (
            _Iterator __lhs,
            _Iterator __rhs,
            std::random_access_iterator_tag )  [inline], [constexpr]
```

Determine the distance between two iterators with some known precision.
References std::make_pair().

__valid_range() [1/2]

```
template<typename _Iterator, typename _Sequence, typename _Category>
bool __gnu_debug::__valid_range (
            const _Safe_iterator< _Iterator, _Sequence, _Category > & __first,
            const _Safe_iterator< _Iterator, _Sequence, _Category > & __last,
            typename _Distance_traits< _Iterator >::__type & __dist)  [inline], [constexpr]
```

Safe iterators know how to check if they form a valid range.

__valid_range() [2/2]

```
template<typename _Iterator, typename _UContainer>
bool __gnu_debug::__valid_range (
            const _Safe_local_iterator< _Iterator, _UContainer > & __first,
            const _Safe_local_iterator< _Iterator, _UContainer > & __last,
            typename _Distance_traits< _Iterator >::__type & __dist_info)  [inline]
```

Safe local iterators know how to check if they form a valid range.

4.5 __gnu_internal Namespace Reference

4.5.1 Detailed Description

GNU implementation details, not for public use or export. Used only when anonymous namespaces cannot be substituted.

4.6 __gnu_parallel Namespace Reference

Variables

- static const int _CASable_bits
- static const _CASable _CASable_mask

4.6.1 Detailed Description

GNU parallel code for public use.

4.6.2 Typedef Documentation

_BinIndex

```
typedef unsigned short __gnu_parallel::_BinIndex
```

Type to hold the index of a bin.
Since many variables of this type are allocated, it should be chosen as small as possible.

_CASable

```
typedef int64_t __gnu_parallel::_CASable
```

Longest compare-and-swappable integer type on this platform.

_SequenceIndex

```
typedef uint64_t __gnu_parallel::_SequenceIndex
```

Unsigned integer to index __elements. The total number of elements for each algorithm must fit into this type.

_ThreadIndex

```
typedef uint16_t __gnu_parallel::_ThreadIndex
```

Unsigned integer to index a thread number. The maximum thread number (for each processor) must fit into this type.

4.6.3 Enumeration Type Documentation

_AlgorithmStrategy

```
enum __gnu_parallel::_AlgorithmStrategy
```

Strategies for run-time algorithm selection:

_FindAlgorithm

```
enum __gnu_parallel::_FindAlgorithm
```

Find algorithms:

_MultiwayMergeAlgorithm

```
enum __gnu_parallel::_MultiwayMergeAlgorithm
```

Merging algorithms:

_Parallelism

```
enum __gnu_parallel::_Parallelism
```

Run-time equivalents for the compile-time tags.

Enumerator

sequential	Not parallel.
parallel_unbalanced	Parallel unbalanced (equal-sized chunks).
parallel_balanced	Parallel balanced (work-stealing).
parallel_omp_loop	Parallel with OpenMP dynamic load-balancing.
parallel_omp_loop_static	Parallel with OpenMP static load-balancing.
parallel_taskqueue	Parallel with OpenMP taskqueue construct.

_PartialSumAlgorithm

enum __gnu_parallel::_PartialSumAlgorithm
Partial sum algorithms: recursive, linear.

_SortAlgorithm

enum __gnu_parallel::_SortAlgorithm
Sorting algorithms:

_SplittingAlgorithm

enum __gnu_parallel::_SplittingAlgorithm
Sorting/merging algorithms: sampling, __exact.

4.6.4 Function Documentation

__calc_borders()

```
template<typename _RAIter, typename _DifferenceTp>
void __gnu_parallel::__calc_borders (
             _RAIter __elements,
             _DifferenceTp __length,
             _DifferenceTp * __off)
```

Precalculate __advances for Knuth-Morris-Pratt algorithm.

Parameters

__elements	Begin iterator of sequence to search for.
__length	Length of sequence to search for.
__off	Returned __offsets.

Referenced by __search_template().

__compare_and_swap()

```
template<typename _Tp>
bool __gnu_parallel::__compare_and_swap (
             volatile _Tp * __ptr,
             _Tp __comparand,
             _Tp __replacement)  [inline]
```

Compare-and-swap.
Compare `*__ptr` and `__comparand`. If equal, let `*__ptr=__replacement` and return `true`, return `false` otherwise.

Parameters

__ptr	Pointer to signed integer.
__comparand	Compare value.
__replacement	Replacement value.

Referenced by __parallel_partition(), __gnu_parallel::_RestrictedBoundedConcurrentQueue< _Tp >::pop_back(), and __gnu_parallel::_RestrictedBoundedConcurrentQueue< _Tp >::pop_front().

__decode2()

```
void __gnu_parallel::__decode2 (
            _CASable __x,
            int & __a,
            int & __b)  [inline]
```

Decode two integers from one gnu_parallel::_CASable.

Parameters

_↩ _x	__gnu_parallel::_CASable to decode integers from.
_↩ _a	First integer, to be decoded from the most-significant _CASable_bits/2 bits of __x.
_↩ _b	Second integer, to be encoded in the least-significant _CASable_bits/2 bits of __x.

See also

__encode2

References _CASable_bits, and _CASable_mask.
Referenced by __gnu_parallel::_RestrictedBoundedConcurrentQueue< _Tp >::pop_back(), __gnu_parallel::_RestrictedBoundedConcurr
and __gnu_parallel::_RestrictedBoundedConcurrentQueue< _Tp >::push_front().

__determine_samples()

```
template<typename _RAIter, typename _DifferenceTp>
void __gnu_parallel::__determine_samples (
            _PMWMSSortingData< _RAIter > * __sd,
            _DifferenceTp __num_samples)
```

Select _M_samples from a sequence.

Parameters

__sd	Pointer to algorithm data. _Result will be placed in __sd->_M_samples.
__num_samples	Number of _M_samples to select.

References __equally_split(), __gnu_parallel::_PMWMSSortingData< _RAIter >::_M_samples, __gnu_parallel::_PMWMSSortingData<
and __gnu_parallel::_PMWMSSortingData< _RAIter >::_M_starts.

__encode2()

```
_CASable __gnu_parallel::__encode2 (
            int __a,
            int __b)  [inline]
```

Encode two integers into one gnu_parallel::_CASable.

Parameters

_↩ _a	First integer, to be encoded in the most-significant _CASable_bits/2 bits.

_↩ _b	Second integer, to be encoded in the least-significant _CASable_bits/2 bits.

Returns

value encoding __a and __b.

See also

__decode2

References _CASable_bits.
Referenced by __gnu_parallel::_RestrictedBoundedConcurrentQueue< _Tp >::_RestrictedBoundedConcurrentQueue(), __gnu_parallel::_RestrictedBoundedConcurrentQueue< _Tp >::pop_back(), __gnu_parallel::_RestrictedBoundedConcurrentQueue< _T and __gnu_parallel::_RestrictedBoundedConcurrentQueue< _Tp >::push_front().

__equally_split()

```
template<typename _DifferenceType, typename _OutputIterator>
_OutputIterator __gnu_parallel::__equally_split (
            _DifferenceType __n,
            _ThreadIndex __num_threads,
            _OutputIterator __s)
```

function to split a sequence into parts of almost equal size.
The resulting sequence __s of length __num_threads+1 contains the splitting positions when splitting the range [0,__n) into parts of almost equal size (plus minus 1). The first entry is 0, the last one n. There may result empty parts.

Parameters

__n	Number of elements
__num_threads	Number of parts
__s	Splitters

Returns

End of __splitter sequence, i.e. __s+__num_threads+1

Referenced by __determine_samples(), __find_template(), __parallel_partial_sum_linear(), __parallel_unique_copy(), __search_template(), and multiway_merge_exact_splitting().

__equally_split_point()

```
template<typename _DifferenceType>
_DifferenceType __gnu_parallel::__equally_split_point (
            _DifferenceType __n,
            _ThreadIndex __num_threads,
            _ThreadIndex __thread_no)
```

function to split a sequence into parts of almost equal size.
Returns the position of the splitting point between thread number __thread_no (included) and thread number __thread↩ _no+1 (excluded).

Parameters

__n	Number of elements
__num_threads	Number of parts
__thread_no	Number of threads

Returns

splitting point

Referenced by __for_each_template_random_access_ed().

__fetch_and_add()

```
template<typename _Tp>
_Tp __gnu_parallel::__fetch_and_add (
             volatile _Tp * __ptr,
             _Tp __addend)  [inline]
```

Add a value to a variable, atomically.

Parameters

__ptr	Pointer to a signed integer.
__addend	Value to add.

Referenced by __find_template(), __for_each_template_random_access_workstealing(), __parallel_partition(), and __gnu_parallel::_RestrictedBoundedConcurrentQueue< _Tp >::push_front().

__find_template() [1/4]

```
template<typename _RAIter1, typename _RAIter2, typename _Pred, typename _Selector>
std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__find_template (
             _RAIter1 __begin1,
             _RAIter1 __end1,
             _RAIter2 __begin2,
             _Pred __pred,
             _Selector __selector)  [inline]
```

Parallel std::find, switch for different algorithms.

Parameters

__begin1	Begin iterator of first sequence.
__end1	End iterator of first sequence.
__begin2	Begin iterator of second sequence. Must have same length as first sequence.
__pred	Find predicate.
__selector	_Functionality (e. g. std::find_if(), std::equal(),...)

Returns

Place of finding in both sequences.

References __find_template(), __gnu_parallel::_Settings::get(), and std::make_pair().
Referenced by __find_template().

__find_template() [2/4]

```
template<typename _RAIter1, typename _RAIter2, typename _Pred, typename _Selector>
std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__find_template (
            _RAIter1 __begin1,
            _RAIter1 __end1,
            _RAIter2 __begin2,
            _Pred __pred,
            _Selector __selector,
            constant_size_blocks_tag )
```

Parallel std::find, constant block size variant.

Parameters

__begin1	Begin iterator of first sequence.
__end1	End iterator of first sequence.
__begin2	Begin iterator of second sequence. Second __sequence must have same length as first sequence.
__pred	Find predicate.
__selector	_Functionality (e. g. std::find_if(), std::equal(),...)

Returns

Place of finding in both sequences.

See also

__gnu_parallel::_Settings::find_sequential_search_size

__gnu_parallel::_Settings::find_block_size There are two main differences between the growing blocks and the constant-size blocks variants.

1. For GB, the block size grows; for CSB, the block size is fixed.
2. For GB, the blocks are allocated dynamically; for CSB, the blocks are allocated in a predetermined manner, namely spacial round-robin.

References _GLIBCXX_CALL, __gnu_parallel::_Settings::find_initial_block_size, __gnu_parallel::_Settings::find_sequential_search_size, std::pair< _T1, _T2 >::first, __gnu_parallel::_Settings::get(), and std::min().

__find_template() [3/4]

```
template<typename _RAIter1, typename _RAIter2, typename _Pred, typename _Selector>
std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__find_template (
            _RAIter1 __begin1,
            _RAIter1 __end1,
            _RAIter2 __begin2,
            _Pred __pred,
            _Selector __selector,
            equal_split_tag )
```

Parallel std::find, equal splitting variant.

Parameters

__begin1	Begin iterator of first sequence.
__end1	End iterator of first sequence.
__begin2	Begin iterator of second sequence. Second __sequence must have same length as first sequence.
__pred	Find predicate.
__selector	_Functionality (e. g. std::find_if(), std::equal(),...)

Returns

Place of finding in both sequences.

References __equally_split(), and _GLIBCXX_CALL.

__find_template() [4/4]

```
template<typename _RAIter1, typename _RAIter2, typename _Pred, typename _Selector>
std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__find_template (
             _RAIter1 __begin1,
             _RAIter1 __end1,
             _RAIter2 __begin2,
             _Pred __pred,
             _Selector __selector,
             growing_blocks_tag )
```

Parallel std::find, growing block size variant.

Parameters

__begin1	Begin iterator of first sequence.
__end1	End iterator of first sequence.
__begin2	Begin iterator of second sequence. Second __sequence must have same length as first sequence.
__pred	Find predicate.
__selector	_Functionality (e. g. std::find_if(), std::equal(),...)

Returns

Place of finding in both sequences.

See also

__gnu_parallel::_Settings::find_sequential_search_size

__gnu_parallel::_Settings::find_scale_factor

There are two main differences between the growing blocks and the constant-size blocks variants.

1. For GB, the block size grows; for CSB, the block size is fixed.
2. For GB, the blocks are allocated dynamically; for CSB, the blocks are allocated in a predetermined manner, namely spacial round-robin.

References __fetch_and_add(), _GLIBCXX_CALL, __gnu_parallel::_Settings::find_scale_factor, __gnu_parallel::_Settings::find_sequentia
std::pair< _T1, _T2 >::first, __gnu_parallel::_Settings::get(), std::max(), and std::min().

__for_each_template_random_access()

```
template<typename _IIter, typename _UserOp, typename _Functionality, typename _Red, typename _Result>
_UserOp __gnu_parallel::__for_each_template_random_access (
            _IIter __begin,
            _IIter __end,
            _UserOp __user_op,
            _Functionality & __functionality,
            _Red __reduction,
            _Result __reduction_start,
            _Result & __output,
            typename std::iterator_traits< _IIter >::difference_type __bound,
            _Parallelism __parallelism_tag)
```

Chose the desired algorithm by evaluating __parallelism_tag.

Parameters

__begin	Begin iterator of input sequence.
__end	End iterator of input sequence.
__user_op	A user-specified functor (comparator, predicate, associative operator,...)
__functionality	functor to *process* an element with __user_op (depends on desired functionality, e. g. accumulate, for_each,...
__reduction	Reduction functor.
__reduction_start	Initial value for reduction.
__output	Output iterator.
__bound	Maximum number of elements processed.
__parallelism_tag	Parallelization method

References __for_each_template_random_access_ed(), __for_each_template_random_access_omp_loop(), __for_each_template_rando parallel_omp_loop, parallel_omp_loop_static, and parallel_unbalanced.

__for_each_template_random_access_ed()

```
template<typename _RAIter, typename _Op, typename _Fu, typename _Red, typename _Result>
_Op __gnu_parallel::__for_each_template_random_access_ed (
            _RAIter __begin,
            _RAIter __end,
            _Op __o,
            _Fu & __f,
            _Red __r,
            _Result __base,
            _Result & __output,
            typename std::iterator_traits< _RAIter >::difference_type __bound)
```

Embarrassingly parallel algorithm for random access iterators, using hand-crafted parallelization by equal splitting the work.

Parameters

__begin	Begin iterator of element sequence.
__end	End iterator of element sequence.

__o	User-supplied functor (comparator, predicate, adding functor, ...)
__f	Functor to "process" an element with __op (depends on desired functionality, e. g. for std::for_each(), ...).
__r	Functor to "add" a single __result to the already processed elements (depends on functionality).
__base	Base value for reduction.
__output	Pointer to position where final result is written to
__bound	Maximum number of elements processed (e. g. for std::count_n()).

Returns

User-supplied functor (that may contain a part of the result).

References __equally_split_point(), and min().
Referenced by __for_each_template_random_access().

__for_each_template_random_access_omp_loop()

```
template<typename _RAIter, typename _Op, typename _Fu, typename _Red, typename _Result>
_Op __gnu_parallel::__for_each_template_random_access_omp_loop (
            _RAIter __begin,
            _RAIter __end,
            _Op __o,
            _Fu & __f,
            _Red __r,
            _Result __base,
            _Result & __output,
            typename std::iterator_traits< _RAIter >::difference_type __bound)
```

Embarrassingly parallel algorithm for random access iterators, using an OpenMP for loop.

Parameters

__begin	Begin iterator of element sequence.
__end	End iterator of element sequence.
__o	User-supplied functor (comparator, predicate, adding functor, etc.).
__f	Functor to *process* an element with __op (depends on desired functionality, e. g. for std::for_each(), ...).

__r	Functor to *add* a single __result to the already processed elements (depends on functionality).
__base	Base value for reduction.
__output	Pointer to position where final result is written to
__bound	Maximum number of elements processed (e. g. for std::count_n()).

Returns

User-supplied functor (that may contain a part of the result).

References min().
Referenced by __for_each_template_random_access().

__for_each_template_random_access_omp_loop_static()

```
template<typename _RAIter, typename _Op, typename _Fu, typename _Red, typename _Result>
_Op __gnu_parallel::__for_each_template_random_access_omp_loop_static (
              _RAIter __begin,
              _RAIter __end,
              _Op __o,
              _Fu & __f,
              _Red __r,
              _Result __base,
              _Result & __output,
              typename std::iterator_traits< _RAIter >::difference_type __bound)
```

Embarrassingly parallel algorithm for random access iterators, using an OpenMP for loop with static scheduling.

Parameters

__begin	Begin iterator of element sequence.
__end	End iterator of element sequence.
__o	User-supplied functor (comparator, predicate, adding functor, ...).
__f	Functor to *process* an element with __op (depends on desired functionality, e. g. for std::for_each(), ...).
__r	Functor to *add* a single __result to the already processed __elements (depends on functionality).
__base	Base value for reduction.
__output	Pointer to position where final result is written to
__bound	Maximum number of elements processed (e. g. for std::count_n()).

Returns

User-supplied functor (that may contain a part of the result).

References std::min().

__for_each_template_random_access_workstealing()

```
template<typename _RAIter, typename _Op, typename _Fu, typename _Red, typename _Result>
_Op __gnu_parallel::__for_each_template_random_access_workstealing (
            _RAIter __begin,
            _RAIter __end,
            _Op __op,
            _Fu & __f,
            _Red __r,
            _Result __base,
            _Result & __output,
            typename std::iterator_traits< _RAIter >::difference_type __bound)
```

Work stealing algorithm for random access iterators.
Uses O(1) additional memory. Synchronization at job lists is done with atomic operations.

Parameters

__begin	Begin iterator of element sequence.
__end	End iterator of element sequence.
__op	User-supplied functor (comparator, predicate, adding functor, ...).
__f	Functor to *process* an element with __op (depends on desired functionality, e. g. for std::for_each(), ...).
__r	Functor to *add* a single __result to the already processed elements (depends on functionality).
__base	Base value for reduction.
__output	Pointer to position where final result is written to
__bound	Maximum number of elements processed (e. g. for std::count_n()).

Returns

User-supplied functor (that may contain a part of the result).

References __fetch_and_add(), __yield(), _GLIBCXX_CALL, __gnu_parallel::_Job< _DifferenceTp >::_M_first, __gnu_parallel::_Job< _DifferenceTp >::_M_last, __gnu_parallel::_Job< _DifferenceTp >::_M_load, __gnu_parallel::_Settings::cache_l __gnu_parallel::_Settings::get(), max(), and min().
Referenced by __for_each_template_random_access().

__is_sorted()

```
template<typename _IIter, typename _Compare>
bool __gnu_parallel::__is_sorted (
```

```
            _IIter __begin,
            _IIter __end,
            _Compare __comp)
```

Check whether [__begin, __end) is sorted according to __comp.

Parameters

__begin	Begin iterator of sequence.
__end	End iterator of sequence.
__comp	Comparator.

Returns

true if sorted, false otherwise.

Referenced by __sequential_multiway_merge(), multiway_merge_loser_tree_sentinel(), and parallel_multiway_merge().

__median_of_three_iterators()

```
template<typename _RAIter, typename _Compare>
_RAIter __gnu_parallel::__median_of_three_iterators (
            _RAIter __a,
            _RAIter __b,
            _RAIter __c,
            _Compare __comp)
```

Compute the median of three referenced elements, according to __comp.

Parameters

__a	First iterator.
__b	Second iterator.
__c	Third iterator.
__comp	Comparator.

Referenced by __qsb_divide().

__merge_advance()

```
template<typename _RAIter1, typename _RAIter2, typename _OutputIterator, typename _DifferenceTp,
typename _Compare>
_OutputIterator __gnu_parallel::__merge_advance (
            _RAIter1 & __begin1,
            _RAIter1 __end1,
            _RAIter2 & __begin2,
            _RAIter2 __end2,
            _OutputIterator __target,
            _DifferenceTp __max_length,
            _Compare __comp)  [inline]
```

Merge routine being able to merge only the __max_length smallest elements.

The __begin iterators are advanced accordingly, they might not reach __end, in contrast to the usual variant. Static switch on whether to use the conditional-move variant.

Parameters

__begin1	Begin iterator of first sequence.
__end1	End iterator of first sequence.
__begin2	Begin iterator of second sequence.
__end2	End iterator of second sequence.
__target	Target begin iterator.
__max_length	Maximum number of elements to merge.
__comp	Comparator.

Returns

Output end iterator.

References __merge_advance_movc(), and _GLIBCXX_CALL.
Referenced by __parallel_merge_advance(), and __sequential_multiway_merge().

__merge_advance_movc()

```
template<typename _RAIter1, typename _RAIter2, typename _OutputIterator, typename _DifferenceTp,
typename _Compare>
_OutputIterator __gnu_parallel::__merge_advance_movc (
             _RAIter1 & __begin1,
             _RAIter1 __end1,
             _RAIter2 & __begin2,
             _RAIter2 __end2,
             _OutputIterator __target,
             _DifferenceTp __max_length,
             _Compare __comp)
```

Merge routine being able to merge only the __max_length smallest elements.
The __begin iterators are advanced accordingly, they might not reach __end, in contrast to the usual variant. Specially designed code should allow the compiler to generate conditional moves instead of branches.

Parameters

__begin1	Begin iterator of first sequence.
__end1	End iterator of first sequence.
__begin2	Begin iterator of second sequence.
__end2	End iterator of second sequence.
__target	Target begin iterator.
__max_length	Maximum number of elements to merge.
__comp	Comparator.

Returns

Output end iterator.

Referenced by __merge_advance().

__merge_advance_usual()

```
template<typename _RAIter1, typename _RAIter2, typename _OutputIterator, typename _DifferenceTp,
typename _Compare>
_OutputIterator __gnu_parallel::__merge_advance_usual (
             _RAIter1 & __begin1,
             _RAIter1 __end1,
             _RAIter2 & __begin2,
             _RAIter2 __end2,
             _OutputIterator __target,
             _DifferenceTp __max_length,
             _Compare __comp)
```

Merge routine being able to merge only the __max_length smallest elements.
The __begin iterators are advanced accordingly, they might not reach __end, in contrast to the usual variant.

Parameters

__begin1	Begin iterator of first sequence.
__end1	End iterator of first sequence.
__begin2	Begin iterator of second sequence.
__end2	End iterator of second sequence.
__target	Target begin iterator.
__max_length	Maximum number of elements to merge.
__comp	Comparator.

Returns

Output end iterator.

__parallel_merge_advance() [1/2]

```
template<typename _RAIter1, typename _RAIter3, typename _Compare>
_RAIter3 __gnu_parallel::__parallel_merge_advance (
             _RAIter1 & __begin1,
             _RAIter1 __end1,
             _RAIter1 & __begin2,
             _RAIter1 __end2,
             _RAIter3 __target,
             typename std::iterator_traits< _RAIter1 >::difference_type __max_length,
             _Compare __comp)  [inline]
```

Parallel merge routine being able to merge only the __max_length smallest elements.
The __begin iterators are advanced accordingly, they might not reach __end, in contrast to the usual variant. The functionality is projected onto parallel_multiway_merge.

Parameters

__begin1	Begin iterator of first sequence.
__end1	End iterator of first sequence.
__begin2	Begin iterator of second sequence.
__end2	End iterator of second sequence.
__target	Target begin iterator.
__max_length	Maximum number of elements to merge.
__comp	Comparator.

Returns

Output end iterator.

References std::make_pair(), multiway_merge_exact_splitting(), and parallel_multiway_merge().

__parallel_merge_advance() [2/2]

```
template<typename _RAIter1, typename _RAIter2, typename _RAIter3, typename _Compare>
_RAIter3 __gnu_parallel::__parallel_merge_advance (
             _RAIter1 & __begin1,
             _RAIter1 __end1,
             _RAIter2 & __begin2,
             _RAIter2 __end2,
             _RAIter3 __target,
             typename std::iterator_traits< _RAIter1 >::difference_type __max_length,
             _Compare __comp)  [inline]
```

Merge routine fallback to sequential in case the iterators of the two input sequences are of different type.

Parameters

__begin1	Begin iterator of first sequence.
__end1	End iterator of first sequence.
__begin2	Begin iterator of second sequence.
__end2	End iterator of second sequence.
__target	Target begin iterator.
__max_length	Maximum number of elements to merge.
__comp	Comparator.

Returns

Output end iterator.

References __merge_advance().

__parallel_nth_element()

```
template<typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_nth_element (
             _RAIter __begin,
```

```
            _RAIter __nth,
            _RAIter __end,
            _Compare __comp)
```

Parallel implementation of std::nth_element().

Parameters

__begin	Begin iterator of input sequence.
__nth	_Iterator of element that must be in position afterwards.
__end	End iterator of input sequence.
__comp	Comparator.

References __parallel_partition(), _GLIBCXX_CALL, __gnu_parallel::_Settings::get(), std::max(), __gnu_parallel::_Settings::nth_element_
and __gnu_parallel::_Settings::partition_minimal_n.
Referenced by __parallel_partial_sort().

__parallel_partial_sort()

```
template<typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_partial_sort (
            _RAIter __begin,
            _RAIter __middle,
            _RAIter __end,
            _Compare __comp)
```

Parallel implementation of std::partial_sort().

Parameters

__begin	Begin iterator of input sequence.
__middle	Sort until this position.
__end	End iterator of input sequence.
__comp	Comparator.

References __parallel_nth_element().

__parallel_partial_sum()

```
template<typename _IIter, typename _OutputIterator, typename _BinaryOperation>
_OutputIterator __gnu_parallel::__parallel_partial_sum (
            _IIter __begin,
            _IIter __end,
            _OutputIterator __result,
            _BinaryOperation __bin_op)
```

Parallel partial sum front-__end.

Parameters

__begin	Begin iterator of input sequence.
__end	End iterator of input sequence.
__result	Begin iterator of output sequence.

__bin_op	Associative binary function.

Returns

End iterator of output sequence.

References __parallel_partial_sum_linear(), _GLIBCXX_CALL, and __gnu_parallel::_Settings::get().

__parallel_partial_sum_basecase()

```
template<typename _IIter, typename _OutputIterator, typename _BinaryOperation>
_OutputIterator __gnu_parallel::__parallel_partial_sum_basecase (
            _IIter __begin,
            _IIter __end,
            _OutputIterator __result,
            _BinaryOperation __bin_op,
            typename std::iterator_traits< _IIter >::value_type __value)
```

Base case prefix sum routine.

Parameters

__begin	Begin iterator of input sequence.
__end	End iterator of input sequence.
__result	Begin iterator of output sequence.
__bin_op	Associative binary function.
__value	Start value. Must be passed since the neutral element is unknown in general.

Returns

End iterator of output sequence.

Referenced by __parallel_partial_sum_linear().

__parallel_partial_sum_linear()

```
template<typename _IIter, typename _OutputIterator, typename _BinaryOperation>
_OutputIterator __gnu_parallel::__parallel_partial_sum_linear (
            _IIter __begin,
            _IIter __end,
            _OutputIterator __result,
            _BinaryOperation __bin_op,
            typename std::iterator_traits< _IIter >::difference_type __n)
```

Parallel partial sum implementation, two-phase approach, no recursion.

Parameters

__begin	Begin iterator of input sequence.
__end	End iterator of input sequence.
__result	Begin iterator of output sequence.
__bin_op	Associative binary function.

__n	Length of sequence.

Returns

End iterator of output sequence.

References __equally_split(), __parallel_partial_sum_basecase(), __gnu_parallel::_Settings::get(), std::max(), std::min(), and __gnu_parallel::_Settings::partial_sum_dilation.
Referenced by __parallel_partial_sum().

__parallel_partition()

```
template<typename _RAIter, typename _Predicate>
std::iterator_traits< _RAIter >::difference_type __gnu_parallel::__parallel_partition (
            _RAIter __begin,
            _RAIter __end,
            _Predicate __pred,
            _ThreadIndex __num_threads)
```

Parallel implementation of std::partition.

Parameters

__begin	Begin iterator of input sequence to split.
__end	End iterator of input sequence to split.
__pred	Partition predicate, possibly including some kind of pivot.
__num_threads	Maximum number of threads to use for this task.

Returns

Number of elements not fulfilling the predicate.

References __compare_and_swap(), __fetch_and_add(), _GLIBCXX_CALL, _GLIBCXX_VOLATILE, __gnu_parallel::_Settings::get(), std::max(), __gnu_parallel::_Settings::partition_chunk_share, and __gnu_parallel::_Settings::partition_chunk_size.
Referenced by __parallel_nth_element(), __parallel_sort_qs_divide(), and __qsb_divide().

__parallel_random_shuffle()

```
template<typename _RAIter, typename _RandomNumberGenerator>
void __gnu_parallel::__parallel_random_shuffle (
            _RAIter __begin,
            _RAIter __end,
            _RandomNumberGenerator __rng = _RandomNumber())  [inline]
```

Parallel random public call.

Parameters

__begin	Begin iterator of sequence.
__end	End iterator of sequence.
__rng	Random number generator to use.

References __parallel_random_shuffle_drs().

__parallel_random_shuffle_drs()

```
template<typename _RAIter, typename _RandomNumberGenerator>
void __gnu_parallel::__parallel_random_shuffle_drs (
            _RAIter __begin,
            _RAIter __end,
            typename std::iterator_traits< _RAIter >::difference_type __n,
            _ThreadIndex __num_threads,
            _RandomNumberGenerator & __rng)
```

Main parallel random shuffle step.

Parameters

__begin	Begin iterator of sequence.
__end	End iterator of sequence.
__n	Length of sequence.
__num_threads	Number of threads to use.
__rng	Random number generator to use.

References __gnu_parallel::_DRSSorterPU< _RAIter, _RandomNumberGenerator >::__bins_end, __parallel_random_shuffle_drs_pu(), __rd_log2(), __round_up_to_pow2(), __sequential_random_shuffle(), _GLIBCXX_CALL, __gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M_bins_begin, __gnu_parallel::_DRandomShufflingGlobalDa __gnu_parallel::_DRSSorterPU< _RAIter, _RandomNumberGenerator >::_M_bins_begin, __gnu_parallel::_DRandomShufflingGlobalDa __gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M_num_bins, __gnu_parallel::_DRandomShufflingGlobalData< _RAIter > __gnu_parallel::_DRSSorterPU< _RAIter, _RandomNumberGenerator >::_M_num_threads, __gnu_parallel::_DRSSorterPU< _RAIter, __gnu_parallel::_DRSSorterPU< _RAIter, _RandomNumberGenerator >::_M_seed, __gnu_parallel::_DRandomShufflingGlobalData< _ __gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M_temporaries, __gnu_parallel::_Settings::get(), __gnu_parallel::_Settings::L2_cache_size, std::max(), std::numeric_limits< _Tp >::max(), std::min(), and __gnu_parallel::_Settings::TLB_

Referenced by __parallel_random_shuffle().

__parallel_random_shuffle_drs_pu()

```
template<typename _RAIter, typename _RandomNumberGenerator>
void __gnu_parallel::__parallel_random_shuffle_drs_pu (
            _DRSSorterPU< _RAIter, _RandomNumberGenerator > * __pus)
```

Random shuffle code executed by each thread.

Parameters

__pus	Array of thread-local data records.

References __random_number_pow2(), __sequential_random_shuffle(), __gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M __gnu_parallel::_DRSSorterPU< _RAIter, _RandomNumberGenerator >::_M_bins_begin, __gnu_parallel::_DRandomShufflingGlobalDa __gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M_num_bins, __gnu_parallel::_DRandomShufflingGlobalData< _RAIter > __gnu_parallel::_DRSSorterPU< _RAIter, _RandomNumberGenerator >::_M_num_threads, __gnu_parallel::_DRSSorterPU< _RAIter, __gnu_parallel::_DRSSorterPU< _RAIter, _RandomNumberGenerator >::_M_seed, __gnu_parallel::_DRandomShufflingGlobalData< _ __gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M_starts, __gnu_parallel::_DRandomShufflingGlobalData< _RAIter >::_M and std::partial_sum().

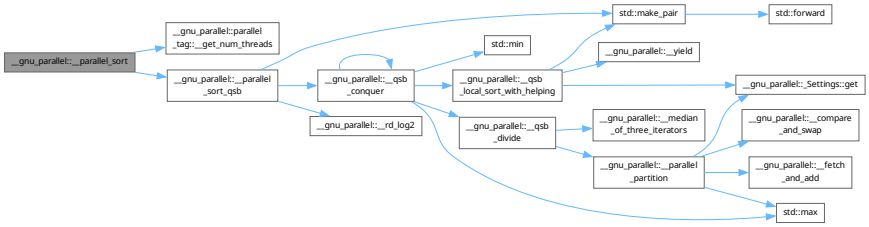
Referenced by __parallel_random_shuffle_drs().

__parallel_sort() [1/7]

```
template<bool __stable, typename _RAIter, typename _Compare>
```

```
void __gnu_parallel::__parallel_sort (
            _RAIter __begin,
            _RAIter __end,
            _Compare __comp,
            balanced_quicksort_tag __parallelism)  [inline]
```

Choose balanced quicksort for parallel sorting.



Parameters

__begin	Begin iterator of input sequence.
__end	End iterator of input sequence.
__comp	Comparator.

Template Parameters

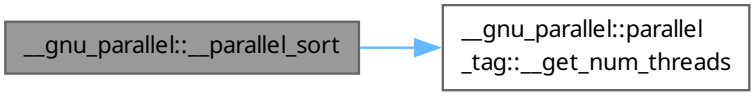
__stable	Sort stable.

References __gnu_parallel::parallel_tag::__get_num_threads(), __parallel_sort_qsb(), and _GLIBCXX_CALL.
Here is the call graph for this function:

__parallel_sort() [2/7]

```
template<bool __stable, typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort (
            _RAIter __begin,
            _RAIter __end,
            _Compare __comp,
            default_parallel_tag __parallelism)  [inline]
```

Choose multiway mergesort with exact splitting, for parallel sorting.



Parameters

__begin	Begin iterator of input sequence.
__end	End iterator of input sequence.
__comp	Comparator.

Template Parameters

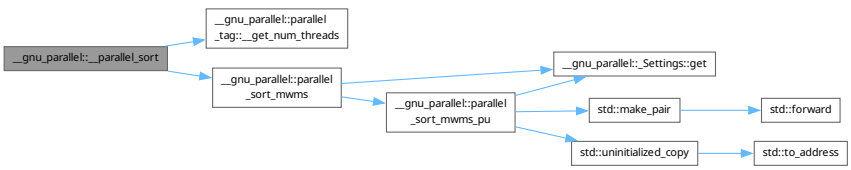
__stable	Sort stable.

References __gnu_parallel::parallel_tag::__get_num_threads(), and _GLIBCXX_CALL.
Here is the call graph for this function:

__parallel_sort() [3/7]

```
template<bool __stable, typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort (
            _RAIter __begin,
            _RAIter __end,
            _Compare __comp,
            multiway_mergesort_exact_tag __parallelism)  [inline]
```

Choose multiway mergesort with exact splitting, for parallel sorting.



Parameters

__begin	Begin iterator of input sequence.
__end	End iterator of input sequence.
__comp	Comparator.

Template Parameters

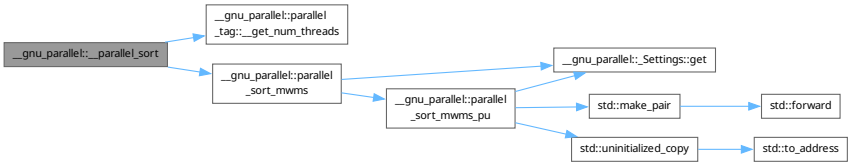
__stable	Sort stable.

References __gnu_parallel::parallel_tag::__get_num_threads(), _GLIBCXX_CALL, and parallel_sort_mwms().
Here is the call graph for this function:

__parallel_sort() [4/7]

```
template<bool __stable, typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort (
             _RAIter __begin,
             _RAIter __end,
             _Compare __comp,
             multiway_mergesort_sampling_tag __parallelism)  [inline]
```

Choose multiway mergesort with splitting by sampling, for parallel sorting.



Parameters

__begin	Begin iterator of input sequence.
__end	End iterator of input sequence.
__comp	Comparator.

Template Parameters

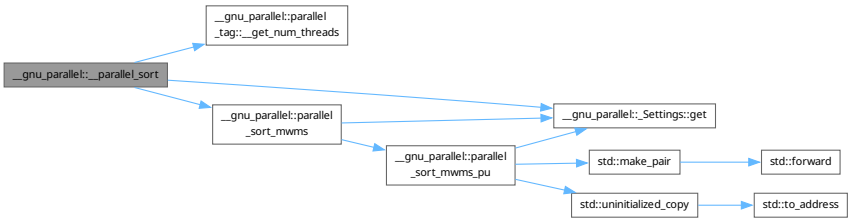
__stable	Sort stable.

References __gnu_parallel::parallel_tag::__get_num_threads(), _GLIBCXX_CALL, and parallel_sort_mwms().
Here is the call graph for this function:

__parallel_sort() [5/7]

```
template<bool __stable, typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort (
             _RAIter __begin,
             _RAIter __end,
             _Compare __comp,
             multiway_mergesort_tag __parallelism)  [inline]
```

Choose multiway mergesort, splitting variant at run-time, for parallel sorting.



Parameters

__begin	Begin iterator of input sequence.
__end	End iterator of input sequence.
__comp	Comparator.

Template Parameters

__stable	Sort stable.

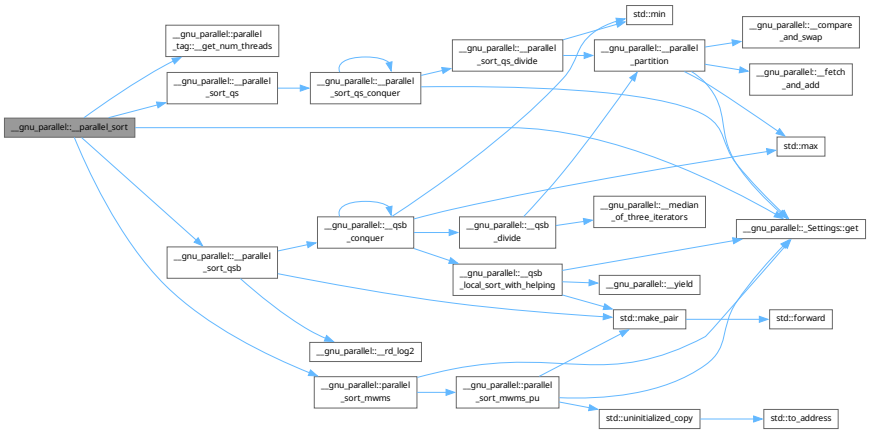
References __gnu_parallel::parallel_tag::__get_num_threads(), _GLIBCXX_CALL, __gnu_parallel::_Settings::get(), and parallel_sort_mwms().
Here is the call graph for this function:

__parallel_sort() [6/7]

```
template<bool __stable, typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort (
            _RAIter __begin,
            _RAIter __end,
            _Compare __comp,
            parallel_tag __parallelism)  [inline]
```

Choose a parallel sorting algorithm.

Parameters



__begin	Begin iterator of input sequence.
__end	End iterator of input sequence.
__comp	Comparator.

Template Parameters

__stable	Sort stable.

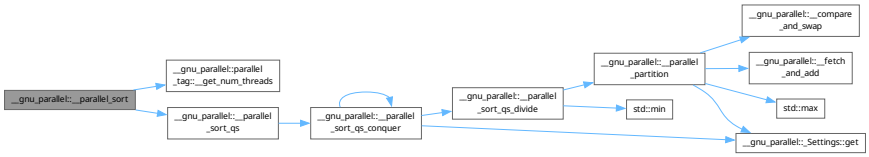
References __gnu_parallel::parallel_tag::__get_num_threads(), __parallel_sort_qs(), __parallel_sort_qsb(), _GLIBCXX_CALL, __gnu_parallel::_Settings::get(), and parallel_sort_mwms().

Here is the call graph for this function:

__parallel_sort() [7/7]

```
template<bool __stable, typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort (
            _RAIter __begin,
            _RAIter __end,
            _Compare __comp,
            quicksort_tag __parallelism)  [inline]
```

Choose quicksort for parallel sorting.



Parameters

__begin	Begin iterator of input sequence.
__end	End iterator of input sequence.
__comp	Comparator.

Template Parameters

__stable	Sort stable.

References __gnu_parallel::parallel_tag::__get_num_threads(), __parallel_sort_qs(), and _GLIBCXX_CALL.
Here is the call graph for this function:

__parallel_sort_qs()

```
template<typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort_qs (
             _RAIter __begin,
             _RAIter __end,
             _Compare __comp,
             _ThreadIndex __num_threads)
```

Unbalanced quicksort main call.

Parameters

__begin	Begin iterator of input sequence.
__end	End iterator input sequence, ignored.
__comp	Comparator.
__num_threads	Number of threads that are allowed to work on this part.

References __parallel_sort_qs_conquer(), and _GLIBCXX_CALL.
Referenced by __parallel_sort(), and __parallel_sort().

__parallel_sort_qs_conquer()

```
template<typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort_qs_conquer (
             _RAIter __begin,
             _RAIter __end,
             _Compare __comp,
             _ThreadIndex __num_threads)
```

Unbalanced quicksort conquer step.

Parameters

__begin	Begin iterator of subsequence.
__end	End iterator of subsequence.
__comp	Comparator.
__num_threads	Number of threads that are allowed to work on this part.

References __parallel_sort_qs_conquer(), __parallel_sort_qs_divide(), and __gnu_parallel::_Settings::get().
Referenced by __parallel_sort_qs(), and __parallel_sort_qs_conquer().

__parallel_sort_qs_divide()

```
template<typename _RAIter, typename _Compare>
std::iterator_traits< _RAIter >::difference_type __gnu_parallel::__parallel_sort_qs_divide (
             _RAIter __begin,
             _RAIter __end,
             _Compare __comp,
             typename std::iterator_traits< _RAIter >::difference_type __pivot_rank,
             typename std::iterator_traits< _RAIter >::difference_type __num_samples,
             _ThreadIndex __num_threads)
```

Unbalanced quicksort divide step.

Parameters

__begin	Begin iterator of subsequence.
__end	End iterator of subsequence.
__comp	Comparator.
__pivot_rank	Desired __rank of the pivot.
__num_samples	Choose pivot from that many samples.
__num_threads	Number of threads that are allowed to work on this part.

References __parallel_partition(), and std::min().
Referenced by __parallel_sort_qs_conquer().

__parallel_sort_qsb()

```
template<typename _RAIter, typename _Compare>
void __gnu_parallel::__parallel_sort_qsb (
             _RAIter __begin,
             _RAIter __end,
             _Compare __comp,
             _ThreadIndex __num_threads)
```

Top-level quicksort routine.

Parameters

__begin	Begin iterator of sequence.
__end	End iterator of sequence.
__comp	Comparator.
__num_threads	Number of threads that are allowed to work on this part.

References __qsb_conquer(), __rd_log2(), _GLIBCXX_CALL, and std::make_pair().
Referenced by __parallel_sort(), and __parallel_sort().

__parallel_unique_copy() [1/2]

```
template<typename _IIter, class _OutputIterator>
_OutputIterator __gnu_parallel::__parallel_unique_copy (
             _IIter __first,
             _IIter __last,
             _OutputIterator __result)  [inline]
```

Parallel std::unique_copy(), without explicit equality predicate.

Parameters

__first	Begin iterator of input sequence.
__last	End iterator of input sequence.
__result	Begin iterator of result __sequence.

Returns

End iterator of result __sequence.

References __parallel_unique_copy().

__parallel_unique_copy() [2/2]

```
template<typename _IIter, class _OutputIterator, class _BinaryPredicate>
_OutputIterator __gnu_parallel::__parallel_unique_copy (
              _IIter __first,
              _IIter __last,
              _OutputIterator __result,
              _BinaryPredicate __binary_pred)
```

Parallel std::unique_copy(), w/__o explicit equality predicate.

Parameters

__first	Begin iterator of input sequence.
__last	End iterator of input sequence.
__result	Begin iterator of result __sequence.
__binary_pred	Equality predicate.

Returns

End iterator of result __sequence.

References __equally_split(), and _GLIBCXX_CALL.
Referenced by __parallel_unique_copy().

__qsb_conquer()

```
template<typename _RAIter, typename _Compare>
void __gnu_parallel::__qsb_conquer (
              _QSBThreadLocal< _RAIter > ** __tls,
              _RAIter __begin,
              _RAIter __end,
              _Compare __comp,
              _ThreadIndex __iam,
              _ThreadIndex __num_threads,
              bool __parent_wait)
```

Quicksort conquer step.

Parameters

__tls	Array of thread-local storages.
__begin	Begin iterator of subsequence.
__end	End iterator of subsequence.
__comp	Comparator.
__iam	Number of the thread processing this function.
__num_threads	Number of threads that are allowed to work on this part.

References __qsb_conquer(), __qsb_divide(), __qsb_local_sort_with_helping(), __gnu_parallel::_QSBThreadLocal< _RAIter >::_M_eler

Referenced by __parallel_sort_qsb(), and __qsb_conquer().

__qsb_divide()

```
template<typename _RAIter, typename _Compare>
std::iterator_traits< _RAIter >::difference_type __gnu_parallel::__qsb_divide (
            _RAIter __begin,
            _RAIter __end,
            _Compare __comp,
            _ThreadIndex __num_threads)
```

Balanced quicksort divide step.

Parameters

__begin	Begin iterator of subsequence.
__end	End iterator of subsequence.
__comp	Comparator.
__num_threads	Number of threads that are allowed to work on this part.

Precondition

(__end-__begin)>=1

References __median_of_three_iterators(), and __parallel_partition().
Referenced by __qsb_conquer().

__qsb_local_sort_with_helping()

```
template<typename _RAIter, typename _Compare>
void __gnu_parallel::__qsb_local_sort_with_helping (
            _QSBThreadLocal< _RAIter > ** __tls,
            _Compare & __comp,
            _ThreadIndex __iam,
            bool __wait)
```

Quicksort step doing load-balanced local sort.

Parameters

__tls	Array of thread-local storages.
__comp	Comparator.
__iam	Number of the thread processing this function.

References __yield(), _GLIBCXX_PARALLEL_ASSERTIONS, __gnu_parallel::_QSBThreadLocal< _RAIter >::_M_elements_leftover,

and __gnu_parallel::_Settings::sort_qsb_base_case_maximal_n.
Referenced by __qsb_conquer().

__random_number_pow2()

```
template<typename _RandomNumberGenerator>
```

```
int __gnu_parallel::__random_number_pow2 (
            int __logp,
            _RandomNumberGenerator & __rng)  [inline]
```

Generate a random number in [0,2^__logp).

Parameters

__logp	Logarithm (basis 2) of the upper range __bound.
__rng	Random number generator to use.

Referenced by __parallel_random_shuffle_drs_pu(), and __sequential_random_shuffle().

__rd_log2()

```
template<typename _Size>
_Size __gnu_parallel::__rd_log2 (
            _Size __n)  [inline]
```

Calculates the rounded-down logarithm of __n for base 2.

Parameters

_↩ _n	Argument.

Returns

Returns 0 for any argument <1.

Referenced by __gnu_parallel::_LoserTreeBase< _Tp, _Compare >::_LoserTreeBase(), __parallel_random_shuffle_drs(), __parallel_sort_qsb(), __round_up_to_pow2(), __sequential_random_shuffle(), multiseq_partition(), and multiseq_selection().

__round_up_to_pow2()

```
template<typename _Tp>
_Tp __gnu_parallel::__round_up_to_pow2 (
            _Tp __x)
```

Round up to the next greater power of 2.

Parameters

_↩ _x	_Integer to round up

References __rd_log2().
Referenced by __parallel_random_shuffle_drs(), __sequential_random_shuffle(), and multiseq_selection().

__search_template()

```
template<typename __RAIter1, typename __RAIter2, typename _Pred>
__RAIter1 __gnu_parallel::__search_template (
            __RAIter1 __begin1,
            __RAIter1 __end1,
            __RAIter2 __begin2,
```

```
            __RAIter2 __end2,
            _Pred __pred)
```

Parallel std::search.

Parameters

__begin1	Begin iterator of first sequence.
__end1	End iterator of first sequence.
__begin2	Begin iterator of second sequence.
__end2	End iterator of second sequence.
__pred	Find predicate.

Returns

Place of finding in first sequences.

References __calc_borders(), __equally_split(), _GLIBCXX_CALL, std::max(), and std::min().

__sequential_multiway_merge()

```
template<bool __stable, bool __sentinels, typename _RAIterIterator, typename _RAIter3, typename ↩
_DifferenceTp, typename _Compare>
_RAIter3 __gnu_parallel::__sequential_multiway_merge (
            _RAIterIterator __seqs_begin,
            _RAIterIterator __seqs_end,
            _RAIter3 __target,
            const typename std::iterator_traits< typename std::iterator_traits< _RAIterIterator
>::value_type::first_type >::value_type & __sentinel,
            _DifferenceTp __length,
            _Compare __comp)
```

Sequential multi-way merging switch.
The _GLIBCXX_PARALLEL_DECISION is based on the branching factor and runtime settings.

Parameters

__seqs_begin	Begin iterator of iterator pair input sequence.
__seqs_end	End iterator of iterator pair input sequence.
__target	Begin iterator of output sequence.
__comp	Comparator.
__length	Maximum length to merge, possibly larger than the number of elements available.
__sentinel	The sequences have __a __sentinel element.

Returns

End iterator of output sequence.

References __is_sorted(), __merge_advance(), _GLIBCXX_CALL, _GLIBCXX_PARALLEL_LENGTH, and std::min().
Referenced by multiway_merge(), multiway_merge_sentinels(), and parallel_multiway_merge().

__sequential_random_shuffle()

```
template<typename _RAIter, typename _RandomNumberGenerator>
void __gnu_parallel::__sequential_random_shuffle (
             _RAIter __begin,
             _RAIter __end,
             _RandomNumberGenerator & __rng)
```

Sequential cache-efficient random shuffle.

Parameters

__begin	Begin iterator of sequence.
__end	End iterator of sequence.
__rng	Random number generator to use.

References __random_number_pow2(), __rd_log2(), __round_up_to_pow2(), __sequential_random_shuffle(), __gnu_parallel::_Settings::get(), __gnu_parallel::_Settings::L2_cache_size, std::max(), std::min(), std::partial_sum(), and __gnu_parallel::_Settings::TLB_size.
Referenced by __parallel_random_shuffle_drs(), __parallel_random_shuffle_drs_pu(), and __sequential_random_shuffle().

__shrink()

```
template<typename _IIter>
void __gnu_parallel::__shrink (
             std::vector< _IIter > & __os_starts,
             size_t & __count_to_two,
             size_t & __range_length)
```

Combines two ranges into one and thus halves the number of ranges.

Parameters

__os_starts	Start positions worked on (oversampled).
__count_to_two	Counts up to 2.
__range_length	Current length of a chunk.

References std::vector< _Tp, _Alloc >::size().
Referenced by __shrink_and_double().

__shrink_and_double()

```
template<typename _IIter>
void __gnu_parallel::__shrink_and_double (
             std::vector< _IIter > & __os_starts,
             size_t & __count_to_two,
             size_t & __range_length,
             const bool __make_twice)
```

Shrinks and doubles the ranges.

Parameters

__os_starts	Start positions worked on (oversampled).
__count_to_two	Counts up to 2.

__range_length	Current length of a chunk.
__make_twice	Whether the __os_starts is allowed to be grown or not

References __shrink(), std::vector< _Tp, _Alloc >::resize(), and std::vector< _Tp, _Alloc >::size().
Referenced by list_partition().

__yield()

```
void __gnu_parallel::__yield ()  [inline]
```

Yield control to another thread, without waiting for the end of the time slice.
Referenced by __for_each_template_random_access_workstealing(), and __qsb_local_sort_with_helping().

list_partition()

```
template<typename _IIter, typename _FunctorType>
size_t __gnu_parallel::list_partition (
              const _IIter __begin,
              const _IIter __end,
              _IIter * __starts,
              size_t * __lengths,
              const int __num_parts,
              _FunctorType & __f,
              int __oversampling = 0)
```

Splits a sequence given by input iterators into parts of almost equal size.
The function needs only one pass over the sequence.

Parameters

__begin	Begin iterator of input sequence.
__end	End iterator of input sequence.
__starts	Start iterators for the resulting parts, dimension __num_parts+1. For convenience, __starts [__num_parts] contains the end iterator of the sequence.
__lengths	Length of the resulting parts.
__num_parts	Number of parts to split the sequence into.
__f	Functor to be applied to each element by traversing __it
__oversampling	Oversampling factor. If 0, then the partitions will differ in at most $\sqrt{\text{end} - \text{begin}}$ elements. Otherwise, the ratio between the longest and the shortest part is bounded by $1/(\text{oversampling} \cdot \text{num_parts})$

Returns

Length of the whole sequence.

References __shrink_and_double(), and std::vector< _Tp, _Alloc >::size().

max()

```
template<typename _Tp>
```

```
const _Tp & __gnu_parallel::max (
            const _Tp & __a,
            const _Tp & __b)  [inline]
```

Equivalent to std::max.
Referenced by __for_each_template_random_access_workstealing().

min()

```
template<typename _Tp>
const _Tp & __gnu_parallel::min (
            const _Tp & __a,
            const _Tp & __b)  [inline]
```

Equivalent to std::min.
Referenced by __for_each_template_random_access_ed(), __for_each_template_random_access_omp_loop(), and __for_each_template_random_access_workstealing().

multiseq_partition()

```
template<typename _RanSeqs, typename _RankType, typename _RankIterator, typename _Compare>
void __gnu_parallel::multiseq_partition (
            _RanSeqs __begin_seqs,
            _RanSeqs __end_seqs,
            _RankType __rank,
            _RankIterator __begin_offsets,
            _Compare __comp = std::less< typename std::iterator_traits<typename std::iterator_traits<↩
_RanSeqs>::value_type:: first_type>::value_type>())
```

Splits several sorted sequences at a certain global __rank, resulting in a splitting point for each sequence. The sequences are passed via a sequence of random-access iterator pairs, none of the sequences may be empty. If there are several equal elements across the split, the ones on the __left side will be chosen from sequences with smaller number.

Parameters

__begin_seqs	Begin of the sequence of iterator pairs.
__end_seqs	End of the sequence of iterator pairs.
__rank	The global rank to partition at.
__begin_offsets	A random-access __sequence __begin where the __result will be stored in. Each element of the sequence is an iterator that points to the first element on the greater part of the respective __sequence.
__comp	The ordering functor, defaults to std::less<_Tp>.

References __rd_log2(), _GLIBCXX_CALL, std::vector< _Tp, _Alloc >::begin(), std::distance(), std::priority_queue< _Tp, _Sequence, _C
std::vector< _Tp, _Alloc >::end(), std::make_pair(), std::max(), std::min(), std::priority_queue< _Tp, _Sequence, _Compare >::pop(),
std::priority_queue< _Tp, _Sequence, _Compare >::push(), std::vector< _Tp, _Alloc >::push_back(), and std::priority_queue< _Tp, _Se
Referenced by multiway_merge_exact_splitting().

multiseq_selection()

```
template<typename _Tp, typename _RanSeqs, typename _RankType, typename _Compare>
_Tp __gnu_parallel::multiseq_selection (
            _RanSeqs __begin_seqs,
            _RanSeqs __end_seqs,
            _RankType __rank,
```

```
            _RankType & __offset,
            _Compare __comp = std::less<_Tp>())
```

Selects the element at a certain global __rank from several sorted sequences.
The sequences are passed via a sequence of random-access iterator pairs, none of the sequences may be empty.

Parameters

__begin_seqs	Begin of the sequence of iterator pairs.
__end_seqs	End of the sequence of iterator pairs.
__rank	The global rank to partition at.
__offset	The rank of the selected element in the global subsequence of elements equal to the selected element. If the selected element is unique, this number is 0.
__comp	The ordering functor, defaults to std::less.

References __rd_log2(), __round_up_to_pow2(), _GLIBCXX_CALL, std::vector< _Tp, _Alloc >::begin(), std::distance(), std::priority_queue< _Tp, _Sequence, _Compare >::empty(), std::vector< _Tp, _Alloc >::end(), std::make_pair(), std::max(), std::min(), std::priority_queue< _Tp, _Sequence, _Compare >::pop(), std::priority_queue< _Tp, _Sequence, _Compare >::pu
std::vector< _Tp, _Alloc >::push_back(), and std::priority_queue< _Tp, _Sequence, _Compare >::top().

multiway_merge()

```
template<typename _RAIterPairIterator, typename _RAIterOut, typename _DifferenceTp, typename _↩
Compare>
_RAIterOut __gnu_parallel::multiway_merge (
            _RAIterPairIterator __seqs_begin,
            _RAIterPairIterator __seqs_end,
            _RAIterOut __target,
            _DifferenceTp __length,
            _Compare __comp,
            __gnu_parallel::sequential_tag )
```

Multiway Merge Frontend.
Merge the sequences specified by seqs_begin and __seqs_end into __target. __seqs_begin and __seqs_end must point to a sequence of pairs. These pairs must contain an iterator to the beginning of a sequence in their first entry and an iterator the _M_end of the same sequence in their second entry.
Ties are broken arbitrarily. See stable_multiway_merge for a variant that breaks ties by sequence number but is slower.
The first entries of the pairs (i.e. the begin iterators) will be moved forward.
The output sequence has to provide enough space for all elements that are written to it.
This function will merge the input sequences:

- not stable
- parallel, depending on the input size and Settings
- using sampling for splitting
- not using sentinels

Example:

```
int sequences[10][10];
for (int __i = 0; __i < 10; ++__i)
  for (int __j = 0; __i < 10; ++__j)
    sequences[__i][__j] = __j;

int __out[33];
```

```
std::vector<std::pair<int*> > seqs;
for (int __i = 0; __i < 10; ++__i)
  { seqs.push(std::make_pair<int*>(sequences[__i],
                                   sequences[__i] + 10)) }

multiway_merge(seqs.begin(), seqs.end(), __target, std::less<int>(), 33);
```

See also

stable_multiway_merge

Precondition

All input sequences must be sorted.

Target must provide enough space to merge out length elements or the number of elements in all sequences, whichever is smaller.

Postcondition

[__target, return __value) contains merged __elements from the input sequences.

return __value - __target = min(__length, number of elements in all sequences).

Template Parameters

_RAIterPairIterator	iterator over sequence of pairs of iterators
_RAIterOut	iterator over target sequence
_DifferenceTp	difference type for the sequence
_Compare	strict weak ordering type to compare elements in sequences

Parameters

__seqs_begin	__begin of sequence __sequence
__seqs_end	_M_end of sequence __sequence
__target	target sequence to merge to.
__comp	strict weak ordering to use for element comparison.
__length	Maximum length to merge, possibly larger than the number of elements available.

Returns

_M_end iterator of output sequence

References __sequential_multiway_merge(), and _GLIBCXX_CALL.

multiway_merge_3_variant()

```
template<template< typename _RAI, typename _Cp > class iterator, typename _RAIterIterator, typename
_RAIter3, typename _DifferenceTp, typename _Compare>
_RAIter3 __gnu_parallel::multiway_merge_3_variant (
            _RAIterIterator __seqs_begin,
```

```
            _RAIterIterator __seqs_end,
            _RAIter3 __target,
            _DifferenceTp __length,
            _Compare __comp)
```

Highly efficient 3-way merging procedure.
Merging is done with the algorithm implementation described by Peter Sanders. Basically, the idea is to minimize the number of necessary comparison after merging an element. The implementation trick that makes this fast is that the order of the sequences is stored in the instruction pointer (translated into labels in C++).
This works well for merging up to 4 sequences.
Note that making the merging stable does *not* come at a performance hit.
Whether the merging is done guarded or unguarded is selected by the used iterator class.

Parameters

__seqs_begin	Begin iterator of iterator pair input sequence.
__seqs_end	End iterator of iterator pair input sequence.
__target	Begin iterator of output sequence.
__comp	Comparator.
__length	Maximum length to merge, less equal than the total number of elements available.

Returns

End iterator of output sequence.

References _GLIBCXX_CALL.

multiway_merge_4_variant()

```
template<template< typename _RAI, typename _Cp > class iterator, typename _RAIterIterator, typename
_RAIter3, typename _DifferenceTp, typename _Compare>
_RAIter3 __gnu_parallel::multiway_merge_4_variant (
            _RAIterIterator __seqs_begin,
            _RAIterIterator __seqs_end,
            _RAIter3 __target,
            _DifferenceTp __length,
            _Compare __comp)
```

Highly efficient 4-way merging procedure.
Merging is done with the algorithm implementation described by Peter Sanders. Basically, the idea is to minimize the number of necessary comparison after merging an element. The implementation trick that makes this fast is that the order of the sequences is stored in the instruction pointer (translated into goto labels in C++).
This works well for merging up to 4 sequences.
Note that making the merging stable does *not* come at a performance hit.
Whether the merging is done guarded or unguarded is selected by the used iterator class.

Parameters

__seqs_begin	Begin iterator of iterator pair input sequence.
__seqs_end	End iterator of iterator pair input sequence.
__target	Begin iterator of output sequence.
__comp	Comparator.

__length	Maximum length to merge, less equal than the total number of elements available.

Returns

End iterator of output sequence.

References _GLIBCXX_CALL.

multiway_merge_exact_splitting()

```
template<bool __stable, typename _RAIterIterator, typename _Compare, typename _DifferenceType>
void __gnu_parallel::multiway_merge_exact_splitting (

multiway_merge_loser_tree()

```
template<typename _LT, typename _RAIterIterator, typename _RAIter3, typename _DifferenceTp, typename
_Compare>
_RAIter3 __gnu_parallel::multiway_merge_loser_tree (
            _RAIterIterator __seqs_begin,
            _RAIterIterator __seqs_end,
            _RAIter3 __target,
            _DifferenceTp __length,
            _Compare __comp)
```

Multi-way merging procedure for a high branching factor, guarded case.
This merging variant uses a LoserTree class as selected by _LT.
Stability is selected through the used LoserTree class _LT.
At least one non-empty sequence is required.

Parameters

__seqs_begin	Begin iterator of iterator pair input sequence.
__seqs_end	End iterator of iterator pair input sequence.
__target	Begin iterator of output sequence.
__comp	Comparator.
__length	Maximum length to merge, less equal than the total number of elements available.

Returns

End iterator of output sequence.

References _GLIBCXX_CALL, and _GLIBCXX_PARALLEL_LENGTH.

multiway_merge_loser_tree_sentinel()

```
template<typename _UnguardedLoserTree, typename _RAIterIterator, typename _RAIter3, typename _↩
DifferenceTp, typename _Compare>
_RAIter3 __gnu_parallel::multiway_merge_loser_tree_sentinel (
            _RAIterIterator __seqs_begin,
            _RAIterIterator __seqs_end,
            _RAIter3 __target,
            const typename std::iterator_traits< typename std::iterator_traits< _RAIterIterator
>::value_type::first_type >::value_type & __sentinel,
            _DifferenceTp __length,
            _Compare __comp)
```

Multi-way merging procedure for a high branching factor, requiring sentinels to exist.

Template Parameters

_UnguardedLoserTree	Loser Tree variant to use for the unguarded merging.

Parameters

__seqs_begin	Begin iterator of iterator pair input sequence.
__seqs_end	End iterator of iterator pair input sequence.
__target	Begin iterator of output sequence.
__comp	Comparator.
__length	Maximum length to merge, less equal than the total number of elements available.

Returns

End iterator of output sequence.

References __is_sorted(), _GLIBCXX_CALL, and multiway_merge_loser_tree_unguarded().

multiway_merge_loser_tree_unguarded()

```
template<typename _LT, typename _RAIterIterator, typename _RAIter3, typename _DifferenceTp, typename
_Compare>
_RAIter3 __gnu_parallel::multiway_merge_loser_tree_unguarded (
            _RAIterIterator __seqs_begin,
            _RAIterIterator __seqs_end,
            _RAIter3 __target,
            const typename std::iterator_traits< typename std::iterator_traits< _RAIterIterator
>::value_type::first_type >::value_type & __sentinel,
            _DifferenceTp __length,
            _Compare __comp)
```

Multi-way merging procedure for a high branching factor, unguarded case.
Merging is done using the LoserTree class `_LT`.
Stability is selected by the used LoserTrees.

Precondition

No input will run out of elements during the merge.

Parameters

__seqs_begin	Begin iterator of iterator pair input sequence.
__seqs_end	End iterator of iterator pair input sequence.
__target	Begin iterator of output sequence.
__comp	Comparator.
__length	Maximum length to merge, less equal than the total number of elements available.

Returns

End iterator of output sequence.

References _GLIBCXX_CALL.

multiway_merge_sentinels()

```
template<typename _RAIterPairIterator, typename _RAIterOut, typename _DifferenceTp, typename _↩
Compare>
_RAIterOut __gnu_parallel::multiway_merge_sentinels (
             _RAIterPairIterator __seqs_begin,
             _RAIterPairIterator __seqs_end,
             _RAIterOut __target,
             _DifferenceTp __length,
             _Compare __comp,
             __gnu_parallel::sequential_tag )
```

Multiway Merge Frontend.
Merge the sequences specified by seqs_begin and __seqs_end into __target. __seqs_begin and __seqs_end must point to a sequence of pairs. These pairs must contain an iterator to the beginning of a sequence in their first entry and an iterator the _M_end of the same sequence in their second entry.
Ties are broken arbitrarily. See stable_multiway_merge for a variant that breaks ties by sequence number but is slower.
The first entries of the pairs (i.e. the begin iterators) will be moved forward accordingly.
The output sequence has to provide enough space for all elements that are written to it.
This function will merge the input sequences:

- not stable

- parallel, depending on the input size and Settings
- using sampling for splitting
- using sentinels

You have to take care that the element the _M_end iterator points to is readable and contains a value that is greater than any other non-sentinel value in all sequences.
Example:

```
int sequences[10][11];
for (int __i = 0; __i < 10; ++__i)
  for (int __j = 0; __i < 11; ++__j)
    sequences[__i][__j] = __j; // __last one is sentinel!

int __out[33];
std::vector<std::pair<int*> > seqs;
for (int __i = 0; __i < 10; ++__i)
  { seqs.push(std::make_pair<int*>(sequences[__i],
                                   sequences[__i] + 10)) }

multiway_merge(seqs.begin(), seqs.end(), __target, std::less<int>(), 33);
```

Precondition

All input sequences must be sorted.

Target must provide enough space to merge out length elements or the number of elements in all sequences, whichever is smaller.

For each __i, __seqs_begin[__i].second must be the end marker of the sequence, but also reference the one more __sentinel element.

Postcondition

[__target, return __value) contains merged __elements from the input sequences.

return __value - __target = min(__length, number of elements in all sequences).

See also

stable_multiway_merge_sentinels

Template Parameters

_RAIterPairIterator	iterator over sequence of pairs of iterators
_RAIterOut	iterator over target sequence
_DifferenceTp	difference type for the sequence
_Compare	strict weak ordering type to compare elements in sequences

Parameters

__seqs_begin	__begin of sequence __sequence
__seqs_end	_M_end of sequence __sequence

__target	target sequence to merge to.
__comp	strict weak ordering to use for element comparison.
__length	Maximum length to merge, possibly larger than the number of elements available.

Returns

_M_end iterator of output sequence

References __sequential_multiway_merge(), and _GLIBCXX_CALL.

parallel_multiway_merge()

```
template<bool __stable, bool __sentinels, typename _RAIterIterator, typename _RAIter3, typename ↩
_DifferenceTp, typename _Splitter, typename _Compare>
_RAIter3 __gnu_parallel::parallel_multiway_merge (
            _RAIterIterator __seqs_begin,
            _RAIterIterator __seqs_end,
            _RAIter3 __target,
            _Splitter __splitter,
            _DifferenceTp __length,
            _Compare __comp,
            _ThreadIndex __num_threads)
```

Parallel multi-way merge routine.
The _GLIBCXX_PARALLEL_DECISION is based on the branching factor and runtime settings.
Must not be called if the number of sequences is 1.

Template Parameters

_Splitter	functor to split input (either __exact or sampling based)
__stable	Stable merging incurs a performance penalty.
__sentinel	Ignored.

Parameters

__seqs_begin	Begin iterator of iterator pair input sequence.
__seqs_end	End iterator of iterator pair input sequence.
__target	Begin iterator of output sequence.
__comp	Comparator.
__length	Maximum length to merge, possibly larger than the number of elements available.

Returns

End iterator of output sequence.

References __is_sorted(), __sequential_multiway_merge(), _GLIBCXX_CALL, _GLIBCXX_PARALLEL_LENGTH, __gnu_parallel::_Settings::get(), std::make_pair(), __gnu_parallel::_Settings::merge_oversampling, and std::min().
Referenced by __parallel_merge_advance().

parallel_sort_mwms()

```
template<bool __stable, bool __exact, typename _RAIter, typename _Compare>
void __gnu_parallel::parallel_sort_mwms (
            _RAIter __begin,
            _RAIter __end,
            _Compare __comp,
            _ThreadIndex __num_threads)
```

PMWMS main call.

Parameters

__begin	Begin iterator of sequence.
__end	End iterator of sequence.
__comp	Comparator.
__num_threads	Number of threads to use.

References _GLIBCXX_CALL, __gnu_parallel::_PMWMSSortingData< _RAIter >::_M_num_threads, __gnu_parallel::_PMWMSSortingD

and __gnu_parallel::_Settings::sort_mwms_oversampling.
Referenced by __parallel_sort(), __parallel_sort(), __parallel_sort(), and __parallel_sort().

parallel_sort_mwms_pu()

```
template<bool __stable, bool __exact, typename _RAIter, typename _Compare>
void __gnu_parallel::parallel_sort_mwms_pu (
            _PMWMSSortingData< _RAIter > * __sd,
            _Compare & __comp)
```

PMWMS code executed by each thread.

Parameters

__sd	Pointer to algorithm data.
__comp	Comparator.

4.6.5 Variable Documentation

_CASable_bits

```
const int __gnu_parallel::_CASable_bits  [static]
```

Number of bits of _CASable.
Referenced by __decode2(), and __encode2().

_CASable_mask

```
const _CASable __gnu_parallel::_CASable_mask  [static]
```

_CASable with the right half of bits set to 1.
Referenced by __decode2().

4.7.1 Detailed Description

GNU extensions for policy-based data structures for public use.

4.8 __gnu_sequential Namespace Reference

4.8.1 Detailed Description

GNU sequential classes for public use.

4.9 abi Namespace Reference

4.9.1 Detailed Description

The cross-vendor C++ Application Binary Interface. A namespace alias to __cxxabiv1, but user programs should use the alias 'abi'.
A brief overview of an ABI is given in the libstdc++ FAQ, question 5.8 (you may have a copy of the FAQ locally, or you can view the online version at http://gcc.gnu.org/onlinedocs/libstdc++/faq.html#5_8).
GCC subscribes to a cross-vendor ABI for C++, sometimes called the IA64 ABI because it happens to be the native ABI for that platform. It is summarized at http://www.codesourcery.com/cxx-abi/ along with the current specification.
For users of GCC greater than or equal to 3.x, entry points are available in <cxxabi.h>, which notes, *'It is not normally necessary for user programs to include this header, or use the entry points directly. However, this header is available should that be needed.'*

Standard Stream Objects

The <iostream> header declares the eight standard stream objects. For other declarations, see https://gcc.gnu.org/onlinedocs/libstdc++/manual/io.html and the I/O forward declarations

They are required by default to cooperate with the global C library's FILE streams, and to be available during program startup and termination. For more information, see the section of the manual linked to above.

- istream cin
- ostream cout

4.10.1 Detailed Description

ISO C++ entities toplevel namespace is std.

4.10.2 Typedef Documentation

__ptr_rebind

```
template<typename _Ptr, typename _Tp>
using std::__ptr_rebind
```

Convenience alias for rebinding pointers.

__umap_traits

```
template<bool _Cache>
using std::__umap_traits
```

Base types for unordered_map.

__ummap_traits

```
template<bool _Cache>
using std::__ummap_traits
```

Base types for unordered_multimap.

__umset_traits

```
template<bool _Cache>
using std::__umset_traits
```

Base types for unordered_multiset.

__uset_traits

```
template<bool _Cache>
using std::__uset_traits
```

Base types for unordered_set.

compare_three_way_result_t

```
template<typename _Tp, typename _Up = _Tp>
using std::compare_three_way_result_t
```

[cmp.result], result of three-way comparison

index_sequence

```
template<size_t... _Idx>
using std::index_sequence
```

Alias template index_sequence.

index_sequence_for

```
template<typename... _Types>
using std::index_sequence_for
```
Alias template index_sequence_for.

iter_rvalue_reference_t

```
template<__detail::__dereferenceable _Tp>
using std::iter_rvalue_reference_t
```
The result type of ranges::iter_move(std::declval<_Tp&>()).

make_index_sequence

```
template<size_t _Num>
using std::make_index_sequence
```
Alias template make_index_sequence.

make_integer_sequence

```
template<typename _Tp, _Tp _Num>
using std::make_integer_sequence
```
Alias template make_integer_sequence.

new_handler

```
typedef void(* std::new_handler) ()
```
If you write your own error handler to be called by `new`, it must be of this type.

projected

```
template<indirectly_readable _Iter, indirectly_regular_unary_invocable< _Iter > _Proj>
using std::projected
```
[projected], projected

streamoff

```
typedef long long std::streamoff
```
Type used by fpos, char_traits<char>, and char_traits<wchar_t>.
In clauses 21.1.3.1 and 27.4.1 streamoff is described as an implementation defined type. Note: In versions of GCC up to and including GCC 3.3, streamoff was typedef long.

streampos

```
typedef fpos<mbstate_t> std::streampos
```
File position for char streams.

streamsize

```
typedef ptrdiff_t std::streamsize
```
Integral type for I/O operation counts and buffer sizes.

u16streampos

```
typedef fpos<mbstate_t> std::u16streampos
```
File position for char16_t streams.

u32streampos

typedef fpos<mbstate_t> std::u32streampos
File position for char32_t streams.

wstreampos

typedef fpos<mbstate_t> std::wstreampos
File position for wchar_t streams.

4.10.3 Enumeration Type Documentation

chars_format

enum class std::chars_format [strong]
floating-point format for primitive numerical conversion

float_denorm_style

enum std::float_denorm_style
Describes the denormalization for floating-point types.
These values represent the presence or absence of a variable number of exponent bits. This type is used in the std::↩ numeric_limits class.

Enumerator

denorm_indeterminate	Indeterminate at compile time whether denormalized values are allowed.
denorm_absent	The type does not allow denormalized values.
denorm_present	The type allows denormalized values.

float_round_style

enum std::float_round_style
Describes the rounding style for floating-point types.
This is used in the std::numeric_limits class.

Enumerator

round_indeterminate	Intermediate.
round_toward_zero	To zero.
round_to_nearest	To the nearest representable value.
round_toward_infinity	To infinity.
round_toward_neg_infinity	To negative infinity.

io_errc

enum class std::io_errc [strong]
I/O error code.

4.10.4 Function Documentation

__gen_two_uniform_ints()

```
template<typename _IntType, typename _UniformRandomBitGenerator>
pair< _IntType, _IntType > std::__gen_two_uniform_ints (
            _IntType __b0,
            _IntType __b1,
            _UniformRandomBitGenerator && __g)
```

Generate two uniformly distributed integers using a single distribution invocation.

Parameters

__b0	The upper bound for the first integer.
__b1	The upper bound for the second integer.
__g	A UniformRandomBitGenerator.

Returns

A pair (i, j) with i and j uniformly distributed over [0, __b0) and [0, __b1), respectively.

Requires: __b0 * __b1 <= __g.max() - __g.min().
Using uniform_int_distribution with a range that is very small relative to the range of the generator ends up wasting potentially expensively generated randomness, since uniform_int_distribution does not store leftover randomness between invocations.
If we know we want two integers in ranges that are sufficiently small, we can compose the ranges, use a single distribution invocation, and significantly reduce the waste.
References make_pair().
Referenced by shuffle().

__lg()

```
template<typename _Tp>
_Tp std::__lg (
            _Tp __n)  [inline], [constexpr]
```

This is a helper function for the sort routines and for random.tcc.
Referenced by nth_element(), nth_element(), std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::operator()(), and std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed().

_Construct()

```
template<typename _Tp, typename...  _Args>
void std::_Construct (
            _Tp * __p,
            _Args &&...  __args)  [inline], [constexpr]
```

Constructs an object in existing memory by invoking an allocated object's constructor with an initializer.
References forward().
Referenced by std::allocator_traits< _OuterAlloc >::construct(), std::allocator_traits< allocator< _Tp > >::construct(), and std::allocator_traits< allocator< void > >::construct().

_Destroy() [1/2]

```
template<typename _ForwardIterator>
void std::_Destroy (
```

```
            _ForwardIterator __first,
            _ForwardIterator __last)  [inline], [constexpr]
```

Destroy a range of objects. If the value_type of the object has a trivial destructor, the compiler should optimize all of this away, otherwise the objects' destructors must be invoked.
References _Destroy(), and addressof().
Referenced by std::vector< _Tp, polymorphic_allocator< _Tp > >::~vector(), _Destroy(), _Destroy_n(), std::deque< _Tp, _Alloc >::_M_
std::deque< _Tp, _Alloc >::_M_range_initialize(), std::allocator_traits< _OuterAlloc >::destroy(), std::allocator_traits< allocator< void >
std::vector< _Tp, _Alloc >::operator=(), and std::vector< _Tp, _Alloc >::reserve().

_Destroy() [2/2]

```
template<typename _Tp>
void std::_Destroy (
            _Tp * __pointer)  [inline], [constexpr]
```

Destroy the object pointed to by a pointer type.

_Destroy_n()

```
template<typename _ForwardIterator, typename _Size>
_ForwardIterator std::_Destroy_n (
            _ForwardIterator __first,
            _Size __count)  [inline], [constexpr]
```

Destroy a range of objects. If the value_type of the object has a trivial destructor, the compiler should optimize all of this away, otherwise the objects' destructors must be invoked.
References _Destroy(), addressof(), and advance().

abs()

```
template<typename _Tp>
_Tp std::abs (
            const complex< _Tp > & __z)  [inline]
```

Return magnitude of *z*.
References abs(), and arg().

acosh()

```
float std::acosh (
            float __x)  [constexpr]
```

Additional overloads.

advance()

```
template<typename _InputIterator, typename _Distance>
void std::advance (
            _InputIterator & __i,
            _Distance __n)  [inline], [constexpr]
```

A generalization of pointer arithmetic.

Parameters

_↩ _*i*	An input iterator.
_↩ _*n*	The *delta* by which to change __i.

This increments i by n. For bidirectional and random access iterators, __n may be negative, in which case __i is decremented.
For random access iterators, this uses their + and − operations and are constant time. For other iterator classes they are linear time.
Referenced by _Destroy_n(), std::deque< _Tp, _Alloc >::_M_range_initialize(), __gnu_pbds::detail::pat_trie_base::_Node_citer< node, l __gnu_pbds::detail::pat_trie_base::_Node_iter< node, leaf, head, inode, const_iterator, iterator, _Alloc >::get_child(), and partition_point().

begin() [1/3]

```
template<typename _Container>
auto std::begin (
            _Container & __cont) -> decltype(__cont.begin())  [inline], [constexpr], [noexcept]
```

Return an iterator pointing to the first element of the container.

Parameters

__*cont*	Container.

Since

C++11

Referenced by cbegin(), std::vector< _Tp, _Alloc >::insert(), std::list< _Tp, _Alloc >::merge(), std::list< _Tp, _Alloc >::merge(), std::list< _Tp, _Alloc >::remove(), std::list< _Tp, _Alloc >::remove_if(), std::list< _Tp, _Alloc >::sort(), std::list< _Tp, _Alloc >::sort(), std::list< _Tp, _Alloc >::unique(), and std::list< _Tp, _Alloc >::unique().

begin() [2/3]

```
template<typename _Tp, size_t _Nm>
_Tp * std::begin (
            _Tp(&) __arr[_Nm])  [inline], [constexpr], [noexcept]
```

Return an iterator pointing to the first element of the array.

Parameters

__*arr*	Array.

Since

C++11

begin() [3/3]

```
template<typename _Container>
auto std::begin (
            const _Container & __cont) -> decltype(__cont.begin())  [inline], [constexpr], [noexcept]
```

Return an iterator pointing to the first element of the const container.

Parameters

__cont	Container.

boolalpha()

```
ios_base & std::boolalpha (
            ios_base & __base)  [inline]
```

Calls base.setf(ios_base::boolalpha).
References std::ios_base::boolalpha.

cbegin()

```
template<typename _Container>
auto std::cbegin (
            const _Container & __cont) -> decltype(std::begin(__cont))  [constexpr], [noexcept]
```

Return an iterator pointing to the first element of the const container.

Parameters

__cont	Container.

Since

C++14

References begin().
Referenced by std::vector< _Tp, _Alloc >::insert().

cend()

```
template<typename _Container>
auto std::cend (
            const _Container & __cont) -> decltype(std::end(__cont))  [constexpr], [noexcept]
```

Return an iterator pointing to one past the last element of the const container.

Parameters

__cont	Container.

Since

C++14

References end().

const_pointer_cast()

```
template<typename _Tp, typename _Tp1, _Lock_policy _Lp>
__shared_ptr< _Tp, _Lp > std::const_pointer_cast (
            const __shared_ptr< _Tp1, _Lp > & __r)  [inline], [noexcept]
```

const_pointer_cast

crbegin()

```
template<typename _Container>
auto std::crbegin (
            const _Container & __cont) -> decltype(std::rbegin(__cont))  [inline], [constexpr],
[noexcept]
```

Return a reverse iterator pointing to the last element of the const container.

Parameters

__cont	Container.

Since

C++14

References rbegin().

crend()

```
template<typename _Container>
auto std::crend (
            const _Container & __cont) -> decltype(std::rend(__cont))  [inline], [constexpr],
[noexcept]
```

Return a reverse iterator pointing one past the first element of the const container.

Parameters

__cont	Container.

Since

C++14

References rend().

data() [1/3]

```
template<typename _Container>
auto std::data (
            _Container & __cont) -> decltype(__cont.data())  [nodiscard], [constexpr], [noexcept]
```

Return the data pointer of a container.

Parameters

__cont	Container.

Since

C++17

Referenced by std::basic_stringbuf< char >::basic_stringbuf(), and std::basic_string< _CharT, _Traits, _Alloc >::find().

data() [2/3]

```
template<typename _Tp, size_t _Nm>
_Tp * std::data (
            _Tp(&) __array[_Nm])  [nodiscard], [constexpr], [noexcept]
```

Return the data pointer of an array.

Parameters

__array	Array.

Since

C++17

data() [3/3]

```
template<typename _Container>
auto std::data (
            const _Container & __cont) -> decltype(__cont.data())  [nodiscard], [constexpr],
[noexcept]
```

Return the data pointer of a const container.

Parameters

__cont	Container.

Since

C++17

dec()

```
ios_base & std::dec (
            ios_base & __base)  [inline]
```

Calls base.setf(ios_base::dec, ios_base::basefield).
References std::ios_base::basefield, and std::ios_base::dec.

defaultfloat()

```
ios_base & std::defaultfloat (
            ios_base & __base)  [inline]
```

Calls `base.unsetf(ios_base::floatfield)`.
References std::ios_base::floatfield.

distance()

```
template<typename _InputIterator>
iterator_traits< _InputIterator >::difference_type std::distance (
            _InputIterator __first,
            _InputIterator __last)  [inline], [nodiscard], [constexpr]
```

A generalization of pointer arithmetic.

Parameters

__first,__last	Input iterators that form a valid range.

Returns

The distance between them.

Returns `n` such that `__first + n == __last`. This requires that `__last` must be reachable from `__first`, or for random access iterators either `__last` is reachable from `__first` or `__first` is reachable from `__last`. In the latter case, `n` may be negative.
For random access iterators, this uses their + and − operations and is constant time. For other iterator classes they are linear time.
References move().
Referenced by std::deque< _Tp, _Alloc >::_M_range_initialize(), is_heap(), is_heap_until(), is_heap_until(), std::sub_match< const char * >::length(), __gnu_parallel::multiseq_partition(), __gnu_parallel::multiseq_selection(), __gnu_pbds::detail::pat_trie_base::_Node_citer< node, leaf, head, inode, const_iterator, iterator, _Alloc >::num↩_children(), partition_point(), std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _↩BidirectionalIterator > > >< const char * >::position(), __gnu_cxx::random_sample_n(), __gnu_cxx::random_sample_n(), std::list< _Tp, polymorphic_allocator< _Tp > >::size(), and std::list< _Tp, polymorphic_allocator< _Tp > >::splice().

dynamic_pointer_cast()

```
template<typename _Tp, typename _Tp1, _Lock_policy _Lp>
__shared_ptr< _Tp, _Lp > std::dynamic_pointer_cast (
            const __shared_ptr< _Tp1, _Lp > & __r)  [inline], [noexcept]
```

dynamic_pointer_cast

empty() [1/2]

```
template<typename _Container>
auto std::empty (
            const _Container & __cont) -> decltype(__cont.empty())  [nodiscard], [constexpr],
[noexcept]
```

Return whether a container is empty.

Parameters

__cont	Container.

Since

C++17

Referenced by std::list< _Tp, _Alloc >::sort(), and std::list< _Tp, _Alloc >::sort().

empty() [2/2]

```
template<typename _Tp, size_t _Nm>
bool std::empty (
            const _Tp(&)[_Nm]) [nodiscard], [constexpr], [noexcept]
```

Return whether an array is empty (always false).

Parameters

-	An array.

Since

C++17

end() [1/3]

```
template<typename _Container>
auto std::end (
            _Container & __cont) -> decltype(__cont.end()) [inline], [constexpr], [noexcept]
```

Return an iterator pointing to one past the last element of the container.

Parameters

__cont	Container.

Since

C++11

Referenced by cend(), std::vector< _Tp, _Alloc >::insert(), std::list< _Tp, _Alloc >::merge(), std::list< _Tp, _Alloc >::merge(), std::vector< _Tp, _Alloc >::operator=(), std::list< _Tp, _Alloc >::remove(), std::list< _Tp, _Alloc >::remove_if(), std::list< _Tp, _Alloc >::resize(), std::list< _Tp, _Alloc >::resize(), std::list< _Tp, _Alloc >::sort(), std::list< _Tp, _Alloc >::sort(), std::list< _Tp, _Alloc >::unique(), and std::list< _Tp, _Alloc >::unique().

end() [2/3]

```
template<typename _Tp, size_t _Nm>
_Tp * std::end (
            _Tp(&) __arr[_Nm]) [inline], [constexpr], [noexcept]
```

Return an iterator pointing to one past the last element of the array.

Parameters

__arr	Array.

Since

C++11

end() [3/3]

```
template<typename _Container>
auto std::end (
            const _Container & __cont) -> decltype(__cont.end())  [inline], [constexpr], [noexcept]
```

Return an iterator pointing to one past the last element of the const container.

Parameters

__cont	Container.

Since

C++11

endl()

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & std::endl (
            basic_ostream< _CharT, _Traits > & __os)  [inline]
```

Write a newline and flush the stream.

This manipulator is often mistakenly used when a simple newline is desired, leading to poor buffering performance. See https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.↩streambuf.buffering for more on this subject.

References flush(), std::basic_ostream< _CharT, _Traits >::put(), and std::basic_ios< _CharT, _Traits >::widen().

ends()

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & std::ends (
            basic_ostream< _CharT, _Traits > & __os)  [inline]
```

Write a null character into the output sequence.

Null character is `CharT()` by definition. For CharT of `char`, this correctly writes the ASCII `NUL` character string terminator.

References std::basic_ostream< _CharT, _Traits >::put().

fabs()

```
template<typename _Tp>
_Tp std::fabs (
            const std::complex< _Tp > & __z)  [inline]
```

fabs(__z) TR1 8.1.8 [tr.c99.cmplx.fabs]

References abs(), and fabs().

Referenced by fabs().

fixed()

```
ios_base & std::fixed (
            ios_base & __base)  [inline]
```

Calls base.setf(ios_base::fixed, ios_base::floatfield).

References std::ios_base::fixed, and std::ios_base::floatfield.

flush()

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & std::flush (
            basic_ostream< _CharT, _Traits > & __os)  [inline]
```

Flushes the output stream.
This manipulator simply calls the stream's `flush()` member function.
References std::basic_ostream< _CharT, _Traits >::flush().
Referenced by endl().

from_chars()

```
template<typename _Tp, enable_if_t< __or_< __is_signed_or_unsigned_integer< _Tp >, is_same<
char, _Tp > >::value, int > = 0>
from_chars_result std::from_chars (
            const char * __first,
            const char * __last,
            _Tp & __value,
            int __base = 10)  [constexpr]
```

std::from_chars for integer types.
References std::__detail::__from_chars_alnum(), and std::__detail::__from_chars_pow2_base().

generate_canonical()

```
template<typename _RealT, size_t __digits, typename _Urbg>
_RealT std::generate_canonical (
            _Urbg & __urng)
```

Produce a random floating-point value in the range [0..1)
The result of `std::generate_canonical<RealT,digits>(urng)` is a random floating-point value of type `RealT` in the range [0..1), using entropy provided by the uniform random bit generator `urng`. A value for `digits` may be passed to limit the precision of the result to so many bits, but normally `-1u` is passed to get the native precision of `RealT`. As many `urng()` calls are made as needed to obtain the required entropy. On rare occasions, more `urng()` calls are used. It is fastest when the value of `Urbg::max()` is a power of two less one, such as from a `std::philox4x32` (for `float`) or `philox4x64` (for `double`).

Since

C++11

References std::__numeric_limits_base::digits, generate_canonical(), and std::__numeric_limits_base::radix.

get() [1/12]

```
template<typename _Tp, typename _Up>
const _Tp && std::get (
            const pair< _Tp, _Up > && __p)  [constexpr], [noexcept]

get_money()

```
template<typename _MoneyT>
_Get_money< _MoneyT > std::get_money (
            _MoneyT & __mon,
            bool __intl = false)  [inline]
```

Extended manipulator for extracting money.

Parameters

__mon	Either long double or a specialization of `basic_string`.
__intl	A bool indicating whether international format is to be used.

Sent to a stream object, this manipulator extracts *__mon*.

get_new_handler()

```
new_handler std::get_new_handler ()  [noexcept]
```

Return the current new handler.

get_temporary_buffer()

```
template<typename _Tp>
pair< _Tp *, ptrdiff_t > std::get_temporary_buffer (
            ptrdiff_t __len)  [noexcept]
```

Allocates a temporary buffer.

Parameters

__len	The number of objects of type Tp.

Returns

See full description.

Reinventing the wheel, but this time with prettier spokes!
This function tries to obtain storage for __len adjacent Tp objects. The objects themselves are not constructed, of course. A pair<> is returned containing *the buffer's address and capacity (in the units of sizeof(_Tp)), or a pair of 0 values if no storage can be obtained.* Note that the capacity obtained may be less than that requested if the memory is unavailable; you should compare len with the .second return value.
Provides the nothrow exception guarantee.

get_time()

```
template<typename _CharT>
_Get_time< _CharT > std::get_time (
            std::tm * __tmb,
            const _CharT * __fmt)  [inline]
```

Extended manipulator for extracting time.
This manipulator uses time_get::get to extract time. [ext.manip]

Parameters

__tmb	struct to extract the time data to.
__fmt	format string.

getline() [1/6]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_istream< _CharT, _Traits > & std::getline (
            basic_istream< _CharT, _Traits > && __is,
            basic_string< _CharT, _Traits, _Alloc > & __str)  [inline]
```

Read a line from an rvalue stream into a string.
References getline().

getline() [2/6]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_istream< _CharT, _Traits > & std::getline (
            basic_istream< _CharT, _Traits > && __is,
            basic_string< _CharT, _Traits, _Alloc > & __str,
            _CharT __delim)  [inline]
```

Read a line from an rvalue stream into a string.
References getline().

getline() [3/6]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
basic_istream< _CharT, _Traits > & std::getline (
            basic_istream< _CharT, _Traits > & __is,
            __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base > & __str)  [inline]
```

Read a line from stream into a string.

Parameters

__is	Input stream.
__str	Buffer to store into.

Returns

Reference to the input stream.

Stores characters from is into *__str* until '
' is found, the end of the stream is encountered, or str.max_size() is reached. If is.width() is non-zero, that is the limit on the number of characters stored into *__str*. Any previous contents of *__str* are erased. If end of line was encountered, it is extracted but not stored into *__str*.
References getline(), and std::basic_ios< _CharT, _Traits >::widen().

getline() [4/6]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
basic_istream< _CharT, _Traits > & std::getline (
             basic_istream< _CharT, _Traits > & __is,
             __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
             _CharT __delim)
```

Read a line from stream into a string.

Parameters

__is	Input stream.
__str	Buffer to store into.
__delim	Character marking end of line.

Returns

Reference to the input stream.

Stores characters from *__is* into *__str* until *__delim* is found, the end of the stream is encountered, or str.max_size() is reached. If is.width() is non-zero, that is the limit on the number of characters stored into *__str*. Any previous contents of *__str* are erased. If *delim* was encountered, it is extracted but not stored into *__str*.
References __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append(), __gnu_cxx::__versa_string< _CharT, _Traits, _Allo
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::max_size(), std::basic_ios< _CharT, _Traits >::rdbuf(),
and std::basic_ios< _CharT, _Traits >::setstate().

getline() [5/6]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_istream< _CharT, _Traits > & std::getline (
             basic_istream< _CharT, _Traits > & __is,
             basic_string< _CharT, _Traits, _Alloc > & __str)  [inline]
```

Read a line from stream into a string.

Parameters

__is	Input stream.
__str	Buffer to store into.

Returns

Reference to the input stream.

Stores characters from is into *__str* until '
' is found, the end of the stream is encountered, or str.max_size() is reached. Any previous contents of *__str* are erased. If end of line is encountered, it is extracted but not stored into *__str*.
References getline(), and std::basic_ios< _CharT, _Traits >::widen().

getline() [6/6]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_istream< _CharT, _Traits > & std::getline (
            basic_istream< _CharT, _Traits > & __is,
            basic_string< _CharT, _Traits, _Alloc > & __str,
            _CharT __delim)
```

Read a line from stream into a string.

Parameters

__is	Input stream.
__str	Buffer to store into.
__delim	Character marking end of line.

Returns

Reference to the input stream.

Stores characters from *__is* into *__str* until *__delim* is found, the end of the stream is encountered, or str.max_size() is reached. Any previous contents of *__str* are erased. If *__delim* is encountered, it is extracted but not stored into *__str*.
References std::basic_string< _CharT, _Traits, _Alloc >::erase(), std::basic_string< _CharT, _Traits, _Alloc >::max_size(), std::basic_ios< _CharT, _Traits >::rdbuf(), and std::basic_ios< _CharT, _Traits >::setstate().
Referenced by getline(), getline(), getline(), and getline().

hex()

```
ios_base & std::hex (
            ios_base & __base)  [inline]
```

Calls base.setf(ios_base::hex, ios_base::basefield).
References std::ios_base::basefield, and std::ios_base::hex.

hexfloat()

```
ios_base & std::hexfloat (
            ios_base & __base)  [inline]
```

Calls base.setf(ios_base::fixed|ios_basescientific, ios_base::floatfield).
References std::ios_base::fixed, std::ios_base::floatfield, and std::ios_base::scientific.

inout_ptr()

```
template<typename _Pointer = void, typename _Smart, typename...  _Args>
auto std::inout_ptr (
            _Smart & __s,
            _Args &&...  __args)  [inline]
```

Adapt a smart pointer for functions taking an inout pointer parameter.

Template Parameters

_Pointer	The type of pointer to convert to.

Parameters

__s	The pointer that should take ownership of the result.
__args	Pack of arguments to use when resetting the smart pointer.

Returns

A `std::inout_ptr_t` referring to `__s`.

Since

C++23

References forward().

internal()

```
ios_base & std::internal (
            ios_base & __base)  [inline]
```

Calls base.setf(ios_base::internal, ios_base::adjustfield).
References std::ios_base::adjustfield, and std::ios_base::internal.

isalnum()

```
template<typename _CharT>
bool std::isalnum (
            _CharT __c,
            const locale & __loc)  [inline]
```

Convenience interface to ctype.is(ctype_base::alnum, __c).
References use_facet().

isalpha()

```
template<typename _CharT>
bool std::isalpha (
            _CharT __c,
            const locale & __loc)  [inline]
```

Convenience interface to ctype.is(ctype_base::alpha, __c).
References use_facet().

isblank()

```
template<typename _CharT>
bool std::isblank (
            _CharT __c,
            const locale & __loc)  [inline]
```

Convenience interface to ctype.is(ctype_base::blank, __c).
References use_facet().

iscntrl()

```
template<typename _CharT>
bool std::iscntrl (
            _CharT __c,
            const locale & __loc)  [inline]
```

Convenience interface to ctype.is(ctype_base::cntrl, __c).
References use_facet().

isdigit()

```
template<typename _CharT>
bool std::isdigit (
            _CharT __c,
            const locale & __loc)  [inline]
```

Convenience interface to ctype.is(ctype_base::digit, __c).
References use_facet().

isgraph()

```
template<typename _CharT>
bool std::isgraph (
            _CharT __c,
            const locale & __loc)  [inline]
```

Convenience interface to ctype.is(ctype_base::graph, __c).
References use_facet().

islower()

```
template<typename _CharT>
bool std::islower (
            _CharT __c,
            const locale & __loc)  [inline]
```

Convenience interface to ctype.is(ctype_base::lower, __c).
References use_facet().

isprint()

```
template<typename _CharT>
bool std::isprint (
            _CharT __c,
            const locale & __loc)  [inline]
```

Convenience interface to ctype.is(ctype_base::print, __c).
References use_facet().

ispunct()

```
template<typename _CharT>
bool std::ispunct (
            _CharT __c,
            const locale & __loc)  [inline]
```

Convenience interface to ctype.is(ctype_base::punct, __c).
References use_facet().

isspace()

```
template<typename _CharT>
bool std::isspace (
            _CharT __c,
            const locale & __loc)  [inline]
```

Convenience interface to ctype.is(ctype_base::space, __c).
References use_facet().

isupper()

```
template<typename _CharT>
bool std::isupper (
            _CharT __c,
            const locale & __loc)  [inline]
```

Convenience interface to ctype.is(ctype_base::upper, __c).
References use_facet().

isxdigit()

```
template<typename _CharT>
bool std::isxdigit (
            _CharT __c,
            const locale & __loc)  [inline]
```

Convenience interface to ctype.is(ctype_base::xdigit, __c).
References use_facet().

left()

```
ios_base & std::left (
            ios_base & __base)  [inline]
```

Calls base.setf(ios_base::left, ios_base::adjustfield).
References std::ios_base::adjustfield, and std::ios_base::left.

noboolalpha()

```
ios_base & std::noboolalpha (
            ios_base & __base)  [inline]
```

Calls base.unsetf(ios_base::boolalpha).
References std::ios_base::boolalpha.

noshowbase()

```
ios_base & std::noshowbase (
            ios_base & __base)  [inline]
```

Calls base.unsetf(ios_base::showbase).
References std::ios_base::showbase.

noshowpoint()

```
ios_base & std::noshowpoint (
            ios_base & __base)  [inline]
```

Calls base.unsetf(ios_base::showpoint).
References std::ios_base::showpoint.

noshowpos()

```
ios_base & std::noshowpos (
            ios_base & __base)  [inline]
```

Calls base.unsetf(ios_base::showpos).
References std::ios_base::showpos.

noskipws()

```
ios_base & std::noskipws (
            ios_base & __base)  [inline]
```

Calls base.unsetf(ios_base::skipws).
References std::ios_base::skipws.

nounitbuf()

```
ios_base & std::nounitbuf (
            ios_base & __base)  [inline]
```

Calls base.unsetf(ios_base::unitbuf).
References std::ios_base::unitbuf.

nouppercase()

```
ios_base & std::nouppercase (
            ios_base & __base)  [inline]
```

Calls base.unsetf(ios_base::uppercase).
References std::ios_base::uppercase.

oct()

```
ios_base & std::oct (
            ios_base & __base)  [inline]
```

Calls base.setf(ios_base::oct, ios_base::basefield).
References std::ios_base::basefield, and std::ios_base::oct.

operator"!=() [1/5]

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
bool std::operator!= (
            const multimap< _Key, _Tp, _Compare, _Alloc > & __x,
            const multimap< _Key, _Tp, _Compare, _Alloc > & __y)  [inline]
```

Based on operator==.

operator"!=() [2/5]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator!= (
            const multiset< _Key, _Compare, _Alloc > & __x,
            const multiset< _Key, _Compare, _Alloc > & __y)  [inline]
```

Returns !(x == y).

operator"!=() [3/5]

```
template<typename _Tp, typename _Seq>
bool std::operator!= (
            const queue< _Tp, _Seq > & __x,
            const queue< _Tp, _Seq > & __y)  [inline], [nodiscard]
```

Based on operator==.

operator"!=() [4/5]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator!= (
            const set< _Key, _Compare, _Alloc > & __x,
            const set< _Key, _Compare, _Alloc > & __y)  [inline]
```

Returns !(x == y).

operator"!=() [5/5]

```
template<typename _Tp, typename _Seq>
bool std::operator!= (
            const stack< _Tp, _Seq > & __x,
            const stack< _Tp, _Seq > & __y)  [inline], [nodiscard]
```

Based on operator==.

operator&()

```
template<size_t _Nb>
bitset< _Nb > std::operator& (
            const bitset< _Nb > & __x,
            const bitset< _Nb > & __y)  [inline], [constexpr], [noexcept]
```

Global bitwise operations on bitsets.

Parameters

_↩ _x	A bitset.
_↩ _y	A bitset of the same size as __x.

Returns

A new bitset.

These should be self-explanatory.

operator+() [1/5]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_string< _CharT, _Traits, _Alloc > std::operator+ (
            _CharT __lhs,
            const basic_string< _CharT, _Traits, _Alloc > & __rhs)  [inline], [nodiscard], [constexpr]
```

Concatenate character and string.

Parameters

__lhs	First string.
__rhs	Last string.

Returns

New string with *__lhs* followed by *__rhs*.

References std::basic_string< _CharT, _Traits, _Alloc >::c_str(), std::basic_string< _CharT, _Traits, _Alloc >::get_allocator(), and std::basic_string< _CharT, _Traits, _Alloc >::size().

operator+() [2/5]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_string< _CharT, _Traits, _Alloc > std::operator+ (
            const _CharT * __lhs,
            const basic_string< _CharT, _Traits, _Alloc > & __rhs)  [inline], [nodiscard], [constexpr]
```

Concatenate C string and string.

Parameters

__lhs	First string.
__rhs	Last string.

Returns

New string with value of *__lhs* followed by *__rhs*.

References std::basic_string< _CharT, _Traits, _Alloc >::c_str(), std::basic_string< _CharT, _Traits, _Alloc >::get_allocator(), and std::basic_string< _CharT, _Traits, _Alloc >::size().

operator+() [3/5]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_string< _CharT, _Traits, _Alloc > std::operator+ (
            const basic_string< _CharT, _Traits, _Alloc > & __lhs,
            _CharT __rhs)  [inline], [nodiscard], [constexpr]
```

Concatenate string and character.

Parameters

__lhs	First string.
__rhs	Last string.

Returns

New string with *__lhs* followed by *__rhs*.

References std::basic_string< _CharT, _Traits, _Alloc >::c_str(), std::basic_string< _CharT, _Traits, _Alloc >::get_allocator(), and std::basic_string< _CharT, _Traits, _Alloc >::size().

operator+() [4/5]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_string< _CharT, _Traits, _Alloc > std::operator+ (
            const basic_string< _CharT, _Traits, _Alloc > & __lhs,
            const _CharT * __rhs)  [inline], [nodiscard], [constexpr]
```

Concatenate string and C string.

Parameters

__lhs	First string.
__rhs	Last string.

Returns

New string with *__lhs* followed by *__rhs*.

References std::basic_string< _CharT, _Traits, _Alloc >::c_str(), std::basic_string< _CharT, _Traits, _Alloc >::get_allocator(), and std::basic_string< _CharT, _Traits, _Alloc >::size().

operator+() [5/5]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_string< _CharT, _Traits, _Alloc > std::operator+ (
            const basic_string< _CharT, _Traits, _Alloc > & __lhs,
            const basic_string< _CharT, _Traits, _Alloc > & __rhs)  [inline], [nodiscard], [constexpr]
```

Concatenate two strings.

Parameters

__lhs	First string.
__rhs	Last string.

Returns

New string with value of *__lhs* followed by *__rhs*.

References std::basic_string< _CharT, _Traits, _Alloc >::c_str(), std::basic_string< _CharT, _Traits, _Alloc >::get_allocator(), and std::basic_string< _CharT, _Traits, _Alloc >::size().

operator<() [1/5]

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
bool std::operator< (
            const multimap< _Key, _Tp, _Compare, _Alloc > & __x,
            const multimap< _Key, _Tp, _Compare, _Alloc > & __y)  [inline]
```

Multimap ordering relation.

Parameters

_↩ _x	A multimap.

_↩ _y	A multimap of the same type as __x.

Returns

True iff *x* is lexicographically less than *y*.

This is a total ordering relation. It is linear in the size of the multimaps. The elements must be comparable with <. See std::lexicographical_compare() for how the determination is made.

operator<() [2/5]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator< (
            const multiset< _Key, _Compare, _Alloc > & __x,
            const multiset< _Key, _Compare, _Alloc > & __y)  [inline]
```

Multiset ordering relation.

Parameters

_↩ _x	A multiset.
_↩ _y	A multiset of the same type as __x.

Returns

True iff __x is lexicographically less than __y.

This is a total ordering relation. It is linear in the size of the sets. The elements must be comparable with <. See std::lexicographical_compare() for how the determination is made.

operator<() [3/5]

```
template<typename _Tp, typename _Seq>
bool std::operator< (
            const queue< _Tp, _Seq > & __x,
            const queue< _Tp, _Seq > & __y)  [inline], [nodiscard]
```

Queue ordering relation.

Parameters

_↩ _x	A queue.
_↩ _y	A queue of the same type as *x*.

Returns

True iff __x is lexicographically less than __y.

This is an total ordering relation. Complexity and semantics depend on the underlying sequence type, but the expected rules are: this relation is linear in the size of the sequences, the elements must be comparable with <, and std::↩ lexicographical_compare() is usually used to make the determination.
References std::queue< _Tp, _Sequence >::c.

operator<() [4/5]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator< (
            const set< _Key, _Compare, _Alloc > & __x,
            const set< _Key, _Compare, _Alloc > & __y)  [inline]
```

Set ordering relation.

Parameters

_↩ _x	A set.
_↩ _y	A set of the same type as *x*.

Returns

True iff __x is lexicographically less than __y.

This is a total ordering relation. It is linear in the size of the sets. The elements must be comparable with <.
See std::lexicographical_compare() for how the determination is made.

operator<() [5/5]

```
template<typename _Tp, typename _Seq>
bool std::operator< (
            const stack< _Tp, _Seq > & __x,
            const stack< _Tp, _Seq > & __y)  [inline], [nodiscard]
```

Stack ordering relation.

Parameters

_↩ _x	A stack.
_↩ _y	A stack of the same type as *x*.

Returns

True iff *x* is lexicographically less than __y.

This is an total ordering relation. Complexity and semantics depend on the underlying sequence type, but the expected rules are: this relation is linear in the size of the sequences, the elements must be comparable with <, and std::↩ lexicographical_compare() is usually used to make the determination.

operator<<() [1/14]

```
template<typename _Ostream, typename _Tp>
__rvalue_stream_insertion_t< _Ostream, _Tp > std::operator<< (
            _Ostream && __os,
            const _Tp & __x)  [inline]
```

Generic inserter for rvalue stream.

Parameters

__os	An input stream.
__x	A reference to the object being inserted.

Returns

__os

This is just a forwarding function to allow insertion to rvalue streams since they won't bind to the inserter functions that take an lvalue reference.

operator<<() [2/14]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
basic_ostream< _CharT, _Traits > & std::operator<< (
            basic_ostream< _CharT, _Traits > & __os,
            const __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base > & __str)  [inline]
```

Write string to a stream.

Parameters

__os	Output stream.
__str	String to write out.

Returns

Reference to the output stream.

Output characters of *__str* into os following the same rules as for writing a C string.

operator<<() [3/14]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_ostream< _CharT, _Traits > & std::operator<< (
            basic_ostream< _CharT, _Traits > & __os,
            const basic_string< _CharT, _Traits, _Alloc > & __str)  [inline]
```

Write string to a stream.

Parameters

__os	Output stream.

__str	String to write out.

Returns

Reference to the output stream.

Output characters of *__str* into os following the same rules as for writing a C string.

operator<<() [4/14]

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & std::operator<< (
            basic_ostream< _CharT, _Traits > & __out,
            _CharT __c)  [inline]
```

Character inserters.

Parameters

__out	An output stream.
__c	A character.

Returns

out

Behaves like one of the formatted arithmetic inserters described in std::basic_ostream. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.
If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

operator<<() [5/14]

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & std::operator<< (
            basic_ostream< _CharT, _Traits > & __out,
            char __c)  [inline]
```

Character inserters.

Parameters

__out	An output stream.
__c	A character.

Returns

out

Behaves like one of the formatted arithmetic inserters described in std::basic_ostream. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.
If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

operator<<() [6/14]

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & std::operator<< (
            basic_ostream< _CharT, _Traits > & __out,
            const _CharT * __s)  [inline]
```

String inserters.

Parameters

__out	An output stream.
__s	A character string.

Returns

out

Precondition

__s must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in std::basic_ostream. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at __s, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

operator<<() [7/14]

```
template<typename _CharT, typename _Traits>
basic_ostream< _CharT, _Traits > & std::operator<< (
            basic_ostream< _CharT, _Traits > & __out,
            const char * __s)
```

String inserters.

Parameters

__out	An output stream.
__s	A character string.

Returns

out

Precondition

__s must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in std::basic_ostream. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at __s, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

operator<<() [8/14]

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
            basic_ostream< char, _Traits > & __out,
            char __c)  [inline]
```

Character inserters.

Parameters

__out	An output stream.
__c	A character.

Returns

out

Behaves like one of the formatted arithmetic inserters described in std::basic_ostream. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). `_↩_out.width(0)` is then called.
If `__c` is of type `char` and the character type of the stream is not `char`, the character is widened before insertion.

operator<<() [9/14]

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
            basic_ostream< char, _Traits > & __out,
            const char * __s)  [inline]
```

String inserters.

Parameters

__out	An output stream.
__s	A character string.

Returns

out

Precondition

`__s` must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in std::basic_ostream. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at `__s`, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

operator<<() [10/14]

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
```

```
            basic_ostream< char, _Traits > & __out,
            const signed char * __s)  [inline]
```

String inserters.

Parameters

__out	An output stream.
__s	A character string.

Returns

out

Precondition

__s must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in std::basic_ostream. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at __s, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

operator<<() [11/14]

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
            basic_ostream< char, _Traits > & __out,
            const unsigned char * __s)  [inline]
```

String inserters.

Parameters

__out	An output stream.
__s	A character string.

Returns

out

Precondition

__s must be a non-NULL pointer

Behaves like one of the formatted arithmetic inserters described in std::basic_ostream. After constructing a sentry object with good status, this function inserts `traits::length(__s)` characters starting at __s, widened if necessary, followed by any required padding (as determined by [22.2.2.2.2]). `__out.width(0)` is then called.

operator<<() [12/14]

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
            basic_ostream< char, _Traits > & __out,
            signed char __c)  [inline]
```

Character inserters.

Parameters

__out	An output stream.
__c	A character.

Returns

out

Behaves like one of the formatted arithmetic inserters described in std::basic_ostream. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). _↩
_out.width(0) is then called.
If __c is of type char and the character type of the stream is not char, the character is widened before insertion.

operator<<() [13/14]

```
template<typename _Traits>
basic_ostream< char, _Traits > & std::operator<< (
            basic_ostream< char, _Traits > & __out,
            unsigned char __c)  [inline]
```

Character inserters.

Parameters

__out	An output stream.
__c	A character.

Returns

out

Behaves like one of the formatted arithmetic inserters described in std::basic_ostream. After constructing a sentry object with good status, this function inserts a single character and any required padding (as determined by [22.2.2.2.2]). _↩
_out.width(0) is then called.
If __c is of type char and the character type of the stream is not char, the character is widened before insertion.

operator<<() [14/14]

```
template<class _CharT, class _Traits, size_t _Nb>
std::basic_ostream< _CharT, _Traits > & std::operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const bitset< _Nb > & __x)
```

Global I/O operators for bitsets.
Direct I/O between streams and bitsets is supported. Output is straightforward. Input will skip whitespace, only accept *0* and *1* characters, and will only extract as many digits as the bitset will hold.
References std::basic_ios< _CharT, _Traits >::rdbuf(), std::basic_ios< _CharT, _Traits >::setstate(), and std::basic_ios< _CharT, _Traits
Referenced by std::shared_ptr< _State_base >::operator<<().

operator<=() [1/5]

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
bool std::operator<= (
            const multimap< _Key, _Tp, _Compare, _Alloc > & __x,
            const multimap< _Key, _Tp, _Compare, _Alloc > & __y)  [inline]
```

Based on operator<.

operator<=() [2/5]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator<= (
            const multiset< _Key, _Compare, _Alloc > & __x,
            const multiset< _Key, _Compare, _Alloc > & __y)  [inline]
```

Returns !(y < x).

operator<=() [3/5]

```
template<typename _Tp, typename _Seq>
bool std::operator<= (
            const queue< _Tp, _Seq > & __x,
            const queue< _Tp, _Seq > & __y)  [inline], [nodiscard]
```

Based on operator<.

operator<=() [4/5]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator<= (
            const set< _Key, _Compare, _Alloc > & __x,
            const set< _Key, _Compare, _Alloc > & __y)  [inline]
```

Returns !(y < x).

operator<=() [5/5]

```
template<typename _Tp, typename _Seq>
bool std::operator<= (
            const stack< _Tp, _Seq > & __x,
            const stack< _Tp, _Seq > & __y)  [inline], [nodiscard]
```

Based on operator<.

operator<=>() [1/7]

```
template<typename _CharT, typename _Traits, typename _Alloc>
auto std::operator<=> (
            const basic_string< _CharT, _Traits, _Alloc > & __lhs,
            const _CharT * __rhs) -> decltype(__detail::__char_traits_cmp_cat< _Traits >(0))
[nodiscard], [constexpr], [noexcept]
```

Three-way comparison of a string and a C string.

Parameters

__lhs	A string.
__rhs	A null-terminated string.

Returns

A value indicating whether __lhs is less than, equal to, greater than, or incomparable with __rhs.

operator<=>() [2/7]

```
template<typename _CharT, typename _Traits, typename _Alloc>
auto std::operator<=> (
            const basic_string< _CharT, _Traits, _Alloc > & __lhs,
            const basic_string< _CharT, _Traits, _Alloc > & __rhs) -> decltype(__detail::__↩
char_traits_cmp_cat< _Traits >(0))  [nodiscard], [constexpr], [noexcept]
```

Three-way comparison of a string and a C string.

Parameters

__lhs	A string.
__rhs	A null-terminated string.

Returns

A value indicating whether __lhs is less than, equal to, greater than, or incomparable with __rhs.

operator<=>() [3/7]

```
template<typename _Tp, typename _Alloc>
__detail::__synth3way_t< _Tp > std::operator<=> (
            const deque< _Tp, _Alloc > & __x,
            const deque< _Tp, _Alloc > & __y)  [inline], [nodiscard]
```

Deque ordering relation.

Parameters

_↩ _x	A deque.
_↩ _y	A deque of the same type as __x.

Returns

A value indicating whether __x is less than, equal to, greater than, or incomparable with __y.

See std::lexicographical_compare_three_way() for how the determination is made. This operator is used to synthesize relational operators like < and >= etc.
References std::deque< _Tp, _Alloc >::begin(), std::deque< _Tp, _Alloc >::end(), and std::deque< _Tp, _Alloc >::size().

operator<=>() [4/7]

```
template<typename _Tp, typename _Alloc>
__detail::__synth3way_t< _Tp > std::operator<=> (
            const forward_list< _Tp, _Alloc > & __x,
            const forward_list< _Tp, _Alloc > & __y)  [inline], [nodiscard]
```

Forward list ordering relation.

Parameters

_↩ _x	A forward_list.
_↩ _y	A forward_list of the same type as __x.

Returns

A value indicating whether __x is less than, equal to, greater than, or incomparable with __y.

See std::lexicographical_compare_three_way() for how the determination is made. This operator is used to synthesize relational operators like < and >= etc.

operator<=>() [5/7]

```
template<typename _Tp, typename _Alloc>
__detail::__synth3way_t< _Tp > std::operator<=> (
            const list< _Tp, _Alloc > & __x,
            const list< _Tp, _Alloc > & __y)  [inline], [nodiscard]
```

List ordering relation.

Parameters

_↩ _x	A list.
_↩ _y	A list of the same type as __x.

Returns

A value indicating whether __x is less than, equal to, greater than, or incomparable with __y.

See std::lexicographical_compare_three_way() for how the determination is made. This operator is used to synthesize relational operators like < and >= etc.
References std::list< _Tp, _Alloc >::begin(), std::list< _Tp, _Alloc >::end(), and std::list< _Tp, _Alloc >::size().

operator<=>() [6/7]

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
__detail::__synth3way_t< pair< const _Key, _Tp > > std::operator<=> (
            const map< _Key, _Tp, _Compare, _Alloc > & __x,
            const map< _Key, _Tp, _Compare, _Alloc > & __y)  [inline]
```

Map ordering relation.

Parameters

_↩ _x	A map.
_↩ _y	A map of the same type as x.

Returns

A value indicating whether __x is less than, equal to, greater than, or incomparable with __y.

This is a total ordering relation. It is linear in the size of the maps. The elements must be comparable with <.
See std::lexicographical_compare_three_way() for how the determination is made. This operator is used to synthesize relational operators like < and >= etc.

operator<=>() [7/7]

```
template<typename _Tp, typename _Alloc>
__detail::__synth3way_t< _Tp > std::operator<=> (
            const vector< _Tp, _Alloc > & __x,
            const vector< _Tp, _Alloc > & __y)  [nodiscard], [constexpr]
```

Vector ordering relation.

Parameters

_↩ _x	A vector.
_↩ _y	A vector of the same type as __x.

Returns

A value indicating whether __x is less than, equal to, greater than, or incomparable with __y.

See std::lexicographical_compare_three_way() for how the determination is made. This operator is used to synthesize relational operators like < and >= etc.
References std::vector< _Tp, _Alloc >::begin(), std::vector< _Tp, _Alloc >::end(), and lexicographical_compare_three_way().

operator==() [1/14]

```
template<typename _CharT, typename _Traits, typename _Alloc>
bool std::operator== (
            const basic_string< _CharT, _Traits, _Alloc > & __lhs,
            const _CharT * __rhs)  [inline], [nodiscard], [constexpr]
```

Test equivalence of string and C string.

Parameters

__lhs	String.
__rhs	C string.

Returns

True if *__lhs.compare*(*__rhs*) == 0. False otherwise.

References std::basic_string< _CharT, _Traits, _Alloc >::data(), and std::basic_string< _CharT, _Traits, _Alloc >::size().

operator==() [2/14]

```
template<typename _CharT, typename _Traits, typename _Alloc>
bool std::operator== (
```

```
            const basic_string< _CharT, _Traits, _Alloc > & __lhs,
            const basic_string< _CharT, _Traits, _Alloc > & __rhs)  [inline], [nodiscard], [constexpr],
[noexcept]
```

Test equivalence of two strings.

Parameters

__lhs	First string.
__rhs	Second string.

Returns

True if *__lhs.compare*(*__rhs*) == 0. False otherwise.

operator==() [3/14]

```
template<typename _Tp, typename _Alloc>
bool std::operator== (
            const deque< _Tp, _Alloc > & __x,
            const deque< _Tp, _Alloc > & __y)  [inline], [nodiscard]
```

Deque equality comparison.

Parameters

_↩ _x	A deque.
_↩ _y	A deque of the same type as *__x*.

Returns

True iff the size and elements of the deques are equal.

This is an equivalence relation. It is linear in the size of the deques. Deques are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

operator==() [4/14]

```
template<typename _Tp, typename _Alloc>
bool std::operator== (
            const forward_list< _Tp, _Alloc > & __lx,
            const forward_list< _Tp, _Alloc > & __ly)
```

Forward list equality comparison.

Parameters

_↩ _lx	A forward_list
_↩ _ly	A forward_list of the same type as *__lx*.

Returns

True iff the elements of the forward lists are equal.

This is an equivalence relation. It is linear in the number of elements of the forward lists. Deques are considered equivalent if corresponding elements compare equal.
References std::forward_list< _Tp, _Alloc >::cbegin(), and std::forward_list< _Tp, _Alloc >::cend().

operator==() [5/14]

```
template<typename _StateT>
bool std::operator== (
            const fpos< _StateT > & __lhs,
            const fpos< _StateT > & __rhs)  [inline]
```

Test if equivalent to another position.

operator==() [6/14]

```
template<typename _Res, typename...  _Args>
bool std::operator== (
            const function< _Res(_Args...)> & __f,
            nullptr_t )  [inline], [noexcept]
```

Test whether a polymorphic function object wrapper is empty.

Returns

`true` if the wrapper has no target, `false` otherwise

This function will not throw exceptions.

operator==() [7/14]

```
template<typename _Tp, typename _Alloc>
bool std::operator== (
            const list< _Tp, _Alloc > & __x,
            const list< _Tp, _Alloc > & __y)  [inline], [nodiscard]
```

List equality comparison.

Parameters

_↩ _x	A list.
_↩ _y	A list of the same type as __x.

Returns

True iff the size and elements of the lists are equal.

This is an equivalence relation. It is linear in the size of the lists. Lists are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

operator==() [8/14]

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
bool std::operator== (
```

```
            const map< _Key, _Tp, _Compare, _Alloc > & __x,
            const map< _Key, _Tp, _Compare, _Alloc > & __y)  [inline]
```

Map equality comparison.

Parameters

_↩ _x	A map.
_↩ _y	A map of the same type as *x*.

Returns

True iff the size and elements of the maps are equal.

This is an equivalence relation. It is linear in the size of the maps. Maps are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

operator==() [9/14]

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
bool std::operator== (
            const multimap< _Key, _Tp, _Compare, _Alloc > & __x,
            const multimap< _Key, _Tp, _Compare, _Alloc > & __y)  [inline]
```

Multimap equality comparison.

Parameters

_↩ _x	A multimap.
_↩ _y	A multimap of the same type as __x.

Returns

True iff the size and elements of the maps are equal.

This is an equivalence relation. It is linear in the size of the multimaps. Multimaps are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

operator==() [10/14]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator== (
            const multiset< _Key, _Compare, _Alloc > & __x,
            const multiset< _Key, _Compare, _Alloc > & __y)  [inline]
```

Multiset equality comparison.

Parameters

_↩ _x	A multiset.

_↩ _y	A multiset of the same type as __x.

Returns

True iff the size and elements of the multisets are equal.

This is an equivalence relation. It is linear in the size of the multisets. Multisets are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

operator==() [11/14]

```
template<typename _Tp, typename _Seq>
bool std::operator== (
            const queue< _Tp, _Seq > & __x,
            const queue< _Tp, _Seq > & __y)  [inline], [nodiscard]
```

Queue equality comparison.

Parameters

_↩ _x	A queue.
_↩ _y	A queue of the same type as __x.

Returns

True iff the size and elements of the queues are equal.

This is an equivalence relation. Complexity and semantics depend on the underlying sequence type, but the expected rules are: this relation is linear in the size of the sequences, and queues are considered equivalent if their sequences compare equal.
References std::queue< _Tp, _Sequence >::c.

operator==() [12/14]

```
template<typename _Key, typename _Compare, typename _Alloc>
bool std::operator== (
            const set< _Key, _Compare, _Alloc > & __x,
            const set< _Key, _Compare, _Alloc > & __y)  [inline]
```

Set equality comparison.

Parameters

_↩ _x	A set.
_↩ _y	A set of the same type as *x*.

Returns

True iff the size and elements of the sets are equal.

This is an equivalence relation. It is linear in the size of the sets. Sets are considered equivalent if their sizes are equal, and if corresponding elements compare equal.

operator==() [13/14]

```
template<typename _Tp, typename _Seq>
bool std::operator== (
            const stack< _Tp, _Seq > & __x,
            const stack< _Tp, _Seq > & __y)  [inline], [nodiscard]
```

Stack equality comparison.

Parameters

_↩ _x	A stack.
_↩ _y	A stack of the same type as __x.

Returns

True iff the size and elements of the stacks are equal.

This is an equivalence relation. Complexity and semantics depend on the underlying sequence type, but the expected rules are: this relation is linear in the size of the sequences, and stacks are considered equivalent if their sequences compare equal.

operator==() [14/14]

```
template<typename _Tp, typename _Alloc>
bool std::operator== (
            const vector< _Tp, _Alloc > & __x,
            const vector< _Tp, _Alloc > & __y)  [inline], [nodiscard], [constexpr]
```

Vector equality comparison.

Parameters

_↩ _x	A vector.
_↩ _y	A vector of the same type as __x.

Returns

True iff the size and elements of the vectors are equal.

This is an equivalence relation. It is linear in the size of the vectors. Vectors are considered equivalent if their sizes are equal, and if corresponding elements compare equal.
References std::vector< _Tp, _Alloc >::begin(), std::vector< _Tp, _Alloc >::end(), and std::vector< _Tp, _Alloc >::size().

operator>() [1/5]

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
bool std::operator> (
            const multimap< _Key, _Tp, _Compare, _Alloc > & __x,
            const multimap< _Key, _Tp, _Compare, _Alloc > & __y)  [inline]
```

```

Returns !(x < y).

operator>=() [5/5]

```
template<typename _Tp, typename _Seq>
bool std::operator>= (
            const stack< _Tp, _Seq > & __x,
            const stack< _Tp, _Seq > & __y)  [inline], [nodiscard]
```

Based on operator<.

operator>>() [1/10]

```
template<typename _Istream, typename _Tp>
__rvalue_stream_extraction_t< _Istream, _Tp > std::operator>> (
            _Istream && __is,
            _Tp && __x)  [inline]
```

Generic extractor for rvalue stream.

Parameters

_↩ _is	An input stream.
_↩ _x	A reference to the extraction target.

Returns

__is

This is just a forwarding function to allow extraction from rvalue streams since they won't bind to the extractor functions that take an lvalue reference.
References forward(), and move().

operator>>() [2/10]

```
template<typename _CharT, typename _Traits>
basic_istream< _CharT, _Traits > & std::operator>> (
            basic_istream< _CharT, _Traits > & __in,
            _CharT & __c)
```

Character extractors.

Parameters

_↩ _*in*	An input stream.
_↩ _*c*	A character reference.

Returns

in

Behaves like one of the formatted arithmetic extractors described in std::basic_istream. After constructing a sentry object with good status, this function extracts a character (if one is available) and stores it in __*c*. Otherwise, sets failbit in the input stream.
References std::ios_base::badbit, std::ios_base::eofbit, std::ios_base::failbit, std::ios_base::goodbit, std::basic_ios< _CharT, _Traits >::rd and std::basic_ios< _CharT, _Traits >::setstate().

operator>>() [3/10]

```
template<typename _CharT, typename _Traits, size_t _Num>
basic_istream< _CharT, _Traits > & std::operator>> (
            basic_istream< _CharT, _Traits > & __in,
            _CharT(&) __s[_Num])  [inline]
```

Character string extractors.

Parameters

_↩ _*in*	An input stream.
_↩ _*s*	A character array (or a pointer to an array before C++20).

Returns

__in

Behaves like one of the formatted arithmetic extractors described in `std::basic_istream`. After constructing a sentry object with good status, this function extracts up to `n` characters and stores them into the array ___`s`. `n` is defined as:

- if `width()` is greater than zero, `n` is `min(width(), n)`
- otherwise `n` is the number of elements of the array
- (before C++20 the pointer is assumed to point to an array of the largest possible size for an array of `char_type`).

Characters are extracted and stored until one of the following happens:

- `n - 1` characters are stored
- EOF is reached
- the next character is whitespace according to the current locale

`width(0)` is then called for the input stream.
If no characters are extracted, sets failbit.

operator>>() [4/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
basic_istream< _CharT, _Traits > & std::operator>> (
            basic_istream< _CharT, _Traits > & __is,
            __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base > & __str)
```

Read stream into a string.

Parameters

__is	Input stream.
__str	Buffer to store into.

Returns

Reference to the input stream.

Stores characters from *__is* into *__str* until whitespace is found, the end of the stream is encountered, or str.max_size() is reached. If is.width() is non-zero, that is the limit on the number of characters stored into *__str*. Any previous contents of *__str* are erased.
References std::ios_base::getloc(), std::basic_ios< _CharT, _Traits >::rdbuf(), std::basic_ios< _CharT, _Traits >::setstate(), use_facet(), and std::ios_base::width().

operator>>() [5/10]

```
template<typename _CharT, typename _Traits, typename _Alloc>
basic_istream< _CharT, _Traits > & std::operator>> (
            basic_istream< _CharT, _Traits > & __is,
            basic_string< _CharT, _Traits, _Alloc > & __str)
```

Read stream into a string.

Parameters

__is	Input stream.
__str	Buffer to store into.

Returns

Reference to the input stream.

Stores characters from *__is* into *__str* until whitespace is found, the end of the stream is encountered, or str.max_size() is reached. If is.width() is non-zero, that is the limit on the number of characters stored into *__str*. Any previous contents of *__str* are erased.
References std::basic_string< _CharT, _Traits, _Alloc >::append(), std::basic_string< _CharT, _Traits, _Alloc >::erase(), std::ios_base::getloc(), std::basic_string< _CharT, _Traits, _Alloc >::max_size(), std::basic_ios< _CharT, _Traits >::rdbuf(), std::basic_ios< _CharT, _Traits >::setstate(), use_facet(), and std::ios_base::width().

operator>>() [6/10]

```
template<class _Traits>
basic_istream< char, _Traits > & std::operator>> (
```

```
            basic_istream< char, _Traits > & __in,
            signed char & __c)  [inline]
```

Character extractors.

Parameters

_↩ _in	An input stream.
_↩ _c	A character reference.

Returns

in

Behaves like one of the formatted arithmetic extractors described in std::basic_istream. After constructing a sentry object with good status, this function extracts a character (if one is available) and stores it in __c. Otherwise, sets failbit in the input stream.

operator>>() [7/10]

```
template<class _Traits, size_t _Num>
basic_istream< char, _Traits > & std::operator>> (
            basic_istream< char, _Traits > & __in,
            signed char(&) __s[_Num])  [inline]
```

Character string extractors.

Parameters

_↩ _in	An input stream.
_↩ _s	A character array (or a pointer to an array before C++20).

Returns

__in

Behaves like one of the formatted arithmetic extractors described in `std::basic_istream`. After constructing a sentry object with good status, this function extracts up to `n` characters and stores them into the array __s. `n` is defined as:

- if `width()` is greater than zero, `n` is `min(width(), n)`
- otherwise `n` is the number of elements of the array
- (before C++20 the pointer is assumed to point to an array of the largest possible size for an array of `char_type`).

Characters are extracted and stored until one of the following happens:

- `n - 1` characters are stored
- EOF is reached
- the next character is whitespace according to the current locale

`width(0)` is then called for the input stream.
If no characters are extracted, sets failbit.

operator>>() [8/10]

```
template<class _Traits>
basic_istream< char, _Traits > & std::operator>> (
            basic_istream< char, _Traits > & __in,
            unsigned char & __c)  [inline]
```

Character extractors.

Parameters

_↩ _in	An input stream.
_↩ _c	A character reference.

Returns

in

Behaves like one of the formatted arithmetic extractors described in std::basic_istream. After constructing a sentry object with good status, this function extracts a character (if one is available) and stores it in __c. Otherwise, sets failbit in the input stream.

operator>>() [9/10]

```
template<class _Traits, size_t _Num>
basic_istream< char, _Traits > & std::operator>> (
            basic_istream< char, _Traits > & __in,
            unsigned char(&) __s[_Num])  [inline]
```

Character string extractors.

Parameters

_↩ _in	An input stream.
_↩ _s	A character array (or a pointer to an array before C++20).

Returns

__in

Behaves like one of the formatted arithmetic extractors described in `std::basic_istream`. After constructing a sentry object with good status, this function extracts up to `n` characters and stores them into the array ___s. `n` is defined as:

- if `width()` is greater than zero, `n` is `min(width(), n)`
- otherwise `n` is the number of elements of the array
- (before C++20 the pointer is assumed to point to an array of the largest possible size for an array of `char_type`).

Characters are extracted and stored until one of the following happens:

- `n - 1` characters are stored

- EOF is reached
- the next character is whitespace according to the current locale

`width(0)` is then called for the input stream.
If no characters are extracted, sets failbit.

operator>>() [10/10]

```
template<class _CharT, class _Traits, size_t _Nb>
std::basic_istream< _CharT, _Traits > & std::operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            bitset< _Nb > & __x)
```

Global I/O operators for bitsets.
Direct I/O between streams and bitsets is supported. Output is straightforward. Input will skip whitespace, only accept *0* and *1* characters, and will only extract as many digits as the bitset will hold.

operator^()

```
template<size_t _Nb>
bitset< _Nb > std::operator^ (
            const bitset< _Nb > & __x,
            const bitset< _Nb > & __y)  [inline], [constexpr], [noexcept]
```

Global bitwise operations on bitsets.

Parameters

_↩ _x	A bitset.
_↩ _y	A bitset of the same size as __x.

Returns

A new bitset.

These should be self-explanatory.

operator"" | ()

```
template<size_t _Nb>
bitset< _Nb > std::operator| (
            const bitset< _Nb > & __x,
            const bitset< _Nb > & __y)  [inline], [constexpr], [noexcept]
```

Global bitwise operations on bitsets.

Parameters

_↩ _x	A bitset.
_↩ _y	A bitset of the same size as __x.

Returns

A new bitset.

These should be self-explanatory.

out_ptr()

```
template<typename _Pointer = void, typename _Smart, typename...  _Args>
auto std::out_ptr (
            _Smart & __s,
            _Args &&...  __args)  [inline]
```

Adapt a smart pointer for functions taking an output pointer parameter.

Template Parameters

_Pointer	The type of pointer to convert to.

Parameters

__s	The pointer that should take ownership of the result.
__args	Pack of arguments to use when resetting the smart pointer.

Returns

A `std::out_ptr_t` referring to `__s`.

Since

C++23

References forward().

put_money()

```
template<typename _MoneyT>
_Put_money< _MoneyT > std::put_money (
            const _MoneyT & __mon,
            bool __intl = false)  [inline]
```

Extended manipulator for inserting money.

Parameters

__mon	Either long double or a specialization of `basic_string`.
__intl	A bool indicating whether international format is to be used.

Sent to a stream object, this manipulator inserts *__mon*.

put_time()

```
template<typename _CharT>
_Put_time< _CharT > std::put_time (
```

```
            const std::tm * __tmb,
            const _CharT * __fmt)  [inline]
```

Extended manipulator for formatting time.
This manipulator uses time_put::put to format time. [ext.manip]

Parameters

__tmb	struct tm time data to format.
__fmt	format string.

rbegin() [1/4]

```
template<typename _Container>
auto std::rbegin (
            _Container & __cont) -> decltype(__cont.rbegin())  [inline], [constexpr], [noexcept]
```

Return a reverse iterator pointing to the last element of the container.

Parameters

__cont	Container.

Since

C++14

Referenced by crbegin().

rbegin() [2/4]

```
template<typename _Tp, size_t _Nm>
reverse_iterator< _Tp * > std::rbegin (
            _Tp(&) __arr[_Nm])  [inline], [constexpr], [noexcept]
```

Return a reverse iterator pointing to the last element of the array.

Parameters

__arr	Array.

Since

C++14

rbegin() [3/4]

```
template<typename _Container>
auto std::rbegin (
            const _Container & __cont) -> decltype(__cont.rbegin())  [inline], [constexpr], [noexcept]
```

Return a reverse iterator pointing to the last element of the const container.

Parameters

__cont	Container.

Since

C++14

rbegin() [4/4]

```
template<typename _Tp>
reverse_iterator< const _Tp * > std::rbegin (
            initializer_list< _Tp > __il)  [inline], [constexpr], [noexcept]
```

Return a reverse iterator pointing to the last element of the initializer_list.

Parameters

_↩ _il	initializer_list.

Since

C++14

rend() [1/4]

```
template<typename _Container>
auto std::rend (
            _Container & __cont) -> decltype(__cont.rend())  [inline], [constexpr], [noexcept]
```

Return a reverse iterator pointing one past the first element of the container.

Parameters

__cont	Container.

Since

C++14

Referenced by crend().

rend() [2/4]

```
template<typename _Tp, size_t _Nm>
reverse_iterator< _Tp * > std::rend (
            _Tp(&) __arr[_Nm])  [inline], [constexpr], [noexcept]
```

Return a reverse iterator pointing one past the first element of the array.

Parameters

__arr	Array.

Since

C++14

rend() [3/4]

```
template<typename _Container>
auto std::rend (
            const _Container & __cont) -> decltype(__cont.rend())  [inline], [constexpr], [noexcept]
```

Return a reverse iterator pointing one past the first element of the const container.

Parameters

__cont	Container.

Since

C++14

rend() [4/4]

```
template<typename _Tp>
reverse_iterator< const _Tp * > std::rend (
            initializer_list< _Tp > __il)  [inline], [constexpr], [noexcept]
```

Return a reverse iterator pointing one past the first element of the initializer_list.

Parameters

_↩ _il	initializer_list.

Since

C++14

replace_copy()

```
template<typename _InputIterator, typename _OutputIterator, typename _Tp>
_OutputIterator std::replace_copy (
            _InputIterator __first,
            _InputIterator __last,
            _OutputIterator __result,
            const _Tp & __old_value,
            const _Tp & __new_value)  [inline], [constexpr]
```

Copy a sequence, replacing each element of one value with another value.

Parameters

__first	An input iterator.
__last	An input iterator.

__result	An output iterator.
__old_value	The value to be replaced.
__new_value	The replacement value.

Returns

The end of the output sequence, `result+`(last-first).

Copies each element in the input range [__first,__last) to the output range [__result,__result+(__last-__first)) replacing elements equal to `__old_value` with `__new_value`.

resetiosflags()

```
_Resetiosflags std::resetiosflags (
            ios_base::fmtflags __mask)  [inline]
```

Manipulator for `setf`.

Parameters

__mask	A format flags mask.

Sent to a stream object, this manipulator resets the specified flags, via *stream.setf(0,__mask)*.

return_temporary_buffer()

```
template<typename _Tp>
void std::return_temporary_buffer (
            _Tp * __p)  [inline]
```

The companion to get_temporary_buffer().

Parameters

__p	A buffer previously allocated by get_temporary_buffer.

Frees the memory pointed to by __p.

right()

```
ios_base & std::right (
            ios_base & __base)  [inline]
```

Calls base.setf(ios_base::right, ios_base::adjustfield).
References std::ios_base::adjustfield, and std::ios_base::right.

sample()

```
template<typename _PopulationIterator, typename _SampleIterator, typename _Distance, typename _↩
UniformRandomBitGenerator>
_SampleIterator std::sample (
            _PopulationIterator __first,
            _PopulationIterator __last,
            _SampleIterator __out,
```

```
            _Distance __n,
            _UniformRandomBitGenerator && __g)
```

Take a random sample from a population.
References forward().

saturating_add()

```
template<typename _Tp>
_Tp std::saturating_add (
            _Tp __x,
            _Tp __y)  [constexpr], [noexcept]
```

Add two integers, with saturation in case of overflow.

saturating_cast()

```
template<typename _Res, typename _Tp>
_Res std::saturating_cast (
            _Tp __x)  [constexpr], [noexcept]
```

Divide one integer by another, with saturation in case of overflow.

saturating_div()

```
template<typename _Tp>
_Tp std::saturating_div (
            _Tp __x,
            _Tp __y)  [constexpr], [noexcept]
```

Divide one integer by another, with saturation in case of overflow.

saturating_mul()

```
template<typename _Tp>
_Tp std::saturating_mul (
            _Tp __x,
            _Tp __y)  [constexpr], [noexcept]
```

Multiply two integers, with saturation in case of overflow.

saturating_sub()

```
template<typename _Tp>
_Tp std::saturating_sub (
            _Tp __x,
            _Tp __y)  [constexpr], [noexcept]
```

Subtract one integer from another, with saturation in case of overflow.

scientific()

```
ios_base & std::scientific (
            ios_base & __base)  [inline]
```

Calls base.setf(ios_base::scientific, ios_base::floatfield).
References std::ios_base::floatfield, and std::ios_base::scientific.

search()

```
template<typename _ForwardIterator, typename _Searcher>
_ForwardIterator std::search (
```

```
            _ForwardIterator __first,
            _ForwardIterator __last,
            const _Searcher & __searcher)  [inline], [nodiscard], [constexpr]
```

Search a sequence using a Searcher object.

Parameters

__first	A forward iterator.
__last	A forward iterator.
__searcher	A callable object.

Returns

`__searcher(__first,__last).first`

set_new_handler()

```
new_handler std::set_new_handler (
            new_handler ) throw ( )
```

Takes a replacement handler as the argument, returns the previous handler.

setbase()

```
_Setbase std::setbase (
            int __base)  [inline]
```

Manipulator for `setf`.

Parameters

__base	A numeric base.

Sent to a stream object, this manipulator changes the `ios_base::basefield` flags to `oct`, `dec`, or `hex` when *base* is 8, 10, or 16, accordingly, and to 0 if *__base* is any other value.

setfill()

```
template<typename _CharT>
_Setfill< _CharT > std::setfill (
            _CharT __c)  [inline]
```

Manipulator for `fill`.

Parameters

_↩ _c	The new fill character.

Sent to a stream object, this manipulator calls `fill(__c)` for that object.

setiosflags()

```
_Setiosflags std::setiosflags (
            ios_base::fmtflags __mask)  [inline]
```

Manipulator for `setf`.

Parameters

__mask	A format flags mask.

Sent to a stream object, this manipulator sets the format flags to *__mask*.

setprecision()

```
_Setprecision std::setprecision (
            int __n)  [inline]
```

Manipulator for `precision`.

Parameters

_↩ _n	The new precision.

Sent to a stream object, this manipulator calls `precision(__n)` for that object.

setw()

```
_Setw std::setw (
            int __n)  [inline]
```

Manipulator for `width`.

Parameters

_↩ _n	The new width.

Sent to a stream object, this manipulator calls `width(__n)` for that object.

showbase()

```
ios_base & std::showbase (
            ios_base & __base)  [inline]
```

Calls base.setf(ios_base::showbase).
References std::ios_base::showbase.

showpoint()

```
ios_base & std::showpoint (
            ios_base & __base)  [inline]
```

Calls base.setf(ios_base::showpoint).
References std::ios_base::showpoint.

showpos()

```
ios_base & std::showpos (
            ios_base & __base)  [inline]
```

Calls base.setf(ios_base::showpos).
References std::ios_base::showpos.

size() [1/2]

```
template<typename _Container>
auto std::size (
            const _Container & __cont) -> decltype(__cont.size())  [nodiscard], [constexpr],
[noexcept]
```

Return the size of a container.

Parameters

__cont	Container.

Since

C++17

Referenced by std::basic_stringbuf< char >::basic_stringbuf(), std::deque< _Tp, _Alloc >::_M_new_elements_at_back(), std::deque< _Tp, _Alloc >::_M_new_elements_at_front(), std::deque< _Tp, _Alloc >::_M_push_back_aux(), std::deque< _Tp, _Alloc >, std::basic_string< _CharT, _Traits, _Alloc >::find(), std::basic_string< _CharT, _Traits, _Alloc >::find(), std::basic_string< _CharT, _Traits, std::basic_string< _CharT, _Traits, _Alloc >::find_first_not_of(), std::basic_string< _CharT, _Traits, _Alloc >::find_first_of(), std::basic_string< _CharT, _Traits, _Alloc >::find_last_not_of(), std::basic_string< _CharT, _Traits, _Alloc >::find_last_not_of(), std::basic_string< _CharT, _Traits, _Alloc >::find_last_of(), std::deque< _Tp, _Alloc >::operator=(), std::vector< _Tp, _Alloc >::operator, std::basic_string< _CharT, _Traits, _Alloc >::reserve(), std::vector< _Tp, _Alloc >::reserve(), std::vector< _State< _TraitsT::char_type >, std::basic_string< _CharT, _Traits, _Alloc >::rfind(), and std::basic_string< _CharT, _Traits, _Alloc >::rfind().

size() [2/2]

```
template<typename _Tp, size_t _Nm>
size_t std::size (
            const  _Tp(&)[_Nm])  [nodiscard], [constexpr], [noexcept]
```

Return the size of an array.

Parameters

-	An array.

Returns

The number of elements in the array.

Since

C++17

skipws()

```
ios_base & std::skipws (
            ios_base & __base)  [inline]
```

Calls base.setf(ios_base::skipws).
References std::ios_base::skipws.

ssize() [1/2]

```
template<typename _Container>
auto std::ssize (
            const _Container & __cont) -> common_type_t< ptrdiff_t, make_signed_t< decltype(__↩
cont.size())> > [nodiscard], [constexpr], [noexcept]
```

Return the size of a container, as a signed integer.

Parameters

__cont	Container.

Since

C++20

ssize() [2/2]

```
template<typename _Tp, ptrdiff_t _Num>
ptrdiff_t std::ssize (
            const _Tp(&)[_Num]) [nodiscard], [constexpr], [noexcept]
```

Return the length of an array, as a signed integer.

Since

C++20

static_pointer_cast()

```
template<typename _Tp, typename _Tp1, _Lock_policy _Lp>
__shared_ptr< _Tp, _Lp > std::static_pointer_cast (
            const __shared_ptr< _Tp1, _Lp > & __r) [inline], [noexcept]
```

static_pointer_cast

swap() [1/19]

```
template<class _CharT, class _Traits>
void std::swap (
            basic_filebuf< _CharT, _Traits > & __x,
            basic_filebuf< _CharT, _Traits > & __y) [inline]
```

Swap specialization for filebufs.

swap() [2/19]

```
template<class _CharT, class _Traits>
void std::swap (
            basic_fstream< _CharT, _Traits > & __x,
            basic_fstream< _CharT, _Traits > & __y) [inline]
```

Swap specialization for fstreams.

swap() [3/19]

```
template<class _CharT, class _Traits>
void std::swap (
```

```
            basic_ifstream< _CharT, _Traits > & __x,
            basic_ifstream< _CharT, _Traits > & __y)  [inline]
```

Swap specialization for ifstreams.

swap() [4/19]

```
template<class _CharT, class _Traits, class _Allocator>
void std::swap (
            basic_istringstream< _CharT, _Traits, _Allocator > & __x,
            basic_istringstream< _CharT, _Traits, _Allocator > & __y)  [inline]
```

Swap specialization for istringstreams.

swap() [5/19]

            basic_ofstream< _CharT, _Traits > & __x,
            basic_ofstream< _CharT, _Traits > & __y)  [inline]
```

Swap specialization for ofstreams.

swap() [6/19]

```
template<class _CharT, class _Traits, class _Allocator>
void std::swap (
            basic_ostringstream< _CharT, _Traits, _Allocator > & __x,
            basic_ostringstream< _CharT, _Traits, _Allocator > & __y)  [inline]
```

Swap specialization for ostringstreams.

swap() [7/19]

```
template<typename _CharT, typename _Traits, typename _Alloc>
void std::swap (
            basic_string< _CharT, _Traits, _Alloc > & __lhs,
            basic_string< _CharT, _Traits, _Alloc > & __rhs)  [inline], [constexpr], [noexcept]
```

Swap contents of two strings.

Parameters

__lhs	First string.
__rhs	Second string.

Exchanges the contents of *__lhs* and *__rhs* in constant time.

swap() [8/19]

```
template<class _CharT, class _Traits, class _Allocator>
void std::swap (
            basic_stringbuf< _CharT, _Traits, _Allocator > & __x,
            basic_stringbuf< _CharT, _Traits, _Allocator > & __y)  [inline], [noexcept]
```

Swap specialization for stringbufs.

swap() [9/19]

```
template<class _CharT, class _Traits, class _Allocator>
void std::swap (
```

```
            basic_stringstream< _CharT, _Traits, _Allocator > & __x,
            basic_stringstream< _CharT, _Traits, _Allocator > & __y)  [inline]
```

Swap specialization for stringstreams.

swap() [10/19]

```
template<typename _Tp, typename _Alloc>
void std::swap (
            deque< _Tp, _Alloc > & __x,

```

See std::forward_list::swap().

swap() [12/19]

```
template<typename _Res, typename...  _Args>
void std::swap (
            function< _Res(_Args...)> & __x,
            function< _Res(_Args...)> & __y)  [inline], [noexcept]
```

Swap the targets of two polymorphic function object wrappers.
This function will not throw exceptions.

swap() [13/19]

```
template<typename _Tp, typename _Alloc>
void std::swap (
            list< _Tp, _Alloc > & __x,
            list< _Tp, _Alloc > & __y)  [inline], [noexcept]
```

See std::list::swap().

swap() [14/19]

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
void std::swap (
            map< _Key, _Tp, _Compare, _Alloc > & __x,
            map< _Key, _Tp, _Compare, _Alloc > & __y)  [inline], [noexcept]
```

See std::map::swap().
References std::pair< _T1, _T2 >::swap().

swap() [15/19]

```
template<typename _Key, typename _Tp, typename _Compare, typename _Alloc>
void std::swap (
            multimap< _Key, _Tp, _Compare, _Alloc > & __x,
            multimap< _Key, _Tp, _Compare, _Alloc > & __y)  [inline], [noexcept]
```

See std::multimap::swap().
References std::multimap< _Key, _Tp, _Compare, _Alloc >::swap().

swap() [16/19]

```
template<typename _Key, typename _Compare, typename _Alloc>
void std::swap (
            multiset< _Key, _Compare, _Alloc > & __x,
            multiset< _Key, _Compare, _Alloc > & __y)  [inline], [noexcept]
```

See std::multiset::swap().
References std::multiset< _Key, _Compare, _Alloc >::swap().

swap() [17/19]

```
template<typename _Key, typename _Compare, typename _Alloc>
void std::swap (
            set< _Key, _Compare, _Alloc > & __x,
            set< _Key, _Compare, _Alloc > & __y)  [inline], [noexcept]
```

See std::set::swap().
References std::set< _Key, _Compare, _Alloc >::swap().

swap() [18/19]

```
template<typename _Tp, typename _Alloc>
void std::swap (
            vector< _Tp, _Alloc > & __x,
            vector< _Tp, _Alloc > & __y)  [inline], [constexpr], [noexcept]
```

See std::vector::swap().

tolower()

```
template<typename _CharT>
_CharT std::tolower (
            _CharT __c,
            const locale & __loc)  [inline]
```

Convenience interface to ctype.tolower(__c).
References tolower(), and use_facet().
Referenced by tolower().

toupper()

```
template<typename _CharT>
_CharT std::toupper (
            _CharT __c,
            const locale & __loc)  [inline]
```

Convenience interface to ctype.toupper(__c).
References toupper(), and use_facet().
Referenced by toupper().

unitbuf()

```
ios_base & std::unitbuf (
            ios_base & __base)  [inline]
```

Calls base.setf(ios_base::unitbuf).
References std::ios_base::unitbuf.

uppercase()

```
ios_base & std::uppercase (
            ios_base & __base)  [inline]
```

Calls base.setf(ios_base::uppercase).
References std::ios_base::uppercase.

ws()

```
template<typename _CharT, typename _Traits>
basic_istream< _CharT, _Traits > & std::ws (
            basic_istream< _CharT, _Traits > & __is)
```

Quick and easy way to eat whitespace.
This manipulator extracts whitespace characters, stopping when the next character is non-whitespace, or when the input sequence is empty. If the sequence is empty, `eofbit` is set in the stream, but not `failbit`.
The current locale is used to distinguish whitespace characters.
Example:

```
MyClass  mc;

std::cin » std::ws » mc;
```

will skip leading whitespace before calling operator>> on cin and your object. Note that the same effect can be achieved by creating a std::basic_istream::sentry inside your definition of operator>>.
References std::ios_base::badbit, std::ios_base::eofbit, std::ios_base::getloc(), std::ios_base::goodbit, std::basic_ios< _CharT, _Traits >::
std::basic_ios< _CharT, _Traits >::setstate(), and use_facet().

4.10.5 Variable Documentation

cerr

```
ostream std::cerr  [extern]
```

Linked to standard error (unbuffered).

cin

```
istream std::cin  [extern]
```

Linked to standard input.

clog

```
ostream std::clog  [extern]
```

Linked to standard error (buffered).

cout

```
ostream std::cout  [extern]
```

Linked to standard output.

default_sentinel

```
default_sentinel_t std::default_sentinel  [inline], [constexpr]
```

A default sentinel value.

destroying_delete

```
destroying_delete_t std::destroying_delete  [inline], [constexpr]
```

Tag variable of type destroying_delete_t.

ignore

```
_Swallow_assign std::ignore  [inline], [constexpr]
```

Used with `std::tie` to ignore an element of a tuple

When using `std::tie` to assign the elements of a tuple to variables, unwanted elements can be ignored by using `std::ignore`. For example:

```
int x, y;
std::tie(x, std::ignore, y) = std::make_tuple(1, 2, 3);
```

This assignment will perform `x=1; std::ignore=2; y=3;` which results in the second element being ignored.

Since

C++11

wcerr

```
wostream std::wcerr  [extern]
```

Linked to standard error (unbuffered).

wcin

```
wistream std::wcin  [extern]
```

Linked to standard input.

wclog

```
wostream std::wclog  [extern]
```

Linked to standard error (buffered).

wcout

```
wostream std::wcout  [extern]
```

Linked to standard output.

4.11.1 Detailed Description

GNU debug code, replaces standard behavior with debug behavior.
Macros and namespaces used by the implementation outside of debug wrappers to verify certain properties. The _glibcxx_requires_xxx macros are merely wrappers around the __glibcxx_check_xxx wrappers when we are compiling with debug mode, but disappear when we are in release mode so that there is no checking performed in, e.g., the standard library algorithms.

4.11.2 Function Documentation

swap()

```
template<typename _Tp, typename _Alloc>
void std::__debug::swap (
            forward_list< _Tp, _Alloc > & __lx,
            forward_list< _Tp, _Alloc > & __ly)  [inline], [noexcept]
```

See std::forward_list::swap().

4.12.1 Detailed Description

Implementation details not part of the namespace std interface.

4.12.2 Function Documentation

__from_chars_alnum()

```
template<bool _DecOnly, typename _Tp>
bool std::__detail::__from_chars_alnum (
             const char *& __first,
             const char * __last,
             _Tp & __val,
             int __base)  [constexpr]
```

std::from_chars implementation for integers in any base. If _DecOnly is true, then we may assume __base is at most 10.
Referenced by std::from_chars().

__from_chars_pow2_base()

```
template<bool _DecOnly, typename _Tp>
bool std::__detail::__from_chars_pow2_base (
```

```
            const char *& __first,
            const char * __last,
            _Tp & __val,
            int __base)  [constexpr]
```

std::from_chars implementation for integers in a power-of-two base. If _DecOnly is true, then we may assume __base is at most 8.
Referenced by std::from_chars().

operator<<() [1/2]

```
template<typename _CharT, typename _Traits, typename _String>
std::basic_ostream< _CharT, _Traits > & std::__detail::operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const _Quoted_string< _String, _CharT > & __str)
```

Inserter for quoted strings.

operator<<() [2/2]

```
template<typename _CharT, typename _Traits>
std::basic_ostream< _CharT, _Traits > & std::__detail::operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const _Quoted_string< const _CharT *, _CharT > & __str)
```

Inserter for quoted strings.

operator>>()

```
template<typename _CharT, typename _Traits, typename _Alloc>
std::basic_istream< _CharT, _Traits > & std::__detail::operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            const _Quoted_string< basic_string< _CharT, _Traits, _Alloc > &, _CharT > & __str)
```

Extractor for delimited strings. The left and right delimiters can be different.
References std::basic_ios< _CharT, _Traits >::clear(), std::ios_base::flags(), std::basic_ios< _CharT, _Traits >::good(), std::ios_base::setf(), std::ios_base::skipws, and std::basic_istream< _CharT, _Traits >::unget().

4.13.1 Detailed Description

GNU parallel code, replaces standard behavior with parallel behavior.

4.13.2 Function Documentation

search()

```
template<typename _ForwardIterator, typename _Searcher>
_ForwardIterator std::__parallel::search (
            _ForwardIterator __first,
            _ForwardIterator __last,
            const _Searcher & __searcher)  [inline]
```

Search a sequence using a Searcher object.

Parameters

__first	A forward iterator.
__last	A forward iterator.
__searcher	A callable object.

Returns

`__searcher(__first,__last)`.first

4.14.1 Detailed Description

ISO C++ 2011 namespace for date and time utilities.

4.15 std::decimal Namespace Reference

Classes

- class decimal128
- class decimal32
- class decimal64

Functions

- double **decimal128_to_double** (decimal128 __d)
- float **decimal128_to_float** (decimal128 __d)
- long double **decimal128_to_long_double** (decimal128 __d)
- long long **decimal128_to_long_long** (decimal128 __d)
- double **decimal32_to_double** (decimal32 __d)
- float **decimal32_to_float** (decimal32 __d)
- long double **decimal32_to_long_double** (decimal32 __d)
- long long decimal32_to_long_long (decimal32 __d)

4.15.1 Detailed Description

ISO/IEC TR 24733 Decimal floating-point arithmetic.

4.15.2 Function Documentation

decimal32_to_long_long()

```
long long std::decimal::decimal32_to_long_long (
            decimal32 __d)
```

Non-conforming extension: Conversion to integral type.

4.16 std::experimental Namespace Reference

4.16.1 Detailed Description

Namespace for features defined in ISO Technical Specifications.

4.16.2 Function Documentation

gcd()

```
template<typename _Mn, typename _Nn>
common_type_t< _Mn, _Nn > std::experimental::fundamentals_v2::gcd (
            _Mn __m,
            _Nn __n)  [constexpr], [noexcept]
```

Greatest common divisor.

get_deleter()

```
template<typename _Del, typename _Tp>
_Del * std::experimental::fundamentals_v2::get_deleter (
            const shared_ptr< _Tp > & __p)  [inline], [noexcept]
```

C++14 20.8.2.2.10.

lcm()

```
template<typename _Mn, typename _Nn>
common_type_t< _Mn, _Nn > std::experimental::fundamentals_v2::lcm (
            _Mn __m,
            _Nn __n)  [constexpr]
```

Least common multiple.

make_boyer_moore_horspool_searcher()

```
template<typename _RAIter, typename _Hash = std::hash<typename std::iterator_traits<_RAIter>::↩
value_type>, typename _BinaryPredicate = equal_to<>>
boyer_moore_horspool_searcher< _RAIter, _Hash, _BinaryPredicate > std::experimental::fundamentals↩
_v1::make_boyer_moore_horspool_searcher (
            _RAIter __pat_first,
            _RAIter __pat_last,
            _Hash __hf = _Hash(),
            _BinaryPredicate __pred = _BinaryPredicate())  [inline]
```

Generator function for boyer_moore_horspool_searcher.
References std::move().

make_boyer_moore_searcher()

```
template<typename _RAIter, typename _Hash = std::hash<typename std::iterator_traits<_RAIter>::↩
value_type>, typename _BinaryPredicate = equal_to<>>
boyer_moore_searcher< _RAIter, _Hash, _BinaryPredicate > std::experimental::fundamentals_v1::↩
make_boyer_moore_searcher (
            _RAIter __pat_first,
            _RAIter __pat_last,
            _Hash __hf = _Hash(),
            _BinaryPredicate __pred = _BinaryPredicate())  [inline]
```

Generator function for boyer_moore_searcher.
References std::move().

make_default_searcher()

```
template<typename _ForwardIterator, typename _BinaryPredicate = std::equal_to<>>
default_searcher< _ForwardIterator, _BinaryPredicate > std::experimental::fundamentals_v1::make↩
_default_searcher (
            _ForwardIterator __pat_first,
            _ForwardIterator __pat_last,
            _BinaryPredicate __pred = _BinaryPredicate())  [inline]
```

Generator function for default_searcher.

make_ostream_joiner()

```
template<typename _CharT, typename _Traits, typename _DelimT>
ostream_joiner< decay_t< _DelimT >, _CharT, _Traits > std::experimental::fundamentals_v2::make↩
_ostream_joiner (
            basic_ostream< _CharT, _Traits > & __os,
            _DelimT && __delimiter)  [inline]
```

Object generator for ostream_joiner.
References std::forward().

not_fn()

```
template<typename _Fn>
auto std::experimental::fundamentals_v2::not_fn (
            _Fn && __fn)  [inline], [noexcept]
```

[func.not_fn] Function template not_fn
References std::forward().

sample()

```
template<typename _PopulationIterator, typename _SampleIterator, typename _Distance, typename _↩
UniformRandomNumberGenerator>
_SampleIterator std::experimental::fundamentals_v2::sample (
            _PopulationIterator __first,
            _PopulationIterator __last,
            _SampleIterator __out,
            _Distance __n,
            _UniformRandomNumberGenerator && __g)
```

Take a random sample from a population.
References std::forward().

4.16.3 Variable Documentation

is_bind_expression_v

```
template<typename _Tp>
bool std::experimental::fundamentals_v1::is_bind_expression_v  [constexpr]
```

Variable template for std::is_bind_expression.

is_placeholder_v

```
template<typename _Tp>
int std::experimental::fundamentals_v1::is_placeholder_v  [constexpr]
```

Variable template for std::is_placeholder.

4.17 std::filesystem Namespace Reference

Classes

- class directory_entry
- class directory_iterator
- class file_status
- class filesystem_error
- class path
- class recursive_directory_iterator
- struct space_info

Typedefs

- using file_time_type

Enumerations

- enum class copy_options : unsigned short {
  none , **skip_existing** , **overwrite_existing** , **update_existing** ,

4.19.1 Detailed Description

ISO C++ 2014 namespace for suffixes for duration literals.
These suffixes can be used to create `chrono::duration` values with tick periods of hours, minutes, seconds, milliseconds, microseconds or nanoseconds. For example, `std::chrono::seconds(5)` can be written as `5s` after making the suffix visible in the current scope. The suffixes can be made visible by a using-directive or using-declaration such as:

- `using namespace std::chrono_literals;`
- `using namespace std::literals;`
- `using namespace std::chrono;`
- `using namespace std;`
- `using std::chrono_literals::operator""s;`

The result of these suffixes on an integer literal is one of the standard typedefs such as `std::chrono::hours`. The result on a floating-point literal is a duration type with the specified tick period and an unspecified floating-point representation, for example `1.5e2ms` might be equivalent to `chrono::duration<long double, chrono::milli>(1.5e2)`.

- constexpr error_type error_complexity (_S_error_complexity)
- constexpr error_type error_stack (_S_error_stack)

4.21.1 Detailed Description

ISO C++ 2011 namespace for options and flags used with std::regex.

4.21.2 Enumeration Type Documentation

error_type

```
enum std::regex_constants::error_type
```

The expression contained an invalid collating element name.

match_flag_type

```
enum std::regex_constants::match_flag_type :  unsigned int
```

This is a bitmask type indicating regex matching rules.
The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

syntax_option_type

```
enum std::regex_constants::syntax_option_type :  unsigned int
```

This is a bitmask type indicating how to interpret the regex.
The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.
A valid value of type syntax_option_type shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

4.21.3 Function Documentation

error_backref()

```
error_type std::regex_constants::error_backref (
            _S_error_backref )  [inline], [constexpr]
```

The expression contained an invalid back reference.

error_badbrace()

```
error_type std::regex_constants::error_badbrace (
            _S_error_badbrace )  [inline], [constexpr]
```

The expression contained an invalid range in a {} expression.

error_badrepeat()

```
error_type std::regex_constants::error_badrepeat (
            _S_error_badrepeat )  [inline], [constexpr]
```

One of *∗?+{* was not preceded by a valid regular expression.

error_brace()

```
error_type std::regex_constants::error_brace (
            _S_error_brace )  [inline], [constexpr]
```

The expression contained mismatched { and }

error_brack()

```
error_type std::regex_constants::error_brack (
            _S_error_brack )  [inline], [constexpr]
```

The expression contained mismatched [and].

error_collate()

```
error_type std::regex_constants::error_collate (
            _S_error_collate )  [inline], [constexpr]
```

The expression contained an invalid collating element name.

error_complexity()

```
error_type std::regex_constants::error_complexity (
            _S_error_complexity )  [inline], [constexpr]
```

The complexity of an attempted match against a regular expression exceeded a pre-set level.

error_ctype()

```
error_type std::regex_constants::error_ctype (
            _S_error_ctype )  [inline], [constexpr]
```

The expression contained an invalid character class name.

error_escape()

```
error_type std::regex_constants::error_escape (
            _S_error_escape )  [inline], [constexpr]
```

The expression contained an invalid escaped character, or a trailing escape.

error_paren()

```
error_type std::regex_constants::error_paren (
            _S_error_paren )  [inline], [constexpr]
```

The expression contained mismatched (and).

error_range()

```
error_type std::regex_constants::error_range (
            _S_error_range )  [inline], [constexpr]
```

The expression contained an invalid character range, such as [b-a] in most encodings.

error_space()

```
error_type std::regex_constants::error_space (
            _S_error_space )  [inline], [constexpr]
```

There was insufficient memory to convert the expression into a finite state machine.

error_stack()

```
error_type std::regex_constants::error_stack (
            _S_error_stack )  [inline], [constexpr]
```

There was insufficient memory to determine whether the regular expression could match the specified character sequence.

operator&() [1/2]

```
match_flag_type std::regex_constants::operator& (
            match_flag_type __a,
            match_flag_type __b)  [constexpr], [noexcept]
```

This is a bitmask type indicating regex matching rules.
The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

operator&() [2/2]

```
syntax_option_type std::regex_constants::operator& (
            syntax_option_type __a,
            syntax_option_type __b)  [constexpr], [noexcept]
```

This is a bitmask type indicating how to interpret the regex.
The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.
A valid value of type syntax_option_type shall have exactly one of the elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep` set.

operator&=() [1/2]

```
match_flag_type & std::regex_constants::operator&= (
            match_flag_type & __a,
            match_flag_type __b)  [inline], [constexpr], [noexcept]
```

This is a bitmask type indicating regex matching rules.
The `match_flag_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

operator&=() [2/2]

```
syntax_option_type & std::regex_constants::operator&= (
            syntax_option_type & __a,
            syntax_option_type __b)  [inline], [constexpr], [noexcept]
```

This is a bitmask type indicating how to interpret the regex.
The `syntax_option_type` is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

A valid value of type syntax_option_type shall have exactly one of the elements ECMAScript, basic, extended, awk, grep, egrep set.

operator^() [1/2]

```
match_flag_type std::regex_constants::operator^ (
            match_flag_type __a,
            match_flag_type __b)  [constexpr], [noexcept]
```

This is a bitmask type indicating regex matching rules.
The match_flag_type is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

operator^() [2/2]

```
syntax_option_type std::regex_constants::operator^ (
            syntax_option_type __a,
            syntax_option_type __b)  [constexpr], [noexcept]
```

This is a bitmask type indicating how to interpret the regex.
The syntax_option_type is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.
A valid value of type syntax_option_type shall have exactly one of the elements ECMAScript, basic, extended, awk, grep, egrep set.

operator^=() [1/2]

```
match_flag_type & std::regex_constants::operator^= (
            match_flag_type & __a,
            match_flag_type __b)  [inline], [constexpr], [noexcept]
```

This is a bitmask type indicating regex matching rules.
The match_flag_type is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

operator^=() [2/2]

```
syntax_option_type & std::regex_constants::operator^= (
            syntax_option_type & __a,
            syntax_option_type __b)  [inline], [constexpr], [noexcept]
```

This is a bitmask type indicating how to interpret the regex.
The syntax_option_type is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.
A valid value of type syntax_option_type shall have exactly one of the elements ECMAScript, basic, extended, awk, grep, egrep set.

operator"|() [1/2]

```
match_flag_type std::regex_constants::operator| (
            match_flag_type __a,
            match_flag_type __b)  [constexpr], [noexcept]
```

This is a bitmask type indicating regex matching rules.
The match_flag_type is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

operator"|() [2/2]

```
syntax_option_type std::regex_constants::operator| (
```

```
            syntax_option_type __a,
            syntax_option_type __b)  [constexpr], [noexcept]
```

This is a bitmask type indicating how to interpret the regex.
The syntax_option_type is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.
A valid value of type syntax_option_type shall have exactly one of the elements ECMAScript, basic, extended, awk, grep, egrep set.

operator"|=() [1/2]

```
match_flag_type & std::regex_constants::operator|= (
            match_flag_type & __a,
            match_flag_type __b)  [inline], [constexpr], [noexcept]
```

This is a bitmask type indicating regex matching rules.
The match_flag_type is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

operator"|=() [2/2]

```
syntax_option_type & std::regex_constants::operator|= (
            syntax_option_type & __a,
            syntax_option_type __b)  [inline], [constexpr], [noexcept]
```

This is a bitmask type indicating how to interpret the regex.
The syntax_option_type is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.
A valid value of type syntax_option_type shall have exactly one of the elements ECMAScript, basic, extended, awk, grep, egrep set.

operator~() [1/2]

```
match_flag_type std::regex_constants::operator~ (
            match_flag_type __a)  [constexpr], [noexcept]
```

This is a bitmask type indicating regex matching rules.
The match_flag_type is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.

operator~() [2/2]

```
syntax_option_type std::regex_constants::operator~ (
            syntax_option_type __a)  [constexpr], [noexcept]
```

This is a bitmask type indicating how to interpret the regex.
The syntax_option_type is implementation defined but it is valid to perform bitwise operations on these values and expect the right thing to happen.
A valid value of type syntax_option_type shall have exactly one of the elements ECMAScript, basic, extended, awk, grep, egrep set.

4.21.4 Variable Documentation

__multiline

```
syntax_option_type std::regex_constants::__multiline  [inline], [constexpr]
```

Extension: Equivalent to regex_constants::multiline for C++11 and C++14.

__polynomial

```
syntax_option_type std::regex_constants::__polynomial  [inline], [constexpr]
```

Extension: Ensure both space complexity of compiled regex and time complexity execution are not exponential. If specified in a regex with back-references, the exception regex_constants::error_complexity will be thrown.

awk

syntax_option_type std::regex_constants::awk [inline], [constexpr]
Specifies that the grammar recognized by the regular expression engine is that used by POSIX utility awk in IEEE Std 1003.1-2001. This option is identical to syntax_option_type extended, except that C-style escape sequences are supported. These sequences are: \\, \a, \b, \f, \n, \r, \t , \v, \&apos„ &apos„ and \ddd (where ddd is one, two, or three octal digits).

basic

syntax_option_type std::regex_constants::basic [inline], [constexpr]
Specifies that the grammar recognized by the regular expression engine is that used by POSIX basic regular expressions in IEEE Std 1003.1-2001, Portable Operating System Interface (POSIX), Base Definitions and Headers, Section 9, Regular Expressions [IEEE, Information Technology – Portable Operating System Interface (POSIX), IEEE Standard 1003.1-2001].

collate

syntax_option_type std::regex_constants::collate [inline], [constexpr]
Specifies that character ranges of the form [a-b] should be locale sensitive.

ECMAScript

syntax_option_type std::regex_constants::ECMAScript [inline], [constexpr]
Specifies that the grammar recognized by the regular expression engine is that used by ECMAScript in ECMA-262 [Ecma International, ECMAScript Language Specification, Standard Ecma-262, third edition, 1999], as modified in section [28.13]. This grammar is similar to that defined in the PERL scripting language but extended with elements found in the POSIX regular expression grammar.

egrep

syntax_option_type std::regex_constants::egrep [inline], [constexpr]
Specifies that the grammar recognized by the regular expression engine is that used by POSIX utility grep when given the -E option in IEEE Std 1003.1-2001. This option is identical to syntax_option_type extended, except that newlines are treated as whitespace.

extended

syntax_option_type std::regex_constants::extended [inline], [constexpr]
Specifies that the grammar recognized by the regular expression engine is that used by POSIX extended regular expressions in IEEE Std 1003.1-2001, Portable Operating System Interface (POSIX), Base Definitions and Headers, Section 9, Regular Expressions.

format_default

match_flag_type std::regex_constants::format_default [inline], [constexpr]
When a regular expression match is to be replaced by a new string, the new string is constructed using the rules used by the ECMAScript replace function in ECMA- 262 [Ecma International, ECMAScript Language Specification, Standard Ecma-262, third edition, 1999], part 15.5.4.11 String.prototype.replace. In addition, during search and replace operations all non-overlapping occurrences of the regular expression are located and replaced, and sections of the input that did not match the expression are copied unchanged to the output string.
Format strings (from ECMA-262 [15.5.4.11]):

- $$ The dollar-sign itself ($)
- $& The matched substring.
- $` The portion of the string that precedes the matched substring. This would be match_results::prefix().
- $' The portion of the string that follows the matched substring. This would be match_results::suffix().
- $n The nth capture, where n is a positive integer less than 100. If `n <= match_results::size()` and the nth capture is undefined, use the empty string instead. If `n > match_results::size()`, the result is implementation-defined.

Referenced by std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::format(), std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::format(), std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::format(), and std::match_results< _BidirectionalIterator, polymorphic_allocator< sub_match< _BidirectionalIterator > > >< const char * >::format().

format_first_only

`match_flag_type std::regex_constants::format_first_only [inline], [constexpr]`
When specified during a search and replace operation, only the first occurrence of the regular expression shall be replaced.

format_no_copy

`match_flag_type std::regex_constants::format_no_copy [inline], [constexpr]`
During a search and replace operation, sections of the character container sequence being searched that do not match the regular expression shall not be copied to the output string.

format_sed

`match_flag_type std::regex_constants::format_sed [inline], [constexpr]`
When a regular expression match is to be replaced by a new string, the new string is constructed using the rules used by the POSIX sed utility in IEEE Std 1003.1- 2001 [IEEE, Information Technology – Portable Operating System Interface (POSIX), IEEE Standard 1003.1-2001].

grep

`syntax_option_type std::regex_constants::grep [inline], [constexpr]`
Specifies that the grammar recognized by the regular expression engine is that used by POSIX utility grep in IEEE Std 1003.1-2001. This option is identical to syntax_option_type basic, except that newlines are treated as whitespace.

icase

`syntax_option_type std::regex_constants::icase [inline], [constexpr]`
Specifies that the matching of regular expressions against a character sequence shall be performed without regard to case.

match_any

`match_flag_type std::regex_constants::match_any [inline], [constexpr]`
If more than one match is possible then any match is an acceptable result.

match_continuous

match_flag_type std::regex_constants::match_continuous [inline], [constexpr]
The expression only matches a sub-sequence that begins at first .
Referenced by std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++().

match_default

match_flag_type std::regex_constants::match_default [inline], [constexpr]
The default matching rules.
Referenced by std::regex_iterator< const char * >::regex_iterator(), std::regex_token_iterator< const char * >::regex_token_iterator(), std::regex_token_iterator< const char * >::regex_token_iterator(), std::regex_token_iterator< const char * >::regex_token_iterator(), std::regex_token_iterator< const char * >::regex_token_iterator(), std::regex_match(), std::regex_match(), std::regex_match(), std::regex_match(), std::regex_match(), std::regex_match(), std::regex_match(), std::regex_replace(), std::regex_replace(), std::regex_replace(), std::regex_replace(), std::regex_replace(), std::regex_replace(), std::regex_search(), std::regex_search(), std::regex_search(), std::regex_search(), std::regex_search(), std::regex_search(), and std::regex_search().

match_not_bol

match_flag_type std::regex_constants::match_not_bol [inline], [constexpr]
The first character in the sequence [first, last) is treated as though it is not at the beginning of a line, so the character (^) in the regular expression shall not match [first, first).

match_not_bow

match_flag_type std::regex_constants::match_not_bow [inline], [constexpr]
The expression \b is not matched against the sub-sequence [first,first).

match_not_eol

match_flag_type std::regex_constants::match_not_eol [inline], [constexpr]
The last character in the sequence [first, last) is treated as though it is not at the end of a line, so the character ($) in the regular expression shall not match [last, last).

match_not_eow

match_flag_type std::regex_constants::match_not_eow [inline], [constexpr]
The expression \b should not be matched against the sub-sequence [last,last).

match_not_null

match_flag_type std::regex_constants::match_not_null [inline], [constexpr]
The expression does not match an empty sequence.
Referenced by std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++().

match_prev_avail

match_flag_type std::regex_constants::match_prev_avail [inline], [constexpr]
--first is a valid iterator position. When this flag is set then the flags match_not_bol and match_not_↩ bow are ignored by the algorithms regex_match, regex_search, and regex_replace, and by the iterators regex_iterator and regex_token_iterator.
Referenced by std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++().

multiline

`syntax_option_type std::regex_constants::multiline [inline], [constexpr]`
Specifies that the ^ anchor matches at the beginning of a line, and the $ anchor matches at the end of a line, not only at the beginning/end of the input. Valid for the ECMAScript syntax, ignored otherwise.

Since

C++17

nosubs

`syntax_option_type std::regex_constants::nosubs [inline], [constexpr]`
Specifies that when a regular expression is matched against a character container sequence, no sub-expression matches are to be stored in the supplied match_results structure.

optimize

`syntax_option_type std::regex_constants::optimize [inline], [constexpr]`
Specifies that the regular expression engine should pay more attention to the speed with which regular expressions are matched, and less to the speed with which regular expression objects are constructed. Otherwise it has no detectable effect on the program output.

4.22 std::rel_ops Namespace Reference

Functions

- template<class _Tp>
  bool operator!= (const _Tp &__x, const _Tp &__y)
- template<class _Tp>
  bool operator<= (const _Tp &__x, const _Tp &__y)
- template<class _Tp>
  bool operator> (const _Tp &__x, const _Tp &__y)
- template<class _Tp>
  bool operator>= (const _Tp &__x, const _Tp &__y)

4.22.1 Detailed Description

The generated relational operators are sequestered here.
Libstdc++ headers must not use the contents of `rel_ops`. User code should also avoid them, because unconstrained function templates are too greedy and can easily cause ambiguities.
C++20 default comparisons are a better solution.

4.22.2 Function Documentation

operator"!=()

```
template<class _Tp>
bool std::rel_ops::operator!= (
            const _Tp & __x,
            const _Tp & __y)  [inline]
```

Defines != for arbitrary types, in terms of ==.

Parameters

_↩ _x	A thing.
_↩ _y	Another thing.

Returns

__x != __y

This function uses == to determine its result.

operator<=()

```
template<class _Tp>
bool std::rel_ops::operator<= (
             const _Tp & __x,
             const _Tp & __y)  [inline]
```

Defines <= for arbitrary types, in terms of <.

Parameters

_↩ _x	A thing.
_↩ _y	Another thing.

Returns

__x <= __y

This function uses < to determine its result.

operator>()

```
template<class _Tp>
bool std::rel_ops::operator> (
             const _Tp & __x,
             const _Tp & __y)  [inline]
```

Defines > for arbitrary types, in terms of <.

Parameters

_↩ _x	A thing.
_↩ _y	Another thing.

Returns

__x > __y

This function uses < to determine its result.

operator>=()

```
template<class _Tp>
bool std::rel_ops::operator>= (
            const _Tp & __x,
            const _Tp & __y)  [inline]
```

Defines >= for arbitrary types, in terms of <.

Parameters

_↩ _x	A thing.
_↩ _y	Another thing.

Returns

__x >= __y

This function uses < to determine its result.

4.23 std::this_thread Namespace Reference

Functions

- thread::id get_id () noexcept
- template<typename _Rep, typename _Period>
  void sleep_for (const chrono::duration< _Rep, _Period > &__rtime)
- template<typename _Clock, typename _Duration>
  void sleep_until (const chrono::time_point< _Clock, _Duration > &__atime)
- void yield () noexcept

4.23.1 Detailed Description

ISO C++ 2011 namespace for interacting with the current thread.
C++11 30.3.2 [thread.thread.this] Namespace this_thread.

4.23.2 Function Documentation

get_id()

```
thread::id std::this_thread::get_id ()  [inline], [noexcept]
```

The unique identifier of the current thread.

sleep_for()

```
template<typename _Rep, typename _Period>
void std::this_thread::sleep_for (
            const chrono::duration< _Rep, _Period > & __rtime)  [inline]
```

this_thread::sleep_for
Referenced by sleep_until().

sleep_until()

```
template<typename _Clock, typename _Duration>
void std::this_thread::sleep_until (
            const chrono::time_point< _Clock, _Duration > & __atime)  [inline]
```

this_thread::sleep_until
References sleep_for().

yield()

```
void std::this_thread::yield ()  [inline], [noexcept]
```

Allow the implementation to schedule a different thread.

4.24.1 Detailed Description

ISO C++ TR1 entities toplevel namespace is std::tr1.

4.24.2 Function Documentation

arg()

```
template<typename _Tp>
_Tp std::arg (
             const complex< _Tp > & __z)  [inline]
```

Return phase angle of *z*.

conf_hyperg()

```
template<typename _Tpa, typename _Tpc, typename _Tp>
__gnu_cxx::__promote_3< _Tpa, _Tpc, _Tp >::__type __gnu_cxx::conf_hyperg (
             _Tpa __a,
             _Tpc __c,
             _Tp __x)  [inline]
```

Return the confluent hypergeometric function ${}_1F_1(a;c;x)$ of real numeratorial parameter `a`, denominatorial parameter `c`, and argument `x`.
The confluent hypergeometric function is defined by

$$ {}_1F_1(a;c;x) = \sum_{n=0}^{\infty} \frac{(a)_n x^n}{(c)_n n!} $$

where the Pochhammer symbol is $(x)_k = (x)(x+1)...(x+k-1)$, $(x)_0 = 1$

Parameters

_↩ _*a*	The numeratorial parameter
_↩ _*c*	The denominatorial parameter
_↩ _*x*	The argument

conf_hypergf()

```
float __gnu_cxx::conf_hypergf (
            float __a,
            float __c,
            float __x)  [inline]
```

Return the confluent hypergeometric function ${}_1F_1(a;c;x)$ of `float` numeratorial parameter `a`, denominatorial parameter `c`, and argument `x`.

See also

conf_hyperg for details.

conf_hypergl()

```
long double __gnu_cxx::conf_hypergl (
            long double __a,
            long double __c,
            long double __x)  [inline]
```

Return the confluent hypergeometric function ${}_1F_1(a;c;x)$ of `long double` numeratorial parameter `a`, denominatorial parameter `c`, and argument `x`.

See also

conf_hyperg for details.

hyperg()

```
template<typename _Tpa, typename _Tpb, typename _Tpc, typename _Tp>
__gnu_cxx::__promote_4< _Tpa, _Tpb, _Tpc, _Tp >::__type __gnu_cxx::hyperg (
            _Tpa __a,
            _Tpb __b,
            _Tpc __c,
            _Tp __x)  [inline]
```

Return the hypergeometric function ${}_2F_1(a,b;c;x)$ of real numeratorial parameters `a` and `b`, denominatorial parameter `c`, and argument `x`.
The hypergeometric function is defined by

$$ {}_2F_1(a;c;x) = \sum_{n=0}^{\infty} \frac{(a)_n (b)_n x^n}{(c)_n n!} $$

where the Pochhammer symbol is $(x)_k = (x)(x+1)...(x+k-1)$, $(x)_0 = 1$

Parameters

_↩ _a	The first numeratorial parameter
_↩ _b	The second numeratorial parameter
_↩ _c	The denominatorial parameter
_↩ _x	The argument

hypergf()

```
float __gnu_cxx::hypergf (
            float __a,
            float __b,
            float __c,
            float __x)  [inline]
```

Return the hypergeometric function ${}_2F_1(a,b;c;x)$ of @ float numeratorial parameters a and b, denominatorial parameter c, and argument x.

See also

hyperg for details.

hypergl()

```
long double __gnu_cxx::hypergl (
            long double __a,
            long double __b,
            long double __c,
            long double __x)  [inline]
```

Return the hypergeometric function ${}_2F_1(a,b;c;x)$ of long double numeratorial parameters a and b, denominatorial parameter c, and argument x.

See also

hyperg for details.

norm()

```
template<typename _Tp>
_Tp constexpr std::norm (
            const complex< _Tp > & )  [constexpr]
```

Return *z* magnitude squared.

polar()

```
template<typename _Tp>
complex< _Tp > std::polar (
            const _Tp & __rho,
            const _Tp & __theta = _Tp(0))  [inline]
```

Return complex with magnitude *rho* and angle *theta*.

4.26.1 Detailed Description

Namespace for non-standard "TR2" extensions.

4.27 std::tr2::__detail Namespace Reference

4.27.1 Detailed Description

Implementation details not part of the namespace std::tr2 interface.

5 Concept Documentation

5.1 std::assignable_from Concept Reference

`#include <concepts>`

5.1.1 Concept definition

```
template<typename _Lhs, typename _Rhs>
concept assignable_from = is_lvalue_reference_v<_Lhs>
  && common_reference_with<__detail::__cref<_Lhs>, __detail::__cref<_Rhs»
  && requires(_Lhs __lhs, _Rhs&& __rhs) {
    { __lhs = static_cast<_Rhs&&>(__rhs) } -> same_as<_Lhs>;
  }
```

5.1.2 Detailed Description

[concept.assignable], concept assignable_from

5.2 std::common_reference_with Concept Reference

`#include <concepts>`

5.2.1 Concept definition

```
template<typename _Tp, typename _Up>
concept common_reference_with = same_as<common_reference_t<_Tp, _Up>, common_reference_t<_Up, _Tp>>
  && convertible_to<_Tp, common_reference_t<_Tp, _Up>>
  && convertible_to<_Up, common_reference_t<_Tp, _Up>>
```

5.2.2 Detailed Description

[concept.commonref], concept common_reference_with

5.3 std::common_with Concept Reference

```
#include <concepts>
```

5.3.1 Concept definition

```
template<typename _Tp, typename _Up>
concept common_with = same_as<common_type_t<_Tp, _Up>, common_type_t<_Up, _Tp>>
  && requires {
    static_cast<common_type_t<_Tp, _Up>>(std::declval<_Tp>());
    static_cast<common_type_t<_Tp, _Up>>(std::declval<_Up>());
  }
  && common_reference_with<add_lvalue_reference_t<const _Tp>,
                           add_lvalue_reference_t<const _Up>>
  && common_reference_with<add_lvalue_reference_t<common_type_t<_Tp, _Up>>,
                           common_reference_t<
                             add_lvalue_reference_t<const _Tp>,
                             add_lvalue_reference_t<const _Up>»
```

5.3.2 Detailed Description

[concept.common], concept common_with

5.4 std::constructible_from Concept Reference

```
#include <concepts>
```

5.4.1 Concept definition

```
template<typename _Tp, typename... _Args>
concept constructible_from = destructible<_Tp> && is_constructible_v<_Tp, _Args...>
```

5.4.2 Detailed Description

[concept.constructible], concept constructible_from

5.5 std::convertible_to Concept Reference

```
#include <concepts>
```

5.5.1 Concept definition

```
template<typename _From, typename _To>
concept convertible_to = is_convertible_v<_From, _To>
  && requires { static_cast<_To>(std::declval<_From>()); }
```

5.5.2 Detailed Description

[concept.convertible], concept convertible_to

5.6 std::copy_constructible Concept Reference

`#include <concepts>`

5.6.1 Concept definition

```
template<typename _Tp>
concept copy_constructible = move_constructible<_Tp>
  && constructible_from<_Tp, _Tp&> && convertible_to<_Tp&, _Tp>
  && constructible_from<_Tp, const _Tp&> && convertible_to<const _Tp&, _Tp>
  && constructible_from<_Tp, const _Tp> && convertible_to<const _Tp, _Tp>
```

5.6.2 Detailed Description

[concept.copyconstructible], concept copy_constructible

5.7 std::default_initializable Concept Reference

`#include <concepts>`

5.7.1 Concept definition

```
template<typename _Tp>
concept default_initializable = constructible_from<_Tp>
  && requires
  {
    _Tp{};
    (void) ::new _Tp;
  }
```

5.7.2 Detailed Description

[concept.defaultinitializable], concept default_initializable

5.8 std::derived_from Concept Reference

`#include <concepts>`

5.8.1 Concept definition

```
template<typename _Derived, typename _Base>
concept derived_from = __is_base_of(_Base, _Derived)
  && is_convertible_v<const volatile _Derived*, const volatile _Base*>
```

5.8.2 Detailed Description

[concept.derived], concept derived_from

5.9 std::destructible Concept Reference

`#include <concepts>`

5.9.1 Concept definition

```
template<typename _Tp>
concept destructible = __detail::__destructible<_Tp>
```

5.9.2 Detailed Description

[concept.destructible], concept destructible

5.10 std::equivalence_relation Concept Reference

`#include <concepts>`

5.10.1 Concept definition

```
template<typename _Rel, typename _Tp, typename _Up>
concept equivalence_relation = relation<_Rel, _Tp, _Up>
```

5.10.2 Detailed Description

[concept.equiv], concept equivalence_relation

5.11 std::indirectly_comparable Concept Reference

`#include <iterator_concepts.h>`

5.11.1 Concept definition

```
template<typename _I1, typename _I2, typename _Rel, typename _P1 = identity, typename _P2 = identity>
concept indirectly_comparable = indirect_binary_predicate<_Rel, projected<_I1, _P1>,
                                projected<_I2, _P2>>
```

5.11.2 Detailed Description

[alg.req.ind.cmp], concept `indirectly_comparable`

5.12 std::indirectly_copyable Concept Reference

`#include <iterator_concepts.h>`

5.12.1 Concept definition

```
template<typename _In, typename _Out>
concept indirectly_copyable = indirectly_readable<_In>
  && indirectly_writable<_Out, iter_reference_t<_In>>
```

5.12.2 Detailed Description

[alg.req.ind.copy], concept `indirectly_copyable`

5.13 std::indirectly_movable Concept Reference

`#include <iterator_concepts.h>`

5.13.1 Concept definition

```
template<typename _In, typename _Out>
concept indirectly_movable = indirectly_readable<_In>
  && indirectly_writable<_Out, iter_rvalue_reference_t<_In>>
```

5.13.2 Detailed Description

[alg.req.ind.move], concept `indirectly_movable`

5.14 std::indirectly_readable Concept Reference

`#include <iterator_concepts.h>`

5.14.1 Concept definition

```
template<typename _In>
concept indirectly_readable = __detail::__indirectly_readable_impl<remove_cvref_t<_In»
```

5.14.2 Detailed Description

Requirements for types that are readable by applying operator∗.

5.15 std::indirectly_swappable Concept Reference

`#include <iterator_concepts.h>`

5.15.1 Concept definition

```
template<typename _I1, typename _I2 = _I1>
concept indirectly_swappable = indirectly_readable<_I1> && indirectly_readable<_I2>
  && requires(const _I1 __i1, const _I2 __i2)
  {
    ranges::iter_swap(__i1, __i1);
    ranges::iter_swap(__i2, __i2);
    ranges::iter_swap(__i1, __i2);
    ranges::iter_swap(__i2, __i1);
  }
```

5.15.2 Detailed Description

[alg.req.ind.swap], concept `indirectly_swappable`

5.16 std::indirectly_writable Concept Reference

`#include <iterator_concepts.h>`

5.16.1 Concept definition

```
template<typename _Out, typename _Tp>
concept indirectly_writable = requires(_Out&& __o, _Tp&& __t)
  {
    *__o = std::forward<_Tp>(__t);
    *std::forward<_Out>(__o) = std::forward<_Tp>(__t);
    const_cast<const iter_reference_t<_Out>&&>(*__o)
      = std::forward<_Tp>(__t);
    const_cast<const iter_reference_t<_Out>&&>(*std::forward<_Out>(__o))
      = std::forward<_Tp>(__t);
  }
```

5.16.2 Detailed Description

Requirements for writing a value into an iterator's referenced object.

5.17 std::invocable Concept Reference

`#include <concepts>`

5.17.1 Concept definition

```
template<typename _Fn, typename... _Args>
concept invocable = is_invocable_v<_Fn, _Args...>
```

5.17.2 Detailed Description

[concept.invocable], concept invocable

5.18 std::mergeable Concept Reference

`#include <iterator_concepts.h>`

5.18.1 Concept definition

```
template<typename _I1, typename _I2, typename _Out, typename _Rel = ranges::less, typename _P1 = identity,
  typename _P2 = identity>
concept mergeable = input_iterator<_I1> && input_iterator<_I2>
  && weakly_incrementable<_Out> && indirectly_copyable<_I1, _Out>
  && indirectly_copyable<_I2, _Out>
  && indirect_strict_weak_order<_Rel, projected<_I1, _P1>,
                                projected<_I2, _P2>>
```

5.18.2 Detailed Description

[alg.req.mergeable], concept `mergeable`

5.19 std::move_constructible Concept Reference

`#include <concepts>`

5.19.1 Concept definition

```
template<typename _Tp>
concept move_constructible = constructible_from<_Tp, _Tp> && convertible_to<_Tp, _Tp>
```

5.19.2 Detailed Description

[concept.moveconstructible], concept move_constructible

5.20 std::permutable Concept Reference

`#include <iterator_concepts.h>`

5.20.1 Concept definition

```
template<typename _Iter>
concept permutable = forward_iterator<_Iter>
  && indirectly_movable_storable<_Iter, _Iter>
  && indirectly_swappable<_Iter, _Iter>
```

5.20.2 Detailed Description

[alg.req.permutable], concept `permutable`

5.21 std::predicate Concept Reference

`#include <concepts>`

5.21.1 Concept definition

```
template<typename _Fn, typename... _Args>
concept predicate = regular_invocable<_Fn, _Args...>
  && __detail::__boolean_testable<invoke_result_t<_Fn, _Args...»
```

5.21.2 Detailed Description

[concept.predicate], concept predicate

5.22 std::ranges::bidirectional_range Concept Reference

`#include <ranges_base.h>`

5.22.1 Concept definition

```
template<typename _Tp>
concept bidirectional_range = forward_range<_Tp> && bidirectional_iterator<iterator_t<_Tp»
```

5.22.2 Detailed Description

A range for which ranges::begin returns a bidirectional iterator.

5.23 std::ranges::borrowed_range Concept Reference

`#include <ranges_base.h>`

5.23.1 Concept definition

```
template<typename _Tp>
concept borrowed_range = range<_Tp> && __detail::__maybe_borrowed_range<_Tp>
```

5.23.2 Detailed Description

[range.range] The borrowed_range concept.

5.24 std::ranges::common_range Concept Reference

`#include <ranges_base.h>`

5.24.1 Concept definition

```
template<typename _Tp>
concept common_range = range<_Tp> && same_as<iterator_t<_Tp>, sentinel_t<_Tp»
```

5.24.2 Detailed Description

A range for which ranges::begin and ranges::end return the same type.

5.25 std::ranges::contiguous_range Concept Reference

`#include <ranges_base.h>`

5.25.1 Concept definition

```
template<typename _Tp>
concept contiguous_range = random_access_range<_Tp> && contiguous_iterator<iterator_t<_Tp»
  && requires(_Tp& __t)
  {
    { ranges::data(__t) } -> same_as<add_pointer_t<range_reference_t<_Tp>»;
  }
```

5.25.2 Detailed Description

A range for which ranges::begin returns a contiguous iterator.

5.26 std::ranges::forward_range Concept Reference

`#include <ranges_base.h>`

5.26.1 Concept definition

```
template<typename _Tp>
concept forward_range = input_range<_Tp> && forward_iterator<iterator_t<_Tp»
```

5.26.2 Detailed Description

A range for which ranges::begin returns a forward iterator.

5.27 std::ranges::input_range Concept Reference

`#include <ranges_base.h>`

5.27.1 Concept definition

```
template<typename _Tp>
concept input_range = range<_Tp> && input_iterator<iterator_t<_Tp»
```

5.27.2 Detailed Description

A range for which ranges::begin returns an input iterator.

5.28 std::ranges::output_range Concept Reference

`#include <ranges_base.h>`

5.28.1 Concept definition

```
template<typename _Range, typename _Tp>
concept output_range = range<_Range> && output_iterator<iterator_t<_Range>, _Tp>
```

5.28.2 Detailed Description

A range for which ranges::begin returns an output iterator.

5.29 std::ranges::random_access_range Concept Reference

`#include <ranges_base.h>`

5.29.1 Concept definition

```
template<typename _Tp>
concept random_access_range = bidirectional_range<_Tp> && random_access_iterator<iterator_t<_Tp»
```

5.29.2 Detailed Description

A range for which ranges::begin returns a random access iterator.

5.30 std::ranges::range Concept Reference

`#include <ranges_base.h>`

5.30.1 Concept definition

```
template<typename _Tp>
concept range = requires(_Tp& __t)
  {
    ranges::begin(__t);
    ranges::end(__t);
  }
```

5.30.2 Detailed Description

[range.range] The range concept.

5.31 std::ranges::sized_range Concept Reference

`#include <ranges_base.h>`

5.31.1 Concept definition

```
template<typename _Tp>
concept sized_range = range<_Tp>
  && requires(_Tp& __t) { ranges::size(__t); }
```

5.31.2 Detailed Description

[range.sized] The sized_range concept.

5.32 std::ranges::view Concept Reference

`#include <ranges_base.h>`

5.32.1 Concept definition

```
template<typename _Tp>
concept view = range<_Tp> && movable<_Tp> && enable_view<_Tp>
```

5.32.2 Detailed Description

[range.view] The ranges::view concept.

5.33 std::ranges::viewable_range Concept Reference

`#include <ranges_base.h>`

5.33.1 Concept definition

```
template<typename _Tp>
concept viewable_range = range<_Tp>
  && ((view<remove_cvref_t<_Tp>> && constructible_from<remove_cvref_t<_Tp>, _Tp>)
      || (!view<remove_cvref_t<_Tp>>
          && (is_lvalue_reference_v<_Tp>
              || (movable<remove_reference_t<_Tp»
                  && !__detail::__is_initializer_list<remove_cvref_t<_Tp»))))
```

5.33.2 Detailed Description

A range which can be safely converted to a view.

5.34 std::regular_invocable Concept Reference

`#include <concepts>`

5.34.1 Concept definition

```
template<typename _Fn, typename... _Args>
concept regular_invocable = invocable<_Fn, _Args...>
```

5.34.2 Detailed Description

[concept.regularinvocable], concept regular_invocable

5.35 std::relation Concept Reference

`#include <concepts>`

5.35.1 Concept definition

```
template<typename _Rel, typename _Tp, typename _Up>
concept relation = predicate<_Rel, _Tp, _Tp> && predicate<_Rel, _Up, _Up>
  && predicate<_Rel, _Tp, _Up> && predicate<_Rel, _Up, _Tp>
```

5.35.2 Detailed Description

[concept.relation], concept relation

5.36 std::same_as Concept Reference

`#include <concepts>`

5.36.1 Concept definition

```
template<typename _Tp, typename _Up>
concept same_as = __detail::__same_as<_Tp, _Up> && __detail::__same_as<_Up, _Tp>
```

5.36.2 Detailed Description

[concept.same], concept same_as

5.37 std::simd::__vec_builtin Concept Reference

`#include <vec_ops.h>`

5.37.1 Concept definition

```
template<typename _Tp>
concept __vec_builtin = __vec_builtin_of<_Tp, remove_cvref_t<decltype(declval<const _Tp>()[0])»
```

5.37.2 Detailed Description

Constrain to any vector builtin.

5.38 std::simd::__vec_builtin_of Concept Reference

`#include <vec_ops.h>`

5.38.1 Concept definition

```
template<typename _Tp, typename _ValueType, __simd_size_type _Width = sizeof(_Tp) / sizeof(_ValueType)>
concept __vec_builtin_of = !is_class_v<_Tp> && !is_pointer_v<_Tp> && !is_arithmetic_v<_Tp>
      && __vectorizable<_ValueType>
      && _Width >= 1 && sizeof(_Tp) / sizeof(_ValueType) == _Width
      && same_as<__vec_builtin_type_bytes<_ValueType, sizeof(_Tp)>, _Tp>
      && requires(_Tp& __v, _ValueType __x) { __v[0] = __x; }
```

5.38.2 Detailed Description

Constrain to any vector builtin with given value type and optional width.

5.39 std::sortable Concept Reference

`#include <iterator_concepts.h>`

5.39.1 Concept definition

```
template<typename _Iter, typename _Rel = ranges::less, typename _Proj = identity>
concept sortable = permutable<_Iter>
  && indirect_strict_weak_order<_Rel, projected<_Iter, _Proj»
```

5.39.2 Detailed Description

[alg.req.sortable], concept `sortable`

5.40 std::strict_weak_order Concept Reference

`#include <concepts>`

5.40.1 Concept definition

```
template<typename _Rel, typename _Tp, typename _Up>
concept strict_weak_order = relation<_Rel, _Tp, _Up>
```

5.40.2 Detailed Description

[concept.strictweakorder], concept strict_weak_order

5.41 std::uniform_random_bit_generator Concept Reference

`#include <random>`

5.41.1 Concept definition

```
template<typename _Gen>
concept uniform_random_bit_generator = invocable<_Gen&> && unsigned_integral<invoke_result_t<_Gen&»
  && requires
  {
    { _Gen::min() } -> same_as<invoke_result_t<_Gen&>>;
    { _Gen::max() } -> same_as<invoke_result_t<_Gen&»;
    requires bool_constant<(_Gen::min() < _Gen::max())>::value;
  }
```

5.41.2 Detailed Description

Requirements for a uniform random bit generator.

Since

C++20

5.42 std::weakly_incrementable Concept Reference

`#include <iterator_concepts.h>`

5.42.1 Concept definition

```
template<typename _Iter>
concept weakly_incrementable = movable<_Iter>
  && requires(_Iter __i)
  {
    typename iter_difference_t<_Iter>;
    requires __detail::__is_signed_integer_like<iter_difference_t<_Iter»;
    { ++__i } -> same_as<_Iter&>;
    __i++;
  }
```

5.42.2 Detailed Description

Requirements on types that can be incremented with ++.

6 Class Documentation

6.1 __gnu_parallel::__accumulate_binop_reduct< _BinOp > Struct Template Reference

`#include <for_each_selectors.h>`

Public Member Functions

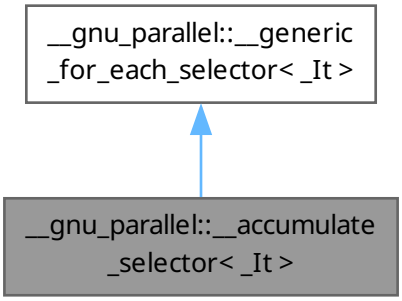
- **__accumulate_binop_reduct** (_BinOp &__b)
- template<typename _Result, typename _Addend>
  _Result **operator()** (const _Result &__x, const _Addend &__y)

Public Attributes

- _BinOp & **__binop**

6.1.1 Detailed Description

template<typename _BinOp>
struct __gnu_parallel::__accumulate_binop_reduct< _BinOp >



General reduction, using a binary operator.
The documentation for this struct was generated from the following file:

- for_each_selectors.h

6.2 __gnu_parallel::__accumulate_selector< _It > Struct Template Reference

`#include <for_each_selectors.h>`

Inheritance diagram for __gnu_parallel::__accumulate_selector< _It >:

Public Member Functions

- template<typename _Op>
  std::iterator_traits< _It >::value_type operator() (_Op __o, _It __i)

Public Attributes

- _It _M_finish_iterator

6.2.1 Detailed Description

template<typename _It>
struct __gnu_parallel::__accumulate_selector< _It >

std::accumulate() selector.

6.2.2 Member Function Documentation

operator()()

```
template<typename _It>
template<typename _Op>
std::iterator_traits< _It >::value_type __gnu_parallel::__accumulate_selector< _It >::operator()
(
            _Op __o,
            _It __i)  [inline]
```

Functor execution.

Parameters

_↩ _o	Operator (unused).

_↩ _i	iterator referencing object.

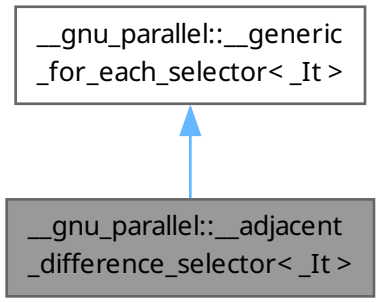
Returns

The current value.

6.2.3 Member Data Documentation

_M_finish_iterator

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator  [inherited]
```



_Iterator on last element processed; needed for some algorithms (e. g. std::transform()).
The documentation for this struct was generated from the following file:

- for_each_selectors.h

6.3 __gnu_parallel::__adjacent_difference_selector< _It > Struct Template Reference

```
#include <for_each_selectors.h>
```

Inheritance diagram for __gnu_parallel::__adjacent_difference_selector< _It >:

Public Member Functions

- template<typename _Op>
  bool **operator()** (_Op &__o, _It __i)

Public Attributes

- _It _M_finish_iterator

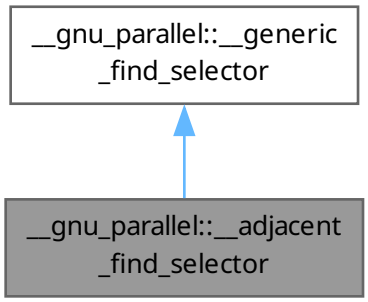
6.3.1 Detailed Description

template<typename _It>
struct __gnu_parallel::__adjacent_difference_selector< _It >

Selector that returns the difference between two adjacent __elements.

6.3.2 Member Data Documentation

_M_finish_iterator



```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator  [inherited]
```

_Iterator on last element processed; needed for some algorithms (e. g. std::transform()).
The documentation for this struct was generated from the following file:

- for_each_selectors.h

6.4 __gnu_parallel::__adjacent_find_selector Struct Reference

`#include <find_selectors.h>`
Inheritance diagram for __gnu_parallel::__adjacent_find_selector:

Public Member Functions

- template<typename _RAIter1, typename _RAIter2, typename _Pred>
  std::pair< _RAIter1, _RAIter2 > _M_sequential_algorithm (_RAIter1 __begin1, _RAIter1 __end1, _RAIter2 __↩
  begin2, _Pred __pred)
- template<typename _RAIter1, typename _RAIter2, typename _Pred>
  bool operator() (_RAIter1 __i1, _RAIter2 __i2, _Pred __pred)

6.4.1 Detailed Description

Test predicate on two adjacent elements.

6.4.2 Member Function Documentation

_M_sequential_algorithm()

```
template<typename _RAIter1, typename _RAIter2, typename _Pred>
std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__adjacent_find_selector::_M_sequential_algorithm
(
            _RAIter1 __begin1,
            _RAIter1 __end1,
            _RAIter2 __begin2,
            _Pred __pred)  [inline]
```

Corresponding sequential algorithm on a sequence.

Parameters

__begin1	Begin iterator of first sequence.
__end1	End iterator of first sequence.
__begin2	Begin iterator of second sequence.
__pred	Find predicate.

References std::make_pair().

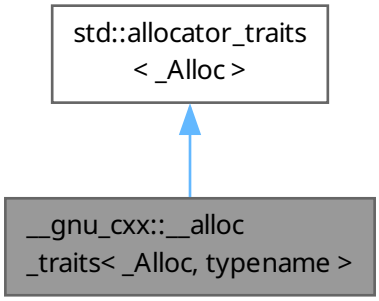
operator()()

```
template<typename _RAIter1, typename _RAIter2, typename _Pred>
bool __gnu_parallel::__adjacent_find_selector::operator() (
            _RAIter1 __i1,
            _RAIter2 __i2,
            _Pred __pred)  [inline]
```

Test on one position.

Parameters

__i1	_Iterator on first sequence.
__i2	_Iterator on second sequence (unused).
__pred	Find predicate.



The documentation for this struct was generated from the following file:

- find_selectors.h

6.5 __gnu_cxx::__alloc_traits< _Alloc, typename > Struct Template Reference

```
#include <alloc_traits.h>
```

Inheritance diagram for __gnu_cxx::__alloc_traits< _Alloc, typename >:

Public Types

- static constexpr _Alloc select_on_container_copy_construction (const _Alloc &__rhs)

6.5.1 Detailed Description

template<typename _Alloc, typename = typename _Alloc::value_type>
struct __gnu_cxx::__alloc_traits< _Alloc, typename >

Uniform interface to C++98 and C++11 allocators.

6.5.2 Member Typedef Documentation

const_void_pointer

```
template<typename _Alloc>
using std::allocator_traits< _Alloc >::const_void_pointer  [inherited]
```

The allocator's const void pointer type.
`Alloc::const_void_pointer` if that type exists, otherwise `pointer_traits<pointer>::↩ rebind<const void>`

is_always_equal

```
template<typename _Alloc>
using std::allocator_traits< _Alloc >::is_always_equal  [inherited]
```

Whether all instances of the allocator type compare equal.
`Alloc::is_always_equal` if that type exists, otherwise `is_empty<Alloc>::type`

propagate_on_container_copy_assignment

```
template<typename _Alloc>
using std::allocator_traits< _Alloc >::propagate_on_container_copy_assignment  [inherited]
```

How the allocator is propagated on copy assignment.
`Alloc::propagate_on_container_copy_assignment` if that type exists, otherwise `false_type`

propagate_on_container_move_assignment

```
template<typename _Alloc>
using std::allocator_traits< _Alloc >::propagate_on_container_move_assignment  [inherited]
```

How the allocator is propagated on move assignment.

`Alloc::propagate_on_container_move_assignment` if that type exists, otherwise `false_type`

propagate_on_container_swap

```
template<typename _Alloc>
using std::allocator_traits< _Alloc >::propagate_on_container_swap  [inherited]
```

How the allocator is propagated on swap.

`Alloc::propagate_on_container_swap` if that type exists, otherwise `false_type`

void_pointer

```
template<typename _Alloc>
using std::allocator_traits< _Alloc >::void_pointer  [inherited]
```

The allocator's void pointer type.

`Alloc::void_pointer` if that type exists, otherwise `pointer_traits<pointer>::rebind<void>`

6.5.3 Member Function Documentation

allocate() [1/4]

```
template<typename _Alloc, typename = typename _Alloc::value_type>
constexpr pointer std::allocator_traits< _Alloc >::allocate (
            _Alloc & __a,
            size_type __n)  [inline], [static], [nodiscard], [constexpr]
```

Allocate memory.

Parameters

__a	An allocator.
__n	The number of objects to allocate space for.

Calls `a.allocate(n)`

allocate() [2/4]

```
template<typename _Alloc, typename = typename _Alloc::value_type>
constexpr pointer std::allocator_traits< _Alloc >::allocate (
            _Alloc & __a,
            size_type __n,
            const_void_pointer __hint)  [inline], [static], [nodiscard], [constexpr]
```

Allocate memory.

Parameters

__a	An allocator.

__n	The number of objects to allocate space for.
__hint	Aid to locality.

Returns

Memory of suitable size and alignment for *n* objects of type `value_type`

Returns `a.allocate(n, hint)` if that expression is well-formed, otherwise returns `a.allocate(n)`

allocate() [3/4]

```
template<typename _Alloc>
constexpr pointer std::allocator_traits< _Alloc >::allocate (
            _Alloc & __a,
            size_type __n)  [inline], [static], [nodiscard], [constexpr], [inherited]
```

Allocate memory.

Parameters

_↩ _a	An allocator.
_↩ _n	The number of objects to allocate space for.

Calls `a.allocate(n)`

allocate() [4/4]

```
template<typename _Alloc>
constexpr pointer std::allocator_traits< _Alloc >::allocate (
            _Alloc & __a,
            size_type __n,
            const_void_pointer __hint)  [inline], [static], [nodiscard], [constexpr], [inherited]
```

Allocate memory.

Parameters

__a	An allocator.
__n	The number of objects to allocate space for.
__hint	Aid to locality.

Returns

Memory of suitable size and alignment for *n* objects of type `value_type`

Returns `a.allocate(n, hint)` if that expression is well-formed, otherwise returns `a.allocate(n)`

allocate_at_least()

```
template<typename _Alloc>
constexpr allocation_result< pointer, size_type > std::allocator_traits< _Alloc >::allocate_at↩
_least (
            _Alloc & __a,
            size_type __n)  [inline], [static], [nodiscard], [constexpr], [inherited]
```

Allocate memory, generously.

Parameters

_↩ _a	An allocator.
_↩ _n	The minimum number of objects to allocate space for.

Returns

Memory of suitable size and alignment for `n` or more contiguous objects of type `value_type`.

Returns `a.allocate_at_least(n)` if that expression is well-formed, else `{ a.allocate(n), n }`. When an allocator is obliged to reserve more space than required for the cited `n` objects, it may deliver the extra space to the caller.

construct()

```
template<typename _Alloc, typename = typename _Alloc::value_type>
template<typename _Tp, typename...  _Args>
constexpr void std::allocator_traits< _Alloc >::construct (
            _Alloc & __a,
            _Tp * __p,
            _Args &&...  __args)  [inline], [static], [constexpr], [noexcept]
```

Construct an object of type `_Tp`.

Parameters

__a	An allocator.
__p	Pointer to memory of suitable size and alignment for Tp
__args	Constructor arguments.

Calls `__a.construct(__p, std::forward<Args>(__args)...)` if that expression is well-formed, otherwise uses placement-new to construct an object of type *_Tp* at location *__p* from the arguments *__args*...

deallocate() [1/2]

```
template<typename _Alloc, typename = typename _Alloc::value_type>
constexpr void std::allocator_traits< _Alloc >::deallocate (
            _Alloc & __a,
            pointer __p,
            size_type __n)  [inline], [static], [constexpr]
```

Deallocate memory.

Parameters

_↩ _a	An allocator.
_↩ _p	Pointer to the memory to deallocate.
_↩ _n	The number of objects space was allocated for.

Calls `a.deallocate(p, n)`

deallocate() [2/2]

```
template<typename _Alloc>
constexpr void std::allocator_traits< _Alloc >::deallocate (
            _Alloc & __a,
            pointer __p,
            size_type __n)  [inline], [static], [constexpr], [inherited]
```

Deallocate memory.

Parameters

_↩ _a	An allocator.
_↩ _p	Pointer to the memory to deallocate.
_↩ _n	The number of objects space was allocated for.

Calls `a.deallocate(p, n)`

destroy()

```
template<typename _Alloc, typename = typename _Alloc::value_type>
template<typename _Tp>
constexpr void std::allocator_traits< _Alloc >::destroy (
            _Alloc & __a,
            _Tp * __p)  [inline], [static], [constexpr], [noexcept]
```

Destroy an object of type *_Tp*.

Parameters

_↩ _a	An allocator.
_↩ _p	Pointer to the object to destroy

Calls `__a.destroy(__p)` if that expression is well-formed, otherwise calls `__p->~_Tp()`

max_size()

```
template<typename _Alloc, typename = typename _Alloc::value_type>
```

```
constexpr size_type std::allocator_traits< _Alloc >::max_size (
            const _Alloc & __a)  [inline], [static], [constexpr], [noexcept]
```

The maximum supported allocation size.

Parameters

_↩ _a	An allocator.

Returns

`__a.max_size()` or `numeric_limits<size_type>::max()`

Returns `__a.max_size()` if that expression is well-formed, otherwise returns `numeric_limits<size_↩ type>::max()`

select_on_container_copy_construction()

```
template<typename _Alloc>
constexpr _Alloc std::allocator_traits< _Alloc >::select_on_container_copy_construction (
            const _Alloc & __rhs)  [inline], [static], [constexpr], [inherited]
```

Obtain an allocator to use when copying a container.

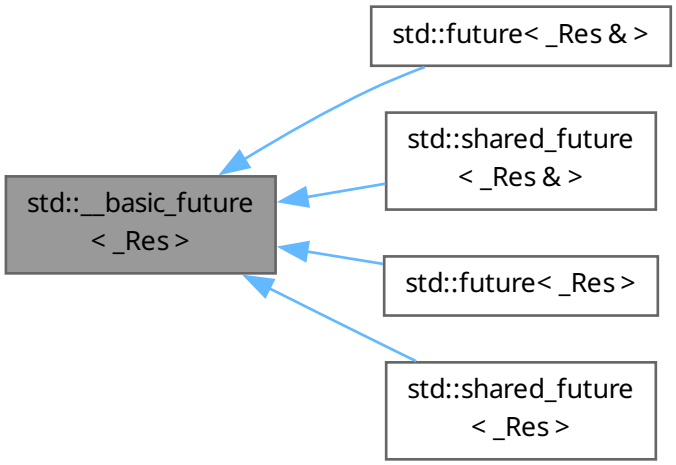
Parameters

__rhs	An allocator.

Returns

`__rhs.select_on_container_copy_construction()` or *__rhs*

Returns `__rhs.select_on_container_copy_construction()` if that expression is well-formed, otherwise returns *__rhs*



The documentation for this struct was generated from the following file:

- ext/alloc_traits.h

6.6 std::__basic_future< _Res > Class Template Reference

`#include <future>`

Inheritance diagram for std::__basic_future< _Res >:

Public Member Functions

- **__basic_future** (const __basic_future &)=delete
- __basic_future & **operator=** (const __basic_future &)=delete
- bool **valid** () const noexcept
- void **wait** () const

- **__basic_future** (shared_future< _Res > &&) noexcept
- __result_type _M_get_result () const
- void **_M_swap** (__basic_future &__that) noexcept

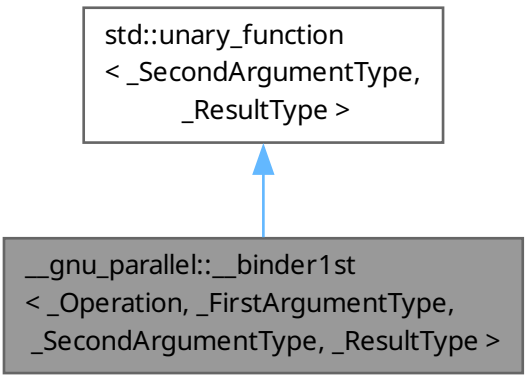
6.6.1 Detailed Description

template<typename _Res>
class std::__basic_future< _Res >

Common implementation for future and shared_future.

6.6.2 Member Function Documentation

_M_get_result()



```
template<typename _Res>
__result_type std::__basic_future< _Res >::_M_get_result () const  [inline], [protected]
```

Wait for the state to be ready and rethrow any stored exception.
Referenced by std::future< _Res >::get(), and std::shared_future< _Res >::get().
The documentation for this class was generated from the following file:

- future

6.7 __gnu_parallel::__binder1st< _Operation, _FirstArgumentType, _SecondArgumentType, _ResultType > Class Template Reference

`#include <base.h>`
Inheritance diagram for __gnu_parallel::__binder1st< _Operation, _FirstArgumentType, _SecondArgumentType, _ResultType >:

Public Types

- typedef _SecondArgumentType argument_type
- typedef _ResultType result_type

Public Member Functions

- **__binder1st** (const _Operation &__x, const _FirstArgumentType &__y)

- _ResultType **operator()** (const _SecondArgumentType &__x)

Protected Attributes

- _Operation **_M_op**
- _FirstArgumentType **_M_value**

6.7.1 Detailed Description

template<typename _Operation, typename _FirstArgumentType, typename _SecondArgumentType, typename _ResultType>
class __gnu_parallel::__binder1st< _Operation, _FirstArgumentType, _SecondArgumentType, _ResultType >

Similar to std::binder1st, but giving the argument types explicitly.

6.7.2 Member Typedef Documentation

argument_type

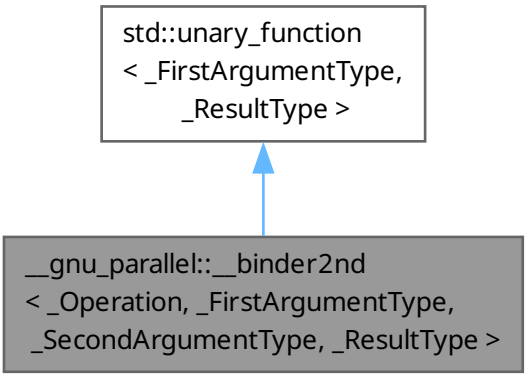
```
typedef _SecondArgumentType std::unary_function< _SecondArgumentType, _ResultType >::argument_type [inherited]
```

`argument_type` is the type of the argument

result_type

```
typedef _ResultType std::unary_function< _SecondArgumentType, _ResultType >::result_type [inherited]
```

`result_type` is the return type



The documentation for this class was generated from the following file:

- base.h

6.9.1 Detailed Description

template<typename _InternT, typename _ExternT, typename _StateT>
class std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >

Common base for codecvt functions.
This template class provides implementations of the public functions that forward to the protected virtual functions.
This template also provides abstract stubs for the protected virtual functions.

6.9.2 Member Function Documentation

do_out()

```
template<typename _InternT, typename _ExternT, typename _StateT>
virtual result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::do_out (
            state_type & __state,
            const intern_type * __from,
            const intern_type * __from_end,
            const intern_type *& __from_next,
```

```
            extern_type * __to,
            extern_type * __to_end,
            extern_type *& __to_next) const  [protected], [pure virtual]
```

Convert from internal to external character set.
Converts input string of intern_type to output string of extern_type. This function is a hook for derived classes to change the value returned.

See also

out for more information.

Implemented in std::codecvt< _InternT, _ExternT, _StateT >, std::codecvt< _Elem, char, mbstate_t >, std::codecvt< _InternT, _ExternT
std::codecvt< char, char, mbstate_t >, std::codecvt< char16_t, char, mbstate_t >, std::codecvt< char32_t, char, mbstate_t >,
and std::codecvt< wchar_t, char, mbstate_t >.
Referenced by out().

in()

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::in (
            state_type & __state,
            const extern_type * __from,
            const extern_type * __from_end,
            const extern_type *& __from_next,
            intern_type * __to,
            intern_type * __to_end,
            intern_type *& __to_next) const  [inline]
```

Convert from external to internal character set.
Converts input string of extern_type to output string of intern_type. This is analogous to mbsrtowcs. It does this by calling codecvt::do_in.
The source and destination character sets are determined by the facet's locale, internal and external types.
The characters in [from,from_end) are converted and written to [to,to_end). from_next and to_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from_next and to_next are not affected.
The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.
The result returned is a member of codecvt_base::result. If all the input is converted, returns codecvt_base::ok. If no conversion is necessary, returns codecvt_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt_base::partial. Otherwise the conversion failed and codecvt_base::error is returned.

Parameters

__state	Persistent conversion state data.
__from	Start of input.
__from_end	End of input.
__from_next	Returns start of unconverted data.
__to	Start of output buffer.
__to_end	End of output buffer.
__to_next	Returns start of unused output area.

Returns

codecvt_base::result.

out()

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::out (
             state_type & __state,
             const intern_type * __from,
             const intern_type * __from_end,
             const intern_type *& __from_next,
             extern_type * __to,
             extern_type * __to_end,
             extern_type *& __to_next) const  [inline]
```

Convert from internal to external character set.

Converts input string of intern_type to output string of extern_type. This is analogous to wcsrtombs. It does this by calling codecvt::do_out.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from_end) are converted and written to [to,to_end). from_next and to_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from_next and to_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt_base::result. If all the input is converted, returns codecvt_base::ok. If no conversion is necessary, returns codecvt_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt_base::partial. Otherwise the conversion failed and codecvt_base::error is returned.

Parameters

__state	Persistent conversion state data.
__from	Start of input.
__from_end	End of input.
__from_next	Returns start of unconverted data.
__to	Start of output buffer.
__to_end	End of output buffer.
__to_next	Returns start of unused output area.

Returns

codecvt_base::result.

References do_out().

unshift()

```
template<typename _InternT, typename _ExternT, typename _StateT>
result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::unshift (
             state_type & __state,
             extern_type * __to,
```

```
        extern_type * __to_end,
        extern_type *& __to_next) const  [inline]
```

Reset conversion state.
Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling codecvt::do_unshift().
For example, if 4 external characters always converted to 1 internal character, and input to in() had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.
The source and destination character sets are determined by the facet's locale, internal and external types.
The result returned is a member of codecvt_base::result. If the state could be reset and data written, returns codecvt_base::ok. If no conversion is necessary, returns codecvt_base::noconv. If the output has insufficient space, returns codecvt_base::partial. Otherwise the reset failed and codecvt_base::error is returned.

Parameters

__state	Persistent conversion state data.
__to	Start of output buffer.
__to_end	End of output buffer.
__to_next	Returns start of unused output area.

Returns

codecvt_base::result.

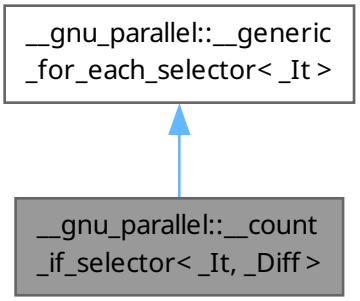
6.10 __gnu_cxx::__common_pool_policy< _PoolTp, _Thread > Struct Template Reference

`#include <mt_allocator.h>`

6.10.1 Detailed Description

template<template< bool > class _PoolTp, bool _Thread>
struct __gnu_cxx::__common_pool_policy< _PoolTp, _Thread >



Policy for shared __pool objects.
The documentation for this struct was generated from the following file:

- mt_allocator.h

6.11 __gnu_parallel::__count_if_selector< _It, _Diff > Struct Template Reference

`#include <for_each_selectors.h>`

Inheritance diagram for __gnu_parallel::__count_if_selector< _It, _Diff >:

Public Member Functions

- template<typename _Op>
  _Diff operator() (_Op &__o, _It __i)

Public Attributes

- _It _M_finish_iterator

6.11.1 Detailed Description

template<typename _It, typename _Diff>
struct __gnu_parallel::__count_if_selector< _It, _Diff >

std::count_if () selector.

6.11.2 Member Function Documentation

operator()()

```
template<typename _It, typename _Diff>
template<typename _Op>
_Diff __gnu_parallel::__count_if_selector< _It, _Diff >::operator() (
            _Op & __o,
            _It __i)  [inline]
```

Functor execution.

Parameters

_↩ _o	Operator.

_↩ _i	iterator referencing object.

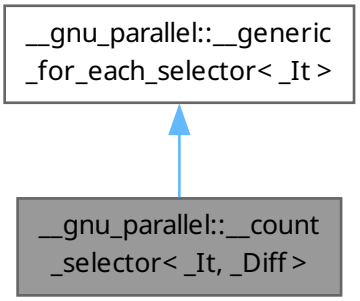
Returns

1 if count, 0 if does not count.

6.11.3 Member Data Documentation

_M_finish_iterator

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator  [inherited]
```



_Iterator on last element processed; needed for some algorithms (e. g. std::transform()).
The documentation for this struct was generated from the following file:

6.13.1 Detailed Description

template<typename _CharT>
class std::__ctype_abstract_base< _CharT >

Common base for ctype facet.
This template class provides implementations of the public functions that forward to the protected virtual functions.
This template also provides abstract stubs for the protected virtual functions.

6.13.2 Member Typedef Documentation

char_type

```
template<typename _CharT>
typedef _CharT std::__ctype_abstract_base< _CharT >::char_type
```

Typedef for the template parameter.

6.13.3 Member Function Documentation

do_is() [1/2]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_is (
            const char_type * __lo,
            const char_type * __hi,
            mask * __vec) const  [protected], [pure virtual]
```

Return a mask array.
This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.
do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

Implemented in std::ctype< _CharT >, and std::mask< _CharT >.

do_is() [2/2]

```
template<typename _CharT>
virtual bool std::__ctype_abstract_base< _CharT >::do_is (
            mask __m,
            char_type __c) const  [protected], [pure virtual]
```

Test char_type classification.
This function finds a mask M for *c* and compares it to mask *m*.
do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

__c	The char_type to find the mask of.
__m	The mask to compare against.

Returns

(M & __m) != 0.

Implemented in std::ctype< _CharT >, std::ctype< wchar_t >, and std::mask< _CharT >.
Referenced by std::mask< _CharT >::is(), and std::mask< _CharT >::is().

do_narrow() [1/2]

```
template<typename _CharT>
virtual char std::__ctype_abstract_base< _CharT >::do_narrow (
            char_type __c,
            char __dfault) const  [protected], [pure virtual]
```

Narrow char_type to char.
This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead.
do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char_type to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

Implemented in std::ctype< _CharT >, std::ctype< wchar_t >, and std::mask< _CharT >.
Referenced by std::mask< _CharT >::narrow(), and std::mask< _CharT >::narrow().

do_narrow() [2/2]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_narrow (
            const char_type * __lo,
            const char_type * __hi,
            char __dfault,
            char * __to) const  [protected], [pure virtual]
```

Narrow char_type array to char.
This virtual function converts each char_type in the range [__lo,__hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, *__dfault* is used instead.
do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

Implemented in std::ctype< _CharT >, and std::mask< _CharT >.

do_scan_is()

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_scan_is (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [protected], [pure virtual]
```

Find char_type matching mask.
This function searches for and returns the first char_type c in [__lo,__hi) for which is(__m,c) is true.
do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

Pointer to a matching char_type if found, else *__hi*.

Implemented in std::ctype< _CharT >, std::ctype< wchar_t >, and std::mask< _CharT >.
Referenced by std::mask< _CharT >::scan_is().

do_scan_not()

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_scan_not (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [protected], [pure virtual]
```

Find char_type not matching mask.
This function searches for and returns a pointer to the first char_type c of [lo,hi) for which is(m,c) is false.
do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

__m	The mask to compare against.
__lo	Pointer to start of range.

_↩ _hi	Pointer to end of range.

Returns

Pointer to a non-matching char_type if found, else __hi.

Implemented in std::ctype< _CharT >, std::ctype< wchar_t >, and std::mask< _CharT >.
Referenced by std::mask< _CharT >::scan_not().

do_tolower() [1/2]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_tolower (
            char_type * __lo,
            const char_type * __hi) const  [protected], [pure virtual]
```

Convert array to lowercase.
This virtual function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched.
do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

Implemented in std::ctype< _CharT >, and std::mask< _CharT >.

do_tolower() [2/2]

```
template<typename _CharT>
virtual char_type std::__ctype_abstract_base< _CharT >::do_tolower (
            char_type __c) const  [protected], [pure virtual]
```

Convert to lowercase.
This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.
do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

_↩ _c	The char_type to convert.

Returns

The lowercase char_type if convertible, else __c.

Implemented in std::ctype< _CharT >, std::ctype< wchar_t >, and std::mask< _CharT >.
Referenced by std::mask< _CharT >::tolower(), and std::mask< _CharT >::tolower().

do_toupper() [1/2]

```
template<typename _CharT>
virtual const char_type * std::__ctype_abstract_base< _CharT >::do_toupper (
            char_type * __lo,
            const char_type * __hi) const  [protected], [pure virtual]
```

Convert array to uppercase.
This virtual function converts each char_type in the range [__lo,__hi) to uppercase if possible. Other elements remain untouched.
do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.

Returns

__hi.

Implemented in std::ctype< _CharT >, and std::mask< _CharT >.

do_toupper() [2/2]

```
template<typename _CharT>
virtual char_type std::__ctype_abstract_base< _CharT >::do_toupper (
            char_type __c) const  [protected], [pure virtual]
```

Convert to uppercase.
This virtual function converts the char_type argument to uppercase if possible. If not possible (for example, '2'), returns the argument.
do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

__c	The char_type to convert.

Returns

The uppercase char_type if convertible, else __c.

Implemented in std::ctype< _CharT >, std::ctype< wchar_t >, and std::mask< _CharT >.
Referenced by std::mask< _CharT >::toupper(), and std::mask< _CharT >::toupper().

do_widen() [1/2]

```
template<typename _CharT>
virtual char_type std::__ctype_abstract_base< _CharT >::do_widen (
            char __c) const  [protected], [pure virtual]
```

Widen char.
This virtual function converts the char to char_type using the simplest reasonable transformation.
do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _c	The char to convert.

Returns

The converted char_type

Implemented in std::ctype< _CharT >, std::ctype< char >, std::ctype< wchar_t >, and std::mask< _CharT >.
Referenced by std::mask< _CharT >::widen(), and std::mask< _CharT >::widen().

do_widen() [2/2]

```
template<typename _CharT>
virtual const char * std::__ctype_abstract_base< _CharT >::do_widen (
            const char * __lo,
            const char * __hi,
            char_type * __to) const  [protected], [pure virtual]
```

Widen char array.
This function converts each char in the input to char_type using the simplest reasonable transformation.
do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _lo	Pointer to start range.
_↩ _hi	Pointer to end of range.
_↩ _to	Pointer to the destination array.

Returns

__hi.

Implemented in std::ctype< _CharT >, and std::mask< _CharT >.

is() [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::is (
```

```
            const char_type * __lo,
            const char_type * __hi,
            mask * __vec) const  [inline]
```

Return a mask array.
This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char_type>::do_is().

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__vec	Pointer to an array of mask storage.

Returns

__hi.

is() [2/2]

```
template<typename _CharT>
bool std::__ctype_abstract_base< _CharT >::is (
            mask __m,
            char_type __c) const  [inline]
```

Test char_type classification.
This function finds a mask M for *__c* and compares it to mask *__m*. It does so by returning the value of ctype<char_↩ type>::do_is().

Parameters

_↩ _c	The char_type to compare the mask of.
_↩ _m	The mask to compare against.

Returns

(M & __m) != 0.

Referenced by std::time_get< _CharT, _InIter >::get().

narrow() [1/2]

```
template<typename _CharT>
char std::__ctype_abstract_base< _CharT >::narrow (
            char_type __c,
            char __dfault) const  [inline]
```

Narrow char_type to char.
This function converts the char_type to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. It does so by returning ctype<char_type>::do_narrow(__c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char_type to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

Referenced by std::time_get< _CharT, _InIter >::do_get_year(), std::time_get< _CharT, _InIter >::get(), and std::time_put< _CharT, _OutIter >::put().

narrow() [2/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::narrow (
            const char_type * __lo,
            const char_type * __hi,
            char __dfault,
            char * __to) const  [inline]
```

Narrow array to char array.
This function converts each char_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char_type in the input that cannot be converted, *dfault* is used instead. It does so by returning ctype<char_type>::do_narrow(__lo, __hi, __dfault, __to).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

scan_is()

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_is (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [inline]
```

Find char_type matching a mask.
This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char_type>::do_scan_is().

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to matching char_type if found, else __*hi*.

scan_not()

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::scan_not (
            mask __m,
            const char_type * __lo,
            const char_type * __hi) const  [inline]
```

Find char_type not matching a mask.

This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char_type>::do_scan_not().

Parameters

_↩ _m	The mask to compare against.
_↩ _lo	Pointer to first char in range.
_↩ _hi	Pointer to end of range.

Returns

Pointer to non-matching char if found, else __*hi*.

tolower() [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::tolower (
            char_type * __lo,
            const char_type * __hi) const  [inline]
```

Convert array to lowercase.

This function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_tolower(__lo, __hi).

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

tolower() [2/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::tolower (
            char_type __c) const  [inline]
```

Convert to lowercase.
This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_tolower(c).

Parameters

_↩ _c	The char_type to convert.

Returns

The lowercase char_type if convertible, else *__c*.

Referenced by std::time_get< _CharT, _InIter >::get().

toupper() [1/2]

```
template<typename _CharT>
const char_type * std::__ctype_abstract_base< _CharT >::toupper (
            char_type * __lo,
            const char_type * __hi) const  [inline]
```

Convert array to uppercase.
This function converts each char_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>:: do_toupper(lo, hi).

Parameters

_↩ _lo	Pointer to start of range.
_↩ _hi	Pointer to end of range.

Returns

__hi.

toupper() [2/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::toupper (
            char_type __c) const  [inline]
```

Convert to uppercase.
This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_toupper().

Parameters

_↩ _c	The char_type to convert.

Returns

The uppercase char_type if convertible, else __c.

Referenced by std::time_get< _CharT, _InIter >::get().

widen() [1/2]

```
template<typename _CharT>
char_type std::__ctype_abstract_base< _CharT >::widen (
            char __c) const  [inline]
```

Widen char to char_type.
This function converts the char argument to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

_↩ _c	The char to convert.

Returns

The converted char_type.

Referenced by std::money_get< _CharT, _InIter >::do_get(), std::time_get< _CharT, _InIter >::do_get(), std::money_put< _CharT, _Out and std::time_put< _CharT, _OutIter >::do_put().

widen() [2/2]

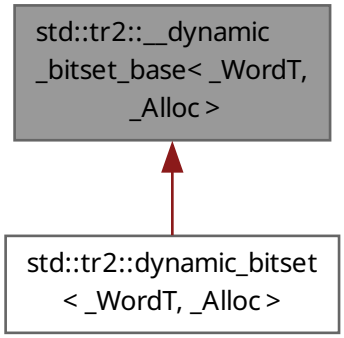
```
template<typename _CharT>
const char * std::__ctype_abstract_base< _CharT >::widen (
            const char * __lo,
            const char * __hi,
            char_type * __to) const  [inline]
```

Widen array to char_type.
This function converts each char in the input to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).
Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__to	Pointer to the destination array.

Returns



__hi.

6.14.1 Detailed Description

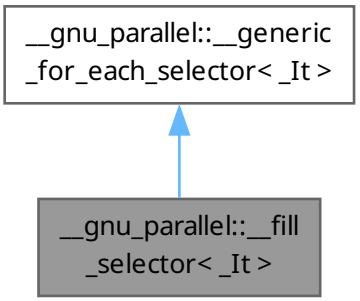
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
struct std::tr2::__dynamic_bitset_base< _WordT, _Alloc >

Base class, general case.
See documentation for dynamic_bitset.

6.14.2 Member Data Documentation

_M_w

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::vector<block_type, allocator_type> std::tr2::__dynamic_bitset_base< _WordT, _Alloc >::_M_w
```



0 is the least significant word.
The documentation for this struct was generated from the following files:

- dynamic_bitset
- dynamic_bitset.tcc

6.15 __gnu_parallel::__fill_selector< _It > Struct Template Reference

```
#include <for_each_selectors.h>
```

Inheritance diagram for __gnu_parallel::__fill_selector< _It >:

Public Member Functions

- template<typename _ValueType>
  bool operator() (_ValueType &__v, _It __i)

Public Attributes

- _It _M_finish_iterator

6.15.1 Detailed Description

template<typename _It>
struct __gnu_parallel::__fill_selector< _It >

std::fill() selector.

6.15.2 Member Function Documentation

operator()()

```
template<typename _It>
template<typename _ValueType>
bool __gnu_parallel::__fill_selector< _It >::operator() (
            _ValueType & __v,
            _It __i)  [inline]
```

Functor execution.

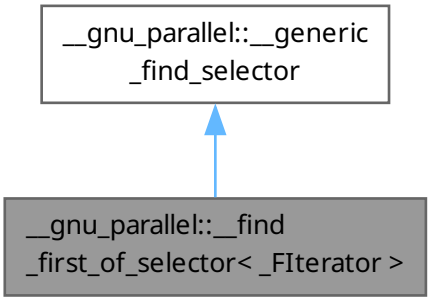
Parameters

_↩ _v	Current value.
_↩ _i	iterator referencing object.

6.15.3 Member Data Documentation

_M_finish_iterator

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator  [inherited]
```



_Iterator on last element processed; needed for some algorithms (e. g. std::transform()).
The documentation for this struct was generated from the following file:

- for_each_selectors.h

6.16 __gnu_parallel::__find_first_of_selector< _FIterator > Struct Template Reference

```
#include <find_selectors.h>
```

Inheritance diagram for __gnu_parallel::__find_first_of_selector< _FIterator >:

Public Member Functions

Public Attributes

- _FIterator **_M_begin**
- _FIterator **_M_end**

6.16.1 Detailed Description

template<typename _FIterator>
struct __gnu_parallel::__find_first_of_selector< _FIterator >

Test predicate on several elements.

6.16.2 Member Function Documentation

_M_sequential_algorithm()

```
template<typename _FIterator>
template<typename _RAIter1, typename _RAIter2, typename _Pred>
std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__find_first_of_selector< _FIterator >::_M_↩
sequential_algorithm (
            _RAIter1 __begin1,
            _RAIter1 __end1,
            _RAIter2 __begin2,
            _Pred __pred)  [inline]
```

Corresponding sequential algorithm on a sequence.

Parameters

__begin1	Begin iterator of first sequence.
__end1	End iterator of first sequence.
__begin2	Begin iterator of second sequence.
__pred	Find predicate.

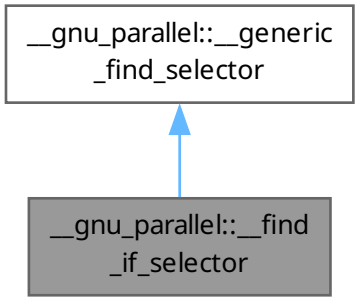
References std::make_pair().

operator()()

```
template<typename _FIterator>
template<typename _RAIter1, typename _RAIter2, typename _Pred>
bool __gnu_parallel::__find_first_of_selector< _FIterator >::operator() (
            _RAIter1 __i1,
            _RAIter2 __i2,
            _Pred __pred)  [inline]
```

Test on one position.

Parameters



__i1	_Iterator on first sequence.
__i2	_Iterator on second sequence (unused).
__pred	Find predicate.

The documentation for this struct was generated from the following file:

- find_selectors.h

6.17 __gnu_parallel::__find_if_selector Struct Reference

`#include <find_selectors.h>`
Inheritance diagram for __gnu_parallel::__find_if_selector:

Public Member Functions

- template<typename _RAIter1, typename _RAIter2, typename _Pred>
  std::pair< _RAIter1, _RAIter2 > _M_sequential_algorithm (_RAIter1 __begin1, _RAIter1 __end1, _RAIter2 __↩
  begin2, _Pred __pred)
- template<typename _RAIter1, typename _RAIter2, typename _Pred>
  bool operator() (_RAIter1 __i1, _RAIter2 __i2, _Pred __pred)

6.17.1 Detailed Description

Test predicate on a single element, used for std::find() and std::find_if ().

6.17.2 Member Function Documentation

_M_sequential_algorithm()

```
template<typename _RAIter1, typename _RAIter2, typename _Pred>
std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__find_if_selector::_M_sequential_algorithm (
            _RAIter1 __begin1,
            _RAIter1 __end1,
```

```
            _RAIter2 __begin2,
            _Pred __pred)  [inline]
```

Corresponding sequential algorithm on a sequence.

Parameters

__begin1	Begin iterator of first sequence.
__end1	End iterator of first sequence.
__begin2	Begin iterator of second sequence.
__pred	Find predicate.

References std::make_pair().

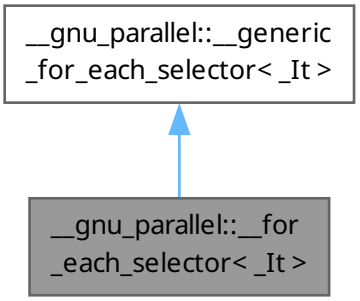
operator()()

```
template<typename _RAIter1, typename _RAIter2, typename _Pred>
bool __gnu_parallel::__find_if_selector::operator() (
            _RAIter1 __i1,
            _RAIter2 __i2,
            _Pred __pred)  [inline]
```

Test on one position.

Parameters

__i1	_Iterator on first sequence.
__i2	_Iterator on second sequence (unused).
__pred	Find predicate.



The documentation for this struct was generated from the following file:

  bool operator() (_Op &__o, _It __i)

Public Attributes

- _It _M_finish_iterator

6.18.1 Detailed Description

template<typename _It>
struct __gnu_parallel::__for_each_selector< _It >

std::for_each() selector.

6.18.2 Member Function Documentation

operator()()

```
template<typename _It>
template<typename _Op>
bool __gnu_parallel::__for_each_selector< _It >::operator() (
            _Op & __o,
            _It __i)  [inline]
```

Functor execution.

Parameters

_↩ _o	Operator.

_↩ _i	iterator referencing object.

6.18.3 Member Data Documentation

_M_finish_iterator

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator  [inherited]
```

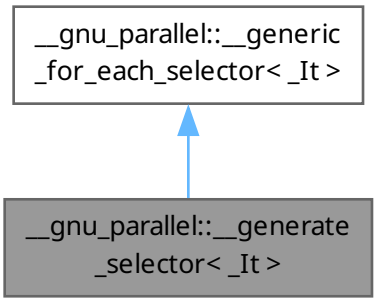
_Iterator on last element processed; needed for some algorithms (e. g. std::transform()).
The documentation for this struct was generated from the following file:

- for_each_selectors.h

6.19 __cxxabiv1::__forced_unwind Class Reference

```
#include <cxxabi_forced.h>
```

6.19.1 Detailed Description



Thrown as part of forced unwinding.
A magic placeholder class that can be caught by reference to recognize forced unwinding.
The documentation for this class was generated from the following file:

- cxxabi_forced.h

6.20 __gnu_parallel::__generate_selector< _It > Struct Template Reference

```

6.23 __gnu_parallel::__identity_selector< _It > Struct Template Reference

`#include <for_each_selectors.h>`
Inheritance diagram for __gnu_parallel::__identity_selector< _It >:

Public Member Functions

- template<typename _Op>
  _It operator() (_Op __o, _It __i)

Public Attributes

- _It _M_finish_iterator

6.23.1 Detailed Description

template<typename _It>
struct __gnu_parallel::__identity_selector< _It >

Selector that just returns the passed iterator.

6.23.2 Member Function Documentation

operator()()

```
template<typename _It>
template<typename _Op>
_It __gnu_parallel::__identity_selector< _It >::operator() (
            _Op __o,
            _It __i)  [inline]
```

Functor execution.

Parameters

_↩ _o	Operator (unused).
_↩ _i	iterator referencing object.

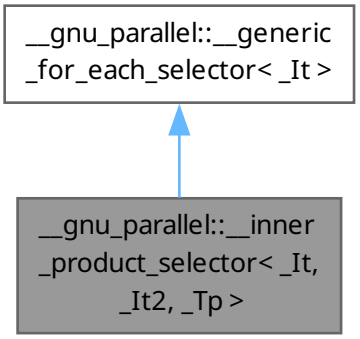
Returns

Passed iterator.

6.23.3 Member Data Documentation

_M_finish_iterator

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator  [inherited]
```



_Iterator on last element processed; needed for some algorithms (e. g. std::transform()).
The documentation for this struct was generated from the following file:

- for_each_selectors.h

6.24 __gnu_parallel::__inner_product_selector< _It, _It2, _Tp > Struct Template Reference

```
#include <for_each_selectors.h>
```

Inheritance diagram for __gnu_parallel::__inner_product_selector< _It, _It2, _Tp >:

Public Member Functions

- __inner_product_selector (_It __b1, _It2 __b2)
- template<typename _Op>
  _Tp operator() (_Op __mult, _It __current)

Public Attributes

- _It __begin1_iterator
- _It2 __begin2_iterator
- _It _M_finish_iterator

6.24.1 Detailed Description

template<typename _It, typename _It2, typename _Tp>
struct __gnu_parallel::__inner_product_selector< _It, _It2, _Tp >

std::inner_product() selector.

6.24.2 Constructor & Destructor Documentation

__inner_product_selector()

```
template<typename _It, typename _It2, typename _Tp>
__gnu_parallel::__inner_product_selector< _It, _It2, _Tp >::__inner_product_selector (
            _It __b1,
            _It2 __b2)  [inline], [explicit]
```

Constructor.

Parameters

__b1	Begin iterator of first sequence.
__b2	Begin iterator of second sequence.

References __begin1_iterator, and __begin2_iterator.

6.24.3 Member Function Documentation

operator()()

```
template<typename _It, typename _It2, typename _Tp>
template<typename _Op>
_Tp __gnu_parallel::__inner_product_selector< _It, _It2, _Tp >::operator() (
            _Op __mult,
            _It __current)  [inline]
```

Functor execution.

Parameters

__mult	Multiplication functor.
__current	iterator referencing object.

Returns

Inner product elemental __result.

References __begin1_iterator, and __begin2_iterator.

6.24.4 Member Data Documentation

__begin1_iterator

```
template<typename _It, typename _It2, typename _Tp>
_It __gnu_parallel::__inner_product_selector< _It, _It2, _Tp >::__begin1_iterator
```

Begin iterator of first sequence.
Referenced by __inner_product_selector(), and operator()().

__begin2_iterator

```
template<typename _It, typename _It2, typename _Tp>
_It2 __gnu_parallel::__inner_product_selector< _It, _It2, _Tp >::__begin2_iterator
```

Begin iterator of second sequence.
Referenced by __inner_product_selector(), and operator()().

_M_finish_iterator

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator  [inherited]
```

_Iterator on last element processed; needed for some algorithms (e. g. std::transform()).
The documentation for this struct was generated from the following file:

- for_each_selectors.h

6.25 std::__is_fast_hash< _Hash > Struct Template Reference

```
#include <functional_hash.h>
```

6.25.1 Detailed Description

template<typename _Hash>
struct std::__is_fast_hash< _Hash >

Hint about performance of hash functions.
If a given hash function object is not fast, the hash-based containers will cache the hash code. The default behavior is to consider that hashers are fast unless specified otherwise.
Users can specialize this for their own hash functions in order to force caching of hash codes in unordered containers. Specializing this trait affects the ABI of the unordered containers, so use it carefully.
The documentation for this struct was generated from the following file:

- functional_hash.h

6.26 std::__is_location_invariant< _Tp > Struct Template Reference

`#include <std_function.h>`

6.26.1 Detailed Description

template<typename _Tp>
struct std::__is_location_invariant< _Tp >

Trait identifying "location-invariant" types, meaning that the address of the object (or any of its members) will not escape. Trivially copyable types are location-invariant and users can specialize this trait for other types.
The documentation for this struct was generated from the following file:

- std_function.h

6.27 __gnu_parallel::__max_element_reduct< _Compare, _It > Struct Template Reference

`#include <for_each_selectors.h>`

Public Member Functions

- **__max_element_reduct** (_Compare &__c)
- _It **operator()** (_It __x, _It __y)

Public Attributes

- _Compare & **__comp**

6.27.1 Detailed Description

template<typename _Compare, typename _It>
struct __gnu_parallel::__max_element_reduct< _Compare, _It >

Reduction for finding the maximum element, using a comparator.
The documentation for this struct was generated from the following file:

- for_each_selectors.h

6.28 __gnu_parallel::__min_element_reduct< _Compare, _It > Struct Template Reference

`#include <for_each_selectors.h>`

- _It **operator()** (_It __x, _It __y)

Public Attributes

- _Compare & **__comp**

6.28.1 Detailed Description

template<typename _Compare, typename _It>
struct __gnu_parallel::__min_element_reduct< _Compare, _It >

Reduction for finding the maximum element, using a comparator.
The documentation for this struct was generated from the following file:

- for_each_selectors.h

6.29 __gnu_cxx::__detail::__mini_vector< _Tp > Class Template Reference

`#include <bitmap_allocator.h>`

Public Types

- typedef const _Tp & **const_reference**
- typedef std::ptrdiff_t **difference_type**
- typedef pointer **iterator**
- typedef _Tp * **pointer**
- typedef _Tp & **reference**
- typedef std::size_t **size_type**
- typedef _Tp **value_type**

Public Member Functions

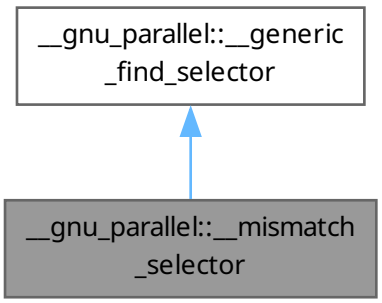
- reference **back** () const throw ()
- iterator **begin** () const throw ()
- void **clear** () throw ()
- iterator **end** () const throw ()
- void **erase** (iterator __pos) throw ()
- void **insert** (iterator __pos, const_reference __x)
- reference **operator[ ]** (const size_type __pos) const throw ()
- void **pop_back** () throw ()
- void **push_back** (const_reference __x)
- size_type **size** () const throw ()

6.29.1 Detailed Description

template<typename _Tp>
class __gnu_cxx::__detail::__mini_vector< _Tp >

__mini_vector<> is a stripped down version of the full-fledged std::vector<>.
It is to be used only for built-in types or PODs. Notable differences are:

1. Not all accessor functions are present.



2. Used ONLY for PODs.
3. No Allocator template argument. Uses operator new() to get memory, and operator delete() to free it. Caveat: The dtor does NOT free the memory allocated, so this a memory-leaking vector!

The documentation for this class was generated from the following file:

- bitmap_allocator.h

6.30 __gnu_parallel::__mismatch_selector Struct Reference

`#include <find_selectors.h>`
Inheritance diagram for __gnu_parallel::__mismatch_selector:

Public Member Functions

- template<typename _RAIter1, typename _RAIter2, typename _Pred>
  std::pair< _RAIter1, _RAIter2 > _M_sequential_algorithm (_RAIter1 __begin1, _RAIter1 __end1, _RAIter2 __begin2, _Pred __pred)
- template<typename _RAIter1, typename _RAIter2, typename _Pred>
  bool operator() (_RAIter1 __i1, _RAIter2 __i2, _Pred __pred)

6.30.1 Detailed Description

Test inverted predicate on a single element.

6.30.2 Member Function Documentation

_M_sequential_algorithm()

```
template<typename _RAIter1, typename _RAIter2, typename _Pred>
std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__mismatch_selector::_M_sequential_algorithm (
            _RAIter1 __begin1,
            _RAIter1 __end1,
            _RAIter2 __begin2,
            _Pred __pred)  [inline]
```

Corresponding sequential algorithm on a sequence.

Parameters

__begin1	Begin iterator of first sequence.
__end1	End iterator of first sequence.
__begin2	Begin iterator of second sequence.
__pred	Find predicate.

operator()()

```
template<typename _RAIter1, typename _RAIter2, typename _Pred>
bool __gnu_parallel::__mismatch_selector::operator() (
             _RAIter1 __i1,
             _RAIter2 __i2,
             _Pred __pred)  [inline]
```

Test on one position.

Parameters

__i1	_Iterator on first sequence.
__i2	_Iterator on second sequence (unused).
__pred	Find predicate.

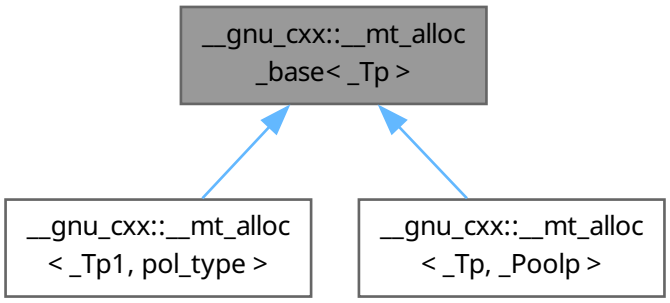
6.31.1 Detailed Description

template<typename _Tp, typename _Poolp = __common_pool_policy<__pool, true >>
class __gnu_cxx::__mt_alloc< _Tp, _Poolp >



This is a fixed size (power of 2) allocator which - when compiled with thread support - will maintain one freelist per size per thread plus a *global* one. Steps are taken to limit the per thread freelist sizes (by returning excess back to the *global* list).
Further details: https://gcc.gnu.org/onlinedocs/libstdc++/manual/mt_allocator.html
The documentation for this class was generated from the following file:

Friends

- template<typename _Up>
  constexpr bool **operator==** (const __new_allocator &, const __new_allocator< _Up > &) noexcept

6.39.1 Detailed Description

template<typename _Tp>
class std::__new_allocator< _Tp >

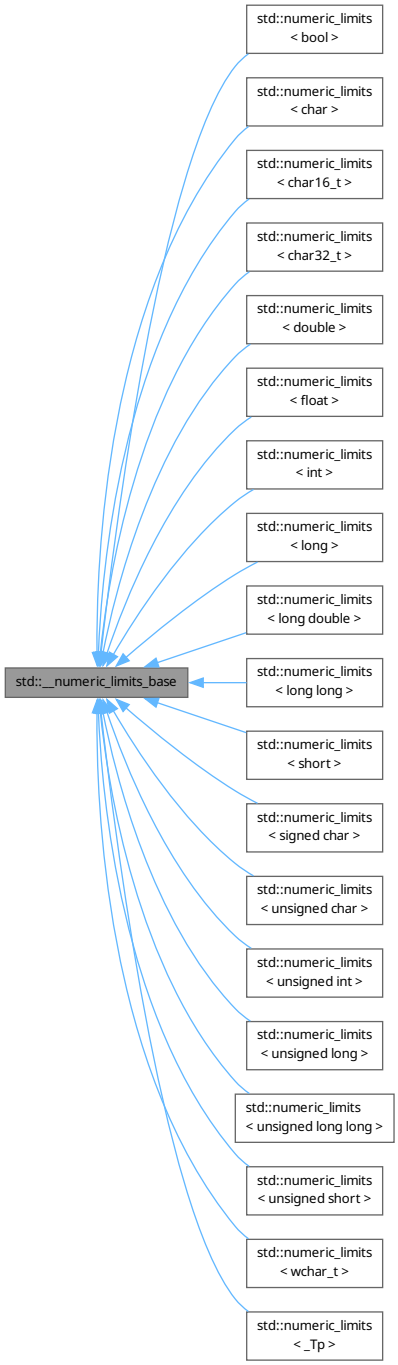
An allocator that uses global `new`, as per C++03 [20.4.1].
This is precisely the allocator defined in the C++ Standard.

- all allocation calls `operator new`
- all deallocation calls `operator delete`

This is the default base-class implementation of `std::allocator`, and is also the base-class of the `__gnu_cxx::new_allocator` extension. You should use either `std::allocator` or `__gnu_cxx::new_allocator` instead of using this directly.

Template Parameters

_Tp	Type of allocated object.



The documentation for this class was generated from the following file:

- bits/new_allocator.h

6.40 std::__numeric_limits_base Struct Reference

`#include <limits>`

Inheritance diagram for std::__numeric_limits_base:

- static constexpr int min_exponent10
- static constexpr int radix
- static constexpr float_round_style round_style
- static constexpr bool tinyness_before
- static constexpr bool traps

6.40.1 Detailed Description

Part of std::numeric_limits.
The `static const` members are usable as integral constant expressions.

Note

This is a separate class for purposes of efficiency; you should only access these members as part of an instantiation of the std::numeric_limits class.

6.40.2 Member Data Documentation

digits

`int std::__numeric_limits_base::digits [static], [constexpr]`
The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.
Referenced by std::generate_canonical(), std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::operator()(), and std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed().

digits10

`int std::__numeric_limits_base::digits10 [static], [constexpr]`
The number of base 10 digits that can be represented without change.

has_denorm

`float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr]`
See std::float_denorm_style for more information.

has_denorm_loss

`bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr]`
True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

has_infinity

`bool std::__numeric_limits_base::has_infinity [static], [constexpr]`
True if the type has a representation for positive infinity.

has_quiet_NaN

`bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr]`
True if the type has a representation for a quiet (non-signaling) Not a Number.

has_signaling_NaN

`bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr]`
True if the type has a representation for a signaling Not a Number.

is_bounded

`bool std::__numeric_limits_base::is_bounded [static], [constexpr]`
True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

is_exact

`bool std::__numeric_limits_base::is_exact [static], [constexpr]`
True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

is_iec559

`bool std::__numeric_limits_base::is_iec559 [static], [constexpr]`
True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

is_integer

`bool std::__numeric_limits_base::is_integer [static], [constexpr]`
True if the type is integer.

is_modulo

`bool std::__numeric_limits_base::is_modulo [static], [constexpr]`
True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or $*$ on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

is_signed

`bool std::__numeric_limits_base::is_signed [static], [constexpr]`
True if the type is signed.

is_specialized

`bool std::__numeric_limits_base::is_specialized [static], [constexpr]`
This will be true for all fundamental types (which have specializations), and false for everything else.

max_digits10

`int std::__numeric_limits_base::max_digits10 [static], [constexpr]`
The number of base 10 digits required to ensure that values which differ are always differentiated.

max_exponent

`int std::__numeric_limits_base::max_exponent [static], [constexpr]`
The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

max_exponent10

`int std::__numeric_limits_base::max_exponent10 [static], [constexpr]`
The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

min_exponent

`int std::__numeric_limits_base::min_exponent [static], [constexpr]`
The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

min_exponent10

`int std::__numeric_limits_base::min_exponent10 [static], [constexpr]`
The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

radix

`int std::__numeric_limits_base::radix [static], [constexpr]`
For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.
Referenced by std::generate_canonical().

round_style

`float_round_style std::__numeric_limits_base::round_style [static], [constexpr]`
See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

tinyness_before

`bool std::__numeric_limits_base::tinyness_before [static], [constexpr]`
True if tininess is detected before rounding. (see IEC 559)

traps

`bool std::__numeric_limits_base::traps [static], [constexpr]`
True if trapping is implemented for this type.

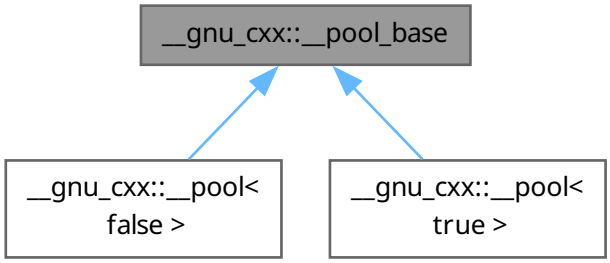
- static char * **_S_start_free**

6.46.1 Detailed Description

Base class for __pool_alloc.
Uses various allocators to fulfill underlying requests (and makes as few requests as possible when in default high-speed pool mode).
Important implementation properties:

1. If globally mandated, then allocate objects from new
2. If the clients request an object of size > _S_max_bytes, the resulting object will be obtained directly from new
3. In all other cases, we allocate an object of size exactly _S_round_up(requested_size). Thus the client has enough size information that we can return the object to the proper free list without permanently losing part of the object.



The documentation for this class was generated from the following file:

- pool_allocator.h

6.48.1 Detailed Description

template<typename _CharT, typename _Traits, typename _Alloc>
class __gnu_cxx::__rc_string_base< _CharT, _Traits, _Alloc >

Documentation? What's that? Nathan Myers ncm@cantrip.org.
A string looks like this:

```
                                    [_Rep]
                                    _M_length
[__rc_string_base<char_type>]       _M_capacity
_M_dataplus                         _M_refcount
_M_p ---------------->              unnamed array of char_type
```

Where the _M_p points to the first character in the string, and you cast it to a pointer-to-_Rep and subtract 1 to get a pointer to the header.
This approach has the enormous advantage that a string object requires only one allocation. All the ugliness is confined within a single pair of inline functions, which each compile to a single *add* instruction: _Rep::_M_refdata(), and __rc_↩ string_base::_M_rep(); and the allocation function which gets a block of raw bytes and with room enough and constructs a _Rep object at the front.
The reason you want _M_data pointing to the character array and not the _Rep is so that the debugger can see the string contents. (Probably we should add a non-inline member to get the _Rep for the debugger to use, so users can check the actual string length.)
Note that the _Rep object is a POD so that you can have a static *empty string* _Rep object already *constructed* before static constructors have run. The reference-count encoding is chosen so that a 0 indicates one reference, so you never try to destroy the empty-string _Rep object.
All but the last paragraph is considered pretty conventional for a C++ string implementation.
The documentation for this class was generated from the following file:

- rc_string_base.h

6.49 std::tr2::__reflection_typelist< _Elements > Struct Template Reference

6.49.1 Detailed Description

template<typename... _Elements>
struct std::tr2::__reflection_typelist< _Elements >

See N2965: Type traits and base classes by Michael Spertus Simple typelist. Compile-time list of types.
The documentation for this struct was generated from the following file:

- tr2/type_traits

6.50 std::tr2::__reflection_typelist< _First, _Rest... > Struct Template Reference

`#include <type_traits>`

Public Types

- typedef std::false_type **empty**

6.50.1 Detailed Description

template<typename _First, typename... _Rest>
struct std::tr2::__reflection_typelist< _First, _Rest... >

Partial specialization.
The documentation for this struct was generated from the following file:

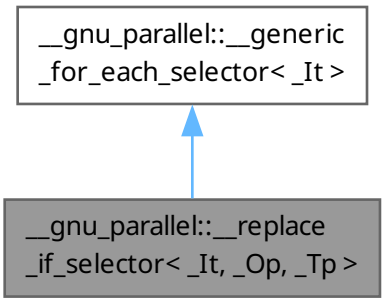
- tr2/type_traits

6.51 std::tr2::__reflection_typelist<> Struct Reference

`#include <type_traits>`

Public Types

- typedef std::true_type **empty**



6.51.1 Detailed Description

Specialization for an empty typelist.
The documentation for this struct was generated from the following file:

- tr2/type_traits

6.52 __gnu_parallel::__replace_if_selector< _It, _Op, _Tp > Struct Template Reference

`#include <for_each_selectors.h>`
Inheritance diagram for __gnu_parallel::__replace_if_selector< _It, _Op, _Tp >:

Public Member Functions

- __replace_if_selector (const _Tp &__new_val)
- bool operator() (_Op &__o, _It __i)

Public Attributes

- const _Tp & __new_val
- _It _M_finish_iterator

6.52.1 Detailed Description

template<typename _It, typename _Op, typename _Tp>
struct __gnu_parallel::__replace_if_selector< _It, _Op, _Tp >

std::replace() selector.

6.52.2 Constructor & Destructor Documentation

__replace_if_selector()

```
template<typename _It, typename _Op, typename _Tp>
__gnu_parallel::__replace_if_selector< _It, _Op, _Tp >::__replace_if_selector (
            const _Tp & __new_val)  [inline], [explicit]
```

Constructor.

Parameters

__new_val	Value to replace with.

References __new_val.

6.52.3 Member Function Documentation

operator()()

```
template<typename _It, typename _Op, typename _Tp>
bool __gnu_parallel::__replace_if_selector< _It, _Op, _Tp >::operator() (
            _Op & __o,
            _It __i)  [inline]
```

Functor execution.

Parameters

_o	Operator.
_i	iterator referencing object.

References __new_val.

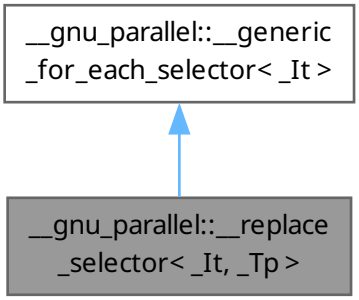
6.52.4 Member Data Documentation

__new_val

```
template<typename _It, typename _Op, typename _Tp>
const _Tp& __gnu_parallel::__replace_if_selector< _It, _Op, _Tp >::__new_val
```

Value to replace with.
Referenced by __replace_if_selector(), and operator()().

_M_finish_iterator



```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator  [inherited]
```

_Iterator on last element processed; needed for some algorithms (e. g. std::transform()).
The documentation for this struct was generated from the following file:

- for_each_selectors.h

6.53 __gnu_parallel::__replace_selector< _It, _Tp > Struct Template Reference

- _It _M_finish_iterator

6.53.1 Detailed Description

template<typename _It, typename _Tp>
struct __gnu_parallel::__replace_selector< _It, _Tp >

std::replace() selector.

6.53.2 Constructor & Destructor Documentation

__replace_selector()

```
template<typename _It, typename _Tp>
__gnu_parallel::__replace_selector< _It, _Tp >::__replace_selector (
            const _Tp & __new_val)  [inline], [explicit]
```

Constructor.

Parameters

__new_val	Value to replace with.

References __new_val.

6.53.3 Member Function Documentation

operator()()

```
template<typename _It, typename _Tp>
bool __gnu_parallel::__replace_selector< _It, _Tp >::operator() (
            _Tp & __v,
            _It __i)  [inline]
```

Functor execution.

Parameters

_↩ _v	Current value.
_↩ _i	iterator referencing object.

References __new_val.

6.53.4 Member Data Documentation

__new_val

```
template<typename _It, typename _Tp>
const _Tp& __gnu_parallel::__replace_selector< _It, _Tp >::__new_val
```

Value to replace with.
Referenced by __replace_selector(), and operator()().

_M_finish_iterator

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator  [inherited]
```

_Iterator on last element processed; needed for some algorithms (e. g. std::transform()).
The documentation for this struct was generated from the following file:

6.54 __gnu_cxx::__scoped_lock Class Reference

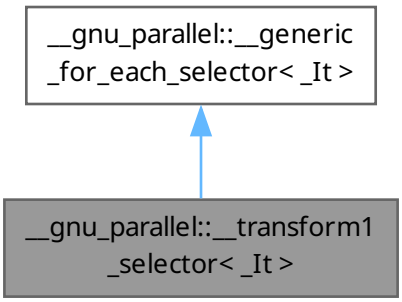
```
#include <concurrence.h>
```

Public Types

- typedef __mutex **__mutex_type**

Public Member Functions

- **__scoped_lock** (__mutex_type &__name)



6.54.1 Detailed Description

Scoped lock idiom.
The documentation for this class was generated from the following file:

- concurrence.h

6.55 __gnu_parallel::__transform1_selector< _It > Struct Template Reference

`#include <for_each_selectors.h>`
Inheritance diagram for __gnu_parallel::__transform1_selector< _It >:

Public Member Functions

- template<typename _Op>
  bool operator() (_Op &__o, _It __i)

Public Attributes

- _It _M_finish_iterator

6.55.1 Detailed Description

template<typename _It>
struct __gnu_parallel::__transform1_selector< _It >

std::transform() __selector, one input sequence variant.

6.55.2 Member Function Documentation

operator()()

```
template<typename _It>
template<typename _Op>
bool __gnu_parallel::__transform1_selector< _It >::operator() (
            _Op & __o,
            _It __i)  [inline]
```

Functor execution.

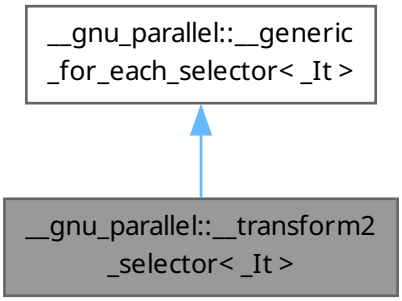
Parameters

_↩ _o	Operator.
_↩ _i	iterator referencing object.

6.55.3 Member Data Documentation

_M_finish_iterator

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator  [inherited]
```



_Iterator on last element processed; needed for some algorithms (e. g. std::transform()).
The documentation for this struct was generated from the following file:

- for_each_selectors.h

6.56 __gnu_parallel::__transform2_selector< _It > Struct Template Reference

```
#include <for_each_selectors.h>
```

Inheritance diagram for __gnu_parallel::__transform2_selector< _It >:

Public Member Functions

- template<typename _Op>
  bool operator() (_Op &__o, _It __i)

Public Attributes

- _It _M_finish_iterator

6.56.1 Detailed Description

template<typename _It>
struct __gnu_parallel::__transform2_selector< _It >

std::transform() __selector, two input sequences variant.

6.56.2 Member Function Documentation

operator()()

```
template<typename _It>
template<typename _Op>
bool __gnu_parallel::__transform2_selector< _It >::operator() (
            _Op & __o,
            _It __i)  [inline]
```

Functor execution.

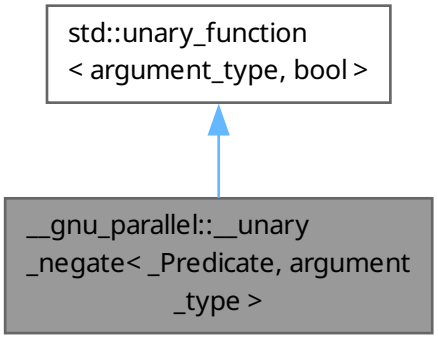
Parameters

_↩ _o	Operator.
_↩ _i	iterator referencing object.

6.56.3 Member Data Documentation

_M_finish_iterator

```
template<typename _It>
_It __gnu_parallel::__generic_for_each_selector< _It >::_M_finish_iterator  [inherited]
```



_Iterator on last element processed; needed for some algorithms (e. g. std::transform()).
The documentation for this struct was generated from the following file:

- for_each_selectors.h

6.57 __gnu_parallel::__unary_negate< _Predicate, argument_type > Class Template Reference

```
#include <base.h>
```

Inheritance diagram for __gnu_parallel::__unary_negate< _Predicate, argument_type >:

Public Types

- typedef argument_type argument_type
- typedef bool result_type

Public Member Functions

- **__unary_negate** (const _Predicate &__x)
- bool **operator()** (const argument_type &__x)

Protected Attributes

- _Predicate **_M_pred**

6.57.1 Detailed Description

template<typename _Predicate, typename argument_type>
class __gnu_parallel::__unary_negate< _Predicate, argument_type >

Similar to std::unary_negate, but giving the argument types explicitly.

6.57.2 Member Typedef Documentation

argument_type

`typedef argument_type std::unary_function< argument_type, bool >::argument_type [inherited]`
`argument_type` is the type of the argument

result_type

`typedef bool std::unary_function< argument_type, bool >::result_type [inherited]`
`result_type` is the return type
The documentation for this class was generated from the following file:

- base.h

6.58.1 Detailed Description

template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename > class _Base>
class __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >

Template class __versa_string.
Data structure managing sequences of characters and character-like objects.

6.58.2 Constructor & Destructor Documentation

__versa_string() [1/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
            const _Alloc & __a = _Alloc())  [inline], [explicit], [noexcept]
```

Construct an empty string using allocator *a*.
Referenced by compare(), compare(), and __gnu_cxx::__versa_string< char >::substr().

__versa_string() [2/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str)  [inline]
```

Construct string with copy of value of *__str*.

Parameters

__str	Source string.

__versa_string() [3/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
            __versa_string< _CharT, _Traits, _Alloc, _Base > && __str)  [inline], [noexcept]
```

String move constructor.

Parameters

__str	Source string.

The newly-constructed string contains the exact contents of *__str*. The contents of *__str* are a valid, but unspecified string.

__versa_string() [4/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
            std::initializer_list< _CharT > __l,
            const _Alloc & __a = _Alloc())  [inline]
```

Construct string from an initializer list.

Parameters

_↩ _l	std::initializer_list of characters.
_↩ _a	Allocator to use (default is default allocator).

__versa_string() [5/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
            size_type __pos,
            size_type __n = npos)  [inline]
```

Construct string as copy of a substring.

Parameters

__str	Source string.
__pos	Index of first character to copy from.
__n	Number of characters to copy (default remainder).

__versa_string() [6/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
            size_type __pos,
```

```
            size_type __n,
            const _Alloc & __a)  [inline]
```

Construct string as copy of a substring.

Parameters

__str	Source string.
__pos	Index of first character to copy from.
__n	Number of characters to copy.
__a	Allocator to use.

__versa_string() [7/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
            const _CharT * __s,
            size_type __n,
            const _Alloc & __a = _Alloc())  [inline]
```

Construct string initialized by a character array.

Parameters

_↩ _s	Source character array.
_↩ _n	Number of characters to copy.
_↩ _a	Allocator to use (default is default allocator).

NB: *__s* must have at least *__n* characters, '\0' has no special meaning.

__versa_string() [8/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
            const _CharT * __s,
            const _Alloc & __a = _Alloc())  [inline]
```

Construct string as copy of a C string.

Parameters

_↩ _s	Source C string.
_↩ _a	Allocator to use (default is default allocator).

__versa_string() [9/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
            size_type __n,
            _CharT __c,
            const _Alloc & __a = _Alloc())  [inline]
```

Construct string as multiple characters.

Parameters

_↩ _n	Number of characters.
_↩ _c	Character to use.
_↩ _a	Allocator to use (default is default allocator).

__versa_string() [10/10]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
template<class _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::__versa_string (
            _InputIterator __beg,
            _InputIterator __end,
            const _Alloc & __a = _Alloc())  [inline]
```

Construct string as copy of a range.

Parameters

__beg	Start of range.
__end	End of range.
__a	Allocator to use (default is default allocator).

~__versa_string()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::~__versa_string ()  [inline], [noexcept]
```

Destroy the string instance.

6.58.3 Member Function Documentation

append() [1/7]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
template<class _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
```

```
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append (
            _InputIterator __first,
            _InputIterator __last)  [inline]
```

Append a range of characters.

Parameters

__first	Iterator referencing the first character to append.
__last	Iterator marking the end of the range.

Returns

Reference to this string.

Appends characters in the range [first,last) to this string.

append() [2/7]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str)  [inline]
```

Append a string to this string.

Parameters

__str	The string to append.

Returns

Reference to this string.

Referenced by __gnu_cxx::__versa_string< char >::append(), std::getline(), __gnu_cxx::operator+(), __gnu_cxx::operator+(), __gnu_cxx::operator+(), __gnu_cxx::__versa_string< char >::operator+=(), __gnu_cxx::__versa_string< char >::operator+=(), __gnu_cxx::__versa_string< char >::operator+=(), and resize().

append() [3/7]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
            size_type __pos,
            size_type __n)  [inline]
```

Append a substring.

Parameters

__str	The string to append.
__pos	Index of the first character of str to append.
__n	The number of characters to append.

Returns

Reference to this string.

Exceptions

std::out_of_range	if *pos* is not a valid index.

This function appends *__n* characters from *__str* starting at *__pos* to this string. If *__n* is is larger than the number of available characters in *__str*, the remainder of *__str* is appended.

append() [4/7]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append (
            const _CharT * __s)  [inline]
```

Append a C string.

Parameters

_↩ _s	The C string to append.

Returns

Reference to this string.

append() [5/7]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append (
            const _CharT * __s,
            size_type __n)  [inline]
```

Append a C substring.

Parameters

_↩ _s	The C string to append.
_↩ _n	The number of characters to append.

Returns

Reference to this string.

append() [6/7]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
```

```
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append (
            size_type __n,
            _CharT __c)  [inline]
```

Append multiple characters.

Parameters

_↩ _*n*	The number of characters to append.
_↩ _*c*	The character to use.

Returns

Reference to this string.

Appends n copies of c to this string.

append() [7/7]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::append (
            std::initializer_list< _CharT > __l)  [inline]
```

Append an initializer_list of characters.

Parameters

↩ _↩ ↩ _↩ *l*	The initializer_list of characters to append.

Returns

Reference to this string.

assign() [1/8]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::assign (
            __versa_string< _CharT, _Traits, _Alloc, _Base > && __str)  [inline], [noexcept]
```

Set value to contents of another string.

Parameters

__str	Source string to use.

Returns

Reference to this string.

This function sets this string to the exact contents of __*str*. __*str* is a valid, but unspecified string.

assign() [2/8]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
template<class _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::assign (
            _InputIterator __first,
            _InputIterator __last)  [inline]
```

Set value to a range of characters.

Parameters

__*first*	Iterator referencing the first character to append.
__*last*	Iterator marking the end of the range.

Returns

Reference to this string.

Sets value of string to characters in the range [first,last).

assign() [3/8]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::assign (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str)  [inline]
```

Set value to contents of another string.

Parameters

__*str*	Source string to use.

Returns

Reference to this string.

Referenced by __gnu_cxx::__versa_string< char >::assign(), __gnu_cxx::__versa_string< char >::operator=(), __gnu_cxx::__versa_string< char >::operator=(), __gnu_cxx::__versa_string< char >::operator=(), and __gnu_cxx::__versa_string< ch

assign() [4/8]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::assign (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
            size_type __pos,
            size_type __n)  [inline]
```

Set value to a substring of a string.

Parameters

__str	The string to use.
__pos	Index of the first character of str.
__n	Number of characters to use.

Returns

Reference to this string.

Exceptions

std::out_of_range	if *__pos* is not a valid index.

This function sets this string to the substring of *__str* consisting of *__n* characters at *__pos*. If *__n* is is larger than the number of available characters in *__str*, the remainder of *__str* is used.

assign() [5/8]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::assign (
            const _CharT * __s)  [inline]
```

Set value to contents of a C string.

Parameters

_↩ _s	The C string to use.

Returns

Reference to this string.

This function sets the value of this string to the value of *__s*. The data is copied, so there is no dependence on *__s* once the function returns.

assign() [6/8]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::assign (
            const _CharT * __s,
            size_type __n)  [inline]
```

Set value to a C substring.

Parameters

_↩ _s	The C string to use.
_↩ _n	Number of characters to use.

Returns

Reference to this string.

This function sets the value of this string to the first __n characters of __s. If __n is is larger than the number of available characters in __s, the remainder of __s is used.

assign() [7/8]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::assign (
            size_type __n,
            _CharT __c)  [inline]
```

Set value to multiple characters.

Parameters

_↩ _n	Length of the resulting string.
_↩ _c	The character to use.

Returns

Reference to this string.

This function sets the value of this string to __n copies of character __c.

assign() [8/8]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::assign (
            std::initializer_list< _CharT > __l)  [inline]
```

Set value to an initializer_list of characters.

Parameters

↩ _↩ ↩ _↩ l	The initializer_list of characters to assign.

Returns

Reference to this string.

at() [1/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
reference __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::at (
            size_type __n)  [inline]
```

Provides access to the data contained in the string.

Parameters

_↩ _n	The index of the character to access.

Returns

Read/write reference to the character.

Exceptions

std::out_of_range	If __n is an invalid index.

This function provides for safer data access. The parameter is first checked that it is in the range of the string. The function throws out_of_range if the check fails. Success results in unsharing the string.

at() [2/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_reference __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::at (
            size_type __n) const  [inline]
```

Provides access to the data contained in the string.

Parameters

_↩ _n	The index of the character to access.

Returns

Read-only (const) reference to the character.

Exceptions

std::out_of_range	If __n is an invalid index.

This function provides for safer data access. The parameter is first checked that it is in the range of the string. The function throws out_of_range if the check fails.

back() [1/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_reference __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::back () const  [inline],
[noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the string.

back() [2/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
reference __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::back ()  [inline], [noexcept]
```

Returns a read/write reference to the data at the last element of the string.

begin() [1/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::begin () const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first character in the string.

begin() [2/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::begin ()  [inline], [noexcept]
```

Returns a read/write iterator that points to the first character in the string. Unshares the string.

Referenced by __gnu_cxx::__versa_string< char >::crend(), __gnu_cxx::__versa_string< char >::rend(), and __gnu_cxx::__versa_string< char >::rend().

c_str()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const _CharT * __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::c_str () const  [inline],
[noexcept]
```

Return const pointer to null-terminated contents.

This is a handle to internal data. Do not modify or dire things may happen.

capacity()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::capacity () const  [inline],
[noexcept]
```

Returns the total number of characters that the string can hold before needing to allocate more memory.

Referenced by __gnu_cxx::__versa_string< char >::push_back(), and __gnu_cxx::__versa_string< char >::shrink_to_fit().

cbegin()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::cbegin () const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first character in the string.

cend()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::cend () const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last character in the string.

clear()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
void __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::clear ()  [inline], [noexcept]
```

Erases the string, making it empty.

compare() [1/6]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
int __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str) const  [inline]
```

Compare to a string.

Parameters

__str	String to compare against.

Returns

Integer < 0, 0, or > 0.

Returns an integer < 0 if this string is ordered before *__str*, 0 if their values are equivalent, or > 0 if this string is ordered after *__str*. Determines the effective length rlen of the strings to compare as the smallest of size() and str.size(). The function then compares the two strings by calling traits::compare(data(), str.data(),rlen). If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

Referenced by __gnu_cxx::operator<(), __gnu_cxx::operator<(), __gnu_cxx::operator<(), __gnu_cxx::operator<=(), __gnu_cxx::operator<=(), __gnu_cxx::operator<=(), __gnu_cxx::operator>(), __gnu_cxx::operator>(), __gnu_cxx::operator>(), __gnu_cxx::operator>=(), __gnu_cxx::operator>=(), and __gnu_cxx::operator>=().

compare() [2/6]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
int __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare (
            const _CharT * __s) const
```

Compare to a C string.

Parameters

__s	C string to compare against.

Returns

Integer < 0, 0, or > 0.

Returns an integer < 0 if this string is ordered before __*s*, 0 if their values are equivalent, or > 0 if this string is ordered after __*s*. Determines the effective length rlen of the strings to compare as the smallest of size() and the length of a string constructed from __*s*. The function then compares the two strings by calling traits::compare(data(),s,rlen). If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.
References std::min(), and size().

compare() [3/6]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
int __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare (
            size_type __pos,
            size_type __n,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str) const
```

Compare substring to a string.

Parameters

__pos	Index of first character of substring.
__n	Number of characters in substring.
__str	String to compare against.

Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the __*n* characters starting at __*pos*. Returns an integer < 0 if the substring is ordered before __*str*, 0 if their values are equivalent, or > 0 if the substring is ordered after __*str*. Determines the effective length rlen of the strings to compare as the smallest of the length of the substring and __*str.size()*. The function then compares the two strings by calling traits::compare(substring.data(),str.data(),rlen). If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.
References __versa_string(), data(), std::min(), and size().

compare() [4/6]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
int __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare (
            size_type __pos,
            size_type __n1,
            const _CharT * __s) const
```

Compare substring to a C string.

Parameters

__pos	Index of first character of substring.
__n1	Number of characters in substring.

__s	C string to compare against.

Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the *__n1* characters starting at *__pos*. Returns an integer < 0 if the substring is ordered before *__s*, 0 if their values are equivalent, or > 0 if the substring is ordered after *__s*. Determines the effective length rlen of the strings to compare as the smallest of the length of the substring and the length of a string constructed from *__s*. The function then compares the two string by calling traits::compare(substring.data(),s,rlen). If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.
References std::min().

compare() [5/6]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
int __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare (
            size_type __pos,
            size_type __n1,
            const _CharT * __s,
            size_type __n2) const
```

Compare substring against a character array.

Parameters

__pos	Index of first character of substring.
__n1	Number of characters in substring.
__s	character array to compare against.
__n2	Number of characters of s.

Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the *__n1* characters starting at *__pos*. Form a string from the first *__n2* characters of *__s*. Returns an integer < 0 if this substring is ordered before the string from *__s*, 0 if their values are equivalent, or > 0 if this substring is ordered after the string from *__s*. Determines the effective length rlen of the strings to compare as the smallest of the length of the substring and *__n2*. The function then compares the two strings by calling traits::↩ compare(substring.data(),__s,rlen). If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.
NB: __s must have at least n2 characters, *\0* has no special meaning.
References std::min().

compare() [6/6]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
int __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::compare (
            size_type __pos1,
```

```
            size_type __n1,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
            size_type __pos2,
            size_type __n2) const
```

Compare substring to a substring.

Parameters

__pos1	Index of first character of substring.
__n1	Number of characters in substring.
__str	String to compare against.
__pos2	Index of first character of substring of str.
__n2	Number of characters in substring of str.

Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the *__n1* characters starting at *__pos1*. Form the substring of *__str* from the *__n2* characters starting at *__pos2*. Returns an integer < 0 if this substring is ordered before the substring of *__str*, 0 if their values are equivalent, or > 0 if this substring is ordered after the substring of *__str*. Determines the effective length rlen of the strings to compare as the smallest of the lengths of the substrings. The function then compares the two strings by calling traits::compare(substring.data(),str.substr(pos2,n2).data(),rlen). If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.
References __versa_string(), data(), and std::min().

copy()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↩
_Traits, _Alloc, _Base >::copy (
            _CharT * __s,
            size_type __n,
            size_type __pos = 0) const
```

Copy substring into C string.

Parameters

__s	C string to copy value into.
__n	Number of characters to copy.
__pos	Index of first character to copy.

Returns

Number of characters actually copied

Exceptions

std::out_of_range	If pos > size().

Copies up to *__n* characters starting at *__pos* into the C string *s*. If *__pos* is greater than size(), out_of_range is thrown.

crbegin()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_reverse_iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::crbegin ()
const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last character in the string. Iteration is done in reverse element order.

crend()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_reverse_iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::crend ()
const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first character in the string. Iteration is done in reverse element order.

data()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const _CharT * __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::data () const  [inline],
[noexcept]
```

Return const pointer to contents.

This is a handle to internal data. Do not modify or dire things may happen.

Referenced by compare(), compare(), __gnu_cxx::__versa_string< char >::compare(), __gnu_cxx::__versa_string< char >::find(), __gnu_cxx::__versa_string< char >::find_first_not_of(), __gnu_cxx::__versa_string< char >::find_first_of(), __gnu_cxx::__versa_string< __gnu_cxx::operator==(), and __gnu_cxx::operator==().

empty()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
bool __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::empty () const  [inline], [nodiscard],
[noexcept]
```

Returns true if the string is empty. Equivalent to `*this == ""`.

end() [1/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::end () const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last character in the string.

end() [2/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::end () [inline], [noexcept]
```

Returns a read/write iterator that points one past the last character in the string. Unshares the string.

Referenced by __gnu_cxx::__versa_string< char >::crbegin(), __gnu_cxx::__versa_string< char >::rbegin(), and __gnu_cxx::__versa_string< char >::rbegin().

erase() [1/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::erase (
            const_iterator __first,
            const_iterator __last) [inline]
```

Remove a range of characters.

Parameters

__first	Iterator referencing the first character to remove.
__last	Iterator referencing the end of the range.

Returns

Iterator referencing location of first after removal.

Removes the characters in the range [first,last) from this string. The value of the string doesn't change if an error is thrown.

erase() [2/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::erase (
            const_iterator __position) [inline]
```

Remove one character.

Parameters

__position	Iterator referencing the character to remove.

Returns

iterator referencing same location after removal.

Removes the character at *__position* from this string. The value of the string doesn't change if an error is thrown.

erase() [3/3]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::erase (
```

```
            size_type __pos = 0,
            size_type __n = npos)  [inline]
```

Remove characters.

Parameters

__pos	Index of first character to remove (default 0).
__n	Number of characters to remove (default remainder).

Returns

Reference to this string.

Exceptions

std::out_of_range	If *__pos* is beyond the end of this string.

Removes *__n* characters from this string starting at *__pos*. The length of the string is reduced by *__n*. If there are < *__n* characters to remove, the remainder of the string is truncated. If *__p* is beyond end of string, out_of_range is thrown. The value of the string doesn't change if an error is thrown.
Referenced by std::getline().

find() [1/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↩
_Traits, _Alloc, _Base >::find (
            _CharT __c,
            size_type __pos = 0) const  [noexcept]
```

Find position of a character.

Parameters

__c	Character to locate.
__pos	Index of character to search from (default 0).

Returns

Index of first occurrence.

Starting from *__pos*, searches forward for *__c* within this string. If found, returns the index where it was found. If not found, returns npos.
References npos, and size().

find() [2/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find (
```

```
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
            size_type __pos = 0) const  [inline], [noexcept]
```

Find position of a string.

Parameters

__str	String to locate.
__pos	Index of character to search from (default 0).

Returns

Index of start of first occurrence.

Starting from *__pos*, searches forward for value of *__str* within this string. If found, returns the index where it begins. If not found, returns npos.

find() [3/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↩
_Traits, _Alloc, _Base >::find (
            const _CharT * __s,
            size_type __pos,
            size_type __n) const
```

Find position of a C substring.

Parameters

__s	C string to locate.
__pos	Index of character to search from.
__n	Number of characters from *__s* to search for.

Returns

Index of start of first occurrence.

Starting from *__pos*, searches forward for the first *__n* characters in *__s* within this string. If found, returns the index where it begins. If not found, returns npos.
References npos, and size().
Referenced by __gnu_cxx::__versa_string< char >::find(), __gnu_cxx::__versa_string< char >::find(), and __gnu_cxx::__versa_string<

find() [4/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find (
            const _CharT * __s,
            size_type __pos = 0) const  [inline]
```

Find position of a C string.

Parameters

__s	C string to locate.
__pos	Index of character to search from (default 0).

Returns

Index of start of first occurrence.

Starting from *__pos*, searches forward for the value of *__s* within this string. If found, returns the index where it begins. If not found, returns npos.

find_first_not_of() [1/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↩
_Traits, _Alloc, _Base >::find_first_not_of (
            _CharT __c,
            size_type __pos = 0) const  [noexcept]
```

Find position of a different character.

Parameters

__c	Character to avoid.
__pos	Index of character to search from (default 0).

Returns

Index of first occurrence.

Starting from *__pos*, searches forward for a character other than *__c* within this string. If found, returns the index where it was found. If not found, returns npos.
References npos, and size().

find_first_not_of() [2/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_first_not_of (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
            size_type __pos = 0) const  [inline], [noexcept]
```

Find position of a character not in string.

Parameters

__str	String containing characters to avoid.
__pos	Index of character to search from (default 0).

Returns

Index of first occurrence.

Starting from *__pos*, searches forward for a character not contained in *__str* within this string. If found, returns the index where it was found. If not found, returns npos.
Referenced by __gnu_cxx::__versa_string< char >::find_first_not_of(), and __gnu_cxx::__versa_string< char >::find_first_not_of().

find_first_not_of() [3/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↩
_Traits, _Alloc, _Base >::find_first_not_of (
            const _CharT * __s,
            size_type __pos,
            size_type __n) const
```

Find position of a character not in C substring.

Parameters

__s	C string containing characters to avoid.
__pos	Index of character to search from.
__n	Number of characters from s to consider.

Returns

Index of first occurrence.

Starting from *__pos*, searches forward for a character not contained in the first *__n* characters of *__s* within this string. If found, returns the index where it was found. If not found, returns npos.
References npos, and size().

find_first_not_of() [4/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_first_not_of (
            const _CharT * __s,
            size_type __pos = 0) const  [inline]
```

Find position of a character not in C string.

Parameters

__s	C string containing characters to avoid.
__pos	Index of character to search from (default 0).

Returns

Index of first occurrence.

Starting from *__pos*, searches forward for a character not contained in *__s* within this string. If found, returns the index where it was found. If not found, returns npos.

find_first_of() [1/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_first_of (
            _CharT __c,
            size_type __pos = 0) const  [inline], [noexcept]
```

Find position of a character.

Parameters

__c	Character to locate.
__pos	Index of character to search from (default 0).

Returns

Index of first occurrence.

Starting from *__pos*, searches forward for the character *__c* within this string. If found, returns the index where it was found. If not found, returns npos.
Note: equivalent to find(c, pos).

find_first_of() [2/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_first_of (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
            size_type __pos = 0) const  [inline], [noexcept]
```

Find position of a character of string.

Parameters

__str	String containing characters to locate.
__pos	Index of character to search from (default 0).

Returns

Index of first occurrence.

Starting from *__pos*, searches forward for one of the characters of *__str* within this string. If found, returns the index where it was found. If not found, returns npos.
Referenced by __gnu_cxx::__versa_string< char >::find_first_of(), and __gnu_cxx::__versa_string< char >::find_first_of().

find_first_of() [3/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↩
_Traits, _Alloc, _Base >::find_first_of (
            const _CharT * __s,
            size_type __pos,
            size_type __n) const
```

Find position of a character of C substring.

Parameters

__s	String containing characters to locate.
__pos	Index of character to search from.
__n	Number of characters from s to search for.

Returns

Index of first occurrence.

Starting from *__pos*, searches forward for one of the first *__n* characters of *__s* within this string. If found, returns the index where it was found. If not found, returns npos.
References npos, and size().

find_first_of() [4/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_first_of (
            const _CharT * __s,
            size_type __pos = 0) const  [inline]
```

Find position of a character of C string.

Parameters

__s	String containing characters to locate.
__pos	Index of character to search from (default 0).

Returns

Index of first occurrence.

Starting from *__pos*, searches forward for one of the characters of *__s* within this string. If found, returns the index where it was found. If not found, returns npos.

find_last_not_of() [1/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
```

```
__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↩
_Traits, _Alloc, _Base >::find_last_not_of (
            _CharT __c,
            size_type __pos = npos) const  [noexcept]
```

Find last position of a different character.

Parameters

__c	Character to avoid.
__pos	Index of character to search back from (default end).

Returns

Index of last occurrence.

Starting from *__pos*, searches backward for a character other than *__c* within this string. If found, returns the index where it was found. If not found, returns npos.
References npos, and size().

find_last_not_of() [2/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_last_not_of (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
            size_type __pos = npos) const  [inline], [noexcept]
```

Find last position of a character not in string.

Parameters

__str	String containing characters to avoid.
__pos	Index of character to search back from (default end).

Returns

Index of last occurrence.

Starting from *__pos*, searches backward for a character not contained in *__str* within this string. If found, returns the index where it was found. If not found, returns npos.
Referenced by __gnu_cxx::__versa_string< char >::find_last_not_of(), and __gnu_cxx::__versa_string< char >::find_last_not_of().

find_last_not_of() [3/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↩
_Traits, _Alloc, _Base >::find_last_not_of (
            const _CharT * __s,
            size_type __pos,
            size_type __n) const
```

Find last position of a character not in C substring.

Parameters

__s	C string containing characters to avoid.
__pos	Index of character to search back from.
__n	Number of characters from s to consider.

Returns

Index of last occurrence.

Starting from *__pos*, searches backward for a character not contained in the first *__n* characters of *__s* within this string. If found, returns the index where it was found. If not found, returns npos.
References npos, and size().

find_last_not_of() [4/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_last_not_of (
            const _CharT * __s,
            size_type __pos = npos) const  [inline]
```

Find last position of a character not in C string.

Parameters

__s	C string containing characters to avoid.
__pos	Index of character to search back from (default end).

Returns

Index of last occurrence.

Starting from *__pos*, searches backward for a character not contained in *__s* within this string. If found, returns the index where it was found. If not found, returns npos.

find_last_of() [1/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_last_of (
            _CharT __c,
            size_type __pos = npos) const  [inline], [noexcept]
```

Find last position of a character.

Parameters

__c	Character to locate.
__pos	Index of character to search back from (default end).

Returns

Index of last occurrence.

Starting from __*pos*, searches backward for __*c* within this string. If found, returns the index where it was found. If not found, returns npos.
Note: equivalent to rfind(c, pos).

find_last_of() [2/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_last_of (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
            size_type __pos = npos) const  [inline], [noexcept]
```

Find last position of a character of string.

Parameters

__*str*	String containing characters to locate.
__*pos*	Index of character to search back from (default end).

Returns

Index of last occurrence.

Starting from __*pos*, searches backward for one of the characters of __*str* within this string. If found, returns the index where it was found. If not found, returns npos.
Referenced by __gnu_cxx::__versa_string< char >::find_last_of(), and __gnu_cxx::__versa_string< char >::find_last_of().

find_last_of() [3/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string< _CharT, _Traits, _Alloc, _Base >::size_type __gnu_cxx::__versa_string< _CharT, ↩
_Traits, _Alloc, _Base >::find_last_of (
            const _CharT * __s,
            size_type __pos,
            size_type __n) const
```

Find last position of a character of C substring.

Parameters

__*s*	C string containing characters to locate.
__*pos*	Index of character to search back from.
__*n*	Number of characters from s to search for.

Returns

Index of last occurrence.

Starting from *__pos*, searches backward for one of the first *__n* characters of *__s* within this string. If found, returns the index where it was found. If not found, returns npos.
References npos, and size().

find_last_of() [4/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::find_last_of (
            const _CharT * __s,
            size_type __pos = npos) const  [inline]
```

Find last position of a character of C string.

Parameters

__s	C string containing characters to locate.
__pos	Index of character to search back from (default end).

Returns

Index of last occurrence.

Starting from *__pos*, searches backward for one of the characters of *__s* within this string. If found, returns the index where it was found. If not found, returns npos.

front() [1/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_reference __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::front () const  [inline],
[noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the string.

front() [2/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
reference __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::front ()  [inline], [noexcept]
```

Returns a read/write reference to the data at the first element of the string.

get_allocator()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
allocator_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::get_allocator ()
const  [inline], [noexcept]
```

Return copy of allocator used to construct this string.

insert() [1/9]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::insert (
            const_iterator __p,
            _CharT __c)  [inline]
```

Insert one character.

Parameters

_↩ _p	Iterator referencing position in string to insert at.
_↩ _c	The character to insert.

Returns

Iterator referencing newly inserted char.

Exceptions

std::length_error	If new length exceeds `max_size()`.

Inserts character __c at position referenced by __p. If adding character causes the length to exceed max_size(), length_error is thrown. If __p is beyond end of string, out_of_range is thrown. The value of the string doesn't change if an error is thrown.

insert() [2/9]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
template<class _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::insert (
            const_iterator __p,
            _InputIterator __beg,
            _InputIterator __end)  [inline]
```

Insert a range of characters.

Parameters

__p	Const_iterator referencing location in string to insert at.
__beg	Start of range.
__end	End of range.

Returns

Iterator referencing the first inserted char.

Exceptions

std::length_error	If new length exceeds `max_size()`.

Inserts characters in range [beg,end). If adding characters causes the length to exceed max_size(), length_error is thrown. The value of the string doesn't change if an error is thrown.

insert() [3/9]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::insert (
            const_iterator __p,
            size_type __n,
            _CharT __c)  [inline]
```

Insert multiple characters.

Parameters

__p	Const_iterator referencing location in string to insert at.
__n	Number of characters to insert
__c	The character to insert.

Returns

Iterator referencing the first inserted char.

Exceptions

std::length_error	If new length exceeds `max_size()`.

Inserts *__n* copies of character *__c* starting at the position referenced by iterator *__p*. If adding characters causes the length to exceed max_size(), length_error is thrown. The value of the string doesn't change if an error is thrown.
Referenced by __gnu_cxx::__versa_string< char >::insert().

insert() [4/9]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::insert (
            const_iterator __p,
            std::initializer_list< _CharT > __l)  [inline]
```

Insert an initializer_list of characters.

Parameters

_↩ _p	Const_iterator referencing location in string to insert at.
_↩ _l	The initializer_list of characters to insert.

Returns

Iterator referencing the first inserted char.

Exceptions

std::length_error	If new length exceeds `max_size()`.

insert() [5/9]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::insert (
            size_type __pos,
            const _CharT * __s)  [inline]
```

Insert a C string.

Parameters

__pos	Iterator referencing location in string to insert at.
__s	The C string to insert.

Returns

Reference to this string.

Exceptions

std::length_error	If new length exceeds `max_size()`.
std::out_of_range	If *__pos* is beyond the end of this string.

Inserts the first *__n* characters of *__s* starting at *__pos*. If adding characters causes the length to exceed max_size(), length_error is thrown. If *__pos* is beyond end(), out_of_range is thrown. The value of the string doesn't change if an error is thrown.

insert() [6/9]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
```

```
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::insert (
            size_type __pos,
            const _CharT * __s,
            size_type __n)  [inline]
```

Insert a C substring.

Parameters

__pos	Iterator referencing location in string to insert at.
__s	The C string to insert.
__n	The number of characters to insert.

Returns

Reference to this string.

Exceptions

std::length_error	If new length exceeds `max_size()`.
std::out_of_range	If *__pos* is beyond the end of this string.

Inserts the first *__n* characters of *__s* starting at *__pos*. If adding characters causes the length to exceed max_size(), length_error is thrown. If *__pos* is beyond end(), out_of_range is thrown. The value of the string doesn't change if an error is thrown.

insert() [7/9]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::insert (
            size_type __pos,
            size_type __n,
            _CharT __c)  [inline]
```

Insert multiple characters.

Parameters

__pos	Index in string to insert at.
__n	Number of characters to insert
__c	The character to insert.

Returns

Reference to this string.

Exceptions

std::length_error	If new length exceeds `max_size()`.
std::out_of_range	If *__pos* is beyond the end of this string.

Inserts *__n* copies of character *__c* starting at index *__pos*. If adding characters causes the length to exceed max_↩ size(), length_error is thrown. If *__pos* > length(), out_of_range is thrown. The value of the string doesn't change if an error is thrown.

insert() [8/9]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::insert (
            size_type __pos1,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str)  [inline]
```

Insert value of a string.

Parameters

__pos1	Iterator referencing location in string to insert at.
__str	The string to insert.

Returns

Reference to this string.

Exceptions

std::length_error	If new length exceeds `max_size()`.

Inserts value of *__str* starting at *__pos1*. If adding characters causes the length to exceed max_size(), length_error is thrown. The value of the string doesn't change if an error is thrown.

insert() [9/9]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::insert (
            size_type __pos1,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
            size_type __pos2,
            size_type __n)  [inline]
```

Insert a substring.

Parameters

__pos1	Iterator referencing location in string to insert at.
__str	The string to insert.
__pos2	Start of characters in str to insert.
__n	Number of characters to insert.

Returns

Reference to this string.

Exceptions

std::length_error	If new length exceeds `max_size()`.
std::out_of_range	If *__pos1* > size() or *__pos2* > *__str.size()*.

Starting at *__pos1*, insert *__n* character of *__str* beginning with *__pos2*. If adding characters causes the length to exceed max_size(), length_error is thrown. If *__pos1* is beyond the end of this string or *__pos2* is beyond the end of *__str*, out_of_range is thrown. The value of the string doesn't change if an error is thrown.

length()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::length () const  [inline],
[noexcept]
```

Returns the number of characters in the string, not including any null-termination.

max_size()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
size_type __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::max_size () const  [inline],
[noexcept]
```

Returns the size() of the largest possible string.
Referenced by std::getline().

operator+=() [1/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::operator+= (
            _CharT __c)  [inline]
```

Append a character.

Parameters

__c	The character to append.

Returns

Reference to this string.

operator+=() [2/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::operator+= (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str)  [inline]
```

Append a string to this string.

Parameters

__str	The string to append.

Returns

Reference to this string.

operator+=() [3/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::operator+= (
            const _CharT * __s)  [inline]
```

Append a C string.

Parameters

_↩ _s	The C string to append.

Returns

Reference to this string.

operator+=() [4/4]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::operator+= (
            std::initializer_list< _CharT > __l)  [inline]
```

Append an initializer_list of characters.

Parameters

↩ _↩ ↩ _↩ *l*	The initializer_list of characters to be appended.

Returns

Reference to this string.

operator=() [1/5]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::operator= (
            __versa_string< _CharT, _Traits, _Alloc, _Base > && __str)  [inline], [noexcept]
```

String move assignment operator.

Parameters

__str	Source string.

The contents of *__str* are moved into this string (without copying). *__str* is a valid, but unspecified string.

operator=() [2/5]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::operator= (
            _CharT __c)  [inline]
```

Set value to string of length 1.

Parameters

_↩ *_c*	Source character.

Assigning to a character makes this string length 1 and (*this)[0] == *__c*.

operator=() [3/5]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::operator= (
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str)  [inline]
```

Assign the value of *str* to this string.

Parameters

__str	Source string.

operator=() [4/5]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::operator= (
            const _CharT * __s)  [inline]
```

Copy contents of *__s* into this string.

Parameters

_↩ _*s*	Source null-terminated string.

operator=() [5/5]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::operator= (
            std::initializer_list< _CharT > __l)  [inline]
```

Set value to string constructed from initializer list.

Parameters

↩ _↩ ↩ _↩ *l*	std::initializer_list.

operator[]() [1/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_reference __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::operator[] (
            size_type __pos) const  [inline], [noexcept]
```

Subscript access to the data contained in the string.

Parameters

__pos	The index of the character to access.

Returns

Read-only (constant) reference to the character.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out_of_range lookups are not defined. (For checked lookups see at().)
Referenced by __gnu_cxx::__versa_string< char >::back(), __gnu_cxx::__versa_string< char >::back(), __gnu_cxx::__versa_string< ch and __gnu_cxx::__versa_string< char >::front().

operator[]() [2/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
reference __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::operator[] (
            size_type __pos) [inline], [noexcept]
```

Subscript access to the data contained in the string.

Parameters

__pos	The index of the character to access.

Returns

Read/write reference to the character.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out_of_range lookups are not defined. (For checked lookups see at().) Unshares the string.

pop_back()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
void __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::pop_back () [inline]
```

Remove the last character.
The string must be non-empty.

push_back()

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
void __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::push_back (
            _CharT __c) [inline]
```

Append a single character.

Parameters

__c	Character to append.

Referenced by __gnu_cxx::operator+(), __gnu_cxx::operator+(), and __gnu_cxx::__versa_string< char >::operator+=().

rbegin() [1/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_reverse_iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::rbegin ()
const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last character in the string. Iteration is done in reverse element order.

rbegin() [2/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
```

```
reverse_iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::rbegin ()  [inline],
[noexcept]
```

Returns a read/write reverse iterator that points to the last character in the string. Iteration is done in reverse element order. Unshares the string.

rend() [1/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
const_reverse_iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::rend () const
[inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first character in the string. Iteration is done in reverse element order.

rend() [2/2]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
reverse_iterator __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::rend ()  [inline],
[noexcept]
```

Returns a read/write reverse iterator that points to one before the first character in the string. Iteration is done in reverse element order. Unshares the string.

replace() [1/11]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
template<class _InputIterator, typename = std::_RequireInputIter<_InputIterator>>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::replace (
            const_iterator __i1,
            const_iterator __i2,
            _InputIterator __k1,
            _InputIterator __k2)  [inline]
```

Replace range of characters with range.

Parameters

__i1	Iterator referencing start of range to replace.
__i2	Iterator referencing end of range to replace.
__k1	Iterator referencing start of range to insert.
__k2	Iterator referencing end of range to insert.

Returns

Reference to this string.

Exceptions

std::length_error	If new length exceeds `max_size()`.

Removes the characters in the range [i1,i2). In place, characters in the range [k1,k2) are inserted. If the length of result exceeds max_size(), length_error is thrown. The value of the string doesn't change if an error is thrown.

replace() [2/11]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::replace (
            const_iterator __i1,
            const_iterator __i2,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str)  [inline]
```

Replace range of characters with string.

Parameters

__i1	Iterator referencing start of range to replace.
__i2	Iterator referencing end of range to replace.
__str	String value to insert.

Returns

Reference to this string.

Exceptions

std::length_error	If new length exceeds `max_size()`.

Removes the characters in the range [i1,i2). In place, the value of *__str* is inserted. If the length of result exceeds max_size(), length_error is thrown. The value of the string doesn't change if an error is thrown.

replace() [3/11]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::replace (
            const_iterator __i1,
            const_iterator __i2,
            const _CharT * __s)  [inline]
```

Replace range of characters with C string.

Parameters

_↩ _i1	Iterator referencing start of range to replace.
_↩ _i2	Iterator referencing end of range to replace.
_↩ _s	C string value to insert.

Returns

Reference to this string.

Exceptions

std::length_error	If new length exceeds `max_size()`.

Removes the characters in the range [i1,i2). In place, the characters of __*s* are inserted. If the length of result exceeds max_size(), length_error is thrown. The value of the string doesn't change if an error is thrown.

replace() [4/11]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::replace (
            const_iterator __i1,
            const_iterator __i2,
            const _CharT * __s,
            size_type __n)  [inline]
```

Replace range of characters with C substring.

Parameters

_↩ _*i1*	Iterator referencing start of range to replace.
_↩ _*i2*	Iterator referencing end of range to replace.
_↩ _*s*	C string value to insert.
_↩ _*n*	Number of characters from s to insert.

Returns

Reference to this string.

Exceptions

std::length_error	If new length exceeds `max_size()`.

Removes the characters in the range [i1,i2). In place, the first *n* characters of __*s* are inserted. If the length of result exceeds max_size(), length_error is thrown. The value of the string doesn't change if an error is thrown.

replace() [5/11]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::replace (
            const_iterator __i1,
            const_iterator __i2,
```

```
            size_type __n,
            _CharT __c)  [inline]
```

Replace range of characters with multiple characters.

Parameters

_↩ _i1	Iterator referencing start of range to replace.
_↩ _i2	Iterator referencing end of range to replace.
_↩ _n	Number of characters to insert.
_↩ _c	Character to insert.

Returns

Reference to this string.

Exceptions

std::length_error	If new length exceeds `max_size()`.

Removes the characters in the range [i1,i2). In place, __n copies of __c are inserted. If the length of result exceeds max_size(), length_error is thrown. The value of the string doesn't change if an error is thrown.

replace() [6/11]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::replace (
            const_iterator __i1,
            const_iterator __i2,
            std::initializer_list< _CharT > __l)  [inline]
```

Replace range of characters with initializer_list.

Parameters

_↩ _i1	Iterator referencing start of range to replace.
_↩ _i2	Iterator referencing end of range to replace.
_↩ _l	The initializer_list of characters to insert.

Returns

Reference to this string.

Exceptions

std::length_error	If new length exceeds `max_size()`.

Removes the characters in the range [i1,i2). In place, characters in the range [k1,k2) are inserted. If the length of result exceeds max_size(), length_error is thrown. The value of the string doesn't change if an error is thrown.

replace() [7/11]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::replace (
            size_type __pos,
            size_type __n,
            const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str)  [inline]
```

Replace characters with value from another string.

Parameters

__pos	Index of first character to replace.
__n	Number of characters to be replaced.
__str	String to insert.

Returns

Reference to this string.

Exceptions

std::out_of_range	If *__pos* is beyond the end of this string.
std::length_error	If new length exceeds `max_size()`.

Removes the characters in the range [pos,pos+n) from this string. In place, the value of *__str* is inserted. If *__pos* is beyond end of string, out_of_range is thrown. If the length of the result exceeds max_size(), length_error is thrown. The value of the string doesn't change if an error is thrown.
Referenced by __gnu_cxx::__versa_string< char >::append(), __gnu_cxx::__versa_string< char >::assign(), __gnu_cxx::__versa_string< char >::insert(), __gnu_cxx::__versa_string< char >::insert(), __gnu_cxx::__versa_string< char >::insert(), __gnu_cxx::__versa_string< char >::insert(), __gnu_cxx::__versa_string< char >::insert(), __gnu_cxx::__versa_string< char >::replace(), __gnu_cxx::__versa_string< char >::replace(), __gnu_cxx::__versa_string< char >::rep, __gnu_cxx::__versa_string< char >::replace(), __gnu_cxx::__versa_string< char >::replace(), __gnu_cxx::__versa_string< char >::rep, and __gnu_cxx::__versa_string< char >::replace().

replace() [8/11]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
```

```
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::replace (
            size_type __pos,
            size_type __n1,
            const _CharT * __s)  [inline]
```

Replace characters with value of a C string.

Parameters

__pos	Index of first character to replace.
__n1	Number of characters to be replaced.
__s	C string to insert.

Returns

Reference to this string.

Exceptions

std::out_of_range	If *__pos* > size().
std::length_error	If new length exceeds `max_size()`.

Removes the characters in the range [pos,pos + n1) from this string. In place, the characters of *__s* are inserted. If *pos* is beyond end of string, out_of_range is thrown. If the length of result exceeds max_size(), length_error is thrown. The value of the string doesn't change if an error is thrown.

replace() [9/11]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::replace (
            size_type __pos,
            size_type __n1,
            const _CharT * __s,
            size_type __n2)  [inline]
```

Replace characters with value of a C substring.

Parameters

__pos	Index of first character to replace.
__n1	Number of characters to be replaced.
__s	C string to insert.
__n2	Number of characters from *__s* to use.

Returns

Reference to this string.

Exceptions

std::out_of_range	If *__pos1* > size().
std::length_error	If new length exceeds `max_size()`.

Removes the characters in the range [pos,pos + n1) from this string. In place, the first *__n2* characters of *__s* are inserted, or all of *__s* if *__n2* is too large. If *__pos* is beyond end of string, out_of_range is thrown. If the length of result exceeds max_size(), length_error is thrown. The value of the string doesn't change if an error is thrown.

replace() [10/11]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::replace (
            size_type __pos,
            size_type __n1,
            size_type __n2,
            _CharT __c)  [inline]
```

Replace characters with multiple characters.

Parameters

__pos	Index of first character to replace.
__n1	Number of characters to be replaced.
__n2	Number of characters to insert.
__c	Character to insert.

Returns

Reference to this string.

Exceptions

std::out_of_range	If *__pos* > size().
std::length_error	If new length exceeds `max_size()`.

Removes the characters in the range [pos,pos + n1) from this string. In place, *__n2* copies of *__c* are inserted. If *__pos* is beyond end of string, out_of_range is thrown. If the length of result exceeds max_size(), length_error is thrown. The value of the string doesn't change if an error is thrown.

replace() [11/11]

```
template<typename _CharT, typename _Traits, typename _Alloc, template< typename, typename, typename
> class _Base>
__versa_string & __gnu_cxx::__versa_string< _CharT, _Traits, _Alloc, _Base >::replace (
            size_type __pos1,
```

```
        size_type __n1,
        const __versa_string< _CharT, _Traits, _Alloc, _Base > & __str,
        size_type __pos2,
        size_type __n2)  [inline]
```

Replace characters with value from another string.

Parameters

__pos1	Index of first character to replace.
__n1	Number of characters to be replaced.
__str	String to insert.
__pos2	Index of first character of str to use.
__n2	Number of characters from str to use.

Returns

Reference to this string.

Exceptions

std::out_of_range	If *__pos1* > size() or *__pos2* > str.size().
std::length_error	If new length exceeds `max_size()`.
